Finally, the engineer has a duty to his country. This he shares with all citizens but the country that has given him his education and his professional preparation has a special claim on his services. It has a right to expect that these abilities which it has helped to cultivate will at the proper time be made available for the general good. It is entitled to the benefit of that reasoned and orderly consideration of her problems that can so well be given by the trained and orderly mind of the experienced engineer. He has a duty, therefore, to unselfishly offer himself for service in elective public office so far as his daily work does not seriously conflict. The engineer of all men should be the last to complain of mediocrity in government if he is not making his training available for the solution of public

questions. Some men are, by nature of their employment by government itself, prevented from actively engaging in politics. There are other outlets available, boards of trade, chambers of commerce, service clubs, church organizations. These all have their effect on public opinion and in the creating of public opinion through these mediums the same orderly process of thought and reasoning that characterize his daily work can be of great value.

In times like these there is also the urge to enter the armed forces, especially among the undergraduates and more recent graduates. Both the Government and the Association of Professional Engineers advise completion of courses in engineering so that men entering industry shall be best enabled to serve it and through it, in turn, the country it serves. Engineers are performing a very essential part in producing the tools of war, in building facilities for training and in addition constructing those works that are necessary for the defensive and offensive strategy of our armed forces, and every decision they make should be measured up in the light of its most effective contribution to the war effort.

If the engineer is then to persuade his employers and the public generally that he has a definite contribution to make in economic public decisions, it is his duty in some such way as outlined to make the public aware that he is more than just a skilled technician. It is one of the objects of the Association to encourage a professional attitude and to this end the speaker referred to the forthcoming report of the Committee on Remuneration of Engineers, known as "Job Evaluation." He asked that engineers study it, criticize it, and be sure to send in their criticisms so that weaknesses of the idea might be studied.

In conclusion Mr. Miller invited all members of the Association to visit its office in Toronto and bring in their ideas and reactions to the activities of the Association.

After a period of discussion a vote of thanks was moved by Mr. T. Jenkins and the meeting adjourned.

## HAMILTON BRANCH

A. R. HANNAFORD, M.E.I.C. - *Secretary-Treasurer*  
W. E. BROWN, JR., E.I.C. - *Branch News Editor*

The Annual Student and Junior Night was held at McMaster University on Friday March 20th. 1942. There were three contestants for the two branch prizes:

Mr. R. J. G. Schofield, J.E.I.C., on **Cotton Yarn Dyeing.**

Mr. Andrew M. Swan, S.E.I.C., on **The Application of Electric Drive to Machine Tools.**

Mr. K. R. Knights, S.E.I.C., on **A History of Water Power Developments on the Saguenay River.**

Mr. Schofield is chemist and assistant dyer for the Canadian Cottons Limited, Hamilton. He graduated from McGill University in chemical engineering in 1935.

Mr. Swan is with the Canadian General Electric Company, Hamilton. He graduated from the University of Manitoba, in electrical engineering in 1939.

Mr. Knights, unfortunately, was unable to present his own paper as he is at Chute-à-Caron. The paper was read by the secretary, on behalf of Mr. Knights.

After the chairman had outlined the object of this annual affair, Norman Eager, chairman of the Papers Committee, introduced the speakers, after which they presented their papers. The judges, Dr. A. H. Wingfield and W. J. W. Reid will report in time for the next meeting. After the papers, our guest speaker, Chancellor G. P. Gilmour, M.A., B.D., gave us a very interesting talk on **Useful and Useless Learning** the text of which is given below.

Col. E. G. Mackay introduced the chancellor, and chairman, S. Shuppe thanked him.

"I sometimes envy men like yourselves who, as chemical, electrical, civil or mechanical engineers, are devoted to 'useful learning.' You have the satisfaction at a

year's end of seeing definite and sometimes fairly permanent results of your labors; and you can so harness the forces with which you work that people without professional accomplishments can use them or direct them by pushing buttons here and there or throwing a lever or reading a gauge. There is, however, a double disadvantage or danger in this: on the one hand, that you should become insular in your own outlook and too often be made the tool of designing men who work in the realm of ideas; and on the other, that the people who use your tools have no outlook at all, or become the dupes of demagogues and fanatics, or lose their moral balance through sheer boredom.

There is, therefore, much to be said for 'useless learning,' to which I have devoted myself since I turned from mathematics and physics to work in history and theology. Such useless learning is sometimes regarded with contempt by the engineering undergraduate; and when in maturer years such professional men turn to an intellectual hobby or strive to appreciate the fields of human relations or religious findings, they too often pay the penalty of unadmitted ignorance or find themselves unable to move happily in the fields of culture or religion. Engineers, for instance, who become fascinated by certain aspects of religion, can be fanatically certain of a deterministic view of history, as though God were an engineer rather than a Father, or less a Father than a remorseless engineer. But more often the penalty is not so much of uninformed certainty in a foreign field as it is the lack of such achievements in life as make a man a good companion (not boon companion) for himself, or his wife, or a wise father to his children, or a sympathetic director of those whose labour he controls.

Two proverbs need criticism because they express only a half-truth. One is the ancient "Let every man be faithful to his own mystery," and the other our familiar, "Let the cobbler stick to his last." These are both true, but they are both defective.

"Let every man be faithful to his own mystery" is a saying from ancient times, when different "mysteries" competed for the allegiance of the serious, and offered ethical principles and religious promises of various kinds. A man was allowed by his fellows, even expected by his fellows, to be true to the ideals he had adopted, even though they cut him off from life here and there. Of course, many men diversified their risks by belonging to several "mysteries." But the word mystery is also applicable to the esoteric learning which a man is allowed to have in his guild or profession, which in old days was carefully guarded. A man had to serve his apprenticeship and fulfil his calling. Life, however, demands that we should not be confined to our own mystery, monopolized by the esoteric learning by which we earn our bread. We must have more catholic interests than any "useful learning" can give.

Similarly, a cobbler who sticks too closely to his last is in the end not the best cobbler. To use the pun that Shakespeare employs in *Julius Caesar*, he is a mere cobbler or dabbler, having no harmony, no wholeness, to his life. Many a specialist loses his influence and effectiveness because he is too much a specialist.

I run over such obvious comments not solely because my own training has taken me into the fields of culture and religion, and not solely because a technical expert may be ill-fitted for the real living that is the main part of life, but because, as I mentioned earlier, the devotee of useful learning who excludes useless learning or thinks he has mastered it when he has only misunderstood it may become himself the slave of designing men of ideas, or may be unaware of how terribly he stunts the growth of his underlings if he is content to see them pushing buttons and caring for automatic devices.

Learning may become the slave of fanaticism, as is very

evident now, and the unlearned may become the slaves of the machines. From such slavery only useless learning can deliver us, the hunger for things that are right as well as for things that are measurable, the desire for cultivated imagination, the development of sympathy and charm, the patient inquiry into the things of the soul. It takes more maturity to be the master of useless things than of useful.

I hope that the connection between this Institute and this University may keep us both alive to the place of the other, that we may be grateful for what the engineer can do and that you may be aware of those vaster resources of the mind and the spirit which a true university exists to guard and to convey. This is a field in which nothing can be reduced to push-button efficiency. It can never be "worked" by slaves. It demands and develops a freedom that the mechanical world cannot give and dares not ignore."

On March 31st, the branch held its monthly meeting in the auditorium of the Delta Collegiate School. Mr. E. Arthur Pinto, of Montreal, addressed the branch on the subject **Essential Air Raid Precautions**. Introduced by Norman Eager, Mr. Pinto gave a most valuable address on the precautions that should be taken, for he said, "even if it does never happen to us, we must be fully ready and organized in case it does happen, and why shouldn't it?" Lieut.-Col. Robinson, in moving a vote of thanks to the speaker, said that the address was the most complete and carefully prepared paper he had ever heard on this important subject.

The guests of the branch on this occasion were, the Hamilton Civil Guard, the Army Trades School Officers and Instructors, the Women's Auxiliary Defence Corps, the Auxiliary Firemen and A.R.P. Wardens and workers. Members of the Hamilton Board of Education, who kindly gave the free use of the hall, were also present. The audience numbered over eleven hundred persons.

First and second prizes were presented to the winners of the Students and Juniors papers competition held on March 20th. They were Andrew M. Swan, S.E.I.C., for his paper "The Application of Electric Drive to Machine Tools," and R. J. G. Schofield, Jr.E.I.C., for his paper on "Cotton Yarn Dyeing."

Mr. T. S. Glover, the Hamilton representative of the Wartime Bureau of Technical Personnel gave a short outline on the importance of this work.

The executive wishes to thank the members for the presence of so many lady guests of the branch at the meeting.

#### LAKEHEAD BRANCH NEWS

W. C. BYERS, Jr.E.I.C. - *Secretary-Treasurer*  
A. L. PIERCE, M.E.I.C. - *Branch News Editor*

The Annual Dance of the Lakehead Branch was held on Friday February 13th in the Norman Room of the Royal Edward Hotel in Fort William.

The ballroom was gaily decorated and at intermission a midnight supper was served. There were seventy couples present, several of whom were guests which added to the enjoyment of the annual ladies night.

The patrons and patronesses were: Mr. and Mrs. B. A. Culpeper, Mr. and Mrs. J. M. Fleming, and Mr. and Mrs. S. T. McCavour.

A special dinner meeting was held by the branch in the Prince Arthur Hotel in Port Arthur on April 4th at 6:30 p.m. to welcome the president of the Institute, Dean C. R. Young.

K. M. Cameron of Ottawa, J. L. Lang of Sault Ste. Marie, and R. L. Dobbin of Peterborough accompanied the president on his visit.

In the absence of the chairman, B. A. Culpeper, the

## LONDON BRANCH

H. L. STEAD, Jr. E.I.C. - - *Secretary-Treasurer*  
A. L. FURANNA, Jr. E.I.C. - *Branch News Editor*

vice-chairman, Miss E. M. G. McGill, presided at the meeting.

The meeting was opened with the singing of "O Canada" and grace was said by G. R. Duncan. Following the dinner the toast to the King was given.

The chairman called on K. M. Cameron, who spoke on his Institute visits to the Ontario branches and of his renewed friendships with the Lakehead Branch. He extended an invitation to the members to visit the Ottawa Branch when in that city. He recommended that more of the young engineers should try for the John Galbraith Prize.

J. L. Lang then expressed his appreciation at being present at the meeting and thought that the work of the Institute helped a great deal to bring about a better unity through Canada.

R. L. Dobbin spoke amusingly about the trip from the east and brought greetings from the Peterborough Branch.

R. B. Chandler then introduced Dean C. R. Young.

**THE PRESIDENT VISITS LAKEHEAD BRANCH**

*From left to right: R. L. Dobbin, R. B. Chandler, J. L. Lang, C. R. Young, K. M. Cameron, and G. H. Burbidge.*

Dean Young gave a very interesting account of the work of the Institute since its founding in 1887. He told of the contribution engineers are making to the war effort in all branches of the service. The international relationships of the Institute were mentioned and the close co-operation with United States engineering societies.

At present, he said, the Institute is co-operating with British and Polish engineers in Canada on war work. There are now 112 Polish engineers in Canada.

Dean Young mentioned how the Institute is constantly making efforts on the behalf of young engineers to enable them to get placed.

The work of the Wartime Bureau of Technical Personnel was reviewed. Air raid precaution was another phase of the Institute's work and at present Professor Webster of England will hold a course of lectures at Toronto commencing April 22nd and lasting for three days. A committee on post war reconstruction has been set up to work with a committee set up to repatriate men returning from the war and to place them in employment.

In closing, Dean Young stated that the engineer should give service and show interest in his work rather than remuneration and that professional status should be based on trusteeship.

S. T. McCavour gave a vote of thanks to the president and the visiting speakers. J. Antonisen seconded the vote of thanks and expressed his appreciation.

G. R. Duncan and W. L. Bird expressed their appreciation of the president's visit and extended the goodwill of the Lakehead Branch.

At its regular monthly meeting on February 27th, the London Branch had as its guest speaker Mr. Otto Holden, M.E.I.C. Mr. Holden is the chief hydraulic engineer of the Hydro-Electric Power Commission of Ontario. His subject was the **Madawaska River Development**.

The speaker began his talk by presenting a general picture of the entire Southern Ontario system. This comprises three co-operative sub-systems namely the Niagara, Georgian Bay and Eastern Ontario. These are interconnected through a network of tie lines and frequency changer sets which permit the interchange of substantial blocks of power between systems. Thus the diversity in time of peak loads, fluctuating load requirements and variations in power supply from different plants may be co-ordinated to the common good. Besides, if the ties and frequency changers are of sufficient capacity, individual plant reserves become available to the whole system and thus the total amount of plant reserve required is reduced.

The Madawaska river empties into the Ottawa river some forty miles above the city of Ottawa, with its head waters composed of many lakes high in the wooded country south of Pembroke. These lakes provide an excellent natural storage. The river has several possible development sites with a total capacity of approximately 100,000 hp. for continuous use or 200,000 hp. for use during the winter season only. The first of these developments, which is to be in operation in July of this year, is at Barrett Chute about twenty-five miles southeast of Pembroke. This plant will develop 56,000 hp. in two 28,000 hp. units under a head of 154 ft.

A dam is also being built at Bark Lake, sixty-seven miles up stream from Barrett Chute, in order to control and regulate the flow. The dam will provide a storage of 300,000 acre-ft. of water.

It is proposed to use this plant as an auxiliary of the Niagara system in that the plant is to be operated only during the winter season when the flow available to the Niagara system is reduced. The possible use of the plant in this way is another strong point in favour of all electrical developments being under one control so that all plants may be used to the greatest advantage of the entire system.

To illustrate his narrative Mr. Holden showed many slides and moving pictures of the development sites and the Barrett Chute plant in the various stages of its construction thus far.

Mr. Holden was introduced to the meeting by Mr. E. V. Buchanan and was thanked for his interesting and instructive address by Mr. W. G. Ure.

On March 18th, Mr. Geo. A. McCubbin, M.E.I.C., O.L.S., drainage consulting engineer of Chatham, Ont. addressed the branch on **The Drainage System of Kent County**. He has had a long career as a civil engineer and for many years has specialized in drainage problems.

In his address Mr. McCubbin showed how the work of a drainage engineer not only involves the technical problems of hydraulics but also the complicated workings of the drainage laws. The speaker stated and discussed the two fundamental drainage laws, firstly the Ditches and Water-courses Act which applies to all small drains, and secondly the Municipal Drainage Act applying to all large drainage projects. The latter requires a petition to Council and a majority vote. Mr. McCubbins chose several cases from his practice to illustrate the engineering principles involved and the effects the above laws had upon the individuals, roads and railways concerned. These cases were described with the use of slides showing the location and other features of the drainage work.

Also through the medium of his hobby, photography, Mr. McCubbin achieved a very pleasing and personal contact between the engineers present and those engineers and lawyers who are responsible for the drainage practice and laws as they are to-day. These slides were part of a prized possession containing the photographs of all the members of the Ontario Land Surveyors' Association.

The keen interest aroused by the speaker was evidenced by the large number of questions asked by those present.

Mr. McCubbin was introduced by Mr. W. G. Ure of Woodstock, and a vote of thanks was tendered by Mr. W. C. Miller of St. Thomas.

### MONCTON BRANCH

V. C. BLACKETT, M.E.I.C. - *Secretary-Treasurer*

Films dealing with **Photoelastic Stress Analysis** were shown at a meeting of the branch held on March 24th. H. J. Crudge, vice-chairman of the branch, presided. C. S. G. Rogers briefly reviewed the subject of the analysis of stress by the photoelastic method and gave a running commentary as the films were screened.

A discussion followed, and some doubts were expressed as to the suitability of visual methods in the determination of stresses in structures composed of two or more materials having different moduli of elasticity. In the case of reinforced concrete, the problem was further complicated by the fact that tensile stresses are arbitrarily compelled to follow the reinforcing steel.

With regard to rivetted joints, it was also pointed out that there are undoubtedly local stresses set up, due to imperfections in workmanship, and which cannot be calculated. It would be very desirable to find out more about these freak stresses but that would not be possible using a "monolithic" model of material such as bakelite.

Attention was drawn to the fact that the use of scale models and proportionate loads does not always accurately disclose conditions in the full size structure. The Quebec Bridge was cited as an example.

The opinion was expressed that the value of the films would be enormously increased if they were accompanied by an exact statement of the method by which the magnitude of a stress may be calculated, and the type (e.g. tensile, compressive or sheer) determined.

A vote of thanks to Professor MacDonald and the University of Manitoba, for the loan of the films; to Mr. Rogers for his commentary, and to the Reid Studio for the loan of a projector, was moved by A. S. Gunn, seconded by G. E. Smith.

### MONTREAL BRANCH

L. A. DUCHASTEL, M.E.I.C. - *Secretary-Treasurer*

On March 19th, Mr. John T. Farmer and Mr. E. A. Goodwin of the Montreal Engineering Company, Limited, presented a paper entitled **The Modernization of a Puerto Rico Electric Generating Station**.

The Montreal Engineering Company, Limited, manage a number of public utilities in Central and South America, one of which is the Puerto Rico Railway, Light and Power Company. The speakers described their work in the remodelling of this company's Santurce steam generating station.

Mr. Farmer gave design figures on the boilers, turbines, condensers, pumps and other equipment in use at the plant. Latest design high pressure oil-fired boilers and modern turbines have been installed in the expansion programme, which has during the last six years increased installed generating capacity from 3000 kw. to 6000, 11,000, 18,500 and finally 26,000 kw. in 1942. Part of this increase has been necessitated by the expansion of United States army and airforce bases in Puerto Rico.

Mr. Goodwin, who was resident engineer on the job, described the installation work, including several ingenious methods devised for getting the job done.

Mr. Moore moved the vote of thanks to the speakers.

On March 26th, Mr. Samuel G. Hibben addressed the branch on the subject of **Blackouts and Protective Lighting**. Mr. Percy Varley was chairman.

The speaker is director of applied lighting, Lamp Division, Westinghouse Electric and Manufacturing Company. New applications of lighting have been his constant specialty and he has been responsible for many innovations, particularly in the field of airport illumination and floodlighting.

Mr. Hibben is in close touch with the defence services on requirements for blackout protection, and was able, during the discussion, to offer numerous practical suggestions in regard to protection of important industrial plants. Mr. Hibben is a representative of the Illuminating Engineering Society on the United States National Civil Protection Committee.

The eastern portion of our continent is especially vulnerable to bombing, and token raids on military objectives are considered a real possibility during this year. An examination of the globe to indicate shortest routes, shows that Montreal is actually closer to German-held bases in Norway than is Washington. Since it is expected that these raids will be intermittent and of short duration, the blackout problem is different to that in London where long alert periods are the rule when heavy raids are in progress there.

The maximum light concentration for good blackout is about 0.0002 ft. candles and compares with the English blackout street lighting. It requires time to become accustomed to such dim light and it is not practical for the short alerts which we expect in this hemisphere.

The British have found total continual blackout to result in a high proportion of street accidents. Our cue from their experience would be to have lights on full until the alert is sounded and then to have total blackout for the period of the actual raid.

We are chiefly concerned with preventing the enemy from locating important military objectives, and this requires blackout co-ordination over whole provinces or states.

The speaker gave various suggestions for blackout and ARP work:

(a) In the dark the eye becomes better able to see blue sources than yellow and red. Therefore blue should be avoided. Similarly it is unnecessary to repaint a red roof on a barn.

(b) Blackout paint on windows is not very useful. Loose curtains are more desirable. Open windows are necessary to equalize pressure after bomb explosions.

(c) Shiny tops of cars parked near a plant, flat roofs and wet roofs give away a location to the pilot. So do traffic signs on wet streets. On wet nights such signs must be turned off during a raid.

(d) Fluorescent and luminescent paints are very useful for making signs which become quickly changed and can in some cases continue to glow for a number of hours. Numerous examples were shown by Mr. Hibben.

(e) Various types of emergency lamps were demonstrated. They are not officially approved yet and the use of any one requires judgment.

Members of the Illuminating Engineering Society, Government and ARP officials were present. All appreciated Mr. Hibben's timely and interesting discussion of this subject.

## NIAGARA PENINSULA BRANCH

J. H. INGS, M.E.I.C. - *Secretary-Treasurer*  
C. G. CLINE, M.E.I.C. - *Branch News Editor*

The Niagara Peninsula Branch held a joint dinner meeting with the Buffalo Section of the American Society of Civil Engineers on March 19th at the Mather Arms, Fort Erie, Ont., with an attendance of 70. W. T. Huber, A.S.C.E., and A. L. McPhail, M.E.I.C., acted as co-chairman. Mr. W. R. Manock, past councillor, welcomed the members of the Buffalo section and expressed the hope that such joint meetings might be held more frequently. Mr. N. Stone introduced the speaker, Mr. W. T. Niederlander, vice-president of the John W. Cowper Co., Buffalo, who gave an interesting paper on **Cantonment Construction at Pine Camp, New York**. Col. R. E. Smythe introduced Major Frank Milligan, district engineer officer, Military District No. 2, who opened the discussion on the paper with references to conditions at Canadian military camps. Col. Geo. W. Miniss, of Buffalo, showed some interesting pictures of camp life on the Mexican border 25 years ago. Mr. W. Jackson proposed a vote of thanks to the speakers.

## OTTAWA BRANCH

A. A. SWINNERTON, M.E.I.C. - *Secretary-Treasurer*  
R. C. PURSER, M.E.I.C. - *Branch News Editor*

At the noon luncheon Thursday, March 26, at the Chateau Laurier, members of the Ottawa Branch were treated to a screening of a remarkable film covering all phases of the construction of the **Portland-Montreal Oil Pipe Line**, which was completed and delivered its first drop of oil to the Canadian metropolitan city on November 16, 1941.

Paul Lebel, asphalt technologist for the Imperial Oil Company of Canada, Limited, who was camera man for the documentary film, contributed a few explanatory remarks. The building of the line took 142 days and was completed one month ahead of schedule. The line cost \$10,000,000, utilized 35,000 tons of steel tubing, and extends over a distance of 236 miles.

The members were shown all forms of mechanical apparatus in actual use in the coloured sound film. Mr. Lebel was heartily congratulated on achieving a photographic work of art as well as for recording in fine sequence the engineering problems involved and the methods utilized for their solution.

In the absence of the chairman, N. B. MacRostie, the speaker was introduced and thanked by T. A. McElhanney, immediate past chairman of the branch.

At the noon luncheon on April 9, W. R. Campbell, city traffic manager for the Trans-Canada Airways at Ottawa, gave an address on air transportation, accompanied by a technicolour sound film, **Skyway Across Canada**. Norman M. MacRostie, chairman of the Ottawa Branch, presided.

Referring to the extensive changes in air transportation brought about by the war, the speaker said that fully 80 per cent of the passengers now carried by the T.C.A. planes on their regular schedules are connected with the war. The extension of services to Newfoundland by May 1st was announced.

The meeting was also addressed by Captain John Riddeil, 3rd Field Company, Royal Canadian Engineers, who asked the support of the members in recruiting men for the reserve forces. "We can no longer take a man off the street, put a rifle in his hands and in a few days have a soldier. To-day we have to give the man an even break against the highly-trained enemy," he said.

## ST. MAURICE VALLEY BRANCH

C. G. DE TONNANCOUR, S.E.I.C. - *Secretary-Treasurer*

Over four hundred residents of Three Rivers, Grand'Mère, and Shawinigan Falls were guests of the St. Maurice Valley Branch in the auditorium of the High School on Friday evening, March 20th, to see the recently completed film of the La Tuque power development **From Rapids to Electricity** and hear Guy Rinfret, the resident engineer during construction of the project, give a most interesting talk and vivid picture of the vast undertaking.

Dr. A. H. Heatley, chairman of the branch, presided at the meeting and expressed the appreciation of the members to the Shawinigan Water and Power Company for loaning them the film for the occasion.

In addition to the film there were on view a handsome oil painting of the development, four water-colour drawings of the landscaping of the property in the vicinity of the power house and a number of enlarged photographs of the work in its different stages.

Both the film and photographs were outstanding and well worth seeing and the La Tuque development was a revelation to many of the guests.

During the showing of the film a local orchestra rendered a number of popular selections and when the film had been shown Mr. Rinfret kindly answered a number of questions asked by the audience. Following the programme the guests were served coffee, sandwiches and cakes by the wives of members of the Institute.

The film was shown on Friday afternoon to the High School pupils and again on Saturday evening when the public was invited.

The speaker was introduced by M. Eaton and thanked by H. G. Timmins of Grand'Mère.

## SAULT STE. MARIE BRANCH

O. A. EVANS, J.E.I.C. - *Secretary-Treasurer*  
N. C. COWIE, J.E.I.C. - *Branch News Editor*

The third general meeting for the year 1942 was held in the Grill Room of the Windsor Hotel on April 2nd. On this occasion the branch had as its guests the president of the Institute, Dean C. R. Young of Toronto, and Vice-President K. M. Cameron of Ottawa. The branch also had as guests for the evening Judge J. K. MacDonald, W. C. Franz and C. McCaffery of Sault Ste. Marie.

Before the forty-three members and guests sat down to dinner, they met informally in the Grill Room where the majority had an opportunity to meet the president and vice-president.

Mr. J. L. Lang a member of the branch and a vice-president of the Institute introduced the speakers, the first being Mr. Cameron, who pleaded for active support of the Institute as he felt that engineers would need an organization to represent them after the war. He also asked the branch to organize a meeting in a district outside the Sault. Mr. Cameron then invited any member who might be in Ottawa to visit the branch there and he was sure that branches in other cities would welcome visitors.

In his opening remarks, Dean Young expressed the regret of the general secretary, Mr. L. Austin Wright, who was unable to be present. The president told his audience that there were now 5,500 members of the Engineering Institute. He spoke of the early history of engineering societies, the first, the Engineering Society of Britain was organized about 1770. It was very exclusive as it had only seven members. The latest developments of The Engineering Institute of Canada were the co-operative agreements with the Professional Societies of Engineers and the establishment of certain new committees, such as

the Committee for the Training and Welfare of the Young Engineer.

The president announced that Professor Webster of England would give a series of lectures on Air Raid Precautions for industries. The course would be given in Toronto.

There were large numbers of engineers serving in the armed forces in Canada and overseas. The president said one of the qualities of an engineer was his adaptability in adjusting himself to different situations. In dealing with the war situation the president said that there were eight to ten times the mechanical equipment of the last war, and a division controls one hundred and nineteen times the horse power. The mechanical equipment of a division was equivalent to four million men. A soldier needs eighteen civilians to supply him with the necessities to fight.

After the war the restoration of democracy would be necessary and the abolition of controls, although he felt that the price ceiling control would stay on for some time.

Canada is now building and manufacturing large ships, armour plate, plastics, instrument glass and pre-fabricated buildings. He predicted that there would be more mechanization of agriculture and improvements in the art of welding, great reconstruction of houses, slum clearances, new highway construction, both urban and rural, and railway rehabilitation. The president said, however, that we must win the war first.

Mr. C. Stenbol thanked the speakers on behalf of those present and Chairman L. R. Brown gave the thanks of the branch.

#### TORONTO BRANCH

S. H. de JONG, M.E.I.C. - *Secretary-Treasurer*  
D. FORGAN, M.E.I.C. - - *Branch News Editor*

On February 19th, the Toronto Branch held one of the most interesting meetings of the current season. Mr. Forrest Nagler, chief engineer, Canadian Allis-Chalmers, was the speaker for the evening and was introduced by Mr. Otto Holden, chief hydraulic engineer, Hydro-Electric Power Commission.

Mr. Nagler's subject **Hydraulic Misbehaviour in Water Power Units** was illustrated with very interesting films taken of actual flows in a transparent model draft tube. The disturbances in draft tubes and their results

could easily be seen and were explained by the speaker. In his preliminary comments Mr. Nagler made some very interesting and enlightening remarks about the natural resources of the Great Lakes basin and their relation to any world war. The speaker also showed how natural resources when developed will draw industry to them as illustrated in the case of Grand Coulee Dam. They had no market for their power before the project was started, yet the generators have not been stopped since the day they started on test. Mr. Nagler was one of the most interesting speakers we have had for a long time.

On March 2nd the branch was favoured with a visit from Lt.-Col. W. E. Phillips. Colonel Phillips repeated the paper which attracted so much interest when he presented it at the Annual Meeting of the Institute held in Montreal in February last, on **The Organization and Work of Research Enterprises, Limited**. The paper has been published in the March issue of the *Journal*.

Two speakers presented papers for the regular branch meeting on Thursday, March 9th, held in Hart House, University of Toronto. These were Mr. C. F. Publow, assistant electrical engineer, and Mr. A. E. Davison, transmission engineer, both of the Hydro Electric Power Commission of Ontario. Mr. Publow's subject was **Power Transformer Station Problems**. Mr. Davison's subject was **Transmission Line Problems**, both of which were discussed with particular reference to the Burlington 220 kv. station and associated lines.

Both speakers have had a wide and long experience in the electrical engineering field, and have made many contributions to engineering publications. Their addresses, which were illustrated by lantern slides, were of special interest not only to electrical engineers, but to those in other branches of the profession. In addition, Mr. Davison presented an exceptionally attractive and beautifully coloured movie entitled "Spanning the Miles" which dealt with the construction of the 220,000-volt steel tower transmission lines.

Mr. H. E. Brandon's reminiscences in his introduction of the speakers were much appreciated by the large audience and the thanks of the gathering were presented by Mr. W. E. Bonn.

### SAVE FOR VICTORY

If you do not keep your *Journals* do not burn or destroy them. Give them to a salvage organization. They are needed for victory.

### AMERICAN STANDARD DEFINITIONS OF ELECTRICAL TERMS, C42

A new American Standard known as Definitions of Electrical Terms, C42, sponsored by the American Institute of Electrical Engineers, is now ready for general distribution. The issue of this volume of electrical definitions as an American Standard should mark an epoch in the literature of the electrical art in America, as it is the first time the definitions of the important terms common to all branches of the art as well as those specifically related to each of the various branches have been assembled and printed under one cover.

This glossary is the result of more than twelve years' work of a sectional committee of 46 members having 18 subcommittees drawn from available specialists. More than 300 individuals have given material assistance and many others have assisted in specific instances. The 34 organizations represented on this sectional committee include the national engineering, scientific and professional societies, trade associations, government departments and miscellaneous groups.

The story of the origin of this work is as follows:

The International Electrotechnical Commission in 1910 appointed a committee on Nomenclature, for the purpose of drafting an international list of terms and definitions. As standardization, both national and international, was at that time very much in its infancy, the work progressed very slowly for some years.

The first work of the IEC Advisory Committee on Nomenclature, under the chairmanship of the late Dr. C. O. Mailloux, consisted of making an exhaustive study of all the recognized systems for classification and numbering of terms in a technical glossary. The system employed in the new American Standard is that adopted at the Bellagio meeting of 1927 and employed in the international vocabulary of some 1,860 terms issued in 1938. Its adoption was based on the belief that it permits the greatest possible latitude for interpolation of terms necessitated by future developments without requiring change in established group and term arrangements and numbering.

For some time before the 1927 meeting of the IEC the U.S. National Committee IEC had been working toward the organization of a committee for the formulation of an American vocabulary, recognizing that the international list would inevitably cover but a fraction of the terms required for a serviceable American vocabulary.

The American Standards Association approved the initiation of the work in 1928 on the recommendation of the Standards Committee of the American Institute of Electrical Engineers, the scope being outlined as follows:

"Definitions of technical terms used in electrical engineering, including correlation of definitions and terms in existing standards."

Under this authorization, the Sectional Committee on Definitions

of Electrical Terms, C42, was organized during the same year, under the sponsorship of the AIEE and chairmanship of Dr. A. E. Kennelly. In 1932 the first report was printed, and 3,000 copies were distributed for comment and criticism. In 1937 the second general revision was compiled and distributed. Early in 1940, C. H. Sanderson was appointed chairman (vacated in 1938 by the death of Dr. Kennelly) and the final preparation of the work for approval and publication as an American Standard was brought to a close in the spring of 1941.

The primary aim in the formulation of the definitions has been to express for each term the meaning which is generally associated with it in electrical engineering in America. The definitions have been generalized wherever practicable to avoid precluding the various specific interpretations which may be attached to a term in particular applications. It has been recognized that brief, simplified phrasing usually presents the clearer word picture. Amplifying notes accompany certain definitions when the added information is particularly helpful, but those notes are not a legitimate part of the standard phrasing. Words used in the definitions have been employed in the accepted meaning as given in the recognized dictionaries, unless they have been defined specifically in this glossary. Specialized definitions for common words have been discouraged.

Prior to the inception of this work the definitions to be found in the literature of the electrical art were comparatively few, were very widely scattered and their formulation as to substance and expression was generally the work of individuals or small groups. Many of these had gained some measure of approval in that branch of the art responsible for their formulation, but were practically unknown elsewhere. Some groups of general terms had long been the subject of much controversy. The engineer or scientist or student who wished to have ready access to the definitions actually existing in printed form was faced with the necessity of assembling a sizable library. Moreover, in some cases he then had to choose between two or more definitions of the same term.

This new American Standard has unified and perfected the existing groups of definitions and has rounded out these groups and added many new groups. Its coverage is more than three times that of this field in any other language. It should prove of great value to the general public as well as to scientists and engineers for it is an extension of the function of the recognized dictionaries into specialized fields not hitherto covered.

The "Definitions" book is a handsome sturdy volume of some 300 pages, 8 x 11 inches; high quality paper and printing; dark blue fabrikoid binding, gold lettering, thoroughly indexed. Price is \$1.00 net each in U.S.A. to all on single copies or in quantity. \$1.25 outside U.S.A. Make checks or money orders payable to AIEE. Address AIEE Headquarters, 33 West 39th St., New York, N.Y.

### ADDITIONS TO THE LIBRARY TECHNICAL BOOKS

#### Canadian Trade Index 1942:

*Canadian Manufacturers' Association Inc., Toronto. 6½ x 10 in. \$6.00.*

#### Elastic Energy Theory:

*2nd. ed. J. A. Van Den Broek. N.Y., John Wiley and Sons, Inc., 1942. 6 x 9¼ in. \$4.50.*

#### The Airplane and Its Components:

*William R. Sears. N.Y., John Wiley and Sons, Inc., 1942. Galcit Aeronautical Series. 6 x 9¼ in. \$1.25.*

#### Scientists Face the World of 1942:

*Essays by Karl T. Compton, Robert W. Trullinger and Vannemar Bush. N.J., Rutgers University Press, 1942. 6 x 9¼ in. \$1.25.*

#### Canada Moves North:

*Richard Finnie. Toronto, Macmillan Co., c. 1942. 5¾ x 9 in. \$4.00.*

#### Teelmi Data:

*Handbook on Engineering, Chemistry, Physics, Mechanics and Mathematics by Edward Lupton Page. N.Y., Norman W. Henley Pub. Co., 1942. 5½ x 8½ in. \$1.00.*

#### Electric Circuits and Machinery:

*Vol. II Alternating Currents by Frederick W. Hehre and George T. Harness. N.Y., John Wiley and Sons, Inc., 1942. 6 x 9 in. \$6.00.*

#### Uniformity in Highway Traffic Control:

*William Phelps Eno. Conn., Eno Foundation for Highway Traffic Control Inc., 1941. 5¼ x 7¼ in. \$1.00.*

#### Canadian Engineering Standards Association:

*Standard specification for Concrete and Reinforced Concrete, 2nd. ed. A23-1942. \$1.00.*

#### Gate Brands:

*3rd. ed. Commercial Standard CS8-41 (supersedes CS8-33) Washington, U.S. Bureau of Standards, 1941. 15c.*

#### Australian Standard:

*Engineering drawing practice. Australian standard No. CZ. 1-1941. The Institution of Engineers, Australia, 1941.*

### PROCEEDINGS, TRANSACTIONS

#### American Society of Mechanical Engineers:

*Transactions vol. 63, 1941.*

#### American Institute of Electrical Engineers:

*Transactions vol. 60, 1941.*

### REPORTS

#### Canada—Department of Mines and Resources—Surveys and Engineering Branch:

*Arctic and Western Hudson Bay Drainage in Alberta, Manitoba and Saskatchewan for 1935-37. Ottawa, 1942. \$1.00 (Water resources paper No. 82).*

#### Quebec—Bureau of Mines:

*The mining industry of the Province of Quebec in 1940.*

#### Quebec—Bureau of Mines—Geological Surveys:

*Matapedia Lake Area. Geological report No. 9.*

#### The Engineering Foundation:

*Annual report 1940-41.*

#### Nova Scotia Power Commission:

*Twenty second annual report for the period ended November 30, 1941.*

#### U.S. Geological Survey—Professional Papers:

*Geology and biology of North Atlantic deep-sea cores: pt. 3 Diatomaceae pt. 4 Ostracoda. Professional paper No. 196B and C.*

#### U.S. Geological Survey—Water Supply Papers:

*Surface water supply of the U.S. in 1939;*

pt. 3 Ohio river basin; pt. 5 Hudson Bay and Upper Mississippi river basins; pt. 10 The Great Basin (Nos. 873, 875, 880). Surface water supply of the U.S. 1940; pt. 10 The Great Basin; pt. 11 Pacific slope basins in California; pt. 12 Pacific slope basins in Washington and Upper Columbia river basin; pt. 13 Snake river basin; pt. 14 Pacific slope basins in Oregon and lower Columbia river basin; (Nos. 900-904). Water levels and artesian pressure in observation wells in the U.S. in 1940 (No. 910).

#### U.S. Geological Survey—Bulletins:

*Spirit leveling in Texas*; pt. 4 North central Texas and pt. 5 South central Texas 1896-1938 (Nos. 883D and E). Nickel-gold deposit near Mount Vernon, Skagit county, Washington (No. 931D).

#### Quebec—Association of Architects:

*Register 1942.*

#### Institution of Structural Engineers:

*Year book and list of members 1940-41.*

#### Nova Scotia—Association of Professional Engineers:

*Engineering profession act and by-laws; amended to April, 1941.*

#### Alberta—Association of Professional Engineers:

*Engineering profession act, by-laws and code of ethics; amended to date.*

#### Bell Telephone System—Technical Publications:

*Contribution of statistics to the science of engineering; Theory of antennas of arbitrary size and shape; The thermal expansion of pure metals, copper, gold, aluminum, nickel and iron; A visual test for calcium in lead; The reliability of holding time measurements; Television—the scanning process; Monographs B-1319-1324.*

#### Bell Telephone Laboratories:

*The mobilization of science in national defense by Frank B. Jewett. February, 1942.*

#### American Institute of Consulting Engineers:

*Constitution, by-laws and list of members 1942.*

#### Iowa State College—Bulletin:

*The Structural design of flexible pipe culverts. Bulletin No. 153, December, 1941.*

#### University of Illinois—Engineering Experiment Station:

*A study of the collapsing pressure of thin walled cylinders; Bulletin No. 329. The suitability of stabilized soil for building construction; Bulletin No. 333. Papers presented at the 28th annual conference on highway engineering held at the University of Illinois, March 5-7, 1941; Circular No. 42.*

#### Port of New York Authority:

*21st annual report 1941.*

#### University of Minnesota—Engineering Experiment Station:

*Predicting dust concentration; Technical paper No. 26.*

#### Canadian General Electric:

*Electrical developments for 1941.*

#### Buenos Aires—Transport Control Committee:

*New principles in urban transportation economy. 2nd ed. rev. 1941.*

#### Electrochemical Society:

*Nickel plating magnesium alloys; New work on tin plating from ammonium stannous oxalate; The rate of film formation on metals; The rate of oxidation of copper at room temperature; Some unusual over-*

*voltage phenomena; Long time charge and decay phenomena; Some corrosion characteristics of high purity magnesium alloys; Electrophoretic dewatering of clay; Preprint Nos. 81-6 to 13.*

### BOOK NOTES

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet the books are not in The Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

#### AIR PILOT TRAINING

By B. A. Shields. McGraw-Hill Book Co. (Whittlesey House), New York and London, 1942. 602 pp., illus., diags., charts, maps, tables, 9½ x 6 in., cloth, \$4.00.

The four sections of this book cover the essential material required for private and commercial pilots' licenses. They deal respectively with aircraft and the theory of flight, aircraft engines, meteorology, and air navigation. Elementary principles are fully explained and are tied in with their applications to appropriate types of flight problems or procedures. Previous technical education is not required.

#### AIRCRAFT HANDBOOK

By F. H. Colvin. 5 ed. McGraw-Hill Book Co., New York and London, 1942. 784 pp., illus., diags., charts, tables, 8½ x 5½ in., lea., \$5.00.

The new edition of this handbook presents detailed and considerably expanded information about all types of airplane engines, propellers, instruments, and other equipment. In order to provide such a manual, of particular assistance to the ground mechanic, previously included material on flight theory, airplane design and construction, etc., has been omitted. Inspection and maintenance work have been emphasized.

#### AIRCRAFT LAYOUT AND DETAIL DESIGN

By N. H. Anderson, with a foreword by C. T. Reid. McGraw-Hill Book Co., New York and London, 1941. 306 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$3.00.

The three main objects covered in this text are descriptive geometry, detail design and fitting analysis. Only those portions of descriptive geometry that have common application to aircraft structures are considered. In detail design, fundamentals are emphasized rather than specific shop methods, although the guiding principles are so laid out that any part should be practicable to produce. Sufficient stress analysis is presented for an intelligent determination of minimum weight for required strength.

#### (The) AIRPLANE AND ITS COMPONENTS (Galcit Aeronautical Series)

By W. R. Sears. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 75 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$1.25.

A condensed general survey of the field of airplane design is presented as an introduction for students and workers with some technical knowledge. Airplane types, their external and internal components, aircraft radio and instruments, engines and propellers are briefly discussed, with emphasis on basic engineering principles. Characteristic problems are pointed out and typical solutions indicated.

#### AIRPLANE METAL WORK, Vol. 4. Airplane Pneumatic Riveting. 103 pp.

#### AIRPLANE METAL WORK, Vol. 5. Airplane Sheet Metal Repair. 94 pp.

By A. M. Robson. D. Van Nostrand Co., New York, 1942. illus., blueprints, diags., tables, 9½ x 7 in., paper, \$1.25 each.

These volumes continue a series intended for mechanics actively engaged in the aircraft industry and for prospective mechanics in training. Volume 4 contains first a general discussion of work habits and operations related to riveting, and then descriptions of actual jobs occurring in pneumatic riveting shop practice. Volume 5 presents a section of related trade information for sheet metal repair and, as before, follows with detailed descriptions of actual jobs in the sheet metal repair shop. There are also in each volume full lists of necessary tools and miscellaneous equipment and tables of useful data.

#### CHEMICAL ENGINEERING FOR PRODUCTION SUPERVISION. (Chemical Engineering Series.)

By D. E. Pierce. McGraw-Hill Book Co., New York and London, 1942. 232 pp., diags., charts, tables, 9½ x 6 in., cloth, \$2.50.

A simple explanation is given of the fundamental chemical engineering principles upon which the successful operation of plant equipment depends. The book presents those basic principles of chemistry, physics and thermodynamics most useful to the operating man, together with their application to five unit operations: heat transfer, evaporation, distillation, drying, and flow of fluids.

#### CHEMICAL ENGINEERING PLANT DESIGN. (Chemical Engineering Series)

By F. C. Vilbrandt. 2 ed. McGraw-Hill Book Co., New York and London, 1942. 452 pp., diags., charts, tables, maps, 9½ x 6 in., cloth, \$5.00.

This volume analyzes the fundamental principles and factors that are involved in the development of a technically and economically efficient plant process from the laboratory stage through the pilot plant stages to the unit of commercial size. The author discusses such topics as foundations, drainage, piping, pumps, flow diagrams, equipment selection, plant layout, and power. The last two chapters deal with preconstruction cost accounting and plant location.

#### ELASTIC ENERGY THEORY

By J. A. Van den Broek. 2 ed. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 298 pp., diags., charts, tables, 9½ x 6 in., cloth, \$4.50.

The theory of elastic energy as an instrument for the solution of problems involving statically indeterminate structures is presented as a text for an elementary course in strength of materials. The graphical summation method is used, because of its more general character and ease of application. The book is designed to be of use to practical engineers as well as to college students.

#### ENGINEERING ECONOMIC ANALYSIS

By C. E. Bullinger. McGraw-Hill Book Co., New York and London, 1942. 359 pp., diags., charts, tables, 9½ x 6 in., cloth, \$3.50.

The chief aim of this tract on cost analysis as applied to engineering projects is to give students an understanding of the economic factors which are present in the engineering process. The four main parts of the book deal respectively with: the economy analysis, probable yield on the investment; the intangible analysis, consideration of human relationships; the financial analysis, provision of funds; and special methods and applications.

#### FLUORESCENT CHEMICALS and Their Applications

By J. De Ment, with a Special Chapter on Ultraviolet Radiation Sources, by H. C. Dake. Chemical Publishing Co., Brooklyn, N.Y., 1942. 240 pp., illus., diags., charts, tables, 9 x 5½ in., cloth, \$4.25.

The general foundations of luminescence having been discussed in a previous book, the

chief concern of the present work is the fluorescent chemicals and their uses in the industries, arts and sciences. There is a brief discussion of fundamentals, and the basis for fluorescence analysis is presented. Nearly 3,000 chemicals are listed, including a number which are comparatively rare. There is also a special chapter on sources of ultraviolet radiation.

#### GAGES AND THEIR USE IN INSPECTION

By F. H. Colvin. McGraw-Hill Book Co., New York and London, 1942. 157 pp., illus., diags., charts, tables, 7½ x 5 in., cloth, \$1.50.

A complete introduction to the use of gages, this book is especially valuable for those who wish to become inspectors. It points out why gages are made, describes all types, and shows plainly how they are used in a variety of work. Tolerances, limits and allowances are covered, with discussion of the proper use of these terms.

#### Great Britain, Department of Scientific and Industrial Research

#### INDEX TO THE LITERATURE OF FOOD INVESTIGATION, Vol. 13, No. 2, Sept., 1941

Compiled by A. E. Glennie and others. His Majesty's Stationery Office, London, 1941. 155 pp., tables, 9½ x 6 in., paper, (obtainable from British Library of Information, 30 Rockefeller Plaza, New York,) \$1.35.

This publication provides abstracts of the literature of the food industry as it appears in periodicals. All phases of the subject are covered, including such problems of engineering as temperature and humidity control, transportation methods, insulation, refrigeration and air conditioning. There is an author index.

#### Great Britain, Department of Scientific and Industrial Research, BUILDING RESEARCH

#### WARTIME BUILDING BULLETIN No. 19. Economy of Timber in Building

His Majesty's Stationery Office, London, 1942. 16 pp., diags., tables, 11 x 8½ in., paper, (obtainable from British Library of Information, 30 Rockefeller Plaza, New York), 30c.

This bulletin discusses ways in which further economy can be achieved in the use of timber in building. Recommendations for the guidance of designers, manufacturers and contractors are set out with several detail sketches illustrating particular points.

#### Great Britain, Mines Department. SAFETY IN MINES RESEARCH BOARD, Nineteenth Annual Report, 1940

His Majesty's Stationery Office, London, 1942. 36 pp., illus., tables, charts, 9½ x 6 in., paper, (obtainable from British Library of Information, 30 Rockefeller Plaza, New York), 50c.

The report summarizes the results of researches in progress during the year. Among matters discussed are: incombustible dust for prevention of coal-dust explosions; rapid analysis of mine dusts; firedamp explosions; flameproof electrical machinery; properties of timber, steel and concrete mine props; deterioration of wire ropes.

#### HEATING, VENTILATING, AIR CONDITIONING GUIDE 1942, Vol. 20

American Society of Heating and Ventilating Engineers, 51 Madison Ave., New York, 1942. 1,160 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$5.00.

The new edition of this valuable reference work follows the pattern of preceding ones. Section one presents the essential technical

data for heating, ventilating and air conditioning. This section has been thoroughly revised and largely rewritten to include recent information. Section two contains catalogue data by many manufacturers of equipment. Section three is the membership list of the Society.

#### HYDRAULICS

By G. E. Russell. 5 ed. Henry Holt & Co., New York, 1942. 468 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$4.25.

The fundamental principles of hydraulics are presented in a clear, logical manner for students and for use as a reference book by engineers. Although the text is devoted mainly to hydraulics, the flow of other liquids and of compressible fluids is briefly discussed. The basic text material has been completely revised for the first time since 1925, and the chapters on hydraulic turbines and centrifugal pumps, added in the previous edition, have been brought up to date.

#### INDUSTRIAL ACCOUNTING

By S. W. Specthrie. Prentice-Hall, Inc., New York, 1942. 243 pp., charts, tables, 9½ x 6 in., cloth, \$3.75.

This volume is intended as a text for engineers, engineering students and industrial administrators who wish to gain an understanding of the processes and executive uses of industrial accounting. The early chapters present basic accounting principles and book-keeping procedures. This is followed by a course in the theory and practice of cost accounting. Finally, the executive use of accounting data is discussed.

#### INDUSTRIAL CHEMISTRY OF COLLOIDAL AND AMORPHOUS MATERIALS

By W. K. Lewis, L. Squires and G. Broughton. The Macmillan Co., New York, 1942. 540 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$5.50.

The introductory chapters of this text are intended to present basic material on the subject of colloids, with emphasis on those phases which are now or likely to be of major importance in industry. Succeeding chapters demonstrate the relation of these principles to various fields and their application in the development of processes in the glass, paper, rayon, leather, rubber, ceramic, textile, paint and synthetic industries. A brief bibliography accompanies each chapter.

#### INDUSTRIAL ELECTRICITY, Part 2. (Electrical Engineering Texts)

By C. L. Dawes. 2 ed. McGraw-Hill Book Co., New York and London, 1942. 523 pp., illus., diags., charts, tables, 8½ x 5½ in., cloth, \$2.75.

The primary object of this text is to develop in a simple manner the principles of alternating currents and alternating-current circuits, and to show their applications to electrical machinery, rectifiers, electron tubes, etc., and also to power transmission. The book has undergone extensive revision throughout, major changes being the inclusion of a new chapter on rectifiers and the omission of the previous brief chapters on illumination and interior wiring.

#### INDUSTRIAL SUPERVISION, CONTROLS. (Pennsylvania State College, Industrial Series). 267 pp.

#### INDUSTRIAL SUPERVISION, ORGANIZATION. (Pennsylvania State College, Industrial Series). 283 pp.

By V. G. Schaefer, W. Wisaler and others. McGraw-Hill Book Co., New York and London, 1941. Diags., charts, tables, 8 x 5 in., cloth, \$1.75 each.

These two volumes deal with the problems of the foreman in industry. The one on controls discusses the various methods of control by which morale and safety are promoted, and waste and turnover are lessened. The volume

on organization considers what can be done with the worker and in coordinating workers with jobs in order to increase efficiency in production.

#### INDUSTRIAL WASTE TREATMENT PRACTICE

By E. F. Eldridge. McGraw-Hill Book Co., New York and London, 1942. 401 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$5.00.

Until now, the available information on the treatment of industrial waste has been widely scattered and badly in need of organization. The present work endeavors to do this, on the basis of the author's experience and the literature. The general principles of waste treatment methods and equipment are first discussed, after which specific industries are considered, such as beet-sugar, milk products, canning, tanning, pulp and paper making, meat packing, oil refining, etc.,. Prominence is given to the design of structures for full-scale treatment.

#### INTERPRETATION OF GEOLOGIC MAPS AND AERIAL PHOTOGRAPHS

By A. J. Eardley. Edwards Brothers, Ann Arbor, Mich., 1941. 99 pp., illus., diags., charts, maps, tables, 9 x 6 in., paper, \$1.50.

This textbook, based upon a course given in the University of Michigan, provides an undergraduate course in the interpretation of geological maps and aerial photographs. It aims to present briefly the principles of map interpretation by means of realistic illustrations with short explanations; upon that study as a basis, to present the principles of geologic interpretation of aerial photographs; to describe the use of such photographs in field mapping.

#### AN INTRODUCTION TO HISTORICAL GEOLOGY, with Special Reference to North America

By W. J. Miller. 5 ed. D. Van Nostrand Co., New York, 1942. 499 pp., illus., diags., charts, maps, tables, 9½ x 6 in., cloth, \$3.50.

Extensive revision has again modernized this standard text, which is a companion volume to the author's "Introduction to Physical Geology." Beginning with a general treatment of fundamentals (fossils, rock formations, etc.) the author proceeds to develop the physical history and corresponding life of the successive geological divisions. Of great assistance to the layman or student are the many illustrations and the appended "Outline Classification of Plants and Animals".

#### INTRODUCTION TO MODERN PHYSICS

By F. K. Richtmyer and E. H. Kennard. 3 ed. McGraw-Hill Book Co., New York and London, 1942. 723 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$5.00.

This work, based upon a series of lectures given at Cornell University, is intended to meet the needs of students who wish a survey of the origin, development and present status of physics, either as an introduction to specialized graduate study or as a supplement to the usual elementary physics courses. The present edition, rewritten after the death of the original author, has been considerably changed in order to conform to its title, noteworthy additions being the chapters on the relativity theory and cosmic rays.

#### MANUFACTURE OF SODA with Special Reference to the Ammonia Process. (American Chemical Society Monograph Series No. 65)

By Te-Pang Hou. 2 ed. rev. and enl. Reinhold Publishing Corp., New York, 1942. 590 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$9.50.

Based mainly upon the author's own experience, this monograph presents a detailed practical account of the ammonia soda industry. The preparation of the raw materials, the manufacture of sodium bicarbonate and caustic soda, and the recovery of by-products are thoroughly covered. In addition to the general extensive revision in this edition, there are new chapters on plant equipment and on modifications and new developments in the industry.

## MANUFACTURING PROCESSES

By M. L. Begeman. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 579 pp., illus., diags., charts, tables, 9 x 6 in., cloth, \$4.50.

This book includes the technical fundamentals of important manufacturing processes, engineering materials and equipment used in processing them. It is intended for use by engineering students to supplement shop laboratory practice or as a text where these courses are omitted. Foundry practice, pattern work, metal casting, plastic molding, heat treatment and welding are discussed. Machine tools and accessories are considered, and their applications and limitations considered.

## MODERN PLYWOOD

By T. D. Perry. Pitman Publishing Corp., New York and Chicago, 1942. 366 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$4.50.

All phases of the plywood industry are covered in this comprehensive work. A brief history of the development of plywood precedes sections dealing with the advantages and characteristics of modern plywood and the adhesives used in its construction. The manufacture of veneers and plywood is covered in detail, and industrial uses are described. Grading rules, a glossary of trade terms and an extensive classified bibliography are also included.

## MODERN PULP AND PAPER MAKING, a Practical Treatise

By G. S. Witham. 2 ed. Reinhold Publishing Corp., New York, 1942. 705 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$6.75.

The purpose of this treatise is to give a general, practical account of the equipment and processes used in American pulp and paper plants. The new edition has been thoroughly revised to include developments since the first edition appeared in 1920, and the material has been arranged more logically.

## THE MODERN STRIP MILL

Edited by T. J. Ess and J. D. Kelly. Association of Iron and Steel Engineers, Empire Bldg., Pittsburgh, Pa., 1941. Two parts bound in one. Pt. 1, 358 pp.; Pt. 2, 127 pp., illus., diags., charts, tables, blue-prints, 12½ x 9 in., leather, \$15; to libraries \$10; outside of United States \$20.

This important volume, based upon articles that have appeared in the "Iron and Steel Engineer," provided a detailed, complete review of the development of the continuous wide-strip mill. The first section discusses mill equipment, unit by unit, with a great fund of operating data for each group. The second section contains descriptions, with layout drawings, of the twenty-eight mills now operating in the United States. An immense amount of information, based upon actual operation, is supplied.

## OPERATION OF SEWAGE-TREATMENT PLANTS

By W. A. Hardenbergh. International Textbook Co., Scranton, Pa., 219 pp., illus., diags., charts, tables, 7½ x 5 in., cloth, \$2.50.

In part one of this practical text, the author discusses general considerations of sewage treatment and procedures for sewage analysis. In parts two and three, the equipment and processes for primary and secondary treatment are described in detail. The final chapter presents operating data, with sample report sheets, for a trickling-filter treatment plant in a city with a population of 80,000.

## PILOTS' AND MECHANICS' AIRCRAFT INSTRUMENT MANUAL

By G. C. DeBaud. Ronald Press Co., New York, 1942. 490 pp., illus., diags., charts, tables, maps, 9 x 6 in., cloth, \$4.50.

This textbook on aircraft instruments is designed to meet the requirements of thorough, systematic courses in technical and aviation schools, and the needs of those who wish to acquire an understanding of instruments without an instructor's guidance. The chapters of the book are so arranged that the user will progressively understand the construction, purpose and necessity of the instrument, likely errors with their remedies, installation and maintenance. There is also a brief outline of instrument flying training.

## PLASTICS IN ENGINEERING (Machine Design Series)

By J. Delmonte. 2 ed. Penton Publishing Co., Cleveland, Ohio, 1942. 601 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$7.50.

Intended for the machine designer and manufacturer rather than the chemist, this work aims to present the data needed by designers in convenient form for reference. The opening chapters review the various types of plastics, methods of compounding, and physical and chemical properties. Succeeding chapters discuss methods of molding, uses for bearings, gears and other machine parts, engineering applications, fabrication and finishing of plastic parts, etc. The revision in the new edition has been influenced by the increasing need of substitutes for many strategic metals.

## POSSIBLE ALTERNATES FOR NICKEL, CHROMIUM AND CHROMIUM-NICKEL CONSTRUCTIONAL ALLOY STEELS (Contributions to the Metallurgy of Steel, No. 5)

(Contributions to the Metallurgy of Steel, No. 5.) American Iron and Steel Institute, 350 Fifth Ave., New York, Jan., 1942. 143 pp., charts, tables, 9 x 6 in., paper, 50c.

This timely pamphlet presents four new series of alloy steels designed to preserve our reserves of strategic metals, especially chromium and nickel. The steels developed embrace a series of carbon-molybdenum, manganese-molybdenum, low chromium-molybdenum and low nickel-chromium-molybdenum steels. Data are given about hardenability and other physical properties.

## POWER PLANT ENGINEERING AND DESIGN

By F. T. Morse, 2 ed. D. Van Nostrand Co., New York, 1942. 703 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$6.50.

The aim of this book is to present in one volume a study of electric generating stations, including public service, industrial and institutional plants. Attention is paid to both mechanical and electrical features and to economic factors. Steam plants are given most attention, but hydroelectric and Diesel-engine plants are also considered. The comprehensive nature of this one-volume text has been attained by assuming a basic knowledge of thermodynamics and mechanics and by omitting minor details of plant equipment and layout.

## PRINCIPLES OF MECHANICS

By J. L. Synge and B. A. Griffith. McGraw Hill Book Co., New York and London, 1942. 514 pp., diags., tables, 9½ x 6 in., cloth, \$4.50.

This textbook in theoretical mechanics covers the usual range of theory and applications, up to and including an introduction to Lagrange's Equations, with emphasis on general principles and underlying philosophical ideas. Vector notation and the complex variable are used wherever they provide the most efficient tools. A chapter on the special theory of relativity is included.

## PRODUCTION CONTROL

By L. L. Bethel, W. L. Tann, F. S. Atwater and E. E. Rung. McGraw-Hill Book Co., New York and London, 1942. 276 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$2.75; accompanying Teachers' Manual, by L. L. Bethel, 19 pp., 8 x 5½ in., paper, 10c.

The principles and procedures for planning and controlling industrial production are covered. Broad factors of production management and of operation control are also included. Case problems, taken from current industrial practices, illustrate the applications of principles. Appendices contain a portion of the written standard practice of an actual company, sample production-control forms, and an example of a typical job order production-control system.

## PRODUCTION ENGINEERING

By E. Buckingham. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 268 pp., tables, 9 x 6 in., cloth, \$2.50.

Under three main headings—preparation for production, production operation and control, and supporting activities—the author co-ordinates the information presented to the production engineering student in his various technical courses. He points out the relationship of these technical details, and emphasizes the importance of active co-operation among the individuals who perform the separate functions involved.

## (The) RADIO AMATEUR'S HANDBOOK (Special Defense Edition)

Published by the American Radio Relay League, West Hartford, Conn., 1942. 288 pp., illus., diags., charts, tables, 9½ x 6½ in., paper, \$1.00.

In this special edition for training courses, the nine basic theoretical chapters of the standard edition are retained intact, and the constructional chapters have been condensed into one which describes representative types of radio equipment. The section on measurements remains, and an introductory chapter covering the necessary elementary mathematics has been added. The material on the construction of amateur equipment and the operation of amateur stations have been omitted completely.

## (The) REFINERY CATALOGUE

A Composite Catalogue of Oil Refinery Equipment, including Process Handbook and Engineering Data; published by Refiner and Natural Gasoline Manufacturer, Houston, Texas, 1940. 9 ed. 529 pp., illus., diags., charts, maps, tables, blue-prints, 12 x 8 in., cloth, apply.

The Catalogue presents data on equipment for oil refineries and natural-gasoline plants supplied by over two hundred manufacturers. In addition the book contains a section on processes, which contains descriptions and flow sheets for many important processes used in refining and treating petroleum and natural gasoline, and a collection of tables frequently wanted in refinery operation.

# PRELIMINARY NOTICE

of Applications for Admission and for Transfer

April 25th, 1942.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.\*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

**Communications relating to applicants are considered by the Council as strictly confidential.**

The Council will consider the applications herein described at the June meeting.

L. AUSTIN WRIGHT, General Secretary.

\*The professional requirements are as follows:—

A **Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupillage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A **Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

## FOR ADMISSION

DAVIS—ROBERT, of 846 Broadview Ave., Toronto, Ont. Born at Duntocher, Dumbartonshire, Scotland, Aug. 25th, 1894; Educ.: Royal Technical College, Glasgow—1913-17, naval architecture, 1919-21, advanced maths., 1939, struct'l. design (2nd year); 1911-17, ap'ticeship as ship f'tsman., John Brown & Co., Clydebank; 1917-19, f'tsman., Royal Naval Air Service; 1919-23, ship f'tsman., John Brown & Co.; 1923-27, struct'l. f'tsman. (Lachine), 1927-29, checker (Toronto), 1929-34, checker (Lachine), Dominion Bridge Co. Ltd.; 1934-39, checker, Sir Wm. Arrol & Co., Glasgow; 1939-42, checker, Dominion Bridge Co. Ltd., at present, on loan as hull engr., to Wartime Merchant Shipping Ltd.

HAILEY—ARTHUR ROBERTS TRAIL, of 515 Bolivar St., Peterborough, Ont. Born at Vancouver, B.C., Nov. 15th, 1914; Educ.: B.A.Sc., Univ. of B.C., 1941; 1941 to date, testman, Can. Gen. Elec. Co. Ltd., Peterborough.

References: G. R. Langley, W. M. Cruthers, D. V. Canning, W. T. Fanjoy, J. Cameron.

LAMBERT—NOEL DUDLEY, of Ottawa, Ont. Born at Vancouver, B.C., Dec. 26th, 1896; Educ.: B.Sc., Univ. of B.C., 1920; R.P.E. of B.C.; 1921-23, transitman; 1923-26, engr., field supt., Pacific Construction Co.; 1926-27, inspr., C. D. Howe & Co.; 1927 to date, with Northern Construction Co. & J. W. Stewart Ltd., 1927-29, engr., grain elevators, docks, warehouses, etc., 1929-30, supt., 1930-38, gen. supt., and from 1938, vice-president and gen. mgr. in general charge of works; at present, Director of Engineer Services (Army), National Defence Headquarters, Ottawa, Ont.

References: J. M. R. Fairbairn, K. M. Cameron, W. Small, J. B. Stirling, H. N. Macpherson.

SLATER—JAMES, of Arvida, Que. Born at Sydney, N.S., Dec. 27th, 1911; Educ.: Eight terms of engrg. study at Sydney Technical School; 1934-35, rodman and chairman, 1935-36, instr'man., Dept. of Highways of N.S.; 1936-40, surveys and constrn., Dept. of Mines & Resources, Cape Breton Highland National Park; 1940-41, Standard Paving Co. (Maritimes) Ltd., constrn. engr., R.C.A.F. Airport, Sydney, N.S.; 1941, Dept. of National Defence, senior asst. engr., R.C.A.F. Airport, Gander, Nfld.; at present, constrn. engr., field engr., Foundation Company of Canada, Arvida, Que.

References: J. Wilson, T. S. Mills, W. M. B. Musgrave, W. H. Nixon.

STEVEN—JAMES HARRY ALEXANDER, of 112 St. Paul St., West Kamloops, B.C. Born at Killin, Perthshire, Scotland, June 15th, 1893; R.P.E. of B.C.; 1912-13, rodman, 1913-15, instr'man and f'tsman., Can. Nor. Pacific Rly.; 1915-19, overseas, C.E.F.; 1919-20, res. engr., C.N.R., Kamloops-Kelowna Branch; 1920-28, asst. engr., Dom. Water Power & Reclamation Service, Dom. Govt.; 1930-34, mining recorder, Dept. of Finance, Govt. of B.C.; 1935-38, private practice, gen. engrg., Cariboo district; 1939 to date, locating engr., survey branch, Dept. of Public Works, Prov. of B.C., on highway location projects.

References: W. Ramsay, W. G. Swan, G. P. Stirett, H. L. Hayne, H. L. Cairns.

## FOR TRANSFER FROM JUNIOR

BENJAFIELD—PHILIP GRANT, of 36 Balsam St., Copper Cliff, Ont. Born at London, Ont., July 15th, 1907; Educ.: B.Sc. (Civil), Queen's Univ., 1932; 1929 (5 mos.), rodman, Mich. Central Rld., St. Thomas; 1930-31-34 (summers), f'tsman., instr'man., checker, Ont. Dept. of Highways; 1934 to date, junior engr. and instr'man., International Nickel Co. Ltd., bldg. constrn. and mtce., track work, etc. (St. 1928, Jr. 1938).

References: C. O. Maddock, W. J. Ripley, J. F. Robertson, F. A. Orange, W. C. Miller.

MALBY—ARTHUR LESLIE ERNEST, of 303 Rubidge St., Peterborough, Ont. Born at London, England, Aug. 5th, 1907; Educ.: B.Sc. (Elec.) Univ. of Man., 1934; R.P.E. of Ont.; 1934-35, test course, 1935 to date, asst. industrial control engr., Can. Gen. Elec. Co. Ltd., Peterborough, Ont. (Jr. 1930).

References: G. R. Langley, D. V. Canning, J. Cameron, R. L. Dobbin, I. F. McRae

## FOR TRANSFER FROM STUDENT

McCRADY—DONALD CARMAN, of Peterborough, Ont. Born at Montreal, Que., Dec. 17th, 1914; Educ.: B. Eng., McGill Univ., 1936; with the Can. Gen. Elec. Co. Ltd., as follows: 1936-38, test course, 1938-39, commercial dept., 1939-41, sales engr., and at present, gen. engr. dept. (St. 1935).

References: D. J. Emery, J. Cameron, W. T. Fanjoy, G. R. Langley, B. Ottewell, H. R. Sills.

McGREGOR—DOUGLAS ROBERT, of Peterborough, Ont. Born at Sherbrooke, Que., May 2nd, 1914; Educ.: B. Eng., McGill Univ., 1935; R.P.E. of Ontario; 1935-36, test. dept., 1936 to date, engrg. dept., Can. Gen. Elec. Co. Ltd. (St. 1933).

References: J. Cameron, R. L. Dobbin, H. R. Sills, D. V. Canning, W. T. Fanjoy, B. I. Burgess, I. S. Patterson.

TAYLOR—CHARLES GRAY, of 112 William St., Arnprior, Ont. Born at Braeside, Ont., Jan. 31st, 1913; Educ.: B.Sc. (Civil), Queen's Univ., 1940; 1936 (summer), Sylvanite Gold Mines, Kirkland Lake; 1938 (summer), Long Lac Diversion, H.E.P.C. of Ont.; 1940-41, instr'man., f'tsman., etc., Beatty & Beatty, Pembroke, Ont.; Jan. 1941 to date, instr'man. in charge of party, right of way and property dept., H.E.P.C. of Ontario. (St. 1940).

References: A. L. Malcolm, N. Malloch, N. B. MacRostie, J. B. Baty, R. A. Low.

VATCHER—CHESLEY HOLMES, of Toronto, Ont. Born at Freshwater, Nfld., June 6th, 1917; B.A.Sc. (Elec.), Univ. of Toronto, 1939; summers—1936-37, Nfld. Airport constrn., H.E.P.C. of Ontario; 1939-40, demonstrator, dept. of elec. engrg., Univ. of Toronto; 1940-41, sales promotion, Vancouver, and 1941 to date, sales engr., Toronto, Canadian National Carbon Co. Ltd. (St. 1938).

# Employment Service Bureau

## SITUATIONS VACANT

**MECHANICAL DESIGNING DRAUGHTSMAN**, Graduate preferred, urgently needed for work in Arvida for specification drawings for plate work, elevators, conveyors, etc., equipment layouts, pipe layouts and details. Apply to Box No. 2375-V.

**MECHANICAL ENGINEER** with machine shop experience, required for work in South America on important war contract. Apply to Box No. 2441-V.

**MECHANICAL ENGINEER** preferred with experience on diesels and tractors, for work in Mackenzie, B.G. Apply to Box No. 2482-V.

**CHEMICAL CONSULTING ENGINEER** with practical experience to advise on efficient management of small plant manufacturing pigments and dry colours for paint and rubber production. Apply to Box No. 2503-V.

**MECHANICAL ENGINEER** with experience in pulp and paper industry for supervision and maintenance work in large paper mill. Must be experienced in machine shop work and the handling of men. Apply to Box No. 2522-V.

**EXPERIENCED CIVIL ENGINEER** to act as resident engineer on huge power development. Must have had five to ten years field experience on heavy construction. Apply to Box No. 2535-V.

**ELECTRICAL ENGINEER** for testing and maintenance of system relays, short circuit studies and preparation of wiring diagrams. Apply to Box No. 2536-V.

**MECHANICAL DESIGNING DRAUGHTSMAN** on permanent moulds and die casting dies. Apply to Box No. 2537-V.

**CIVIL ENGINEER** with actual pile driving experience required for work in British Guiana. Apply to Box No. 2538-V.

**YOUNG GRADUATE ENGINEER** required by machinery supply firm located in Montreal. Some selling experience preferred. State military status. Apply to Box No. 2539-V.

## ENGINEER OFFICERS WANTED

Applications are invited for Commissions in the Royal Canadian Ordnance Corps for service both overseas and in Canada as Ordnance Mechanical Engineers. Since it is probable that several new units will be organized in the near future, a number of senior appointments may be open, and applications from

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to **THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.**

engineers with a good background of military experience would be welcomed in this connection. Applications should be submitted on the regular Royal Canadian Ordnance Corps application forms, which can be obtained from the District Ordnance Officers of the respective Military Districts.

## SITUATIONS WANTED

**INDUSTRIAL PLANT ENGINEER**. Age 47. M.E.I.C. wide experience general plant engineering, responsible charge maintenance, production efficiency, supervision, layout and design, alterations and additions, mechanical, structural, civil engineering, material handling. Available June 1st in compliance with regulations of the Wartime Bureau of Technical Personnel. Apply to Box No. 1027-W.

**ENGINEER ADMINISTRATOR**, experienced in public utilities, shipyard construction, airplane construction, crane construction, general mechanical engineering and inspection work, also sales promotion. Open for appointment. Apply to Box 2429-W.

**GRADUATE ENGINEER** in Electrical and Mechanical Engineering, M.E.I.C., and R.P.E., electric utility experience. Age 30. Married. Transmission line, and distribution, estimating, design, survey and construction three years, (one year acting superintendent), interior light and power wiring design, estimating and supervision one year. Electric meters (AC) six months, electric utility drafting six months, foundation layouts and concrete inspection six months. Steam power plant operation two years. Presently employed but desire advancement. Apply to Box No. 2430-W.

**DESIGNING DRAUGHTSMAN**, M.E.I.C. Age 47. Married. Location immaterial. Experienced in

estimates, design, layouts and details of industrial buildings. Presently employed but desirous of change with prospects of advancement. Apply to Box No. 2439-W.

## AN APPEAL!

One of our members who has just returned from overseas reports that there is an urgent need of surveying instruments in the Canadian Corps in England. Some organizations have already supplied a few instruments on loan but many more are needed.

Any members who would be willing to loan such instruments to our fighting forces should address them to:

**THE CHIEF ENGINEER**  
Headquarters 1st Canadian Corps  
Canadian Army Overseas

The need is mostly for transits and measuring tapes.

## WANTED

Someone to back up my chemical engineering education. Have saved eight hundred dollars to start on, need someone to help from there on. Age 21, army (reserve) discharge. Good references for repayment plus interest, plus promise to loan to another student as you have to me. S.E.I.C. Apply to Box No. 40.

## LIBRARY NOTES

(Continued from page 335)

### REINFORCED CONCRETE, Theory and Design

By J. E. Kirkham. *Edwards Brothers, Inc., Ann Arbor, Mich., 1941. 428 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$3.75.*

Fundamental principles involved in the designing of reinforced concrete structures are presented in a simple, practical manner. By the direct application of simple mechanics in terms of known loads and strengths, the author provides design procedures for beams, slabs, columns, retaining walls, tanks, bridges and buildings. The book is intended for both students and practicing engineers.

### SAFETY SUPERVISION (Pennsylvania State College, Industrial Series)

By V. G. Schaefer. *McGraw-Hill Book Co., New York and London, 1941. 352 pp., tables, 7½ x 5 in., cloth, \$2.50.*

The purpose of this book is to discuss the human element involved in the problems of the supervisor who must promote the safety of the workers in his division. It presents the duties, responsibilities, methods and techniques of safety supervision as elements of personnel management, and makes no attempt to discuss engineering problems of safety or the making of accident records and reports.

### (The) SCIENCE AND PRACTICE OF WELDING

By A. C. Davies. *The Macmillan Co., New York; University Press, Cambridge, England, 1941. 436 pp., illus., diags., charts, tables, 8 x 5 in., cloth, \$2.25.*

This text provides a concise, yet comprehensive, account of the basic theoretical principles underlying the various processes of welding and of the practical methods of applying them. Both gas and electric methods are covered, and there are chapters on gas cutting and on inspection and testing.

### SCIENTISTS FACE THE WORLD OF 1942

*Essays by K. T. Compton, R. W. Trullinger and V. Bush, Rutgers University Press, New Brunswick, New Jersey, 1942, 80 pp., tables, 9½ x 6 in., cloth, \$1.25.*

The three essays by eminent scientists which are contained in this volume present respectively; an integration of the fundamental sciences of physics, chemistry and biology as they are applied to engineering in a time of national emergency; a discussion of the philosophy and technique of biological engineering as applied to the problems of food, health, etc.; and a description of the application of the well-known principles of engineering to the complex phenomena of the farm. Commentaries are appended.

### SIHOP THEORY, revised edition, prepared by the Shop Theory Department, Henry Ford Trade School, Dearborn, Michigan

*McGraw-Hill Book Co., New York and London, 1942. 267 pp., illus., diags., tables, 11 x 9 in., paper, \$1.25.*

The various tools and machines used in a machine shop, and the operations which can be performed by them are described in detail. Heat treatment, abrasives and the routing of bench tool work are other topics covered. The manual is profusely illustrated, and problems and review questions are included in many of the chapters.

### SOLUBILITIES OF ORGANIC COMPOUNDS, Vol. 2

By A. Seidell. 3 ed. *D. Van Nostrand Co., New York, 1941, 926 pp., tables, 9½ x 6 in., cloth, \$10.00.*

The second volume of this edition is confined to organic compounds. It includes the data of the second edition and supplement which have not been superseded, together with the new determinations published since 1928. The work is the most complete available and will be welcomed by chemists.

### THIS CHEMICAL AGE, the Miracle of Man-Made Materials

By W. Haymes. *Alfred A. Knopf, New York, 1942. 385 pp., illus., charts, maps, tables, 8½ x 5½ in., cloth, \$3.50.*

The reader without a chemical background will find this an interesting account of modern developments in this field. The ways in which laboratory discoveries have been developed into such industrial products as dyes, drugs, plastics, nylon, cellophane and synthetic rubber are described clearly and dramatically, with scientific accuracy: a thoroughly readable book.

### TRANSIENTS IN ELECTRIC CIRCUITS Using the Heaviside Operational Calculus

By W. B. Coughard. *Pitman Publishing Corp., New York; Sir Isaac Pitman & Sons, London, 1941. 203 pp., diags., charts, tables, 9 x 5½ in., cloth, \$3.50.*

Dealing especially with electrical engineering problems, this book utilizes the Heaviside operational methods rather than the formal mathematical treatment. Chapters I-VI constitute a section treating of the theory of lumped circuits. Subsequent chapters deal with smooth circuits or repeated lumped circuits. In the last two chapters, some methods for dealing with variable circuits are discussed. A brief bibliography accompanies each chapter.

### WAGE INCENTIVE METHODS, Their Selection, Installation and Operation

By C. W. Lytle. rev. ed. *Ronald Press Co., New York, 1942. 462 pp., diags., charts, tables, 9½ x 6 in., cloth, \$6.00.*

The aim of this book is to facilitate the selection of the best wage plan for any business, by providing means for comparison of possible methods. It presents all the basic incentive plans in use, with their variations and modifications. Some two dozen different plans are described and analyzed in detail, and their strong and weak points presented impartially. This edition has been further revised.

### CLEANING SMALL TUBES

Elliott Company, Tube Cleaner Dept., Springfield, Ohio, have issued a four-page bulletin, No. Y-10, featuring "Elliott-Lagonda" outside suspension type tube cleaners for small tubes such as condensers and other types of heat exchange apparatus. This bulletin contains a number of action photographs in addition to a general description of the equipment. Illustrations of direct-driven and geared air or steam and electric driven cleaners and various types of drills, cutter heads and brushes are also included.

### ELECTRIC STARTERS

An eight-page bulletin, CGEA-1979A, published by Canadian General Electric Co. Ltd., Toronto, Ont., features G-E reduced voltage manual and magnetic starters, for squirrel-cage induction motors. Illustrations, specifications, general descriptions of the construction and operation features of each type are included.

### COMPRESSED AIR LEAKAGE

Saunders Valve & Supply Co., Ltd., Montreal, Que., have available a fifth edition of a 96-page book which was issued in England, by Saunders Valve Co. Ltd., primarily to point out where and how wastage of compressed air power occurs and how losses from resistance and leaks may be eliminated. It contains five chapters: (1) Terminology and Definitions; (2) Theoretical Compression; (3) Air Leakage; (4) Measurement of Leakage; and (5) Valves and Compressed Air. Chapter three is subdivided into sections dealing with pipe line troubles, friction resistance, cost of leakage and prevention of leakage. Illustrations, diagrams, curves and tables are used throughout and two appendices furnish tables and other data of interest.

### OIL CIRCUIT BREAKER

Bulletin CGEA-2165A, eight pages, recently issued by Canadian General Electric Co. Ltd., Toronto, Ont., gives description of General Electric type FK-142 oil circuit breaker. Lists and illustrates features, telling how they help to improve operation and reduce maintenance. Also included is a page of line diagrams showing typical mountings.

### PACKING IN BULK, RINGS OR COIL

Entitled "Anchor Kurlite the Complete Packing," a four-page pamphlet, published by The Anchor Packing Co. Ltd., Montreal, Que., illustrates and describes "Anchor Kurlite," a shredded metal packing made from crimped ribbons of low friction alloy, coated with high temperature grease and fine flake graphite. This packing is available in bulk, molded ring, and coil form and in seven types according to service requirements. It is suitable for temperatures up to 450° F.

### CONVEYORS

An 18-page catalogue, No. 761, being distributed by Jeffrey Mfg. Co. Ltd., Montreal, Que., illustrates many uses for "Jeffrey" portable scraper conveyors both of wheel- and crawler-mounted types, for handling all kinds of bulk materials into or out of trucks or railway cars. Diagrams showing dimensions are given for each type, together with general specifications. Sketches for unloading pits are shown, and descriptions of "Jeffrey" car puller and other types of portable loading and unloading equipment are also included.

### ASBESTOS PACKING AND GASKETS

Advantages claimed for "Durabla" asbestos sheet packing and gaskets are listed in a leaflet recently issued by Canadian Durabla Ltd., Toronto, Ont. Sizes, thicknesses and weights of standard sheets are tabulated, also stock sizes of gaskets. Information about "Durabla" high pressure gauge glasses is also included.

### INDUSTRIAL SAFETY EQUIPMENT

Mine Safety Appliances Co. of Canada Ltd., Toronto, Ont., have published a 142-page catalogue, No. 5-B, which describes the comprehensive line of MSA safety equipment developed to promote the welfare and safety of the industrial worker. Each article is amply illustrated, and its construction and method of use or operation are given, with mention of special features, specifications and catalogue number. Among the items included are surgical and first aid supplies and equipment, medical supplies, safety devices, clothing and equipment, alarms, recorders, indicators, consumable supplies for listed equipment, bulletins, posters, instructions. Safety devices for mines are not included but contained in a separate volume.

### POTENTIOMETER INDICATORS

Bulletin No. A-305, being distributed by The Foxboro Co. Ltd., Montreal, Que., presents the complete line of Foxboro potentiometer temperature indicators and indicating resistance thermometers. The instruments illustrated and described include single-point and multiple-point models, models equipped with selective key-switches for as many as 82 contact points, as well as the popular portable models. Single range and double range dials are shown in full-size reproductions and a complete list of standard ranges is given. Constructional features of the instruments are shown and described, many of these features being exclusive in Foxboro design.

### REFRACTORY LAGGING

Bulletin No. 327E, eight pages, published by Quigley Co. of Canada Ltd., Lachine, Que., tells how plants are solving plastic insulating problems by using "Insulag" plastic refractory lagging. Illustrations show applications for the oil industry, oil burners, boilers, ovens, furnaces, coke ovens, watercoolers. Charts give outside face temperatures for varying insulation thickness, and heat savings for varying hot surface temperatures.

### TYPICAL DESIGNS OF TIMBER STRUCTURES

Timber Engineering Co., Washington, D.C., have issued a reference book, 11 ins. by 17 ins., as a service to architects and engineers and which is in no sense a "plan service." It presents 48 detailed drawings selected by the "Teco" engineering staff from the collection of several hundred designed in the course of practical work on actual timber engineering problems. These plans cover 14 different types of timber design such as trussed rafters for housing projects, trusses for hangars, factories, and markets; grandstands, distillery racks, bridge and towers. Each group is introduced by a photograph of an actual structure in which that type of design was employed and an explanation of its use. Also included are "Handy Tables for use in Timber Design," taken from the National Lumber Manufacturers Association publication "Wood Structural Design Data." V. H. McIntyre Ltd., Toronto, Ont., are the Canadian representatives.

### SAFETY EQUIPMENT

Covering the company's wide range of safety clothing and equipment, Catalogue No. 42, 110 pages, issued by Safety Supply Co., Toronto, Ont., contains descriptive information, specifications and illustrations of each type of equipment. Among the many items are goggles for every purpose, face shields, welders safety equipment, respiratory devices, hoods, masks, helmets, gas detectors and alarms, clothing, shoes, gloves, hats, ladders, safety cans and tank seals, etc.

### PROCESS INDUSTRIES EQUIPMENT

Jeffrey Mfg. Co. Ltd., Montreal, Que., have available a 20-page catalogue, No. 765, devoted to specialized equipment used in the process industries. This booklet contains brief information and illustrations covering feeders, conveyors, elevators, coolers, dryers, screens, crushers, pulverizers, shredders, packers, chains and sprockets, power transmission machinery, bin valves, and portable units of the belt, bucket and scraper types for loading and unloading operations and stackers for bags, boxes, etc. Various types of each class of this equipment are shown and described and while a comprehensive idea of the wide range of equipment available is provided, the company states that more complete details are available in separate catalogues dealing with each item.

### SELF-ACTING TEMPERATURE CONTROLLER

Catalogue No. 36R, published by Taylor Instrument Companies of Canada Ltd., Toronto, Ont., describes "Taylor" self-acting controllers, and lists the conditions for which they are recommended. Diagrams show the installation of these controllers on hot water tanks, Diesel engine water jackets and other equipment. The selection of the proper controller is featured and a temperature range and sensitivity chart is included. Construction features are described and illustrated.

### GRINDING CUTTING TOOLS

A 32-page booklet being distributed by Norton Co. of Canada Ltd., Hamilton, Ont., has an introductory article on the economy of properly sharpened tools and then tells about "Haynes Stellite" "J-metal" and the more recently developed alloy "2400." Alundum abrasives for grinding and sharpening tools made of "J-metal" and "2400" are then described, giving recommendations for various types of tools and describing the sharpening operation in each case.

### 1942 THE YEAR TO WIN OR LOSE

This concise statement of the war situation is the title of a 32-page booklet which has been reproduced by Canadian Westinghouse Co. Ltd., Hamilton, Ont., with the permission of "Business Week," New York. It presents facts relating to the five "fronts": The Middle East Front, The Atlantic Front, The Russian Front, The Far East Front, and The Home Front. Maps are included together with a table showing the distribution of available world production of key commodities in 1938 and in 1942.

### SPUN ROCK WOOL INSULATION

"Atlas Spun Rock Wool Insulation" is the title of an eight-page booklet, published by Atlas Asbestos Ltd., Montreal, Que., in which the subject is treated under the following six headings: General characteristics and advantages; forms of manufacture; typical installations; thermal conductivity; general notes covering selection, application, and finish; "Cork type" for low temperature brine and ammonia lines; and prices and data. The product in its various forms is well illustrated and there is appended a list of "Atlas" products for industrial and home use.

### STEAM-JET EJECTORS

Bulletin, No. W-205-B9, eight pages, made available by Worthington Pump & Machinery Corp., Harrison, N.J., contains details of applications, installations and special developments of the company's two general types of three-stage steam-jet ejectors, the condensing and non-condensing. Full details are given accompanied by illustrations.

## SPECIALIZED TRAINING

FOR

## THE ENGINEERING PROFESSION

International Correspondence Schools are equipped to provide the non-university man with the specialized training necessary to enable him to study for the examinations of engineering societies and associations. I.C.S. Home Study Courses are of particular interest to prospective applicants for membership in any of these organizations.

I.C.S. courses for examinations are arranged with the object of preparing the candidate for his examinations in the shortest possible time, while omitting no features of his training conducive to thoroughness and diversity of knowledge.

Each candidate will receive the individual attention of a vocational and educational specialist. The candidate's examination courses will be arranged to comply with his individual requirements and his rate of progress will be affected by no other student. He will proceed as rapidly as his ability, his study time and his application will permit. He will be allowed ample time to complete his I.C.S. course and will receive full answers to any questions he may need to ask which come within the scope of his course.

The subjects in which I.C.S. training is available include:

- High School Subjects
- Elementary Physics and Mechanics
- Strength and Elasticity of Metals
- Drawing
- Chemistry
- Chemical Engineering
- Civil Engineering
- Electrical Engineering
- Mechanical Engineering
- Mining Engineering
- Structural Engineering

**AN INVITATION**—You are invited to send for information about I.C.S. training. You incur no obligation. Just mark and mail the coupon.

International Correspondence Schools,  
Canadian Limited,  
Department H-3,  
Montreal, Canada.

Please send me complete information on I.C.S. training for engineering.

## Industrial News

(Continued from page 338)

### TIME SWITCHES

The type T-44 automatic general-purpose time switches are described and illustrated with general and sectional views in a four-page bulletin, No. CGEA-1427M, issued by Canadian General Electric Co. Ltd., Toronto, Ont. A list of the principal features of these switches is given together with a table of ratings. The T-44 switch has a wide range of applications where it is desired to open and close electric circuits at predetermined times on a daily repeating schedule.

### PRESSURE RECORDER

The Foxboro Company Limited, Montreal, Que., have available a 32-page Catalogue No. 22-A in which factual information is arranged so as to be of greatest convenience to the reader in selecting the pressure recorder best suited to his particular needs. The "Foxboro" line is well illustrated and described, covering instruments for the measurements and recording of industrial pressures of all kinds, in ranges from 1 inch of water to 20,000 lbs. A complete list of standard ranges is given, accompanied by full-size reproductions of specimen charts. In addition to other construction features, the various types of pressure measuring elements are illustrated. Other sections describe methods of instrument mounting, types of cases available, integral electric signal systems, accessory equipment, and give brief mention of other types of Foxboro pressure measuring instruments.

### TANTALUM-TUNGSTEN CARBIDE TOOLS

A 24-page catalogue and price list, issued by Carbide Tool & Die Co. Ltd., Hamilton, Ont., lists 22 typical styles of Vascoloy-Ramet single point tools, together with a grade selector chart recommending the grade of Ramet Carbide for practically every cutting condition in steels, cast iron and abrasive materials. Included are instructions for ordering tools and blanks, also tables for computing costs of standard tools and blanks and special blanks.

### SAFETY AND FIRST AID EQUIPMENT

A 110-page catalogue issued by Safety Supply Co., Toronto, Ont., illustrates and describes a very comprehensive range of all types of safety equipment and first aid materials. Among the items covered are goggles of all kinds, respirators, gas masks, gas detectors, safety shoes, asbestos gloves and suits, Steelgrip gloves, fire extinguishers, safety ladders, safety guards, safety belts, safety signs, safety hats, welders helmets, hospital equipment, first aid supplies, etc.

### STEAM CONDUIT

Bulletin 4202, published by the Ric-wiL Company, Cleveland, Ohio, illustrates uses for pre-fabricated insulated pipe units for underground steam lines, and gives diagrams with dimensions of fittings and parts. These units are of basically correct design, including all parts, which are standardized and machine-made with precision workmanship. Construction of "Ric-wiL" fits into the working practice of various trades in the field, cutting time and cost on the site.

The result is a pre-sealed underground steam pipe system, in the form of a truckable unit, completely finished in the shop, with nothing extra to buy, ready to install. Units come in pipe sizes from 1 in. to 16 ins. in diameter with complete instructions and service drawings with each order. The company's representatives in Canada are F. S. B. Heward & Co. Ltd., Montreal, Que.

### STEEL ROLLING DOORS

A 40-page booklet issued by The Kinnear Manufacturing Co., Columbus, Ohio, features upward-acting types of doors under two classifications based on type of service and degree of protection. Specifications and illustrations of service doors for stores, warehouses, piers, garages, hangars, industrial and mercantile buildings are given. Fire doors for openings in shafts, stair wells, corridors, etc., and in hotels, hospitals, warehouses or other buildings are also included. Other products include rolling grilles, "Rol-top" doors, "Bi-folding" doors, sliding, barrier and wood rolling doors.

### THERMOSTATS

Canadian General Electric Co. Ltd., Toronto, Ont., have issued a 4-page Folder CGEA-1265D which describes the G.E. "CR2992-R1" Thermostats for use with small heating units. Its operation, application, dimensions, specifications are included together with ordering directions for G.E. thermostats CR2992-R1, for use with small heating units.

### V-TYPE WATT HOUR METERS

Bulletin CGEA-2669B, 8 pp., published by Canadian General Electric Co. Ltd., Toronto, Ont., describes V-Type watt-hour meters, two-element and three-element. Classification charts, application diagrams, and general descriptions of construction and performance are given with illustrations. Diagram of dimensions is also shown with shipping weights and net weights for various sizes.

### POWER PLANT EQUIPMENT

A series of articles feature installations of "Elliott" power plant equipment in hospitals, ferries, barges, steam generating plants, hydro-electric plants, and cargo vessels in Vol. 20, No. 1, of "Powerfax" published by Elliott Co., of Jeannette, Pa., who are represented in Canada by F. S. B. Heward & Co. Ltd. These articles appear under the following titles: "Georgia Power Company's Plant Arkwright," "Fast Boats for Ferry Land," "Manteno State Hospital Adds Turbine-Generating Unit," "Barging on the Mississippi," "An Unusual Feedwater Heater Arrangement," "A Deaerator Installation Job," "Canadian Hydro Plants Use Self-Cleaning Strainers," etc.

### POWER LINE EQUIPMENT

The leading article in the recent issue of "The Line" (Vol. 20, No. 2), published by Canadian Line Materials Ltd., is on resuscitation after electric shock and is illustrated. Another article deals with reclosing fuse cutouts under to-day's emergency conditions. The "MK-39" high pressure contact is described, with table of catalogue numbers for parts, giving general specifications and constructions. The "LM Controlite Luminaire" installation at Miami Beach is the subject of another illustrated article, and shorter descriptive matter tells about isolators, wishbone clamps, versilugs, and fuse cutouts. Finally an article on guying gives tables of loading and strength data for various types of conductors.

### REPAIRS WITH METALLIZING

"Metco News," Vol. 1, No. 9, of Metallizing Engineering Co. Inc., Long Island City, N.Y., features the use of metallizing for repairs in a rubber heel factory, and for speeding mass production in an aircraft plant. How metallizing equipment is used by a transit company in New York city for maintenance of buses and trucks is the subject of another story. Also included are articles on machining with carbonyl tools, giving diagrams and a table of recommended speeds and feeds, and on the strength of sprayed metal bushings.

# THE MODERNIZATION OF A PUERTO RICO STEAM PLANT

J. T. FARMER, M.E.I.C. and E. A. GOODWIN, M.E.I.C.  
*Montreal Engineering Company, Limited, Montreal, Que.*

Paper presented before the Montreal Branch of The Engineering Institute of Canada on March 19th, 1942.

The Porto Rico Railway, Light and Power Company serves the City of San Juan, the capital of Puerto Rico, as well as some thirty-five towns in the contiguous territory embracing nearly half the area of the island with a population of close to a million inhabitants.

While far below the consumption of a similar population in either the Continental United States or Canada, the use of electricity has shown a continuous growth in the last decade throughout the area and more particularly in San Juan itself. The outstanding industry of the country is sugar growing and processing, which, from its nature, does not make any direct demands on a central power supply. Other activity on the island is mainly agricultural, and such manufacturing as exists is on a relatively small scale.

The Island of Puerto Rico is the most easterly United States territory of any size. Its strategic importance as an outpost of the Panama Canal and an operating centre for the Caribbean area and the north coast of South America is evident from a cursory inspection of the map. The United States has established a large army post on the island, and extensive army and navy air bases are under construction, as well as an important naval base on the east coast of Vieques Sound.

All this construction has brought a business boom to the island and this, combined with the influx of people to carry out the work, has imposed on the company a heavy demand for electrical service.

In the early days of this utility, the main source of power was from hydro-electric plants in the interior of the island. The drainage area of the small rivers on the island is naturally limited, but the annual rainfall is fairly heavy; so that from this source it was possible to meet the then moderate demands of the territory. Besides the limited volume of run-off however, its intermittent character, coupled with the absence of any extensive storage facilities, has always been a difficulty; so that even from early days it was necessary to maintain a small steam plant in reserve, to make up temporary deficiencies in the available hydro supply.

Prior to 1936 this steam plant consisted of three steam turbines of 500, 1000 and 1500 kw. capacity respectively, a total of 3000 kw. which could be stretched to 3500 kw. Steam was generated in five boilers from 20 to 35 years old at a working pressure of 160 lb. gauge and about 100 deg. of superheat. The fuel used was Bunker C fuel oil obtained from Venezuela; and the overall fuel rate was about 1.85 lb. per kw.h. The building housing this equipment was of steel and wood framing, with sheet iron roofing and siding. Natural draft was furnished by two 125-ft. steel stacks, already showing the ravages of time and the damp salt air.

This plant, known as the Santurce Steam Plant, is located in the principal suburb of San Juan, about three miles from the centre of that city. It is on the shore of the Condado lagoon, an extension of the inner harbour of San Juan, from which a supply of cooling water is obtainable. A pipe line connects the plant with an oil depot in the city.

This location is near the load centre of the city of San Juan and its suburbs, and is connected directly with the transmission lines from the hydro plants. It was considered the best site for further development.

The building runs almost due north and south. The eastern portion forms the turbine room, while the boilers occupy the western section of the building. (Fig. 1).

Early in 1936 it became apparent that the capacity of the existing plant was barely sufficient to meet the immediate and prospective demands of the system. It was decided to provide additional capacity by enlarging the Santurce Station. With some hesitation, it was decided to double its capacity, with the idea that, if not immediately necessary, this would take care of any likely demands for a long time to come. So far from this enlargement not proving justified, it turned out to be merely the first of a series of extensions which have resulted in the complete modernization of the station.

This 3500 kw. extension had hardly been put into operation before a further extension on a larger scale was found necessary. This took the form of a 5000 kw. unit, installed in 1938, and was followed by the installation of a 7500 kw. turbine and boiler plant which went into service in the latter part of 1941. A duplication of this last addition is now in hand, and is expected to be in operation by the summer of 1943.

The modernization of the station has thus been carried out in four stages, of which three have been completed, and the fourth partially so. As typical of the general scheme, the third stage recently completed will be described in some detail.

The first extension in 1936-37 consisted of a 3500 kw. turbine-generator and a Foster-Wheeler boiler with a steam capacity of 60,000 lb. per hour. Following the trend of present day practice, but without going to extremes, it was decided to install equipment designed to operate with steam at 400 lb. gauge pressure and 700 deg. F. total temperature. These characteristics once established were adhered to in the subsequent additions.

The new units were considerably larger than those of the original plant, so the building was extended to the south, utilizing as much as possible of the original structure, but increasing the width and also the height of the roof. The foundations of the main columns and the major pieces of equipment were set on piles. In the new section of the turbine room, a 20-ton travelling crane was installed on crane rails carried on the building columns, which necessitated a higher roof. The boiler replaced an old boiler in the southern end of the boiler room, and the roof was raised to match that in the turbine room.

In connection with this 3500 kw. addition, an improved cooling water intake was put in. The only provision for the older turbine condensers was a cold water well which was fed by an underground conduit from the shore of the lagoon, which naturally drew on the warmer surface water from near inshore. For the new unit a pump house was built on piles some 250 ft. out from the shore, so that water could be pumped from a greater depth (Fig 2). This water was conveyed through a 30 in. cast iron pipe carried on a series of piers and so delivered into the turbine room. This pipe was branched so as to supply two turbines. This pump house was later enlarged and two pumps were installed to serve the two 7500 kw. units. In this case individual 24-in. pipes were led to each of the units, these pipes being supported on the piers already in place.

As further additions were proceeded with, the old building was remodelled and enlarged to match the first extension in order to accommodate each successive instalment

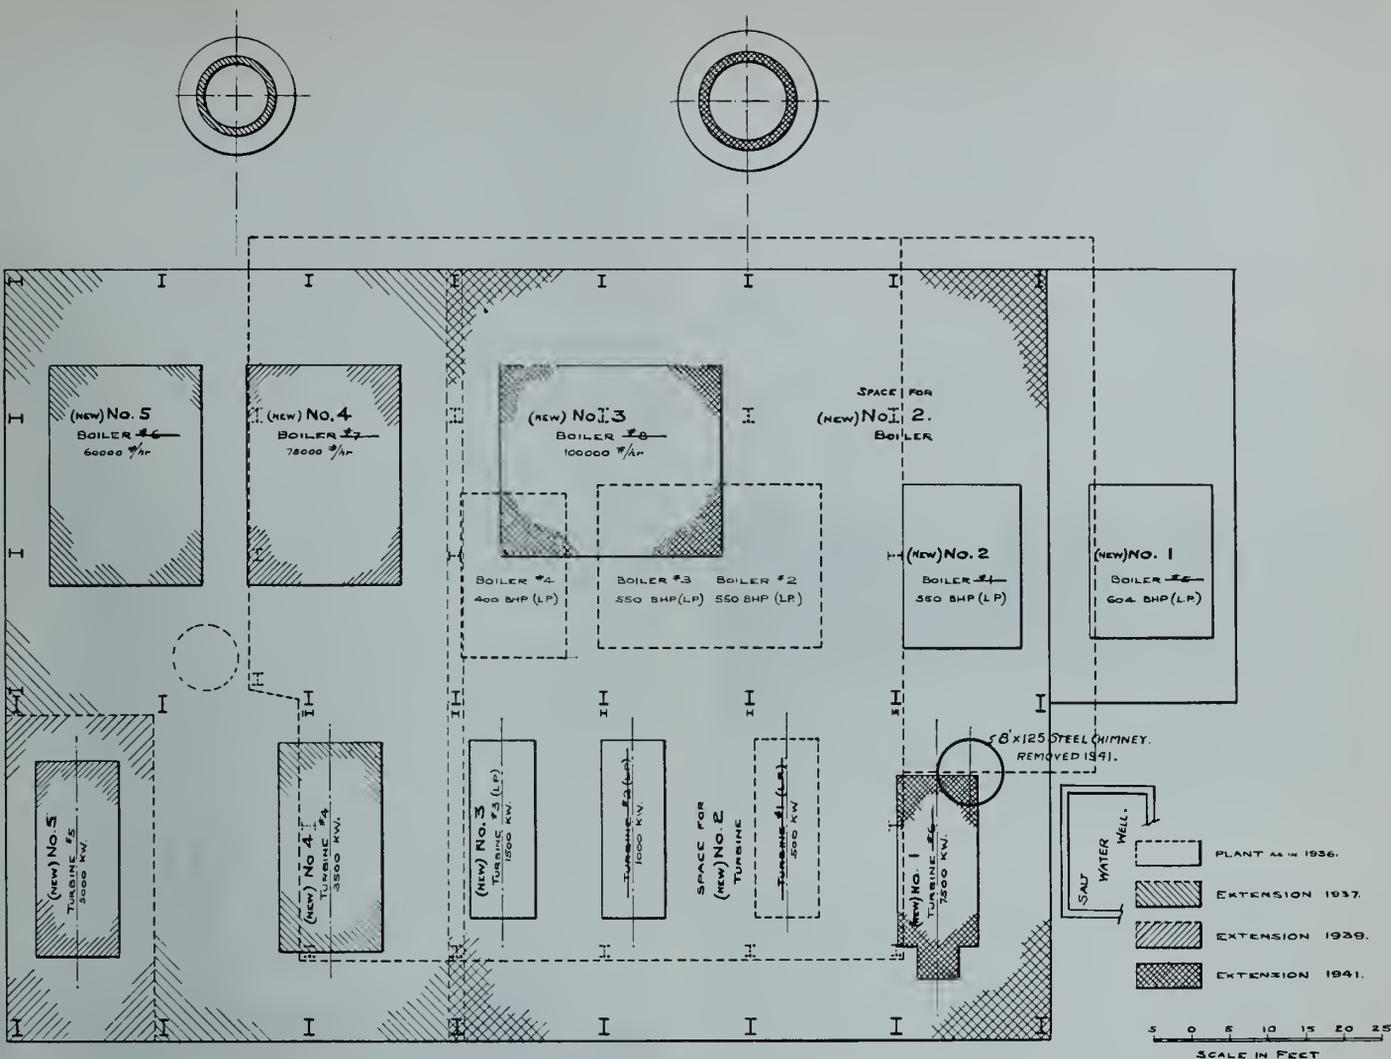

Fig. 1—Progressive development of Santurce steam station.

of equipment. At the third stage the original structure was entirely replaced on the new lines so as to provide space for the fourth and last addition of equipment.

The remodelled building consists of a steel frame with corrugated asbestos roofing and siding. The steel columns were in some cases built up on the original columns; in other cases they were entirely new. The crane rails were continued the whole length of the turbine room so that the crane can serve any of the turbine units. It is capable of lifting and transporting any of the pieces of equipment ordinarily requiring handling during erection or overhaul.

When the first high pressure unit was installed, the boiler was connected up to one of the two steel stacks previously mentioned. With the advent of a second boiler, additional chimney capacity became necessary; and a reinforced concrete chimney 150 ft. high by 8 ft. diameter was built outside the boiler room, to serve both boiler units. This permitted the demolition of the steel chimney in the south end of the boiler room, releasing some space for other purposes. On proceeding with the third extension, a second concrete chimney formed part of the programme. This was similar to the first except that the diameter was increased to 10 ft. On the completion of this chimney, the last of the two steel stacks was dismantled.

In carrying out these extensions, it was considered essential to keep the older low pressure units available for service as long as possible. In fact, it has only been necessary to retire the smallest of the three old turbines to make room for the first of the 7500 kw. units. Even after the erection of the second 7500 kw. unit it will still

be possible to retain the old 1500 kw. turbine as an emergency unit.

The retention of these low pressure units, with low pressure boilers to serve them, made necessary a considerable amount of preliminary work in the way of changing over piping to clear the way for the new high pressure installation.

The prime mover equipment selected for this addition consists of a Westinghouse condensing turbine rated at 7500 kw. but capable of generating continuously 9375 kw. at unity power factor. The operating conditions are, as previously established for the earlier units operating in parallel, steam pressure 400 lb. gauge and 700 deg. F. total temperature, and vacuum 2.5 in. of mercury absolute. The turbine speed is 3600 revolutions per minute. The turbine is of the single cylinder, impulse-reaction type, arranged with three bleed points; and is fitted with the usual accessories. These include a hydraulically operated combination steam and throttle valve with integral steam strainer; hydraulic oil relay governor operating steam admission valves, and equipped with a motor-operated speed changer; over speed and low oil pressure trips; impeller type main oil pump driven from turbine spindle, and turbine driven auxiliary oil pump with automatic regulator to start it up in case of failure of oil pressure. Oil coolers in duplicate are provided, using cooling water tapped off the condenser supply.

The generator is a 9375 kva., 7500 kw. at 80 per cent power factor, three-phase, 60 cycle, 8300 volt generator. Internal ventilating fans are mounted on the generator

rotor. The generator air cooler built into the foundation block has 2,130 sq. ft. of cooling surface. It is supplied with cooling water taken from the main condenser supply. A field discharge resistor is provided, and a motor-operated generator field rheostat.

A 45 kw. 125 volt exciter is directly connected to the generator shaft and is equipped with a hand-operated exciter field rheostat.

The total weight of the turbine unit is about 142,000 lb.

The condensing equipment consists of a Westinghouse two-pass radial flow type surface condenser fitted with

Fig. 2—Pump house.

Muntz metal tube sheets and aluminum brass tubes, having an effective cooling surface of 6,800 sq. ft. The water boxes are divided so that either half of the condenser can be opened up for inspection or cleaning while the other half remains in service. Inlet valves are provided to shut off the cooling water from either half of the condenser.

The condenser body is suspended directly from the exhaust flange of the turbine, and is fitted with jack screws to take the weight in case of the condenser being filled up with water for testing. To relieve any stresses due to temperature variations, expansion joints are provided on the water, air and atmospheric exhaust connections. A 16-in. atmospheric relief valve is provided.

The air released in the condenser is exhausted by a two-stage steam jet ejector, the steam used in the process being largely condensed in the inter and after condensers, the heat being applied to the condensate. The air ejector is in duplicate to minimize the risk of any shut down due to failure of this apparatus.

The supply of cooling water for condensing, as already mentioned, is obtained from the lagoon alongside the plant, in which the only change of water is that due to the tidal ebb and flow. The water temperature in this latitude is naturally high, ranging from 80 to 86 deg. F., so this limits the vacuum attainable. The condenser is designed to maintain a vacuum of 27.5 in. of mercury at normal load. In the existing units the vacuum ranges from 27 to 28 in.

The cooling water after passing the condenser is discharged into a canal on the east side of the building, and thence back to the lagoon (Fig. 3). The point of discharge of the canal is some little distance from the intake at the pump house; and the lagoon is so large that the continuous discharge of warm water does not appear to appreciably affect the temperature of the incoming water. Some observations made some years ago, when the station load was much lighter than at present, failed to detect any appreciable warming of the main body of water, and in fact indicated practically the same temperature as in the open sea along the nearby coast. However, it was felt

that the return of an increasing volume of warm water was bound to have some effect in raising the temperature of the lagoon water locally. With a view to minimizing this, a line of sheet piling was driven forming a curtain wall between the warm water discharge and the pump house location. The idea was that this would tend to deflect the current of warm water along the north shore of the lagoon, and keep it from mixing with the cooler water approaching the pump inlet.

The circulating water pump for this unit is installed in the pump house out in the lagoon, alongside the pumps for the earlier high pressure units, which were of the conventional horizontal centrifugal type. The water is drawn from several feet below the surface, from a suction box arranged with screens to catch any coarse debris floating on the water.

The pump adopted is of the vertical axial flow type. This pump is set on the floor of the pump house with its vertical casing extending to well below low water mark, and housing the propeller and guide vanes. The propeller being always submerged, no priming is required. The pump is designed to deliver 7,650 U.S. gallons per minute against a total head of 25.4 ft., this being the head loss incurred in the passage of the water through the intake pipe and condenser. The characteristics of this pump are such that if this head loss is moderately increased, due to marine growth in the pipe, or fouling of the condenser tubes, the quantity of water pumped will

Fig. 3—Plant seen from lagoon.

not be very seriously curtailed. The pump is equipped with a 75-hp. squirrel cage motor mounted directly on the pump casing.

The water is conveyed to the turbine room through a 24-in. cast iron pipe, supported on the same piers as the pipe serving the earlier machines. A similar pump and pipe will be provided for the second 7500-kw. unit.

One difficulty which is encountered in this intake system is the rapid fouling of the interior surface of the pipe, on which a layer of shellfish builds up, sometimes inches in thickness. In the past this has been held in check to some extent by intermittent injections of chlorine, but some mechanical cleaning has also been necessary. In order to facilitate this operation, the individual pipes for this latest installation were laid out with removable joints at intervals; so that, when necessary, short lengths of the pipe can be opened up and a scraper hauled through.

The condensate discharge from the condenser is handled by a vertical two-stage centrifugal pump, motor driven, capable of pumping against a total head of 140 ft. The condensate is passed through the air ejector condenser and a low pressure closed heater taking steam from the low pressure bleed point of the turbine, and is delivered into the de-aerating heater at a temperature

approaching 200 deg. F. Here it receives additional heat abstracted from the intermediate bleed point of the turbine; and any feed make-up required is automatically added at this point. The de-aerated water is then pumped by the motor driven centrifugal feed pump through the high pressure heater to the boiler. The high pressure heater steam is taken from the high pressure turbine bleed point.

The feed delivered to the boiler is controlled by a Copes feed water regulator with differential pressure valve. A surge tank, situated underneath the de-aerating heater, forms a reservoir of heated de-aerated water to take up any fluctuations in the boiler demand.

The steam generating equipment for this extension consists of a Babcock & Wilcox Integral Furnace Boiler with a normal rated capacity of 100,000 lb. of steam per hour at a pressure of 425 lb. per sq. in. gauge, and a total temperature of 710 deg. F. at the superheater outlet. This output can, if desired, be increased to 110,000 lb. per hour for short periods, all auxiliary equipment being designed to meet this condition. This steam output is sufficient to cover the maximum requirements of the 7500 kw. turbine at its maximum overload of 25 per cent over its rated capacity.

The boiler proper and superheater are of the makers' standard design for this type of boiler, having 8421 and 1758 sq. ft. of heating surface respectively. The boiler is equipped with an air heater of the tubular type, the air circulating through two passes of tubes arranged horizontally while the gas passes vertically upwards through a single pass on the outside of the tubes. A motor driven forced draft fan equipped with inlet vane control delivers air directly to the air inlet of the air heater. The gas passing from the air heater is handled by an induced draft fan driven by a squirrel cage motor through a hydraulic coupling. From the fan it is discharged into the reinforced concrete chimney.

While this boiler is primarily designed to serve the 7500 kw. turbine unit, the steam piping is interconnected so that it can supply steam to the other units in the station; or conversely, the steam required by the 7,500 kw. unit can be obtained from other boilers. Thus in the event of the forced stoppage of a major unit for any reason, the load being carried by it can be transferred to another unit with a minimum of disturbance of the routine of the rest of the plant.

The fuel used in this plant is fuel oil of the class known as Bunker C from the Venezuela oil field. It has a heat value of 18,300 to 18,800 B.t.u. per lb.

The boiler is equipped with six air registers, and combination steam and mechanical burners. Under normal running conditions, mechanical atomization is employed, but for starting up or to meet variable or otherwise abnormal load demands, the use of steam for atomization can be resorted to. Each burner burns 1,200 lb. of oil per hour at the rated load of the boiler, and can considerably exceed this amount during periods of overload. The boiler furnace is completely watercooled, and has a volume of 3,422 cu. ft., which gives a heat liberation of 37,500 B.t.u. per cu. ft. per hour when the boiler output is 100,000 lb. of steam per hour.

The battery of burners is completely enclosed in an insulated sheet steel casing or windbox, to which heated air is supplied through a short duct from the air heater outlet. The pressure set up in this windbox at full rated boiler output is slightly over two in. water gauge.

The waste gases are finally discharged through the second of the concrete chimneys earlier referred to. This chimney was designed to take the gases from a second boiler, a duplicate of that described, still to be installed. For the present it is arranged to take the products of combustion from two old low pressure boilers still retained

to furnish steam on occasion for the low pressure turbines held in reserve. One of these boilers will be displaced to make room for the new high pressure boiler.

The concrete chimney, like its predecessor, is built on a piled base some 30 ft. in diameter. Both these chimneys were designed with specially heavy reinforcement, to withstand the effects of extreme wind velocities: as Puerto Rico is situated in the hurricane belt, and such visitations must be expected at infrequent intervals. Since their erection these two chimneys have not been put to this test; but a number of chimneys on the island, designed on similar lines, successfully stood up to the hurricanes of 1928 and 1932.

These high chimneys were built to lessen the nuisance of smoke and dust in the residential area in the vicinity of the plant. Complaints are still heard, however, as to dust and dirt in the atmosphere, which is attributed to the operation of this Santurce plant. The problem is not an easy one, as the unconsumed solids resulting from oil burning are of such a light impalpable nature that it is very difficult to eliminate them by the ordinary methods of dust collection. In carrying out this last extension, a large chamber was introduced at the entrance to the induced draft fan, with a hopper and spout for discharging any fine dust that would collect therein. This chamber was so designed that a battery of cyclone collectors could be later installed, if found desirable, to assist in the separation of the dust particles.

With perfect combustion in the furnace, however, there should be no carry over of any solid matter when burning oil. With this in mind, in this instance particular attention has been given to the matter of combustion, and a system of automatic control has been adopted affecting both the air supply and the gas discharge, as well as the supply of oil to the burners, so as to maintain at all times and under all changing conditions as nearly perfect combustion conditions as possible. This it is hoped will result in largely preventing the emission of unburnt carbon from the furnace. Up to the present, it has been difficult to determine whether this aim has been realized, as the use of the same chimney by the older low pressure boilers, in which the combustion conditions are admittedly not so good, has tended to confuse the issue.

The boiler is fitted with the usual instruments, including a steam-flow air-flow meter, which is interconnected with the combustion control mechanism to maintain a correct relation between fuel and air admission. A two-pen instrument records steam pressure and temperature. A multi-pointer draft gauge indicates the pressure in the windbox, the furnace and at the boiler uptake. Provision is made for obtaining other secondary readings from indicating thermometers and gauges. A bi-colour water gauge is arranged with mirrors to bring the water level indication into convenient view of the operator. These accessories are believed to include everything necessary to maintain intelligent supervisory control of the boiler operation.

Fuel oil is pumped to the station through a six-in. supply line from the pumping plant at the oil storage depot about a mile and a half distant. At the plant it is stored in two medium sized tanks which have been carefully calibrated so that by means of float indicators a close estimate can be arrived at of the quantity of oil received, and that used in the boilers. The oil is pumped to the burners by motor driven screw type pumps through heaters. These pumping sets are equipped with pressure and temperature regulators.

The present pipe and storage facilities have been found ample to supply the fuel requirements of the plant up to the present time. However with increasing plant output, and with some apprehension as to the regularity of supplies under present conditions, it has been thought pru-

dent to enlarge the storage facilities at the plant itself. Arrangements have been made to erect a tank of 10,000 barrels capacity in the grounds adjacent to the power house as a safeguard against any prolonged interruption of the supply.

This series of changes have thus transformed the plant from an antiquated model of thirty years ago to one that will compare in its essential components, if not in size, with the best of present day practice (Fig. 4).

Fig. 4—Plant after third extension. Looking west.

It is interesting to note the outstanding results of this remodelling. It was mentioned that in 1935 it took about 1.85 lb. of oil to produce one net kw.h. of energy. In the first two months after the last unit was put in operation late in 1941, the fuel consumption averaged 1.05 lb. per net kw.h. Credit for the improvement is of course due, firstly, to the inherent economy of the higher steam pressure and temperature in the prime mover with stage heating of the feed water; and secondly, to the much improved efficiency of the boiler, furnace and burner equipment with its accompanying heat recovery equipment.

An appreciation of the value of this reduced fuel con-

sumption can be gained from the general statement that it represents a saving of \$27 in the fuel cost of running the 7500 kw. turbine for one hour at its rated capacity. Carrying the comparison a stage further, it appears that this steam plant, in conjunction with the hydro generating facilities, can be operated at an annual capacity factor of about 45 per cent, which is equivalent to running at rated capacity for 3,900 hours in the year, thus showing a fuel saving of \$100,000 for the year, as compared with the 1935 performance. At this rate, the fuel saving alone would pay for the installation cost of the improved plant in about six years.

Obviously it does not pay as a general rule to discard and replace old plant, every time some improvement in economy becomes available; but this appears to have been a case where the substitution was fully justified.

This improved efficiency, however, was only a secondary consideration. The main incentive was the necessity of providing for increased output. The original plant had a nominal capacity of 3,000 kw. with rather liberal overload capacity. A heavy days output ran as high as 75,000 kw.h., equivalent to a capacity factor of over 100 per cent. When the second 7500 kw. unit is ready for operation, the plant will have an installed capacity of 25,000 kw., including the old 1500 kw. low pressure unit still remaining.

With one of the largest units out of service, the firm capacity of the plant comes down to 17,500 kw. At 50 per cent capacity factor this corresponds to a 24-hour output of 210,000 kw.h. Already the daily average for a month has exceeded 213,000 kw.h. with single days running over 220,000 kw.h. So the station cannot be said to be over extended.

The question naturally occurs whether the increased power demands could not have been met more economically by the development of more hydro power. The answer is that a stage has been reached at which the water power resources in the limited area of the island, susceptible of economic development, have been practically exhausted and that any further energy requirements must be obtained from fuel. Thus in the last few years, from being essentially a hydro system with a small steam auxiliary, it has become a steam power system with hydro figuring as a secondary source of supply.

## THE WILL TO WIN

From an address by Brigadier-General Earl McFarland

*Mechanical Engineering*, MAY, 1942

Most important of all factors at the moment, and greater than any I have yet spoken of, is the will to win. Unless we are determined, our effort lacks half its energy and our results may be half as great as are required for victory. What I am saying was said by Napoleon, in a simple phrase and one more striking than I might coin. He said, "In battle, the morale is to the material as three is to one." Translated into the vernacular, that simply means that no matter how great our material strength, our determination to win is three times more important. How will that determination be brought about? This is a field somewhat beyond the mechanical engineer and the Ordnance officer, but I venture to state a belief which I hold to be basic to success: Our people must still develop a sense of righteous anger against a contemptible enemy whose actions deserve the sternest treatment. Until we know what it means to have a total hate for an unremitting foe and until we are willing to discipline ourselves and sacrifice our strength in order that we may inflict the

greatest of damage upon such an enemy, our fighting forces and our material strength will not speak the kind of language a ruthless fighter understands. For make no mistake about it, we are face to face with as ruthless an enemy as the world has ever known. Until we are ready to meet that kind of fighting with the intense hatred it deserves, we will never be able to reach the goal for which we are striving.

I wish it were possible for me to conclude my remarks on a more kindly note. But we are at war, the worst war the world has ever known. We will not win it by a lackadaisical attitude in the factory, on the farm, or anywhere else. We must realize that we have a job to do—the greatest job in the history of the world. And until we get mad about it and fight with a hatred as deep as our enemies' cunning and ruthlessness, we can not exert our full strength. The day has come to match our engineering power with the will to fight—to fight hard at all costs—and to win.

# THE LIONS' GATE BRIDGE—III\*

## SUPERSTRUCTURE: DESIGN AND FABRICATION (Continued)

### MAIN CABLES: DESIGN

The maximum tension in the cables of a suspension-bridge occurs when all the spans are loaded, the temperature being at its lowest. Throughout the cable, for any given loading, the horizontal component of the tension is constant, the tension itself varying with the angle of slope.

In the present case, the heaviest loading of the cables takes place when the three spans are covered with the "congested" loading (C) of 615 lb. per lin. ft. (on each side of the bridge), the temperature being the selected minimum of 0 deg. F. Under those severe conditions, the horizontal component was computed to be 5,778 kips. The steepest part of the cable is where it enters the shoreward side of the tower-saddle, and the corresponding maximum cable-tension is 6,400 kips at that point.

Decision had first to be made regarding the general type of cable to be used, the choice lying between a cable composed of individual parallel wires and one consisting of a limited number of parallel pre-fabricated strands. The former type was introduced in America nearly a century ago by J. A. Roebling, and, displacing the once-common eye-bar cable almost entirely, has served more frequently than any other. Its advantages lie in that comparatively small weights of material are handled in the field, the wires (shipped directly from the manufacturer) being placed individually; and in that there is no socketing involved in the anchorage-assemblies. Parallel-wire cables have been invariably employed in spans of great length, where stranded cables would be out of the question because of the impracticability of manufacturing, pre-stressing, and handling very heavy strands.

Cables of pre-fabricated strands (in which groups of individual wires are spun into units whose length is that of the cable itself) were introduced only some fifteen years ago\*\*, and have steadily gained in favour for bridges of short and medium spans. Although with this kind of cable there is a considerable amount of shop-work additional to that involved in the actual wire-drawing, the extra cost thereof is more than offset by the expedition of the field-assembly and adjustments, and by the simplicity of the erection-equipment compared with that needed for wire-by-wire erection\*\*\*. There is the further advantage that most of the handling takes place under "shop" conditions, where the control and inspection are superior to those obtainable in the field. The process of pre-stressing also provides opportunity for close inspection and positive testing of the finished strands. The size of such strands is, however, limited both in length and sectional area by the factors previously mentioned, and also by the rapidly-increasing cost of unspliced wires of more than the normal ingot-weight of about 380 lb. (representing about 3,500 ft. of No. 6 S.W.G. galvanized steel wire). Yet another limit is imposed by the difficulties associated with anchoring numerous and heavy strand-sockets.

Study of the above considerations, made in the light of the engineers' experience with 2,570-ft. strands at the

Island of Orleans, led to decision in favour of stranded cables. The decision was supported by the knowledge that the wire-length required was not abnormal from the manufacturer's point of view, and also by the successful development of a suitable anchorage.

The Lions' Gate bridge cables are the longest yet to have been constructed of prefabricated strands, and in only one instance (the St. John's bridge at Portland Oregon: central span 1,207 ft.) have stranded cables of greater cross-section been used. The cable in that case was 16¾ in. in diameter, consisting of 91 strands 1½ in. in diameter and about 2,600 ft. in length.

The working-unit adopted for the cables was 90,000 lb. per sq. in. This high stress is justified by the excellent and uniform quality of bridge-wire that is nowadays available; by the equally satisfactory physical properties exhibited by the cable-strands under test and during pre-stressing; by the comprehensive nature of the routine-testing throughout; and by the fact that, in a bridge of this magnitude, the range of stress-variation tending to set up conditions of fatigue is not great, the dead-load stress amounting to more than 80 per cent of the maximum under the worst

Fig. 40—Cross-sections of cable and cable-strand.

conditions. The required cross-sectional area of the cable was thus 71.11 sq. in.

The natural grouping of parallel strands lying compactly in contact is hexagonal, and that optimum shape demands that the number of strands shall be one of the series 1, 7, 19, 37, 61, 91, 127, etc. In order to avoid undue stiffness and weight of strand on the one hand, and too cumbersome an anchorage-assembly on the other, the number in this case was selected as 61, the corresponding strand-diameter being approximately 1-7/16 in. (with a steel-area of about 1.17 sq. in.). The build-up of the cable is shown in Fig. 40. In the final assembly, the hexagonal form is rounded out by the six oil-impregnated cedarwood fillers shown, the whole being tightly bound together by a continuous serving of No. 9 S.W.G. soft steel galvanized wire. The finished diameter of the cable is 13¼ in. The weight per running foot of the cable (estimated at 284 lb.) is 283 lb. The length of the strand was calculated to be 3,391.490 ft. between faces of sockets under dead load and at normal temperature.

### SPECIFICATIONS FOR CABLE-STRANDS

A very complete specification was drawn up covering the manufacture and fabrication of the cables. The clauses pertaining to the cable-strands may be summarized as follows:

The approximate length of each of the 122 strands was stated to be 3,400 ft., this figure including allowance for socketing and for test-samples.

1.1875 sq. in. was specified as the ungalvanized or net area of the strand cross-section.

\*Parts I and II appeared respectively in the April and May issues of the *Journal*.

\*\*One of the earliest bridges carried by a stranded cable was that at Grand'Mère, Que. (1929).

\*\*\*It was also borne in mind that no such equipment was in existence in Canada.

The strand was to be built of galvanized wires, the diameter of none of which was to exceed 0.192 in. in the "green" or ungalvanized state.

All wires were to be of the full length of the strand, no splicing whatever being permitted.

In order to obviate twisting of the strand when under load, it was specified that the outer gallery of wires in each strand should be of opposite lay to that of the inner wires.

Strands in respect to their outer wires were to be of right- or left-hand lay according to their positions in the cable, so as to avoid excessive bearing pressures in the saddles due to point-contact between wires of successive layers of strands.

The strand was to possess an ultimate strength of not less than 230,000 lb., with a modulus of elasticity of at least 25,000,000 lb. per sq. in. (of ungalvanized area) over a range of loading up to 50 per cent of that ultimate strength. Forty 100-in. specimens (cut from as many strands) were required to be tested, half of that number for modulus and yield-point, and half to destruction.

The specifications for the wire followed well-established precedent, the steel being required to be acid open-hearth cold-drawn bridge-wire, manufactured in accordance with the best current practice, and the product of works of established reputation. Apart from the engineers' subsequent acceptance of some 150 tons of stock-material (that had been manufactured, to precisely the same specifica-

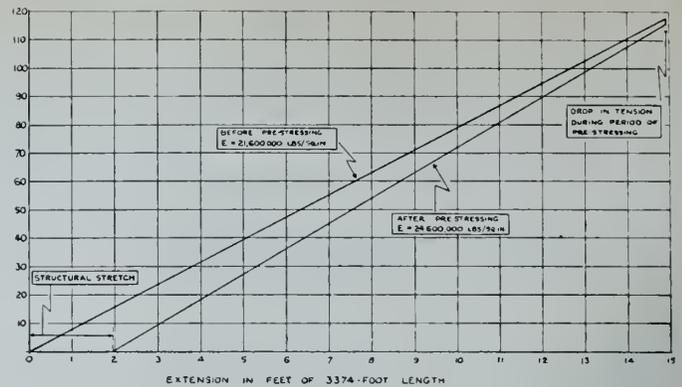

Fig. 42—Typical stress-strain graph of strand pre-stressing.

strength was set at 215,000 lb. per sq. in. of gross area, the permissible average minimum for any one heat, however, being 220,000 lb. per sq. in.

The minimum stress at the yield point (at an elongation of .75 per cent in the gauge-length of 10 in.) was set at 165,000 lb. per sq. in., and the minimum elongation of the same 10-in. test-piece at four per cent (with an area-reduction of not less than 30 per cent).

The wire, before and after galvanizing, was required not to fracture on coiling cold around a mandrel of one and one-half times its own diameter.

Stipulations were made concerning the precise number of tests of each kind to be made, and it was specified that all tests should be made prior to strand-fabrication.

#### CABLE-STRANDS: FABRICATION

Considerable interest in the cable-strands was evinced by wire-rope manufacturers both in Britain and in Canada, and several tenders, from both countries, were eventually received by the contractor. The successful bid was based on the acceptance of the strand shown in Fig. 40. The engineers' approval of this was readily given, since tests of a preliminary sample had already demonstrated its satisfactory properties. The strand is built up of a Seale core of 7/7/1 with two outer galleries of 13 and 19 wires respectively; and it will be noted that 39 of the total of 47 wires are of .196-in. diameter, this being the maximum permitted by the specification. This preponderance of No. 6 gauge wire is due to the fact that the low bid was that of John A. Roebling's Sons Company (of U.S.A.), which firm has had long experience in the development of, and is particularly well-equipped to pro-

duce, a specialized bridge-wire of this particular size. It is of interest to note, however, that the several other designs put forward were all based on a larger number of rather smaller wires, and that such designs would have been at least equally acceptable to the engineers.

The fabrication of the strands (by Anglo-Canadian Wire Rope Company, at Rockfield, Que.) did not present any great problem. They are, of course, of larger and stiffer wire than is met with in ordinary practice; and they required the use of a very sturdy machine for the final closure, working under an estimated tension of about 20 to 25 tons. The strands were spun in two operations, the first of which consisted in laying up the core of 15 wires together with the intermediate gallery of 13 wires, all in the same direction. In the second operation, this assembly of 28 wires became the core onto which, but in opposite

Fig. 41—Closure of cable-strand.

tion, for the Golden Gate bridge, San Francisco) all wire was required to be made especially for this job, and to be properly tagged and identified as such throughout all stages of manufacture. The general substance of other requirements, which applied equally to the stock-material, is given below.

A gauge-tolerance for the ungalvanized wire was established at .003 in. plus or minus, and the increase in diameter due to galvanizing was limited to .005 in. The galvanizing was required to pass a standard Preece test.

The maximum permissible percentage of certain elements in the steel were specified as follows: carbon .08, phosphorus .04, sulphur .04.

A test-piece was to be cut from each end of every coil of wire, and the minimum acceptable ultimate

direction, were laid the 19 outer wires (Fig. 41). A tribute to the quality of the wire and to the skill of the fabricators is implied in the fact that on only two or three occasions did a wire break during the strand-fabrication; such wires were replaced. Great care was taken to preserve the galvanizing. Linseed oil was at first used as a lubricant for that purpose, but it was later found that careful shaping of the dies in the machines would almost completely obviate abrasion.

The nominal gross area of the strand, which was used as a basis for all computations, is 1.2363 sq. in., the ungalvanized or net area being 1.1905 sq. in. From the latter figure, it will be noted that the actual cable-stress under the worst loading-condition is 88,000 lb. per sq. in. The average strand-diameter, obtained from a great number of measurements, is 1.443 in., which is very close to the engineers' assumption of  $1\frac{1}{16}$  in.

#### CABLE-STRANDS: SOCKETING

The strands were made to a length in excess of that finally required, and were socketed at both ends in readiness for pre-stressing. One end of each was fitted with its permanent socket and the other with a temporary one, the latter being removed after the strand had been pre-stressed and later replaced as a permanent fitting. As a matter of convenience, this replacement, together with the final cutting, was done at the pre-stressing plant. The strands were cut neatly and expeditiously by a high-speed cutting-disc.

The specifications relating to the attachment of sockets required primarily that the full strength of the strand should be developed without injury to the socket, and provision was made for the testing of socketed specimens. The socketing-material was to be commercially-pure (99.75 per cent) zinc. Emphasis was placed upon the desirability of a straight lead into the socket, and of the preservation of the lay of the strand right up to its entrance.

The strand-socket (Fig. 46) consists of a steel cylinder (S.A.E. 1030, forging quality) 7 in. in diameter and 16 in. long, part of which is cored out and threaded internally for attachment to the anchor-bolt, the other part being bored to form the conical cavity or basket in which the broomed end of the strand is held. That cavity is 9 in. long, tapering from  $3\frac{3}{4}$  to  $1\frac{9}{16}$  in. in diameter. Three  $\frac{1}{4}$ -in. annular grooves are cut in the inside surface to assist the bond between that surface and the zinc mould. In the case of the temporary sockets, however, the grooves were not machined until the sockets had been removed prior to use as permanent fixtures.

The details of the socketing-process formed the subject of considerable study and experimentation by both the contractors and the engineers, and the following were features of the procedure adopted. The outer wires, after the ends had been seized and evenly broomed, were slightly bent so as to contact the basket at their extremities only, thus ensuring the flow of zinc completely around them. The broomed end was then agitated for about 10 minutes in a clean solution of caustic soda, after which it was washed in boiling water. To facilitate drying, it was dipped into methylated spirits. It will be noted

that no acid was used in the cleaning-process and that none of the ends of the wires were turned back upon themselves.

In order to permit of leading the strand squarely into the socket, the pouring of the zinc took place on a platform elevated some 10 ft. above floor-level. The socket was clamped vertically in an apparatus which at the same time held the end of the strand in its correct position. The socket (the inside of which had been tinned) was pre-heated by blow-torches to about 200 deg. F, and the zinc was introduced in one single pour at a temperature of 850-875 deg. F.: during the pour, the socket was vibrated with wooden mallets to prevent the inclusion of gas-bubbles. After pouring, the assembly was left undisturbed for at least 20 minutes. The metal remaining in the ladle after the pour was cast into a small ingot: this was immediately broken and inspection of the fractured metal made.

Owing to the fact that the ends of the sockets were not invariably true and square (and also on account of the inherent curve in the strand consequent on the tension under which it was reeled), it was found impossible to guarantee that the strand would, after socketing, lead perfectly normally into the socket. To investigate the effect of discrepancies of this nature, test-lengths of strand were equipped with sockets placed deliberately out of alignment by amounts of  $\frac{3}{16}$ ,  $\frac{1}{4}$ , and  $\frac{1}{2}$  in 12. These specimens all broke well away from the socket, at loads of 279, 277, and 280 kips respectively. A tolerance of  $\frac{1}{8}$  in 12 was therefore permitted in the alignment, and the contractors found it possible to keep within this limit.

The whole operation of socketing was subjected to constant inspection by the engineers, and the paramount importance of absolute cleanliness of all parts coming into

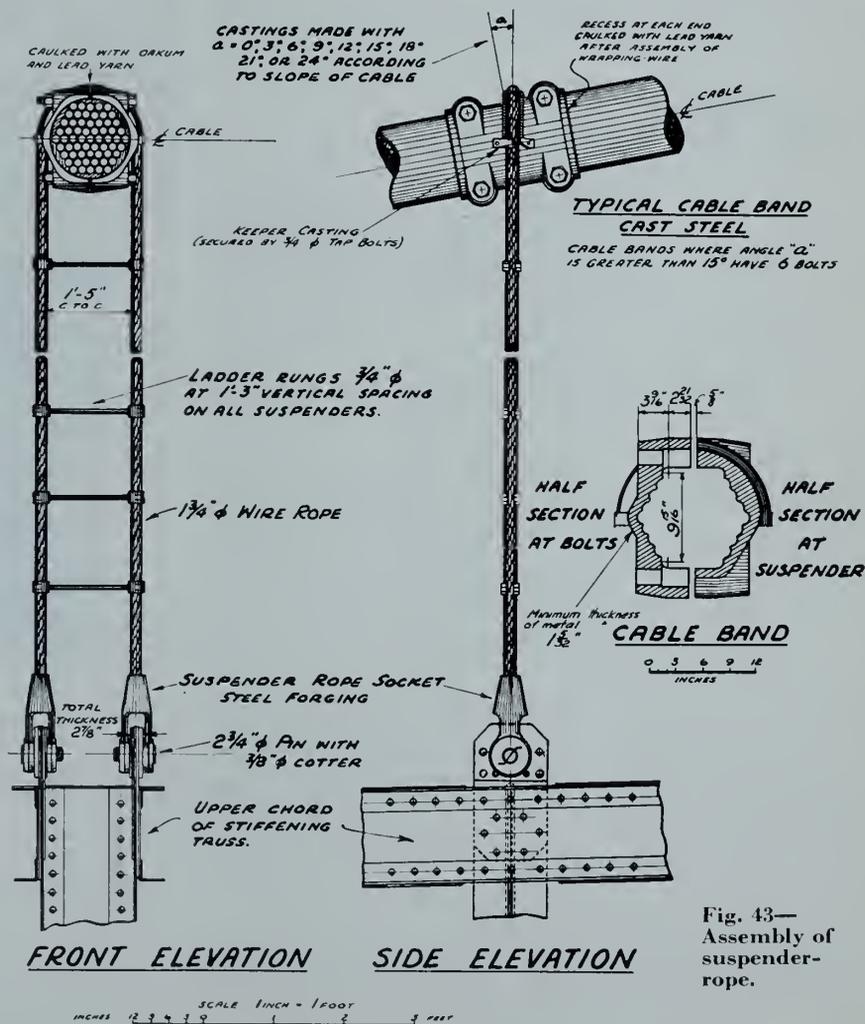

Fig. 43— Assembly of suspender-ropes.

contact with the zinc was continually impressed upon the workmen.

#### CABLE-STRANDS: PRE-STRESSING

In the cable of a suspension bridge it is of evident importance that the tensile stress should be as nearly uniform as possible over the whole cross-section, since any departure from such uniformity means that certain of the component wires or strands are receiving more than their share of the load. In the case of a parallel-wire cable, even stress-distribution is assured by the uniformity of the wire-material, which is attained by careful manufacture and stringent inspection; and by the method of erection, whereby the individual wires are all assembled to a common sag. With a stranded cable, however, as in the present case, two further considerations are involved. It is desirable, in the first place, that the component wires of any one strand shall share the strand-load equally; and, secondly, that the strands themselves shall possess uniform elastic properties in order to participate equally in the cable-tension. The first of these requirements depends upon the design and fabrication of the strand, and the degree of its achievement may be demonstrated by tests to destruction. In an ideal strand all the component wires would fail simultaneously, but, owing to the slight additional stress in some of those wires due to their helical shape, the "efficiency" of the strand—which may be defined as the ratio of its ultimate tensile-strength to the aggregate of the ultimate strengths of the actual wires used in its composition—can never attain to the ideal value of unity. It is satisfactory to record that the efficiencies computed for six random specimens of the Lions' Gate bridge strands were respectively 96.8, 96.5, 96.9, 96.9, 96.9, and 97.1 per cent.

The second requirement is obtained by pre-stressing the strands before their assembly into the bridge-cable. Al-

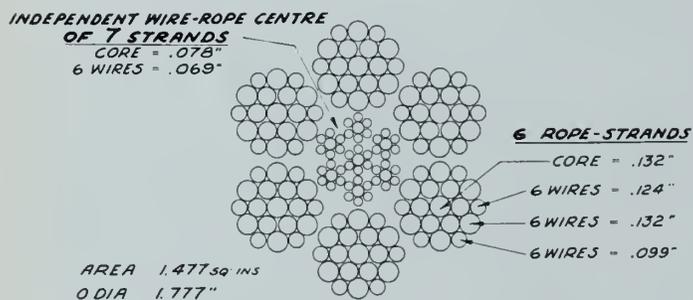

Fig. 44—Cross-section of suspender-rope.

though during fabrication the wires are laid into the strand under considerable tension, further consolidation of the assembly is needed in order to obviate the gradual lengthening, of uncertain amount, that ordinarily occurs when a wire rope is first put into service. The process of pre-stressing consists essentially in the subjection of each strand to considerable tension, the strand being laid out at full length for the purpose. That tension is maintained until such time as stretching has ceased or has become negligible, the effect upon the strand being to increase its modulus of elasticity from a comparatively low figure which varies somewhat for different strands, to a higher and much more uniform value. While the strand is thus unreeled it is the practice to reduce the tension to a figure approximating to the normal dead-load tension, when it is accurately measured and marked for cutting and socketing.

The pre-stressing process provides, incidentally, an opportunity for inspection of the strand; and it also positively demonstrates its capacity to support loads greater than those it will be called upon to carry in service.

The specification regarding pre-stressing and measurement of the strands reads as follows:

"Each  $1\frac{1}{16}$  in. diameter strand shall be finished to a length in excess of the final length of the strand in place and then pre-stressed to a tension of at least one-half of the specified ultimate strength of the strand (i.e. to 115,000 lb.), and held at this tension until stretching has ceased, but in no case for less than 30 minutes. The tension shall then be decreased to about 80,000 lb., at which load the strand shall be measured and the necessary reference points established for use during erection. The marking tension shall be maintained while a suitable mark is painted along the strand as a tell-tale in case of any subsequent twisting.

"Tests for modulus of elasticity shall be made on long lengths of all strands during the pre-stressing process."

"Every effort shall be made to secure measured lengths between sockets precisely equal to the lengths finally specified and approved. Particular precautions shall be taken to avoid any error due to change of length of the strand on account of reeling, subsequent to marking."

"The accuracy of the marking process shall be such as to produce a measured length within one inch of the required length."

The pre-stressing was done at Dominion Bridge Company's plant at Longueuil, Quebec. This pre-stressing plant is the only one in Canada, and, as far as the author is aware, the only one in existence that is not operated by a wire-rope manufacturer. In the former employment of the plant, which was built for the Island of Orleans strands, each 2,470-ft. strand had been laid out at full length in a straight line, with one end fastened to a heavy concrete anchorage and the other attached to the straining-machinery: each strand was in turn unrolled, pre-stressed, and reeled in again.\* Sufficient space was not, however, available for treating strands 3,400 ft. long in this manner, and permission was granted by the engineers to lay each strand out in two parallel parts, the bight passing around a horizontal sheave. Essentially, then, the plant consisted of two massive concrete foundations,

Fig. 45—Assembly of cable-band.

spaced at about 1,750 ft. apart, on one of which was mounted the roller-bearing sheave, and on the other the two hydraulic rams employed for the adjustable anchoring of one end of the strand and for the application of loading to the other. The sheave, by means of interchangeable tread-sections, could be arranged to suit a rope or strand of any given diameter. The diameter of the sheave was 14 ft., so that the strand (which coiled without difficulty

\*A description, by Mr. D. B. Armstrong, M.E.I.C., of the pre-stressing of cable-strands for the Island of Orleans bridge, may be found in *The Engineering Journal* for July, 1938.

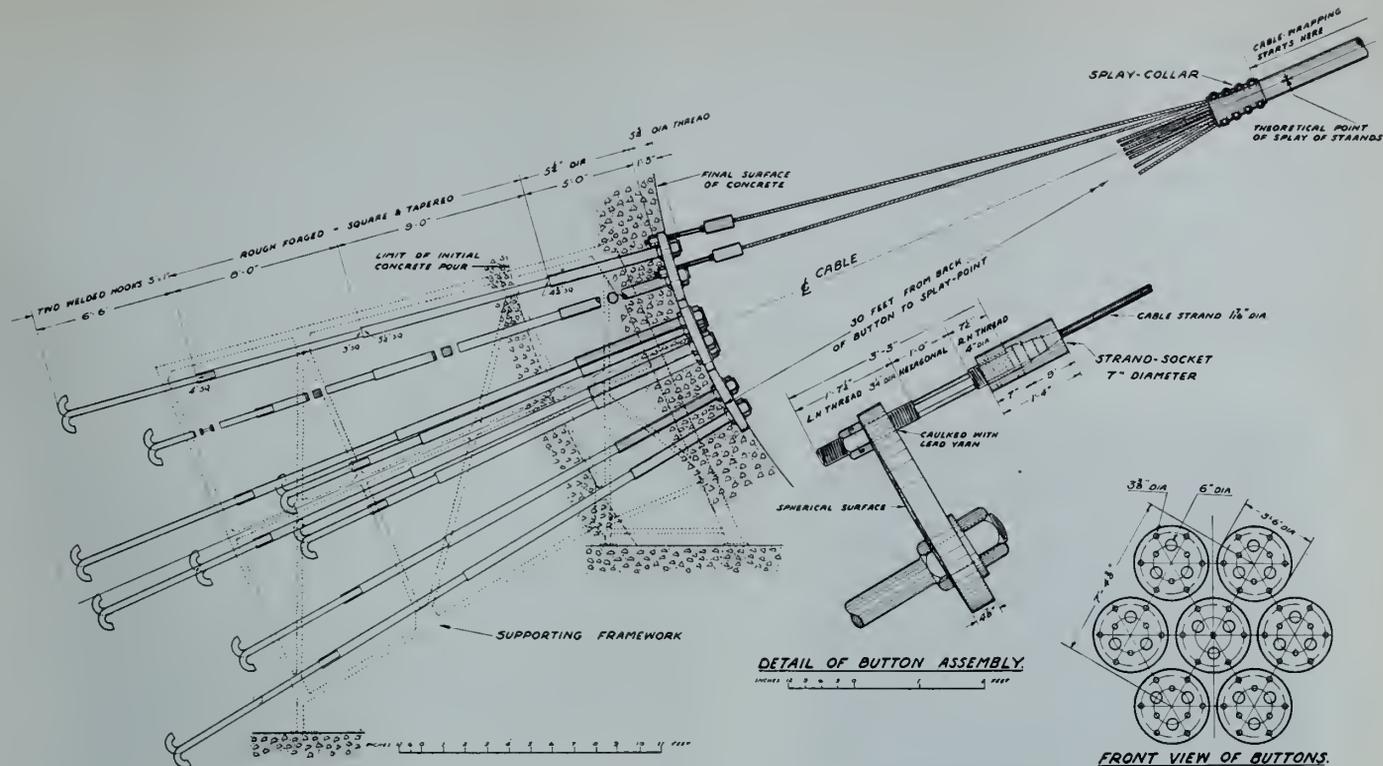

Fig. 46—Anchorage of cable.

over the 3½-ft diameter of the reel) was not subjected to any undue bending. The two parallel parts of the strand were thus 14 ft. apart, and the hydraulic rams were similarly spaced. The long lengths between the two anchorages were carried on stout timber benches (known as "troughs," guard-timbers being secured along the sides to prevent the strand from rolling off) 18 in. wide and about 2 ft. above wooden walkways which ran alongside. The sheave and the rams were at such levels that the whole of the strand lay in a horizontal plane. The troughs were illuminated at night, and a field-telephone was installed between the ends of the plant to facilitate control of the reeling-operations, and for transmittal of temperature-readings.

The two rams, each of about 80-ton capacity, were operated by electrically driven oil-pumps, the working-pressure being about 1,600 lb. per sq. in. The ram for application of the load had an effective stroke of 12 ft.; and, by means of a series of adjustable links and a locking-device, advantage was taken of a second stroke of the ram, so that a total stretch of as much as 22 ft. could be applied to the strand. A further set of links was arranged for dealing with variations in the delivered lengths, which ranged from 3,396 to 3,435 ft.

The smaller ram (installed in the first place as a safeguard against excessive differences between the tensions of the two parts of the strand owing to its passing around the sheave), with a stroke of only 28 in., was used chiefly in making adjustment to the position of the other end of the strand, its value lying in the fact that such movements could be made under load. This ram, like the straining-ram, could be locked at any point of its travel, so that any given stretching of the strand could be maintained indefinitely.

Accurate measurement of the tension applied by the rams was made by means of two extensometer-gauges designed for that purpose. Each of these consisted essentially of a heat-treated nickel-alloy steel bar, about 5 ft. long and with a circular cross-sectional area of 2 sq. in. The rod was upset and threaded at both ends; and the ends were screwed into heavy links for connection, respectively,

to the strand-socket and to the adjustable links of the ram in question. The tension in the bar was measured by observation of the extension of a 30-in. gauge-length, by means of micrometer-dials reading to the ten-thousandth part of an inch. The gauges were calibrated in a laboratory testing-machine.

Stout wooden reels, 78 in. in diameter and 51 in. wide, having a core-diameter of 42 in., were used for shipping the strands by rail to the pre-stressing plant, and also, at a later date, for transportation to Vancouver. Each strand was reeled with the permanent socket on the outside, so that when the reel (fitted with a removable steel axle) was lifted onto bearings mounted near the straining-ram, that socket could be coupled to the temporary socket of a strand already in the trough. The permanent socket of the latter strand was then secured to the inside of its own reel, which was for the purpose mounted on another set of bearings established near the dead-end ram. That (empty) reel was then set in motion by electrically-driven machinery operating by a chain-drive to the shaft; and as the pre-stressed strand was rolled up, the new strand was simultaneously hauled into place in the trough. The speed attained during this reeling-operation amounted at times to 200 ft. per minute. The two coupled sockets were set in a steel sled for passage along the trough. The weight of a strand together with its reel was just short of 8 tons (the weight of the reel alone being 950 lb.), and it was handled at the plant by a derrick-car.

The strand having been laid out in the trough in the manner described, and its ends duly connected to the appropriate extensometer-gauges and loading-rams, an initial tension of about 5 tons was applied in order to ensure its straightness. At this load a temporary reference mark was painted on the strand at a convenient point 3,374 ft. from the "dead-end" socket. The tension was then increased to the specified pre-stressing load (approximately 118,000 lb.), the corresponding lengthening of the strand (some 13½ ft) being meanwhile indicated by the movement of the painted reference-mark. The straining-links were then locked, and the strand remained in the strained condition for half-an-hour. During that time the load

was found to drop by about 1,500 lb., that decrease being due to a further bedding-down of the wires, and taking place principally during the first 20 minutes. At the end of the half-hour the ram was again actuated and tension was removed in decrements of 20,000 lb., observations of stress and strain being recorded for each stage. When the tension had decreased to the original amount of 5 tons it was found that the reference mark had moved back only about 11½ ft., indicating that a permanent set of some 2 ft. had taken place. At the same time there was an increase in the elastic modulus of the strand from an average value of 21.6 million lb. per sq. in. (varying from 20.7 to 22.2 among the 122 strands) to an average of 24.6 million lb. per sq. in. (varying only between 24.3 and 24.9),

Fig. 47—Anchorage: Button-assembly.

these moduli being based on the gross area of the strand. Based on the ungalvanized area, the final modulus was 25.5 million lb. per sq. in., a figure in accordance with the specified requirement. A typical stress-strain graph for the pre-stressing of a strand is shown in Fig. 42. In no case was there a failure of any wire during the heavy loading associated with pre-stressing, and the strands exhibited little or no tendency to twist when loaded.

The strand was next subjected to a tension of 79,000 lb., that being the computed average dead-load tension; and this load was maintained while the strand was marked for cutting and while painted reference-marks were established for use in the field.

For experimental purposes, one of the strands was pre-stressed under a tension of 140,000 lb. (one-half of the actual ultimate strength), and the results were not found to differ from those obtained under the usual 120,000-lb. tension.

The pre-stressing of the cable-strands started on October 15th and was completed on December 30th, 1937. The number of strands treated in any one night varied, mainly in accordance with temperature and weather-conditions, from one to as many as five, though four was the usual number.

#### PRECISION OF MEASUREMENTS DURING PRE-STRESSING

The specification permitted a tolerance of only plus or minus one inch in the strand-length of 3,391,490 ft. A high degree of accuracy was therefore essential in all operations to do with measurement of the strands. Such accuracy depended on four factors: the precision of the actual measuring, of prime importance; the close estimation of the temperature at the time of marking, since a variation of one deg. F. represented a change in length of approximately ¼ in.; the precision of the marking-tension, an error of 1,000 lb. in which would correspond to a length-error of about 1 in.; and, finally, the elimination of subsequent errors in reeling-up and socketing and unreeling again at the bridge-site. These four considerations, in view of the paramount importance of the cable-length,

whereon depends the field-geometry of the bridge, will be discussed in detail.

Since all of the 122 strands were required to be of identical length, the procedure consisted in the establishment of a single set of marking-points along the pre-stressing trough, to which each strand in turn was referred while under the proper tension. Steel plates mounted on independent concrete bases were set up at intervals along the trough, and on these plates marks were scribed corresponding with the positions of the sockets and of the centre-lines of the several saddles. The distances between the marks were chained with the utmost care, at night-time during periods of steady temperature: a government-calibrated 500-ft. tape was used (under appropriate tension), and the measuring was repeated until an overall accuracy probably within ⅛ in. was assured. Where the measurement passed around the sheave, allowance was made for the small elastic movement of the latter towards the rams when marking-tension was applied. Careful observations, repeated at intervals during pre-stressing, proved the immovability of the foundation-masses at the ends of the plant.

All pre-stressing and marking was done at night, commencing some time after sunset to ensure that uniform temperature obtained throughout the strand. The thermometers were laid against the strand, approximately at the quarter-points, and the mean of their readings was taken as the temperature of the strand. Measurements were not made except when the temperature was reasonably uniform and steady.

Frictional resistance along the trough was minimized by the provision of ball-bearing rollers placed at such intervals that the strand when under tension rested on them alone. The amount of this friction was represented by the difference between the gauge-readings at the ends of the strand, and it commonly ranged from 1,000 to 2,000 lb. The friction was assumed to be uniform along the strand, the resistance of the 14-ft. sheave being negligible. Each strand was marked twice, the second application of tension being so arranged that the direction of the friction-drag was reversed; and further measurement was made in the rare cases when the two sets of marks did not agree within half-an-inch. A reference-line, to show up any subsequent twisting, was painted on the strand while under the marking-load.

It was anticipated (from experience with the Island of Orleans strands) that reeling, together with subsequent unreeling at the site, would cause some alteration in strand-length. In order to make due allowance for this variation, a number of the strands were unreeled and re-measured. They were found to have shortened by amounts ranging from .031 to .168 ft., and the average shortening of ten such strands (amounting to approximately one inch) was used as a correction to be applied to the marking of every strand.

#### TESTING OF WIRE AND STRANDS

The wire was delivered in coils of 4-ft diameter from the manufacturer in Trenton, N.J., the coils having an average weight of about 380 lb. In compliance with the specification, some 11,500 separate tensile tests were made, prior to shipment. The ultimate wire-strength (based on the measured gross area of the test-piece) was found to vary from 215,000 to 260,000 lb. per sq. in. The great majority of the results, however, fell between 230,000 and 245,000 lb. per sq. in., so that there was ample margin above the requirement. The stipulated yield-point stress was also invariably surpassed, in approximately the same proportion. The elongation at failure averaged at about six per cent, the area-reduction being some 33 per cent. There was no difficulty in meeting the requirements of the bend-tests, and the cover afforded by the galvanizing was found to be slightly in excess of the specification. The

number of rejections from any cause was negligible. The average chemical composition of the wire was indicated by the following percentages of elements: carbon .80, manganese .65, silicon .22, phosphorus .023, and sulphur .029. There was no specification relating to the modulus of elasticity of the wire, but tests made by the manufacturer showed that it was close to 28 million lb. per sq. in. of gross area.

The tests of specimens cut from the finished strands revealed uniformly high quality. The average ultimate strength of the 40 specimens was 281,160 lb., the minimum being 274,700 lb. The modulus of elasticity averaged at 25.2 million lb. per sq. in. of gross area; as compared, incidentally, with the somewhat lower figure of 24.6 obtained for the 3,374-ft. gauge-length used during pre-stressing.

#### SUSPENDER-ROPES

The governing suspender-load was arrived at by consideration of two adjacent 32-ft. panels of the bridge-deck, assumption being made that the trusses were discontinuous at the ends of each panel and therefore capable only of bridging the space between one suspender and the next. Three 20-ton trucks were then placed, abreast, to deliver the worst possible reaction at the middle pair of the six suspenders involved in this hypothetical case; and both sidewalks at the same time were loaded with 100 lb. of live load per sq. ft. The resulting suspender-load was made up as follows:

Dead load .....	64.0 kips
Load, including 30 per cent impact, from trucks	75.1 kips
Live load on sidewalk .....	12.9 kips
Total .....	152.0 kips

The type of suspender selected consists of a wire rope the ends of which are attached to lugs on the trusses while the bight passes over a casting on the main cable (Fig. 43.) The load is thus shared by two parts of rope. The sockets are of standard open type, each having a pair of lugs which straddle that of the truss and which like the latter are bored to receive a 2 $\frac{3}{4}$ -in. pin which in turn is secured by a  $\frac{3}{8}$ -in. bent cotter. The length of the socket-basket is 6 $\frac{1}{2}$  in., and its internal diameter increases from 1 $\frac{5}{16}$  to 3 $\frac{1}{4}$  in.

A feature of the suspender-assembly is the provision of ladder-rungs, fixed at 15-in. vertical intervals between the two parts of the rope. These rungs are steel forgings,  $\frac{3}{4}$  in. in diameter, with the ends upset to form jaws which are hammered on to the ropes. The rungs serve the double purpose of providing inspection-access to each rope and cable-band and of causing the suspenders themselves to assume a heavier appearance more in keeping with the importance of their function. The provision of these ladders rendered unnecessary the usual expedient of a walkway (with somewhat unsightly hand-lines) along the top of each cable. Some 8,800 rungs in all were used, having a total weight of approximately 12 tons.

The critical stress in the suspender-rope depends on the radius of its curve of contact with the cable-band casting, and occurs at the tangent-point where that curve commences.\* Although there are in existence many formulae which aim at establishing the reduction in strength of a stationary wire rope when subject to bending as well as to tension, the results of such loading nevertheless remain somewhat conjectural, and it was deemed advisable to specify that samples of a suspender-rope should be tested to destruction over a sheave of the same diameter as the actual cable-band. The required ultimate tension in such a test was set at 230,000 lb. for either part of the rope, the suspender thus having a factor of safety of three.

\*It was noted, however, that in the tests of suspender-rope specimens, the fracture invariably did not occur at this point (page 354).

In estimating the size of the rope, the engineers' experience suggested a permissible working unit of 55,000 lb. per sq. in. in direct tension, this unit being low, to allow for the weakness caused by bending. On this assumption, the required metallic area of the rope was 1.38 sq. in., and the diameter about 1 $\frac{3}{4}$  in.

The following is a summary of the specifications relating to the suspender-ropes:

The rope was to be manufactured of galvanized wire, made to the same specification as the cable-wire (see page 348).

With a nominal diameter of 1 $\frac{3}{4}$  in., the rope was to consist of six strands (of 19 wires each) arranged around either an independent-wire-rope centre or around a core-strand of approved construction;

The splicing of individual wires by brazing was permitted, with the proviso that such splices should be as far apart in the rope as practicable.

Pre-stressing was specified, a tension of 115,000 lb. to be maintained for a minimum period of two hours.

The ropes were to be measured and marked at their dead-load tension of about 32,000 lb., and the length of any rope was required to be within  $\frac{1}{4}$ -in. of the specified length.

Seven test-pieces (one from each pre-stressing length) were to be tested to destruction over a 15 $\frac{1}{4}$ -in. sheave, and two 100-in. specimens were to be broken in direct tension for general information.

The rope was to be manufactured in as long lengths as possible, such lengths to be multiples of a length suitable for pre-stressing.

The sockets were required to develop the full strength of the rope.

The cross-section of the suspender-rope is seen in Fig. 44. The rope is built up of seven 19-wire strands of War-

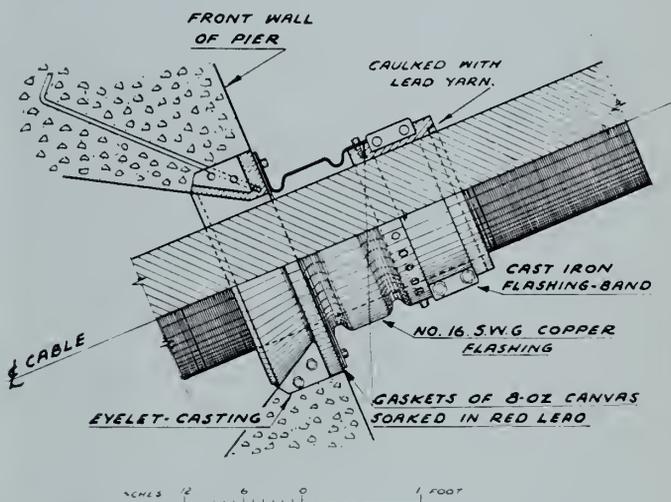

Fig. 48—Flashing at entrance of cable into anchor-pier.

ington type laid around an independent wire-rope centre of seven strands of seven wires each. Five sizes of wire are involved, the total number of wires being 163. In accordance with common practice, both the outer strands and those of the core are on left-hand lay, the core and the rope itself being of right-hand lay. The nominal gross area of the rope was 1.477 sq. in., but, owing to slight overrun of the wire-sizes, the measured gross area was 1.492 sq. in. The average diameter was 1.77 in.

The total length of suspender-rope was about 22,800 ft., and it was fabricated in three lengths of about 6450 ft. and one of 3500 ft. It was shipped to Longueuil on seven reels, each of the longer pieces being cut in half. Temporary sockets were attached prior to shipment.

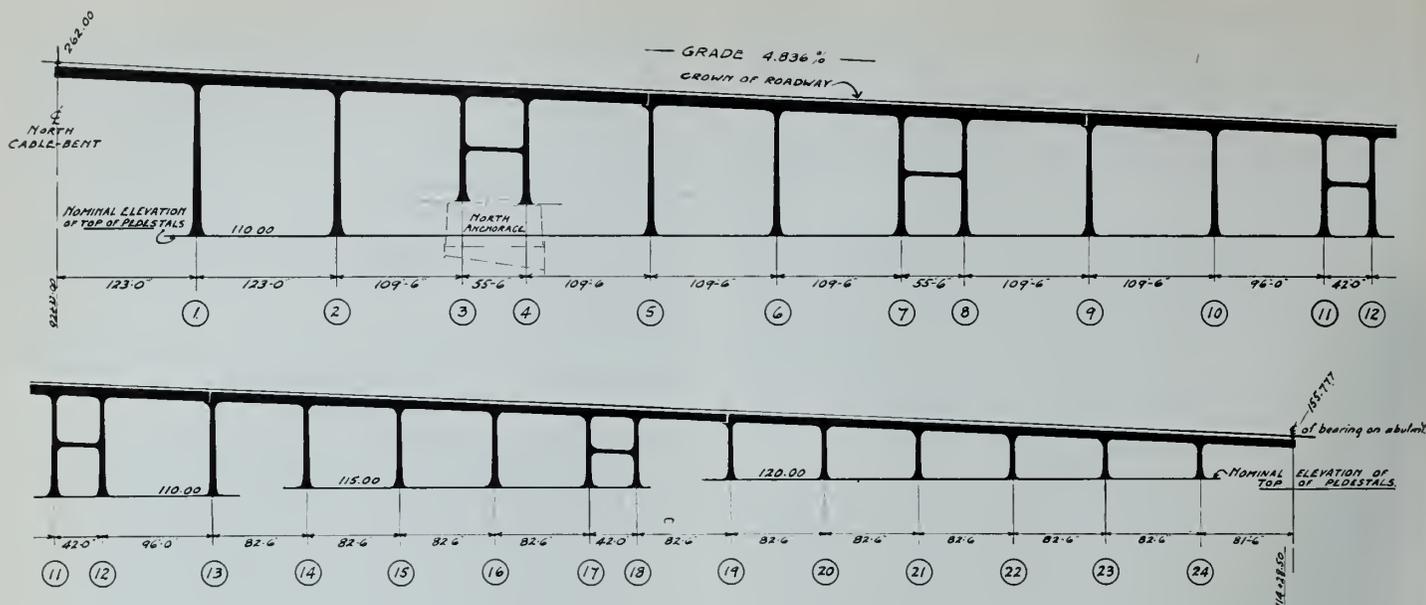

Fig. 49—General elevation of north viaduct.

The pre-stressing procedure was substantially the same as for the strands, the main difference being the length of the pre-stressing period. The specified minimum for this was two hours, while the time that actually elapsed varied from three hours to as long, in one case, as 16 hours. The modulus of elasticity, initially an uncertain quantity of about 16 million lb. per sq. in., was remarkably uniform after pre-stressing, being 19.7 million lb. per sq. in. in six of the seven cases, and 19.4 in the other.

As in the case of the strands, the measuring (which was a tedious operation, there being 166 suspenders in the bridge, involving 43 lengths of rope ranging from 10.248 to 333.682 ft.) was done beforehand, marks being established on the trough. The actual cutting-points were unmistakably identified by file-nicks made in the outer wires.

Unlike the strands, the rope exhibited a strong tendency to twist under tension, causing the straining-links to bind so that the tension could not be accurately measured for loads in excess of 55,000 lb. The precision of measurements in the important neighbourhood of the marking-tension (30,000 lb.) was not affected, however, and suitable approximation could be safely made for the 115,000-lb. pre-stressing load. The greater weight of the suspender-rope (5.13 lb. per ft. as against 4.29 for the strand) together with its lower marking-tension and greater flexibility made it impracticable to keep it clear of the trough at all points, and there was therefore a greater progressive variation of load along the length than had obtained during strand-marking. The resulting error in length, amounting to about  $\frac{1}{4}$  in. between the mid-point and either end of the rope, however, was lost when dissipated among the short lengths of the individual ropes. At the time of marking, each cutting-point between adjacent lengths was established (with an allowance for growth during brooming\*), and reference-marks for location of the sockets were made. The precise centre of each suspender-length was also indicated for use during erection, and, before the marking-load was released, a line of paint-marks was made along the rope so that the suspenders could be placed in the bridge with the same degree of twist as that under which they were measured.

The results of the routine-tests of the suspender-rope and of the wire used in its fabrication were as completely satisfactory as those for the cable-strands. The properties of the wire were similar to those of the cable-wire, the ultimate strength of the majority of the wires lying between 230,000 and 240,000 lb. per sq. in. The wire was

\*Note: the actual booming-growth proved to be about  $\frac{3}{8}$  inch.

delivered in coils weighing about 250 lb., and the number of tensile tests involved was about 1100.

Seven rope-specimens were tested to destruction over a sheave of  $15\frac{3}{16}$  in. tread-diameter, in the Toronto laboratory of the Department of Mines. In every case fracture involved at least three strands and the whole of the wire-rope core, and took place near the top of the sheave. The average ultimate strength of the 2-part rope was 508,230 lb. (maximum 517,200 lb.; minimum 497,200 lb.), a figure well in excess of the requirement of 460,000 lb. Five tests (three of which were not specified but were incidental to socket-testing) were made in direct tension, and showed an average ultimate strength of 293,600 lb. (varying from 288,200 to 299,400 lb.). The reduction in strength due to bending was thus about 14 per cent. The modulus of elasticity obtained from tensile tests of 100-in. specimens was 20 million lb. per sq. in.

#### CABLE-BANDS

The suspender-connection to the cable is shown in Fig. 43. The cable-band from which the rope hangs consists of a pair of symmetrical steel castings, one placed against either side of the cable, and the two bolted together onto the cable (the surface of which was thoroughly cleaned, but not painted) sufficiently tightly to overcome their tendency to slide under the influence of the suspender-pull. The inner surface of each casting is shaped to fit the profile of the outer strands of the cable, the flutings being left rough-cast in order to develop as much friction as possible. The inside dimensions of the castings were permitted to vary by only  $\pm \frac{1}{32}$  in. from the specified figure, and after some experimentation, this tolerance was closely adhered to. The hexagonal exterior of the castings is modified by the presence of machined bosses for the holding-bolts, and by the provision of a saddle-groove to receive the suspender. The angle this groove makes with the casting varies in accordance with the cable-slope, and was cast to the nearest multiple of three degrees, the consequent slight deviations from verticality in some cases being negligible in their effect upon the ropes. At each end of the groove (where the rope becomes tangential to the semi-circular curve of the saddle) a small keeper-casting, secured by two tap-bolts, is provided to hold the suspender in place after erection. The ends of the bands are counter-bored to a depth of  $\frac{1}{2}$  in. to furnish a housing for the wrapping.

The castings are bolted together with  $1\frac{1}{8}$ -in. bolts of high-tensile steel (S.A.E. 31.35), tightened to a specified

tension of 36,000 lb. each. The bands on the flatter parts of the cables are fastened with four bolts each, but six bolts are required where the cable is steeper and the tendency to slip is consequently greater. The number of bolts was computed on the conservative assumption that there would be available a frictional resistance amounting to 30 per cent of the aggregate of the bolt-tensions. The six lowest bands, at the ends and the centre of the suspension-structure, are, further, designed to transfer traction-forces from the roadway to the cables, being cast with lugs on their undersides for connection to the traction-rods described elsewhere (Fig. 27) and are also secured each by six bolts. There are 166 cable-bands. Of this total, 64 are of the 4-bolt type, each weighing 485 lb., including bolts; while the remainder, of the 6-bolt type, weigh 615 lb. each.

Experiments were made to find a practical method of applying the specified tension to the bolts. A specimen-length of cable was prepared from 61 short pieces of strand, and onto this was assembled a cable-band. (Fig. 45). The bolts were tightened by men of different weights pressing downwards on the end of a wrench of known length, and the tension of selected bolts was measured by noting their overall extension, indicated by a sensitive extensometer. A reasonable approximation to the prescribed tension was obtained when two 150-lb. men pressed downwards without jerking on the end of a 6-ft. wrench. That procedure was consequently adopted in the field, neither bolt nor nut-face receiving any special lubrication.

The same experiment also demonstrated that, owing to slight overrun (within the tolerance) of the internal dimensions of some of the castings, together with the elastic distortion produced by tightening, the two halves of the band approached to within less than  $\frac{1}{4}$  in. when squeezed onto the cable. To prevent the two halves of any band coming into actual contact during field-assembly, it was deemed wise to plane  $\frac{1}{16}$  in. off each casting already manufactured and to make appropriate change to the moulds for those yet to be made.

#### CABLE ANCHORAGES

The decision to use stranded cables was subject to solution of the problem of anchoring 61 separate strands within a reasonable space. The type of anchorage adopted is quite novel in several respects and was, in common with several other features of the bridge, the outcome of close collaboration between the engineers and the contractors.

The main feature of the anchorage (Fig. 46) is a group of seven circular steel slabs ("buttons"), symmetrically arranged normally to the direction of the cable, whereby the load from the cable is concentrated into seven parts, each of which is then delivered into the concrete anchorage-mass by three heavy anchor-bars.

The buttons, burned from 6-in. slabs of medium steel, are 3 ft. 6 in. in diameter, that size being determined by the clearances required between strand-sockets for field-assembly. The front face of each is plane, but the rear, or shoreward, face is machined to a spherical radius of 30 ft., the central thickness being  $5\frac{1}{2}$  in., and that at the edge  $4\frac{7}{8}$  in. Each button is perforated by three 6-in. holes for the admission of the main anchors; and attachment of the strand-sockets is effected by bolts passing through a further set of nine (or, in the case of the central button, seven)  $3\frac{3}{8}$  in. holes. The buttons are so arranged on the main anchors that their rear faces all lie on the surface of a sphere, the centre of which is 30 ft. away and on the centre-line of the cable. That same point is made the theoretical origin of the splaying-out of the strands from their compact hexagonal formation in the cable proper, with the result that the splayed strands are radial to the spherical surface.

The 21 primary anchors, embedded into the pier, during

its construction, are medium-steel forgings ranging in length from 21 to 31 ft. They are, except for a fish-tail welded to the lower end, and for a length of about 5 ft. which was not embedded until after assembly of the cable, square in cross-section and were forged into a series of tapered lengths in order to secure positive bond by wedge-action. The lower ends of the anchors are spread to engage an adequate mass of concrete, and the upper ends, which are upset and finished to screw-threads  $5\frac{3}{4}$  in. in diameter, converge to the larger holes in the buttons. A heavy bevelled washer is introduced between the plane face of the button and the tilted bearing-surface of each nut in order to allow for the inclination of the anchor.

The anchorage as so far described was assembled on a structural framework sufficiently robust to maintain alignment during its incorporation into the pier. The framework was furnished with adjustable anchor-bolts for precise location. The appearance of the anchorage, thus built into the pier and ready for connection to the cable, is shown in Fig. 47.

Connection of the strands to the buttons is effected by bolts 3 ft. 3 in. long. Each bolt is screwed into the strand-socket (Fig. 46), and its other end is secured by a nut which bears on the spherical rear surface of the button. The threads on the ends of the bolt being of opposite hand, and the bolt shaft being of hexagonal section, the bolt could be used for adjusting the position of the socket during cable-assembly (Part IV). This device was also designed to compensate for the fact that the inclination of the backstays (the strands being all of the same length) caused the upper sockets to be further from the buttons (by some 5 in.) than are those of the lower strands.

The splay of the strands is controlled by a heavy col-

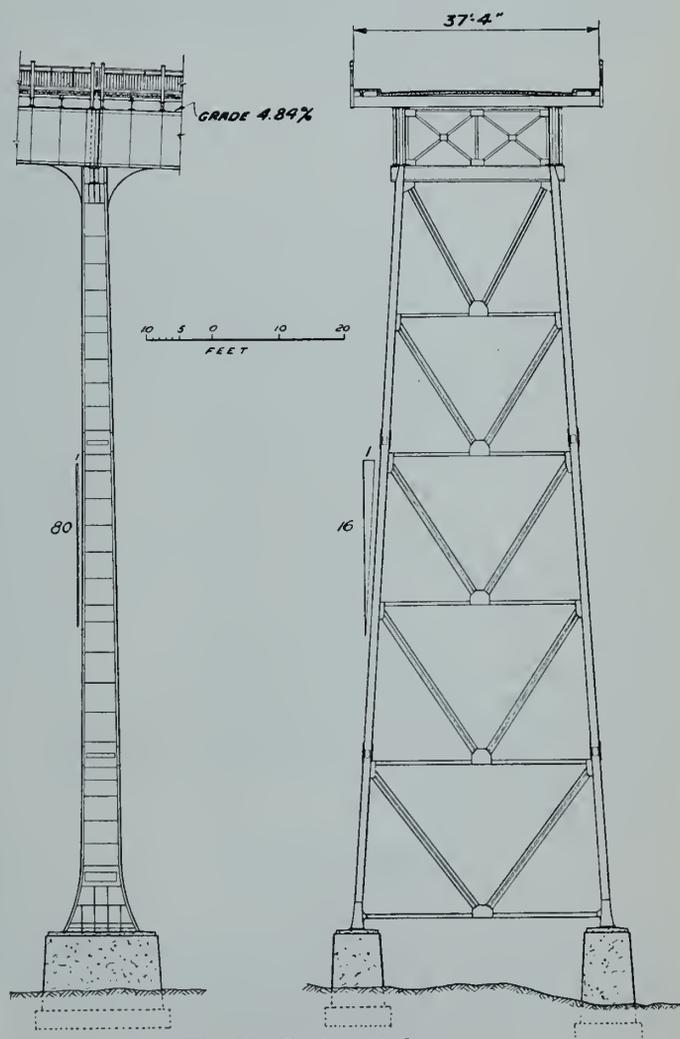

Fig. 50—Typical viaduct-bent.

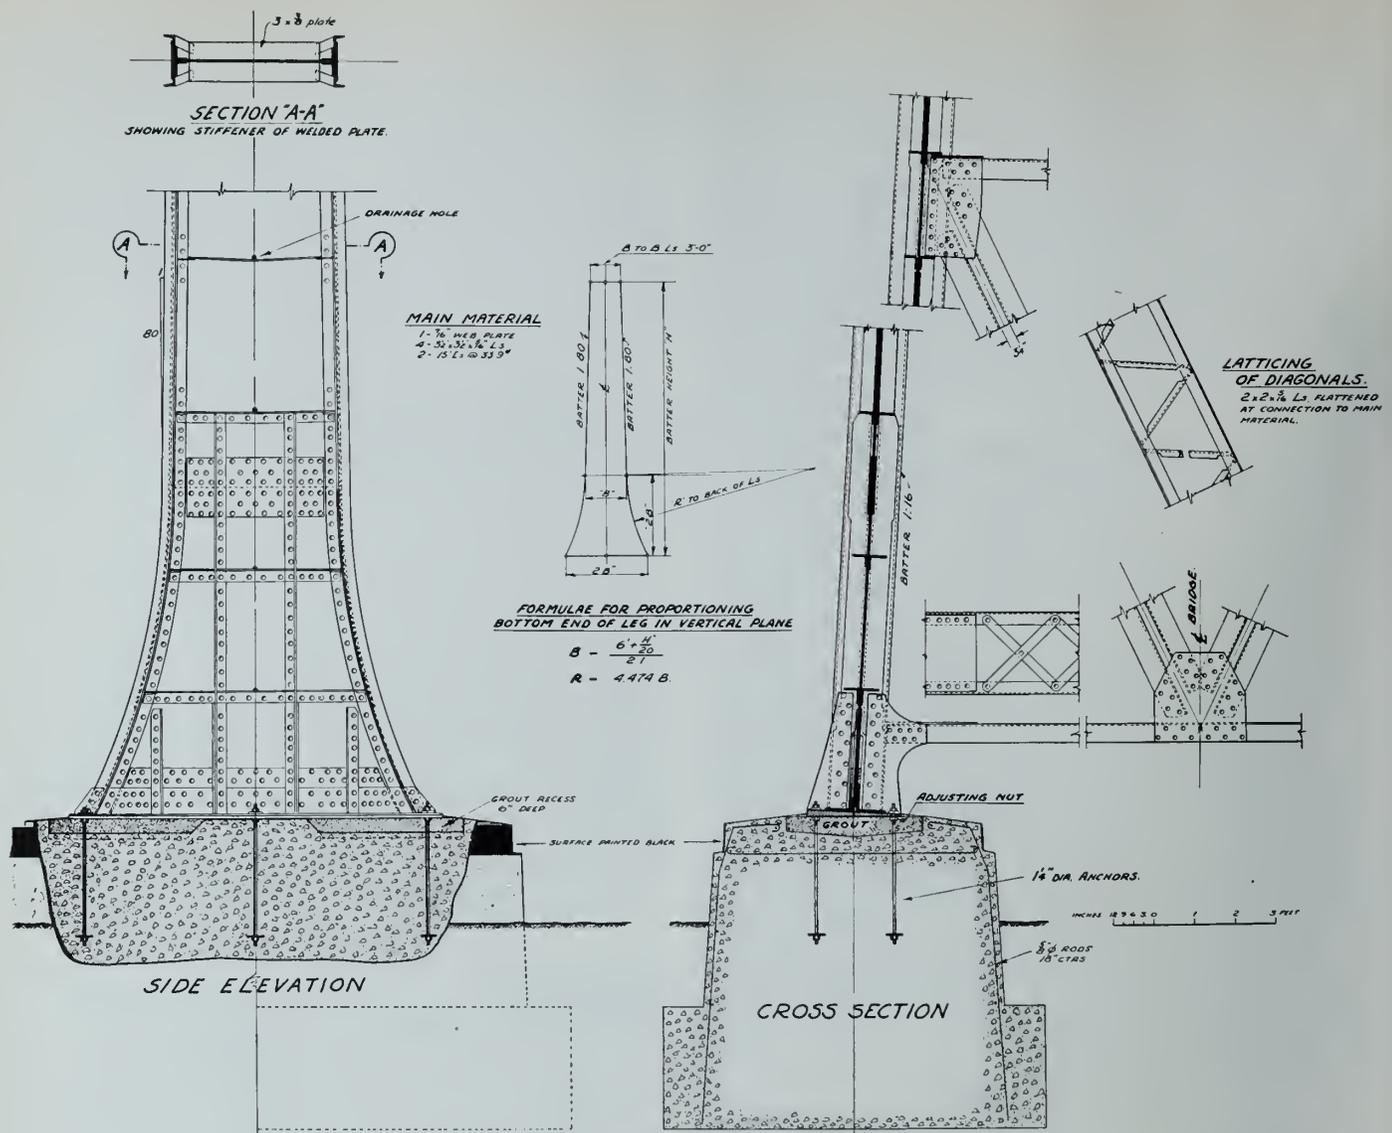

Fig. 51—Detail of viaduct-bent and pedestal.

lar, part of which fits tightly to the profile of the compacted cable, and the remainder of which is shaped to lead the strands into their radial positions without abrupt changes in alignment. Each of the four splay-collars consists of two steel castings 2 ft. 6 in. long, bolted together onto the cable with eight 2-in. high-tensile-steel bolts. The castings are 2 in. thick, and the weight of each assembled pair is 900 lb. The splay-collars are located in open chambers inside the anchor-piers, so that they, together with the splayed strands and socket-assembly, are always accessible for inspection. The wrapping of the cable commences at the smaller end of the collar, which is counterbored for its reception.

Fig. 48 shows the flexible copper flashing at the egress of the wrapped cable from the anchor-pier. The entrance of moisture into the piers is prevented by watertight connection of the tubular flashing to a cast-iron collar on the cable and to an "eyelet-casting" built into the wall.

The cable-anchorage were fabricated by Dominion Bridge Company in Lachine.

## NORTH VIADUCT

### DESCRIPTION

For this portion of the bridge, the relative merits of reinforced concrete, of structural steelwork, and of the combination of steel spans with concrete towers, were carefully weighed by the engineers, with the result that unhesitating decision was made in favour of an all-steel via-

duct. From the point of view of propriety it was evident that the steelwork-design, with its slender support-bents repeating in a diminishing series the general motif of main tower and cable-bent, would minimize rather than accentuate the unavoidable disparity (dictated by the profile of First Narrows) in appearance of the two ends of the bridge. From the standpoint of strength and permanence it was argued that, notwithstanding the need for careful maintenance of the paintwork, the precision and certainty with which steelwork could be designed and fabricated outweighed the advantages claimed for concrete. And in the matter of economy it was definitely demonstrated that for this structure the cost of concrete-work would be considerably greater than that of steelwork, a liberal allowance for the regular maintenance of the latter being included in the comparative figures.

Consisting of 25 deck-plate-girder spans, the north viaduct, 2196 ft. 6 in. long between centres of end-bearings, is shown in elevation in Fig. 49. There are expansion details at either end and also at the tops of bents Nos. 5, 9, 13, and 19; so that the structure really consists of five distinct self-supporting groups of connected bents. The four southerly of these units derive their stability each from a stiff tower formed by the bracing together of two adjacent bents, while, for the most northerly group, reliance is placed on the stiffness of the relatively short and sturdy bents that sustain it. Throughout the viaduct, the girders are simply-supported, and the columns are rigidly fixed at their bases.

In order to give satisfactory proportions to the structure, the lengths of the spans increase as the roadway rises, logical exceptions to this rule, however, being the shorter girders of the four tower-spans. Apart from these, the span-lengths thus vary from 81 ft. 6 in. at the lower end of the viaduct to 123 ft. at the higher end. Two depths of girder are employed, the 15 lower spans being 7 ft. deep and the remainder 9 ft. deep. The lateral spacing of the girders in alternate spans is respectively 22 ft. and 25 ft. 11 in., so that the bearings rest side-by-side on the supporting bents and deliver their vertical reactions without eccentricity. A third spacing, of 24 ft. 8 in., is used for the short tower-spans.

The 24 bents which, together with the cable-bent, carry the viaduct are each composed of two inclined plate-girder columns, battered at 1 in 16 and separated by K-bracing and also by a stout top strut that supports the span-bearings. The columns themselves are uniform in appearance and, as far as possible, in actual detail. Each is 3 ft. wide at the top and increases (with side-slopes of 1 in 80) regularly towards the base, where it is flared out for æsthetic reasons as well as to provide adequate bearing upon the concrete pedestal. At the top of each column, the otherwise crude appearance of its conjunction with the adjacent girders is masked by a pair of quadrant-shaped knee-brace plates, which are connected only to the column and which do not carry any stress. The general appear-

ance of the bents is shown by the two elevations given in Fig. 50, and typical details, together with the formula chosen for the basal flare of the columns, are shown in Fig. 51. The cross-section of each column comprises a single  $\frac{7}{16}$ -in. web-plate, with flanges made up of two small angles and a channel, the latter facing outwards. The flange-channels are 15-in. standard American sections except in the cases of the two longest and most heavily-loaded bents, where 18-in channels are employed. Four of the shorter columns are further reinforced for bending by the addition of flange cover-plates. Stiffeners at the more important parts of the columns are of riveted angles, but the majority consist of flat plates welded to the web and to the flanges. These flats are dished for drainage, and the rainwater from the outer flat spills through a half-round hole cut through the web plate. Each column (except in the case of the shortest bent, where  $1\frac{3}{4}$ -in. bolts are required) is anchored to its pedestal by six  $1\frac{1}{4}$ -in. anchor-bolts.

The majority of the horizontal cross-struts of the bents consist each of a pair of angles connected by a system of single-latticing. For the bottom struts of the heavier columns, and for the diagonal members throughout, a 4-angle section is employed, latticed by a single 2 by 2 by  $\frac{5}{16}$  angle bent into a 60 deg. zig-zag (Fig. 51). This angle, flattened at the bends, is welded to the main angles, which are spaced  $3\frac{1}{4}$  in. back to back. This type of lacing offers the economy deriving from a comparatively large radius of gyration, and has the advantage of easy access for painting: there are no water-pockets.

The plate-girders are of ordinary design, with lateral (lower-flange) and vertical bracing of single-angle sections. As for the columns, intermediate stiffeners consist of welded plates: these bear against the upper flanges only.

The viaduct-deck is supported by transverse beams at 4-ft. 6-in. centres, riveted to the top flanges of the girders and cantilevered beyond them. The cross-beams are 21-in. "CB" sections, and are alternately 30 ft.  $4\frac{1}{2}$  in. and 37 ft.  $3\frac{1}{2}$  in. in length, the shorter ones supporting the roadway-slab and kerbs only, and the longer ones continuing far enough to carry the concrete sidewalk-stringer, the fence, and the lamp-standards. It was found convenient and practicable to employ only two

weights of cross-beam, those athwart the narrow-spaced girders being 59-lb. beams, and the remainder 73-lb. Rivets throughout are  $\frac{7}{8}$ -in. Typical sections of girders and deck are shown in Fig. 52.

The roadway-slab is 7 in. thick, reinforced with  $\frac{5}{8}$ -in. deformed bars. It is haunched over each cross-beam, bond being insured by long bolts passing through the beam-flanges and extending well into the slab. The original intention had been to bulldoze the crossbeams to the road-camber, thus dispensing with the haunching, but upon the insistence of the contractor the engineers finally acceded to his request for permission to use straight beams. The sidewalk-slab is 4-in. thick, reinforced with "Truscon" mesh, and is supported by the 10-in. integral kerb (pierced at  $4\frac{1}{2}$ -ft. intervals by open drain-holes 4 in. deep and  $3\frac{1}{2}$  ft. long), by an integral reinforced beam which rests on and is anchored to the longer cross-beams, and by transverse walls also carried on the beams.

Fig. 53—Bearings for viaduct-girders.

The fence (Fig. 54) is fabricated in panels 8 ft. 6 in. long. The posts are  $6\frac{7}{8}$  in. square, welded from  $\frac{3}{16}$ -in. plate, and crowned with welded cast-iron caps. Two horizontal 6-in. channel-rails support 1-in. square pickets at 4-in. intervals, and the fence is finished off with a 4-in. pipe-rail at the top, the overall height being 3 ft. 9 in. The fence-sections are bolted to lugs on the posts, but the fence is otherwise of welded construction.

Expansion-joints are provided in the deck-slab at the expansion-ends of the girders. The pavement at each joint is supported over the variable gap by a  $1\frac{1}{4}$ -in. plate tapered so that its lower surface is horizontal, the upper surface being on the grade. This plate, like the channel on whose horizontal back it slides, is connected to the end cross-beam; and exposed portions of the supporting-brackets are treated with "Oxoseal" protective metallic coating. The expansion-plate is separated by a  $\frac{1}{2}$ -in. space from the end of the concrete, the latter terminating in a 3 by  $1\frac{1}{2}$  steel bar which is also attached to the end cross-beam. The purpose of that  $\frac{1}{2}$ -in. gap, which is on the upgrade side of the joint, is to protect the moving parts from road-debris. Half-inch deflection-breaks are provided at all the remaining junctions of spans and also at intermediate points of the longer girders. At each deflection-joint the slab on either side terminates in a 3 by  $1\frac{1}{2}$  steel bar which is attached to the appropriate crossbeam

Fig. 54—Viaduct fence.

and against which the slab is poured. The sidewalks have similar provision for expansion and deflection.

To facilitate inspection below the deck of the viaduct, manholes in the sidewalks are provided at frequent intervals. These are 2 ft. square, bounded by angle-kerbs and equipped with light chequered-plated hinged covers with locks. From each hole a short ladder gives access to a light platform at the lower flange of the girder.

#### VIADUCT: DESIGN

The live loading adopted for the viaduct is that due to a reasonable arrangement of automobiles, with heavy trucks interspersed, and is expressed by the following arbitrary formula:

$$29w = \frac{1200(L + 160)}{L}$$

where  $w$  is the equivalent uniform live load, including impact, in lb. per sq. ft. of roadway surface, and  $L$  is the span-length. The sidewalk unit was taken as  $\frac{w}{3}$  lb. per sq. ft. Members loaded locally were designed to carry 20-ton trucks (C.E.S.A.) together with 100 lb. per sq. ft. on the sidewalks.

The lateral loading specified was 200 lb. per lin. ft. applied 6 ft. above the roadway to represent wind on the live load, together with 30 lb. per sq. ft. on the vertical projection of floor and girders, and on twice the vertical projection of the bents. An alternative of 50 lb. per sq. ft. on the unoccupied structure was also specified. Long-

itudinal forces were represented by a horizontal load of 5,100 lb., applicable to either side of any unit of the viaduct. This load represents the force required to bring an arbitrary combination of two heavy trucks and four automobiles travelling at about 30 m.p.h. downgrade along two adjacent roadway-lanes, to rest in two seconds.

For the viaduct-bents, an exact analysis was made of the effects of temperature and traction-forces, the movements of the tops of the bents of each group depending upon the elastic properties of every one. Trial column-sections (corrected later) were first set up, and the deflection-curves for unit horizontal load at the top were computed for each bent and each tower.

Equations for each group were then established to express the simultaneous facts that the tops of the bents must remain at definite distances apart (depending on the temperature) and that the sum of the deflecting forces must be equal to the applied traction-load, and from these equations emerged the movements of the bents required to fulfil the conditions. Further analysis took into account the small resulting eccentricities of the vertical loads consequent on the deflections of the bents; and equations were written to determine the additional deflection of all the bents, and the force evoked in each by such eccentricity.

The material specified for the north viaduct was C.E.S.A. medium steel, with permissible unit stresses as follows:

- Tension: 20,000 lb. per sq. in.
- Compression (axial):  $\frac{20}{18}(17,000 - 60\frac{l}{r})$  lb. per sq. in.
- Compression (bending):  $\frac{20}{18}(18,000 - 170\frac{l}{r})$  lb. per sq. in.

For combinations of axial and flexural stress, a formula similar to that subsequently adopted in the C.E.S.A. specification S6-1938 was employed.

#### VIADUCT: FABRICATION

The viaduct, except for the fence-posts, which were made by Hamilton Bridge Company in Hamilton, was fabricated by Western Bridge Company. The main difficulty encountered was that of controlling distortions of the deep girder-webs during the welding of the plate-stiffeners, and it is the opinion of the fabricator that better results would have been achieved by the use of riveted angle-stiffeners.

A further disadvantage of the welded stiffeners (both on the girders and on the columns) is due to the practical impossibility of maintaining full contact between stiffener and web-plate in the intervals between welds. The small openings are inaccessible for painting, and there is consequently a tendency to rusting, with unsightly stains of the field-paint in the vicinity of such spots.

In the course of fabrication it was discovered that many of the heavy flange-angles (8 by 6 by  $\frac{1}{16}$ ) were rolled with the angle somewhat less than 90 deg. Many of the girders were shipped with the angles so distorted, and it became necessary to introduce tapered shims under the cross-beams before riveting in order to ensure proper bearing and to prevent the occurrence of rust-pockets.

#### BEARINGS OF VIADUCT-GIRDERS

The side-by-side arrangement of girder-bearings—a typical case comprising both a fixed and a sliding end—on the tops of the bents is shown in Fig. 53. This figure is largely self-explanatory, but attention may be drawn to some of the details. Anchor-bolts are not employed, so that the common troubles due to rusting and overtightening of such bolts (working in slotted holes) are avoided. Any tendency towards uplift is controlled by the locking-plates (9 and 19) which in the event of vertical movement will

bear on the horizontal upper surfaces of plates 10 and 20.

The lower bearing-plates (7 and 17) are of high-carbon steel, and their upper surfaces are machined to a 20-in. cylindrical radius. The upper bearing-plates (2 and 11; a saw-steel inset being used for the sliding bearing) are wedge-shaped so that their undersides are horizontal. Girder-deflections are accommodated by insignificant adjustments in the positions of the lines of bearing between the curved lower plates and the flat upper ones.

Longitudinal movement at the fixed ends is confined to the small play afforded by the  $\frac{1}{8}$ -inch clearance between the lower projection of the shoe-plate (11) and the machined recess of the bed-plate (13), the latter being rivetted to the top strut of the bent. Expansion-movements are limited in extent by the engagement of the vertical stop-

angles (8) with lateral lugs forming part of the sliding shoe-plate (1). The greatest range of movement, occurring at the top of bent no. 5, is  $8\frac{3}{16}$  in. Lateral girder-movements are controlled by the upstanding sides of the bed-plates (3 and 13), these side-walls coming into contact, when need arises, with the sides of the projecting parts of the shoe-plates (1 and 11).

A further feature of interest is the provision of an enclosed oil-bath for each sliding bearing, the lower bearing-surface (7) having  $\frac{3}{8}$ -in. grooves to facilitate circulation of the lubricant when movements take place. Screw-plugs for filling and drainage (6) are provided, and precautions are taken to prevent direct ingress of water, dripping from the shoe-plate. A heavy "summer" grade of track oil was used for filling the oil-baths.

EDITOR'S NOTE:—The concluding part of this paper which deals with the erection of the superstructure will appear in the July issue of the *Journal*.

## DISCUSSION ON RATIONAL COLUMN ANALYSIS

Paper by J. A. Van den Broek<sup>1</sup>, published in *The Engineering Journal*, December, 1941, and presented before the General Professional Meeting of The Engineering Institute of Canada, at Montreal, Que., on February 6th, 1942.

DR. FRIEDRICH BLEICH<sup>2</sup>

Almost all papers concerning the design of columns in the last half century considered the problem of buckling as one of stability in which the relationship between load and stress is never linear. Engesser and von Kármán developed the theory of unelastic buckling based upon the actual stress-strain diagram of structural steel. They demonstrated that the analysis of elastic stability also held true in principle in the case of unelastic buckling. Tests made by Kármán (1910), Roš and Brunner (1926) showed the effect of the eccentricity of the load on the carrying capacity of the columns. But the various factors involved in a design of structural steel columns subjected to an eccentric axial load or to a transversal load complicates the investigation. Several attempts to develop rational design formulae were made in order to simplify the computations. The analysis presented by the author defines the maximum load the column can carry as that load producing a stress in the most compressed extreme fibre equal to the yield point. It will be interesting to consider this criterion in the light of the results of exact investigations concerning the behaviour of columns of structural steel loaded by an eccentric axial force.

The load-deflection diagram of a medium long column eccentrically loaded is shown in Fig. 27<sup>3</sup>. At any value of the stress  $S = \frac{P}{A}$  there is a deflection  $y$  due to the moment  $Pe$ , first increasing slowly and then rapidly as  $S$  approaches the maximum value  $S_{cr}$ . The equilibrium between internal and external forces becomes unstable when  $S$  reaches the critical value  $S_{cr}$  because in this state of loading the deflection further increases even when the average pressure  $\frac{P}{A}$  decreases. It should be noted that two values of the deflection  $y$  belong to every value of  $S$  below  $S_{cr}$ . The equilibrium is stable in the case of the smaller value of  $y$  and unstable in the other case.

<sup>1</sup>Professor of engineering mechanics, University of Michigan, Ann Arbor, Mich.

<sup>2</sup>Detroit, Mich.

<sup>3</sup>Th. von Kármán, Untersuchungen über Knickfestigkeit. Forschungsarbeiten, 1911.

The maximum of  $\sigma_{cr} = \frac{P_{cr}}{A}$  belongs to a state of stress, in which a bounded area of yielding arises in the most compressed edge in that region of the column where maximum stresses during buckling occur. This area of yielding extends more or less deeply into the interior of the column. (Fig. 28a). It is evident that a load  $P'_{cr}$  producing a maximum fibre stress equal to the yield point, (Fig. 28b) is less than  $P_{cr}$  and therefore  $S'_{cr} = \frac{P'_{cr}}{A}$  represents a lower limit of  $S_{cr}$ . The difference  $S_{cr} - S'_{cr}$  depends on the shape of the cross section of the column. It is very small for a I-section bent in the direction of the web and bigger for a + - section. For the most frequently used I-section the difference is only a small percentage. The computation of the load  $\mu P$  ( $\mu$  = factor of safety) producing the yield point stress in the most compressed fibre is a simple method of determining the carrying capacity of a column subjected to bending moments with a

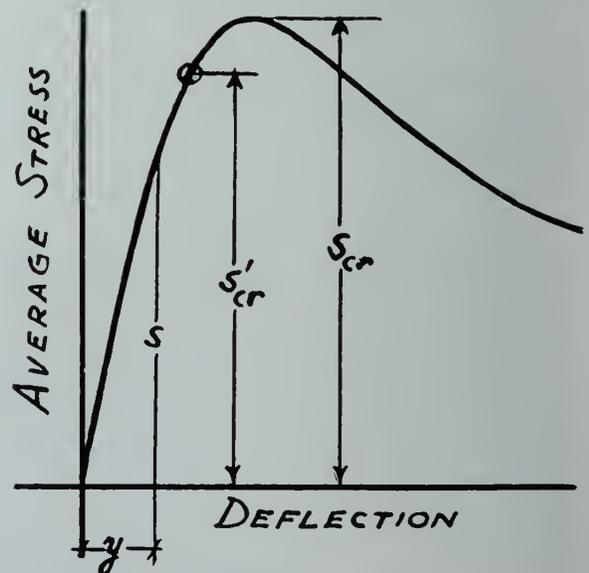

Fig. 27.

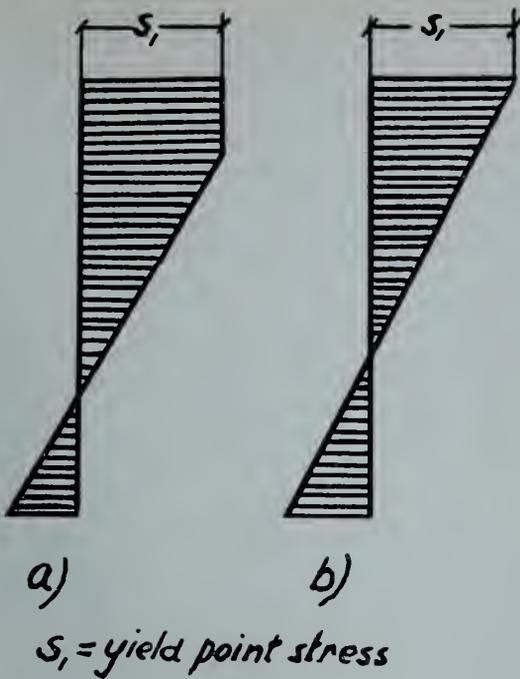

Fig. 28.

sufficient degree of accuracy and with a small surplus of safety.

As far as is known to the writer, it was Müller-Breslau who initiated 30 years ago the same criterion determining the stability of eccentrically loaded columns and of those with initial curvature. It must be emphasized that this criterion can be applied to all problems of stability. For instance, in a recent paper on the Stability of Arch Ribs which will be issued in the near future, the writer applies the condition: maximum fibre stress = yield point stress to determine the critical load of the arch rib which produces buckling.

The writer agrees in all points with the author's considerations of the question of initial crookedness. The suggestion of the author to make the analysis fit ordinary practice conditions by proper selection of the length reduction factor  $n$  deserves serious attention. It is not difficult to determine the value of  $n$  for the conditions of end restraint as found in the common practice of steel structures by theoretical investigations and to verify the results by tests<sup>4</sup>

DR. HANS BLEICH<sup>5</sup>

The author has made a successful attempt to explain the essential facts of the theory of columns in a simple manner. These facts are, unfortunately, not yet generally known and appreciated. His paper will help greatly to improve this state of affairs.

The example of the frame, shown in Fig. 12 of the paper, is very instructive and the writer would like to demonstrate, using the same example, what he considers another important aspect.

In the said example the side legs have been assumed straight; let us now assume these legs to be initially curved in the shape of a sine curve  $x_0 = e_0 \sin \frac{\pi y}{l}$ .

One would expect that the reduction in carrying capacity due to this initial curvature should be approximately as shown in Fig. 3. It is obvious that one should not introduce the ratio  $l/i$  of the actual slenderness but the ratio  $L/i$  of the effective slenderness.

Table II contains the capacity loads  $P$  for several values  $l/i$ , the corresponding values  $L/i$ , and the reductions  $\Delta P$

<sup>4</sup>See the writer's book: *Theorie und Berechnung der eisernen Brücken*, 1924.

<sup>5</sup>Birmingham, England.

due to a curvature  $\frac{e_0 c}{i^2} = 1$  calculated in the manner indicated above.

TABLE II

$l/i =$	60	100	150	200
$P =$	97T	102T	97T	80T
$L/i =$	106	103	106	117
$\Delta P =$	50%	51%	50%	43%

The use of Fig. 3 in connection with the example in the paper is not quite correct, because unfortunately different values for  $E$  have been used. The last line in Table II shows, however, the percentage reduction and the influence of the change in  $E$  on this percentage can only be very small.

In order to see if this simple procedure is justified the writer has made an exact calculation for the same problem.

Using the same notations as the paper the differential equation for the deflection  $x$  of the column is

$$EI \frac{d^4 x}{dy^4} + P \left( \frac{d^2 x}{dy^2} + \frac{d^2 x_0}{dy^2} \right) = 0.$$

The boundary conditions are  $x=0$  and  $M = -EI \frac{d^2 x}{dy^2} = eP$  at both ends,  $x=0$  and  $x=l$ .

This differential equation can be solved easily and the values of the angle  $\phi_2$  and of the stress  $s_1$  can be determined. The results are

$$\left. \begin{aligned} \phi_2 &= e \sqrt{\frac{P}{EI}} \tan \frac{l}{2} \sqrt{\frac{P}{EI}} + \frac{\pi}{l} e_0 \frac{P}{P_E - P} \\ s_1 &= \frac{P}{A} \left( I + \frac{ec}{i^2} \sec \frac{l}{2} \sqrt{\frac{P}{EI}} + \frac{e_0 c P_E}{i^2 (P_E - P)} \right) \end{aligned} \right\} \quad (A)$$

$P_E$  is the Euler load  $P_E = \frac{\pi^2 EI}{l^2}$ .

Compared with the original formulae for  $\phi_2$  and  $s_1$  equations (A) each contain an additional member depending on  $e_0$ .

Finally two equations for  $e$  are obtained,

$$e = \frac{\frac{w_l I^3}{24 EI_1} - \frac{\pi}{l} \frac{e_0 P}{P_E - P}}{\frac{Pl_1}{2 EI_1} + \sqrt{\frac{P}{EI}} \tan \frac{l}{2} \sqrt{\frac{P}{EI}}}, \quad e = \frac{A s_1 - P - \frac{P}{P_E - P} \frac{e_0 c}{i^2} P_E}{\frac{c}{i^2} P \sec \frac{l}{2} \sqrt{\frac{P}{EI}}}, \quad (B)$$

The two equations (B) can be solved by trial and error. The numerical result is shown in Table III.

TABLE III

$l/i =$	60	100	150	200
Frame $e_0 = 0, P =$	97T	102T	97T	80T
Frame $e_0 = 0,6'', P =$	82, 5T	78T	70T	60T
Reduction $\Delta P =$	15%	23%	28%	25%

The reductions shown in Table III are much smaller than those in Table II. The assumption that the influence of an initial curvature on a strut hinged on both ends and on a strut forming part of a structure is equal is not justified.

This is rather an important conclusion because it shows that all formulae based on calculations for two-hinged columns tend to overestimate considerably the influence of initial curvature on actual structures.

The writer cannot suggest a reasonably simple solution for this or similar problems and thinks that there is scope for further investigations as the application of formula (B) in practical design is out of the question.

The majority of engineers use column formulae without any understanding of the questions involved and the specifications, although made by experts, are obsolete. I particularly appreciate the impressive explanation that eccentricities can only be determined after the buckling problem has been solved and that therefore the usual formulae for the carrying capacity of columns under eccentric loads are valueless.

The chapter on elastic deformations of columns under critical load had been of much interest to me because of its applications on the theory of limit design. I should like to see these investigations extended to shorter columns  $l/r=40$  to 100; theoretical values in this area are difficult to obtain and probably not very reliable.

H. J. DURANT<sup>6</sup>

Probably no problem in science has engaged the attention of so many eminent men as the mathematical analysis of struts. The problem was thoroughly analysed nearly two hundred years ago by the famous mathematician Euler, and succeeding analyses are variations of the analysis of that great man.

Engineers need data on the magnitude of the end moments, initial curvatures, eccentricities of end thrusts, and the effect of the shape of the cross sections of members in frames. The author appreciates this.

Such necessary and sufficient data can be obtained only from experiments on the prototype or from experiments on dynamically similar models, because most analysis on struts are based on the assumptions that the struts are prismatic, isotropic, and the amplitudes small.

The writer considers the value of the paper would have been increased by a more general approach. A writer on engineering science now need have no fear that his analysis will be beyond the readers' mathematical attainments.

The formulae in the paper are derivable from a single differential equation, and all that is necessary to obtain a particular formula is to put zero for all unwanted quantities in the particular integral.

The author has assumed equal end moments producing single curvature, but most members in a bridge truss are subjected to moments unequal in magnitude and sign.

A further generalisation would be effected if the moment of inertia were assumed to vary according to some law. In this case, however, the problem could only be solved by means of Bessel Functions.

The author states: ". . . the secant formula is perfect, it is beautiful, yet the formula is futile." Formula 2 is given as an approximation to it.

The secant formula for the design of struts in structural steel of a 23 ton yield stress has been in use by the Government of India for about ten years, and the same formula, with changes in the parameters for mild steel, for a shorter time.

The phenomenon of shear which is important in struts of non-prismatic form, especially in built-up members, has not been dealt with in the paper.

C. M. GOODRICH,<sup>7</sup> M.E.I.C.

Professor Van den Broek's paper "Rational Column Analysis" appears to deserve its title. It gives us the engineer's approach instead of the mathematician's; the philosophy of the problem, the common sense of it, is given rather fully; the new proof of the secant formula makes this formula seem more reasonable, even if this formula is a criterion rather than a working tool for the profession; the final formulae for columns are units instead of the trichotomy, the three dissimilar formulae stuck together at arbitrary joints, usual for the three column phases—philosophically silly even if practically useful—and give us

a smooth curve, instead of one with a hump in it. They are excellently well adapted to use in limit design; they indicate the feasibility of reforming the expression factor of safety, of making it mean something definitely useful.

Further, the formulae include the effect of cross bending. In Trans. ASCE 1926, page 210 von Abo treats this problem in a most mathematical manner; the writer reduced it to two lines, and then was equally surprised and amused to be told by a friend that the same solution was made by Fidler sometime in the seventies. One wonders why the textbooks were not aware of it. Now the Van den Broek formula is better.

Note should be made of Professor Van den Broek's use of graphical integration. This tool includes Greene's Area Moment and Mohr's Elastic Weight Theorems, and proceeds to cover with equal simplicity (all things being relative) such matters as frames and arches. Perhaps some day one of our members who teaches elasticity will give the *Journal* a paper on the subject; no written discussion directly *ad hoc* is known to the writer outside of notebook sheets. Its speed and simplicity commend it greatly.

The experiments are the first since von Kármán's that fulfil theoretical requirements; and they not only fulfil these requirements more completely, but go well beyond those experiments as regards the data sought.

One incidental point of great practical importance may well be noted. In a long latticed column we have two ratios of slenderness, that of the column as a whole, and that of the piece between two stayed points. If the  $L/r$  of this piece is less than the  $L/r$  where the Van den Broek formula gives us the horizontal line in the diagram of Fig. 3, we need not consider any correction in the strength as figured from the  $L/r$  of the whole column, since in a normal column of such a character there is no eccentricity, so far as concerns the panel. Engesser treats long laced columns (see Mayer, *Knickfestigkeit* page 342) but his treatment merely shows that in all normal cases the designer is not interested therein; it fails to discuss what needs discussion. This gap is filled by the present paper in a manner as simple as it is satisfactory. Friedrich Bleich gives a solution in his *Theorie und Berechnung Eisernen Brücken*, but its derivation is formidable, and its application involves quite a bit of calculation. His analysis of battened columns with its resulting definite thumb rules for their spacing should be in all drafting room manuals. Dr. Bleich's work is by far the best book in its field that the writer has ever seen, taking up as it does a host of problems which other books in the field lightly omit.

In Fig. 16 the axial deformation curves suggest a field of inquiry in connection with the distribution of stresses in X-braced panels. Usually the shear is either taken as carried exclusively by the tension member, or as divided 50-50 between tension and compression diagonals. Nothing but simplicity recommends either practice, and in many cases simplicity and economy are incompatible. The method of limit design accents the need for considering the probable distribution.

E. C. HARTMANN<sup>8</sup>

The author has emphasized many points to which all structural engineers should give careful consideration. The writer was especially pleased with his treatment of the framed column and the excellent manner in which he has demonstrated that, depending on the relative proportions of members, the beam can partially fix the column or can cause it to fail at a lower load than if it were pin connected.

Dr. Van den Broek has treated his subject throughout strictly from the standpoint of solid members made from materials which have a definite yield point, such as structural steel. Many materials, particularly the aluminum alloys with which the aircraft designer deals principally, exhibit no definite yield point but have stress-strain curves which depart gradually from the modulus line. For such

<sup>6</sup>Senior engineer, Rendel, Palmer and Tritton, London, England.

<sup>7</sup>Consulting Engineer, Canadian Bridge Company, Limited, Walkerville, Ont.

<sup>8</sup>Research Engineer, Aluminum Company of America, New Kensington, Pa.

materials Dr. Van den Broek's concept of a definite limiting stress,  $s_1$ , is difficult to interpret.

Furthermore, the effective modulus of elasticity of the materials which have no definite yield point does not remain constant up to the limiting stress, but begins to decrease gradually before the material has reached its load-carrying capacity. Therefore, unless one is to ignore the extra load-carrying capacity of such materials above the strictly elastic range, one must take into account the concept of reduced or effective modulus of elasticity.

The concept of reduced modulus can readily be applied to structural steel and other materials which exhibit a definite yield point, simply by assuming the modulus of elasticity to be constant up to the yield point, beyond which it is considered to be reduced abruptly to an effective value of zero. This simple concept, when applied to the Euler column formula, gives the same column curve that the author arrives at in his Fig. 7.

#### MARSHALL HOLT<sup>9</sup>

The author is to be commended for his terse statement of "Objectives and Sense of Values." Certainly in problems where the principle of superposition does not apply, for example, in the field of long columns, the factor of safety should be applied to the ultimate load of the member rather than to the specified strength of the material.

The weakening effect of initial crookedness is shown in Figs. 3 and 4. Can one say this effect is insignificant for slender columns when for a slenderness ratio equal to 200 the average stress at failure is reduced from about 7,300 lb. per sq. in. for zero eccentricity to about 6,400 lb. per sq. in. for a ratio of length to eccentricity equal to 600? This decrease is only about 900 lb. per sq. in. but it is also about 12 per cent. For shorter columns the weakening effect is greater. The author concludes that these effects of initial crookedness should be covered by the factor of safety, whereas it is the writer's thought that the more the uncertainties are isolated and dealt with separately the greater and faster will be the advance in the art of structural analysis. Obviously such isolation of uncertainties leads to longer and more impressive-looking formulae, but it also gives the engineer some idea as to the relative importance of the various factors. It would then be left to his judgment which of the factors should be considered and the relative importance to be attached to each. After a table or curve of column strengths has been prepared, the work of the designer is no more complicated than it is when a simple column formula is used.

The writer agrees with the statement that when theory and practice are said to be in conflict there is a contradiction, but rather than showing a deficiency in the theory or its worthlessness the contradiction may show that the technician is misapplying the theory. Most of the mathematical theories in structural analysis are necessarily limited to rather simple structures. It is the duty of the stress analyst to use the theory that most nearly applies to his problem and if necessary make allowances for the differences in the structural behaviour assumed in the theory and that to be expected in the structure at hand. For example, it seems absurd that a designer should proportion the columns of a riveted structure only on the basis of the Euler formula for columns with round ends. The fact that the theory used does not agree with the behaviour of the structure is evidence, not of the worthlessness of the theory, but of its misapplication.

The testing of complete structures or units of structures would tend to make design procedures more or less empirical, and the testing procedures would be complicated with choosing the proper loading conditions. It is highly improbable that the loading condition and distribution of load selected for the test would be the controlling condition for every member in the test specimen. Thus duplicate speci-

<sup>9</sup>Research Engineer, Aluminum Company of America, New Kensington, Pa.

mens would be required for each loading condition. The loading conditions themselves would be subject to a great deal of compromise, especially if uniformly distributed horizontal forces should be encountered. Uncertain and unknown foundation conditions would still necessitate the exercise of considerable judgment on the part of the designer.

The flat portions of the curves of Figs. 16 and 17 are as might be expected from the theory of the elastica,<sup>10</sup> which deals with large deflections of purely elastic members. The analysis uses the exact expression for curvature, given by the author as the third expression following equation (a), and indicates a determinable lateral deflection after the Euler load has been reached. On the other hand, the Euler column formula for which the expression for the curvature is taken merely as the second derivative indicates an indeterminable deflection at the Euler load. These data are indeed interesting.

Whether or not the load-carrying capacity of a column is suddenly destroyed when the column buckles depends upon the conditions of loading. The data given in the paper show that the column is able to support some load after buckling, but the load-deformation curves shown in Figs. 16 and 17 are possible because the specimens were loaded in a screw-type machine that controls not the load on the specimen but only the over-all deformations. If column tests were made in a machine using dead weights as the loading medium, which approximates the conditions for pin-connected statically determinate structures, then when the column buckled the collapse would be complete. In some statically indeterminate structures the buckling of a compression member may merely cause a redistribution of stress in the other members with consequent large deformations but not complete collapse; however, in some cases the collapse would be complete.

The analysis of the columns of square bents is certainly a valuable contribution to the study of columns as parts of structures.

#### BRUCE JOHNSTON<sup>11</sup>

In a recent report<sup>12</sup> of the American Society of Civil Engineers Committee on "Design Of Structural Members," the following factors affecting the strength of a column were listed:

- (1) Non-linear shape of stress-strain relationship
- (2) Accidental imperfections
- (3) Known end eccentricity
- (4) Shape of cross-section
- (5) Torsional behaviour
- (6) Shearing deformation
- (7) Local buckling or crippling
- (8) Method of fabrication
- (9) Continuity of action in a frame

Professor Van den Broek discusses items (2), (3), and (9). The writer believes that the author is correct in ignoring item (1) in the case of structural steel, which usually has a very linear stress-strain relationship up to the yield point. The stress-strain relationship should be considered more carefully in the case of non-ferrous alloys, however.

Salmon's book on columns, to which the author refers, lists 375 references to previous analytical and experimental works on the subject of columns, and this book was published in 1920. It takes a whole book, indeed, to do the entire subject justice. Nevertheless, Professor Van den Broek approaches the subject with a refreshing viewpoint and touches on some important aspects of the problem, particularly in regard to the column acting as a part of a frame.

The writer agrees with and wishes to re-emphasize Professor Van den Broek's remarks near the bottom of page

<sup>10</sup>S. Timoshenko, "Theory of Elastic Stability," McGraw-Hill (1936), p. 74.

<sup>11</sup>Associate Director, Fritz Engineering Laboratory, Lehigh University, Bethlehem, Pennsylvania.

<sup>12</sup>Preliminary Progress Report, A.S.C.E. Committee on Design of Structural Members, presented at the Annual Meeting, January 22, 1942.

574, to the effect that column tests as made in a laboratory "fail effectively to simulate end conditions of restraints—such as are met in practice." Considerations of this sort led the American Institute of Steel Construction to approve and sponsor a programme of tests at Lehigh University in which columns will be tested as part of a frame. This programme has been unavoidably delayed for more than a year but is now getting under way.

In the analysis of the culvert problem illustrated in Fig. 12 the author's purpose is partly to show the relationship to the Euler column curve. When the problem is simply one of analysis for maximum stress, or eccentricity, the writer prefers to apply the principles of Hardy Cross' method of moment distribution which are so familiar to structural engineers. The moment distribution method as ordinarily encountered in structural frame analysis may be modified easily to include the effects of axial compression or tension. Lundquist<sup>13</sup> has used the method to determine critical buckling loads of frames and has prepared tables of moment distribution factors.<sup>14</sup>

The solution of the author's culvert problem is particularly simple by the moment distribution method because symmetry of the problem makes it unnecessary to use the carry-over part of the process. The reader familiar with moment-distribution will recall that the moment or rotational stiffness of a member at one end is equal to the moment required to produce unit angle change at that end. In application to the present problem, by symmetry, the angle change at the far end of each member is equal and opposite to the angle change at the near end. In this special case, the general relation between moment and angle change<sup>15</sup> at the end of a compressed member reduces to:

$$M = \phi \left[ \frac{2EI}{l} \left( \frac{l}{2} \sqrt{\frac{P}{EI}} \cot \frac{l}{2} \sqrt{\frac{P}{EI}} \right) \right]$$

Hence, by definition, the expression in brackets represents the modified column rotational stiffness in this special case. When  $P$  approaches zero, in the limit, the column stiffness becomes  $\frac{2EI}{l}$ . This may be recognized as one-half the rotational stiffness of a beam with far end fixed. By the moment distribution procedure the moment at the top of the column of any culvert loaded as shown in Fig. 12 is:

$$M_C = M_F \left[ \frac{K_C}{K_C + K_B} \right]$$

where

$M_C$  = moment at top or bottom of column

$M_F$  = fixed end moment in uniformly loaded beam =  $\frac{wl_1^2}{12}$

$$K_C = \text{column stiffness} = \frac{2EI}{l} \left[ \frac{\frac{l}{2} \sqrt{\frac{P}{EI}}}{\tan \frac{l}{2} \sqrt{\frac{P}{EI}}} \right]$$

$$K_B = \text{beam stiffness} = \frac{2EI_1}{l_1}$$

The equivalent eccentricity at the end of a column in the culvert is:

$$e = \frac{M_C}{P} = \frac{2M_C}{wl_1} = \frac{l_1}{6} \left[ \frac{1}{1 + \frac{K_B}{K_C} \left[ \frac{\tan \frac{l}{2} \sqrt{\frac{P}{EI}}}{\frac{l}{2} \sqrt{\frac{P}{EI}}} \right]} \right]$$

When the particular values in the author's solution are substituted in the foregoing formula the result checks exactly with the expression for  $e$  as given by the author.

The culvert problem discussed by the author is a special case of a similar illustrative example used by the writer in an unpublished memorandum<sup>16</sup>. Fig. 29, taken from this memorandum, shows graphically how the initial eccentricity

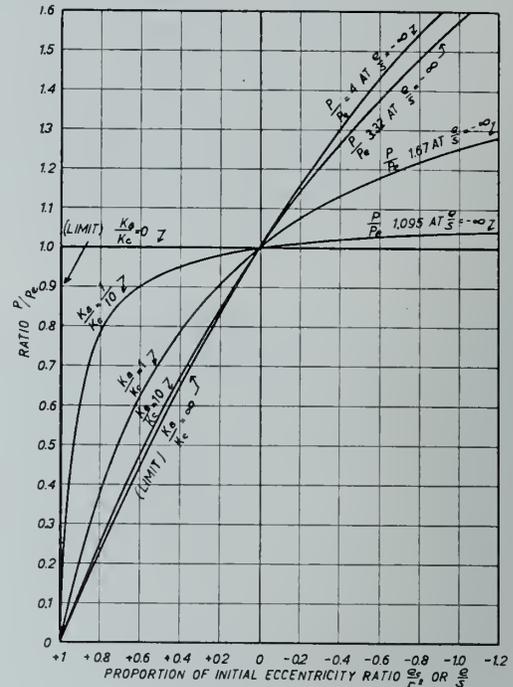

Fig. 29.

varies with increasing column load  $P$ , for various ratios of beam-to-column stiffness. In this example the column load  $P$  was considered to act independently. The equation plotted in Fig. 29, in this case, is:

$$e = \frac{M_C}{P} = \frac{wl_1^2}{12P} \left[ \frac{1}{1 + \frac{K_B}{K_C} \left[ \frac{\tan \frac{l}{2} \sqrt{\frac{P}{EI}}}{\frac{l}{2} \sqrt{\frac{P}{EI}}} \right]} \right]$$

The preceding reduces to the culvert problem when  $P = \frac{wl_1}{2}$ .

Figure 29 shows that in this particular problem, for all ratios of beam-to-column stiffness, the initial eccentricity is reduced to zero when the Euler load for a pin-ended column is reached. Above the Euler load the eccentricity is negative and increases rapidly until the column yields or until deflections are so large that the structure is useless. Theoretically, the pure buckling load is approached as an asymptote, as the eccentricity approaches  $-\infty$ , but it should be remembered that the theory is valid only for deflections that are small in comparison with the column length.

It is of interest to note that above the Euler load, when the eccentricity becomes negative, the rotational stiffness of the column also becomes negative. That is to say, that whereas at low loads it was necessary to apply a certain moment to produce unit angle change, it is now necessary to apply a holding moment of opposite sign to keep the column from buckling. This concept of stiffness is the key to the Lundquist<sup>13</sup> method for determining the buckling strength of a frame. The criterion for pure buckling is as follows: "When the summation of stiffness of the members entering a joint becomes equal to zero, the frame will buckle." This criterion applied to the writer's equation

leads at once to the following condition for "pure" buckling.

$$\tan \frac{l}{2} \sqrt{\frac{P}{EI} + \frac{K_C}{K_B}} \left( \frac{l}{2} \sqrt{\frac{P}{EI}} \right) = 0$$

The foregoing checks the pure buckling solution of this problem as given in Timoshenko's "Elastic Stability," page 91, Eq. 68.

The foregoing discussion simply gives added weight to the author's criticism of the "secant" formula, insofar as it might be unintelligently applied to a frame problem. There are cases, however, in which the eccentricity is not entirely a function of the load, i.e., columns supporting an eccentrically loaded bracket, or derrick booms.

The author points out the illogical misuse that has sometimes been made of the secant formula, applying it to a column in a frame, and introducing the low load eccentricity  $e_0$  as well as a length reduction factor  $n$ . The eccentricity is a weakening factor whereas the factor  $n$  may be a strengthening factor. Illogical as this may be, it gives a fairly reasonable answer in some cases. Fig. 30 shows the length reduction factor which could be used in the author's illustrative culvert example, column load being considered independent of beam load. (In this case the author's statement that the most unfavourable column load condition was considered would not be correct). The initial eccentricity  $e_0$ , would be calculated as

$$e_0 = \frac{wl_0^2}{12P} \left( \frac{1}{1 + \frac{K_B}{K_C}} \right)$$

In Fig. 30, the curves for  $P = 0$  and  $P = P_{cr}$  (pure buckling) represent extreme limits between which a reasonable length reduction factor could be chosen, depending primarily on the ratio of beam-to-column stiffness. The secant

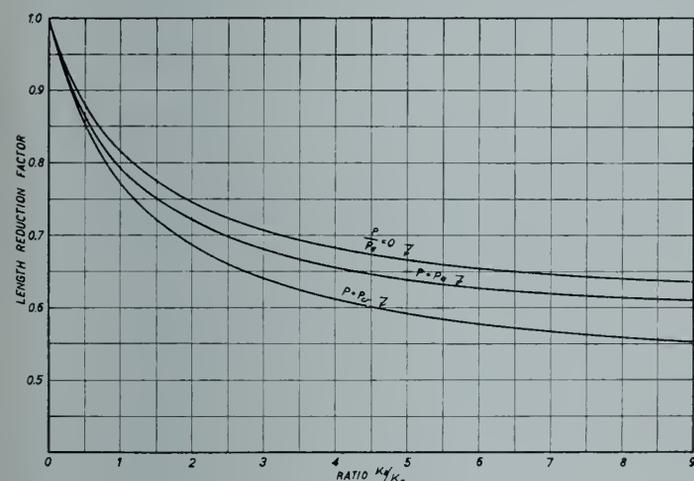

Fig. 30.

formula when used in this illogical fashion will nevertheless give an answer as to when the maximum stress in the framed column reaches the yield point. It should not be concluded that the secant formula could be applied with the same success to other more unusual frame problems.

Although the initial eccentricity in a framed column has no numerical equivalence with the actual eccentricity at failure, it nevertheless does represent an initial starting point and is therefore not unrelated to eccentricities at higher loads.

One of the author's final conclusions infers that the load is maintained constant above the Euler buckling load, for a considerable amount of increasing deformation. However, the author's curves in Fig. 16 show that this occurred in his experiments only for  $l/i$  above 150. This conclusion is therefore limited to structures with very slender columns, in which case considerable bowing may take place in compression members without exceeding the yield point of the material.

In 1920, Salmon wrote in his book on "Columns" ". . . at

present the designer has no real data whatsoever regarding practical end conditions." Much work has been done since then, for example, by the British Steel Structures Research Committee, but the question is still a most important one. The author's paper shows that thoughts are taking the right direction, and the writer looks forward hopefully to the possibility that at some future date "Rational Column Analysis" may become a practical reality.

S. D. LASH,<sup>17</sup> M.E.I.C.

This paper provides a comprehensive review of the column problem and is assured of a prominent place in the very extensive literature of the subject. The following comments are intended to be supplementary to the information given in the paper.

No better example of the need for co-operation between engineers and mathematicians can be found than in the history of column formulae of the eccentricity and curvature types. In 1807 Dr. Thomas Young, a mathematician, developed correct expressions for the lateral deflection of a strut having initial curvature and for a straight strut having an eccentric load.<sup>18</sup> These results apparently did not come to the attention of engineers and were rediscovered later in the 19th century by two professors of engineering, W. H. Smith and John Perry.

The secant formula was derived by W. H. Smith in 1877 in a paper presented to the Edinburgh and Leith Engineers Society. Its use was subsequently extended by Professor Smith in a series of articles published in *The Engineer* ten years later.<sup>19</sup> Professor Smith pointed out that the eccentricity was to be thought of, not only as the result of lack of axiality in application of load but also that  $e$  may be due to imperfection of workmanship, want of elastic homogeneity in the material or journal friction. One other quotation may be considered apt "Engineers not infrequently simply stare in amazement or else laugh derisively at any proposal that they should use an equation whose algebraic solution is either complicated and difficult or 'transcendental' in the technical sense." Apparently engineers continued to stare in amazement for some time, for it is only in recent years that the Committee on Steel Column Research of the American Society of Civil Engineers expressed its approval of the secant formula and recommended a parabolic formula intended to give similar results within certain limits. Thus there was a delay of about 125 years in taking advantage of Dr. Young's results. This delay seems excessive.

It is perhaps worth observing that the approximate eccentric loading formula proposed by Professor Van den Broek (formula 2) leads to a slight overestimation of the strength of the column. This will always be the case when an approximate elastic curve is assumed, since the curve selected will not be that corresponding to the minimum strain energy in the column. Timoshenko has developed a more general method in which the elastic curve is represented by a sine series.<sup>20</sup>

Engineers will, I feel sure, be grateful to Professor Van den Broek for giving the term 'wow' a respectable place in their vocabulary. Formula (3) the 'wow' formula is well known to readers of British literature under the name of the Perry formula. Professor Perry was presenting it to second-year students at the Finsbury Technical College in 1886. The derivation of the formula and its extension to various conditions is given in a paper by Ayrton and Perry<sup>21</sup> published in the same year. On the basis of mathematical studies and an examination of the results of tests the authors made the following statement: "The conclusion at which we have arrived is, then, that any want of straight-

ness in the unloaded strut, or want of homogeneity in the material, may be allowed for by a term "c" such that it may be taken on the lateral deflection of a homogeneous carefully loaded strut. In more recent years the formula has been associated with the work of Professor Andrew Robertson.

Professor Robertson's paper on "The Strength of Struts"<sup>22</sup> has not received the attention which it deserves. He showed that the eccentricity formula fits experimental results, not only for steel specimens of various types, but also for specimens of wood, cast iron, wrought iron and duralumin. It is interesting to note also that there is a close correspondence between the results given by this formula and those given by the Forest Products Laboratory formulae for wood column. The Building Research Station have shown that the formula can also be applied to reinforced concrete columns. For each material and column a choice of suitable values of  $s_1$  and  $e^1$  must be made. For the term  $\frac{e^1 c}{i^2}$

Professor Robertson, following Perry, proposed to substitute  $\frac{L}{i}$ , thus making the 'wow' proportionate to the slenderness ratio. In this form the Perry formula was incorporated in the British Standard Specifications for Steelwork in Buildings (1934) and has subsequently been adopted by a number of other countries in the Empire. In Canada, following extensive discussion a similar formula was included in the section on Steel Construction of the National Building Code. The formula is also included as an alternative to the straight line formula in the C.E.S.A. specification for Steel Structures for Buildings (1940).

The close similarity between the secant formula and the eccentricity formula was first pointed out by Professor Perry who proposed to substitute for an eccentricity  $e^1$  an initial curvature represented by a sine wave with a value at mid-height of  $\frac{6}{5} e' \frac{S}{S_c - S}$  where  $S_c =$  Euler stress,  $S = \frac{P}{A}$ . Timoshenko has suggested a value of  $\frac{4}{\pi} c' \frac{S}{S_c - S}$  for the same fraction. The important point, as Professor Van den Broek has shown, is that similar results can be obtained from the eccentricity and curvature formulae and consequently the eccentricity formula is to be preferred since it is somewhat more convenient. On the other hand, a column formula does not have to be worked out very often and it may be mentioned that D. H. Young<sup>23</sup> has presented families of design curves based on the secant formula.

In considering columns with restrained ends, it does not appear that Professor Van den Broek's statement that eccentricity, partial restraint, end moments and the  $L/i$  ratios are the same in every conceivable respect, is true. Would it not be more accurate to say, that, following the principle of St. Venant, the result of either eccentricity, partial restraint or the application of end moments may be expressed by considering the effective length of the column to be reduced.

The subject of columns forming members of continuous frameworks cannot be considered in general terms. Each type of structure presents its own difficulties and Professor Van den Broek wisely leaves these for future consideration. The problems are inherently complex, much more so than the problems of finding column formulae, and the difficulty of determining the eccentricity (or end moments) when the fibre stress reaches some pre-determined value is not necessarily greater or lesser than the difficulty of finding the effective length.

Extensive studies of columns in building frameworks have been made by Professor Baker.<sup>24, 25</sup> He showed first, that, by making a number of simplifying assumptions, it is possible to develop curves representing the effective lengths

<sup>22</sup>Robertson, A., The Strength of Struts, Selected Engineering Paper, No. 25, Inst. Civil Engineers.

<sup>23</sup>Young, D. H., Rational Design of Steel Columns, Proc. Am. Soc. Civ. Eng., 1934, p. 1421.

of axially loaded columns with semi-rigid beam connections. Professor Baker found that this method would not work in the case of eccentrically loaded columns, but he found it possible to extend a graphical method by Howard to cover certain cases.

Professor Baker's later studies lead him to the following conclusions "The process of designing a pillar . . . is made no more simple or accurate by first considering the pillar as pin-ended and then applying a connection to allow for the restraints existing at the ends. Much more than this can be said of the pillar in an unsymmetrical frame or where beams are unsymmetrically loaded. The very factor, which, in the symmetrical case produces restraint will, in the unsymmetrical, be responsible for large bending moments which alter the effective length making rules so inaccurate as to be potentially dangerous."

Among other things, Professor Baker pointed out that it is impossible to tell, without an elaborate analysis, whether the maximum stress in a column in a building will occur at the middle or the ends. On the basis of Professor Baker's work, the Steel Structures Research Committee recommended a method of column design in which no mention is made of a column formula. This method did not receive wide acceptance, partly because, with the unit stresses proposed it did not lead to any saving in weight, and partly, it is thought, because the method, though simple to use, is difficult to derive and explain.

If we do not use some such rational method, the alternative appears to be to keep on guessing. It is difficult to see any advantage in consolidating our guesses into one or two variables as proposed by Professor Van den Broek. It seems more reasonable to try to make separate estimates of the effects of initial crookedness and end restraint than it does to try to make one guess as to the combined effect of these two variables. Thus I cannot agree with Professor Van den Broek's criticism of the recommendations of the Committee on Steel Column Research of the American Society of Civil Engineers.

We must realize that the process of designing columns as commonly practised is an extremely crude procedure. The consequence is that in some cases columns are made too strong and in other cases too weak. Thus, without questioning Professor Van den Broek's statement that for many types of construction, our column formulae are too conservative, it may be suggested that the opposite is also true. In the course of comparatively few years the assumed live loads on buildings have been reduced by about 50 per cent, allowable working stresses have increased by about 25 per cent, materials of little strength have been used for fire protection in place of concrete or brickwork and many dubious assumptions have been made about effective lengths. Thus, in building frameworks, it is not believed that any further reductions in the factor of safety are justifiable on the basis of our present knowledge and methods of design.

This contribution to the discussion may well close with a quotation from the Report of the Quebec Bridge Inquiry (1908) "We think that, in popular engineering opinion, the ultimate strength of steel columns is largely overestimated."

J. S. NEWELL<sup>26</sup>

Rational methods of analysis for long slender columns were established two centuries ago when the Euler formulae for critical compressive loads and stresses were developed. Rationalization of methods for predicting the allowable loads on short columns and on those of intermediate length has been the aim of engineers and mathematicians for many years, but whether or not complete rationalization can ever

<sup>24</sup>Baker, J. F., A note on the effective length of a pillar forming part of a continuous member in a building frame, 2nd Report, Steel Structures Research Committee, 1934.

<sup>25</sup>Baker, J. F., The behaviour of a pillar forming part of a continuous member in a building frame. Final Report, Steel Structures Research Committee, 1936.

<sup>26</sup>Professor of Aeronautical Structural Engineering, Massachusetts Institute of Technology, Cambridge, Mass.

be achieved seems doubtful. It appears that certain factors for short columns must always be established by empiricism or experience, hence that the formulae containing them cannot be classified as being completely rational.

That such factors may have greater effect on the results obtained for a given column than does the choice of design formula is indicated by the author's Fig. 3. The difference in  $P/A$  obtained by the author's Formula 3 and the secant formula are shown to be insignificant when compared with small changes in the non-dimensional quantity  $ec/i^2$ . The quantity  $c$  represents the distance from the centroidal axis to the extreme fibre, while  $i^2$  is the ratio of moment of inertia to area of the member. For a rectangular section  $c/i^2 = 3/c$ , whereas for a circular member of radius  $r$ ,  $c/i^2 = 4/c$ , and for I-beams of average proportions it is about  $1.5/c$ . The "effective eccentricity" for any member may be expressed as  $e = ki^2/c$ , where  $k$  is established for various types of member by tests or experience. It cannot be obtained rationally, and while the above relations may be helpful to the engineer when he chooses a value for  $ec/i^2$ , or when he is co-ordinating test data, they do not of themselves yield unique values for the eccentricity. Engineers using the secant formula, or the author's "Initial Crookedness Formula," must bear this fact in mind and must realize that the accuracy of the predicted allowable load for a given column obtained by either formula depends upon the accuracy with which the assumed value of  $ec/i^2$  represents the actual effective eccentricity in the column.

As stated by the author, eccentricity of end loading, initial crookedness, end moments or partial restraints, and ratios of effective to geometrical length produce similar effects on column strength. Eccentricity due to non-homogeneity of material in any cross section is in the same category. Each represents a factor which is unpredictable for any given member, but one which may be combined with others to give an overall effective eccentricity which may be determined by actual test on a member even though it cannot be predicted. Kármán, and other investigators,<sup>27</sup> have evaluated such eccentricities, or eliminated their effects, by moving the ends of the member undergoing test with respect to the knife edges or hemispherical blocks through which the loads were applied. When a load approaching the Euler critical could be applied to a column undergoing test without producing buckling, the effective eccentricities were considered to have been removed. A predetermined eccentricity could then be introduced and the behaviour of the member noted.

It is interesting to observe how closely the Euler load was approached during the tests described in the appendix to the author's paper without adjustment of the end loads to offset the eccentricities of the specimens. The excellent results obtained can probably be explained by the slenderness of the specimens used, most of them having  $L/i$  values above 100. Since many building and bridge columns have slenderness ratios between 50 and 100, it would be interesting to have test data on members in that range.

Figure 19 does get down to an  $L/i$  of about 60, and it shows excellent accord between experimental data and the stresses predicted by the secant formula for a rather large value of  $ec/i^2$  on a round rod. Similar data on the angle sections would, perhaps, have been more illuminating. They certainly would have if the angles had had wide, thin legs, say a ratio of width to thickness between 20 and 25 instead of 12, as the failures would then have resulted from a combination of torsional and bending instability and would have occurred at loads less than those indicated by Euler's formula even for the long slender members. This more general form of instability has been treated by Wagner<sup>28</sup> and Kappus,<sup>29</sup> and has been utilized by aeronautical

engineers who must guard against failures involving torsional buckling as well as those caused by bending instability or local buckling. Civil engineers normally avoid such columns and many are unaware that means are available for analyzing them.

The author's development of the secant formula is clear, and his development of the initial crookedness formula is also simple and easy to follow. The latter is obviously superior to the secant formula for practical use since it does not involve a trial and error solution. Each of these formulae and the more general Formula 5, depends upon the  $ec/i^2$  term, however, hence gives results which are functions of the engineer's experience and judgment. They are interesting, and the conclusions drawn from them appear correct, but the writer cannot concede that their use in design will insure safer or more economical structures than can be obtained by other expressions. Euler's formulae are certainly satisfactory for long slender members, that is, for members where the critical stress is less than half the yield point of the material, or less than half the crushing stress on sections subject to local buckling. For short columns, and those of intermediate length, the engineer has a choice between empirical straight lines, the J. B. Johnson parabola, and the more rational reduced-modulus formulae such as those depending on the tangent modulus of elasticity.

Whatever formula is used for the shorter members, be it complex or simple, requires some degree of empiricism. Some term is included which is not predictable by mathematics for any given member, or which is modified to conform with the results of tests. Whether it be  $ec/i^2$ , the ratio of effective to actual length, or the manner in which  $E$  is varied in a reduced-modulus formula, something must be contributed by the engineer and, in this writer's opinion, it is far more important that he be familiar with several formulae and their limitations than that he accept any one and use it blindly.

Many engineers deal only with columns composed of standard I, channel, or angle sections, none of which contain elements subject to local buckling failures. Under the economic system which will probably exist after the war, the demand will be for lighter and cheaper structures. Materials lighter than steel may then be cheap enough to compete with it. Such materials have lower moduli of elasticity than steel, are more susceptible to local buckling and to buckling as complete units, and sections fabricated from them will involve numerous problems of stability not encountered in older types of members. Structural designers may follow the aeronautical engineer's lead in solving some of their problems, but they cannot follow him blindly since stiffness is of greater importance to them than to him.

They can follow him and improve the economy of systems of members by broadening their knowledge of the stability of frames. The author touches upon this phase of the design of compression members, but he was obviously forced by space requirements to touch it but lightly. Much has been learned in this field in the past few years. A great deal more remains to be learned and it is hoped that civil and aeronautical stress analysts may explore the problems together.

Dr. Van den Brek's paper covers a breadth of material and problems, and it should serve as a challenge to young engineers to explore some of the methods he suggests. As such it is a contribution for which the engineering profession as a whole owes him a debt of gratitude, and one for which the members of the profession who accept the challenge will, as individuals, never be able to repay him.

J. M. OXLEY,<sup>30</sup> M.E.I.C.

Professor Van den Broek's paper is of great interest, due to both the ground covered and the clarity of the presentation.

The ultimate value of any such study is in the effect it may have on actual design practice.

<sup>30</sup>Chapman and Oxley, Architects, Toronto, Ont.

<sup>27</sup>See Chapter III, "Theory of Elastic Stability," S. Timoshenko, McGraw Hill Book Co., 1936.

<sup>29</sup>R. Kappus, "Twisting Failure of Centrally Loaded Open-section Columns in the Elastic Range," N.A.C.A. Tech. Memo. No. 851.

For the reader, digestion of the argument would have been easier if the author had included a table of notation, and if the symbols employed in the present paper and his paper on a similar subject in the March, 1941, issue of the *Journal* had corresponded with each other. In the following discussion all symbols used have the same significance as in the paper except that the radius of gyration is denoted by  $r$  instead of  $i$ .

The author's distinction between "stress" and "strength" is particularly valuable in that it reinforces the present tendency toward consideration of the *strength* of a structure as a whole, as contrasted with the *stresses* in its component parts at working loads. The author states that he regards the use of "design formulae which are too safe, too conservative, as the greatest engineering sin second only to that of not being safe enough." I would award that distinction to "unbalanced" design—not safe enough in one part or too safe in some parts but not in all. On the one side danger, on the other, waste.

It is only by applying a given factor of safety or load factor to the ultimate strength of the complete structure that this sin can be avoided. One can agree in principle with the author's opinion that the emphasis on working stress is, in many types of structures, "archaic, confusing and often misleading," and yet face with some apprehension the thought of applying limit design to all of these problems.

To the designing engineer the important question is how to apply analysis in the design of actual structures. Useful leads are given in Figs. 8 to 11, and 12 to 14 and the accompanying discussion. A valuable addition to the first group would be the case of the column having end moments both in the same sense but different in amount—the column resisting side thrust from wind or other source by means of rigid connections.

Referring to the culvert frames illustrated in Figs. 12 to 14, the application to an actual design problem is difficult. Such a frame would probably have to resist side sway and moments from distributed side loads, in addition to the vertical loads indicated. To obtain results by the indirect or trial and error method given would then become difficult, if not impossible, because the unrelated load conditions would also have to be considered.

The author refers to these examples having been "selected with a view to giving to the column a loading pattern as unfavourable as we can imagine." Surely, if the column is merely turned to have its web in the same plane as that of the beam we get a more unfavourable condition. That is, the column will be capable of supporting a lesser axial load because it will resist a greater portion of the moment from the beam at all column lengths. Also the critical  $r$  may still be the minor one, which is not influenced favourably or otherwise by the bending moments, so that, for all values of  $l/r$  greater than the point of intersection with the Euler curve for this smaller  $r$ , the latter will fix the limit load.

There are several general considerations to which further emphasis should be given in any discussion of column analysis.

First, there is the question of effective length, the  $L/l$  ratio, in application to actual design. There are three specifications for design of steel structures in general use in Canada to-day—the Canadian Engineering Standards Association 1940, the National Building Code 1941, and the American Institute of Steel Construction 1937. Not one of these makes any suggestion that the effective length of a column is anything but the "unbraced length," except that the C.E.S.A. specification gives a hint in defining  $L$  as the "equivalent free length" but gives no indication as to how this equivalent length may be ascertained.

The reason is simple enough but does not reflect credit. It is that any attempt made so far to set forth an accurate method of determining the  $L/l$  ratio is so complicated that it is not practicable to include such a method in a specification. The "recommendations for practice" of the British Steel Structures Research Committee as given in their final

report are an example of the complications involved even in their "simplified" method.

In effect, the present position is that the able and experienced authorities chosen by various groups have let this question go by default, to be worried over or ignored by their possibly less able and experienced confreres who design to comply with the specifications. A column may be designed for an  $l/r$  ratio double the true one with a resulting waste of over 40 per cent of the material used. Considering the approximations we already apply in our assumptions regarding live loads, the allowance for or ignoring of initial crookedness, and other elements, it would appear that a set of diagrams similar to those of the author's Figs. 8 to 11 could be prepared covering all the usual cases with sufficient proximity to the theoretical truth, and a clear cut statement could be given showing the method of dealing with unusual cases.

Another question which has seldom been considered is that of the effect of the location of the point of maximum stress. When a member in compression buckles at the critical load a new set of conditions arises. In a round ended column this buckling is a maximum at or near the centre of the length. In a column with restrained ends and end moments, the combined bending and axial stresses may reach a maximum at one end of the column or at some other point depending on the sense and amount of the moments. If this maximum occurs near one or both ends the buckling tendency of the column may cease to be a critical factor.

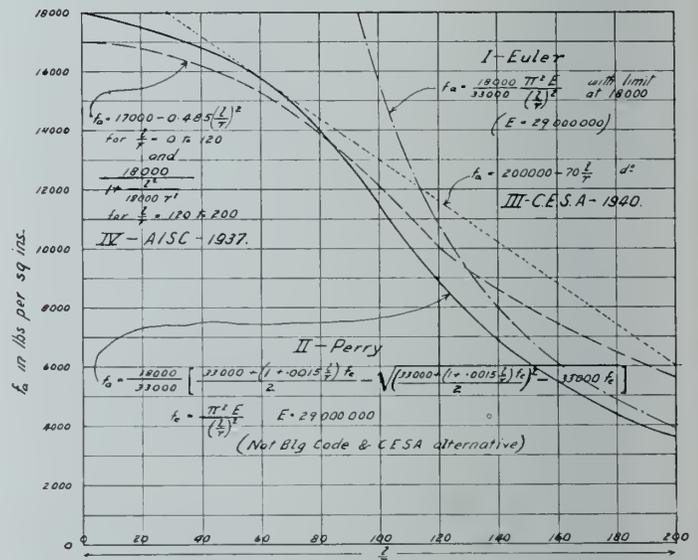

Fig. 31.

Under our present specifications the location of the point of maximum stress has no influence on permissible combined stress.

It would appear that the decision as to when to consider compression members as beams rather than columns and apply the principle of superposition, should depend on the location of maximum stress more than on the slenderness ratio of the member.

The most general, and possibly most important, point is the wide diversity of opinion as to basic working stresses in columns, particularly in those with a slenderness ratio of from 100 to 200. All of the specifications mentioned agree in permitting a basic working stress of 20,000 lb. per sq. in. for members in tension or in bending, yet note the diversity in compression. (Fig. 31).

These graphs show the permissible working stresses for columns under the three specifications mentioned and also the Euler curve for round ended columns for similar constants. (The curve for the Perry formula shown corresponds with the author's Formula 3 for a column with  $c/r^2 = 1$  and an initial eccentricity of  $l/1333$ ).

The three specification curves hang together fairly well for the range from 40 to 80  $l/r$ , but note the relation at 140  $l/r$ . Curves II and III represent alternatives permitted under one specification without any indication as to preference. At 140  $l/r$  III gives a working stress 50 per cent higher than II. Either the designer who chooses II is wasting a lot of material, or the one who prefers III is running close to danger.

Certainly, one is inclined to agree with the author that there is little purpose in taking account of such niceties as initial eccentricity when so much latitude is permitted for more important elements, and when no guidance is given as to effective length.

The simple fact is that these specifications are used by many who may lack time, experience or ability to do more than accept them at their face value. They may be used by a few who are interested chiefly in producing the cheapest possible design regardless of its all-round efficiency. At present the problems of column design are the ones in which most indefiniteness and uncertainty exist, and therefore most in need of further research and analysis.

It is not the primary purpose of these comments to criticize the framers of specifications and codes. I have had enough experience on working committees to have deep sympathy with, and sincere appreciation of those who devote their knowledge, time and labour to such work.

I present a plea that the author, with his ability and facilities, and others in a like position, do not—"leave to the engineer in any special field the problem of determining the coefficient  $n$ "—or other equally important elements, without giving more light on methods of practical application, and, in general, guiding us farther through this tangled growth.

P. L. PRATLEY,<sup>31</sup> M.E.I.C.

These notes were first drawn up for use in verbal discussion, but the writer was unable to reach the meeting in time to take part. They will appear somewhat disconnected as written discussion, but pressure of work prevents re-editing. They are therefore offered with apologies.

The writer's general view is that the paper is not clear in its statements and many claims are made which have no substantial basis either in fact or in the argument presented. The true value of the assumption is not always stated or admitted, and certain conclusions are, therefore, misleading.

1. Page 570—In the discussion of the Secant Formula, the author states that when the eccentricity approaches zero, the elastic curve approaches a sine curve and when the eccentricity approaches infinity, the elastic curve approaches a circle. These statements are not proved and in fact are not true. One valid conclusion can however be drawn from the next sentence wherein the author states the true curve falls between the sine curve and an arc of a circle. This obvious conclusion is that the curve is not a sine curve, and this conclusion has the virtue of being true.

In the author's earlier paper entitled "Euler's Column Formulae" he is on surer ground in that he frankly states he is merely assuming the equation of the elastic line to be a sine curve and on this assumption proceeds to develop what appears to be Euler's Formula. He notes that "the value of  $P$  obtained by this formula is the critical value which initiates the buckling of the column. Equilibrium would be obtained for any value of delta provided the column is not stressed beyond the elastic limit." To the writer, this phrase raises the question as to what precisely is meant by the Euler value. The writer was taught, as far as he remembers, to regard the Euler value as that load which a perfectly straight and pin-ended column of uniform cross-section and uniform elasticity, could resist without starting to buckle. The first half of the above quotation from the author's earlier paper would seem to support this view. But according to Bauschinger, quoted in Huette, the

<sup>31</sup>Consulting Engineer, Montreal, Que.

Euler value is that value at which the deflection of the ideal column which heretofore has grown steadily and proportionately with the increasing load, will suddenly exceed any measurable value. The second half of the author's statement above quoted would seem to adopt this interpretation. In his present paper the usage in general seems inclined to the second view, that is, the load which would keep the ideal column in equilibrium regardless of deflection. The expression itself  $\pi EI/L^2$  is obviously independent of deflection and dependent only on the physical and geometrical properties of the column.

The writer thinks it would be worth while to refer to the method of its derivation. The ideal pin-ended column is presumed bent by some agency and to be in equilibrium under the axial load  $P$ . If the deflection at any point distant  $y$  from the mid-point be  $x$  then the bending moment at this point is  $P.x$ . Now at any point whatever along the column under the usual assumptions upon which the theory of elastic bending is based,  $1/R = M/EI$ , and at the centre point where  $dx/dy = 0$ , the curvature  $1/R$  is equal to  $d^2x/dy^2$ . This is only true at the centre point, but the convenient assumption is now made that  $1/R$  at any point may be equated, without appreciable error to the second differential, which is equivalent to assuming  $1 + (dx/dy)^2 = 1$ . It will readily be seen that this equation can only be strictly true if the elastic curve is at all points parallel to the axis, as it is at the mid-point. Therefore the assumption is only an approximation, growing in closeness as  $dx/dy$  decreases. As long as we confine ourselves to very small deflections, the first differential is also very small, its biggest value being at the ends of the ideal column. The assumption is a convenient one, mathematically, and is reasonably legitimate, as long as it is properly appreciated. The assumption having been made (ablative absolute)  $1/R = d^2x/dy^2$  and  $= P.x/EI$  arithmetically and a differential equation results:

$$\frac{P}{EI} x + \frac{d^2x}{dy^2} = 0$$

The solution proper to the boundary conditions is

$x = \Delta \cos \sqrt{\frac{P}{EI}} y$ ; where  $\Delta$  is the central deflection,  $L$  the length of the column,  $y$  being measured from the mid-point and  $x$  from the axis of action of  $P$ . At the ends of the column where  $y = L/2$  and  $x$  must = 0,  $\cos \sqrt{\frac{P}{EI}} \cdot \frac{L}{2}$  must also = 0.

Therefore  $\sqrt{\frac{P}{EI}} \cdot \frac{L}{2} = \frac{n\pi}{2}$ ; where  $n$  is an odd integer, and for our simple case is unity. Thus  $\sqrt{\frac{P}{EI}} \cdot \frac{L}{2} = \frac{\pi}{2}$  or  $P = \frac{\pi^2 EI}{L^2}$

2. The author in his earlier paper, by assuming the sine curve, and obtaining the deflection geometrically from the moment curve, arrives at this same result and calls it Euler's formula. If he had assumed some other form of curvature he would not have obtained this value, but he does not seem to assert clearly anywhere that this second interpretation of the meaning of the Euler value depends entirely on the assumption of a sine curve as the elastic line. The correct curve is known to investigators and is termed the "Elastica." This curve is free from the restriction that deflections must be kept very small, and is therefore true for very slender columns, such as strips of spring steel. It is, however an awkward thing to handle as it involves elliptic integrals, and is obtained by intrinsic co-ordinates. Generally:

$$s = \sqrt{\frac{EI}{P}} \int_0^\phi \frac{d\phi}{(1 - \sin^2\theta \sin^2\phi)^{3/2}} = \sqrt{\frac{EI}{P}} (F. \theta. \phi.); \text{ where}$$

$$\phi, \text{ the amplitude} = \cos^{-1} \frac{x}{\Delta} = \text{and } \theta, \text{ the modulus}$$

$$= \sin^{-1} \frac{\Delta}{2} \sqrt{\frac{P}{EI}}, s \text{ being the length along the curve,}$$

measured from the mid-point either way. For  $S$ , the length from mid-point to end,  $x=0$ ;  $\phi = \frac{\pi}{2}$ , and  $S = \sqrt{\frac{EI}{P}} (F_1, \theta)$ , the symbol  $F_1$  denoting the complete elliptic integral.

The interesting feature of this curve for our present purpose is that if  $\Delta = 0$ , the modulus  $\theta = 0$  and  $S = \sqrt{\frac{EI}{P}} \times \frac{\pi}{2}$  or  $P = \pi^2 EI / 4S^2$ , and, as this  $S$  is half the length of the column, we have the Euler value  $P = \pi^2 EI / L^2$ . Note that this value only obtains for zero deflection or the unbuckled column. If  $\Delta$  has some small value greater than zero, so does the modulus  $\theta$ , and  $S$  is slightly greater than  $\sqrt{\frac{EI}{P}} \times \frac{\pi}{2}$  which means that  $P$  must be slightly less than the Euler value, if equilibrium is to be maintained.

This was the writer's original understanding of the Euler theorem, and it is his opinion that the author should express himself clearly on this point as will be referred to again in paragraph 5 of these notes.

3. Also in the derivation of the Secant Formula, the writer would regard the author's procedure as more clear were he to introduce an extra line or two in order to state that only at the mid-point of his column is the curvature equal to the second differential, because only at this point is the first differential equal to zero. In the true curve of the column, as already explained, the equation  $\frac{1}{R} = \frac{M}{E \cdot I}$  holds for every point, which is the basis upon which the "elastica" is built and which fact demonstrates that the sine curve is only a convenient approximation.

4. No worthy object is apparent in the statement that the relationship given at the top of page 571 throws no light on the strength of the column, and it again seems misleading to suggest that this formula is of no value except when the stress in question is the elastic limit stress and the corresponding load is the critical load. If the derivation is justified, then it must be true that for any value of  $s$  up to the elastic limit,  $P$  is the corresponding load, or vice versa, for any load  $P$  less than the critical load, the resulting maximum fibre stress is as evaluated by the formula. This remains true down to and including equation (b).

5. The author then introduces the Euler value for  $P$  without saying when this value is good and in the next expression actually has two meanings for  $P$ , firstly that value of the load which causes or produces the elastic limit stress  $s_l$  and secondly the Euler value of  $P$ . He uses the first significance when dividing the load by the area and the second in both the other occurrences. His Secant Formula (1) needs therefore, to be explained much more fully and its assumptions and limitations honestly described instead of being quoted as "quite exact." The inverting of  $\frac{P}{EI}$  in two cases is manifestly a printer's error.

6. It is now pertinent to enquire into the soundness of the argument leading up to the statement that initial crookedness is insignificant. This argument is introduced by a straight honest-to-goodness admission that the curvature is assumed to be initially and continually a sine curve. This assumption permits the integration of the area of the moment diagram and leads to the establishment of equation (c) which in turn shows that  $\Delta$  depends on  $e^t$ .

The legitimacy of the statement that the difference in curvature between the initial and final states represents the additional moment divided by the stiffness factor ought to be established and it should again be noted that the identity of the rate of curvature with the second differential only holds at mid-point where the first differential is zero. The author states that the stress due to the increase in curvature is  $s = \frac{\pi^2 \Delta \cdot c \cdot E}{l^2}$  and that the resulting extreme fibre stress on the inside of the curve is this same quantity plus the average compression unit. The question arises where is the

stress due to the initial curvature? However small the increase in curvature, the bending moment is  $P(\Delta + e^t)$ , and the fibre stress from bending must be a function of this total deflection. The fact that the column is initially crooked suggests to the writer that there is no bending stress at the mid-section under no-load when  $P$  is zero even though there is the deflection  $e^t$ , but as soon as a load is applied, a bending moment equal to  $P \cdot e^t$  exists. This moment causes further deflection, equilibrium being reached when sufficient energy has been expended to deflect the column  $\Delta + e^t$ . It seems therefore that equation (d) needs some substantiation.

7. Accepting (d) as presented for the moment, the elimination of  $\Delta$  from equations (c) and (d) produces a relationship between  $P$  and  $s$  which relationship depends upon the sine curve assumption. Nothing appears to be gained at this stage by introducing the Euler value of  $P$  and the solution of the equation might just as well be stated simply as

$$\frac{P}{A} = \frac{1}{2} \left\{ s + \frac{\pi^2 E}{\left(\frac{l}{i}\right)^2} \left(1 + \frac{e^t c}{i^2}\right) \right\} - \sqrt{\left\{ s + \frac{\pi^2 E}{\left(\frac{l}{i}\right)^2} \left(1 + \frac{e^t c}{i^2}\right) \right\}^2 - 4 \frac{\pi^2 E \cdot s}{\left(\frac{l}{i}\right)^2} \right\}, \text{ thus}$$

omitting two lines of text.

8. This relationship between  $P$  and  $s$  is described by the author as "purely academic and of no interest to the designer." Such a statement seems fantastic as it is of extreme interest to the designer if it is true, and moreover is the basis for the author's formula 3 at the top of page 572. The statement is, therefore, not only superfluous but definitely misleading. It accomplishes nothing and raises doubts in the mind of the reader as to the sense displayed in any effort to determine the relationship. While it is quite true, assuming the equation to be mathematically correct, that if we define  $s^l$  as being the elastic limit stress, the load  $P$  becomes a symbol for the corresponding load producing the elastic limit stress, it is equally true that if we define  $s$  as 16,000 or 20,000, or whatever we choose as a working unit, the symbol  $P$  expresses the load that the column can carry without exceeding such permissible unit; and this is equally useful.

9. Still accepting tentatively Fig. 3, it is of course visible that the introduction of the term involving crookedness makes only a slight difference in the capacity of the column, but why does the author introduce the term "slender"? The sturdier the column, the smaller the absolute difference and it would appear from the curves that the slender columns suffer about the same proportional change as the medium columns.

10. On page 572 the author takes advantage of the opportunity to inject the idea of designing to a factor of safety on the limit load as distinguished from the general practice of designing to a factor of safety on the limiting fibre stress. Dismissing the latter as archaic, etc., he then makes the sensational statement that the term  $P/A$  has no physical significance. This statement must be energetically opposed, as it is grossly untrue. It appears to be introduced, as are many other statements in the text, as the thin edge of a wedge intended to discredit all previous methods of analysis and design, and to establish the so-called limit design as the only sound, safe, and proper method. In the vast majority of structural members met with in practice, the term  $P/A$  means exactly what it expresses, namely, the average stress per unit of area. It expresses this quantity regardless of whether  $P$  is the maximum capacity load or any other load less than the capacity load. It cannot be avoided as an essential and often the governing portion of the total stress, and in all the author's formulac, he is compelled to acknowledge this fact and to introduce the quantity. Most of the ordinarily

accepted formulae for column design state that the extreme fibre stress for any section consists of two parts, one being this average stress and the other being an additional term imposed by one or more of a variety of influences, principally bending from some cause or other. In straight tension or compression, the term  $P/A$  stands alone as the indicator for intensity of stress or for the capacity of the member. Notwithstanding the author's statement that there is no reason for invariably interpreting the term as stress, it always is stress and all that the author is entitled to say, is that it is not always the maximum or the extreme or the governing intensity of stress, which again is almost axiomatic.

11. Objection must also be taken to the finality with which the author states that crookedness or eccentricity determine the direction in which the column deflects. This statement should at least be reduced to "may determine" as it is quite evident that the geometrical properties of the column very frequently have a controlling influence.

12. The use that is made of Fig. 5 at the top of page 573 is also open to question and the statement that the point of deflection always coincides with the quarter point, is inclined to be misleading unless it is duly emphasized that complete fixity at both ends of the column is maintained and unless it is appreciated, that this result accrues from the convenient assumption that the column bends as a sine curve.

13. The author's excursion into logic seems to be particularly unfortunate. While it is quite easy to see the drift of his argument, the statement that "eccentricity, partial restraint or end moments, and the ratio  $L/l$ , are identities" is far from logical. It is obvious that they cannot be identities "the same in every conceivable respect" because the measure of eccentricity is a length, the measure of end moments is length multiplied by force and the ratio  $L/l$  is simply a number. It would be much clearer although less sensational, if the author were to state what he means, which is "that the equilibrium condition of a column, bent under load can be clearly expressed if we can determine any one of these three functions, namely, eccentricity of applied load, degree of end restraint, or length of the elastic line between points of contraflexure." No system of logic can admit that these three things are identical. The only identical thing about them is that they are equally useful under the sine curve assumption in establishing desired relationships between load, deflection and fibre stress.

14. Under the heading "General Column Formula," the author makes two statements to both of which reference has previously been made. He says that very satisfactory results are obtained if the analysis is based on the assumption that the column assumes the shape of a sine curve. With this the writer fully agrees but the author also says that the characteristic of the pin ended column is that when it deflects it assumes the shape of a sine curve which, of course, it does not and it must again be regarded as unfortunate that the language should be so inconsistent and misleading. Furthermore, the author says in the same paragraph "if the elastic curve assumes the shape of a sine curve under any one of these loadings individually, it will do so under the action of any combination of these loadings collectively." This again is untrue, for only if the curve follows the sine curve for each of the individual influences, will it do so under the action of any combination of these influences.

15. Under the same heading in the second column of page 573 the author proceeds to deal with the case of a column subject to compression load, a uniformly distributed lateral load, and an initial deflection. He quotes the fundamental elastic energy equation but without defining  $F$  and without mentioning the further assumptions that have to be made in order to obtain the expression

$$\Delta = \frac{\text{Area} \times \bar{x}}{EI}$$

Incidentally it would have been clearer had he maintained

$y$  as the running dimension of his column instead of changing to  $x$ , which had previously been his lateral dimension. The paragraph which follows seems to be lacking in clarity principally because the terms introduced are not defined. The bending moment diagram expresses the fact that the bending moment at any point includes the joint effects of the compression load multiplied by the actual deflection at the point, and of the lateral load with its reactions. The area of the bending moment diagram may thus truly be said to consist of two parts namely the part due to the load  $P$  and the part due to the lateral load. The deflection consists of three parts, namely the part due to the initial crookedness which is assumed to lie in the plane of the lateral load, secondly, the part due to the strain from the lateral load and thirdly, the part due to the effect of the compression load  $P$ . If it be imagined that the loads are applied in that order then the column will continue to deflect from the position it occupied under the initial crookedness and the lateral load, until equilibrium is established, when the bending moment from the compression load will be the product of  $P$  and the final deflection. Thus in Fig. 6 the maximum deflection ( $\Delta + e'$ ) includes all these effects and the author's equation (e) is approximately true. It ought to be noted however, in obtaining this expression he still assumes that the final elastic curve of the column is a sine curve although it is quite manifest that the deflection from the lateral load contributes a parabolic portion, which may under suitable circumstances be the controlling feature. When re-arranging equation (e) the author introduces  $s$  taken from his earlier equation (d) where it was defined as the stress due to the increase in curvature plus the stress due to the direct load. His equation (f) therefore states that the total increase of curvature arising from both the lateral and the vertical load, bears a linear relation to the total bending stress or vice versa. Following equation  $F$  he proceeds to eliminate the deflection and in so doing introduces again the Euler value of  $P$  which is confusing because the expression  $\frac{\pi^2 E I}{L^2}$  really originates from the geometrical properties of the assumed sine curve deflection diagram.

16. The interesting case of the quadratic equation for  $\frac{P}{A}$  is that given in formula 5, when the lateral load and the initial deflection are both zero, and in expressing this formula both roots of the radical should be retained. Figure 7 would then be readily explained, as the plus sign produces  $s'$  everywhere and the minus sign produces the Euler curve everywhere, so that it can be said quite simply that the formula yields the Euler curve except where artificially prevented by the introduction of the limiting fibre stress  $s_l$ . The figure also indicates that for values of  $l/i$  less than the critical  $\frac{l}{i} = \pi \sqrt{\frac{E}{s}}$  the introduction of the limiting fibre stress means that the capacity of the column is  $P = s \times A$ . For values of  $l/i$  greater than the critical, that is to say, where buckling would occur before  $s_l$  is reached, the Euler value is the value consistent with equilibrium.

17. Page 574. Theory and practice would not conflict if both were perfect. But surely as an alternative to the author's conclusion that theory is usually worthless, there lies the possibility, elsewhere admitted by him, that practice falls short of perfection. Here again he misleads in his desire for the sensational. What he means and could rightly state, is that theoretical studies do not and cannot always appraise the practical departures from idealism. And everybody knows that.

Without expressing any particular fondness for the Secant Formula, the writer fails to see that anything is accomplished by classing it as futile, merely because some empirical value must be introduced for the item  $e$ .

This earlier and more academic part of the paper has proved so provocative that the later and more original part has not yet received the attention it deserves, and the

present writer must confess that although he has read it thoroughly several times, he has not found time to give it the necessary study. He must therefore regretfully leave it for later consideration as opportunity may offer.

F. R. SHANLEY<sup>32</sup>

The writer has always been interested in Dr. Van den Broek's clear approach to problems that are usually handled in an academic manner, and has noted below a few comments that may be of interest.

The author is correct in pointing out that the conception of  $P/A$  as a true stress has been very misleading, as applied to columns. In a paper on buckling (*Engineering Aspects of Buckling*, *Aircraft Engineering*, January, 1939), the writer tried to show the importance of load, rather than stress, by comparing the critical column load with the side load required to deflect the column a certain distance. The term  $P/A$  might be thought of as a measure of the resistance against end load, per unit cross-sectional area.

In this same paper it was suggested that the radius of gyration might be thought of similarly as "a measure of the bending stiffness per unit cross-sectional area." To be more exact, we should say that the radius of gyration squared is a direct measure of the bending stiffness per unit cross-sectional area and unit length.

It is encouraging to see more emphasis placed on the load-deflection curves, such as shown in Fig. 16. In our stress analysis work we have found an increasing need for such information, particularly in redundant structures. Some of the applications of load-deflection data in aircraft work are given in the above mentioned paper, under the heading "Restrained Buckling."

It would seem that a paper on the subject of rational column analysis should at least mention the important work that has been done to correlate column failure with the shape of the stress-strain diagram in the "plastic" range. This subject is well covered by many papers and is substantiated by actual tests (see paper by Templin, Sturm, Hartmann, and Holt, *Column Strength of Various Aluminum Alloys*, Aluminum Research Laboratories). Dr. Van den Broek's paper, through omission of this point, might give the misleading impression that the use of the eccentric loading theory is the only rational explanation of column behaviour. As a matter of fact, a column curve such as shown (in the author's Fig. 4) for zero eccentricity is far from rational, as it implies that the stress-strain diagram is elastic up to the yield point, then a horizontal line to failure.

Neglecting the influence of the actual stress-strain characteristics may also lead to other erroneous conclusions in other respects. In Fig. 13a for instance, the curve indicates practically zero column resistance for very short lengths. Actually the material would simply readjust itself by slight plastic deformation and would probably still be capable of withstanding a high column load, due to the existence of a reasonably high "tangent" modulus in the plastic range.

The use of a pin-ended Euler column curve for comparison, in Fig. 13a, is perhaps misleading, as a coefficient of fixity greater than unity would have been used for analysis purposes, at least in aircraft work.

The points on end restraint (page 6) are well taken, although they would be somewhat unfair if applied to airplane structural analysis. A great deal of work has been done to correlate column test conditions with actual conditions occurring in the airplane structure. Although much remains to be done, the need for such knowledge has long been recognized by aircraft engineers and many papers have been written in this connection. As a typical example, tests were conducted some years ago (at Consolidated Aircraft) in which compression panels for the top of a wing structure were tested over several supports, to obtain a direct correlation with routine panel tests. The effect of wing curvature under bending loads was also evaluated by

displacing the supports to simulate actual conditions. More recently similar work has been done by the NACA and other investigators.

J. C. TRUEMAN<sup>33</sup>

The identity of  $n$  and end moment is an interesting development in column theory. The problem will be to determine the coefficient. This could no doubt be figured in many cases by the elastic theory. The writer wonders whether the author would consider that the effect of deflections past the elastic limit should be taken into account when evaluating  $n$ . Such a procedure would probably be very involved and might yield results quite different from the calculation within the elastic limit. A case in point might be the effect of joint rotation and displacement on the co-efficient for a strut in a truss.

#### THE AUTHOR

It is extremely gratifying to find so serious and generous an interest taken by the numerous discussers in the paper on "Rational Column Analysis." The discussion high lights the extreme divergence of views relative to sense of value, objectives and proper assumptions, in connection with the column problem. The day before the paper was to be presented I pointed out that if all the mathematics were deleted from the paper, what I regard as 97 per cent of its real value would still be intact. If anyone was unduly impressed with the formulae in the paper, he missed the point that the purpose of all the mathematics was to show that all the formulae converge to one simple and well known formula, Euler's formula.

Mr. Pratley lists seventeen separate items of disagreement with my views. With one point which he makes I might almost agree. In his item 10 he says,

"It appears to be introduced, as are many other statements in the text, as the thin edge of a wedge intended to discredit all previous methods of analysis and design, and to establish the so-called limit design as the only sound, safe and proper method."

Quite evidently Mr. Pratley and I understand each other on this point, but, I would not say that I am disgruntled with "all previous methods." I have yet to find anything in August Föppl's methods of analysis, for one example, to which I can take serious objection.

Professor Lash says, "Timoshenko has developed a more general method in which the elastic curve is represented by a sine series." The test of our philosophy is: How is it going to facilitate the design of columns in engineering structures? If we have a load-stress relationship expressed in the form of an infinite series, the question then is, how are we going to use this series? We shall probably agree to ignore all but the first one or two terms of the series. Then our labour begins and by numerous cuts and trials and successive approximations we attempt to find a solution. After a few trials we say that we have obtained sufficient accuracy for our purpose. When Mr. Lash refers to a more general theory, does he not also mean a more exact theory? The relationship may be exact, but the results are approximate, because, first, we ignore all but the first one or two terms of a series, second, because we get tired of trial and error solutions since they must be continued for an infinite length of time in order to obtain infinite accuracy. I would like to suggest that the next time Mr. Lash wants to solve Professor Timoshenko's infinite series, he first solve for the value of  $P$  by means of one of my formulae, substitute it in the series, and satisfy himself that no further trial and error solution of the series is necessary.

While I acknowledge that there is a widespread agreement with Mr. Pratley's view, I must register one serious exception to this statement. In his item 8 Mr. Pratley states,

"It is equally true that if we define  $s$  as 16,000 or 20,000, or whatever we choose as a working unit, the symbol  $P$

<sup>32</sup>Chief Structures Engineer, Lockheed Aircraft Corporation, Burbank, California.

<sup>33</sup>Designing Engineer, Dominion Bridge Company Limited, Winton, Man.

expresses the load that the column can carry without exceeding such permissible unit; and this is equally useful."

Without fear of serious contradiction I claim that Mr. Pratley is unique in holding to this view.

Mr. Pratley regards some of my views as fantastic. He appears to dwell in the past, unaware that the era which formulated such ideas as working stresses, and factor of safety applied to elastic limit or ultimate stresses, is a closed era. If column analysis means anything it means that a conventional working stress in a column offers no criterion of its strength. In deference to some old-fashioned traditions we may juggle a factor of safety and thus arrive at something which we may call a new working stress, that is, if we sacrifice all attempts to be rational. But such a new working stress will then be different from our conventional working stress. In column analysis I believe we are all agreed, all except possibly Mr. Pratley, that our criterion of strength is the capacity strength of the column. Column analysis always has been a phase of limit design. It was so long before the phrase, "limit design" was coined and I see no evidence of any trend toward a change.

In his item 13 Mr. Pratley questions the soundness of my logic when he says,

"The statement that 'eccentricity, partial restraint or end moments, and the ratio  $L/l$  are identities', is far from logical. It is obvious that they cannot be identities . . . because the measure of end moments is length multiplied by force," etc.

In this remark Mr. Pratley avowedly touches a very sensitive spot. Engineering philosophy is my major interest in life and if I should prove vulnerable on this point it might well constitute a mortal blow. Let me ask Mr. Pratley whether, when he speaks of the velocity of a train or an automobile, he is always sure to specify that he means a velocity parallel to the surface of the earth? Surely a velocity is a vector quantity and has two attributes of equal importance, magnitude and direction. In speaking of the velocities of trains and automobiles, the direction is implied as being one parallel to the surface of the earth. The reader or listener draws the obvious conclusion that, if the velocity of an automobile in a direction other than one parallel to the surface of the earth were meant, some other information would be added in the nature of doctors, nurses or ambulances, and numbers of people killed or injured. In writing on columns I assumed a familiarity with columns equal to the average man's familiarity with trains and automobiles. I thought that, by mentioning eccentricity in connection with columns, everyone would know that I meant a *load eccentrically applied to a column*. And certainly, a load multiplied by a distance is equivalent to an end moment. Technically, I acknowledge I stand convicted, but no more so, I believe, than Mr. Pratley would be convicted of an inaccurate statement if he should speak of a train's velocity without specifying its direction.

Mr. Bruce Johnston lends a measure of support to Mr. Pratley's claim regarding the irrationality of my writing when he says,

"the writer looks forward hopefully to the possibility that at some future date, 'Rational Column Analysis' may become a practical reality."

He does not, however, point to anything irrational in my paper. But then, Mr. Johnston tells us he is engaged in column research. Possibly this rational column analysis may be looked for in his forthcoming report.

Mr. Durant joins Mr. Pratley in the defence of the secant formula. To this I will reply by quoting from the discussion by Dr. Hans Bleich, who says:

"I particularly appreciate the impressive explanation that eccentricities can only be determined after the buckling problem has been solved and that therefore the usual formulae for the carrying capacity of columns under eccentric loads are valueless."

For the benefit of Mr. Lash, who knows his English tech-

anical literature so well, and possibly for the benefit also of others, I would like to record the fact that Dr. Hans Bleich has an impressive list of publications on engineering philosophy, in German, to his credit, and that I, personally, value his opinion as much as that of any other living man.

Mr. Hartmann criticizes me for making no reference to the tangent modulus, thus invalidating my treatise insofar as aluminum alloys are concerned. Mr. Shanley supports Mr. Hartmann in this view. Mr. Hartmann and Mr. Shanley may be of the opinion that the steel era belongs to the past and that the future belongs to aluminum. But how about magnesium, which manifests a much more nearly straight line stress-strain curve than does aluminum? Who knows—magnesium may replace aluminum before long. This, however, is not the real answer to Mr. Hartmann and Mr. Shanley. I grant that aluminum fails to exhibit a linear relation between stress and strain. Many of us may be more or less confused about the column phenomena, but I dare say we all fully understand and appreciate the simple bend-

ing formula  $s = \frac{Mc}{I}$ . This formula is predicated on the two major assumptions, that a transverse plane before bending remains plane after bending and that the stress-strain relation is linear. If hairsplitting refinement is necessary, why not start modifying and improving that formula, which is as important as any column formula. If such refinement is justified, are we not amiss in first directing it to the subject of columns, which to me appears as still in a state of near confusion? Mr. Hartmann and Mr. Shanley might feel that I could have used my opportunity to better advantage, had I confined my remarks to aluminum. The tangent modulus I personally regard as a minor detail. Possibly in the future I may want to express myself on that subject, but for the present I must dismiss it as nearly irrelevant.

Professor Newell's discussion is valued highly as an original contribution to the column problem. In one respect, if I understand him correctly, Professor Newell and I do not agree. He says, "as stated by the author, eccentricity of loading, initial crookedness, end moments or partial restraints, and ratios of effective to geometrical length produce similar effects on strength." To be correct, I dismissed  $w$  as negligibly small in my tests on run of the mill specimens, and as probably of still less consequence in larger-size columns, but of the other phenomena I did not speak as producing similar effects. On the basis of the laws of static equilibrium, I called them identities. Thus, my

ratio  $n = \frac{L}{l}$  and Professor Newell's factor  $k = \frac{ec}{i^2}$  are directly related as appears in Figs. 13b and c. If we determine  $n$ , we simultaneously determine  $e$ . I further question Professor Newell's statement, "where  $k$  is established for various types of members by tests or experience. It cannot be obtained rationally." Mr. Pratley evidently concurs in Professor Newell's position where, in his item 17, he says, "The writer fails to see that anything is accomplished by classing it as futile (the secant formula) merely because some empirical value must be introduced for the item  $e$ ." These statements go to the heart of the position I have taken. Neither Professor Newell nor Mr. Pratley indicates how we are to determine this empirical constant. Mr. Johnston evidently concurs in my statement: "Column tests frequently . . . fail effectively to simulate end conditions of restraints—such as are met with in practice." To determine either my coefficient  $n$  or Professor Newell's coefficient  $k$  experimentally we would have to test actual structures, or models which correctly simulate actual structures. I am fairly familiar with tests on full size transmission towers and aeroplanes. Alas, to my knowledge such tests in the past have only been conducted with a view to satisfying either a customer or a government agency as to the overall strength of the structure. I take the position diametrically opposite to the one taken by Professor Newell. Instead of saying, "It cannot be obtained rationally," I believe that

coefficients  $n$  or  $k$  can be obtained rationally better than they can be obtained experimentally. My chapter, "Determination of constant  $n=L/l$ " was written with the intent of proving this point. In this regard it is interesting to note the concluding remarks from the discussions by Dr. Friedrich Bleich and Mr. Oxley.

I will attempt here to point out a few specific conclusions which seem obvious consequences of the generalizations of the paper. Incidentally, I shall point to an instance in which my generalization "for many types of construction our column design formulae are too safe, too conservative" does not apply.

In Mr. Oxley's own field, which I understand to be that of architectural engineering, is it not true that the frames shown in either Fig. 12 or Fig. 14 represent about the most unfavourable column loading possible? Our analysis, then, seems to point to the conclusion that for slender columns the coefficient  $n$  is definitely less than unity, while for short columns we need not regard the column as a stability problem at all, and that we may proceed without appreciable error to conventional methods based on the assumption that the principle of superposition is applicable, the distinction between "slender" and "short" being the same as that of greater or less than  $(l/i)_c$ . I acknowledge that I have not determined a value for  $n$  to govern in all cases. However, it seems to me, to be able to point out that we either treat the member as a post or give to  $n$  a value less than unity is something of specific value.

Transmission towers are unique in the field of structural engineering, and are of special interest as an illustration of the column problem. My comments are confined to the legs and cross bracing below the cross-arms. The principal loadings are the cross-wind and the torque which may result from the breaking of one or more of the cables. Since we don't know from which direction the wind may blow, or which cable may break, almost all members must be designed to take either tension or compression. Furthermore, some members are very slender. In one transmission line the same tower may be repeated hundreds of times, thus introducing the element of quantity production. Finally, the transmission tower is the only unit in the field of structural engineering which, to my knowledge, is sold on the basis of a guarantee of the finished structure under test.

Almost all the structural elements in towers are angle irons. From the cross-arms down, the legs, under the most unfavourable combination of loading, carry a substantially constant load. They are braced by diagonal bracing and cross-struts in two planes at right angles to each other. The panel points may be said to be "position fixed" not "direction fixed." If the leg buckles, it does so in a continuous sine curve. Any end fixity that may result from being connected to diagonals and cross-struts, most of which have themselves a tendency to buckle, seems too uncertain and too intangible to evaluate. I suggest that the leg of a transmission tower should be designed as an Euler column with an end fixity equal to zero, or with a coefficient  $n$  equal to unity. I believe the formula used, at least by one firm, is of the type similar to Mr. Oxley's formula III. I am of the opinion that this formula, in transmission tower design, is not safe enough for slender columns, while too safe for short columns. It would be interesting to know whether the committee of the C.E.S.A. when it recommended its formula for general use, anticipated its being applied to transmission tower design.

The case of the compression diagonal in a transmission tower treated as a column presents another interesting example of column design. I am aware that in cross-bracing the compression member is frequently held as being inactive. Occasionally both compression and tension members in the cross-bracing are held as transmitting equal forces. The one procedure I regard as wasteful, the other as illogical.

The civil engineer has a strongly expressed preference for simple formulae. In this preference I concur, provided

the formula is not obtained at the sacrifice of sound logic. I believe that my suggestion to confine ourselves to Euler's formula modified by a coefficient  $n$  is both logical and very simple.

The civil engineer also shows a tendency to accept errors provided they can be proved to be "on the side of safety." This is often wasteful and generally stultifying. We have now an aeronautical structural engineering profession and if the aero engineer accepts too many errors on the side of safety he will not be able to lift his aeroplane off the ground. If the transmission tower engineer does not count on the functioning of all the tower's members, he is likely to lose out in this highly competitive international field. In diagonal cross-bracing the compression member is position fixed through the one bolt connection, fixing it to the tension member. If the tower legs are slanting, then the bolt connection divides the compression diagonal of the cross-bracing in two unequal parts. The strength of this compression diagonal, if computed at all, is conventionally computed on the assumption that its length is equal to the longer of the two parts into which it is divided by the bolt connecting it to the tension member, and that the coefficient  $n$  is unity. I definitely feel that  $n$  is less than unity. It is a function of the ratio of the two parts in which the compression member is divided. Its value is between 0.699 and 1.0. If  $a$  and  $b$  represent the two parts in which the compression diagonal is divided, then  $n$  approaches unity when  $a/b$  approaches unity. It approaches 0.699 when  $a/b$  approaches zero.

Professor Newell and Dr. Hans Bleich express regret for the fact that I did not test columns with an  $l/i$  ratio, less than critical. As an explanation, may I say that the paper was conceived and the test started in July, with a deadline, against which I was working, for the manuscript to be in the editor's hands by the first of November. Under too high loads I was afraid that my partial spheres would dent my bearing blocks, and time was lacking to make the necessary changes, either smaller specimens, larger loading spheres, or harder bearing blocks.

I should like to express my appreciation to Professor Newell and Mr. Goodrich for being two discussers who have noticed my test results. However, Professor Newell apparently did not glean all the information from them which nonetheless was there. He says:

"They certainly would have failed under loads less than Euler's if the angle had had wide, thin legs, say a ratio of width to thickness between 20 and 25 instead of 12, as the failures would then have resulted from a combination of torsional and bending instability and would have occurred at loads less than those indicated by Euler's formula even for the long slender members."

In the first column on the last page I said, "All of those which failed with the outstanding flanges in compression manifested twisting, as may be observed in the photograph, Fig. 26. It is of interest to note that this twisting, this secondary failure of the flanges, did not occur until after the specimen had failed as an Euler column." Whereas the ratio of width to thickness of angle leg for the smaller angles was 12 as Professor Newell states, the angle illustrated in Fig. 26 was nominally a 3 by 3 by 9/64 angle, thus having a width to thickness ratio of about 22. The average load which it carried is shown by the little cross furthest to the left in Fig. 21, to equal  $P/A = 26,000$  lb. per sq. in. I plead guilty for not directing attention with sufficient emphasis to this test in the text, in view of the fact that Timoshenko in his *Elastic Stability*, p. 408, states: "In such cases (meaning equal leg angles) to eliminate the possibility of buckling at a stress below the yield point, we take for structural steel  $b/h = 12$  (meaning the width to thickness ratio)." He further adds a significant point which makes my test not strictly comparable: "In all these cases it has been assumed that structural steel has a yield-point stress equal to 34,000 lb. per sq. in." Is there no one sufficiently interested to duplicate my tests?

Before Professor Newell's closing paragraph of his discussion I stand with bowed head as it constitutes the greatest compliment ever paid me by anyone.

Mr. Goodrich's remarks of approval and encouragement, as always, serve as an inspiration.

Mr. Oxley and I, it would seem, are not nearly as far apart as may appear to be the case at first glance. For my using different symbols in successive papers on the same subject I humbly apologize. May I offer as an excuse that during the composition of my last manuscript on columns I was engaged in the revision of my text on Elastic Energy Theory. In this new text appears a very extensive list of symbols. The symbols used in the paper under discussion are already in agreement with the above-mentioned list. Mr. Oxley's discussion presents a valued contribution to the problem of column analysis.

The contribution to the discussion by such an authority as Dr. Friedrich Bleich is highly appreciated.

A misunderstanding of anyone's writing is certainly a reflection on the author. I consider myself fortunate that of all the discussers, only Mr. Holt definitely and completely failed to get the meaning of one of the most important thoughts I have tried to convey. Mr. Holt says,

"Can anyone say this effect (the wow effect) is insignificant for slender columns when for an  $l/i$  ratio equal to 200 the average stress at failure . . . is about 12 per cent (below Euler's value)."

To arrive at this conclusion Mr. Holt picked from my Fig. 4 the curve for  $e' = \frac{l}{600}$ . If he had computed the discrepancy

between the Euler strength and the strength of a column with a wow of  $l/100$ , the percentage difference would have been still greater. The most significant feature of Fig. 4 consists in the four little crosses, marking experimental values, and which all lie between the curves for  $e' = 0$  and  $e' = l/5000$ . Please note the cross for  $l/i = 100$ . To me, these experiments give the first authentic and direct data on wow for run of the mill specimens which I have ever seen. The data are not absolute and most likely constitute an upper limit, as there was no way of determining what the accidental eccentricity of the applied load was.

I must confess that my science is sprinkled with just a little faith. Witness that no two rational philosophers ever completely agree. My faith in science is that the laws of nature are inherently simple. They only appear complicated so long as we have not succeeded in getting to the bottom of them. I do not agree that haggling over a few ounces more or less in connection with loads that run into the thousands of pounds is good engineering. I repeat that, basically, end moments, eccentricity and  $L/l$  ratios, in connection with column analysis, are identities. I further insist, since they are identities, that the  $L/l$  ratio makes the strongest physical appeal. Finally, I maintain, it is in the nature of simplification to reason in terms of one variable rather than three, if the three mean the same thing. The only fly in the ointment which prevents all my formulae from reducing to Euler's formula is the wow factor  $e'$ . Since  $e'$ , on the basis of Fig. 4, appears to be definitely less than  $l/5000$  in light angle irons, it is likely to be still less in heavier sections. Since the wow effect is so small and since its inclusion would spoil an otherwise excellent recommendation, I advised to ignore it, or consider it covered by our inevitable factor of safety. Dr. Hans Bleich lends support to this recommendation when he shows that the reduction in strength of a column, as the result of wow, is less for a column elastically restrained at its ends than for a pin-ended column. Furthermore, he shows that an accurate quantitative determination of this reduction in limit strength of a column, elastically restrained at its ends, is extremely involved.

I believe there is one thing on which we, as engineers, are all agreed, namely, to design for an overload factor of the order of magnitude of 100 per cent, or a factor of safety, say of two. Yet, in connection with the column problem,

some seem to love writing interminably about quantities avowedly of secondary order of magnitude.

I understand that the aero engineer, in column analysis, already directs his major attention to end fixity coefficients. I may, conceivably, contribute by lending encouragement to the aero engineer to continue in the trend he is already following.

Mr. Pratley would like to see residual stresses considered in connection with wow. I am as prepared as anyone to discuss residual stresses, but here again my sense of value restrains me. If a refinement such as the consideration of residual stresses, say in connection with hot-rolled or extruded sections, is necessary, I would like to begin with consideration of the beam phenomena, where we are well agreed and on certain footing. In connection with columns, where we still talk at cross purposes, I think we had better wait until there is more general agreement as to fundamentals.

In item 1 Mr. Pratley states "but the convenient assumption is now made that  $l/R$  at any point may be equated without appreciable error to the second differential." I nowhere make such an assumption. To be sure, toward the bottom of page 1, column 2, I state that  $l/R = d^2x/dy^2$  is correct, since for the critical point  $c$ , when  $y = L/2$  then  $dx/dy = 0$ . If Mr. Pratley means here to criticize me again for assuming the elastic curve of the column to be a sine curve, I would reply that this assumption is not only convenient but also justifiable. It simplifies matters materially by ignoring a quantity of secondary order of magnitude.

Mr. Pratley states in his item 17 "the author's conclusion that theory is usually worthless" is like a straw man set up for the purpose of knocking it over. I have devoted my life to engineering theory. I insist on my right to express my thoughts in terms of graphs, diagrams, words or symbols, whichever appear to fit the occasion best. Mr. Pratley, who talks of philosophy, must surely agree that a test of a theory lies not in the medium of its expression. I deny with all the emphasis at my command any allegation that I fail in appreciation and admiration for the science of mathematics. However, when mathematics produces men who are devoid of engineering judgment, who indulge in a wild-goose chase after refinements of detail while ignoring the large aspects of the problem, and who formulate theory without any physical background for the establishment of the theory with the result that some real engineers are crowded off the stage for no reason other than that they may possibly be lacking in mathematical dexterity, then I think it is high time to call a halt.

In any theory, the method of analysis may be of greater significance than any resulting formula which may be obtained. My main reason for presenting the well-known secant formula was stated in my paper, page 6, column 2, where I said, "Therefore, if we base our proof of a recognized and accepted formula on this identity, we add further evidence toward the establishment of this identity." The significance of my proof of the secant formula lies in the fact that it is predicated on the fact that the eccentrically loaded column is but a special case of the pin-ended column. On page 1, column 2, the explicit assumption is introduced; "The portion BD of this curve is then an arc of a full arch of a sine curve." This assumption Mr. Pratley contests all through his discussion. Yet he champions the formula which is directly predicated upon this assumption.

Mr. Oxley's contribution, and particularly Fig. 31 which he submits, is very pertinent to this discussion. On the one hand, Mr. Pratley and Mr. Holt insist on what I would like to call, overemphasizing quantities of the second order, and on the other hand Mr. Oxley points to four design formulae from which his specifications permit him to choose without any authoritative guidance as to the relative merits of these four formulae.

In closing, I would like to make one plea to the profession. In America the unfortunate idea has developed, carefully nursed by some mathematicians, that mathematics

and theory are synonyms. I confess that I have forgotten, through disuse, a great deal of mathematics I once knew. I still know enough of it, however, to recognize that a vast proportion of the mathematics which is passed off on us as theory is spurious. Mr. Durant refers to the "great university" with which I am connected. That connection, however, has brought to me the realization that some men are attracted to engineering science, not for the love for the science, but as an alibi for the exercise of their mathematical proclivities. When Mr. Durant so easily says, "The formulae in the paper are derivable from a single differential equation and all that is necessary to obtain a particular formula is to put zero for all unwanted quantities in a particular integral," what is he shooting at? Is he writing for the entertainment of his confreres or is he trying to save a few pounds of material in the design of an aeroplane? It does seem to me that, with mathematics glorified as an objective rather than a means, our beloved science of engineering is in a state comparable to that of the dog being

wagged by the tail. Won't some engineers, engaged in designing, building and erecting, join in a little tail wagging by the dog himself?

I offer as an excuse for my lengthy closure the fact that the issue, as I see it, far transcends a mere few column formulae. There appears to exist a long-smouldering divergence of opinion on what I have referred to as sense of value, objective and assumptions. This divergence appears to be excellently illustrated by the contrast of opinions expressed by Mr. Pratley and by me. I know that Mr. Pratley's views have a large and impressive following. My views may be minority views, but they nevertheless also have a following. I realize that custom has it that the author, with his closure, has the last word. I am not asking that an exception be made in this instance. I would like the privilege of saying, however, that since Mr. Pratley was to some extent singled out by me in my closure, I would welcome a rebuttal by him to be regarded by me as well as by everyone else as absolutely final.

## Abstracts of Current Literature

### AIRCRAFT FACTORIES UNDERGROUND

FROM *Trade and Engineering*, APRIL, 1942

Long before the war started both France and Germany were known to possess underground aircraft factories. Now it may be disclosed that similar factories have been constructed in this country. Some of them are already in full production, others are getting into their stride, and the latest—which is also the largest—began to produce aircraft components a week or so ago.

It should not be assumed, however, that the general policy of the Ministry of Aircraft Production is to put all aircraft factories underground. It would obviously be undesirable, and indeed impossible, to transfer production from the increasing number of overground factories, with the consequent hold-ups in output, merely in order to put them below ground. The policy is to take advantage of disused quarries and mines, thus avoiding the necessity for the tremendous task of scooping out many million tons of soil. The use of quarries and mines has another obvious advantage for the "roof" of the factory can be of rock, which has greater resistance than soil to a bomb. The underground aircraft factories so far equipped are spread over different parts of the country, as are the bomb-dumps and ammunition stores which have been placed below ground.

The building of the latest factory is a very remarkable achievement. The whole scheme covers an area of something like six square miles, while the factory itself is approximately three-quarters of a mile square. Total cost is in the neighbourhood of £5,500,000, and more than 8,000 workmen were engaged in its preparation. The vast building is not yet complete, but full production is expected by August, when it will employ 14,000 men and women.

The factory lies at a depth of 90 ft. from the surface, and above it are thick layers of clay and brash (loose stone). The factory itself lies in solid rock. The building is ventilated by means of five air intakes and five exhaust shafts, each of 20 ft. diameter. Some of the shafts have been constructed so as to emerge on the surface at a steep angle, thus preventing any possibility of a bomb falling down the shaft and exploding at the bottom. The method of ventilation is by means of forced draught and forced exhaust. There are eight passenger lifts, arranged in pairs, and each can accommodate 50 persons. The entrances to the lifts are protected by 15 ft. of reinforced concrete and are claimed to be proof against a direct hit.

### Abstracts of articles appearing in the current technical periodicals

The factory has its own artesian well and its own reservoir. Lighting is of the fluorescent type, the normal source of supply being the Grid, but there are two alternative methods of supply. The machinery is lowered into the building through a special shaft, at the top of which is a machine hoist capable of dealing with 20 tons at a time.

The passenger lifts are so sited as to be within a quarter of a mile of the farthest point in the factory, while two escalators will also take employees to and from the surface. Operatives living farthest from the factory will be taken to work and back to their homes by motor-coach. When in full production the factory will work day and night shifts, each of 10 hours. This is regarded as a maximum in view of the length of time required to get operatives from their homes and to their benches underground.

Six hostels, each capable of accommodating 1,000 persons, have been erected on the surface, and there are communal restaurants which can supply 500 meals at one time and will be open day and night. Living quarters are being provided for 6,000 single men and women and married quarters for 2,000 couples. So that married women will be able to leave their children with perfect safety, crèches are being provided, with competent persons in charge. The employees' quarters are neat and comfortable and the accommodation is being provided at a most reasonable charge—27s, inclusive of meals, for men, and 22s, inclusive for women. Half of the married quarters have two bedrooms and the other half three. There is a covered way between the canteens and the recreation centres, one of the latter being provided for each of the six hostels. The entertainment centres contain a cinema, which can be used also for concerts and dances, a bar, and sports and reading rooms.

By the time one has been in the factory for half an hour it is difficult to realize that one is 90 ft. underground. The atmosphere is agreeable—it is claimed that the temperature can be kept almost constant throughout the year—and the lighting is excellent. Main "roadways" lead from the lifts, and off each side of them are lofty galleries. While the floors have been concreted, in many cases the walls have been left in their original state. So far, in spite of the existence of great ready-made galleries, a million tons of gob have been removed, though there has been little new excavation.

To safeguard against falls of roof or walls occurring through vibration or change of temperature when the factory is constantly occupied, brick pillars have been erected at intervals, while solid blocks of the original stone have been allowed to remain. The effect is to divide up the underground space into large galleries, which are being converted into the usual shops. Various other safe-guards have been, and will be, taken. To prevent the possibility of flooding, each wet area was drained and sealed off by stout walls and the water level is kept below that of the factory. Sewage is pumped to the surface through pressure pumps.

As the factory was prepared every square foot of ceiling was tested, all excavations being carried out by skilled quarrymen. The attuned ears of these men can detect, from the answering ring of the rock to a blow, whether it is safe or not, and any suspected "bladder" or unsafe area, was immediately pulled down. Safety patrols will also be maintained, a careful check being kept on the effects of vibration on the rock.

In the parts of the factory where construction is still going on the scene is very like that in a coalmine. The one noticeable difference is that smoking is permitted, there being no risk of fire or explosion. The quarried stone is taken by light-gauge railways—some trains pulled by pit ponies and some by engines—to the foot of conveyors which are not unlike the moving staircases on London's tube railways. As the stone reaches the surface it is tipped out and crushed returning underground in powdered form to be used in the mixing of concrete. The factory is equipped with three ambulance and first-aid departments, and the general arrangements for the work-people are excellent.

### A QUIET REVOLUTION

FROM *The Beama Journal* (LONDON), DECEMBER, 1941

In normal times the expenditure of the average citizen, apart from a proportion of his income that goes in rates and taxes, is at his own discretion and disposal. He can buy a car, travel freely, extend his wardrobe, give presents, and broadly speaking live as he wishes to live. In much the same way a manufacturing or selling organization may carry on independently, guided by the decisions of its directors and management.

The whole procedure of life for the private citizen and for the business concern is completely altered under the strenuous conditions of such a conflict as that in which this country is now engaged. First comes the duty of all to serve in some way that directly helps the war effort, either in the armed forces or by part-time work. Secondly, control of raw materials and rationing in its various forms limits expenditure on clothes and cars, on travelling, on foodstuffs; additional limitation being due to the stimulation of voluntary savings, the increase in taxation direct and indirect, and the stopping of supplies of unessential goods. With these restrictions and the swing-over of industry to war production, the nation's entire standard of living has been quietly but very effectively changed—not so much lowered, as rendered rational in connection with the demands of war.

The co-operation and response of industry in general to the needs of control has been remarkable, and the vast extent of the swing-over is probably not realized except by those who are in a position to view it from the top. Torpedoes are coming from a former boot and shoe factory; anti-gas and medicated ointments from a beauty-cream factory; aero-engine parts from a hairpin factory; aeroplane frames from a toy factory; and such examples could be multiplied a hundred times. Each change-over brings, of course, its own problems of structural alteration, movement of machinery, and often the housing of workers. Six months' operation of this re-planning of industry by the Controller-General of Factory and Storage Premises has meant the allocation of nearly 50 million square feet of space, one-third being for production and two-thirds for storage. One example of foresight is the securing of suitable empty buildings distributed over the country, ready for re-housing a damaged production unit at the shortest notice.

Thus the Government has turned the nation's economic resources to war purposes; and one of the characteristics upon which this nation may pride itself and take good heart is the acceptance by industry and the people generally of the new, inevitable burdens and inconveniences. Britain grumbles—it always does; it criticizes its rulers—often constructively and helpfully; and it gets on with the job, in unshakable faith that the Government will not let it down, in equally unshakable determination that "come the world against her, England yet shall stand."

### BRITAIN'S FACTORIES DODGE BOMBS

FROM ROBERT WILLIAMSON\*

A new method of factory layout which has reduced output delays from bomb damage by as much as 50 per cent has been evolved by British scientists and engineers.

Called the "production lattice," factories engaged on similar work are not dispersed all over the country but are grouped close enough together to provide swift inter-communication. If there are, say, four processes in each factory, the bombing of No. 1 process in one works means that Nos. 2, 3 and 4 processes there can still be supplied from another factory; while if a No. 2 process is put out of action the No. 1 output can go through No. 2 process elsewhere and return to its own No. 3 and 4.

To stop output completely, the enemy must put out of action the same process in each factory, and the mathematical odds against this are immense. In fact, because of these odds, the more accurate the bombing the greater the relative advantage of the "lattice," or criss-cross of production lines.

Under the dispersal system, factories are badly placed to assist each other and whenever one process is put out of action the whole output of the factory stops until this has been remedied. With the "lattice" principle, however, practical examples have shown that in severe attacks up to one-half the output rate for a given section of industry may be saved.

## SAVE FOR VICTORY

If you do not keep your *Journals* do not burn or destroy them. Give them to a salvage organization. They are needed for victory.

## WHAT IS BEING DONE ABOUT POST-WAR RECONSTRUCTION

There are many indications that Institute members realize the necessity for adequate planning for post-war reconstruction, so that when victory comes the peace will be won as well as the war. Correspondence received at Headquarters, resolutions passed by the branches, and references to the matter at our meetings all make this attitude clear. At the annual general meeting General McNaughton and Mr. Little both spoke of the urgency of action on this matter. Council has discussed the question on several occasions and items regarding it will be found in recent numbers of the *Journal*.\*

At this time our readers will be interested to have a brief account of the steps which have been taken, the situation as it now stands, and the extent to which the membership of the Institute is being asked to help in solving some of the problems which have arisen or will arise.

The matter, of course, is one in which the Dominion Government is primarily concerned. Preliminary steps were in fact taken two years ago, resulting in the formation of an advisory Committee on Reconstruction, to examine the general aspects of the question, and to make recommendations to the Cabinet as to what government facilities should be established. In speaking on this point the Minister of Pensions and National Health pointed out that the study of the many and diverse problems of reconstruction "should be begun now—and obviously cannot be confined to any one group of men or department; but must be the concern of every branch of the public service and of every provincial and municipal authority in Canada."

It is evident that before any schemes can even be drafted for discussion, a mass of pertinent information must be obtained, so that the many economic, social, industrial and technical problems involved may be clearly presented for consideration.

Actually a "small group of able and distinguished citizens" has been charged with this task—persons "not already under pressure of departmental war work in the public service." They form the Committee on Reconstruction and are to report to the Committee of the Cabinet which was set up in December, 1940, to act in matters relating to rehabilitation and to reconstruction. A separate Committee on Demobilization and Rehabilitation has also been formed and will report to the Cabinet Committee on those subjects.

The calibre of the Committee on Reconstruction may be judged by the fact that its eleven members include Dr. F. Cyril James, Principal of McGill University, who is chairman; Mr. Tom Moore, President of the Trades and Labour Congress of Canada; Dr. R. C. Wallace, Principal of Queen's University; and others who are authorities on social questions, agriculture, commerce and industry; representatives of government departments and international committees concerned; and the chairman of the sister Committee on Demobilization and Rehabilitation. The two committees have a joint executive secretary.

The problems of reconstruction are of wider scope, and perhaps of a more controversial nature, than those of rehabilitation. They are concerned, among other things, with labour and re-employment, agricultural and industrial developments, changes in international trade and investment, changes in legislative economic control, and works programmes for emergency employment or physical and economic restoration. To deal with such matters a number

\*In this connection, see also Post-war Reconstruction, *Engineering Journal*, Feb., 1942, pp. 105-6. National Service—A Challenge to the Engineer, *Engineering Journal*, March, 1942, pp. 151-153. Discussion at Annual General Meeting, *Engineering Journal*, March, 1942, pp. 155.

## News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

of groups or subcommittees have been formed by the Committee on Reconstruction and are now in operation.

Of these, the most interesting to engineers is probably the Sub-committee on Construction Projects, whose chairman is K. M. Cameron, a vice-president of the Institute, and chief engineer of the Department of Public Works, Ottawa. Its duty is the consideration of the matter of a post-war construction reserve to form a back-log of construction projects which will be available to take up the slack in employment subsequent to the cessation of hostilities. It is now making a study of the information which will be needed in order to judge of the relative advantage of such projects.

At the last meeting of Council, Vice-President Cameron presented a draft questionnaire prepared by his subcommittee and entitled "Considerations for Evaluating Projects," regarding which his subcommittee is consulting technical bodies, regional groups, and individuals whose advice is likely to be helpful. The draft suggests some twenty-five questions concerning possible projects, each designed to elicit some pertinent item of information. These questions are grouped under such headings as the probable general effect of the project on economic efficiency and the welfare of community; its effect on unemployment and labour supply; probable cost, the desirable plan for financing it, and how it should be maintained; what engineering studies have been made and what time would be needed to make necessary plans; what legal questions are likely to arise as to the acquisition of property; and if a grant in-aid is indicated, what controls should be set up.

The subcommittee is asking for the views of interested bodies as to the suitability of this proposed draft, and will endeavour to form a composite picture from the opinions thus obtained.

Members of Council present greatly appreciated the action of Mr. Cameron's subcommittee, in consulting the Institute, and discussed at some length the best way of obtaining and co-ordinating the views of Institute members. It was then decided, first, that a copy of the questionnaire submitted by Mr. Cameron be sent to each branch of the Institute with a request for an expression of opinion as to its form and content; and, second, that a committee to be named by the president be set up to study the replies and present to Council a consolidated report for submission to Mr. Cameron's subcommittee. Further it was provided that this new committee should be continued, so that later it will be available to perform such other duties in connection with post-war reconstruction as may be assigned to it by Council.

It will be noted that Council's decisions thus provide the Institute with a standing committee, which can deal promptly with such reconstruction questions as concern the Engineering Institute, or may be referred to the Institute for helpful action. Every care will be taken to avoid overlapping or possible duplication of the work of other bodies. In this way the Institute committee's work will be done within the framework of any general organization which the Government may set up. Obviously the establishment of innumerable local committees by interested but disconnected organizations could result in nothing but chaos.

It is perhaps unfortunate that up to the present the public has been told very little about the work of the Advisory Committee on Reconstruction of which Dr. James is the head. This does not mean that no progress is being made, as is evident from the activities of Mr. Cameron's subcommittee, and of other similar bodies. This apparent

reticence on the subject, however, is unavoidable, and is due to the fact that the Advisory Committee has to report to the Cabinet. Accordingly none of its proceedings or findings can be made public until they have been considered and approved by the Dominion Government. In the meantime Institute members will receive, through the *Journal* any news or reports of progress which may be released by the authorities concerned.

## AN INSTITUTE COMMITTEE ON INDUSTRIAL RELATIONS

The engineer has been taken to task sometimes for having introduced technological changes in our industrial life without at the same time indicating the reforms necessary to avoid serious disturbances in our social order. This charge, which seems somewhat exaggerated, is perhaps meant to infer that the engineer, who is responsible for making possible the early enjoyment of the benefits of technological advance, should at the same time make sure, through judicious control of the rate of change, that the corresponding human adjustments are made without economic loss or human suffering.

The repercussions caused by the changes in tools and processes have been particularly sensible in the relations between the various groups that constitute our industrialized society. It would seem that the engineer, because of his position between management and labour is well situated to study problems of industrial relationship and develop plans and methods for their solution. In fact, engineers have often been chosen to head personnel departments of industrial firms or governmental bodies dealing with labour problems. It is proper, therefore, that the Institute should become interested in the question of industrial relations.

At the April meeting of Council in Toronto, the proposal was brought forward that a committee of the Institute be established to study such problems. The suggestion was approved unanimously and a Committee on Industrial Relations was formed. Mr. Wills Maclachlan, who made the suggestion, was appointed chairman of the new committee. The scope of the work which lies ahead of the committee is indicated by the following terms of reference prepared by the president, Dean Young, at the request of Council:

"That the Committee continuously study, and from time to time report to Council on important developments affecting industrial relations within Canada, thus providing Council with information and specialized advice on which it can decide

- (a) What attitude or action the Institute as a professional engineering body should take in relation to such developments.
- (b) What direction or advice the Institute should provide to its Branches or individual members as to the part they might play in relation to such developments.
- (c) In what manner the Institute might serve the public interest by exerting its influence in the improvement of industrial relations.

"That, without restricting the field of activity that might properly and judicially be undertaken by a Committee of a professional engineering body, the Committee give consideration to such matters as

- (a) The labour policy of governments, as expressed in statutes and Orders-in-Council.
- (b) Means of promoting earlier and more general utilization of the benefits of technological advance without undesirable disturbance of the economic and social life of the people of Canada.
- (c) Physical conditions of employees' work, environment, and housing conditions, both during and after the war.
- (d) Selection, placement, and training of employees.
- (e) Wage and reward systems and associated economic conditions and terms of employment, as related to

the productivity of industry, especially as affected by labour-saving devices.

- (f) Co-operative plans for mutual benefit.
- (g) Accident and Sickness prevention, Workmen's Compensation and health insurance, hospitalization and rehabilitation.

"That the Committee seek to promote the study and consideration of subjects coming within its purview by the provision of suitable speakers at meetings of the Institute or its Branches and by articles in *The Engineering Journal* or other suitable publications."

The importance of such a committee is evident in time of war when the production of materials is largely dependent on the relationship between management and labour. Its work should be equally useful in the post-war period of readjustment and afterwards for the maintenance of industrial peace.

## THE INSTITUTE AND CIVIL DEFENCE

Recent events have directed marked attention to questions of civil defence in Canada. The admirable lectures of Professor Webster, sponsored by the Institute, have made available to many people who can use it, a mass of the latest technical information on the subject. Following these notes will be found a timely memorandum by Professor R. F. Legget, outlining some of the engineering problems which air attack on Canada would involve, and suggesting suitable steps to make good the damage which may be done.

To deal effectively with matters like these, concerted action is required. Accordingly, Council at its last meeting, recognizing the responsibilities of the Institute as regards the assistance which our members can give, decided to set up a committee which will take charge of all defence interests of the Institute, gather information, study the situation and report to Council from time to time. The members of this committee are to be named by the president, its chairman will draw up its terms of reference, and one of its first duties will be to co-ordinate the efforts of the branch committees already established to utilize as fully as possible the material given in the Webster lectures.

The formation of this committee may well have far-reaching effects. Much may depend on the results of its studies. Its task is not an easy one, for as Mr. Legget points out, objectives of major importance may be attacked; their prompt reparation will be essential to the life of the community.

Under the new committee's guidance, qualified Institute members all over Canada will have an opportunity to take their proper part in civil defence, local and Dominion-wide.

Professor Legget's memorandum follows:

"The possibility of Canada being invaded, by air, must now be envisaged. Attack may come on the East Coast, or on the West, or both, and may extend far inland.

"In view of all that is involved, the inevitable loss of the invading planes, and the state of Canada's air defence, it would appear probable that bombing will not be indiscriminate but will be directed towards specific objectives.

"Such objectives will certainly be of major importance, directly or indirectly, in relation to the war effort. Reparation of damage, without delay, will therefore be essential.

"Possible damage can be classed generally as follows:

- (a) Destruction of small buildings, particularly residences;
- (b) Destruction of larger buildings and interference with municipal services; and
- (c) Destruction of, or damage to, major civil engineering works, such as railway and road bridges, canal locks and walls, power plants and dams, etc.

"Restoration of buildings, large and small, and of municipal services is work that can be carried out effectively by local operators, guided and directed by industrial maintenance and municipal engineering staffs. No special construction equipment will normally be necessary for such work.

"Restoration of major civil engineering projects that may be damaged is, however, work of a very different nature.

Design for temporary structures and repairs will often be necessary before any repair work can be started. Special construction equipment will frequently be required, together with the special skills of men with experience in heavy construction. And special materials, such as long construction timbers, steel sheet piling and quick setting cement, will be essential for the carrying out of much work of this character.

"This memorandum is related to this third category of repair work only.

"The men, the plant and the special materials required for such work are, to a large extent, already associated with construction projects of an essential character. Practically all of these projects are being carried out to unusually rigid and exacting time schedules (e.g. the Shipshaw scheme, near Arvida). Any major interference with the progress of such works (as by diverting plant and men to repair projects) would have a serious effect upon their completion and upon the planned operation of associated projects (e.g., the Aluminum plant extensions at Arvida.)

"If, therefore, adequate plans are to be made for dealing with possible damage to civil engineering structures, they must be made so as to interfere as little as possible with construction work already in progress.

"It follows that plans must therefore be drawn up on a widespread regional basis so that the constructional resources of the region may be drawn upon when emergencies arise rather than that any one construction project should be temporarily halted.

"Many other factors lead inevitably to the idea of regional organization. These include—the limited availability of special construction equipment (especially of a mobile character); the relatively small number of vital works repair to which has to be contemplated; the undesirability of having to rely on one or two contracting organizations only, in case of emergency.

"Regions which naturally suggest themselves are: the Maritime provinces, Quebec and the eastern tip of Ontario, Ontario excluding the centre part and the section from the Lakehead westwards, the Prairie provinces plus the last-named area, and British Columbia.

"Regional committees could be set up for each of these regions, the work of all being correlated by a small national executive committee or staff.

"The question of available men—with construction and engineering experience who could be spared from their regular jobs for emergency work without difficulty—could be handled by each committee in conjunction with the Wartime Bureau of Technical Personnel.

"Essential construction materials, especially those already mentioned, can be watched in each region by the maintenance of a running inventory, maintained in conjunction with the appropriate material controllers.

"An immediate inventory of construction equipment would be necessary to give the essential data on plant; once obtained it would have to be maintained on a day-to-day basis.

"Co-operation of the principal railways would be essential to the success of the proposed scheme not only in relation to transportation but also in view of the availability of such material as the C.N.R. Central Region stock of old steel bridges.

"Although not previously stated, it is naturally expected that all the organization so far suggested will work in conjunction with, and be guided by local maintenance engineering staffs. It is only in view of the probability of serious damage, beyond the scope of local repair facilities, that this memorandum has been prepared.

"Government authorization will be necessary for the use of essential materials, and for the commandeering of construction equipment. Fortunately, British Orders-in-Council Nos. 1277 (1941) and 57 (1942) are available to serve as a guide.

"The scheme herein proposed should most properly be

launched under Government auspices. Pending such action, initial steps might usefully be taken—in conjunction with the Canadian Construction Association—by The Engineering Institute of Canada, to the Council of which this memorandum is, in the first instance, respectfully submitted."

## THE END OF THE PRIZE YEAR

At this time, when the sessions of our branches are ending and the time for sending in papers is nearing its close, it might be appropriate to draw attention to the opportunities provided by the Institute prizes and medals and to urge members to contribute papers. The list follows:

The Gzowski Prize—a gold medal—for the best paper contributing to the literature of the profession of civil engineering.

The Duggan Prize—a gold medal and cash to a value of \$100—for the best paper on constructional engineering involving the use of metals for structural or mechanical purposes.

The Plummer Prize—a gold medal—for the best paper on chemical and metallurgical subjects.

The Leonard Prize—a gold medal—for the best paper on a mining subject.

In addition, five prizes of twenty-five dollars each are offered in each of the four vice-presidential zones—plus one for a French speaking member in the province of Quebec—for the best paper on any subject presented by a Student or a Junior member.

Papers submitted in competition for any of the above prizes should be in the hands of the branch secretary or sent to Headquarters **not later than June 30th.**

## MEMBERSHIP CERTIFICATES

Members are reminded that they can obtain a certificate, suitable for framing, attesting their membership in the Institute. These certificates are engraved on parchment vellum and bear the full name of the member, his classification, and the dates of his election and transfer. They measure approximately nine by twelve inches.

Some time ago, a substantial reduction in the price of membership certificates was authorized by Council. This decision aimed at making new certificates available at the minimum cost to all those Members who were automatically transferred from Associate Members, two years ago, by the by-law amendment abolishing the latter classification. The new certificate contains a complete history of the individual's Institute membership from Student to Member.

The price of the certificate is \$1.25.

## MEETINGS OF COUNCIL

A regional meeting of the Council of the Institute was held at the Royal York Hotel, Toronto, Ont., on Saturday, April 25th, 1942, at ten thirty a.m.

Present: President C. R. Young (Toronto) in the chair; Vice-Presidents deGaspé Beaubien (Montreal), and J. L. Lang (Sault Ste. Marie); Councillors J. E. Armstrong (Montreal), A. E. Berry (Toronto), D. S. Ellis (Kingston), J. G. Hall (Montreal), N. MacNicol (Toronto), A. W. F. McQueen (Niagara Peninsula), W. J. W. Reid (Hamilton), H. R. Sills (Peterborough), and J. A. Vance (London); General Secretary L. Austin Wright, and Assistant General Secretary Louis Trudel. There were also present by invitation—Past-President J. B. Challies (Montreal); Past Vice-President J. Clark Keith (Border Cities); Past-Councillors W. E. Bonn, E. G. Hewson, A. U. Sanderson and C. E. Sisson of Toronto, H. F. Bennett (London), also chairman of the Committee on the Young Engineer, T. H. Jenkins (Border Cities), I. P. Macnab (Halifax), W. R. Manock (Niagara Peninsula), D. A. R. McCannel (Regina), also president of the Dominion Council of Professional Engineers; Branch Chairmen F. T. Julian (London), H. L. Johnston (Border Cities), J. A. Lalonde (Montreal), N. B. MacRostie (Ot-

tawa), and A. L. McPhail (Niagara Peninsula); D. R. Smith, vice-chairman, Saint John Branch; W. S. Wilson, chairman, H. E. Brandon, immediate past-chairman; S. H. deJong, secretary-treasurer, F. J. Blair, S. R. Frost and C. F. Morrison, members of executive, and J. J. Spence, immediate past-secretary-treasurer of the Toronto Branch; W. C. Miller, president, Association of Professional Engineers of Ontario, and Major Barry Watson, registrar of the Ontario Association and secretary of the Dominion Council of Professional Engineers; C. C. Cariss, of Brantford, and Wills Maclachlan, of Toronto.

In welcoming the councillors and guests, the president pointed out that this was the second regional meeting of Council to be held within a week. He was very pleased to see such a large attendance. He extended a special welcome to Mr. McCannel and Major Barry Watson, president and secretary of the Dominion Council of Professional Engineers. Although only members of Council could vote, the president hoped that the guests would take part in all discussions, as Council would be very glad to have the benefit of their views. He asked each person to rise, give his name, place of residence, and Institute affiliation.

At the March meeting of Council in Montreal a suggestion made by Councillor G. M. Pitts regarding the distribution in Canada of the publications of the Founder Societies had been referred to the Publication Committee for consideration and report. For the information of members present the general secretary read Mr. Pitts' original communication, together with an interim report from the Publication Committee. The proposal had been discussed at the Vancouver meeting, but no action had been recommended.

The general secretary presented to the meeting a copy of the A.S.M.E. catalogue which lists all the publications issued by that society. This was a very comprehensive booklet, and confirmed the remarks of the chairman of the Publication Committee as to the large number of publications issued by the Founder Societies. Mr. Wright outlined the arrangement already in force between the Institute and the Founder Societies whereby Institute members may obtain the publications of the American societies at the same price as that paid by their own members. This information is published in the *Journal* at least once a year.

An arrangement such as that suggested by Mr. Pitts had already been discussed with Mr. Davies, the secretary of the American Society of Mechanical Engineers. Mr. Davies was now in the army in an executive capacity at Washington, and therefore there had been no opportunity to give further consideration to this matter. The general secretary thought that if this could be left until after the war it might be possible to work out some arrangement, although it would probably involve the Institute in some expense, and would require a good deal of organization work.

The president reported that the matter had been discussed at some length at the Vancouver meeting and while no formal motion had been passed, the general view appeared to be that the existing facilities should be drawn more forcibly to the attention of members of the Institute, either by inserting a notice in the *Journal* or by communicating with the different branches, but that no new machinery should be set up at the present time.

Mr. Sills thought it might be possible for some of the Institute branches to act as branches of the Founder Societies and as such receive a supply of their literature for distribution. Obviously, the Engineering Institute cannot cover the whole engineering field. Mr. Sills suggested that the *Engineering Journal* be devoted entirely to Canadian conditions. For world wide conditions our members might be supplied with the publications of the

Founder Societies. He understood that at the present time this would be rather difficult but brought it up as a possible objective for the future.

Major Watson inquired whether it would be possible for the Institute to publish lists of all available publications. If a list similar to that shown to the meeting by Mr. Wright could be published in the *Journal*, members of the Institute would know just what publications were available.

Mr. Vance asked if it would be possible to secure copies of the lists of publications and place them in the hands of the branch secretaries and distribute them among the membership.

Mr. Wright thought these suggestions to be very practical. He knew that reprints of the A.S.M.E. catalogue could be secured, and asked whether we should try to cover the whole membership or just get enough copies for councillors, chairmen and secretaries of branches, etc. He could say almost definitely that the A.S.M.E. would be glad to supply the catalogues, and felt sure that the other societies would do the same thing if they had the lists available. He would be glad to go into the matter.

Some of the American societies published abstracts of some of their papers, and Mr. Sills suggested that it might be possible to secure these and publish them in the *Journal*. Mr. Wright did not know whether this would be possible, but pointed out that through the courtesy of the Engineering Societies Library the Institute receives and publishes in the *Engineering Journal* copies of reviews of all the books received by the American societies. After further discussion, it was decided to leave this matter in the hands of the general secretary for further investigation.

The president stated that this discussion and that at the Vancouver meeting would be reported to the Publication Committee for its consideration and assistance in preparing its final report, which would be presented to a later meeting of Council.

The general secretary explained that this question had been brought up by a resolution from the Montreal Branch in which they had asked Council to consider the possibility of abolishing the classification of Branch Affiliate. Branch Affiliates were not members of the Institute itself, but only of the branch. The branches may admit them at any fee they decide upon. Members had complained that affiliates received all the privileges at less than half the fee. When Institute membership lists were published, complaints had been received from Branch Affiliates that their names did not appear in the list. At the March meeting of Council the matter had been referred to the Institute's membership committee for consideration and report. A report had been received from the committee which the chairman, Mr. Hall, read to the meeting and which recommended:

- (1) That the classification be not eliminated.
- (2) That the name be changed from "Branch Affiliate" to "Branch Associate," or some similar name so as to eliminate the confusion in the use of the term "affiliate."
- (3) That Council recommended to each Branch that a fee of, say, \$5.00 be the minimum for "Branch Associate," also, that each Branch be reminded of its power to increase the fee to any desired figure, or, to eliminate the classification entirely, if there is still a tendency to choose it rather than that of Affiliate, as reported by Montreal Branch."

In elaborating on the report, Mr. Hall pointed out that the Montreal Branch had brought up, first, the difficulty in collecting the fee, and, secondly, the fact that, because of the lower annual fee, people tended to apply for admission as Branch Affiliate rather than Institute Affiliate. As far as the first point is concerned, that is entirely up to

# AT THE WEBSTER LECTURES, TORONTO

*Left: General picture of the "class"*

the branch. Each branch must decide for itself whether or not it wishes to have Branch Affiliates. With regard to the second point, the committee felt strongly that there should be some clarification of the qualifications for these two classifications. Based on his experience as a member of Council, Mr. Hall felt that there was definitely some uncertainty as to what an Affiliate really is. Section 11 of the by-laws, describing Institute Affiliates, indicates a very high type of professional man—not just a salesman who wishes to be connected with the Engineering Institute. There is possibly some confusion between the term "Branch Affiliate" and "Affiliate."

Mr. Hall reported that he had just received from Councillor Macpherson, of Vancouver, a long letter giving his views, particularly on the recently established practice of admitting as Affiliates persons who did not quite fulfill the educational or professional requirements for Junior or Member. Mr. Macpherson was not in favour of this, and did not think it was in accordance with the intent of the by-laws.

The president thanked Mr. Hall for his valuable report. He reported that letters had also been received from the Calgary and Edmonton branches opposing the abolition of the class of Branch Affiliate. The Lethbridge Branch also finds it very desirable to have Branch Affiliates, and are most anxious to retain that particular classification. They would probably have no objection to having the name changed.

Applications were received from many persons who, in the opinion of Council, had not the necessary educational qualifications for membership. Frequently they were given the option of election as Affiliate until such time as they were prepared to sit for the Institute's examinations for Junior or Member.

In response to an inquiry from Mr. Berry, the president read figures from the last annual report giving the number of Branch Affiliates in each branch. Mr. Bennett could see the possibility of abuse of this classification. Persons not eligible for Institute Affiliateship might become Branch Affiliates and pay the smaller fee. In the London Branch their meetings were advertised in the press, and frequently engineers attended who were not members of the Institute and not even Branch Affiliates.

Following further discussion, on the motion of Mr. Hall, seconded by Mr. Vance, it was unanimously resolved that the classification of Branch Affiliate be not eliminated; that consideration be given to the changing of the name, and that some decision be made as to the fees for that classification.

The question of the qualifications for Institute Affiliate had been discussed, and on the motion of Mr. Vance, seconded by Mr. Berry, it was unanimously resolved that the Membership Committee be asked to continue its studies and investigate the qualifications for Institute Affiliate and report to Council at a later meeting.

The general secretary quoted from a memorandum by Mr. P. B. Motley a suggestion that Council consider and report on the desirability of amending the by-laws so that Life Membership would be removed from the section dealing with exemptions, and placed in the same category as Honorary Membership.

At the request of the Finance Committee the matter had been discussed at the Vancouver meeting of Council, and the opinions expressed were summed up in the following minute of that meeting:

"It was agreed that the opinion of this Council meeting is that some steps should be taken to place Life Membership in the category of an honour rather than a concession. It was hoped that this expression of opinion would be of some assistance to the Finance Committee in dealing with the matter."

Mr. Armstrong stated that Mr. Motley is very anxious

to know what action Council has taken on this memorandum.

Mr. McQueen felt that Life Membership should be granted as an honour. Members should not feel that their names were placed on this list simply because they were unable to pay their fees.

Mr. Bennett, Mr. Vance and Mr. Hall spoke on the question, indicating that no change in procedure seemed to be necessary. Finally it was moved and seconded that the proposal be tabled.

The president pointed out that this would not preclude consideration of Mr. Motley's suggestion regarding the by-law covering specifications.

The general secretary outlined the circumstances that had led up to the Institute sponsoring a series of lectures by Professor F. Webster, Deputy Chief Engineer of the Ministry of Home Security, London, England. He described the events leading up to the final arrangements for the lectures, which had been held under the able direction of the officers of the Toronto Branch. He had been extremely pleased to hear of the presentation which had been made to Professor Webster who had deeply appreciated this action. He asked Mr. Wilson, the chairman of the Toronto Branch, to present a report on the lectures.

Mr. Wilson thought it rather superfluous to go into details, as nearly everyone at the Council meeting had attended the lectures. There had been a registration of about one hundred and eighty-five. The lectures had been quite technical and extremely interesting. There had been many favourable comments on the excellent lead the Institute had taken in arranging such lectures. Professor Webster had had a hard assignment. He spoke for two and a half hours at a time. The members attending had indicated their desire to show their appreciation in some tangible way and presented Professor Webster with a very fine wrist watch and a wallet of money. He had stated that he could not possibly accept the money, but finally sent it to the Milk Fund for the children in England. The Toronto Branch had been very glad to have some part in arranging for these lectures.

Mr. Bennett emphasized the necessity of getting the report of these lectures into the hands of those who could make good use of the information. Many engineers who could have been and who should have been at the meetings were disappointed, and he felt that these people should get a copy of the proceedings. The Engineering Institute had a wonderful opportunity to take the lead in getting this information circulated to the right people. Engineers are leading the army and engineers should lead the civilians.

At twelve forty-five the meeting adjourned for lunch and reconvened at two o'clock, with the president in the chair.

Before continuing the discussion on the Webster lectures, Mr. Macnab asked permission to present on behalf of Past Vice-President Wilson, of Sydney, and Past Vice-President Dunsmore, of Halifax, their regret at being unable to be present, and their best wishes for the success of the meeting.

It had given him, personally, a great deal of pleasure to attend the lectures. He had heard Professor Webster in Halifax and, having heard his first talk, was very anxious and very pleased to be able to attend this series of lectures. Both the Cape Breton and the Halifax branches had asked him to represent them and to go back and pass on the information which he would receive. He was very proud of what the Institute had done in sponsoring these lectures. In his opinion it was one of the biggest contributions to the welfare of the country that the Institute had ever made. The way in which the matter was dealt with from now on was very important. While realizing that much of the information received was of a

more or less confidential nature, he felt that those who had attended the meetings should have the privilege of passing much of it on to interested bodies for their guidance. It was most important that the Maritimes should have this information, also the people on the west coast, and he was definitely of the opinion that the information should be disseminated under the leadership of The Engineering Institute of Canada. He felt that a strong committee of the Institute should be appointed with branch committees or provincial committees to work out the details as applied to the different localities.

The president explained that the meetings had been called with that thought in mind—that those who attended would go back to their own localities and act as consultants or advisers, using discretion as to what should or should not be made public.

In reply to an enquiry from Mr. Vance, Mr. Wright stated that when the notes are completed, it might be that Professor Webster would indicate those parts which were to be treated as strictly confidential, or he might delete them altogether from the report. It was impossible to say just how soon the report would be ready, but a considerable amount of work was involved, and Professor Webster has several other appointments in the near future which might delay the editing of the material. From the discussion which followed it seemed desirable that some indication should be given to those who had attended the lectures as to which portions of the material should be treated as confidential. Accordingly, on the motion of Mr. Hall, seconded by Mr. Armstrong, it was unanimously resolved that the general secretary contact Professor Webster at the earliest opportunity and secure from him a list of items which were not to be disclosed, and that it be sent out to all who were registered at the lectures.

It had been suggested that in disseminating this valuable information and in continuing the good work which had been started, some official recognition and support might be secured from the Dominion Government. Accordingly, on the motion of Mr. Vance, seconded by Mr. Armstrong, it was unanimously resolved "that the President of The Engineering Institute of Canada approach the proper authorities of the Dominion Government to urge the formation of a central authority for the implementing of the information obtained by the group assembled at the University of Toronto by The Engineering Institute of Canada, under the leadership of Professor F. Webster, Deputy Chief Engineer of the Ministry of Home Security of Great Britain, in order that the valuable engineering information on protection to personnel, property and vital machinery, should be made available at once to all who are responsible for such protection."

Mr. Bennett reported that through the establishment of counselling committees, the Committee on The Young Engineer has become personal to each branch of the Institute and, rather than present a report on the work of the committee as a whole, he would have preferred to receive comments from the members of the various branches attending the meeting. Many of the branches have already organized their counselling committees, in many cases the chairman of the branch being on the committee. Good progress had been made in the distribution of the booklet "The Profession of Engineering in Canada." Copies of the E.C.P.D. booklet, "Engineering as a Career," and their Guidance Manual had also been distributed in Canada by Mr. Bennett's committee. The response had been most encouraging.

A suggestion had been made that there should be a French translation of the Canadian booklet for distribution in the province of Quebec. Mr. Bennett also felt that the committee would need three or four thousand additional copies of the English edition to carry on for the next year or so. He would like authority to purchase these

additional copies. The president referred the matter to Vice-President Beaubien, chairman of the Finance Committee, who thought that such an expenditure could be provided for. Accordingly, on the motion of Mr. Hall, seconded by Mr. Sills, it was unanimously resolved that the matter of additional copies of the booklet be referred to the Finance Committee with power to act.

Mr. Bennett also reported that the question of Students' and Juniors' Prizes was receiving consideration by his committee. In his opinion these prizes should be continued and Students and Juniors of the Institute should be encouraged to submit papers. Opinions are being obtained from the various branches and a report will be submitted as soon as possible.

The president thanked Mr. Bennett for his very informative report and expressed the hope that this very gratifying activity of the Institute would be carried on in the future as it had in the past with a great deal of vigour and foresight.

A number of applications were considered and the following elections and transfers were effected:

ADMISSIONS

TRANSFERS	
Student to Junior .....	1

As president of the Dominion Council of Professional Engineers, Mr. McCannel extended the sincere thanks of that Council for the gracious way in which he had been received at the Council meeting—a further evidence of the courtesy which has always been extended. Mr. McCannel also expressed his pleasure at being able to attend the lectures given by Professor Webster and, on behalf of the Dominion Council, extended congratulations to the Institute for their efforts in sponsoring this very valuable series of lectures.

In response to Mr. Vance's enquiry, the president stated that he hoped to visit the Quebec and Maritime branches during the latter part of July and the first part of August. He would be glad to visit any of the Ontario branches that he had not already visited, at the convenience of the branches themselves. Replying to Mr. Hall, the president stated that he would be greatly pleased if any members of Council could accompany him on any of these visits. He had not made the suggestion as he did not wish to impose on the councillors. He knew they were all extremely busy people.

There being no further business, the Council rose at five o'clock p.m.

A meeting of the Council of the Institute was held at Headquarters on Saturday, May 16th, 1942, at ten thirty a.m.

*Present:* President C. R. Young in the chair; Vice-Presidents deGaspé Beaubien and K. M. Cameron; Councillors E. D. Gray-Donald, J. G. Hall, W. G. Hunt, M. G. Saunders and H. R. Sills; Treasurer E. G. M. Cape; Past-Councillor R. A. Spencer, of Saskatoon; Secretary Emeritus R. J. Durley, General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel.

The general secretary presented a letter from Mr. Thos. E. Storey, secretary of the Joint Committee on Co-operation in Manitoba, together with a copy of a proposed co-operative agreement between the Association of Professional Engineers of the Province of Manitoba and The Engineering Institute of Canada, which had been approved for submission to the Institute by the Council of

the Association and the Executive of the Winnipeg Branch of the Institute.

The proposal had been studied by the Institute's Committee on Professional Interests, and the general secretary read a letter from Mr. Challies, the chairman of that committee, advising that general approval had been given to the proposal by his committee. The committee was of the opinion that with some clarification and some minor changes, the proposal should be acceptable to the Institute. Mr. Challies suggested that if the Council would approve of the general principle of the agreement, his committee would discuss the matter with the joint committee and later submit a final draft for the acceptance of Council.

Council recorded its pleasure at receiving this proposed agreement, and on the motion of Mr. Beaubien, seconded by Mr. Gray-Donald, it was unanimously resolved that Council, on the recommendation of the Committee on Professional Interests, approves of the general principle of the proposed agreement, and leaves the matter of further negotiations in the hands of that committee.

The general secretary read a letter from the executive of the Saint John Branch which expressed appreciation of the progress which has already been made towards co-operation with Provincial Professional Associations, and urging that negotiations be continued with other provinces so that greater benefits would accrue to the engineers in all parts of Canada. This was noted.

The general secretary read a letter which the president had written to the High Commissioner for the United Kingdom in Canada expressing the Institute's appreciation of the courtesy extended in permitting Professor F. Webster, Deputy Chief Engineer of the British Ministry of Home Security, to give the series of lectures at Toronto. He also read an acknowledgment from the Acting High Commissioner, Sir Patrick Duff.

The general secretary reported that after consultation with the president and Professor Webster it had been decided to copyright the material covering the Webster lectures. This was being done in order to prevent unauthorized persons from reprinting all or any portion of it. Professor Webster has requested that the notes be circulated only to those persons who attended the lectures and to appropriate organizations selected by the Institute. This action was unanimously approved.

The general secretary reported that after discussions with the president as to the procedure to be followed with a view to implementing the application of the information received from Professor Webster, as had been suggested at the Toronto meeting of Council, a letter had been sent to the Institute branches suggesting that in each branch a committee be set up consisting of the chairman and councillors of the branch and those persons who had attended the lectures, such committees to discuss local conditions, methods of adapting the material, and to decide how and to whom the material should be distributed.

It was noted that the financial statement to the end of April had been examined and found satisfactory.

Following the practice established last year, it was unanimously resolved, on the recommendation of the Finance Committee, that the annual fees of members resident in the United Kingdom be remitted for the year 1942.

The general secretary read a resolution from the executive of the Saint John Branch suggesting that an opportunity now existed for improving the status of the engineer in the Royal Canadian Engineers and other engineering services in the Canadian Army by obtaining rank and pay equivalent to that accorded to the medical and dental services, and asking that immediate action be taken by the Council of the Institute to bring this mat-

ter to the attention of the Minister of National Defence.

The general secretary stated that this matter had been before Council on several occasions, and that there had been considerable correspondence with the Minister of National Defence. At one time it had seemed that some progress was being made, with particular reference to the engineers in the Ordnance Department, but at that time the whole set-up had been changed and engineers were taken out of that Department entirely, except for maintenance work. Engineers, unlike the doctors and dentists, did not have one single organization representing them, or a common basis of education and accrediting. This, coupled with the fact that professional engineering work in the army is now being done largely by civilians, was the main difficulty. In acknowledging receipt of the resolution, the general secretary had explained the situation to the branch. The resolution and correspondence were noted, and the general secretary stated that he would keep in touch with the situation at Ottawa, to see if anything could be done.

A number of applications were considered and the following elections and transfers were effected:

The president welcomed Professor R. A. Spencer of Saskatoon, who was visiting in the city, and asked if he had anything he would like to bring up at the meeting.

Professor Spencer stated that he had come to Ottawa as part of a delegation to attend a conference called by the Wartime Bureau of Technical Personnel, under the chairmanship of General LaFleche, to consider the question of engineering requirements for the active services and industry for the coming year, and a proposal to funnel those requirements through one common channel. The requirements greatly exceeded the supply, but the Bureau pointed out that by withdrawing men from non-essential industry it would be possible to bridge the gap to a great extent. The Bureau recommended that the engineering schools handle as many students as they could accommodate. All applications for technical personnel (students and graduates) would now come through the Bureau, which was a great step forward. A Board would be set up in each university to consider individual cases, and after consultation with the students themselves recommendations would be made as to where they should go. In Professor Spencer's opinion the conference had been a great success.

Professor Spencer commented on the success of the recent visit of the president to Saskatoon. Such visits were an important part in the unification of engineers across Canada, and should be established as a permanent feature.

#### COMING MEETINGS

**Eastern Photoelasticity Conference** — Fifteenth Semi-Annual Meeting at the University Club, 40 Trinity Place, Boston, Mass., on Saturday, June 20, 1942.

**American Water Works Association** — Sixty-second Annual Convention at Stevens Hotel, Chicago, Ill., June 21-25. Executive Secretary, Harry E. Jordan, 22 East 40th Street, New York, N.Y.

## ELECTIONS AND TRANSFERS

At the meeting of Council held on May 16th, 1942, the following elections and transfers were effected:

### Members

- Bell**, Clarence William, B.Sc. (Civil) (Univ. of Sask.), asst. branch mgr., Currie Products Ltd. Toronto, Ont.
- Burdett**, George Henry, B.A.Sc., C.E. (Ecole Polytechnique), regional representative, Wartime Bureau of Technical Personnel, Montreal, Que.
- Collard**, Richard Reeve, Air Commodore, director of works and bldgs., R.C.A.F., Ottawa, Ont.
- Morrison**, Charles Austin, B.A.Sc. (Elec.) (Univ. of Toronto), mgr., lamp sales divn., Canadian General Electric Co. Ltd., Montreal, Que.
- Thorne**, Edward Charles, Major, R.C.E., Department of National Defence, Ottawa, Ont.
- Vinet**, Jacques, B.A.Sc., C.E. (Ecole Polytechnique), cost engr., A. Janin & Co. Ltd., Gaspé, Que.

### Affiliates

- Johnson**, Stanley, (School of Technology, Manchester), gen. supt. of mfg., Johnson Wire Works Ltd., Montreal, Que.
- Loranger**, Aime, Canadian Propellers Ltd., Montreal, Que.
- Seed**, Charles Edward, asst. engr., Angus Robertson Construction Co., Ottawa, Ont.
- White**, Gerald Langdale, B.A.Sc. (Chem.) (Univ. of Toronto), editor and asst. business mgr., Westman Publications Ltd., Toronto, Ont.

### Transferred from the class of Junior to that of Member

- Hyman**, Howard Davison, B.Sc. (Civil) (McGill Univ.), gen. mgr., J. R. Booth Ltd., Ottawa, Ont.
- Ruggles**, Edgar Lenfest, B.Sc. (Civil) (Univ. of Sask.), field engr., The Bird-Archer Co. Ltd., Regina, Sask.

### Transferred from the class of Student to that of Member

- Rogers**, Howard W., B.Sc. (Elec.) (McGill Univ.), sales engr., asst. to branch mgr., Canadian Blower & Forge Co. Ltd. and Canada Pumps Ltd., Montreal, Que.

### Transferred from the class of Student to that of Junior

- Read**, Frederick Cyril, B.A.Sc. (Chem.) (Univ. of Toronto), research asst., Dominion Tar & Chemical Co., Montreal, Que.
- Watters**, Edgar Steen, B.Sc. (Elec.) (Univ. of N.B.), radio operator, Station C.B.A., Sackville, N.B.
- Wiebe**, Leslie, B.Sc. (Mech.) (Univ. of Sask.), chief draftsman, MacDonald Bros. Aircraft Ltd., Robinson St. Divn., Winnipeg, Man.

### Students Admitted

- Baird**, Robert Gordon, (Univ. of N.B.), 287 King St. W., Saint John, N.B.
- Cox**, Kenneth Victor, (Univ. of N.B.), 572 Needham St., Fredericton, N.B.
- Hibbard**, David Ernest, (Univ. of Toronto), 186 St. George St., Toronto, Ont.
- Jewett**, Arthur Earle, (Univ. of N.B.), 101 Aberdeen St., Fredericton, N.B.
- Kennedy**, Robert William, (McGill Univ.), 6922 De Montmagny Ave., Montreal, Que.
- Marr**, Ralph Burton, (Univ. of N.B.), P.O. Box 285, Fairville, N.B.
- Peabody**, Gerald Stead, (Univ. of N.B.), North Devon, N.B.
- Quist**, Jack Ernest, (Univ. of Toronto), 310 Monaghan Road, Peterborough, Ont.
- Shaw**, Douglas Thomas, (McGill Univ.), 2204 Prud'homme Ave., Montreal, Que.
- Smith**, Walter Marshall, (Univ. of N.B.), 554 Brunswick St., Fredericton, N.B.
- Thibault**, Bernard, (Ecole Polytechnique), 4080 St. Hubert St., Montreal, Que.
- Wirtanen**, Ernest W., B.Sc. (Elec.) (Milwaukee School of Engineering) 313 Maitland Ave., Peterborough, Ont.

## Personals

**The Hon. C. D. Howe**, HON. M.E.I.C., received an honorary degree of LL.D., at the convocation held at Queen's University last month.

**J. E. Porter**, M.E.I.C., has recently been elected vice-president and director of Ford Motor Company of Canada, Limited. A graduate from the University of Toronto in the class of 1915, he joined the staff of the Department of

J. E. Porter, M.E.I.C.

Public Works of Canada as assistant engineer in the district of western Ontario. In 1918 he went with the Canadian Steel Corporation Limited at Ojibway, Ont., as field engineer and inspector. In 1922 he joined the staff of the Ford Motor Company and was in charge of the civil engineering branch. Later he became in charge of all engineering activities of the company and last July he was appointed general superintendent of the company.

## News of the Personal Activities of members of the Institute, and visitors to Headquarters

In 1926 Mr. Porter was a councillor of the Institute representing the Border Cities Branch.

**Dr. Arthur Surveyer**, M.E.I.C., consulting engineer of Montreal and past-president of the Institute has recently been appointed a member of the National Research Council.

**D. R. Smith**, M.E.I.C., is the newly elected chairman of the Saint John Branch of the Institute. Born at St. Martin's, N.B., he was educated at the University of New Brunswick and graduated in 1910 as a civil engineer. For a few years after graduation he was employed as assistant to G. G. Murdoch, consulting engineer at Saint John. From 1913 to 1915 he was in private practice as a civil engineer on surveys, water and sewer construction and suburban development.

During the last war he served overseas from 1916 to 1919.

Mr. Smith is now director of works of the City of Saint John.

**Dr. C. A. Robb**, M.E.I.C., who had been on the staff of the University of Alberta for twenty-five years, has recently accepted a position with the Aluminum Company of Canada Limited in Montreal. At the outbreak of the present war Dr. Robb was put in charge of the Gauge Division of the War Supply Board. Later he was power consultant in the munitions branch of the Department of Munitions and Supply.

**Colonel H. J. Lamb**, M.E.I.C., is now with the Department of Munitions and Supply as resident technical officer, at the strip mill of Anaconda American Brass Limited, New Toronto. Colonel Lamb is a past president of the Association of Professional Engineers of Ontario.

**W. A. Duff**, M.E.I.C., has recently retired from the position of engineer of bridges and roadway, Canadian National Railways. A native of Wentworth County, Ont., Mr. Duff has had a professional career of 41 years, 35 of which have been in railway services and four years with bridge construction companies in the United States and Canada.

Graduating in applied science from the University of Toronto, in 1901 his first position was as draughtsman and engineer with the Vancouver, Victoria and Eastern Railway in the Kettle Valley, B.C., but he came East a year later to join the Grand Trunk at Hamilton. Then followed a four-year period with bridge companies and in 1907 Mr. Duff became assistant bridge engineer for the National Transcontinental Railway at Ottawa, later becoming engineer of bridges for the Canadian Government Railways at Moncton, and then assistant chief engineer. In 1920 he was transferred to the Canadian National Railways as engineer of standards and in 1932 his responsibilities were

**Professor R. W. Angus**, HON.M.E.I.C., head of the department of mechanical engineering at the University of Toronto, has received the George Warren Fuller Award of the American Water Works Association "for his noteworthy contributions to research in water hammer and other hydraulic subjects." The award was presented to him at the annual convention of the Canadian Section of the American Water Works Association held at Niagara Falls last April.

**J. A. Ouimet**, M.E.I.C., joint chief engineer of the Canadian Broadcasting Corporation, has been elected chairman of the Montreal Branch of the Institute of Radio Engineers.

**J. V. Rogers**, M.E.I.C., was transferred at the beginning of this year from the position of chief draughtsman to that of plant engineer with the Alberta Nitrogen Products Limited, and is in charge of all construction and maintenance work.

**W. A. Duff, M.E.I.C.**

**R. O. Stewart, M.E.I.C.**

**J. A. Ellis, M.E.I.C.**

enlarged by appointments as engineer of bridges and roadway.

**R. O. Stewart**, M.E.I.C., has been appointed engineer of bridges with Canadian National Railways at Montreal. Born at Lindsay, Ont., he graduated with honours in applied science from the University of Toronto in 1911. His first position was with the Dominion Bridge Company in 1910 and in 1913 he became assistant bridge engineer for the Canadian Government Railways at Moncton. After the organization of the Canadian National Railways Mr. Stewart became assistant engineer of standards, first at Toronto, then at Montreal remaining in the latter city through subsequent promotions.

**René Dupuis**, M.E.I.C., has recently been appointed director of the new department of electrical engineering of Laval University, Quebec.

He began his engineering education at McGill University, Montreal, and completed his course at Nancy, France, where he obtained his diplomas in Mechanics and Physics. He also studied Political Economy. Returning to Canada, Mr. Dupuis was employed for two years by the Canadian Westinghouse Company, Hamilton, Ont. From 1928 to 1930, he was employed in the repair shop of the Shawinigan Water and Power Company at Three Rivers, where his work brought him into relation with Quebec Power Company engineers. In 1930 he was invited to go to Quebec as assistant superintendent of the power division. In 1937 he was appointed superintendent of that division and in 1939 he became assistant general superintendent of the company.

Mr. Dupuis has also been appointed lately a member of the Superior Board of Technical Education of the province. He has been lecturing at Laval University for the last two years in the Mining and Metallurgical Department.

**J. A. Ellis**, M.E.I.C., has been appointed engineer of track for Canadian National Railways at Montreal. He was born at Arbroath, Scotland, and his engineering qualifications were gained at the City and Guilds Technical College, London. Following service on underground railway construction in London and with the former Great Northern Railway, now part of the London and North Eastern, Mr. Ellis spent five years on construction and maintenance with the Oudh and Rohilkhand State Railway in India. He came to Canada in 1911 and joined the Canadian Northern Railway, later entering the service of the Canadian Government Railways at Moncton where he afterwards became office engineer. In 1921 Mr. Ellis was appointed assistant engineer of roadway standards for the Canadian National Railways at Toronto, later being transferred to Montreal in a similar capacity and continuing these duties until his present appointment.

**George E. Kent**, M.E.I.C., has recently returned from Talara, Peru, where he was assistant refinery superintendent with the International Petroleum Company. He has now gone to Regina, Alta., to take the position of assistant refinery superintendent with Imperial Oil Limited.

**George H. Midgley**, M.E.I.C., who was loaned to Wartime Merchant Shipping Limited, Montreal, has now returned to Dominion Bridge Company Limited, Lachine, Que. During the past year he has been acting as chief engineer, manager of purchasing division, etc., for Wartime Merchant Shipping Limited. Owing to ill health it was necessary for him to take a considerable rest. Mr. Midgley has now recovered and is in charge of certain phases of Dominion Bridge Company's war work.

**R. L. Morrison**, M.E.I.C., who is employed with Messrs. Airspeed (1934) Limited at Portsmouth, England, has

recently been transferred from the grade of Associate to that of Associate Fellow in the Royal Aeronautical Society.

**R. M. Hardy**, M.E.I.C., of the Department of Civil Engineering at the University of Alberta is in Montreal for the summer months and is employed in the general engineering department of the Aluminum Company of Canada Limited.

**W. E. Weatherbie**, M.E.I.C., has accepted a position with the Aluminum Company of Canada at Shawinigan Falls, Que. He has spent the past two years at Trinidad, B.W.I., employed by the Trinidad Leaseholds Limited and later with Walsh and Driscoll, contractors.

**Bernard Collitt**, M.E.I.C., was elected a director of Jenkins Brothers Limited at the recent annual meeting of the shareholders held in Montreal. He has been metallurgist with the company for the past twelve years.

**Bernard Collitt, M.E.I.C.**

**Viggo Jepsen, M.E.I.C.**

**G. W. Griffin, M.E.I.C.**

Born in Lincoln, England, Mr. Collitt was educated at Queen Elizabeth's Grammar School, Gainsborough. After a thorough training in chemistry in London, he studied metallurgy in Sheffield and in Germany and came to Canada in 1909. During the Great War of 1914-1918 he was chief chemist and metallurgist with Ruston and Hornsby Limited, of Lincoln, England, a company which at that time employed over 10,000 workpeople in the manufacture of aeroplanes, aero-engines, submarine engines, tank engines, tractors, paravanes and numerous other munitions of war. Holding high qualifications both as an engineer and a chemist, he has had a wide experience in the application of metallurgy and chemistry to engineering and is well known to the leading metallurgists of the Dominion and to many of those in the United States.

In 1937 he was chairman of the Montreal Chapter of the American Society for Metals.

**Viggo Jepsen**, M.E.I.C., is the newly elected chairman of the St. Maurice Valley Branch of the Institute. He was born and educated in Denmark and came to Canada in 1928. He joined the staff of the Shawinigan Water and Power Company, Limited where he was engaged in power development. In 1932 he went with James A. Ogilvy's Limited, Montreal, as sales engineer for oil burning equipment. For a few months in 1936 he worked on the installation of caustic treatment plant at the Canadian Copper Refineries Limited, Montreal. Later in the same year he joined the staff of Consolidated Paper Corporation, Limited, in the Laurentide Division, at Grand'Mère, Que., and soon became chief draughtsman, a position which he still occupies.

**Guillaume Piette**, Jr.E.I.C., has received his degree of Master of Science in Engineering after two years of post-graduate work at the University of Michigan, Ann Arbor. He graduated as a B.A.Sc. from Ecole Polytechnique of Montreal in 1939 and he is at present employed with the Department of Highways at Quebec.

**G. B. Batanoff**, S.E.I.C., has joined the staff of the Canadian General Electric Company and is working in their plant at Peterborough, Ont. He graduated from the University of Saskatchewan in mechanical engineering this spring.

**G. A. Mussen**, S.E.I.C., is now employed by Amalgamated Electric Corporation Limited in Toronto. He graduated in electrical engineering from McGill University in the class of 1935, and had been employed by the Dominion Bridge Company, Montreal, since 1937.

**G. W. Griffin**, M.E.I.C., has recently been appointed secretary-treasurer of the Saint John Branch of the Institute. Mr. Griffin is assistant engineer of the Canadian Pacific Railway at Saint John, N.B.

**Major Frank S. Milligan**, M.E.I.C., is attached to Military

District No. 2 as district engineer officer. During the last war Major Milligan served overseas with the Royal Engineers, 206th Field Company in France. As a civilian he was in private practice in Toronto.

**Robert A. Cunningham**, S.E.I.C., has joined the staff of E. G. M. Cape and Company at St. John's, Newfoundland. He was formerly with Price Brothers and Company, Limited, at Kenogami, Que. He graduated from Queen's University with the degree of B.Sc., in civil engineering in the class of 1941.

**Flying-Officer Raymond P. Woodfield**, S.E.I.C., is now attached to Air Force Headquarters at Ottawa after taking a course in aeronautical engineering at Montreal. Previous to his enlistment, he was on the staff of Canadian Westinghouse Company, Hamilton, Ont. Flying-Officer Woodfield graduated from the University of Manitoba in electrical engineering with the degree of B.Sc., in the class of 1939.

**W. R. Topham**, S.E.I.C., has been commissioned as a pilot officer in the R.C.A.F. and is at present stationed in the school of aeronautical engineering at Montreal. Before his enlistment he was on the staff of the Canadian Industries Limited at Beloeil, Que.

**Frederick Dixon**, S.E.I.C., has joined the staff of the Westinghouse Electric and Manufacturing Company, Limited, Atlanta, Georgia, U.S.A., and he expects to take the co-operative course in electrical engineering at the Georgia School of Technology. He was previously employed as a junior in the engineering department of Bepco Canada Limited, Montreal.

**Gilbert Proulx**, S.E.I.C., has recently joined the staff of the Saguenay Electric Company at Chicoutimi, Que., as assistant to the superintendent. He had been employed by

the Dominion Bridge Company, Limited in Montreal since his graduation from Ecole Polytechnique in 1941.

**John C. Hamilton**, S.E.I.C., has taken a position with the Canadian International Paper Company, Limited, at Three Rivers, Que. He graduated this spring from Queen's University.

**Allan C. Findlay**, S.E.I.C., who has received his degree from McGill University this spring is now employed by the Steel Company of Canada, Montreal.

**J. A. Martin**, S.E.I.C., has taken a position in the aircraft department of Canadian Vickers Limited, at Montreal. He received his degree from Ecole Polytechnique last month.

**P. W. Bishop**, S.E.I.C., who graduated from the University of New Brunswick this spring has joined the staff of Demerara Bauxite Company at Mackenzie, British Guiana.

### VISITORS TO HEADQUARTERS

**J. J. Hurley**, S.E.I.C., of Toronto, Ont., on April 27th, 1942.

**John E. Cade**, M.E.I.C., assistant chief engineer, Fraser Companies Limited, Edmundston, N.B., on April 27th, 1942.

**Major Alexandre Dugas**, Officers' Training Centre, Brockville, Ont., on April 29th, 1942.

**J. N. Galli**, S.E.I.C., Winnipeg, Man., on April 30th, 1942.

**W. V. Morris**, S.E.I.C., Winnipeg, Man., on April 30th, 1942.

**Camille Lessard**, M.E.I.C., consulting engineer, Quebec, Que., on May 5th, 1942.

**M. F. Dean**, S.E.I.C., Halifax, N.S., on May 6th, 1942.

**George E. Kent**, M.E.I.C., Imperial Oil Limited, Regina, Sask., on May 8th, 1942.

**Harold A. Fuller**, M.E.I.C., engineer, Tropical Oil Company, Colombia, South America, on May 11th, 1942.

**R. L. Smith**, S.E.I.C., Portreeve, Sask., on May 12th, 1942.

**Morris Fast**, S.E.I.C., Aluminum Company, Shawinigan Falls, Que., on May 15th, 1942.

**Professor R. A. Spencer**, M.E.I.C., Department of Mechanical Engineering, University of Saskatchewan, Saskatoon, Sask., on May 16th, 1942.

**M. G. Saunders**, M.E.I.C., Arvida, Que., on May 16th, 1942.

**K. M. Cameron**, M.E.I.C., chief engineer, Department of Public Works, Ottawa, Ont., on May 16th, 1942.

**Pilot Officer E. S. Braddell**, M.E.I.C., R.C.A.F., Winnipeg, Man., on May 16th, 1942.

**Arnold Haltrecht**, Affiliate E.I.C., National Research Council, Ottawa, Ont., on May 18th, 1942.

**John E. Pringle**, M.E.I.C., Port-of-Spain, Trinidad, B.W.I., on May 19th, 1942.

**P. G. Wolstenholme**, Affiliate E.I.C., Port-of-Spain, Trinidad, B.W.I., on May 19th, 1942.

**Charles A. Robb**, M.E.I.C., Edmonton, Alta., on May 20th, 1942.

**M. B. Watson**, M.E.I.C., secretary-treasurer, Dominion Council of Professional Engineers, Toronto, Ont., on May 21st, 1942.

**Roy W. Emery**, M.E.I.C., Demerara Bauxite Company, Mackenzie, British Guiana, S.A., on May 21st, 1942.

**P. J. MacDonald**, M.E.I.C., Aluminum Company of Canada, Kenogami, Que., on May 23rd, 1942.

**Guillaume Piette**, Jr., E.I.C., Department of Highways, Quebec, Que., on May 23rd, 1942.

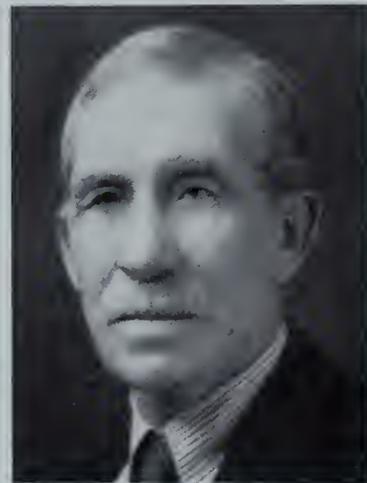

## Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

**Thomas Stiryaker Armstrong**, M.E.I.C., died at the hospital in Port Arthur on March 25th, 1942. He was born at Liverpool, England, on January 22nd, 1868. He came to Canada in 1878 and began his engineering career as a Dominion land surveyor in the North-West Territories. Two years later he was with the location and construction department of the Canadian Pacific Railway working between British Columbia and Quebec.

From 1890 to 1893 he was employed by the Toronto Belt Line street railway system, but he relinquished this job late in 1893 to take a position with the Grand Trunk Railway and the Canadian Pacific Railway as locator and construction man.

He was assistant engineer in charge of location and construction for the Canadian Pacific Railway between Port Arthur and British Columbia for nine years starting in

T. S. Armstrong, M.E.I.C.

1896, and in 1905 he became district engineer, District F, in charge of reconnaissance and location for the Transcontinental Railway. From 1906 to 1915 he was district engineer, District E, located at Cochrane, Ont.

He was associated for four months in 1916 with Professor Swain in a valuation of Canadian National and Canadian Pacific Railways properties, and in 1918 he worked on arbitration of Canadian National Railways property. From 1920 to 1930 he was with the Toronto Transportation Commission and from 1930 until his retirement in 1937 with the Northern Development Branch, of the Department of Highways of Ontario.

In recent years he had been living with his son, T. C. Armstrong, Affiliate E.I.C., at Port Arthur.

Mr. Armstrong joined the Institute as a Member in 1907 and in 1926 he was made a Life Member.

**G. Rupert Duncan**, M.E.I.C., died suddenly at his home at Port Arthur on April 19th, 1942. He was born at Ottawa, Ont., on February 7th, 1878, and was educated at McGill University, Montreal, where he graduated in electrical engineering in 1900. He spent the following year as a demonstrator in physics at McGill and received the degree of M.Sc. for post-graduate research work in 1901. He then joined the staff of the Montreal Pipe Foundry Company at Three Rivers as electrical and mechanical engineer and he went to Fort William with this company in 1906 to supervise the construction of the Canada Iron Foundries Limited. The plant was completed in 1908 and Mr. Duncan stayed as superintendent and engineer until February, 1909, when he founded the firm of G. R. Duncan and Company, real estate, of which he was still president at the time of his death.

He was also managing director of the Superior Brick and Tile Company, Limited, director of the Fort William Commercial Chambers, Limited, manager and secretary of the Schreiber Gold Mines Limited and the Atikokan Iron and Lands Limited.

G. R. Duncan, M.E.I.C.

In civic affairs, Mr. Duncan represented Fort William's Ward 3 as an alderman on the City Council in 1916 and 1917. At the Atlantic City convention in June, 1919, he was elected vice-president of the National Association of Real Estate Boards. The same year and the following year he was president of the Fort William Board of Trade, and president of the Fort William Chamber of Commerce in 1932, 1933 and 1934.

In 1934 and 1935 he was president of the North West Ontario Associated Chambers of Commerce. He was a member of the St. John's Ambulance Association, and an

officer brother of the Order of the Hospital of St. John of Jerusalem.

Mr. Duncan was the father of Gaylen R. Duncan, S.E.I.C., of McKean Sheet Piling Company, Montreal, and Frederick Duncan, S.E.I.C., of Canadian General Electric Company, now studying law at Osgoode Hall, Toronto.

Mr. Duncan joined the Institute as a Student in 1899 and was transferred to Associate Member in 1902. He became a Member in 1940. He was particularly active in Institute affairs, having been chairman of the Lakehead Branch.

**Leonard Ernest Schlemm**, M.E.I.C., died suddenly at his home in Montreal on April 29th, 1942. He was born at Brooklyn, N. Y., on September 16th, 1878, and was educated at the Massachusetts Institute of Technology. From 1903 until 1908 he was engaged on railway reconnaissance, location and construction work in the United States. He then spent two years with Brett and Hall, landscape architects, Boston, and was in charge of their construction work.

In 1910 he came to Montreal and engaged in private practice as a consultant in landscape architecture and town planning. During his successful practice he carried out developments, such as Redpath Crescent, West Crescent Heights, Monklands, Trafalgar Circle, Belvedere Terrace, Mount Alison University Grounds, Town of Leaside, Toronto. He was consulting engineer for the Towns of Hampstead, Mount Royal and Beaconsfield, Que. He was also town planning consultant for the Town of Iriquois Falls, Ont.

In 1930 he was appointed by the City Executive Committee of Montreal as a member of the board of town planning. He also served for a time as chairman of the town planning section of the Metropolitan Planning Board, Montreal.

Mr. Schlemm joined the Institute as an Associate Member in 1913 and he was transferred to Member in 1923.

## News of the Branches

### CALGARY BRANCH

K. W. MITCHELL, M.E.I.C. - *Secretary-Treasurer*  
J. N. FORD, J.F.E. I.C. - *Branch News Editor*

President C. R. Young visited the Calgary Branch on Friday, April 10th, 1942. After a busy day, Dean Young had dinner with the Executive Committee of the branch at the Ranchmen's Club, and immediately following the dinner and ensuing discussions, he addressed a general meeting of the branch at the Glencoe Club.

The president, addressing the large gathering, presented a comprehensive and interesting picture of Institute affairs. He pointed out that it was the tradition of each newly elected president to visit all the twenty-five branches of the Institute. He regretted that Mr. L. Austin Wright was not able to make the western trip with him, due to his appointment as assistant to Mr. Little, director of National Selective Service. Mr. Young gave figures showing that the Institute had now the highest membership in its history, and that its financial position was very sound. The property loss at Headquarters was dealt with in detail.

Dean Young paid tribute to the work being done by the Bennett Committee on the training and advising of the young engineer, and pointed out that the welfare of the young engineer was one of the most important jobs of the Institute.

The president digressed from purely Institute affairs at this point and offered his views on technological post war activities and how Canada is equipped to cope with this problem.

### Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

"We have," he said, "numerous highly trained technical personnel. We have an impressive backlog of ideas and inventions that never have been developed. We are not by any means at the end of our inventive tether." Canadians are now being deprived of vast quantities of consumer goods, the president pointed out, and we will want all these things after the war. Many new developments would be forthcoming. Television would be a commercial enterprise. There would be new materials and alloys. Probably, there would be a great extension of air conditioning. He thought we would find combinations of agricultural holdings in eastern Canada as a result of mechanical development.

Dean Young spoke of reconstruction and rehabilitation after the war. "Reconstruction," he said, "involves the whole question of rehabilitation of democracy." There was a strong feeling within a cabinet committee to which he belonged, one of a number set up to consider the question of rehabilitation, that government expenditure should be invoked only as a supplement to, and aid to, private enterprise.

In conclusion, the president left this thought with the meeting—the most important function of the Institute is the guarding of the "trusteeship," which is entrusted to all members. "The Institute is not concerned in restriction or licensure to practise. This is left to the Professional

Associations," he stated. The layman, when placing his case in an engineer's hands, trusts him as he would his doctor or lawyer. "Every young engineer should be aware of this trusteeship and practise it," the president concluded.

### HALIFAX BRANCH

S. W. GRAY, M.E.I.C. - *Secretary-Treasurer*  
G. V. ROSS, M.E.I.C. - *Branch News Editor*

The last scheduled dinner meeting of the Halifax Branch for this season, was held in the Halifax Hotel, on April 23. Dr. Allen E. Cameron, Deputy Minister of Mines for the Province of Nova Scotia, was the speaker.

Several years ago the government of Nova Scotia set up an Economic Council, of which the Economic Survey Committee is headed by Dr. Cameron. This committee has undertaken the task of co-ordinating the studies of the different government bodies such as the Federal Departments of Agriculture, Mines, Fisheries, National Research Council, etc., and the Provincial Departments of Agriculture, Mines, Lands and Forests, etc. No province of Canada has been more completely covered by topographical and geological survey parties and a large portion of it has been photographed from the air. The committee is at work on soil surveys and forest surveys and for some sections of the province three dimension maps and forest cover maps have already been prepared. Dr. Cameron stated that full co-operation had been obtained from Federal authorities in all this work, and that many survey parties had been put in the field through agreements to share expenses that could not have operated otherwise.

The recent development of barite deposits and, within the past few days, the bringing into production of a tungsten mine, are a direct outcome of committee investigations which will help Canada's war effort. It is hoped that in the near future results will be obtained from the studies now being made on the recovery of magnesium from the dolomite deposits of Cape Breton. But the soil, forests and minerals are not the only resources studied by the committee. The eagle eye has been turned on the oyster and the clam to see how they can be made to produce more and better stews and chowders.

P. A. Lovett was chairman of the meeting which was attended by about forty members and guests.

### MONTREAL BRANCH

L. A. DUCHASTEL, M.E.I.C. - *Secretary-Treasurer*

The last regular Thursday night meeting in the 1941-1942 session of the branch, was held on April 9th, at which time a paper was presented by Dr. D. A. Keys. The speaker is Macdonald professor of physics at McGill University, director of the R.C.A.F. Radio Mechanics Course at McGill, and on behalf of the Wartime Bureau of Technical Personnel in Ottawa, is in charge of a survey and registration of all persons in Canada qualified for research.

The subject of the talk was the **Electron Microscope**, a tool which has opened up a new and broader field in microscopic work. An instrument of this type was under construction at McGill University at the outbreak of war, but work was of necessity discontinued due to war duties taken on by the research personnel.

In order to provide a suitable background for the subject, Dr. Keys reviewed the fundamental principles and formulæ necessary to an understanding of the optical microscope, touching briefly on the difficulties encountered due to spherical and chromatic aberration and showing that the resolving power of an optical microscope is limited by the wave-length of light. He then proceeded to draw the analogy between the optical and electron microscope, the

latter having the same type of limitations but at much higher magnifications. The electrons from a filament are accelerated by a high potential and travel at a constant velocity past the object under study. They are then controlled by either a magnetic or an electrostatic field analogous to the way in which the light rays in an optical microscope are brought to a focus by means of a lens. In the case of an electron microscope, the electrons impinge on a photographic plate or fluorescent screen.

Due to the use of electrons with a much shorter wave length than that of light, the resolving power of an electron microscope is such that its maximum practical magnification is a great many times that of the optical type.

Dr. Keys then showed a number of very interesting slides made from photographs taken with the electron microscope. These included pictures of the smoke from different burning metals, pus cells, cocci and bacilli.

An interesting point emphasized in the question period was the fact that the electron microscope cannot be used for the study of fractures in metals, since its operation depends upon the ability of the electrons to pass by the object to the photographic plate.

On April 20th, a special meeting of the branch was held at which Professor F. Webster, Deputy Chief Engineer of the Ministry of Home Security, London, England, gave an interesting talk on the effects of bombing on structures and the methods whereby the damage can be minimized.

### NIAGARA PENINSULA BRANCH

J. H. INGS, M.E.I.C. - *Secretary-Treasurer*

The Niagara Peninsula Branch held a joint dinner meeting with the Canadian Section of the American Water Works Association on April 15th at the General Brock Hotel, Niagara Falls, with an attendance of 100. Mr. A. L. McPhail acted as chairman and introduced the two speakers: Mr. William Storrie, M.E.I.C., consulting engineer and chairman of the Canadian Section, A.W.W.A.; and Dr. A. E. Berry, M.E.I.C., director Sanitary Engineering Division, Ontario Department of Health and secretary of the Canadian Section, A.W.W.A.

Mr. Storrie introduced the general subject for the evening: **Public Health Engineering in Canada**. The control of our environment, as regards water and food supplies and the disposal of waste, was definitely a public problem, one that we could not handle as individuals. The matter of supplying pure and wholesome water was mainly the responsibility of the public health engineers, whose duty it is to control the forces of nature for the protection and improvement of the public health. The first water works system in Canada was built at Saint John, N.B., in 1837, the Toronto system was started in 1841, by 1900 there were 235 municipal systems, but now there are 1,400 public systems in Canada, serving 60 per cent of the population. Three different sets of law-making bodies control the field of water supply legislation in Canada. The Federal Government controls only water problems that are interprovincial or international in scope. A greater degree of control is exercised by the provincial governments because they pass the legislation that controls the activities of the municipalities who actually own and operate the individual systems. Of the 95 municipal systems in Ontario, 33 are managed directly by the council, 17 by a committee of council and 45 by separate commissions. In the past, we have depended mainly on our lakes and rivers for water but as the population has grown, the danger of pollution from sewage has increased. Mr. Storrie expects that after the war, it will be necessary to spend more money in Canada on sewage disposal than on water supply.

Dr. Berry spoke on **Water Treatment**. There are two general objectives in treating water. The quality of the water, as regards its taste and appearance, is improved by mechanical filtration and by aeration. Water softening is an added refinement that is necessary sometimes in the case of water obtained from wells. Water is made safe by chlorination, which destroys any disease organisms that may be in the water and so protects the public health. In Canada, the chlorination of water was introduced first in Toronto in 1910, but now 80 per cent of the water supplied by public systems is chlorinated. Two important health improvements have been the chlorination of water and the pasteurization of milk, in the introduction of which engineers and doctors have worked together. As these two improvements have come into more general use, the death rate from typhoid fever has declined.

Both speakers used lantern slides to illustrate their subjects and additional slides on water treatment apparatus were shown. Mr. A. W. F. McQueen moved the vote of thanks to the speakers

### OTTAWA BRANCH

A. A. SWINNERTON, M.E.I.C. - *Secretary-Treasurer*  
R. C. PURSER, M.E.I.C. - *Branch News Editor*

In co-operation with the local branches, respectively, of the Canadian Institute of Mining and Metallurgy, and of the Society of Chemical Industry, an evening meeting was held on April 17 at the auditorium of the National Research Council. A. E. Byrne, of the staff of the Canadian General Electric Company, Limited, gave an address on the subject of **Plastics** illustrated by lantern slides and by actual specimens. The subject was one, stated the speaker, that was difficult to cover completely in a single popular lecture so the greater part of the time was taken up in describing the commercially-important synthetic plastics of the phenol-formaldehyde type.

Plastics, which are entering more and more into our daily life, may exhibit a variety of characteristics. They may, for instance, be tough, brittle, elastic, translucent or transparent. Grouping them according to chemical origin they may be of natural origin such as those made from soy beans, casein, or even coffee beans, or they may be of synthetic origin such as those of the phenol-formaldehyde type referred to.

From a physical point of view they may be thermo-plastic or thermosetting. Those belonging to the thermo-plastic class when subjected to an elevated temperature will liquefy and then when allowed to cool to ordinary temperatures will reharden with no change in their structure. Thermosetting plastics on the other hand will change by the application of heat and pressure into chemically different materials which cannot be remelted. In the electrical industry, plastics of the thermosetting class are mostly used.

Plastics themselves are very complex in chemical composition, though all modern examples are usually composed of five or six elements such as carbon, hydrogen, oxygen, nitrogen, chlorine and sometimes sulphur, as in the case of synthetic substances exhibiting the characteristics of rubber. Synthetic resins, a general generic term applied to an initial product in the manufacture of modern plastics, are usually non-crystalline and form the basis of the plastics themselves. Phenol, derived from soft coal, and formaldehyde, a compound of carbon, hydrogen and oxygen, will react to form a synthetic resin which itself is ground up, blended with a filler, placed in a mould and turned into a plastic form through the simultaneous application of heat and pressure.

The filler is very important. It may consist of wood flour, a finely ground up cloth fabric, mica in the case of electric insulators, or asbestos in the case of high heat-

resisting devices. It helps to give the desired physical characteristics and may also serve to impart the required colour to the end product. The making of the mould is also most important and requires considerable skill on the part of the operator.

Plastics as replacement materials in engineering industries often eliminate many machine operations that would otherwise be required if a metal were used. At the present time with the war effort rendering certain metals difficult to obtain in quantity a tremendous impetus has been given to the plastics industry. Basic ingredients in the manufacture of plastics, according to the speaker, are coal, air, water, limestone, salt, petroleum, oil and sunshine. Wherever these are available together with the necessary machinery and labour the making of plastics is readily possible.

---

At a special evening meeting April 20 at the auditorium of the National Research Laboratories an address on **Bombs and Structures** was given by Professor F. Webster, dean of engineering, University of Rangoon, and deputy chief engineer of the Ministry of Home Security, London, England. Professor Webster had been sent to Canada and the United States by the British Government to advise engineers in the re-inforcing of buildings to withstand heavy bombs. His talk was illustrated by slow-motion film studies of the effects of bomb explosives upon experimental structures. The meeting, which was not open to the general public, was presided over by N. B. MacRostie, chairman.

---

At an evening meeting at the auditorium of the National Research Laboratories on May 7, an address was given by C. E. MacDonald of the International Nickel Company of Canada, Limited, on the **Mining, Smelting and Refining of Nickel-Copper Ores**.

Mr. MacDonald, who described himself as a "salesman in reverse" stated that his efforts are now directed toward retarding the use of nickel wherever possible so that it may be made more completely available as an essential contribution to the war effort.

He described the uses of nickel as an engineering material and by means of sound pictures taken at International Nickel Company plants illustrated various steps in its production. He forecast a tremendous increase in the use of nickel after the war for hitherto unsuspected purposes.

### PETERBOROUGH BRANCH

D. J. EMERY, M.E.I.C. - *Secretary-Treasurer*  
E. WHITELEY, JR., E.I.C. - *Branch News Editor*

The Peterborough Branch met on Thursday, April 23rd, for the last technical meeting of the season. Mr. G. E. Bourne, Canadian General Electric Company, Toronto, presented a fine paper on **Electricity in Warfare**.

Obviously, the uses of electricity in modern warfare are too many and varied to describe in detail in a paper such as this one. Mr. Bourne, with the aid of a large number of lantern slides briefly touched on typical uses to give an overall view of the subject.

Every civilian and military function now depends more or less on electricity. Direct military applications, are electrical machinery, control, lighting, communication equipment and degaussing equipment used by the navy; modern mechanized armies are guided, controlled and protected by telephone and radio; aircraft instruments and motorized controls are essential to modern Air Force equipment.

Production of war material is now many times as great and much faster, due to the wide-spread use of electricity in industry and improvement in machines made possible by electric drives. Typical examples are the electrolytic

refining of aluminum and copper, and the high-speed metal rolling mills now in service.

The Peterborough Branch held their annual Student and Junior Night on May 7. At this meeting it is the custom that the chairman of the student and junior section takes charge and the programme is provided by student and junior members. With Mr. J. M. Mercier in the chair and two fine papers by Richard Scott, S.E.I.C. and A. M. McQuarrie, JR.E.I.C. the meeting was well up to the high standard set in previous years.

Mr. Scott discussed the **Pickwick Landing Project** of the Tennessee Valley Authority, with the idea that this is one of the United States Government's large-scale efforts in social reconstruction. An objective study of such projects can show much experience which we will do well to consider in our plans for post-war reconstruction.

Technical details of the dam and power house were mentioned only briefly as these are well known by now, and they are only a part of the project. As a link in the chain of dams and power plants being built by the Tennessee Valley Authority the project will help to provide flood control, navigation facilities, and, as a by-product, electrical power for the people along the Tennessee river. Throughout, however, emphasis has been placed on improving the living conditions of these people.

Since the days of the American Civil War, settlers along the Tennessee river have existed at a very low level. By providing part time employment for these settlers and by educational programmes, a general raising of their standard of living has been achieved. The flood areas created by the dam were carefully cleaned to control malaria. The relocation of farmers from these flooded areas was used as a means of improvement. The new lakes and the river are being stocked with edible fish, and game is being encouraged in wooded areas. By locating local leadership, and by giving it responsibility it is hoped that the improvements will continue and will be permanent.

Mr. McQuarrie spoke on **Sound Reproduction in Motion Picture Theatres**. The equipment used and the technique of recording sound on photographic film, and later reproducing it, were described. Since this is the most commonly used system now, the paper did not describe any other except to mention briefly one or two that had been tried and abandoned.

Both papers provoked a lively question and discussion period following their presentation.

### ST. MAURICE VALLEY BRANCH

J. B. SWEENEY, S.E.I.C. - *Secretary-Treasurer*

On April 22nd, the St. Maurice Valley Branch held its annual dinner meeting at the Cascade Inn, Shawinigan Falls. The retiring chairman, Dr. A. H. Heatley, presided. Also present at the head table were, Viggo Jepsen, the newly appointed chairman, H. G. Timmis, J. A. Hambly, president, Shawinigan Chemical Association, C. G. de Tonnancour, retiring secretary-treasurer and the guest speaker of the evening, Dr. R. S. Jane, assistant to the vice-president in charge of research, Shawinigan Chemicals Limited.

Following the presentation of annual reports by the secretary-treasurer and Mr. M. Mitchell, chairman of the Branch Nominating Committee, the chairman reviewed the year's activities and asked Mr. Jepsen to introduce the new members of the Executive Committee.

The meeting adjourned and joined the Shawinigan Chemical Association to hear Dr. Jane, who was introduced by Mr. J. A. Hambly.

Dr. Jane had chosen as a subject **Synthetic Rubber, its Possibilities and Development**—a subject of vital concern indeed, due to recent developments in the Pacific ocean. Speaking to engineers as well as to chemists, the

speaker first defined some terms used freely by chemists, such as "monomer," "polymer" and made a brief summary of the early work on the constitution of natural rubber, and the discovery of polymerization by the French chemist Bouchardat. He then explained why so little was achieved in the field of synthetic rubber until 1916, due to a false orientation of efforts and talents in the next to impossible search for the synthesis of natural rubber, from isoprene.

### SAGUENAY BRANCH

D. S. ESTABROOKS, M.E.I.C. - *Secretary-Treasurer*

A meeting of the Saguenay Branch was held in the Arvida Protestant School on Wednesday, April 22nd.

Previous to introducing the speaker of the evening a film entitled **London Night** was shown. This was the story of London on any night of a blitz. The film was actually filmed during bombing attacks and showed clearly the wonderful work being done by the women's branch of the army.

The speaker, Dr. Philip L. Pratley, M.E.I.C., was introduced by the chairman, N. F. McCaghey.

Dr. Pratley gave a most interesting and enlightening lecture on the **Lions' Gate Bridge**. This bridge which spans the Narrows at Vancouver is the most filmed bridge in the world and the longest suspension span in the British Empire. It gets its name from two mountain peaks which resemble lions when viewed from certain angles.

A detailed account of the construction of the bridge was given from the time it was first designed until it was completed. The river at the point where the bridge was constructed was 1600 ft. wide and the two piers were spaced at 1550 ft. centre to centre.

The towers were built to accommodate elevators which were to be used to provide access to marine signals placed on top of the towers. However the authorities decided on another position for the signals and the elevators have never been installed.

The cables were built by the Anglo-Canadian Wire Rope Company and when assembled were 13¼ in. in diameter and contained 61 strands which in turn were made up of many wires. The building up of the cable was a very interesting feature. The various tests used on the wire were explained and it was pointed out that every wire in the cable had been tested. Every wire was required to run the whole length of the bridge without a splice. The completed cables weighed just over 1000 tons and contained 4715 miles of wire.

The method of anchoring the cables at each end was explained and it was interesting to note the pleasing appearance of the finished pylons.

During the construction of the cat-walks, the Narrows were closed to boat traffic for a little over 35 minutes.

The completed structure cost \$3,634,000 and required 5000 gallons of paint.

Toward the close of his lecture Dr. Pratley showed four interesting films on the construction of the bridge which he had already explained so thoroughly.

A vote of thanks was extended to Dr. Pratley by M. G. Saunders.

### SASKATCHEWAN BRANCH

STEWART YOUNG, M.E.I.C. - *Acting Secretary-Treasurer*

The Saskatchewan Branch, jointly with the Association of Professional Engineers, held a special meeting in the Hotel Saskatchewan, Regina, on April 20th to honour Dean C. R. Young, president of the Institute. The attendance was 45.

Upon concluding the dinner hour and after a short period of entertainment, Dean Young delivered an unusually inspiring address on matters of professional interest. Dealing with the affairs of The Engineering Institute of Canada, he outlined briefly the work of the com-

mittee on student guidance, and contacts with the Engineers' Council for Professional Development, the War-time Bureau of Technical Personnel and Polish engineers in Canada. Mention was also made of the recent arrangements made by the Institute for a series of lectures to selected Canadian engineers on protection against bombing.

Speaking of the several co-operative agreements between Professional Associations and the Institute, President Young expressed the view that there was something more fundamental behind these than a mere effort to simplify procedure or obtain reduced fees, namely a sincere desire to advance the interests of the engineering profession. Forty years ago engineers were not considered to be members of a profession but, over a period of years, this attitude had changed. He stated also that the profession of engineering is much more than the mastering of a technique based on mathematics; it is a trusteeship to be carefully guarded and advanced through cultural attainment.

### SAULT STE. MARIE BRANCH

O. A. EVANS, Jr., E.I.C. - *Secretary-Treasurer*  
N. C. COWIE, Jr., E.I.C. - *Branch News Editor*

The fourth general meeting for the year was held in the Grill Room of the Windsor Hotel on Friday, April 24th, when twenty members and guests were present.

Chairman R. L. Brown announced that three members of the branch were attending Professor Webster's lectures in Toronto on Air Raid Precautions, and their services would be available in a consulting capacity on their return to the city.

The chairman then called upon William Seymour, M.E.I.C. to address the meeting. Mr. Seymour had for his address a review of Dr. Rueckel's paper on **New Principles in Heating Becker Coke Ovens.**

Mr. Seymour showed in detail the various heating curves for coal and gasses in the coke ovens, stressing that to make uniform coke the coal must be heated at a uniform rate and uniformly about the charge. The average rate of heating the coal to make coke in the ovens was one inch per hour. The address was well illustrated with slides.

At the conclusion of his address, Mr. Seymour showed a film by the Kopps Coke Oven Company of the flames inside the flues of the old and new coke ovens. There was a striking difference in the flames of the old and new coke ovens. In the old the flames were highly luminous while in the new the flames were barely visible showing that almost complete combustion was taking place.

Mr. Seymour then showed two films of his own, one a trip down the St. Lawrence and up the Saguenay rivers and one depicting the coloured foliage of Algoma countryside in the fall of the year.

C. Stenbol thanked the speaker, remarking that few people would have taken the trouble to review such a highly technical paper and present it in such a way that the layman would understand it.

### VANCOUVER BRANCH

P. B. STROYAN, M.E.I.C. - *Secretary-Treasurer*  
A. PEEBLES, M.E.I.C. - *Branch News Editor*

The Vancouver Branch held a dinner meeting in the Georgia Hotel on April 17, in honour of the president of the Institute, Dean Young. Branch Chairman W. O. Scott presided, and forty members and guests were present. Following dinner and some vocal entertainment, Dean Young spoke on the affairs of the Institute. He described the progress which has been made by the War-time Bureau of Technical Personnel in making an inventory of technically trained persons, and in using that information to supply the needs of war industries. The Institute has played a major part in the preparation and use of the catalogue of the Bureau. A committee on the Training and Welfare of the Young Engineer has prepared a pamphlet for distribution to high schools and colleges throughout Canada, designed to acquaint students with the nature of engineering as a profession, as well as the requirements and responsibilities attached to it. This knowledge should be of great value to students who face the very real problem of choosing a life work.

Dean Young also informed the branch that cordial relations were being maintained with other engineering societies in Canada and the United States, resulting in mutual advantages to the members. He spoke of a group of Polish engineers who have found refuge in this country, whose training and experience are proving extremely valuable to Canadian industry. The Institute has extended to them certain privileges which are very much appreciated.

A vote of thanks to the president for his excellent address was proposed by Dr. E. A. Cleveland, and met with unanimous approval. Other members who spoke briefly were Professor I. M. Fraser, councillor from Saskatoon, Councillor S. G. Coultis of Calgary, Councillor J. Haines of Lethbridge, Councillor H. N. Macpherson of Vancouver, and Mr. F. Newell of Montreal.

Dean Young also visited the University of British Columbia where he addressed the engineering students and presented the Institute's prize to Eric Smith, fifth-year student in chemical engineering. He was present at a meeting of the branch executive, and was entertained by the council of the Association of Professional Engineers of British Columbia. A Regional Meeting of the Council of the Institute and other activities concluded a very busy three-day visit to Vancouver.

The Vancouver Branch has been exceedingly fortunate to have three lectures delivered by Professor F. Webster of London, England, on the subject of air raid shelters and the making of structures bomb-resistant. Professor Webster's experience in this work in Great Britain plus his experience in structural engineering instruction, produced a wealth of authoritative information, presented in understandable form. A large attendance of members and specially invited guests at each lecture indicated the degree of interest in the subject.

## SAVE FOR VICTORY

If you do not keep your *Journals* do not burn or destroy them. Give them to a salvage organization. They are needed for victory.

## ADDITIONS TO THE LIBRARY

### TECHNICAL BOOKS

**Steam Boiler Yearbook and Manual:**  
*London, Paul Elek, (1942). 5½ x 8½ in. 20s. 7d.*

**Public Works Engineers' Yearbook, 1942:**  
*Chicago, American Public Works Association, 1942. 5¾ x 8¾ in. \$3.50.*

### PROCEEDINGS, TRANSACTIONS

**Institution of Water Engineers:**  
*Transactions, vol. xlvi, 1941.*

**Canadian Institute of Mining and Metallurgy:**  
*Including the Mining Society of Nova Scotia Transactions, vol. 44, 1941.*

**Electric Supply Authority Engineers' Association of New Zealand:**  
*Transactions, vol. 13, 1941.*

**Society of Naval Architects and Marine Engineers:**  
*Transactions, vol. 49, 1941.*

### REPORTS

**Nova Scotia, Board of Commissioners of Public Utilities:**  
*Report for the year, ended December 31, 1941.*

**Southern California, The Metropolitan Water District:**  
*Report for the fiscal year July 1, 1940, to June 30, 1941.*

**Royal Society of Edinburgh:**  
*Yearbook 1940-41.*

**Winnipeg Hydro Electric System:**  
*Thirtieth annual report, December 31, 1941.*

**American Institute of Electrical Engineers:**  
*Year Book 1942.*

**Electrochemical Society:**  
*Theory of oxidation and tarnishing of metals; thin oxide films on iron; corrosion on binary alloys; electrolytic behaviour of ferrous and non-ferrous metals in soil corrosion circuits; anodic and surface conversion coatings on metals; cathodic protection; single metal, binary and ternary alloy deposition from thiosulfate solutions; "Null" methods applied to corrosion measurements; ferro-alloys in Australia and notes on other metallurgical developments there; some mechanisms of alloy corrosion; the parabolic and logarithmic oxidation of copper; the effect of hydrochloric acid plus inhibitor on the corrosion resistance of 18/8 stainless steel. Preprint 81-14 to 81-25.*

**Ohio State University Studies—Engineering Series:**  
*Steam flow through safety valves; engineering experiment station bulletin No. 110.*

**University of Illinois—Engineering Experiment Station:**  
*The effect of range of stress on the fatigue strength of metals; bulletin series No. 334. Eighth progress report of the joint investigation of fissures in railroad rails. Reprint series No. 22.*

**University of California—Department of Geological Sciences—Bulletin:**  
*The molluscan genus siphonalia of the Pacific Coast Tertiary; Vol. 26, No. 3.*

## Book notes, Additions to the Library of the Engineering Institute, Reviews of New Books and Publications

**University of Minnesota—Engineering Experiment Station:**  
*Developments in high speed cathode ray oscillography. Technical paper No. 27.*

**American Institute of Steel Construction:**  
*Specification for the design, fabrication and erection of structural steel for buildings by arc and gas welding (tentative), January, 1942.*

**Edison Electric Institute and Bell Telephone System:**  
*Positive disconnection of distribution circuits during faults to ground; engineering report No. 47.*

**U.S. Bureau of Standards—Building Materials and Structures:**  
*Performance test of floor coverings for use in low-cost housing; pt. 4. Report No. 80.*

**U.S. Bureau of Mines:**  
*Sponge chromium; investigations of permissible electric mine lamps 1930-40; seismic effects of quarry blasting; inter-crystalline cracking of boiler steel and its prevention; coal mine accidents in the U.S., 1939. Bulletins Nos. 436, 441-444.*

**Federal Security Agency—Vocational Division:**  
*Engineers are needed; a plan for secondary schools and engineering institutions to supply engineers urgently needed for war production.*

**Canada—Department of Mines and Resources—Forest Service:**  
*Decay in Red Stained Jack Pine ties under service conditions; Circular No. 58. Results of the examination of six ground line treatments on Eastern White Cedar Poles after two years' service.*

**Asphalt Institute:**  
*Specification for stock-pile asphalt paving mixture for making quick repairs of bombed surfaces.*

**Institution of Mechanical Engineers:**  
*Proneness to damage of plant through enemy action by Hal Gutteridge.*

### AIR RAID PRECAUTION BULLETINS

**Ministry of Home Security—Research and Experiments Department:**  
*Bulletin No. C14—Refuge room dormitories (2nd ed.). No. C24—Protective walls in single-storey factories. Methods of heightening and strengthening existing walls. No. C25—Protected accommodation in large buildings of load-bearing wall construction. No. C26—Timber shelters for countries where timber is plentiful and steel difficult to obtain.*

**Department of Scientific and Industrial Research—Building Research:**  
*Standard designs for single storey factories for war industries with notes on siting and layout; Wartime building bulletin No. 15.*

The following books have been presented to the Institute Library by Mrs. T. C. Keefer in memory of her husband who was the son of the first president of the Institute and they are gratefully acknowledged here:

**Scientific American:**  
*N.Y., Sept.-Dec., 1848.*

**Hicks, W. M.**  
*Elementary dynamics of particles and solids. Lond., Macmillan, 1897.*

**Hunt, Charles Warren:**  
*Historical sketch of the American Society of Civil Engineers, 1852-1897.*

**Lyndon, Lamar:**  
*Storage battery engineering, 3rd ed. McGraw Hill Book Co., 1911.*

**Morgan, Henry J.:**  
*Sketches of celebrated Canadians and persons connected with Canada from the earliest period down to the present time. Quebec, 1862.*

### BOOK NOTES

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet the books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

**AIRCRAFT ASSEMBLY**  
*By C. F. Marschner. Pitman Publishing Corp., New York and Chicago, 1942. 104 pp., illus., diagrs., tables, 8½ x 5½ in., cloth, \$1.00.*

Aircraft assembly procedure, design and equipment are briefly covered in the first three chapters. Succeeding chapters deal with the specific operations necessary for attaching and grouping together the many parts which make up the various basic structural units. The last chapter covers the final assembly of the complete airplane.

**AIRCRAFT SHEET METALWORK**  
**Pt. 1: The Textbook**  
*123 pp., 10 x 7 in., cloth, \$2.50.*

**Pt. 2: Workbook in Blueprint Form**  
*58 pp., 8½ x 13½ in., paper, \$1.50.*  
*By J. W. Ciachino. Manual Arts Press, Peoria, Ill., 1942. Illus., diagrs., charts, blueprints, tables.*

Part I of this two-volume set describes the layout, cutting, bending, forming, riveting and development operations performed in aircraft sheet metalwork. Part II, the workbook, presents in blueprint form actual jobs for the practical application of the information given in volume one. The text also contains a brief chapter dealing with aluminum and its alloys.

**BENCH WORK UNIT (Dunwoody Series, Machine Shop Training Jobs)**  
*155 pp., \$1.35; (work sheets, 30c.).*

**GRINDER JOB TRAINING UNITS (Dunwoody Series, Machine Shop Training Jobs)**  
*111 pp., \$1.25; (work sheets, 30c.).*  
*American Technical Society, Chicago, Ill., 1942. Illus., diagrs., charts, tables, 11 x 8½ in., paper.*

These publications belong to a series of six manuals for training on various machine tools. General and special procedures in working with the respective machines are briefly described with the care and use of necessary tools. Detailed instructions are given for a series of practical jobs, including check sheets for determining the learner's grasp of each problem, and a final section relates the knowledge gained to actual shop work. Helpful hints are also given on blueprint reading.

**COTTON LOOMFIXERS' MANUAL**  
*By I. Moberg. McGraw-Hill Book Co., New York and London, 1942. 197 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$2.50.*

Practical, step-by-step instructions are given on all phases of cotton loomfixing. The book covers the setting, adjusting and timing of modern looms and the latest loom motions as applied on older looms. The material is so presented that the book can serve as a textbook for courses or as a self-study manual.

#### **ELECTRICAL CIRCUITS AND MACHINERY, Vol. 2: Alternating Currents**

By F. W. Hehre and G. T. Harness. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 635 pp., illus., diags., charts, tables, 9 x 6 in., cloth, \$6.00.

As in volume one of this two-volume treatment of Electrical Circuits and Machinery, the authors have followed the general plan and method of textbook with that title written in 1933 by Morecroft and Hehre. The book is intended as a general text for non-electrical engineering students and as an introductory text for electrical engineering students. It is comprehensive in scope and includes two chapters on electronic devices. There are many problems chosen with special reference to present commercial practice.

#### **(The) ELECTRON MICROSCOPE**

By E. F. Burton and W. H. Kohl. Reinhold Publishing Corp., New York, 1942. 233 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$3.85.

Beginning with a simple exposition of the properties of light and electrons, this book proceeds to a comparison of light and electronic activity and of the methods for their control for use in microscopes. The history of the electron microscope is briefly related, the construction and use of both the electrostatic and electromagnetic types are described, and present and future applications are noted.

#### **HIGHWAY RESEARCH BOARD, Proceedings of the Twentieth Annual Meeting, held at Washington, D.C., Dec. 3-6, 1940**

Edited by R. W. Crum. National Research Council, Division of Engineering and Industrial Research, Washington, D.C. 883 pp., illus., diags., tables, 10 x 6½ in., cloth, \$3.25.

Some sixty technical papers and reports presented at the 1940 annual meeting of the Highway Research Board are published in this volume. The comprehensive scope of the Board is reflected in the separate titles which are grouped under the headings—economics, design, materials and construction, maintenance, soils, traffic and safety. Brief information about the Board is included.

#### **(The) HISTORY OF COMBAT AIRPLANES. (The James Jackson Cabot Professorship of Air Traffic Regulation and Air Transportation at Norwich University, Publication No. 7)**

By C. G. Grey. Norwich University, Northfield, Vermont, Dec., 1941. 158 pp., 9 x 6 in., paper, \$1.00.

The author describes in considerable detail examples of the many types and variations of airplanes which were developed specifically for combat from 1914 to the present day. All countries are covered, comparisons are indicated, and the men who played the leading parts in this development are given due credit.

#### **INSTRUCTOR'S GUIDE. (Dunwoody Series, Machine Shop Training Jobs)**

American Technical Society, Chicago, Ill., 1942. 39 pp., diags., charts, tables, 11 x 8½ in., paper, 75c.

This instructor's guide furnishes helpful information and suggestions regarding the use of any or all of the units of the Dunwoody series of manuals on lathe, drill press, milling machine, grinder, shaper and planer, and

bench work. It covers the use of the manuals themselves, the organization and control of the training experience, and methods of instruction.

#### **LOCOMOTIVE CYCLOPEDIA of American Practice, 11th ed., 1941**

Compiled and edited for the Association of American Railroads—Mechanical Division; edited by R. V. Wright and R. C. Augur. Simmons-Boardman Publishing Corp., New York, 1941. 1,312 pp., illus., diags., charts, maps, tables, 12 x 8 in., cloth, \$5.00.

In the eleventh edition of this well-known reference work, as in previous ones, considerable revision has occurred both in the text and in the arrangement and indexing. By the addition of new material, such as the chapter on welding and cutting in locomotive shops, the book remains representative of the latest practice in locomotive design, construction and maintenance. In order to keep the book to a reasonable size little except current practice is included, and previous editions should be consulted for information on older locomotives.

#### **MACHINE SHOP WORK**

By J. T. Shuman and others. American Technical Society, Chicago, Ill., 1942. 499 pp., illus., diags., charts, tables, 8½ x 5½ in., cloth, \$3.50.

The fundamentals and principles of modern machine-shop practice are described, including all major machines and operations rather than merely typical ones. A trouble-shooting page accompanies each chapter, listing common operating difficulties, probable causes and suggested remedies. Review questions are also provided for each chapter.

#### **METALLURGICAL AND INDUSTRIAL RADIOLOGY**

By K. S. Low. Sir Isaac Pitman & Sons, Ltd., London; Pitman Publishing Corp., New York, 1940. 88 pp., illus., diags., charts, tables, 7½ x 5 in., cloth, \$2.50.

The obvious advantages of non-destructive testing and examination of objects indicate the increasing importance of radiological methods. The general principles, apparatus and equipment, and methods of radiographic technique in metallurgical work are described, and the interpretation of radiographs is explained. Certain specialized practices are also briefly discussed.

#### **MODERN ASSEMBLY PROCESSES, Their Development and Control**

By J. L. Miller, with a foreword by E. A. Watson. Chapman & Hall, London, 1941. 166 pp., illus., diags., charts, tables, 9 x 5½ in., cloth, 13s. 6d.

This book deals with the processes used to assemble small parts in large-scale production. In surveying these processes the book describes recent developments, shows how the processes may be controlled and discusses the factors which influence the designer and the production engineer in the choice of the process to be used.

#### **OPTIMUM HOURS OF WORK IN WAR PRODUCTION. (Research Report Series No. 65)**

By J. D. Brown and H. Baker. Princeton University, Industrial Relations Section, Princeton, New Jersey, March, 1942. 25 pp., tables, 10 x 7 in., paper, 75c.

Based on information obtained from 140 companies in war production, this pamphlet presents experiences with various work schedules of from 40 to 60 hours per week and from 5 to 7 days per week. The several important factors in the determination of optimum hours (physical effort, rest periods,

labor supply, etc.) are discussed and conclusions drawn.

#### **(The) PHYSICAL EXAMINATION OF METALS, Vol. 2: Electrical Methods**

By B. Chalmers and A. G. Quarrell. Longmans, Green & Co., New York; Edward Arnold & Co., London, 1941. 280 pp., illus., diags., charts, tables, 8½ x 5½ in., cloth, \$6.00.

This second of two volumes on the application of the various branches of physics to the examination of metals deals with magnetic, electric, electronic and X-ray methods. Underlying physical theories are explained, the apparatus and more important applications are described, and some discussion of operational techniques is included.

#### **S A E HANDBOOK, 1942 Edition**

Society of Automotive Engineers, 29 West 39th St., New York, 1942. 828 pp., illus., diags., charts, tables, 8½ x 5½ in., cloth, \$5.00; \$2.50 to members.

All the current standards and recommended practices of the Society of Automotive Engineers concerning automobile and aircraft materials and parts, tests and codes, production equipment, nomenclature and definitions are contained in this annually revised handbook. The numerous changes include new and revised standards, corrections and cancellations. There is also a partial list of American standards of interest to the automotive industry.

#### **TABLES OF THE MOMENT OF INERTIA AND SECTION MODULUS OF ORDINARY ANGLES, CHANNELS AND BULB ANGLES WITH CERTAIN PLATE COMBINATIONS**

Prepared by the Federal Works Agency, Work Projects Administration for the City of New York, as a report of Official Project No. 165-2-97-22, Mathematical Tables Project; conducted under the sponsorship and for sale by the National Bureau of Standards, Washington, D.C., 1941. 197 pp., tables, 10½ x 8 in., cloth, \$1.25 (payable in advance).

This new volume in the series of mathematical tables sponsored by the U.S. Bureau of Standards presents tables of the moment of inertia and section modulus of ordinary angles, channels and bulb angles with certain plate combinations. Tables of various dimensional properties of these structural shapes are appended.

#### **TECHNIDATA HAND BOOK, Engineering, Chemistry, Physics, Mechanics, Mathematics, etc.**

By E. L. Page. Norman W. Henley Pub. Co., New York, 1942. 64 pp., diags., charts, tables, 8½ x 5½ in., looseleaf, paper, \$1.00; cloth, \$1.50.

Essential data taken from the fields of mathematics, physics, chemistry, and engineering mechanics, are presented in condensed form. Facts, figures, theory, definitions, laws, formulas, simple calculations, diagrams and numerical tables are all utilized. The use of the slide rule is also briefly exemplified.

#### **UNIFORMITY IN HIGHWAY TRAFFIC CONTROL**

By W. P. Eno. The Eno Foundation for Highway Traffic Control, Saugatuck, Conn., 1941. 83 pp., diags., illus., 7 x 5 in., paper, \$1.00.

The basic principles of traffic control as developed by the author during the last forty years are summarized for general use. Topics covered include police enforcement, licensing, traffic aids, pedestrian rules, parking, one-way traffic and noise reduction. The necessity for uniformity is stressed.

## of Applications for Admission and for Transfer

May 27th, 1942.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.\*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

**Communications relating to applicants are considered by the Council as strictly confidential.**

The Council will consider the applications herein described at the July meeting.

L. AUSTIN WRIGHT, General Secretary.

\*The professional requirements are as follows:—

**A Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

**A Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

**A Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

**An Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

**FINLAYSON—HAROLD MUSGRAVE**, of Montreal, Que. Born at Toronto, Ont., Aug. 8th, 1897; Educ.: B.Sc. (Civil), McGill Univ., 1923; 1922 (summer), instr'man., City of Montreal; 1923-28, junior engr., Dept. Rlys. and Canals; 1928 (summer), res. engr., John S. Metcalf Co.; 1928-30, field engr., Shawinigan Engineering Co.; 1930 to date, hydraulic engr., Shawinigan Water & Power Company, Montreal, Que.

# Employment Service Bureau

## SITUATIONS VACANT

**MECHANICAL DESIGNING DRAUGHTSMAN**, Graduate preferred, required for work in Arvida on specification drawings for plate work, elevators, conveyors, etc., equipment layouts, pipe layouts and details. Apply to Box No. 2375-V.

**MECHANICAL ENGINEER**, with machine shop experience required for position in South America on important war work. Apply to Box No. 2441-V.

**MECHANICAL ENGINEER**, Mechanical construction and maintenance, some experience on diesels and tractors preferred, for work in Mackenzie, B.G. Apply to Box No. 2482-V.

**MECHANICAL ENGINEER** with experience in pulp and paper industry for supervision and maintenance work in large paper mill. Must be experienced in machine shop work and the handling of men. Apply to Box No. 2522-V.

**ELECTRICAL ENGINEER**, construction and maintenance of diesel electric locomotives for work at Mackenzie, B.G. Apply to Box No. 2536-V.

## AN APPEAL!

One of our members who has just returned from overseas reports that there is an urgent need of surveying instruments in the Canadian Corps in England. Some organizations have already supplied a few instruments on loan but many more are needed.

Any members who would be willing to loan such instruments to our fighting forces should address them to:

**THE CHIEF ENGINEER**  
Headquarters 1st Canadian Corps  
Canadian Army Overseas

The need is mostly for transits and measuring tapes.

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.

**MECHANICAL DESIGNING DRAUGHTSMAN**, on permanent moulds and die casting dies. Apply to Box No. 2537-V.

**CIVIL ENGINEER**, with actual pile driving and heavy construction experience required for work in British Guiana. Apply to Box No. 2538-V.

**YOUNG GRADUATE ENGINEER** required by machinery supply firm located in Montreal. Some selling experience preferred. State military status. Apply to Box No. 2539-V.

**CIVIL ENGINEER**, supervising construction operations in Mackenzie, B.G. Apply to Box No. 2549-V.

**MECHANICAL DRAUGHTSMAN**, for important war work in Montreal. Apply to Box No. 2550-V.

## SITUATIONS WANTED

**GRADUATE ENGINEER** in Electrical and Mechanical Engineering, M.E.I.C., and R.P.E., electric utility experience. Age 30. Married. Transmission line, and distribution, estimating, design, survey and construction three years, (one year acting superintendent), interior light and power wiring design, estimating and supervision one year. Electric meters (AC) six months, electric utility drafting six months, foundation layouts and concrete inspection six months. Steam power plant operation two years. Presently employed but desire advancement. Apply to Box No. 2430-W.

**DESIGNING DRAUGHTSMAN**, M.E.I.C. Age 47. Married. Location immaterial. Experienced in

estimates, design, layouts and details of industrial buildings. Presently employed but desirous of change with prospects of advancement. Apply to Box No. 2439-W.

**GRADUATE CIVIL, STRUCTURAL ENGINEER**, M.E.I.C., middle age. Twenty years' experience estimator, designer, and sales engineer. Excellent references. Open for engagement. Apply to Box No. 2440-W.

## WANTED

Someone to back up my chemical engineering education. Have saved eight hundred dollars to start on, need someone to help from there on. Age 21, army (reserve) discharge. Good references for repayment plus interest, plus promise to loan to another student as you have to me. S.E.I.C. Apply to Box No. 40.

## FOR SALE

Transit, Buff and Buff Mfg. Five-inch circle, brass telescope and sliding leg tripod. One nick in the vertical half-circle, but no other damage. Thirty-year old instrument, but not much used. Would sell for \$225.00. Apply Box No. 45-S.

## PRELIMINARY NOTICE

(Continued)

**WALTERS—PAUL W.**, of 39 Hickory St., Ottawa, Ont. Born at Toronto, Feb. 7th, 1912; Educ.: B.A.Sc. (Civil), Univ. of Toronto, 1934; R.P.E. of Ont.; 1930-31 (summers), Turnbull Elevator Co.; 1934, Raynor Constr. Co.; 1935, asst. engr. and checker, Dufferin Constr. Co.; 1935, engr. i/c of constr. of landing field, Trans Canada Airlines; 1936-41, with the Dept. of Highways of Ontario, 1936, draftsman, 1937, on survey and constr., Queen Elizabeth Highway, 1938, res. engr., Grimsby, 1938-41, res. engr., Niagara Falls and district; at present, investigator, organization branch, Civil Service Commission, handling organization and personnel work for Dept. of Munitions and Supply.

# BARRETT CHUTE DEVELOPMENT

A. L. MALCOLM, M.E.I.C.

Resident Engineer, The Hydro-Electric Power Commission of Ontario, Calabogie, Ont.

Paper presented before the Ottawa Branch of The Engineering Institute on December 18th, 1941.

**NOTE**—No attempt is made herein to give in detail a description of the construction of headworks, penstocks and power house. Procedure in this part of the work followed, in general, the methods pursued on many similar projects.

At the present time (June 23rd, 1942), the penstock for the first unit is completed and the concrete envelope is being poured. Erection of the first unit in the power house is practically completed. It is anticipated that the remaining diversion sluice in the main dam will be closed shortly after the first of July and the headpond raised sufficiently to operate No. 1 unit for the generator dry-out run. Following this and the conducting of necessary tests, the unit will be placed in commercial service early in August. It is expected the second unit will be ready for operation about one month later.

The Hydro-Electric Power Commission of Ontario has under construction at the present time a 54,000 hp. hydro-electric development at Barrett Chute on the Madawaska river, twenty-five miles south-east of the town of Renfrew. This is one of a series of eight projected developments which, along with appropriate storage works and the existing plant at Calabogie, will eventually effect a complete and carefully correlated development of the major part of the main stream for the production of power.

The Madawaska river, one of the main tributaries of the Ottawa, rises in Algonquin Park and flows south-easterly for a distance of about 190 mi. to its confluence with the Ottawa at Arnprior (Fig. 1). It drains an area of 3,300 sq. mi., falling over 1,000 ft. from its headwaters to the mouth. Of this total fall, 665 ft. occurs in the last eighty miles of its course, and it is in this part of the river that the eight development sites referred to above are located. There are many lakes in the upper half of the drainage basin, some of which are susceptible of economical development as storage basins. Barrett Chute Development is located about thirty miles from the mouth of the river.

At the site of the development the river, following a wide semi-circular course, drops through a series of rapids immediately before it enters the south end of Lake Calabogie, at elevation 505 G.S. datum. Proceeding downstream, the series comprises Chain Rapids, Ragged Rapids, High Falls and, lastly, Barrett Chute. The highest and most beautiful of these is High Falls, where the river pitches through narrow gorges between pine-covered rock islands

(Fig. 2). The locality for many years has been a centre of tourist attraction both for fishing and hunting. The entire watershed of the river is rugged and beautiful and, being less frequented, has the advantage of being in a more natural state than many better known resorts. There are no settlements of any size from the village of Calabogie up to Bark lake, a distance of ninety miles by the river.

From the seventies on, when lumbering operations were at their height, extensive cribbing and flume construction were necessary to drive logs over the rapids close to the site of the present development. Through one of the islands at High Falls, solid rock cut, well over 250 ft. long, had to be excavated by hand labour, to carry the log-slide in a direct line to the pool above Barrett Chute. Facilities of this nature were carried out by the Upper Ottawa River Improvement Company. With the depletion of the original pine in the lower part of the watershed, cutting of cedar proceeded and, thereafter, log-driving gradually dwindled. No log-drive of any size has been taken down the Madawaska for over twenty-five years, so that now only broken and decayed remnants of the original flumes and mooring cribs remain as evidence of the activity of that day. The bulk of the original pine went down in the eighties and nineties. Clearings along the shores of the river above the development and private cemetery plots alone bear mute evidence of occupation by early settlers, who for a time attempted to farm on the timber clearings but have long since abandoned their holdings. The development now under construction perpetuates the name of one of those early settlers.

## DESCRIPTION OF THE DEVELOPMENT

The Barrett Chute generating station, when completed, will operate with two vertical units of 28,000 turbine hp. each, under a gross head of 155 ft. The main dam will raise the waters of the Madawaska to elevation 660 for a distance of eight miles upstream to the foot of Mountain Chute. In the forebay so formed, including Mud lake, which is tributary to it, a pondage 3,700 acres in area will be available. The low water flow of the Madawaska river has for some years been augmented from storage on Bark

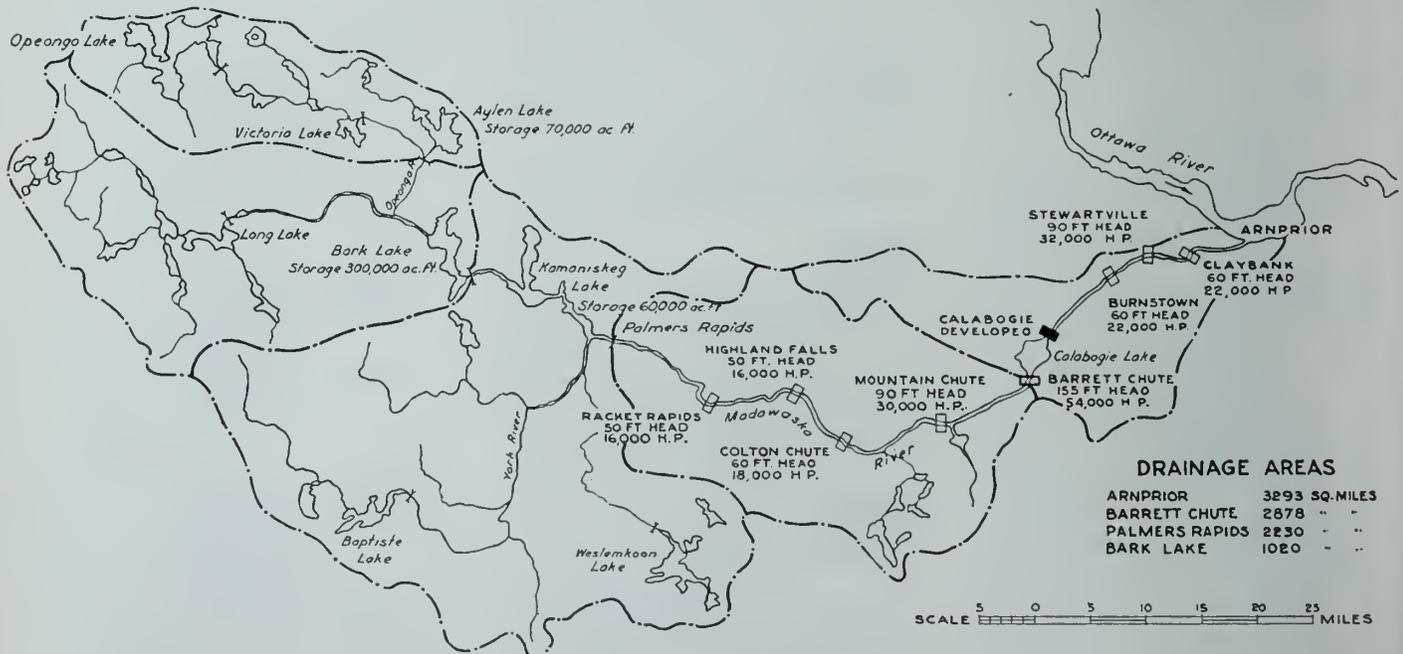

Fig. 1—Barrett Chute Development on the Madawaska River.

lake. An old rock-filled timber dam, originally built by Booth, has been improved from time to time and impounded approximately 30,000 acre-ft. on that lake.

Coincident with the development at Barrett Chute the Commission has under construction, by contract with the Dominion Construction Corporation, a new storage dam at Bark lake. The Bark lake dam is, in the main, an earth-fill structure with concrete control section comprising five sluiceways of the conventional type and, at a lower level,

Fig. 2—Foot of the High Falls.

Fig. 3—Power Canal excavation looking upstream.

four conduits  $5\frac{1}{2}$  ft. in diameter controlled by butterfly valves. This dam will enable water to be stored to a maximum depth of 30 ft. on a greatly increased lake area, the total storage amounting to 300,000 acre-ft. This project is to be completed in time to impound the spring run-off of 1942.

Like many similar water power projects, the scheme of the Barrett Chute Development is quite simple. A short distance downstream from the foot of Ragged Rapids a power canal, 2,400 ft. in length and 38 ft. in width, is now being excavated through solid rock to the headworks structure (Fig. 3). This will involve the excavation of approximately 140,000 cu. yd. of rock and 32,000 cu. yd. of earth. Two shovels, one Diesel and one steam-engine operated, a battery of trucks, and two Athey steel waggons of 14 cu. yd. capacity and tractor drawn, comprise the excavating and disposal equipment. If the haul is not too great, the Athey waggons are far superior to the ordinary dump truck on which the upkeep is very heavy on this class of work. With this set-up, from 12,000 to 15,000 cu. yd. of solid rock can readily be handled per month. For the regular channel excavation, waggon drills are used with  $1\frac{1}{8}$  in. hollow round steel, and for trimming the sides of the cut, plugger drills are used.

At the lower end of the canal, a reinforced concrete headworks structure, 80 ft. in length by 40 ft. in height, will control the flow into the two penstocks by means of electrically operated steel gates (Figs 4 and 5). From the headworks, two 14-ft. diameter steel penstocks will conduct the water to the units in the power house. They will be spaced at 40-ft. centres and, instead of the usual concrete saddles, each pipe will be half embedded in concrete

throughout its entire length. Additional angles riveted on the underside will supply anchorage and render the building of cumbersome and unsightly anchor blocks unnecessary. The narrow rock cuts in which the pipes will be built will limit the sides of the concrete envelope. The penstocks will be approximately 535 ft. in length, and will be laid on a uniform grade to the power station.

For its capacity of 56,000 hp. the power house is of very moderate size, being only 104 ft. long by 80 ft. wide. Two vertical Allis-Chalmers turbines at 40-ft. centres are now being installed in the substructure, which is approximately 40 per cent completed at this date. The station is well located in a deep bay near the foot of Barrett Chute, the rough water of which is deflected from the tailrace by a natural rock ridge extending more than 200 ft. downstream from the foot of the rapids.

#### TRANSPORTATION FACILITIES AND CAMPS

In the early stages of construction, access to the site was obtained by water transportation from the Canadian Pacific Railway siding in Calabogie to the head of the lake, a distance of four miles by water. The work began in September 1940, and the original camp was in tents. Before heavy equipment could be brought in, a new road,  $2\frac{1}{2}$  mi. long, was built around the head of the lake from the Calabogie-Black Donald Mines highway, which is maintained by the Department of Highways. The road was largely a sidehill cut, with a small yardage of solid rock excavation. With the use of two one-yard steam shovels, three bulldozers, two portable compressors and about ten dump trucks, the road to the power site was completed in a little over two months.

Following the completion of the road, the permanent camps and staff houses were built quickly for occupancy by the end of January 1941, after which the tent camp was dismantled. All the camps are of frame construction with Donnacona board for exterior sheathing. Each camp has its own hot and cold water service from the colony water mains. Water service for both camp and construction requirements is supplied from an electrically operated pump house located upstream from the dam. The water main is laid in a trench 3 ft. deep with a steam line wrapped in tar paper beside it. Although installed in mid-winter no appreciable trouble was experienced. A complete sewerage system, with three septic tanks, was built to serve the camp of 600 men. A recreation hall, equipped with radio and a camp commissary handling soft drinks, candy and tobacco, affords the workmen facilities for social gatherings in the evenings.

#### DIVERSION SLUICES

Following closely on the completion of the permanent camps, preparations for construction of the main dam and mixing plant were made in the early spring. By the middle of April 1941, excavation for the foundation of the dam on the north bank of the river, next to the mixing plant,

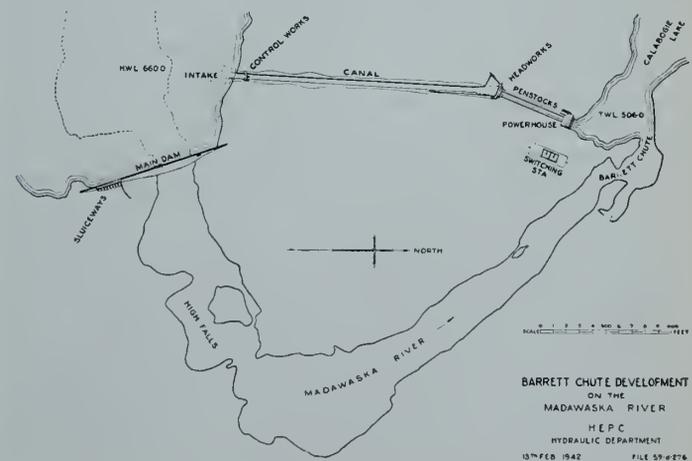

Fig. 4—Madawaska river drainage area.

was very nearly completed and the steam shovel was moved over the construction bridge to the south bank. Coincident with this work a cofferdam was built to unwater the south shore and about one-third of the river channel. By May 24th the piers and floors of the diversion sluices were completed. These temporary sluices were designed to pass the flow of the river during the construction of the major part of the dam and are to be filled with concrete when the headwater is raised to operating level. (Fig. 8).

#### CONCRETE PLACING BY PUMPCRETE MACHINE

Two systems of concrete placing were used, the first of which was by means of the Rex pumperete machine. For several years the Commission has placed most of the concrete on its projects using the pumperete system of dis-

Fig. 5—Headworks gatehouse substructure and penstocks.

tribution, except where the volume exceeded 50,000 cu. yd. This system has many advantages, chief of which is that it eliminates towers and high chutes entirely and discharges the concrete through a 7-in. steel pipe at the exact spot desired. The machine is located in the mixing plant directly below the mixers and its hopper is of the same capacity as the mixer itself. The action of pumping is a pulsating flow, the entire mass of concrete in the pipe coming to rest at the end of each pulsation, during which approximately 0.4 cu. ft. of concrete has been spouted from the discharge pipe into the forms. One disadvantage of the system is that the momentum of the moving mass causes the pipe to surge about one-half an inch with each pulsation, and great care must be taken to see that the supports for distributing pipe are free of the forms. Generally, 6-in. by 6-in. posts are used for this purpose.

The system works well on the level for a distance of six or seven hundred feet, and quite satisfactorily uphill for a shorter distance. When used for pumping downhill our experience with it was not as satisfactory. When so used, segregation of the aggregate sometimes takes place, the stone lagging behind the mortar, causing the pipe to plug. The pipe, which comes in lengths of 10 ft. approximately with an internal diameter of 7 in. has then to be dismantled. Each length of pipe has a smooth end and an enlarged hub end, in the face of which is mounted a fixed round rubber gasket. By means of two clamps, 180 deg. apart, operating on a cam rotation, the ends of adjacent pipes are quickly drawn together. The arm of the clamps is about 10 in. long, and a special T pipe handle is used for additional leverage. The pipes can be disconnected in less than ten seconds and reconnected in a slightly longer time. In service, when running along the horizontal, they should be blocked up about a foot from the ground. Although they are self-aligning, the speed of connecting depends largely on a reasonably even blocking. Standard bends of 90 deg. and less are also used; such bends are indispensable when altering the discharge end of the pipe above a form, so that all concrete will not drop in one place. One desirable feature of the system is that it does not place the concrete too fast for proper puddling, as so often occurs with the use of

chutes and towers. A one-yard pumperete machine will handle the batch from a one-yard mixer and place it in the forms at the rate of 20 cu. yd. per hour, which is quite fast enough for the size of the forms and the heavy reinforcing in ordinary power house construction.

On the Barrett Chute dam, which is a large mass concrete gravity type structure, the pumperete machines owned by the Commission were too small to distribute the concrete for the major part of the dam. For this reason, the pumperete was used to pour the diversion sluices only, a total of 4,800 cu. yd. As the sluices were located on the opposite side of the river from the mixing plant, a four-cable suspension bridge was built from shore to shore. Plank slats 4 ft. long, spaced about 4 in. apart, were cleated to the cables, and the pumperete pipe connected on this catenary platform for a distance of 650 ft. A crib near the south shore carried the cables high enough above the ground to clear the tops of the diversion sluice piers.

A word regarding the filling of these temporary sluices may be of interest at this point. In front of each of the two sluices, short piers were built to hold sectional steel gates. When the time comes to raise the headwater, these gates will be dropped in place and the river will rise to the level of the lowest of the sills in the regulating sluices at the southern end of the dam. After chinking the diversion sluice gates and providing for seepage, concrete will be poured down a series of 10-in. filling pipes extending from the ceiling of the diversion sluice openings to the top of the dam. This will be done in four sections. The procedure for each section will be to pour the concrete to within 2 or 3 in. of the ceiling. When this has set for sufficient time to assure no further shrinkage, the gap will be plugged with dry-pack concrete rammed into place. This procedure will be repeated for each of the four sections in each sluice, working from the front of the dam to the downstream side.

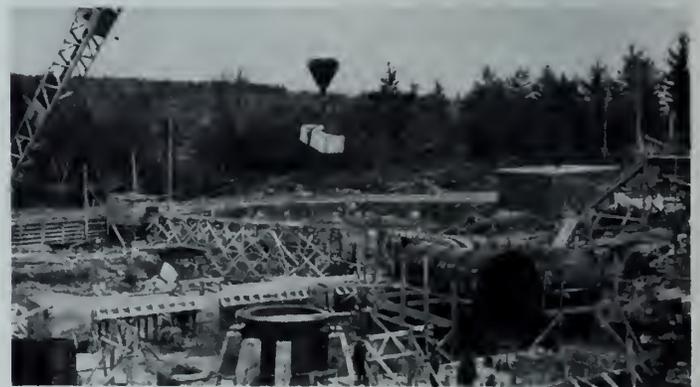

Fig. 6—Scroll case erection at power house site

#### CONCRETE PLACING BY CONVEYOR

Upon completion of the diversion sluice piers the cofferdam was reversed to unwater the north shore and the remaining two-thirds of the river channel. The reversal of the upstream wing of the cofferdam diverted the river through the diversion sluices. A timber trestle, 1,260 ft. in length by 110 ft. high in the centre of the river, was built across the site about 5 ft. upstream from the front line of the dam (Fig. 9). On an 18-ft. plank deck, with planks spaced 1½ in. apart, a 36-in. track on raised sills was installed to carry the tripper and the carriers for a 24-in. concrete belt conveyor. In the mixing plant at the north end of the dam, a pair of two-cubic-yard mixers was set up over a 4-yd. air-operated steel hopper. These mixers discharged alternately into the hopper, and an operator at this point fed the concrete to the belt. With this set-up, 1,200 cu. yards of concrete could be placed per day. For much of the time only one mixer could be used, especially near the top of the dam, as at this rate the concrete rose too rapidly for the safety of the forms. With a system of signal lights on the trestle and at the mixer, and a telephone on the tripper, pouring could be stopped at a moment's notice.

An interesting phase of the work on the dam is now in progress. A contract has been awarded the Dur-ite Company of Chicago to pressure-grout all the cracks and faults in the rock immediately below, and for a short distance in front of, the dam. The grouting will be carried to a depth of 30 ft. if found necessary. The Dur-ite grout is made up of equal parts of Portland cement and Dur-ite powder, to which is added a lubricating agent to facilitate flow in the fine cracks. The grout mixture is made up in a mechanical mixer and water is added until it has the consistency of thin gruel. This is at once pumped into the grout holes, drilled in a row at 5-ft. centres, about two feet in front of the dam. The grout pump has special valves, and extra strong rubber hose is used to carry the grout to the holes.

The procedure used in carrying out this work is as follows:

By the use of special drill steel, holes of 2½ in. in diameter are first put down at 5-ft. centres to an even depth of 5 ft. When fifty or more such holes are completed, inserts are introduced into the first four or five holes, to the first of which the hose is attached. To prevent breaking out, the insert, which is a patented device, is then adjusted so that it closes the hole about one foot from the top, compressing a special gasket to do so. The insert is hollow and, when the operator opens a valve at the top of the insert, grout

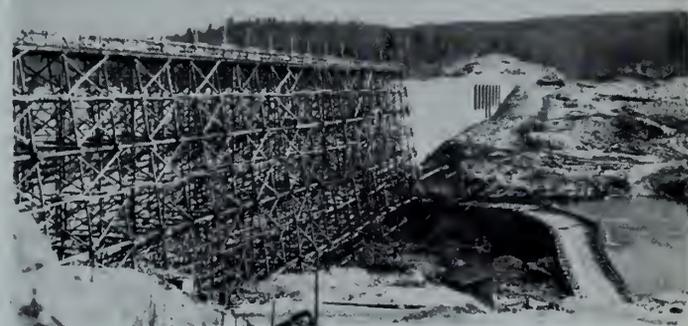

Fig. 9—Upstream face of dam showing conveyor trestle (partly dismantled) and coffer dam.

from the pump flows into the hole. As the pressure rises the grout is forced into the cracks in the rock. A rapid rise in pressure observed by the operator at the pump shows that the hole is nearing the "saturated" stage. The pump is then stopped and the gauge is watched to note any pressure drop. To effect saturation, the pressure in the first 5-ft. lift is raised to 250 lb. per sq. in. If the pressure drops within a minute, the pump is started up slowly until the gauge reading is static at the 250-lb. reading; the hose is then detached and moved to the next insert where the process is repeated.

When the pressure grouting is completed in the series, the inserts are removed and an air jet is applied into each hole to blow out the grout remaining in the hole itself. Next day, drilling is resumed to a depth of 10 ft. and the process of pressure-grouting repeated. If not much grout is taken up in the 5-ft. grout zone, it is then considered fairly well saturated. The drilling to 10-ft. depth is then carried out in every other hole, that is, at 10-ft. spacing. The applied pressure in the second zone is raised to 350 lb. per sq. in. and, if only 0.5 cu. ft. of grout is taken in each hole on the average, the rock is considered tight enough to stop leakage and grouting is discontinued. In this way, so long as the holes take grout, they are deepened 5 ft. at a time until at 25-ft. depth most of them take very little. If there are faults or micaceous areas within the limits of the drilling, the grout most certainly detects their presence and fills them. On the north bank of the river, where excavation for the dam foundation uncovered crystalline limestone and pegmatite intrusions, some decomposition was found along the lines of contact with the com-

Fig. 7—Tail race and lower end of pipeline excavation.

In building the forms for the gravity section of the dam, the front and back forms were continuous with transverse bulkheads every 30 ft. The order of pouring consisted in filling every other section. When a number of such sections were poured, the bulkhead forms were stripped and the exposed end faces of each section covered with a ⅜-in. layer of emulsified asphalt to provide for expansion and contraction. The intermediate sections were then poured. In the deep part of the dam the yardage per section varied from 2,800 to 3,500. A few of the sections were poured continuously from bottom to top, slightly more than two days being required for this. Later, this practice was changed to two lifts per section to avoid the possibility of excessive shrinkage stresses when cooling. Throughout the construction of the dam, pouring was continuous, day and night shifts being used.

#### DRAINAGE SYSTEM

In the design of the Barrett Chute dam, provision was made for the collection of all leakage through the construction joints from the front of the structure. At the end of each 30-ft. section a 6 by 6-in. vertical box was formed on the bulkhead from top to bottom at a distance of 7 ft. from the upstream face. A similar box drain was formed along the rock foundation at the same distance from the face. The vertical drains led into the top of this horizontal box, thus interconnecting the whole drainage system. At a distance of 8 ft. from the upstream face and adjacent to the vertical drains, an arched tunnel, 4 ft. wide by 8 ft. high, was formed through the deep sections of the dam, approximately 10 ft. above the rock. The presence of this tunnel makes possible the inspection for leakage at the construction joints and observation of shrinkage cracks and temperature changes. During midsummer, temperatures of 135 deg. F. were recorded as the structure cooled. Connecting with the vertical drains, a 9 by 9-in. gutter was formed along the upstream side of the tunnel floor. Thus all leakage will have to flow along the gutter before draining out through two 10-in. wrought iron pipes which have their outlets well below tailwater level at the rear of the dam.

Fig. 8—Dam, looking south from mixing plant, showing conveyor trestle and diversion sluices.

petent grey gneiss. Some micaceous layers were also found along the lines of contact, and the occasional vug was opened up. Whenever a hole cut one of these lines of contact there was generally an increase in the volume of grout taken; as much as 40 cu. ft. and more was pumped into a few of the grout holes. If the line of contract was not cut

Fig. 10—Power house steel superstructure, looking north, on April 9th, 1942.

by the drill hole until the third zone, at 15-ft. depth, the upper zone grouting might not give any evidence of the underlying fault. It should be emphasized here that the presence of such faults in the rock at this depth below the base of the dam did not cause it to be considered unsuitable in terms of its competency as a foundation for the dam. The grouting was done solely to stop flow through some of the uncovered contacts which might, in the course of time, become water-bearing. The entire foundation of the dam was core drilled before construction was started. The cores were boxed, suitably labelled and sent to head office for examination. Most of the core drill holes were put down to

50 ft., and in the river channel some of them to 100 ft. A full knowledge of the foundation rock was thus obtained before the site was accepted.

The pressure-grouting contract is still in progress and at the end of November was about 60 per cent completed. Grouting operations may yet be considered from the tunnel floor, which will give a new line of holes 8 ft. from the face of the dam. They would be at greater spacing than out in front where undoubtedly some of the grout, and possibly most of it, works its way upstream from the dam, where sealing of the cracks is equally effective and just as necessary.

#### TIME OF COMPLETION

The early completion of the Barrett Chute Development is desired as a war measure to ensure adequate power for the Eastern System of the Commission. It is estimated to cost \$5,250,000, and the Bark Lake storage dam \$1,750,000.

Conditions favourable for construction have prevailed since the beginning of the project. Except for possible delays in the manufacture and delivery of structural steel and equipment, which are subject to priority regulations, it is expected that the development will be completed on time, that is to say, by early midsummer, 1942, and the Bark Lake storage dam in time to impound the spring run-off of 1942.

#### ACKNOWLEDGMENT

Mr. Otto Holden, M.E.I.C., chief hydraulic engineer of the Hydro-Electric Power Commission, is responsible for the design and supervision of construction of the development. The electrical features are being designed and supervised by the Electrical Engineering Department, of which Mr. A. H. Hull, M.E.I.C., electrical engineer, is the head. Construction is being carried on by the Commission's Construction Department, of which Mr. D. Forgan, M.E.I.C., is construction engineer and is represented in the field by Mr. Angus Richardson, superintendent. The writer is resident engineer.

## WAGES STABILIZATION

DR. W. J. COUPER

*Executive Assistant to the Deputy Minister, Interdepartmental Committee on Labour Co-ordination, Department of Labour, Ottawa.*

**NOTE**—This address deals with price fixing and wage ceiling in relation to inflation. It is an unusually clear explanation of a subject which vitally affects every citizen, but which is not fully understood by all. It was given at Ottawa at the annual meeting of the Canadian Association of Administrators of Labour Legislation, as part of a symposium on wage stabilization policy.—*Editor.*

It is my purpose to start to-day's discussion by indicating in a very few minutes the underlying theory of the wages stabilization policy. I think it can be stated very simply, and it is in essence very simple.

In time of war we have to stop producing automobiles for civilian use and produce military equipment; we have to stop producing washing machines and produce shells; we have to make far-reaching adjustments in our whole productive system. That is to say, we have to divert productive resources from the production of things which civilians consume into the things which the military forces will destroy. We have to reduce consumption. It is on that principle that the wages stabilization policy is based.

The importance of that is obscured, because we entered the war at a time when we were not using our productive resources fully, and it was therefore possible during a considerable period of time, both to expand the production of civilian goods and to expand the production of military equipment; but as we came nearer and nearer the point of relatively full employment we had to face the fact, as I stated at the outset, that we have to reduce consumption.

Now, there are only two main ways to reduce consumption of civilian goods. The first is by a combination of definite government policies such as rationing, taxation and saving. The other is by a process of inflation. Let us pause

there for a just a moment to examine the choice before us, because it is a choice which we cannot escape. Inflation is nothing very mysterious. Inflation is any sustained rise in prices, and the function of inflation is to cut consumption. I am putting it very simply and in a very elementary fashion, because I think it is in those terms that we should always think.

We started out, as I said, without full utilization of our resources. By the government's policy of spending money to buy munitions and other military supplies more and more money got into the hands of the public in the form of spendable money income. While large numbers of men were unemployed, the spending of that money income on civilian goods could produce opportunities for their employment, could stimulate the production of goods to balance the increased money income; but that process can continue only for a relatively limited period of time, and we finally reach the situation where through the government's spending policy more and more money is pumped into the pockets of the consumer without at the same time more goods being produced on which he can spend that money. Then, as I say, one of two major things must happen: either the government must take that money from him in taxation so that he cannot spend it, or the consumer deliberately must fail to spend it and save it; or by spending an increasing amount of money on a not increasing, or at a later stage, an actually decreasing supply of goods, he will force up the prices of those civilian goods.

Putting it in very crude, arithmetical terms, you start off, let us say, with net spendable income after taxation and saving, of two billion dollars, and you spend it on

goods, which for simplicity's sake we will say average a dollar apiece. If you increase your spending income to three billion dollars, that is by 50 per cent, and at the same time increase the supply of civilian goods by 50 per cent, there is no necessary change in prices. If, however, you increase your spendable income from two billion dollars to three billion dollars or by 50 per cent and do not increase your supply of civilian goods by the same proportion, prices must begin to rise: they begin to rise because there must be some arrangement to decide which of those consumers with the three billion dollars, together shall share the relatively limited supply of consumption goods. And that process becomes tremendously accelerated when we reach the stage of increasing money income because of increasing employment, overtime rates and higher money wages; and at the same time face an absolutely decreasing supply of civilian goods.

I want to emphasize that despite all the discussions and fear of inflation, in time of war it is a necessary development unless something can be substituted for it, and it has many advantages: it operates without any Order in Council; it operates without any conscious decision by any governmental authority; it operates without any army of bureaucrats to enforce it. It is a simple process by which, as prices rise, you and I and everybody else in the community because of that price rise are forced to cut our consumption.

It has, however, some appallingly serious defects: it is a process which, once really started, can continue on indefinitely to levels that for those of us who have never seen it, are utterly inconceivable. The prices do not rise at the rate of 1 per cent per month, but at the rate of 10, 30, 50 or 100 per cent per day; it "snow-balls" up, and it has the defect of being exceedingly unjust since different groups in the community are in various positions with respect to their power to adjust their incomes more or less to the rising price level. Because of that injustice it creates unrest, and because of that unrest after a certain point is reached it seriously interferes with the efficiency of production. So that although it works quietly and smoothly in its earlier stages it disrupts all social relations in its later stages, and if allowed to continue in Canada, even to the point that it reached during the last war when our wholesale price level increased by about 150 per cent and our cost of living index rose approximately 100 per cent, would leave in its train a very serious problem of post war readjustment. It allocates sacrifice in an arbitrary fashion.

Because of the fact that this war is so much more highly mechanised, it is going to take a very much larger proportion of the total national income in all belligerent countries than did the last war, and the degree of inflation necessary to restrain consumption during this war would be very much greater than the extent necessary during the last war. So for those general reasons, and because of the particular reason that the extent of inflation this time would need to be very much more severe, the government set its face in the very beginning of the war in the direction of any kind of policy that would check inflation. So that, broadly speaking, the whole wage policy can be summed up in one very simple sentence: Generally speaking, the government has undertaken to say that, apart from some minor adjustments, there shall be no increase in basic wage rates because of the fundamental fact that there cannot be any general increase in real wages; it is physically impossible in time of total war to increase real wage rates, namely, the things that consumers can in fact buy with their wages. That is the story.

Any criticism of the wage policy in its broad meaning is a criticism which must contend that it is physically possible to give all consumers in Canada more and more civilian consumption goods at a time when we are withdrawing men and women from the production of civilian consumption goods.

Let me jump very quickly to the other half of the picture, namely, the price control policy: If money incomes are increasing more rapidly than the supply of the goods on

which those incomes may be spent, unless something is done about it prices will inevitably rise, and I repeat again for emphasis that the only things that can be done about it are taking the money away by taxation, encouraging the people to put their money away by saving, or prohibiting them from spending it through rationing, (and that of itself has a tendency to raise prices of unrationed goods). The government then in its price policy has done as it has in connection with the wage policy, and has said that as of a given date there may be no more rise in prices; but a government declaration of that sort cannot be made effective as long as money incomes increase more rapidly than the goods on which they are spent, and I want to emphasize the fact that the War Time Prices and Trade Board is acutely conscious of that fact. You cannot just by fiat stop prices from rising when the forces of increased income and the short supply of goods are pushing prices up.

So the wage ceiling and price ceiling policies which are the most obvious features of our present Canadian policy are not in themselves the basic instruments. The basic instruments are the taking of money away by taxation, and the saving of money by the population, and the maintenance of supply of goods. The major effort of the War Time Prices and Trade Board is not the prosecution of offenders against the price ceiling. Its major effort is continually to review the supply of goods to make sure that they are maintained in sufficient quantity to permit their distribution without a rise in prices. And I think that we should link up the wage policy under which we have lived for several months with the new policy which is implied in what I have just said. Just as the War Time Prices and Trade Board cannot possibly, and knows it cannot possibly maintain the price ceiling without maintaining the supply of goods, so I think the authorities concerned in all phases of labour relations and related problems are aware of the fact that we cannot maintain the wage ceiling without at the same time maintaining and directing the supply of labour. It is for that reason that we are just beginning a policy of National Selective Service. And just as through the War Time Prices and Trade Board the price control policy is defended by a series of rationing arrangements which thus far chiefly take the form of saying that the rations shall be zero, and you are not allowed to buy this and that, so I think the wage ceiling policy will necessarily have to be supported by a similar arrangement in the rationing of labour. One could continue on at very considerable length to analyze details of the wage policy, but I think in very broad terms I have stated the basic problem.

Let me just repeat it again: The problem is to divert resources and reduce consumption; and in the reduction of that consumption to allocate the sacrifice with a reasonable degree of equity over the different classes in the community. The wage ceiling policy is only one small phase of that problem which says in effect: In this general situation where money incomes are necessarily rising because of increased employment, because of increased spending by the government, we will take one of the factors that would increase money incomes, we will take the rise in wage rates. That is only a small part of the problem, but we do it on the ground that if we do not do it in this way impersonal forces of inflation will do it in another way which will impose sacrifices in a very much more arbitrary and capricious fashion. But we do not exaggerate the importance of it. It is only one small phase of the problem. The basic problem is to increase taxation, to encourage people not to spend their money, and by every device to maintain the supply of goods to the maximum possible extent compatible with the war effort and, when necessary, when they are definitely short, to allocate them under a rationing system. And to do that we have to do the same thing with labour; and I think in the Wartime Bureau of Technical Personnel Regulations (P.C. 638) you get a little indication of the probable trend of development with respect to every other class of labour.

# A PEACE WORTH FIGHTING FOR

WILLIAM E. WICKENDEN

*President of the Case School of Applied Science, Cleveland, Ohio, U.S.A.*

Substance of an address delivered at the Edison Medal presentation, January 28th, 1942, during the American Institute of Electrical Engineers 1942 Convention, New York, N.Y.\*

The name of Edison reminds us that imagination is no less a tool of the engineering profession than fact-bound analysis. The medal which honors the revered memory of Benjamin Lamme bears these words from his pen, "The engineer views hopefully the hitherto unattainable." Kettering is quoted as saying that the difference between a research man and an inventor is that the latter does not know all the reasons why a thing cannot be done, therefore he goes ahead and does it. We engineers who have not only a war to win but also a peace to make secure should pray for a double portion of their spirit.

The 30th of September in 1938 may be marked in future histories as the most tragic date in a thousand years. The Munich pact which sealed the fate of Czechoslovakia not only shattered the tottering structure of world peace, but blasted the last vestige of international good faith on which a new and better peace could be built. Where law had once reigned, only a shadow of law remained, and gangsters were free to take over with impunity. We in the United States, a nation without border complexes to breed an instinct of distrust, were slow to perceive the truth. For three years we moved in a fog of indecision, allowing the shifting pressure of events to shape our course. We had neither enlightened policy nor consistent leadership as our guide. With our political left hand we sought to extend a social revolution, while our industrial right hand was called upon to prepare for a total war. Neither hand trusted or understood the other. Authority was confused and co-ordination lacking. The normal processes of democracy worked badly and the defense results were disappointingly meager and unduly costly. Then came Pearl Harbor.

As if by a flash of lightning, the fog dissipated. The character and the caliber of the foes to be faced stood revealed in starkest outlines. Our own weaknesses were pitilessly laid bare. The path ahead grew clear, brutally clear. Grim resolution seized the nation. Yet there was an unmistakable wave of relief, for even brutal certainty is often easier to bear than confusion of mind and conflict of will. Thus like Britain and France before us we were plunged into a war which none but fanatics desired, sadly, reluctantly, without hate, in a spirit of fatalism. Never in modern times had a whole generation of mankind so completely lost its way.

When future historians come to fix a label upon our times it should surprise no one to find this called "the age of Hollywood"—an era that preferred diverting illusions to solid realities; a generation of jazz and jitterbugs, that thought it more important to be smart than to be wise, that preferred glamor out of a make-up kit to charm acquired through painstaking cultivation; an age of Utopias, that fought a war to end wars, that created a League of Nations without police powers, that built peace on political disintegration in a Europe desperately in need of economic integration, that signed the Kellogg-Briand Pact and trusted its security to the deep caverns of a Maginot line; an age—in America, at least—of economic fantasies, that spent the 1920's abolishing poverty by the magic of stock-market inflation and the '30's restoring social security by spending more than was produced, that dreamed of an America made immune from the ills of mankind by broad seas and a tariff wall, an island of peace and of plenty in the midst of a world of want and of woe.

In all soberness, I do not believe that thoughtful men are willing to go through an inferno of blood and sweat and

tears merely to get our old world back. With all our souls we do not want Hitler's new order of international gangsterism, nor Tokyo's co-prosperity sphere, nor Lenin's proletarian Utopia. To lick Hitler and avenge ourselves of Japanese treachery is necessary, but it is not enough. Remembering Pearl Harbor will put a useful shot of adrenalin into our blood stream to spur our immediate efforts, but it will not give us the staying power for a long and exhausting conflict. Faith, not anger or fear, is the greatest source of staying power that human experience has revealed. Faith in what? We are therefore justified in looking beyond the actual conflict to a peace worth fighting for. Experience has shown too often and too clearly that if you do not prepare for defense until your country is invaded, it is then too late; but it is equally true that if you do not prepare for peace until an armistice is declared, it is then too late. A peace conceived in an atmosphere of economic prostration and emotional exhaustion carries within it the germs of its own destruction.

This is a good time to examine the fruits of our experience. Wise men, it is said, make mistakes but fools repeat them. The United States helped once to win a world war as a minor military partner and found itself outvoted at the peace table. As a compromise, its chief negotiator imposed on Europe a new scheme of collective security designed to replace the long-familiar system of a balance of power. The only chance of the novel scheme's success lay in United States participation as a balancing and moderating influence, but our Senate had not been consulted in the planning stages—a fatal error politically—and repudiated it. Unfortunately, the architect of the plan was better versed in political ideals than in economic realities. The ideal of self-determination was allowed to overshadow completely the economic integration which Europe desperately needed. In place of the collective security of Wilson's dreams, a flood of destructive nationalism was let loose on the world.

Having insured the political collapse of the peace structure, we proceeded to its economic sabotage, not by deliberate calculation but by refusing to assume the role into which the war had thrust us. We were innocents abroad, in a world beyond our experience. We had entered the war a debtor nation. For three centuries we had drawn on European capital to develop our land and mineral resources, build our railroads, and equip our industries. We were accustomed to settle the interest account by sending abroad an export surplus each year of 600 millions of dollars. Our market for manufactures was elastic; as costs fell its volume rose behind a tariff dyke. Our market for food, cotton, and other agricultural staples was relatively inelastic, and we found it convenient to let the surplus flow out over the spillway at the ruling prices of the world. In short, the protectionist policy of our prewar years was one well fitted to our economy.

We came out of the war in the unfamiliar role of a creditor nation. On paper, Europe owed us 25 billions of dollars. To collect our interest and spread the amortization over 50 years would mean our taking in an import surplus of a billion a year. The whole idea seemed repugnant to our instincts. Here we were, geared to an immense surplus of production, with Europe hungry, its stocks depleted, its equipment deteriorated, needing everything we could supply. They wanted our goods. We wanted the business. We wanted to sell without buying and expected a settlement in cash. Very well, we would lend them the means to keep the game going, and did so until it blew up in our faces. As

to terms, was it not Calvin Coolidge who expressed in his sparse Vermont idiom the verdict of the nation, "They hired the money, didn't they?" In the cold light of experience, we can whistle for the money, forever.

If it is hard to forgive the Harding-Coolidge regime on the League of Nations and the World Court, or Hoover—who of all men ought to have known the rudiments of international economy—on the tariff and the debts, it is also hard to forgive the Roosevelt regime for scuttling the London Economic Conference after sending delegates pledged to co-operation in world rehabilitation, and for embarking on a policy of dollars wild in the poker game of currency devaluation. Alas for our peace of mind, too many of Europe's tragedies have been in no small measure of our making.

But we were not alone in our bungling. Our former allies were not to be outdone. In repeated visits to Germany over a six-year period, beginning shortly after the restabilization of the money and ending only a year before Hitler came to power, I was able to see at first hand the tide turn from hope to despair and from faith in free institutions to the fanatical introversions of blood and race. We had a good chance to save the peace down to the days of Briand and Stresemann. The Germans, I believe, sincerely meant to accept the reparations settlement under the Dawes and the Young plans.

Germany could bear this burden only as a surplus of production over her own elemental needs; lacking raw materials, this surplus could come only from their own intelligence and labor. It meant extra hours of hard work, for the seeming benefit of their recent enemies, but the Germans said they liked to work—they would work 50 hours a week, 50 weeks a year, and 50 years a lifetime. To avoid deranging the economic life of Western Europe, the Germans felt they must be given a free hand to exploit the raw materials and the hungry markets of Russia. In 1926 negotiations to this end were actively under way and Germany was engaged in a most intensive effort to perfect her working tools and operations and to master thoroughly the arts of mass production on American lines. Then the secret began to leak out—the very scale of industrial development and operation necessary to settle the reparation account would inevitably give German industry an overwhelming dominance in all Europe. When the British and the French fully perceived this fact, they refused to go along, setting in motion the policy of progressive frustration which finally drove a not-too-willing Germany into Hitler's arms. It is reported that when one highly respected German consular official in America learned that the Nazis had come to power, he remarked to a friend with a gesture of despair, "The hoodlums have taken over!"

Paradoxical as it may seem, it is not war but its aftermath that destroys nations and threatens civilization. Doctor Harry Emerson Fosdick, New York's famous preacher, illustrates that point with the story of a man who fell from the roof of his house; when a friend asked if the fall hurt him, he answered "No, the fall did not hurt me, it was the stopping that nearly killed me." Human nature, it seems, can withstand the disciplined rigors of war better than the disintegration of peace, as the Hapsburgs, the Romanoffs, and the Hohenzollerns would quite agree. To make a successful peace, it is not enough to have blueprints ready in an official file, it is also important to condition the people for their acceptance. Woodrow Wilson learned this to his sorrow. Returning soldiers, sick of fighting and fed up with their recent allies, and emotionally exhausted civilians homesick for normalcy, cannot be counted upon to build a brave new world.

As a prelude to the problems of peace, we shall have to take some of the risks of prophecy. Some outcomes seem inevitable, no matter who wins the war. There will be world-wide depletion of men, materials, equipment, and liquid wealth. Whole continents will be enfeebled by inadequate nutrition. World-trade, shipping, and banking

structures which it has taken two centuries to build will be largely destroyed. Staples like silk and rubber on which trade empires have been built may yield place to synthetic substitutes. The bonds of world empires will be loosened. Primitive peoples who in the past have asked little of life except that their rice bowls be filled will have felt the impact of technological war and technological economy, awakening their craving to share in the means of defense and in the abundance of goods which only an industrial civilization can supply.

Whatever the military outcome, it seems that the world is being welded by blood and sweat into a group of larger economic units in which the economy of mass production and mass distribution can operate effectively. Men everywhere will want to share the American secret of high wages and of more, better, and cheaper goods. Little nations lacking assured access to a great variety of raw materials and to vast and diversified markets are excluded effectually from this system. How to assure to Finns, Danes, Belgians, Swiss, and other small peoples whose contributions to civilization have been unique and precious, freedom of language and culture, together with autonomy of regional and local government, in the larger economic aggregations which seem sure to come, is a problem to give us pause.

In to-morrow's world it may no longer be possible to fence off privileged areas and to possess them in security by virtue of technological pre-eminence or monopoly of basic materials. It may be no longer possible to preserve a \$14-a-day standard of living for the American workman in the presence of a 14-cent-a-day standard for the equally intelligent and incomparably more industrious Chinese coolie. It may not be in our interest to try do to so. No one expects, and few desire, an immediate equalization of income standards over the world, even though the present conflict should turn out to be a prelude to Utopia, but there are inherent leveling forces in an economy of science and technology which soon must be reckoned with on a world-wide basis. A nation far advanced may hold its favored position for a time by exporting its products while retaining a semi-monopoly of technological equipment and skill. This was the classic economic strategy of Great Britain, against which we rebelled in 1776, but which continued to operate in a diminishing degree down to World War I. Sooner or later the advanced nation reaches the point where it begins to export not only goods but tools for producing them, to equip steel mills in Brazil or machine shops in Russia or arsenals in China, and the slow but inevitable leveling process picks up acceleration as one nation after another industrializes.

No matter who wins the war, unless all civilization is converted into a permanent arsenal, much of the world must grapple with the problem of converting an armament economy back into an economy of social welfare. With it we must tackle the problem of restoring a dictated economy to a free economy. The dislocation of a return to peace is beyond our imagining. At the lowest possible estimate, the war's end will find 250 millions of people in Europe, America, and the British dominions entirely dependent for their living on the production of the material of war. The incidence of war on the world of production is usually gradual. Hitler spread the transition over seven years in Germany and spent over 90 billions of reichsmarks on war production before the first blow was struck. But the incidence of peace is almost instantaneous; production stops overnight. The Nazis have an answer: war is the normal state of human existence, while peace is a mere interlude in which to replenish population and restock the arsenals. We need a better answer, and finding it is likely to take the full measure of our wisdom and of our planning capacity.

Let us not delude ourselves into thinking of a mere return to the soil as the way back to a peace economy. That door was closed for most of mankind over a century ago. The world's population has considerably more than doubled since 1800; some areas have grown acutely overcrowded.

"Lebensraum" is a real enough problem when we recall that some 12 Germans or 18 Italians or perhaps 30 Japanese have to contrive to get a living with the aid of natural resources roughly equivalent to those available to the average American. Only mechanized industry and open channels of trade can give *lebensraum* to crowded peoples without pillage. Hjalmar Schacht, the German economic genius, knew that when he said "If goods do not cross frontiers, armies will."

The people of the United States will have problems at home from which no victory can shield us. Debt, for one thing. Last year our public debt—Federal, state, and local—reached a total of 85 billion dollars, exceeding for the first time in our history the corporate debts of our business system and equaling approximately our annual national income. The program of war effort already announced is fairly certain to raise the Federal debt to 150 billion, and no one knows where the ceiling will be. A debt of 200 billions is bearable, and need not invite repudiation, as it represents less than half our national wealth and is roughly twice our annual income. A Federal debt of this magnitude would be roughly equivalent to a public mortgage of 75 cents on every dollar of the nation's productive assets, including farm land and urban real estate. Some measure of inflation is inevitable and the wisest controls will be needed, but debt alone is not likely to cause a runaway. Most of us will recognize inflation when it comes simply as our old acquaintance, Mr. High Cost O'Living. The mere carrying of this debt will impose a severe strain on government finance; it will eat up three or four billions a year in taxes, and the first \$25 or \$30 of income for each member of the average family will be earmarked in advance for interest charges. Government will find it necessary for its own relief to use every known expedient to hold interest rates and the return on invested funds in general down to the lowest possible level. This will bring no joy either to colleges dependent on endowment earnings or to holders of insurance policies. Competition for tax money among the various units of government—national, state, city, and local—and among publicly supported institutions and social services will grow severe. There will be no will-o'-the-wisp of reparations to buoy up false hopes and no money return from lend-lease operations.

In dealing with the debt, we shall have three possibilities to choose among. Either we shall repudiate the debt by inflation, or grin and bear it, or ease its burden by creating new wealth and a greater national income. Freedom is better than slavery at any price, but only the third of these courses of action can stir our hope of a better age to come.

We shall have not only increased debt, but increased assets as well. On paper, the national balance sheet may not look quite so bad. Not all our war outlay is going to be used up in action. A rough calculation indicates that our capital investment in defense plant may run up to 40 or 50 billion dollars. It will be represented by our enormously increased capacity for producing metals, chemicals, power, aircraft, machine tools, and machine products. If we succeed in making this greatly augmented plant investment earn its way, we shall be well on the road to a solution of the problem of finding employment for our greatly increased working population. If the plans recently announced by the President for 1942 and 1943 are carried out—and they must be—war production and the armed forces together will require the services of about 24 million people, in comparison with the 16 million ordinarily employed in production industries. Past experience indicates that relatively few of the millions thus added to our employment rolls will voluntarily accept demobilization at the end of hostilities.

Another problem to be faced is the gold hoard now in our possession, five sixths of the entire world supply, valued at some 23 billion dollars. We do well to consider that what gives our gold this value is not its utility in industry and in art, but rather its potential usefulness as a monetary

base and especially its unique value as a convenient medium for the settlement of international trade balances. Apart from a free economy such values have little meaning. In Nazi internal economy, currency is merely a government-backed claim against whatever goods are available for civilian consumption; in Nazi external economy, money is merely a reckoning unit in hard-driven barter deals or forced requisitions. Unless we can restore a gold-backed monetary system in the postwar world of international trade, our gold hoard is merely so much lustrous metal, good for filling teeth and making jewelry, with a value fixed by the law of supply and demand.

With these premises, let us confront the issue: is there a peace beyond mere military security worth fighting for? To struggle for self-preservation alone is after all little more than an instinctive fatalism. We crave a higher faith to transform sacrifice into privilege, to face tragedy with fortitude, and to nerve our spirits when the flesh wearies and the will grows faint. Win or lose, the outlook for much of the world is dark. The vanquished must face the peace hungry and exhausted, their goods gone, their productive equipment worn out, the scant remnant of their capital frozen in armament industries, and their social structure together with the ideology that sustained it in utter ruin. Their intellectual and spiritual bankruptcy may threaten a return to the dark ages. Where in all the Nazi world may one look for even a remnant of uncorrupted youth to be the nucleus of a reborn culture? Is there not a Biblical parable of a man who had been cleansed of a devil only to have seven devils move into the empty place? Our allies in victory will at least be the captains of their souls, however stricken in material resources.

It is not too much to say that if civilization is not to pass into a lasting decline we in America shall have to underwrite its rehabilitation. Whatever the cost and wastage of the war may be, I have faith to believe that we shall finish the job with our man power and vigor but little impaired with our productive capacity vastly increased, and with our trust in human worth and in a free and just society unshattered. True, we shall be burdened with debt and vexed with dislocations, but I believe we can rise above them. Indeed, the surest way to rise above our troubles may be to forget them and dedicate ourselves without reserve to the salvage and spread of civilization which we alone can undertake.

When we come actually to face this issue, no doubt the isolationists will still be with us, counseling us not to waste our shrunken wealth on the down-and-outs, but to wash our hands of the sick world and retire into an economic quarantine. Perhaps they might consent to some sort of swap for coffee and bananas, or for tin and manganese, or for tea and rubber, but as for the rest—let the world go hang. Leaving all humanitarian sentiment aside for the moment, there are certain costs to be counted before committing ourselves to any such self-serving program. We shall have to pay for the war, no matter who fights it. Win or lose the peace, we shall have to pay for it anyway. We can pay for it by withdrawing into a closed economy, which may mean the writing off of a hundred billion dollars of capital more or less, without chance of recovery; or we may pay for it by underwriting the world's recovery and the extension of civilization, in which case we may not only do some good, but have at least a sporting chance of getting our money back with some profit.

Suppose the United States does withdraw into a closed economy, what are the chances of gain or loss? As a start, we should have to write off forever all we are putting into the lend-lease program. Next, we might have to write off some fifteen billion dollars or more of the supposed value of our gold hoard. If gold is just metal, priced by supply and demand, our overstock might be little more than a monument to our folly. Then we might experience difficulty in finding much use for the greater part of the new war-goods plant we are now building. Who will be buying air-

craft, or machine tools, or armor plate—or using power, for that matter—in the amounts we will be geared to produce? Not the home market surely. That might mean writing off another 30 or 40 or perhaps 50 billions of capital. And who would buy the extra acreage we are putting into production, beyond our normal requirements, to make good on the food end of the lend-lease program? Who would provide employment in a closed economy for the greatly swollen ranks of our working population? If there are no outlets abroad for what these men and women can produce, may we not expect a new generation of false prophets, to arise, preaching salvation by division instead of multiplication, while relief rolls and made-work projects and pump-priming expenditures suck us down even faster into the vortex of national insolvency?

If we do accept the great adventure and decide to risk our wealth on world recovery rather than to hoard it, we might logically begin by digging our gold out of the vaults of Kentucky for use in re-establishing the world's money system and as a base for international credit. That would mean lending it to recent friend and recent foe alike. If we lend it, we ought to expect some reasonable guarantees. It might do more good and we might have better prospects of a return on it if we placed it in the hands of strong borrowers, with diversified resources that might be organized into a well-balanced economy, than into too many small and weak hands paralyzed by mutual hates. Choosing the borrowers would give us a powerful voice in any economic and political regrouping of the world.

The tragic failure of World War I and its aftermath testifies to the futility of building a new order on political disintegration rather than economic integration. Sovereignty without a decent economic sufficiency is an empty shell. Under the guise of self-determination, the concept of extreme nationalism reached its all-time peak in the last postwar interlude. Sovereignty was understood to secure to each nation its right to manage its fiscal affairs, to devalue its money, to protect its industries by tariffs and preferences, to force its goods on others by intimidation at no matter what cost to its neighbors. And of course, sacred honor gave it the right to make war on anybody at any time. The obsessions of ultranationalism rise but little above the economics of the robber barons. It is only a meager and transient wealth that a man gains by pillaging his neighbors, keeping them poor, and refusing to do business with them. The modern key to wealth is more, better, and cheaper goods, produced in volume through advanced technology by high-paid workmen where supplies of materials are favorable, and sold in the widest markets at the lowest costs. This principle is no respecter of political sovereignty. It cannot operate in close confinement.

If the United States is to be the world's banker and use its gold to reanimate the world's atrophied economy, it will be well to remind ourselves that the surest way to guarantee our own prosperity is to create prosperity elsewhere, that the surest way to protect our standard of living is not to quarantine it against the plague of world poverty but to encourage a healthy standard in other lands. We cannot sustain the banker's role by lending our money and immediately taking it back in cash payment for the food, cotton, oil, metal, and industrial equipment the world will be needing so desperately when peace comes. We must insist on the borrower's keeping our money in his business as working capital and using our gold to re-establish his credit. Give or sell we must, or millions will starve and our own economy will languish; but we must sell on long-term credits and be prepared to take other peoples' specialized goods and raw materials in excess of our exports. Our role will be to lead in destroying trade barriers rather than in erecting them.

Any peace worth fighting for must not only keep our own industrial plant working, but insure its gradual renewal and expansion as well. Economists assure us that we cannot prosper by merely producing goods to consume; we must

gain added buying power by adding to our capacity to produce. We do this partly by saving, but mostly by borrowing from the future through the mechanism of credit. We then sluice this borrowed capital into added consuming power by spending it for labor, materials, and equipment to build new tools and larger plants. Without this expansive force, it is doubtful if a free economy can survive, much less prosper.

War expansion is now discounting this normal expansive force many years in advance. When peace comes there will be the United States' own war deficits in consumption and the world's tragic depletion to be made up. After a transient postwar boom, then what? Can the expansive force be preserved? The development of new products and new industries, which D. C. Prince has advocated so effectively, will go far, but will that be far enough? Depressions are like epidemics with a world-wide sweep. The forces of economic health must have as wide a scope. Frankly, I see but one chance to preserve the expansive forces of economic freedom and vigor. There are still immense areas of the world which sustain overcrowded populations of hundreds of millions at a bare subsistence level. Primitive agriculture and handcraft hold out no promise of betterment. Human experience offers only one hope, and that is industrialization. The United States alone will have the capital and the productive capacity to tackle the huge job of industrializing such areas as India and China. In doing so we might find our one chance to keep our own wealth working and our own plant going at a real prosperity level.

The postwar role I have suggested for the United States is one that would make unprecedented demands on our faith, our foresight, our restraint, and our organizing capacity. It is a role which no other nation could assume. It calls for the faith to try the key to our own prosperity on the closed doors of the world. It calls for faith to free science and technology from the barriers of an outmoded nationalism. It calls for faith to abandon the idea that America is to be kept as a free and prosperous island in an economically submerged world. It calls for the restraint of refusing to impose either the political or economic overlordship of America and the white race on the retarded areas of the world.

It would also demand an organizing capacity in world affairs which far outruns our experience. In many respects our present partnership with Great Britain may turn out to be almost providential. The circumstances of our entry into the war left us with the greatest freedom of action. We have no obligation to become mere financial underwriters and copolicemen for the historic type of British imperialism. The British, however, have a world experience which we lack, and British experience and talent may well serve in an expert capacity in the execution of a reconstruction plan of our own conceiving.

The titanic conflict in which we are now engulfed has come upon us as a revolt against the misdirected consequences of human freedom, particularly in the handling of new and vast economic forces generated by the advance of science and technology, in these past 150 years. However much we and our fathers have blundered in the handling of these forces, I have faith that they hold the germs of a new and better world order. Unthinking men who have observed engineers working with equal zeal in both free and totalitarian systems, under capitalism and communism alike—or even embracing the New Deal with enthusiasm—have assumed that we are but abject tools of whatever powers may be in control. That is not the truth. Beneath the surface of our conformity, often silent and inarticulate, a social creed is taking form that transcends the prevailing order. We have faith that science and technology, which know no frontiers of geography or political system, hold potentialities of human betterment as yet dimly recognized. We have a faith—and at times, it can burn with religious conviction—that the well-being of mankind comes through

the multiplication of wealth, not through fencing it off, or looting it from the other fellow, or unloading a lot of debt claims on Wall Street, or by distributing a lot of purchasing power through political channels.

We insist that the problems of national security, of social welfare, and of international order must be solved by multiplication and not by division. We insist that our greatest source of multiplied wealth is in new knowledge of nature won through research, in new tools of production, in improved instruments of human living, in more efficient ways of doing work, in more harmonious co-ordination of human effort. We can accept for the moment any political or economic system so far as it works toward those ends,

but we cannot accept as final any theory of society or organization of civilization that does not aim at the spread of enlightenment, abundance, and freedom among all men. We are peculiarly the executors of these potentialities in the realm of material well-being. Ours is a profession of imagination, visualization, experimentation, and constructive boldness. Why suggest revolutionary ideas to such hard-headed men as engineers? To whom can we better suggest them, pray tell? We who "view hopefully the hitherto unattainable" have the call to visualize for mankind an economic order that will restore its now shaken faith in human decency and progress, and to sketch the blueprint of a peace worth fighting for.

## SIZE AND THE AEROPLANE

MAJOR OLIVER STEWART, M.C., A.F.C.,  
*Editor of Aeronautics, London, England*

**SUMMARY**—In this article, written specially for the *Journal*, the author expresses his views, influenced by operational events, on the optimum size of aircraft. Two outstanding planes, the Short *Stirling* bomber and the *Spitfire* are taken as examples and discussed.

Optimum aircraft size has for many years been a subject to which senior Royal Air Force officers, technical advisers to the Air Staff and aircraft manufacturers have devoted special attention. Obviously optimum size is related directly to the duties which an aircraft has to perform and the size best suited to the bomber will be totally different from that best suited to the fighter. There is perhaps no subject on which there is greater diversity of opinion than this of aircraft size and we see in the aeroplanes of the belligerent nations to-day a reflection of the numerous different opinions which are held upon the subject. Let us see whether any more precise definition can be obtained by scrutinizing the machines that are actually in use in the Royal Air Force.

If we start with the fighter we find that the position is comparatively simple. For a given power the smaller the fighter the better. The reason is plain; it is concerned with the tactical advantage of speed. In aerial combat speed is the trump card and the fighter must be given all the speed that can be built into it. Aerodynamically speaking, the smaller the aircraft for a given power and a given design merit, the faster it will fly. There are, of course, many complications, among them that of wing loading. If one may speak again in the wildest generalization one may say that as the smaller the faster, so the higher the wing loading the faster. In brief, the very small aircraft with very small wings and a very powerful engine is the fastest aircraft. Speed being the pre-eminent requisite for the fighter, this very small aircraft with very small wings and very high power automatically becomes the ideal type of fighter.

The limitations, however, are severe. If the wing loading goes up beyond a certain point the aircraft is unable to remain in the air below a certain speed. In other words, the higher the wing loading not only the higher the maximum speed but also the higher the minimum speed at which the aircraft can remain in the air. In consequence the aircraft with a high wing loading must necessarily land and take off at high speed. This means larger aerodromes and already aerodromes have been extended up to something approaching practical limits, at any rate in a small island, like Great Britain.

### THE TWO OUTSTANDING PLANES OF THE WAR

Now let us, before coming to actual examples which illustrate optimum aircraft size, look at the other end of the picture, the load carrying machine or heavy bomber. The

heavy bomber must be contrived to take the biggest weight for a given horse-power if its hitting power is to be as great as possible. But the complications in the bomber are far more difficult to resolve than in the fighter. For the bomber must still have a sufficient speed to enable it to pierce enemy defences without undue loss. Consequently there is

British Short "Stirling" heavy bomber.

in a bomber a balance which has to be held between weight and bombs carried and the speed of flight. The greater the weight of bombs for a given power the lower will be the speed of flight. In aviation there is always a balance of this kind to be struck. It is always impossible to get something for nothing, and those people who speak of high speed bombers which carry a heavy load or of high speed fighters that have great range are speaking in paradoxes, for the bigger the load the lower the speed. I am deliberately simplifying a great many matters in this discussion but by this means it is possible to see clearly into the thoughts of the great engineers who have been responsible for the production of the two outstanding types of aircraft of the present war. I name these two types as the Short *Stirling* and the Vickers-Armstrongs *Spitfire*. The Short *Stirling* carries a greater bomb load than any other aircraft in regular use in the operational units of any air force in the world. The *Spitfire* flies faster than any fighter in regular operational use in any other air force in the world.

My own views on bomber design have been influenced by operational events, as is natural, and I am of the opinion that improvements in anti-aircraft fire and other defence methods, especially night fighters, demand that bomber speeds be increased. The Short *Stirling*, however, is not a slow aircraft for its size. The speed has not been officially disclosed but German reports give it as 267 miles an hour. This is a high speed for a four-engined machine with a wing span of 99 ft. and a length of 87 ft.

There can be no doubt whatever that, provided a target is selected where the defences are not prohibitively strong,

the Short *Stirling* is able to deliver a more useful attack than any other machine. In fact Royal Air Force pilots who have been flying the *Stirling* expressed the view that after using these aircraft against the enemy the use of smaller types with their greatly restricted hitting power appears to be comparatively useless. The technical features of the Short *Stirling* are many for this machine is not only of large size but it embodies a great many advanced design characteristics. The range with full bomb load is over 2,000 miles and the bomb load can be increased in special circumstances. The aircraft has a number of power-operated turrets which are equipped with Browning machine guns, and there is a very complete armoured protection for the crew. The equipment is also elaborate and includes every conceivable device for aiding the operational efficiency of the aircraft and for increasing the safety of the crew in emergencies.

The engines are four Bristol Hercules sleeve-valve units each with a take off power of about 1,600 hp. Wright Cyclone engines are alternative power units. The bomb bay is over 42 ft. long.

This aircraft is the direct outcome of a long period of careful research and development work undertaken by Short Brothers of Rochester, Kent. This work may be said to have included that done on the famous Short flying boats which were used by Imperial Airways Limited before war broke out and which are to-day still in use with British Overseas Airways Corporation.

Before the war Short Brothers had prepared a design for long range passenger carrying and this design has in some respects been of assistance in the evolution of the *Stirling*.

#### MALTA'S SPITFIRES

I turn now to the other extremity of air force equipment, the fast fighter. The *Spitfire* still retains the position it has held throughout of being supreme in this class and consequently it may be claimed for the Royal Air Force with justice that, at the two extremes of the scale, weight carrying and speed, it has aircraft of greater technical merit than any other country. It is necessary to qualify this statement by remarking that the more specialized an aircraft becomes the fewer the operations on which it can be used with full effect. Thus the very big bomber of the *Stirling* type cannot be employed where the defences are extremely strong in the daylight. Similarly, the *Spitfire* pays for its very great speed by reduced power of operating from improvised aerodromes. Nevertheless, dispatches coming from Malta in the middle of March related that for the first time the *Spitfire* was operating from the island. This is the first occasion on which this machine has been used in battle outside Britain.

The *Spitfire* has been successively improved in performance since the early days of the war and one of the latest

changes has been in relation to the engine, the type of engine now employed being the Rolls-Royce Merlin XX, an engine with two speed superchargers capable of maintaining power at great heights. There is also the Rolls-Royce Merlin XLV, which is not a specially high altitude engine but which gives extremely good performance at the lower levels. Precise figures of *Spitfire* performance have not been

Cannon-armed Spitfire.

given recently but it may safely be assumed that the maximum speed is now in the region of 400 miles an hour. The armament of the *Spitfire* has also been progressively improved and now includes cannon.

Between these two extremes, the fastest aircraft and the greatest weight carrier, there are innumerable different types, and the merits of these intermediate Royal Air Force aircraft vary. In some cases they are fully as high relative to the aircraft of other countries as in the two extremes. In other cases there is room for considerable improvement and work is proceeding to try and build up the technical quality of these intermediate classes of aircraft so that there is a uniformly high grade in this respect throughout service.

## SUPERSTRUCTURE: ERECTION

### ERECTION-PROGRESS

The erection of the superstructure was carried out, on behalf of the contracting partnership, by the Dominion Bridge Company's Vancouver organization, under direction from the main office at Lachine. Operations at the site were begun on November 8th, 1937, and, in spite of certain delays in substructure-work (on account of which the contract-date for completion was moved forward 105 days, from Nov. 1st, 1938, to February 15th, 1939) the bridge was adjudged to be sufficiently complete to enable commercial traffic to use it on September 30th, 1938. On that date the greater part of the cable-wrapping was yet to be done, the catwalks were still in position, and the tower-tops were necessarily not completely erected; and it was anticipated that those parts of the work would be carried on while the bridge was open to traffic. The contractor, however, took full advantage of the few weeks remaining before the completion of the toll-collection plaza, and succeeded in finishing the steel-work erection a few days prior to the opening of the bridge on Monday, November 14th, 1938. Part of the painting was left over until the following year, and was finished in readiness for the Royal visit to Vancouver on May 29th, 1939.

The remarkable speed with which the erection was performed, while primarily due to the high quality of the shop-work and to the meticulous care with which the erection-programme had been worked out by the contractor, was attributable in part to the excellence of the weather throughout the summer and in part to the convenient proximity of the contractor's offices and plants. A tribute to the organization is implied in the fact that no fatalities, and only one serious injury, occurred throughout the erection of some 10,000 tons of steel, most of it at elevations of more than 200 ft.

The actual dates of erection-progress are given in the accompanying tabulation (Table I), in which is included also an analysis of the weight of the bridge.

### CABLE-ANCHORAGES

The first steel to be erected was that of the cable-anchorages. In each case the heavy forgings and "buttons" were pre-aligned by assembly onto a light structural framework, and accurate final positioning inside the pier-cavity was readily performed by means of the adjustable holding-down bolts provided (Fig. 47).

### CABLE-BENT AND APPROACH-VIADUCT

For construction of the viaduct, a standard-gauge service-track was established on piles alongside the site, extending from a wharf near the north main pier. The steel was shipped on scows from Western Bridge Company's wharf at False Creek, and was then transferred onto flat-cars. Erection of the entire viaduct (excepting the tower-girders immediately above the anchor-pier) was accomplished by a steel derrick-tower 40 ft. by 30 ft. in plan, carried on four 4-wheel bogies, two running on the service track and two on a second track laid in short sections as required. The traveller supported a stiffleg-derrick (75-ft. boom and 30-ft. mast) on a working-platform 120 ft. above rail-level. The weight of the traveller was about 190 tons, and it was capable of lifting the heaviest viaduct-piece, \*\* and a secondary 5-ton hook could be used at a radius of as much as 80 ft.

\*This is the final part of the paper. Parts I, II and III respectively appeared in the April, May and June issues of the *Journal*.

\*\*The 123-foot girders weighed 27 tons each, and the heaviest section of the cable-bent weighed 22 tons.

The cable-bent was erected first, the base-slabs being set on canvas soaked with red lead on the dressed central areas of the pedestals, and fully grouted as soon as the columns had been made plumb. The cable-saddles, offset 15-in. northward, were assembled, together with jacking-brackets and catwalk-supports; and the completed bent was tied back to the anchor-pier by two 1½-in. pre-stressed bridge-wire strands which resisted the southward push of the main cables pending their final clamping to the cable-bent saddle. Erection of the next two bents followed, and then the four longest girders were placed. A 5-ton stiffleg-derrick was

Fig. 55—Erection of north viaduct.

mounted on the floorbeams at the south end in readiness for placing the cable-strands in the saddles. This much of the viaduct (Fig. 55) was fully riveted, and then erection ceased owing to delay in delivery of steel from British mills. Work was resumed a month later and proceeded continuously until the viaduct was complete except for tower 3-4 and for the fences. An 8-ton stiffleg-derrick was assembled on the deck near bent 4 for lifting the strand reels onto the anchor-pier for unreeling. The traveller was dismantled, and the missing parts of the viaduct were erected later by the above-mentioned derrick. The completed steelwork of tower 3-4 is seen in Fig. 56.

Throughout the viaduct, the bents were plumbed by guys and then secured by the adjustable anchor-bolts, after which the pedestals were grouted up to the base-plates. Some 25 cu. yd. of grout (a 7-sack mix with aggregate graded up to ½-in., and an admixture of 175 lb. of "Embeco" per cu. yd.) was used in this connection.

### VIADUCT-PAVING

The concrete deck of the viaduct (Fig. 49) was poured in eleven sections, each of which, with an average length of about 200 ft., was bounded at either end by the transverse steel of a break in the pavement. Timber forming was used, and the reinforcement was bent at the site.

To make the process as continuous as possible, the contractor built a stout timber framework across the width of the viaduct. Mounted on skids, this could be moved along on greased timbers that were laid just within the fences. It carried a stiffleg-derrick and a narrow-gauge track, the

Steelwork in suspension-bridge.....			14,747,897	
Steelwork in north viaduct.....			5,521,907	
Total steelwork.....			20,269,804	

\*Most of this work was done by 3 shifts of men, working continuously day and night except on Sundays.

latter extending from side to side of the road. Concrete was supplied from the mixing-plant at the main pier and was delivered alongside the viaduct in trucks.

The batches were lifted over the viaduct-fence by the derrick, and placed in a small dumping-buggy running on the narrow-gauge track. The concrete was thus deposited with precision, the amount of spading being reduced to a minimum, and was flowed into place by electrically-driven spud-vibrators. Rough surfacing was done with a heavy screed pulled by the structure as the latter was moved up the grade. Further screeding was performed by heavy canvas belting, and the final wood-float finish was roughened with corn-brooms drawn athwart the roadway. The surface was sprinkled with a metallic hardener (20 lb. of "Metaliron" per 100 sq. ft.) and was sprayed with the Hunt process of liquid waterproofing to retard evaporation during curing. It was found that, owing to the vibration of the viaduct caused by operation of the derrick, the deck-concrete of each span tended to slump downgrade, causing a slight depression at the upper end of the slab, and a corresponding hump at the lower end. The retention of such

waves in the surface was prevented by careful workmanship during the finishing process.

The roadway-slab, poured in the manner described, was finished to a width of some 31 ft., including the lower parts of the kerbs. Dowels for the latter were placed near the edges of the slab before the concrete was set.

The sidewalk-slabs (together with kerbs and stringers) for each section were poured on the day following completion of the roadway-slab, the concrete being distributed in wheelbarrows running on the roadway. It was vibrated and the top surfaces were treated with the Hunt process. No metallic hardener was used.

Work on the viaduct-deck went forward smoothly and without haste, the substructure-contractor arranging his programme so as to be ready to place the concrete of the suspended-span decks as soon as the grid-sections were ready to receive it. The work went forward smoothly, the only trouble encountered being that of leakage of wet concrete through the joints of the wooden formwork onto the steel work below. Some of this deposit (during the first few pours) had time to harden, and the contractor

had considerable difficulty in cleaning the steelwork to the satisfaction of the painters and the engineers. On later occasions, however, a gang of men with hosepipes and brooms were set to cleaning the steel both during the pour and afterwards until leakage had stopped.

With a specified strength of 3,000 lb. per sq. in. at 28 days, a water-cement ratio of approximately  $4\frac{1}{2}$  gallons per sack was selected for the viaduct-slab. A typical batch consisted of  $6\frac{1}{2}$  sacks of cement, 1,365 lb. of sand (containing four per cent of surface-water), 2,080 lb. of stone ( $\frac{1}{2}$  to  $1\frac{1}{2}$ -in. in size: water-content one per cent) and  $21\frac{1}{2}$  gallons of added water. This proportioning produced a

Fig. 56—Viaduct-tower.

workable mixture with a slump ranging from 1 to  $1\frac{3}{4}$  in. As a general rule, three test-cylinders were made for each day's work. The 28-day strengths varied from 3,500 to 4,800, with an average of 4,430 lb. per sq. in.

#### SOUTH TOWER

The first erection-operation was the assembly of a platform on the tops of the pier-shafts: this was supported on steel posts that had been set in the concrete of the pier and which were later burned off below the surface, the recesses then being grouted flush. On this platform was built the creeper-traveller by means of which the tower was erected. The creeper (Fig. 57) consisted of a structural framework built to embrace the two tower-columns, and on which was mounted a steel stiffleg-derrick. The derrick (with 30-ft. mast and 69-ft. boom) had a capacity of 21 tons at a radius of 50 ft., enabling loads to be picked up from scows moored alongside the pier. An auxiliary 5-ton hook at the head of the boom, operative at a slightly greater radius, was also provided. The entire creeper-assembly was capable of being jumped up the tower by lifting-tackle attached to the tops of the columns at each stage of their erection, and was guided by sliding-devices attached to those columns. All the operating machinery (with the exception of the boom-swinging engine, set on the working platform) was located either on the pier or on shore, and communication with the engine-men was made by telephone.

The creeper-derrick was arranged with its mast on the shoreward side of the tower in order to minimize eccentricity of loading when handling steelwork, and the mast-offset (variable on account of the diminishing section of the columns) was kept as small as possible. The smallest offset, with the creeper at the top of the tower, was 8 ft. The framework of the creeper, fitted with ladders and hand-

railings, served to support working-platforms for operation, assembly, and riveting. The total weight of the creeper, when unloaded and ready for jumping, was approximately 82 tons. The lifting-effort required to overcome friction amounted to some 90 tons.

The tower-splices (nine in each column) were so arranged that the sections to be lifted ranged in length around 40 ft., with the single exception of the sixth section. This member, extending through the portal, was 52 ft. long, and, in order to avoid undue weight, its core-section was divided into two parts (see Fig. 32). The heaviest piece, which determined the derrick-capacity, was the 21-ton main cross-strut at roadway level, other pieces being generally about 19 tons in weight.

The main shoes (18 tons each: see Fig. 35) and the three lower sections of each column, together with the bottom cross-strut and the lowest diagonal members, were placed while the creeper was resting on its assembly-platform. The shoes were scribed with centre-lines which were accurately aligned with corresponding scribings on the dressed areas of the pier-tops, and each shoe was laid on sheets of oiled canvas.

The creeper was subsequently jumped to six successive new locations, being suspended each time by hanger-bars from the top of the previously-erected columns; and its width was adjusted at each move in accordance with the decreasing size of the tower. In its highest position, hung from the splice-point at elevation 435, the creeper erected the top sections of the columns and bracing, and the top strut: the cable-saddles were also placed, in the offset-positions noted on p. 421. Final operations in the tower-erection consisted in the assembly of temporary saddles for the catwalk-strands, jacking-brackets for the later adjustment of the main saddles, a commodious timber working-platform over the top cross-strut, and a 5-ton guy-derrick (with 20-ft. mast and 40-ft. boom, capable of lifting 5 tons plus impact at a radius of 27 ft.) for handling catwalk-material and cable-strands.

Meticulous care was taken to achieve perfect contact at the column-splices. Because of the method of erection, with eccentric loadings of constantly-varying amounts, it was useless to take interim observations on the plumbness of the columns, and full reliance for the verticality of the structure was perforce placed upon the accuracy of the shop-work and of the field-connections. Before riveting was commenced at any joint, a careful survey of the abutting surfaces was made, and the match-marked splice-material was securely pinned and bolted into place, the acceptable tolerance in the splices being established at .004 in. In drawing-down the splices, advantage was taken of the effects of sunshine in its expanding and distorting effects upon the steelwork. As a further safeguard, the engineers insisted upon the full riveting of the principal parts of each splice before the creeper was moved into its next position. The number of field-rivets in each tower was approximately 48,000. Up to seven rivet-gangs were employed simultaneously, each driving 300 to 400 rivets a day. As a protection to the steelworkers (who were also supplied with metal helmets), trapdoors of  $\frac{1}{4}$ -in. plate were set in the towers at various levels: they were eventually retained as a permanent part of the structure.

On completion of the tower, and after the creeper had been removed, a series of transit-observations was made on several mornings before sunrise, by different observers, and it was found that both the columns stood within  $\frac{1}{2}$ -in. of verticality. It was also recorded that the daily northward movement of the free-standing tower amounted at least to six inches.

#### NORTH TOWER

Erection of the two towers was prerequisite for work on the cables, and every effort was therefore made to expedite their construction. For this reason the north tower-shoes and the bottom sections of the columns were erected by the substructure-contractors stiffleg-derrick, the creeper mean-

while being dismantled and re-assembled at the north pier. From then on, erection followed the same lines as for the south tower. Observations on the verticality of the north tower indicated that the east and west columns leaned shorewards  $3\frac{3}{4}$  and  $2\frac{1}{8}$  in. respectively. These deviations from plumb, although very small in comparison with the 360-ft. height of the tower, were large in view of the excellent results obtained for the other tower, and were attributed to the combined effects of sun on the offshore faces of the columns and of the shoreward eccentricity of the erection-loads.

#### SOUTH CABLE-POSTS

The two rocker-posts at the south end of the bridge, together with cable-saddles and temporary catwalk-supports, were erected by the derrick on the anchor-pier. Temporary lateral support was provided by cross-timbers, and the posts were shored up so that the saddles were approximately 2 in. shoreward of their final positions, thus allowing for the lengthening of the backstays due to the effect of dead load.

Fig. 57—Crepper-traveller erecting north tower.

#### CATWALKS

The decision of the contractor to use catwalks for erection was made without hesitation, particularly in view of his satisfactory experience with similar equipment in building the Island of Orleans Bridge. The advantages that they possess over other methods of erection (which can only give access to one or two places at a time) are, for the engineers, those of providing continuous access to all points of the cable and ancillary parts, and of permitting detailed inspection of construction, (including cable-wrapping and painting), with the result that more careful workmanship is assured. From the contractor's point of view, the work is considerably expedited by the aforesaid freedom of access, while the greater safety afforded is reflected in the increased quality and quantity of the work done. It is worthy of note, incidentally, that, although the Workmen's Compensation Board of British Columbia were at first inclined to require the use of safety-nets, the contractor was able to persuade that body that the hazards of assembly and dismantling of nets would outweigh their advantages. The contractor's subsequent enviable safety-record, to which attention has already been drawn, provided vindication of his argument.

The two catwalks extended for the full 3,400-ft. length of the cables, being slung at elevations some three feet

below those of the first cable-strands to be erected. Each was supported by four pre-stressed strands (fabricated, specially for the purpose, from unspliced wire of the same quality as that for the cable-strands), two under each side of the deck, the strands being hung from temporary brackets riveted to the steelwork at a convenient distance below the cable-saddles proper.

The four strands for each catwalk were mounted on individual reels on a scow that was towed northwards across the Narrows, the strands (the outer ends of which had been secured to the south anchorage) meanwhile being unreeled and laid on the bottom. Upon arrival of the scow at the north shore, the strands were connected with shorter lengths that had previously been connected at the north anchorage and laid out on the shore. Then each strand in turn was hoisted into place onto the temporary saddles, being raised at the two towers simultaneously by the 5-ton derricks on the tower-tops. These operations, which were carried out for the two catwalks respectively at slack water of high tide on two successive early mornings, were completed each in approximately  $1\frac{1}{4}$  hours, the work going forward smoothly and with precision. The aggregate period of  $2\frac{1}{2}$  hours during which the signal "Fairway Obstructed" was exhibited at Prospect Point was the only time that First Narrows was closed to navigation during the whole of the construction.

The catwalks were formed of 2 by 10 planks long enough to lie athwart the supporting-strands and to provide a walk-way 6 ft. wide. The material selected was clear Sitka spruce, a tough and resilient wood weighing about 27 lb. per cu. ft. The planks were laid with 2-in. spaces and were kept in place by longitudinal toe-boards and by hook-bolts around the strands at frequent intervals. Handrail-posts braced in two directions were used, and the railing consisted of  $\frac{5}{8}$ -in. wire-rope, bolted to every post. The catwalk-decks were prepared at the site in 10-ft. lengths. These sections were lifted to the tops of the towers and the cable-bent, laid on the strands (to which they were loosely bolted), and allowed to slide down to the low points. When the deck was in position, the hook-bolts were tightened, the posts and hand-lines assembled, and a light trussed cross-bridge was erected at mid-span to give access from one catwalk to the other (Fig. 58).

The catwalks were braced together with 12 by 12 cross-struts at about 200-ft. intervals to prevent undue lateral movement, while vertical rigidity was ensured by guy-ropes in a vertical plane. These guys formed an inverted suspension-system, fastened at intervals by wire-rope bridles to the catwalk-strands, and, incidentally, caused the greatest constriction of underclearance that occurred during construction.

The catwalk-anchorage consisted of two long  $3\frac{1}{2}$ -in. rods set into the anchor-pier and connecting to two pairs of long 3-in. bolts. The sockets of the strands in turn connected with those bolts and were at first placed as close to the anchorages as the assembly permitted. The amount of adjustment then available at each end of the catwalks was about 4 ft. As the cables sagged under the suspended loads, the catwalks were correspondingly lowered by paying out the sockets along the 3 in. bolts.

#### MAIN CABLES: ERECTION

The 122 cable-strands, each on an individual wooden reel (total weight eight tons) were shipped by truck, via the Second Narrows Bridge, from Dominion Bridge Company's Burnaby plant to the north shore. They were unloaded (by

the eight-ton derrick on the approach-deck near Bent No. 4) directly into temporary storage on the top of the incomplete anchorage-pier. For cable-erection, each reel in turn was fitted with a shaft and mounted (by the same derrick) on bearings behind and above the appropriate cable-anchor cavity. Its outer socket (resting in a small steel box designed to skid easily over the catwalk-planking and to hold the socket against twisting) was then hauled over the catwalk with a  $\frac{5}{8}$ -in. line by means of a hoisting-engine established on the south anchorage-pier. At the tops of the towers hardwood blocks were placed to receive the heavy pressure of the moving strands and to preserve the galvanizing, and wooden rubbing-strips were provided wherever there was any possibility of the strands coming into contact with bolt-heads or other steelwork.

Fig. 58—Catwalks and cross-bridge.

The hauling-operations were controlled throughout by telephone, watchmen being stationed at the tops of the towers and the cable-bent and also on the cross-bridge at the centre of the span. Each skid was accompanied by a man whose duty it was to prevent its overturning and to give due warning in case of any obstacle to its progress. It was found that there was practically no tendency to overturning, and that the tell-tale paint-marks on the strand never indicated more than one or two twists in the full length. Operations on the two sides of the bridge were entirely independent of each other, although it was found convenient and expedient to conduct them more or less simultaneously.

Upon the arrival of the leading socket at the south end of the catwalk it was disconnected from the skid, which itself was retracted by a  $\frac{1}{2}$ -in. overhauling-line operated from the north anchor-pier. At the same time, the north-end socket was disconnected from the reel, the latter being then removed and the next full one substituted. The two sockets were attached to the appropriate anchorage-buttons by the adjustable anchor-bolts (Fig. 46). Each end of the strand was also laid into a temporary splay-jig (lined with hardwood: Fig. 59) located a few feet nearer to the anchorage than the designed position of the permanent splay-casting. The main part of the strand meanwhile rested on the deck of the catwalk.

The next operation consisted in picking up the strand from the catwalk and laying it into the four saddles. Lifting into the saddle was done with a double sling of wire rope, the two points of contact with the strand being protected with burlap: hardwood levers were used while the burlap was removed and the strand eased into position. Great care was exercised to avoid damage to the strand by scraping the galvanizing or by abrupt bending.

At the time of erection, each strand was positioned by setting the appropriate painted mark in coincidence with the scribed centreline of the north-tower saddle, and this point was chosen as the starting-point for adjustment. At the other points of support the strand was arbitrarily placed so that its sag in the middle of each bight was a few inches less than the ideal. In this manner the subsequent

adjustment involved slackening of the socket-bolts rather than tightening, the former operation being the more readily performed. Both before and after adjustment, the strand was held from slipping in the saddles by means of hardwood blocks bolted down upon the partially-assembled cable.

As may be seen in Fig. 40, the strands of each cable are arranged in nine horizontal layers, the lowest of which (consisting of four strands) takes its bearing directly onto the fluted invert of the saddle (Fig. 36). The lower half of the cable, including the bottom and the adjacent four layers, is confined laterally by the sides of the saddle. The remaining four upper layers are rendered stable by the strands of each layer bedding into the hollows between the strands of the layer below, and they are further prevented from lateral movement by the six keepers shown in place in Fig. 61.

#### GUIDE-STRAND ADJUSTMENT AND SURVEY

Notwithstanding the care that had been exercised in measuring the guide-strands and in checking the positions of the towers, it was deemed prudent to make, as a further check, a comprehensive guide-strand survey. To this end charts were prepared to show the required elevations of the free-strand catenary at the mid-point of each span. The curves were plotted for a temperature-range of 30 to 90 deg. F., and also for such range of horizontal distances between points of support as might occur from saddle-movements due to erection-loads or other causes. The survey, which was made independently on two guide-strands, involved the determination of the position of each saddle, the elevation of the strands in the centre of each catenary, and the position of each socket in relation to the anchorage.

Since it was essential to make the survey in calm unless weather with a steady temperature, it began at 3 a.m. and was finished before sunrise. To ensure that the interrelated observations might be made as nearly simultaneously as possible, four parties were employed: each comprised two observers and a rodman, so that every measurement could be made several times and checked independently. Six instruments were used, all having been previously arranged for speedy setting-up; and lines of sight were easily established by means of targets painted on the steelwork and illuminated where necessary. The towers and the cable-bent were plumbed by means of transits set up (on shore) on lines perpendicular to the bridge centre-line and offset a few feet from the member in question so as to read onto each saddle independently.

The strand-elevation in the centre span was read with a level set up on the portal-strut of one tower, and reading onto a vertical rod held on the strand at the mid-point of span. The strand-elevation in each side-span and in the north backstay was measured with a transit set up with its line of collimation parallel with the catenary-tangent at mid-span and reading onto a rod held on the mid-point of the strand and normally to the tangent, thus avoiding errors that might derive from reading onto a vertical rod.

The guide-strand survey was made on May 14th, 1938. During the previous day, two strands of each cable (being the four strands that had been measured with special care) had been hauled across the catwalks, placed in the saddles, and adjusted so that the strand-markings agreed with the scribed centre-lines of the saddles and so that the sockets were at their theoretical distances from the anchorage-buttons. The weather-conditions on the morning of the survey were perfect, with a steady temperature of  $42\frac{1}{2}$  deg. F. The two guide-strands were then moved at the saddles and anchorages the small amounts indicated by a comparison of the observed elevations with the corresponding calculated ones. On the following morning, under equally good weather-conditions, the survey was repeated, and the results were so close to those of the first survey (the greatest variation being represented by a strand-movement of  $\frac{1}{8}$ -in. at one of the main saddles) that no

further observations were adjudged necessary. It is of interest in this connection to recall that, in the case of the Island of Orleans Bridge in the winter of 1934, no less than three weeks elapsed between the erection of the guide-strands and the completion of the final survey, that long delay being due to lack of suitable weather conditions.

In order to avoid any encroachment upon the clearance under the central span such as might eventuate from any kind of settlement or bedding-down of any part of the structure, it was considered advisable to set the guide-strands (in the central span) 3 in. higher than was indicated by the calculations.

#### MAIN CABLES: ADJUSTMENT

The adjustment of the cable-strands (the criterion for which was that each strand should hang freely in conformity with the guide-strands) demanded a uniform temperature throughout the assembly, and was necessarily done at night. It was found that temperature-inequalities due to the day's sunshine frequently persisted until after midnight, so that the adjustment-crew were not able to commence work until that hour. The procedure followed was to haul and place the strands of one layer of the cable during the day-time and to perform the adjustment of that layer during the ensuing night. This plan was very satisfactory, since the growing skill of the steelworkers in this operation enabled them to assemble the increasing number of strands each day without rushing the work.

The adjustment of each strand took place simultaneously northwards and southwards from the established setting at the north main tower. The north side-span and north backstay were treated as a unit, as also were the central span and south side-span. The short south backstay needed no special treatment, because the cable-profile there approximated very closely to a straight line.

The first adjustment-operation for each strand was the measurement of the distances by which its sag in each of the four spans required to be increased so that it would lie in contact with the already-adjusted strands. The ratio  $\frac{\text{change in sag}}{\text{change in length}}$  for each span had been previously evaluated and amounted to 2.3, 6.3, and 11.0 for the central span, the side-spans, and the north backstay respectively.

From these figures the approximate amount by which any particular anchor-bolt had to be slackened was quickly determined. The strand was then moved through the cable-bent and south-tower saddles by means of turnbuckles pulling on clamps bolted onto the strand near the saddle. Observers remained on the catwalks at the centre of the spans, and controlled the movements by megaphone. The final precise settings of the anchor-bolts were controlled in the same way. When the strands had all been adjusted, the nuts were spot-welded to the bolts to preserve the setting, and the four permanent splay-castings (Fig. 61) were bolted onto the cables at the designed locations. The temporary jigs were then dismantled and the strands

Fig. 59—Temporary splay-jig.

Fig. 60—Completed main saddle.

allowed to spring out into bearing against the splay-castings.

During the adjustments no attention was paid to the painted reference-marks (p. 352) except that care was taken that the original setting at the north tower did not alter. A later examination of the other marks, however, showed excellent agreement between the different strands at each saddle, those marks rarely being as much as an inch distant from one another in spite of the fact that the cables had been pre-stressed at temperatures ranging from  $-20$  to  $50$  deg. F. and were adjusted at temperatures between  $50$  and  $80$  deg. F.

At all times during the erection of the cables, the adjusted strands were held solidly together by hardwood frames (adjustable to suit the variations of the cable-section as it increased layer by layer: Fig. 62) at frequent intervals.

The usual daytime-phenomenon of twisting or rolling of the cable owing to the thermal lengthening of the upper strands was observed. Thus in the side-spans when the sun was shining the cables would roll over (towards the sun) until the list at the middle of the bight amounted to  $45$  deg. or more, as seen in Fig. 62. After sundown, when a uniform temperature obtained among all the strands, the list would disappear.

In the central span, however, it was noted that the maximum list of both cables occurred at approximately the quarter-points of the bight. This list, which sometimes amounted to  $90$  deg., was opposite in direction for the two halves of the bight respectively, while at the lowest points (span-centre) the cables always remained nearly upright. Furthermore, the cables in the central span did not entirely right themselves even during the uniform-temperature periods of early morning. This persistent reverse-roll was undoubtedly the effect of over-adjustment of the upper layers of strands, whereby the length of these strands was, in the central span, slightly more than ideal. It was a difficult matter to decide at the time of adjustment when a strand was precisely in contact with the lower strands, and the excess length referred to above was due to the cumulative effect of successive heavy contacts. The reversal at span-centre of the cable-roll may be set down to the same natural phenomena due to which oscillations (from wind or other causes) of the free strands in the long central span generally occurred as double vibrations with a node at span-centre.

The excess length (probably amounting to less than an inch) of the upper strands is not sufficient to cause any significant variation of stress through the cable cross-section; and the list was readily corrected by holding the cable in an upright position while the truss-sections were connected to the suspenders, the weight of the trusses thereafter being more than adequate to maintain its verticality.

#### CABLE-BANDS

The cable-bands were brought to the site in scows and delivered alongside the main piers, the two parts of each band having been previously bolted together. The bands

were lifted to the tops of the towers and were distributed along the catwalks on wooden sleighs, the latter being pulled along by the hauling-lines that had been reeved for strand-erection. The bands were positioned by reference to the painted marks on the two outer strands of each cable (Fig. 40), and were assembled onto the cable by hand. The two halves of the saddle-groove were carefully aligned to prevent damage to the suspender-ropes, and the bolts were then tightened to the specified tension (in the manner described on p. 355).

During the subsequent erection of the suspended structure, the increasing load on the cables caused them to decrease in diameter, owing to compaction of the 61-strand assembly. On this account, and to prevent slipping, the bolts were retightened to their original tension on two occasions during the progress of the work. When all the dead loads, including that of the deck-concrete, were in place, a third and final tightening was carried out, under careful inspection.

After the cable-wrapping had been applied, the space at the upper junction of the two halves of each band was filled with oakum and then caulked with lead wool, as also were the counterborings at the ends of the band. Small openings were, however, left in the underside-caulking of bands near the low points of the cables, to permit the free drainage of any moisture that might accumulate inside the cables.

#### SUSPENDER-ROPES

The suspender-ropes were delivered alongside the main piers, hoisted to the tower-tops, and then assembled by hand. Care was taken to place the marked centre-point of each rope exactly over the joint of the cable-band, and that positioning was maintained by the small keeper-castings (Fig. 43). The sockets were left hanging freely in readiness for assembly to the trusses.

One of the few erection mishaps occurred when a long suspender slipped out of control while being lowered into place, and fell to the ground near the south tower. The rope was condemned, and a new suspender, fabricated from a reserve of tested wire, was duly pre-stressed and installed prior to the opening of the bridge.

Immediately before connection to the stiffening-truss, the suspender-sockets were rotated as required in order to bring the tell-tale paint-marks (see p. 354) into alignment, and thus to ensure the correctness of the suspender-length. The galvanized ladder-rungs were assembled after the suspenders had received the greater part of their dead load. They were clinched onto the ropes by hand, with copper-headed hammers. The annular depression at the top of each socket (see Fig. 43) was filled with a non-hardening putty (Tremco) to prevent the accumulation of moisture.

#### STIFFENING-TRUSSES

The contractor, being satisfied after study of the site that no undue hazard would attend, decided to erect the suspended steelwork as far as possible from the water. This procedure was eminently successful, and the erection-forces were able to work under practically any conditions of the tidal stream. There was no interference with navigation through the Narrows.

For the central span, all steel was delivered on standard scows\*, loaded at False Creek, towed to the site around Prospect Point, and manoeuvred into position underneath the span: two tugs were necessary to hold the scow when the tide was running swiftly. The steel was lifted directly into place by falls attached to the cables, the latter being protected by hardwood waistcoats at the points of attachment. Hoisting-engines were located at the main piers, the hauling-lines running to the tower-tops and thence along the catwalks. Signals were transmitted by field-telephone.

\*A 300-ton standard scow is 30 by 90 ft. in plan and 8 ft. deep, drawing about 2 ft. of water when unloaded.

The first lift consisted of the two central sections of each truss, shop-assembled with floorbeams and lateral bracing. This unit was lifted by four tackles and was connected to four suspender-ropes. Subsequent lifts consisted each of a single truss-section which was secured by hanging from one suspender and bolting to the adjacent section that was already in place; and a modicum of lateral stiffness was provided by assembling a floorbeam at approximately every sixth panel-point. Erection of the two trusses took place simultaneously (in order to avoid differences between the cable-loads, with consequent racking of the towers) and proceeded both northward and southward from span-centre (see Fig. 63). The order of erection was governed principally by the deflections of the towers and is discussed later in connection with saddle-adjustments.

In the early stages of truss-assembly, the concentration of dead load was in the middle of the span, and the cable-curve was consequently accentuated in that vicinity. It was thus feasible to bolt only the upper-chord splices, the lower ones remaining open. Later, when the trusses were fully erected, the suspended load then being uniform but considerably less than the eventual total, the trusses were constrained to an exaggerated camber that made it necessary to release the upper splices to avoid kinking the cables, and to connect the lower ones only.

Fig. 61—Splay-casting: hand-wrapping of cable.

For the north side-span, trusses were delivered by scow to a dredged basin near the main pier, whence the steel was unloaded onto flat-cars on a service-track running approximately on the centre-line of the bridge. The cars were positioned by a gasoline-locomotive, and were hoisted as for the central span. (Fig. 64). Occasional floorbeams were assembled with the trusses. Connection of only the lower splices was feasible at the time of erection.

Truss-erection in the south side-span was, owing to the rugged nature of the terrain, less speedy than for the other spans. The sections were delivered by truck (passing through the city at special hours permitted by the authorities) to a flat piece of ground underneath the side-span, at the head of the clay-bluff. From here they were transferred to a narrow-gauge funicular railway whence they were erected in the manner described for the other spans. The most northerly sections were brought alongside the main pier on scows.

To provide safe passage across the bridge during the period between erection of the trusses and that of the floor, and to give protection to riveters on the upper chords, a full-length wooden walkway was assembled along the outside of each truss, at lower-chord level. The walkways were secured by hook-bolts passing through stitch-rivet holes left for the purpose. Each truss-section was fitted with its appropriate portion of walkway at the site, prior to erection. The walkways remained in use for about 2½ months, and were dismantled upon the completion of riveting.

## ADJUSTMENT OF CABLE-SADDLES

During assembly of the suspended loading, daily observations were made on the verticality of the towers and the cable-bent, and the sequence of erection was ordered in such a way as to prevent undue deflections of those structures. In general, as suspended weight was applied the towers deflected riverwards in accordance with the elastic lengthening of the cables, and, finally, all dead load being in place, the movements of the saddles were equal and opposite to the amounts by which they had originally been offset shorewards. These total movements for the north and south main saddles were respectively 35 and 20 ins., and, during the course of erection, the saddles were from time to time moved riverward in relation to the tower-tops by amounts sufficient to restore the towers approximately to the plumb position. In the final condition the towers were vertical, and the saddles were then permanently fixed on the centre-lines.

Those saddle movements on the towers were accomplished by means of 50-ton jacks operating horizontally against temporary steel brackets riveted to the tops of the tower-columns and afterwards burned off. In order to maintain positive control of the jacking, a pair of turnbuckle-stays was used as a tie-back for each saddle, the turnbuckles being slackened as the jacks pushed forward. The saddles moved quite readily on all occasions. The jacking was performed at the earliest practicable date, since that operation became progressively more difficult as the saddle-reactions increased with added load. It was arbitrarily established that the tower-deflections should not be allowed to exceed about one foot, even though, under the partial loadings obtaining, considerably greater deflections could take place without damage to the structures.

Approximately the middle one-third of the central-span trusses were placed before erection in the side-spans began. At this juncture, when the tower-tops were each deflected about one foot riverwards (owing principally to the straightening of the cables in the sidespans), the four main saddles were jacked 10 in. riverwards. Further adjustment, of 15 in. in the case of the north saddles, and 10 in. in the case of the south saddles, followed a few days later, while the preponderance of trusses erected was in the central span. The final main-saddle jacking, of 10 in. for the north saddles, took place after another short interval. Subsequent observations on the deflections of the towers did not suggest any modification of a straightforward programme of truss-assembly simultaneously in the two side-spans and in the two outer thirds of the central span. The progress of erection in each of these four cases was towards the towers, and the panel-by-panel erection of the floor-steel followed the same sequence.

In the case of the north cable-bent, the riverward movement of the saddles (due entirely to the lengthening and straightening of the backstay) took place slowly and regularly, being dependent on the amount of the suspended load rather than on its disposition. The saddle-offsets (originally 15 in.) were reduced to zero each in four movements. The initial adjustment, amounting to 6 in., was made early in the course of truss-assembly, when the bent had moved forward owing chiefly to the straightening of the backstay. A second jacking, of 3 in. was performed towards the end of the truss-assembly, and the saddles were moved a further 3 in. during the erection of floor-steel.

After that third jacking it was noted (in the course of routine-observations by transit) that the three inches of saddle-movement was not fully reflected as a complementary shoreward displacement of the top of the bent. An examination of the saddle-assemblies revealed that the saddles had slipped forward on the cables by approximately half-an-inch, and it was evident that insufficient friction was being developed by the pressure of the saddle-covers. The sixteen cap-bolts were therefore screwed down as much as possible, and reference-marks were painted on the cables as tell-tales in case of possible further movement in the

saddles. In the course of the next week or two (during which period a considerable weight of floor-steel was added to the suspension-system) it became apparent that a definite, although almost imperceptible, slipping was taking place. As a temporary preventative measure, the  $1\frac{1}{4}$ -in. tie-back strands (which were still in place, though they had been slackened after the placing of the saddle-caps) were re-tightened; and the final 3-in. jacking was postponed. At this time the total riverward movement of the top of the cable-bent relative to the cables amounted to  $\frac{7}{8}$  in. No further movement occurred.

A revision of the computations relating to the cable-bent

Fig. 62—Partially-assembled cable.

saddle was at once made, and this indicated that sufficient friction\* was not available to obviate entirely the risk of cable-slip. To develop the necessary additional grip, recourse was made to the expedient of clamping onto each cable (in contact with the saddle) a "keeper" consisting of a pair of steel castings bolted together similarly to the two halves of a cable-band. The keeper-castings were fabricated as quickly as possible, and were erected soon after commencement of the deck-concreting. The saddles were then jacked the final three inches and fastened permanently to the bent, and the heavy guys were dismantled. In Fig. 65, the keeper-casting, secured by ten  $1\frac{3}{4}$ -in. high-tensile bolts, is seen in place against the cable-bent saddle: the photograph shows the wrapped cable.

No saddle-adjustment was required at the rocker-posts at the south end of the bridge. The assembly at these saddles, complete except for cable-wrapping, is shown in Fig. 66.

## FLOOR-STEEL

Erection of the remaining floorbeams followed that of the trusses. In order to load the cables and thus to bring the trusses into alignment for riveting as soon as possible, the roadway-grids were delivered at the same time as the stringers and lateral bracing, the several items for each panel being loaded onto the same scow. The stringers and bracing were bolted into place, but the grids were merely piled across the stringers so as to leave room for riveting the floor members (Fig. 67).

The stringers of the four bays contiguous to the main towers were not assembled with the others. The members in question were fabricated a few inches longer than their theoretical dimensions in order to provide for any contingencies, and were not precisely cut until the trusses had taken their final positions under full dead load. When all the grid-concrete (except, of course, that of the bays in question) had been poured, the end-stringers were cut and fitted so that the expansion-fingers could be assembled to the proper setting for the temperature obtaining at the time. The stringers and expansion-joints were then riveted, the grid-sections welded, and the grids concreted. During the two months that elapsed between the erection of the bridge-

\*NOTE: The difference in the cable-tension across the saddle is 440 kips.

deck and the final assembly of the end-stringers, the end bays of the trusses were bridged by stout timberwork, to permit the free passage of the contractors' equipment along the spans.

Beginning at the south end of the bridge, distribution of the teegrid-sections followed closely upon the riveting of the floor-steel, and the tedious (some 2,300 man-hours) process of welding the grids to the stringers then began. The grid-sections were handled by a 5-ton gasoline crane, which, running on pneumatic tires, was able to operate over the unfilled grids without damage to them.

After the roadway-grids were laid, the sidewalk-supports, kerbs, anglgrids, traveller-rails, fence-posts, and fences were erected. Heavier members were placed by the crane, and small pieces by hand. The observation-platforms were assembled in the same manner, and riveting of all these small parts followed.

Fig. 63—Trusses partly erected, central span.

The signal bridge at the centre of the span was not erected until cable-wrapping had taken place over the middle bays; and, since the latter operation was not permitted to go forward until the great majority of dead load had been placed, this structure was not built until the deck of the bridge had been concreted. It was fabricated and delivered in pieces as large as was convenient, each of the two cabins being shipped as a unit. The inspection-travellers were hoisted into position (from below the bridge) as soon as the traveller-rails had been riveted, and were of great value during the painting of the underside of the deck.

#### RIVETING OF STIFFENING-TRUSSES AND DECK

At the time of lower-chord riveting, the smaller members comprising the steelwork of the sidewalks, kerbs, fences, and traveller-rails were not erected. The weight of those parts, however, was approximately represented by that of the two wooden walkways, and the suspended loading therefore amounted to about 75 per cent of the final dead load, the remaining 25 per cent representing mainly the weight of the concrete filling of the grids. The camber of the central span at this time was some 5 ft. greater than its final amount of 25 ft. Under these conditions it was found practicable to bolt-up all the lower-chord splices, although those of the upper chords remained slightly open in general, and could only be loosely connected with one or two bolts. The stringers, floorbeams, and lateral bracing were riveted at the same time as the lower-chord splices, and the work was carried out from the two wooden walkways, supplemented by underslung stagings. As many as 12 gangs of riveters were simultaneously at work during the lower chord riveting, and the maximum number of rivets driven in one 8-hour day was 5,092. The riveting was carefully inspected, the number of rejects amounting usually to

about 0.5 per cent. At the chord-splices, the engineers insisted upon full bearing of the faced material, the stipulation being that at no part of any splice should the opening exceed 0.005 in. Drawbars were used where necessary, and the splices were heavily bolted before riveting was permitted. That these requirements were met without difficulty except in rare cases bore testimony to the precision of the fabrication.

The upper-chord splices were not made until the whole of the dead load, excepting only the cable-wrapping and the concrete of the end panels was in position. At this juncture the splices could be drawn together without difficulty, and drawbars were not ordinarily required. The riveting was done from stagings slung from the trusses, the lower-chord walkways remaining in place for safety. Ten gangs of riveters were employed. The same strict ruling regarding tightness of bearing obtained as for the lower splices, and every rivet was inspected. The number of rivets in the field-connections of the deck and trusses was about 120,000.

#### MAIN EXPANSION-DETAILS

The heavy expansion-details at the main towers were placed as soon as the deck-concrete had been poured except in the end-panels involved. As originally installed in accordance with the drawings, the difference in level between the fingers and the normal slab amounted to one-inch. This apparently insignificant variation in level, occurring over a distance of some 12 ft., was found to cause a slight but definite shock to a vehicle passing at speed, while simultaneously a noticeable vibration occurred at the more sensitive parts of the suspension-structure. Certain alterations, after a few months' operation, were therefore made to the expansion-joints. These changes, whereby the maximum deviation of the riding-surface from the regular grade was reduced to  $\frac{1}{2}$  in.,

proved to be entirely satisfactory as a remedial measure. Figure 31 shows the final profile at the joints.

The twelve traction-rods (see p. 290) were erected soon after the expansion-joints, their turnbuckles being tightened just sufficiently to ensure a slight initial tension. Figure 68 shows one of the traction-rod assemblies.

Before the bridge was opened to traffic, it was found that the sliding shoes of the trusses moved jerkily and noisily under the influence of temperature-changes. This phenomenon, occurring at both ends of the central span, was particularly noticeable as the temperature increased on sunny mornings. The vibratory effects of traffic, however, together with a maintenance-programme involving regular greasing of the slides, eliminated this trouble.

#### CONCRETE FILLING FOR GRIDS

The concrete filling of the Tee-grid slab constitutes one of the heaviest items of the suspended structure, and the sequence of pouring was therefore arranged to avoid undue deflections. A length of approximately 250 ft. was chosen as the most practicable unit for concreting, and the order in which the panels of concrete were placed is shown in Fig. 70. It will be noted that each group of pours was so spread as to load the three spans more or less evenly. Owing to the north-shore location of the mixing-plant, the southernmost section of each of the four groups was the first to be concreted; and, in order not to disturb the green concrete, a period of at least seven days elapsed between the final pour of a group and the first pour of the next group. Observations on the towers were taken at the end of each day's work, and the worst deflection was less than three inches.

The concrete was trucked over the unfilled grids and after dumping was spaded out to a uniform depth of about 6 in. in order to render effective the use of surface-vibrators.

The wood-floated finish was kept fractionally above the tops of the grids so as to avoid depressions between the stems of the tees. The surface received 20 lb. of "Metalicon" per 100 sq. ft., and was protected during curing by the Hunt spraying-process.

In spite of the tightness of the grids and the dryness of the mix, a certain amount of leakage of concrete onto the floor-steel occurred owing to the vibration, and this was cleaned off the steel by men stationed on the lower-chord walkways with hoses.

The specified 28-day strength of the concrete was 3,000 lb. per sq. in. In view, however, of the special exigencies of this work, (requiring the driving of concrete-trucks over the surface as soon as possible after pouring), the mix was designed to give a high strength at seven days. A total of 15 test-cylinders was included in the routine-testing. Five were broken at seven days, and yielded an average strength of 3,430 lb. per sq. in. The remaining ten, broken at 28 days, gave results varying from 4,920 to 5,660. The mix was based on as low a water-cement ratio (approximately  $4\frac{1}{4}$  imperial gallons of water per  $87\frac{1}{2}$ -lb. sack of cement) as practicable in view of the small size of the pockets of the grids. The average proportions of material per batch were: seven sacks of cement, 1,200 lb. of sand (containing about four per cent of surface-moisture), 2,225 lb. of gravel (maximum stone-size  $\frac{3}{4}$  in.: surface-moisture  $\frac{3}{4}$  per cent), and 23 gallons of added water\*. The slump varied between 1 and 2 in. The resulting concrete was unusually dense and hard, with an average weight of 152 lb. per cu. ft.

CABLE-WRAPPING

The cable-wrapping consists of a continuous serving of No. 9 S.W.G. soft annealed galvanized wire, the purpose of which is to seal the cable against weather. Immediately prior to its application, the cable (cleaned and dry) received a generous brush-coat of red-lead paste,\*\* and the oil-impregnated cedar fillers (Fig. 40) supplied in 10-ft lengths, were assembled. As far as possible, the wrapping-wire was applied mechanically, this method, besides being more expeditious, giving a very tight and close wrapping of even and regular appearance. The wrapping-machine (Fig. 70) was of the usual planetary type, three turns of wire being laid simultaneously from three revolving spools. The machine was operated by a compressed-air motor, and was guided by a beam clamped to and parallel with the cable. It was propelled upwards along the cable by means of the pressure exerted by the wire as it was laid against that already in place. On the steeper slopes, the machine was assisted by a hand-tackle. Its best operating speed, at approximately 70 r.p.m., was such as to wrap about 2 ft. per minute, but the general rate was much slower, since frequent stops were necessary for changing spools and

\*Expressed in terms of dry materials, the average batch would contain seven sacks cement, 1,150 lb. sand, 2,200 lb. stone, 29 gallons water.

\*\*The paste used was a red-lead-and-linseed-oil paint containing 62 per cent of red lead and weighing about 28.5 lb. per gallon.

Fig. 65—Cable-saddle and keeper at cable-bent.

splicing the wire (by brazing) and for moving the machine past the cable-bands. The wrapping-wire was delivered in coils at the bases of the main piers, and spooling-machinery was set up, under cover, on the tops of the towers.

The first few inches of wrapping on the upper side of each cable-band was done by hand, commencing inside the counter-boring. Machine-wrapping then proceeded towards the next cable-band as far as possible, after which the wrapping was soldered down to keep it tight, and the end few inches was again applied by hand. As each panel of wrapping was completed, it was closely inspected, and, wherever adjacent turns did not appear to be in tight contact, the open spaces were sealed by soldering. Every precaution was thus taken to ensure watertightness prior to painting; and the three subsequent coats of paint effectually sealed such minor imperfections as otherwise escaped notice.

Hand-wrapping was also resorted to over short distances inside the anchor cavities of the piers, when there was no room for the machine to operate (Fig. 61).

Wrapping was permitted in wet weather (provided that the wood-fill assembly ahead of the machine was kept under cover) because it was impossible to prevent the ingress of water into the higher reaches of the cable. Drain-holes were left in the caulking of the bands to permit the escape of such water.

COMPLETION OF THE TOWERS

The towers remained in their unfinished state, with a guy-derrick and working-platform at the top of each, until completion of the wrapping and painting of the cables terminated the useful life of the catwalks. The catwalk-decks were then dismantled, the strands were lowered to the deck by the tower-derricks, and the saddle-brackets and other temporary structures were removed. The final operations performed by each tower-top derrick were the removal of the platform from the top of the tower, and the assembly of the previously-omitted parts of the crown-strut, the final-covers for the saddles, and the aerial-beacon support. After these structures had been riveted, the derricks were dismantled.

PAINTING

In accordance with common practice, all of the structural steelwork (as distinct from steelwork under the cable-classification) received one sprayed coat of priming-paint before leaving the shops, and two finish-coats in the field, the shop-coat being first repaired where it was in any way damaged.

The shop-paint approved was an expensive proprietary brand of red-lead primer with a modern synthetic-resin vehicle. The contractor's experience with this paint, however, was unfortunate. In the first place, probably owing to the readily-flowing nature of the vehicle, the protective film appeared to be abnormally thin, and, after two or three weeks' outdoor exposure, it was noticed that rusting was taking place. The paint-manufacturer was apprised of the state of affairs, and made changes in the composition of the paint. Nevertheless, the primer continued to be

Fig. 66—Saddle at south cable-post.

generally unsatisfactory, and many fabricated pieces had to be repainted during the three or four months of storage in the yards. Similar deterioration, with rusting, occurred in the field. When the time came for spot-painting of rivets and abrasions prior to application of the field-paint, it was found that very large areas, notably in the towers and trusses, had to be completely reprimed. Those areas were cleaned very thoroughly, and at considerable expense, by means of rotary wire-brushes, and some 600 gallons of primer were used in brush-painting them.

The failures of the shop-paint were attributed by the manufacturer to improper cleaning of the steel, incomplete removal of mill-scale, and to painting under other than ideal conditions. The contractor on the other hand maintained (and was supported in his contention by the engineers' inspectors) that the steel had been cleaned in the shops with mechanical wire brushes and had, in damp weather, been warmed by blow-torches immediately before painting: all the painting had been done under cover. There was no doubt, in fact, that more than ordinary care had been employed in the preparation of the steel.

The author inclines to the view that the synthetic primer used, while possibly an excellent base-coat in the case of perfectly-cleaned metal, was not suited to such limited preparatory treatment of the steel as is generally considered economical for structural purposes. The whole subject of protection of steelwork is frequently under review in the technical press, and it is becoming clear that the only really satisfactory solution lies in the absolute cleaning of the steel down to solid metal by sandblasting (possibly after a preliminary period of weathering), or by the recently-introduced flame-cleaning process. Failing such procedure the safest method is probably to use the old-fashioned red-lead-and-linseed-oil primer, which, when applied to reasonably-cleaned steel, is known to give a long-lived protection even under extremely adverse conditions.

It may here be noted that, in accordance with modern Canadian practice, no paint was applied to surfaces shop-riveted together. In view of the almost inevitable and most unsightly staining of the field-paint due to subsequent infiltration of moisture between such surfaces, the author is of the opinion that the older practice of applying shop-paint (or at least linseed-oil) to those surfaces before riveting, should be revived, at any rate in the case of structures exposed to the weather.

In the field, after the shop-coat had been spot-painted and repaired under careful inspection, two further coats of paint were applied to all structural steelwork as distinct from the cables and suspenders. The engineers, rather reluctantly, approved the application of the field-coats by spraying except in the cases of those portions of the main towers above roadway level as far as, and inclusive of, the portal-strut; and the bottom 20 ft. of each tower-leg. The engineers stipulated that the painting should be done to their satisfaction and by experienced spray-painters with modern equipment, and failing such satisfaction, they reserved the right to order brush-painting throughout, the

additional cost of which would be borne by the owners. That right was not exercised, however, since the subcontractor's men were fully experienced in spray-painting and the coverage of the steel was generally excellent. The several advantages of spray-painting, particularly its efficacy in reaching into small crevices and to other places that are rarely properly painted by brushwork, were in evidence, and the greater speed of the work enabled full advantage to be taken of the fine weather that prevailed during the summer of 1938.

The first coat throughout was of a light grey colour, chosen to provide a practicable contrast with the dark-brown primer and also with the various finishing-colours. The second or finishing-coat was a rich olive-green for the majority of the structure, including the viaduct. In contrast, the underside of the suspended spans was finished in a dark brown. The insides of the towers, to assist the lighting, were done in light grey. A light grey finish was also chosen for the aerial-beacon supports and for the hand-railing at the tops of the towers. Neither of those two erections has structural importance, and the lighter finish was designed to render them inconspicuous and thus to preserve the functional appearance of the towers. The success of the expedient may be judged from the photograph of the south tower shown in Fig. 71.

The field-paints for the structural steelwork were compounded, along established lines, under the direction of the engineers. The main pigmenting-materials for the first coat were white lead, zinc oxide, and aluminum, and, for the finishing-coats (except in the case of the dark-brown paint, where ferric oxide and graphite were the main ingredients), white lead and zinc oxide. The vehicle in every case was based upon linseed-oil.

In the case of the wrapped cable, suspender-ropes, and ladder-rungs, the galvanized metal was first cleaned of dirt and grease, after which it was treated with a weak solution of cupric salts and hydrochloric acid, in order to destroy the smooth finish and to present a surface better suited for the reception of paint. Three coats were then brush-painted onto these members. The first, brownish in colour, was a fast-drying varnish-paint with a dull finish adapted to receive the final coats, the pigment consisting principally of ferric oxide, zinc chromate, and zinc oxide. The two subsequent coats, comparatively slow in drying, were "International Aviation Red" in colour (a requirement of the Department of Transport) and differed from each other only in that the final coat offered a glossy weather-resistant finish while the intermediate coat was dull in appearance. With a vehicle the permanent part of which was spar-varnish, the pigment for these two paints was composed principally of lead chromate. In order to preserve uniformity of appearance, the cable-saddles and covers, the cable-bands, and the suspender-sockets, were finished with the same three coats. The following table shows the amount of paint used.

Fig. 67—Erection of deck-steelwork.

TABLE II  
QUANTITIES OF PAINT USED

Description	Amount used (imp. gals.)	Approx. average weight per imp. gal. (lb.)
Structural steelwork:—		
Shop-coat (brown).....	2045*	13
First field-coat grey.....	1710	13½
Finish-coat green.....	1678	17
Finish-coat light grey.....	262	16½
Finish-coat brown.....	814	12
Cables and suspenders:—		
Red-lead paste.....	241	28½
Galvanized-iron fixative.....	60	10.2
Red metal primer.....	120	13
First coat red.....	120	13½
Finish-coat red.....	135	13½

SURVEY OF THE SUSPENSION-BRIDGE

On the day before the bridge was opened, the contractor co-operated with the engineers in making a survey of the suspension-structure, partly as a check on the accuracy of the construction, and partly in order to establish reference-data to which measurements made during future inspections might be referred. Weather-conditions were good. It was a cloudy morning, without wind, and the steelwork was dry: a uniform temperature of 36 deg. F., prevailed. Transit-observations were made on the verticality of the towers and the cable-bent, and a line of levels was run from end to end of the roadway.

The towers were found to be very nearly plumb, the south tower leaning ¼ in. to northward and the north tower ½ in. in the same direction. The elevation of the crown-of-road was found to be 276.23, 314.61, and 276.23 at the centres of the south, central, and north spans respectively; and the difference in level between the two sidewalks at each of those points amounted, respectively, to ½ in., ⅝ in., and ⅞ in.

For comparison with the ideal geometry, however, these results must be corrected for the normal temperature of 60 deg. F. The calculated movements of the main saddles for a 24 deg. rise in temperature are 1½ in. and 2 in. for south and north respectively. The indication therefore is that, at normal temperature, the towers will both lean off-shore, the south tower by 1¾ in., and the north by 1½ in. With reference to road-elevations, it was computed that a temperature-rise of 24 deg. F. will cause a sag of .90 ft. at the centre of the central span and of .10 ft. at the centre of each side-span. The corrected elevations for central and side-spans respectively are thus 313.71 and 276.13, and, the theoretical elevations being 315.00 and 276.19, it will be seen that the centre of the bridge is about 15 in. lower than the design-figure.

The explanation of this discrepancy lies mainly in that the dead loads are about one per cent in excess of those estimated (p. 288), the preponderance of that excess being comprised in the 17-ton weight of the central signal-station. Re-calculation (on the basis of the actual suspender-loads) of the cable-polygon gave the elevation of crown-of-road at span-centre of 313.69, a figure in close accord with that actually obtained. The same computation, incidentally, shows that the dead-load stress in the cables exceeds the estimated amount by 1.68 per cent, and that the maximum stress is increased by 1.3 per cent. These increments, however, are offset by the excess of cable cross-section referred to on p. 349. In regard to clearance over the ship-channel, attention is drawn to the liberal allowance that was made for contingencies in this respect (p. 282). In view of this, the underclearance under the most unfavourable conditions exceeds the 200-ft. requirement by at least 1½ ft.

\*This figure does not include the additional paint used in the field for repairing the shop-coat.

In addition to the survey described, reference hubs were established for future use in checking any settlement of the main piers or forward-movement of the anchorages.

ELECTRICAL INSTALLATION

Further to the obvious requirement of roadway-illumination throughout the length of the structure, the electrical equipment of the Lions' Gate Bridge includes the provision of lighting for the interiors of the main towers, the anchorage-piers, the administration-building and toll-booths, the pylons of the south bridge-head, and the beacons on those pylons (Fig. 11.) Navigation-lights and aerial warnings are also provided in accordance with Federal Government requirements, and there is a power-line on the bridge to supply electricity to the signal-station at mid-span and to

Fig. 68—Traction-rods at north end.

the south end of the bridge. In addition, the signal-station is equipped to control the navigation-signals at First Narrows Inner and Outer Beacons (Fig. 1) and at Prospect Point.

Telephones for policing and administrative purposes are installed at strategic points along the bridge, and communicate with the south plaza, the signal-station, and the administration-building. The latter three stations are also connected with the city system, and there is a direct line between the signal-station and the signalman's residence.

The electric power for the bridge\* is obtained from a 4,000-volt transmission-line (B. C. Electric Railway Company) that passes, under the viaduct-deck, along the side of the Pacific Great Eastern Railway's right-of-way (Fig. 2). A sub-station is located on the top of the north anchor-pier (Fig. 15), and here, by means of three 25 kva. single-phase 2300v/550v transformers in star-delta arrangement, the supply is stepped down to 550 volts, at which voltage it is distributed to the various outlets on the bridge. A further transformer (3 kva.: 2300v/230-115v) is furnished for an independent supply for the sub-station itself.

Two 6.6-amp. series-circuits, fed from two constant-current transformers (15 kw. and 10 kw. respectively) equipped with "Novalux" controllers, are employed for the roadway-lighting, which comprises 4 units on the south plaza, 22 on the suspension-bridge, 16 on the viaduct, 7 on the embankment and plaza, and 11 on the grade-separation roads. Of these, 34 are on an all-night circuit, controlled entirely by a photo-electric cell. The other circuit, carrying 26 lamps, is closed in the evening by the same photo-electric cell, but the lights are extinguished at midnight (or other suitable time) by a clockwork mechanism. The wiring of each circuit consists of two single No. 8 conductors (R.I.L.C.) carried in a 2-in. conduit.

The 60 roadway-lighting units are supported on British Mannesman fluted weldless-steel standards, with orna-

\*Power for the administration-building and toll-booths is supplied separately, from a pole-line running along Marine Drive, through a 25 kw. transformer.

mental brackets, the light-centres being situated 24 ft. above the roadway and 6 ft. inside the fence-line. The lamp-standards are shown structurally in Figs. 25 and 52 and their general appearance is seen in Fig. 11. The lights, spaced at approximately 130-ft. intervals, are alternately on opposite sides of the road, those on the west side being the all-night lights. The 247 va. isolating current transformer for each lamp is housed in the base of the standard in the case of units resting on concrete pedestals, and in an inconspicuous box attached to the stiffening-truss in the case of those mounted on the steelwork.

The lighting-unit adopted was the Canadian Westinghouse "Reflectolux Senior" luminaire, equipped for a 10,000-lumen sodium-vapour lamp. The assembly, which was developed especially for this bridge, is of the pendant type, totally enclosed, and with a single vertical flask: the reflectors throughout are of "Alzak" aluminum. This form of unit was adjudged by the engineers to be superior to the open butterfly-type both aesthetically and because of its higher resistance to corrosive influences. With a "coefficient of utilization" of 20.5 per cent (2050 lumens from each unit actually reach the 29-ft. carriageway) the luminaire is believed to be the most efficient of its kind yet developed.

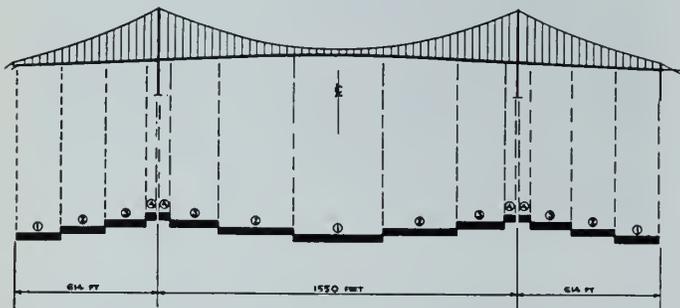

Fig. 69—Programme of pouring deck-concrete.

The gentle glow of the sodium-vapour lamps, and the appearance of the lighting as a whole, have been the subject of many favourable comments, particularly owing to the remarkable absence of glare. From a distance, the general appearance of the yellow lights, reproducing the profile of the roadway over the Narrows, is most pleasing.

In addition to the lighting-circuits, a 550-volt three-phase power-line extends from the substation as far as the south bridge-head. The line commences as three No. 1 conductors (R.I.L.C.) running in 2-in. conduit, and the conductor-size is progressively reduced in accordance with the diminishing capacity needed. This power-supply is used as follows. A 7 kva. transformer (550v/230-115v) is located at each main tower, supplying power for the inspection-lighting of the tower, for the two 500-w lamps of the aerial beacon (300-mm. code obstruction-beacon), and for the six 500-w floodlights which, illuminating the masonry of the pier-ends, serve as an aid to navigation. Near the signal-station, and mounted on the outside of the eastern stiffening-truss, are two transformers (550v/230-115v) of 10 kva. and 5 kva. capacity respectively. The former delivers to the 7½-hp. motor-generator by which direct current is supplied to the two signal-station search-lights, while the latter provides for heating and lighting in the signal-station cabins, for signalling, and for the navigation-lights that, hung below the deck of the central span, mark the limits of the five-fathom L.W.O.S.T. ship-channel. At the south entrance to the bridge, a 7½ kva. transformer, set on the upper floor of the west pylon, is provided for lighting in the two pylons and for the two ornamental beacons. The three-phase line also supplies power for the signalman's residence, for the fog-bell and light below Prospect Point, and for the restaurant on the headland.

Two control-cables, originating at the signal-station, are

required for the operation of the harbour-signals to which reference has already been made. The multiple cable running northward along the bridge contains 27 separate 19-wire conductors, the whole being rubber-insulated, lead-sheathed and running in 2½-in. conduit, while that serving equipment on the south-shore contains 19 similar conductors. Control-cabinets are housed inside the main-tower columns at sidewalk-level; and a comprehensive switch-board in the signal-station controls the lights, fog-horns and bells at Prospect Point and at the two Beacons, as well as the beacons and navigation-lights that pertain to the bridge itself. A 32-volt nickel-iron battery provides for emergency-operation of the last-mentioned lights by means of automatic stand-by lamps.

The telephone-wiring is carried in a one-inch conduit which extends, beneath the deck, over the full length of the bridge.

The conduits, pull-boxes, junction-boxes, and fastenings throughout the work were electro-plated by the "Oxoseal" patent process, and are further protected by the two field-coats of paint. For the most part the conduits are laid out of sight below the deck. On the suspended spans, however, the conduits for the series lighting-circuits are secured, for convenience of connection to the lighting-units, along the inner webs of the top chords of the trusses (Fig. 68), while the control-cable conduit is located on the top of the chord. The conduits in general are clamped onto the steelwork, as the engineers did not permit the drilling of any primary structural members. Provision for expansion at the joints of the viaduct is made by sliding-sleeves where the conduits enter the pull-boxes. On the suspension-bridge, the cables are conveyed past the expansion-joints in lengths of flexible conduit.

The electrical contractor began the installation of conduits as soon as the viaduct-steelwork was sufficiently far advanced. The roadway-lighting was put into regular operation on December 3rd, 1938, and the signal-station was formally handed over to the National Harbours Board on January 14th, 1939. A maintenance-period of six months elapsed before the electrical installation was finally accepted by the engineers.

## PARTICULARS REGARDING CONTRACTS AND PERSONNEL

The main part of the works, comprising the suspension-bridge and the approach-viaduct in their entirety, together with the filling and paving of the north embankment, was executed under two major contracts.

The general contractor for the substructure (including the four main piers together with their architectural features, the pedestals and abutment-wall of the viaduct, the concrete of the bridge-deck throughout, and the construction, paving and fencing of the north embankment) was Stuart Cameron & Company Limited, Vancouver. The contract was privately awarded by the owners in July, 1936 on a cost-plus basis (with profits limited to \$100,000), and the total cost of the work was \$1,116,585. The names of the principal sub-contractors, with an indication of the work done by each, follow:

- Boyle Bros. Drilling Co. Ltd., Vancouver, exploratory diamond drilling.\*
- North-Western Dredging Co. Ltd., Vancouver, dredging of pier-sites.
- Dominion Bridge Co. Ltd., Vancouver, cutting-edges for south caissons.
- Ross & Howard Iron Works Co. Ltd., Vancouver, cutting-edges for north caissons.
- Vancouver Granite Co. Ltd., quarrying of granite for pier-facings.
- A. S. Allan & Co. Ltd., Vancouver, granite-cutting.
- J. A. & C. H. McDonald, Vancouver, granite-cutting.
- W. C. Arnett & Co. Ltd., Vancouver, construction of north-approach embankment.
- San-O-Heat, Vancouver, plumbing installations.

The contract for supply and erection of the metallic

\*This work did not form part of the main contract, but was carried out at an earlier date under a separate arrangement with the owners.

superstructure was awarded privately by the owners to a partnership of Dominion Bridge Company Ltd., and Hamilton Bridge Company Limited, at the lump-sum price of \$2,365,000. That price was later adjusted by certain exemptions from Government Sales Tax and by the extra cost of certain small additions to the structure ordered by the owners, the final total, apart from a \$50,000 bonus awarded under a contract-clause relating to early completion of the work, amounting to \$2,372,220. The

Fig. 70—Cable-wrapping machine.

principal parts of the work that were sub-let, together with the names of the approved subcontractors, are given hereunder:

- Anglo-Canadian Wire Rope Co. Ltd., cable-strands and suspender-ropes.
- John A. Roebling's Sons Co. Ltd., wire for strands and suspenders.
- B. C. Anchor Fence Co. Ltd., wire mesh fences for suspended spans.
- Steel Company of Canada Ltd., wire for fences and for cable-wrapping.
- Vancouver Engineering Works Ltd., steel castings for cable-bands, etc.
- Canada Foundries & Forgings, Ltd., suspender-rope sockets.
- C. H. Brawn, Vancouver, field-painting.
- E. Chrystal & Co. Ltd., Vancouver, shaped and treated wood-fills for cable.
- San-O-Heat, Vancouver, plumbing and water-line for signal-station.

The supply and installation of the equipment involved in the electrical services for the bridge was the subject of a third primary contract. This contract was awarded to the C. H. E. Williams Company Limited, Vancouver, at the price of \$58,014, that figure being the lowest of the six tenders received. Subsequent additions to the contract, including those required for the Marine Drive overpass, brought the final cost to \$63,427. The cost of extensions to the control-system, made at the instance of the Department of Transport, amounted to an additional \$4,150, this latter item being borne by the Department.

Construction of the toll-booths and administration-building on the north plaza was the subject of a separate contract. This work was designed and supervised by Messrs. Palmer & Bow, architects, of Vancouver, under the direction of the engineers. Tenders were called, and the contract was awarded, in August 1938, to Andrew Davidson of Vancouver (the lowest bidder), at a price of \$18,980, this figure being subsequently increased, by extra requirements, to \$19,830. The electrical work and plumbing were done by the same contractors who handled the corresponding items under the major contracts.

The architectural treatment of the four main piers of the suspension-bridge was developed by the engineers in collaboration with Mr. John W. Wood, architect, of Montreal; and the late Mr. Charles Marega, sculptor, of Vancouver, was responsible for the modelling of the monumental lions that form a striking feature of the bridge-head in Stanley Park.

The decision to provide a grade-separation at the junction of the bridge-road with Marine Drive was not made until the main works had progressed to an advanced stage. Plans for this "modified clover-leaf" were subject to the approval of the Provincial Department of Public Works and were prepared by Major W. G. Swan, M.E.I.C., who also supervised the field-work. Competitive bids were received, and a contract was awarded, in July 1938, to Dawson Wade & Co. Ltd., of Vancouver, the lowest bidder. The construction of the 40-ft. concrete overpass was sublet to Hodgson King & Marble Ltd., of Vancouver, while the principal contractor himself undertook the considerable amount of earth-filling involved in the grade-separation and in the necessary extension to the existing main embankment. The cost of the complete grade-separation was \$47,197.

Inspection of materials and workmanship (apart from that done directly by the engineers) throughout was handled, under the direction of the engineers, by Macdonald & Macdonald, testing and inspecting engineers, of Vancouver.

Messrs. Monsarrat & Pratley, consulting engineers, of Montreal, were retained by The First Narrows Bridge Company Limited, for the design and supervision of the construction of the Lions' Gate Bridge, with Major W. G. Swan, consulting engineer, of Vancouver, as associate. Mr. James Muirhead, electrical consultant, of Vancouver, was employed by the engineers for the design of the electrical installations. Messrs. Robinson & Steinman, consulting engineers of New York City, were retained by the owners in an advisory capacity with regard to certain features, such as the relative merits of sodium-vapour and incandescent lighting, the use of electrical equipment for toll-recording, and the reviewing of Messrs. Cockfield, Brown and Company's Report on Traffic and Earnings.

In the field, the substructure-work was directed by Mr. W. F. Way, superintendent for Stuart Cameron & Co. Ltd. For the superstructure-contractors, operations were directed by Mr. E. E. Davis and Mr. James Robertson, M.E.I.C., while Mr. D. B. Armstrong, M.E.I.C. (Dominion Bridge Company, head office, Lachine) was engineer-in-charge for the contract. The engineers were represented at the site by Mr. J. W. Roland, M.E.I.C. and the author, as resident engineers respectively for the substructure and the superstructure, and Mr. G. W. F. Ridout-Evans, M.E.I.C., was the principal field-inspector.

The 30-ft. concrete approach-road (some 6,500 ft. long) through Stanley Park, together with the necessary accommodation for crossing and connecting with existing thoroughfares, was constructed by Anglo-Construction Co. Ltd., of Vancouver, at a cost of roughly \$400,000. This part

Fig. 71—Completed south tower.

of the project, however, did not come under the jurisdiction of the engineers and therefore does not enter the scope of this paper.

The total cost of the bridge and all its approach-works, together with franchises and rights-of-way, and including a provision for working-capital, is stated by the owners to have been \$5,700,000. The First Narrows Bridge Company is capitalized by shares to the extent of \$500,000, and by 30-year and 40-year bond issues amounting to \$5,700,000, the authorized loan-capital amounting to \$6,000,000. Reference to that company would be incomplete without

mention of its president, Mr. A. J. T. Taylor, to whose unremitting efforts the successful promotion of the whole project was largely due.

#### ACKNOWLEDGEMENT

For permission to present this paper, and for valued criticism during its preparation, the author in concluding wishes to acknowledge his indebtedness to P. L. Pratley, D.Eng., M. INST. C.E., M.E.I.C., M. Am. Soc. C.E., M.I. Struct. E., the surviving member of the firm of Monsarrat and Pratley.

## Abstracts of Current Literature

### MARINE OIL ENGINES

FROM *Supplement to the Overseas Daily Mail*, APRIL 25, 1942

The developments of marine oil engines concern both the largest and smallest types, ranging from engines suitable for the standardized or semi-standardized cargo vessels to the needs of the smaller coastal vessels.

Details are available of two engines which are typical of these applications. The first concerns two engines of 6,000 S.hp., of the Kincaid-Harland-B. and W. type for a twin-screw vessel.

These are the highest powered six-cylinder units so far built by the particular engine builder concerned, although there are also under construction eight-cylinder units of the same cylinder size which will develop 8,000 S.hp. The particulars of the six-cylinder units are as follows:

Designed output 6,000 S.hp.

Cyl. diameter 620 mm.

Piston stroke 1,400 mm.

Piston speed, 1,000 ft. per min.

Mean effective pressure 85 lb. per sq. in.

It will be noted that the mean effective pressure has been kept to a moderate figure, although some engines of this type have been constructed for a mean effective pressure of 96 lb. per sq. in., giving a shaft horse power of 1,120 from the same size of cylinder. In the present case the shipowners have taken the view that economy, low maintenance and avoidance of replacements make the lower rating advisable. As the rating is low, they intend, however, to operate continuously at speeds and output approximating to the normal rating.

In this type of engine the main piston uncovers scavenging air ports situated at the centre belt of the double-acting cylinder—that is, at the top and bottom respectively of the lower and upper combustion spaces. The cylinder therefore exhausts at its extremities; the exhaust ports are uncovered by separate exhaust pistons, which are given a seven deg. lead of the main piston, to cause the exhaust pressure to fall quickly to the level of the scavenge air pressure.

The separate exhaust pistons are roughly two-thirds of the diameter of the main piston, and their employment is stated to augment the power output by about 10 per cent of that which would otherwise be developed.

The scavenging air is supplied to the scavenging ports by two-positive displacement rotor-type blowers placed at the back of the engine. The blowers are chain-driven from the crankshaft through spring shock-absorbing couplings at 2.6 times the engine speed. The scavenging pressure is just below two lb.

One of the most remarkable phenomena of pre-war shipping was the growing popularity of the coaster type of vessel carrying upwards of a thousand tons of cargo. Although the type was pioneered before 1914 by British shipbuilders, with triple-expansion reciprocating steam

### Abstracts of articles appearing in the current technical periodicals

engines taking steam from unsuperheated Scotch boilers, this method of propulsion proved rather extravagant of fore and aft space, a length equal to 50 per cent of the length devoted to cargo being occupied by machinery abaft the cargo space.

From about 1925 the use of oil engines became popular with Dutch and German shipbuilders and shipowners for this type of vessel, and as power for power the oil engine occupied less than half the space, with other economies, many such ships were built. British owners and builders, however, took up the type a few years before the war, and as described in a recent issue of their "Crossley Chronicle" by Crossley Brothers, Ltd., Manchester, the present day British built engine does all that the Continental engines did in the Dutch-built coasters, and more so.

Many vessels have been equipped with the Crossley direct-reversing scavenging engine in various sizes, of which the six-cylinder type may be regarded as typical, although many other sizes from four-cylinder 100 hp. upwards have been installed in coaster vessels for use in home waters and abroad.

In the six-cylinder engine, developing 330 b.hp., the scavenge-pump is at the forward end of the engine, together with the fuel pumps and the controls. This type of engine is easy to handle, and is adaptable to remote control from the wheel-house by a simple and neat arrangement.

### CONSERVATION OF WELDING ELECTRODE

CLAYTON B. HERRICK

*Welding Engineer, The Lincoln Electric Company, Cleveland, Ohio.*

It is important at this time to recall the factors contributing to the best use of the welding electrode and resulting in a faster rate of production and conservation of metal.

1. SELECT THE RIGHT TYPE OF JOINT AND BE CAREFUL OF FIT-UP—Since the type of joint greatly affects the amount of metal required, it is suggested that a study be made to make sure the joint is proper for the particular application. Obviously, the joint to select is the one which meets requirements at the greatest speed and the lowest cost.

Joints and their fit-up should be given most careful consideration, as fit-up affects not only the cost of the welded joint as such, but also the performance of the finished product. As an illustration of the effect upon cost in a very simple fit-up, take the case of T-weld with  $\frac{1}{4}$ -in. plates. Assume that the cost of deposited metal is \$1.00 per lb. Then if the joint is properly fitted up, the cost per ft. of joint (two beads), would be \$0.40. If, however, there is a gap between the vertical plate and the horizontal plate of

$\frac{1}{16}$ -in., the cost is increased to \$0.58 per ft. If this discrepancy is  $\frac{1}{8}$ -in., the cost is increased to \$0.80 per ft., resulting in a difference of \$0.18 to \$0.40 for  $\frac{1}{16}$ -in. and  $\frac{1}{8}$ -in. respectively. Obviously money spent in obtaining good fit-up is readily saved in welding.

2. CHOOSE THE CORRECT TYPE OF ELECTRODE—While the general purpose electrode will produce satisfactory welds under virtually every condition, special electrodes as for example heavily coated fast flowing types would prove more efficient. The electrode should be chosen with respect to: (a), physical properties required; (b), type of joint; (c), position of welding, that is, flat, vertical, overhead or horizontal; and (d), condition of fit-up of the work. Recommendations of the equipment manufacturer should be considered.

3. USE AN ELECTRODE WHICH HAS AND MAINTAINS A UNIFORM COATING—The electrode coating, if not correct, will cause rejects not only of the electrodes themselves but possibly of the welds produced by their use. It should be remembered that the coating not only produces the protecting shield but it also controls: (1), fluidity of the metal; (2), penetration; (3), shape of the beads; (4), physical properties of the deposit; and (5), composition of the deposit.

4. USE ELECTRODES WHICH PROVIDE PROPER PHYSICAL PROPERTIES—Electrodes manufactured to-day are clearly described by the manufacturer in respect to the quality of weld they will produce. Required physical properties of the work at hand should be known and the electrode should be selected to meet these requirements.

5. USE FAST FLOWING ELECTRODES WHEREVER POSSIBLE—Certain electrodes are manufactured to-day to permit the fastest possible welding under specified conditions. It is obvious, therefore, that electrode and, hence, time will be saved if these fast flowing types are used wherever practical.

6. SELECT AN ELECTRODE WHICH KEEPS SPLATTER AND SLAG LOSS AT A MINIMUM—Since all splatter is a waste of weld metal, the importance of this is obvious. It should be realized that the splatter loss of the electrodes vary and care should be taken to avoid use of those which have excessive losses.

7. WHEREVER POSSIBLE USE ELECTRODES WHICH PRODUCE FLAT BEADS—It is a waste of welding electrode to deposit any more metal than is required. Not only is the welding electrode itself wasted but useless time is required to remove the excess metal from the welded joint.

8. SELECT THE RIGHT SIZE ELECTRODE—The largest diameter electrode which can be used effectively is the best from the standpoint of electrode conservation. The saving runs up to 40 per cent per pound deposited, for example, when  $\frac{1}{4}$ -in. is used instead of  $\frac{3}{16}$ -in.

9. USE LONG ELECTRODES IN THE LARGER SIZE—The obvious result is the reduction in the number of stub ends and in the time saved by eliminating interruptions to change rods. The 18-in. length should be used in  $\frac{1}{4}$ -in. and larger sizes.

10. DO NOT BEND ELECTRODES—This generally unnecessary habit will waste from  $\frac{1}{4}$  to  $\frac{1}{3}$  of the electrode. Use electrodes straight and get the maximum of deposited weld metal from each rod.

11. USE PROPER VOLTAGE AND CURRENT SETTINGS—Every electrode manufactured is designed to operate at a certain voltage and within a specified current range. If current is too high or too low, it will manifest itself either in excessive splatter loss or inferior welds, having improper fusion and penetration.

12. FOLLOW THE PROCEDURE SPECIFIED FOR THE ELECTRODE—Accompanying each different electrode manufactured are detailed specifications regarding procedures to be followed. These specifications have been prepared carefully by the electrode manufacturer and, if followed consistently, will prevent waste of electrode and assure high quality welding.

13. AVOID USING AN EXCESSIVE NUMBER OF BEADS—If one bead of weld metal will meet design requirements, it is obviously a waste of electrode to add additional beads. This same applies to applications where two beads suffice. Additional beads are simply a useless waste of electrode.

14. USE ELECTRODE DOWN TO MINIMUM STUB END—Remember that the electrode can be used the entire length of its coated surface. By using care in gripping the electrode at its extreme end in the holder and burning it down to the maximum extent, the operator is rendering a patriotic service in saving electrode. Just  $\frac{1}{2}$ -in. difference in stub end saves  $3\frac{1}{2}$  per cent on an 18-in. length rod. The great variation in stub ends in one welding shop caused waste amounting to  $17\frac{1}{2}$  per cent. In cost, for the time covered, it amounted to \$268.36.

15. COLLECT AND SAVE STUB ENDS OF ELECTRODE—At the rate at which welding is being used to-day in war production, the amount of metal which would be wasted by failure to save stub ends would be tremendous. The average stub end is 2 in. long and this length multiplied by the millions of electrodes used, would constitute the great loss.

16. USE MODERN HIGH CAPACITY WELDING GENERATOR—Welding generators manufactured to-day have much higher capacity and much greater efficiency. For example, a modern 40-volt generator was shown to produce 7.7 in. of joint per electrode as against 6.6 in. for an older machine.

## AEROPLANE versus TANK

FROM *The Engineer*, (LONDON) MAY 1, 1942

That the aeroplane and the tank have proved themselves to be two of the most potent weapons of the war will be readily admitted, but their relative strength when in combat with each other has still to be disclosed. We are told of aeroplanes and tanks weighing 60 tons apiece, and although the former possess the advantage of vastly higher speed, the tank is immensely more stoutly armoured. The flying attack on the tank will not, however, be made by an aeroplane of comparable mass, but by some smaller and faster aircraft just large enough to carry the right size of bomb or gun for the task. Any such gun could well be the "tank-buster" desired of the popular Press, though whether an aircraft or some other vehicle is the best form of mounting for it has, we may suppose, yet to be settled.

The power of the bomb is already well known, but when one has to consider the problem whether an aircraft can carry a gun of sufficient power to destroy even the most powerful tank, one will naturally first ascertain what kind of gun is carried for this purpose by rival tanks. It has been disclosed that an "M3" tank of combined British and American design, with an all-up weight of 28 tons, carries a 3 in. gun; this is in addition to a  $1\frac{1}{2}$  in. A.A. gun and the usual battery of machine guns. The big gun is carried in a fixed position pointing forward, but in a larger tank, of twice the weight, it is reported to be mounted in a revolving turret, which, of course, makes it much more effective. This tank also carries heavy armour, but how thick remains undisclosed. It is hard to discuss intelligently the relative strengths of gun and armour when the facts have, as at present, to remain hidden, but if we turn to the standard text-books on such subjects we find that the thickness of armour penetrated by a given projectile is stated to rise in direct proportion to the projectile diameter and much more rapidly than the impact velocity; in fact, as fast as  $V^{1.5}$ . If, as is likely, these general rules apply even to the projectiles and armour of to-day—much improved no doubt, though one can picture the degree of improvement as much the same in both—one may make suggestive calculations. Given that modern tanks are fitted with 3 in. guns in order to dispose of their rivals, we can assume that if an aeroplane could carry

such a weapon it would be at least equally able to deal with them; but it should not be necessary to go nearly so far as this, for the gun carried in the aeroplane has the enormous advantage that its projectile shares the high forward speed of possibly as much as 500 ft. per second, even before the gun is fired. If the gun normally has a muzzle velocity sufficient at close range to give a striking velocity of 2,200 ft. per second, it may, if fired from an aeroplane, have its velocity raised to 2,700 ft. per second. The consequent penetrative power will, owing to the law already cited, rise much more quickly than in the ratio of 2,700 to 2,200; in fact, it may be expected to rise more nearly as 3,000 is to 2,200. This is a considerable jump, and if the former figure sufficed to ensure penetration with a 3 in. gun, it would follow, on these classical rules, that a 2¼ in. gun should suffice if fired from an aeroplane. Similarly, a 3 in. gun in the air should compare in penetrative power with a 4 in. gun on the ground. Indeed, one may go further and have the reasonable hope that, with the greater freedom possessed by aircraft in choosing the precise point to be attacked, an even smaller gun rightly aimed would be able to do all that is necessary. We know that the American "Airacobra" carried a 1½ in. gun, so that the advance suggested here cannot be said to be extravagant. One must not forget, however, that there is still the recoil force of the gun to be taken into consideration. If this considerable force is not arranged to pass through the centre of gravity of the aircraft, it will produce a pitching couple which may prove troublesome to both pilot and gunner. This point certainly needs to be watched. There is also the effect of the recoil force in tending to retard the motion of the aeroplane as a whole, which, in the limit, might lead to stalling. As it happens, this risk need not trouble us much since the aircraft is certain to be attacking its target during a dive, and this additional amount of braking effect would be welcome rather than otherwise; indeed, machines designed as dive bombers need to be fitted with air brakes under their wings for this very purpose. Hence a gun which acts as an appreciable air brake is certainly no hindrance.

We realize that there need to be taken into account many other considerations than these, but such matters cannot well be pursued in the public Press. We have based this discussion on what is already text-book matter and on such information as has been published elsewhere, but so far as it goes it suggests that the tank may yet find the large gun aeroplane to be the most powerful foe it has to encounter. And it is obvious that other targets than tanks might well find themselves in the future to be the objectives of such enhanced forms of air striking force. The gun has the advantage over the bomb in its greater penetrative power and its surer aim, but for some targets the bomb would, no doubt, retain its old priority.

### ABSENTEEISM

From *Trade & Engineering*, MAY, 1942.

In the factories much has been done to improve liaison and understanding between managements and employees by setting up joint committees, composed of representatives of both sides, to discuss factory problems. Their one weakness was that they did nothing to deal with what were perhaps the two most serious problems—absenteeism and bad time-keeping. Between them these two things must have robbed the war effort of a great number of man-hours and machine-hours. It was pleasing therefore to note that the Minister of Labour recently made a new order to deal with both evils at the same time, amending the Essential Work (General Provisions) Order, 1942.

Hitherto, absence or persistent lateness on the part of workers in scheduled undertakings had not been a direct offence under the Defence (General) Regulations. The Essential Work Order provided that such cases could be

reported by the employer to the National Service Officer, who, after investigation, could give the worker concerned directions as to the method or manner of his work and the times at which and during which he should present himself for work and remain at work. The worker had the right of appeal to a local Appeal Board against any direction. When a direction had been given and was not withdrawn as the result of an appeal the worker committed an offence if he did not comply with the direction and attend for work at the specified times.

This procedure was found to be too cumbrous and to result in difficulties in dealing promptly with serious cases of absenteeism or persistent bad time-keeping. The amending order makes it an offence for a person to whom the Essential Work Order applies either to absent himself from work or to be persistently late without reasonable excuse. Proceedings can be taken against an offender without the National Service Officer having to give a specific direction to the person concerned and without him having an opportunity to appeal. Where, however, there is in the undertaking a works committee or other joint council which, in the opinion of the National Service Officer, can appropriately deal with the matter, the case must be referred to that body.

A similar amendment to the order relating to the building and civil engineering industries came into force just before Easter and the question of amendments to other orders relating to special industries is being further discussed with the industries concerned. It would appear that if full use is made of these extended powers absenteeism and persistent lateness will cease to be a nightmare to those responsible for war production.

### THE "F.W. 190" FIGHTER

FROM *The Engineer* (LONDON) APRIL, 17, 1942

More and more frequently, in accounts of the air fighting across the Channel, mention is made of encounters with Germany's new fighter, the "F.W. 190." So far, in their sweeps and on bomber escorting raids over enemy occupied territory, British "Spitfires" have had much the best of these brushes with the "F.W.s" despite the advantage which the enemy had in operating near his own bases, and with the support of ground defences. In January R.A.F. pilots reported that they did not find the new German fighter capable of any exceptional performance, and that the latest type "Spitfires" and "Hurricanes" were more than a match for it.

The R.A.F. first encountered the "F.W. 190" last September, when two radial-engined fighters of an unidentified type were reported shot down. Since then the "F.W." has appeared in increasing numbers in the west. From twos and threes they have been met with in batches of at least thirty. The type has also been reported in action against the Russians in the East. Comparing the "F.W. 190" with the enemy's standard single-seat fighter—the "Me. 109"—the most obvious point about it is that it has an air-cooled radial motor, instead of the liquid-cooled, in-line type generally chosen for fighter aircraft where speed is a foremost consideration. Apart from any purely mechanical advantages or disadvantages, the shape of an in-line engine—with cylinders arranged one behind the other—lends itself to better streamlining than the radial form, where the cylinders are arranged in a circle. For this reason most of the world's fastest short-range fighters—British "Spitfires" and "Hurricanes," American "Airacobras," Russian "M.I.G. 3s," German "Me. 109s," and Italian "Macchi 202s," all have liquid-cooled, in-line motors. Only in America has the air-cooled radial engine continued to find favour for single-seat fighters in recent years. In the States a great deal of development went on after other countries more or less dropped the type. One result of American research was the Curtiss "Hawk"

fighter supplied to the French Armée de l'Air which although comparatively slow, did good work against the "Me. 109s" before France fell.

In reverting to the radial engine for a new fighter to which the Germans at one time seemed to pin a good deal of faith, it would appear that the *Luftwaffe* has some special object in mind. It has been suggested that its need was for an interceptor with a very rapid rate of climb to contend with the increasing power of British sweeps over occupied territory. But as these sweeps are of comparatively recent date and as it takes a considerable time to design and build a new aircraft, it is certain that the development of the "F.W. 190" was started much earlier, and with a different object. More probably the outstanding successes which the highly manoeuvrable "Hawk 75s" gained during the Battle of France impressed the Germans with the possibilities of the type. Also the relatively greater ease of maintenance and freedom from coolant troubles may have persuaded the *Luftwaffe* that what was lost in absolute speed might be made up in other directions.

So far the "F.W. 190" has not ventured into combat with British fighters on this side of the Channel, and although a number have already been destroyed by British fighters they have mostly fallen on enemy territory. Nevertheless, a certain amount is now known about it. The engine appears to be an improved version of the "B.M.W." fourteen-cylinder engine, similar to that fitted in the enemy's new two-motor bomber, the "Do. 217E." It probably develops around 1,600 hp.—which is about 25 per cent more power than the latest "Me. 109" is credited with. In general appearance the "F.W. 190" is not unlike the "Messerschmitt." Its armament is not very great—less than the latest British "Spitfires" and "Hurricanes." The general performance of the "F.W. 190" does not appear to be greatly different from its predecessor, and on the evidence of its showing so far it is no great menace to the R.A.F.'s existing fighters, and definitely below the standard of the new British and American fighters known to be on the way.

### ATLANTIC FERRYING RECORD

From *Trade & Engineering*, MAY, 1942.

Though it has been operating for nine months and has brought across the Atlantic aircraft worth millions of pounds, not a single machine of R.A.F. Ferry Command has yet been intercepted by the enemy. At the head of Ferry Command is Air Chief Marshall Sir Frederick Bowhill, formerly Commander-in-Chief, Coastal Command. His headquarters are at Montreal, and it is from there that delivery flights are controlled. The terminal base for incoming aircraft is somewhere on the west coast of Britain. Associated with this is the control centre, which is in constant touch with the American-made aircraft as they make their way across the Atlantic. The new bombers are first delivered to Montreal from the American factories, and are then flown by Ferry Command pilots and crews to Newfoundland for the long hop of 1,900 miles across the Atlantic. The flying-boats make an even longer flight of

about 3,500 miles. Passengers and crew carry only a few sandwiches and some fruit juice to sustain them on the journey—which, in itself, is proof of the faith they have in the reliability of the service. This is well justified, for aircraft brought to this country are rarely more than five minutes over their estimated time of arrival.

It is a military offence for pilots to hazard an aircraft by attempting to set up a new time record. Nevertheless, favourable conditions have enabled some extremely fast times to be set up, the best performance to date being that of a civilian pilot, who crossed with a bomber in six hours 50 minutes. The first recorded case of an aerial stowaway occurred in connection with the Atlantic Ferry. He was a member of the civilian ground staff who had tried to join the R.A.F. but had been graded as indispensable. He reported to the captain half-way across the Atlantic—and eventually achieved his object. Recently a British Airways captain completed his twenty-fifth Atlantic crossing in 10 months—a very fine record.

### PRODUCER GAS FOR ROAD VEHICLES

From *The Engineer*, MAY, 8TH, 1942.

At a meeting of the Mobile Producer Gas Association, which was held in London last week, a scheme was put forward for the conversion of 50,000 road vehicles to run on producer gas. It was stated that the proposed conversion would save 3,000 gallons of petrol yearly for each vehicle, or an aggregate of 150,000,000 gallons. Mr. J. W. Noel Gordon, the Chairman of the Association, pointed out that 50,000 vehicles represented but a fraction of our motor transport fleet. The extent of the fuel saving would, he said, be dependent on the amount of fuel released for the making of producer gas and the quantity of producer gas plant which could be manufactured. On the Continent, he added, some 300,000 vehicles were operating on producer gas, of which about two-thirds were in Axis countries. Compared with that position, only a handful of vehicles were using producer gas in this country, which possessed the finest coals in the world from which gas could be made. The British Coal Research Association, with the assistance of the Department of Scientific and Industrial Research and industrial concerns, had evolved a producer gas plant which could be manufactured and used in large numbers, while Imperial Chemical Industries Ltd., had shown how fuel gas could be made from certain kinds of British coke and anthracite. Intensive research had enabled a scheme to be laid before the Government which provided for a standardised form of producer that could be made in quantity with comparatively little labour. The larger transport operators would, Mr. Jordan said, be able to get producer plants direct from the manufacturers and their own mechanics could install them in existing lorries. The supply of steel and labour which would be necessary to carry out the scheme would be infinitely less than that needed to build tankers to transport the equivalent quantity of petrol saved. It was further stated that fuel of the necessary quality could be manufactured at a number of centres in England, Scotland and Wales, and that this special fuel, together with anthracite fuel, could be distributed by service stations.

## PRESIDENT YOUNG TO VISIT QUEBEC AND MARITIME BRANCHES

Institute members in all the Branches east of Montreal will welcome the news that the president is planning a two weeks' journey to visit all the Branches in that territory. He will be present at meetings to be held in Three Rivers, Quebec City, Moncton, Sydney, Halifax, Saint John and Arvida, at which he will speak on Institute affairs, more particularly as regards the aid members can give in the war effort. Detail arrangements are now being made for these gatherings.

The president's tentative itinerary is as follows:—

Lv. Toronto.....	P.M.	Wednesday,	June 29th
Ar. Three Rivers.....	A.M.	Thursday,	July 30th
Meeting with St. Maurice Valley Branch			
Lv. Three Rivers.....	A.M.	Friday,	July 31st
Ar. Quebec.....	P.M.	Friday,	July 31st
Meeting with Quebec Branch			
Lv. Quebec.....	P.M.	Sunday,	August 2nd
Ar. Moncton.....	P.M.	Monday,	August 3rd
Meeting with Moncton Branch			
Lv. Moncton.....	P.M.	Tuesday,	August 4th
Ar. Sydney.....	A.M.	Wednesday,	August 5th
Meeting with Cape Breton Branch			
Lv. Sydney.....	A.M.	Thursday,	August 6th
Ar. Halifax.....	P.M.	Thursday,	August 6th
Meeting with Halifax Branch			
Lv. Halifax.....	A.M.	Saturday,	August 8th
Ar. Saint John.....	P.M.	Saturday,	August 8th
Meeting with Saint John Branch			
Lv. Saint John.....	A.M.	Tuesday,	August 11th
Ar. Rivière-du-Loup.....	P.M.	Tuesday,	August 11th
Lv. Rivière-du-Loup.....	A.M.	Wednesday,	August 12th
Ar. Bagotville.....	P.M.	Wednesday,	August 12th
Meeting with Saguenay Branch			
Lv. Bagotville.....	A.M.	Friday,	August 14th
Ar. Murray Bay.....	P.M.	Friday,	August 14th

Visitations of this kind make considerable demands on the president's time, but are willingly undertaken, for they do so much to promote and maintain that fellow feeling which unites Institute members wherever they reside. Further, they enable him to meet old friends and make new ones and they give Branch officers and members an enjoyable opportunity of paying their respects to the official head of the Institute to which they are proud to belong.

## THE JAMES WATT INTERNATIONAL MEDAL

Word has been received that the Council of the Institution of Mechanical Engineers has awarded this medal for 1942 to A. G. M. Michell, of Melbourne, Australia. Awards are made with the co-operation of engineering societies throughout the world; Mr. Michell's name was put forward by The Engineering Institute of Canada, and also by the Institution of Engineers, Australia, and the South African Institution of Engineers. It may be noted that the recipient of the medal in 1941, Dr. Aurel Stodola, was nominated by the Institute, as well as by the Swiss Society of Engineers and Architects, and the Czechoslovakian Society of Engineers.

The terms of reference for the James Watt Awards call for a scientist, an inventor and a producer who has achieved international recognition by his work as a mechanical engineer and in the application of science to the progress of mechanical engineering. A. G. M. Michell amply fulfills these conditions.

His name is best known as the discoverer of improvement in journal and thrust bearings, based on investigations which continued and greatly extended the classical study

## News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

of lubrication commenced by Beauchamp Tower and Osborne Reynolds. After publishing an important paper on the "Lubrication of Plane Surfaces," Michell patented his thrust bearing in 1905. The marine thrust bearing of to-day employs the principles he developed, which made possible the successful operation of marine propelling machinery of much greater size and power than previously, and differs little if at all from his original design. The work of Kingsbury in the United States along similar lines is well known.

In addition to this achievement Michell made other valuable contributions to the science of engineering, notably in his regenerative centrifugal pump and an opposed-piston crankless steam engine which is being manufactured in the United States. He is a Fellow of the Royal Society and an author of many technical papers. Personally he is of a retiring disposition, and is not a seeker for honours, so that the distinction now to be conferred upon him seems to call for special mention.

## AN ENGINEERING SOCIETY IN WARTIME

As yet restrictions due to war conditions have not seriously limited the activities of engineering societies on this side of the Atlantic, although many new kinds of effort have been necessary, and some lines of work have been made more difficult. There has been marked development in advisory and committee work, in which the societies are rendering important service to their governments, particularly as regards the technical and personnel questions for which their organization specially fits them. But conditions are by no means so favourable for the publication and discussion of professional papers. Even in Canada, censorship regulations—whose necessity everyone admits—make it difficult, if not impossible, to publish or discuss matter dealing with the very subjects in which engineers are now most interested. This applies even more forcibly in Britain, where the work of such institutions has to be carried on under conditions of which as yet we have had no experience in this country.

Aeronautical engineering, a branch to which the war has given immense impetus, is a case in point. The last number of the *Journal of the Royal Aeronautical Society*, for example, reports an increase in membership, some bomb damage to its headquarters in London, a surplus of income over expenditure, and the maintenance of a skeleton organization by most of the sixteen branches of the Society. But since the majority of its members are engaged on work for the Ministry of Aircraft Production, the Royal Air Force, or the aircraft industry, and therefore come under the Secrecy Act, and also since the only subject not barred by censorship seems to be civil aviation, it has only been possible to carry out a very meagre programme of society and branch meetings, although some informal technical discussions have been held. The Society is of course represented on or by a number of important committees which are actively concerned in the war effort and are giving results of great value. Its publications, and notably its *Journal*, have maintained their high standard in spite of paper shortage and other difficulties due to war conditions. An admirable series of abstracts from the scientific and technical press, and references to current scientific papers (occupying more than sixty pages in the May issue) is provided by the Air Ministry each month. This is an important feature of the *Journal* and is notable because it pays special attention to the work carried out in foreign countries.

The Engineering Institute of Canada has long maintained cordial relations with the Royal Aeronautical

Society. Institute members will recall\* that some years ago an agreement was entered into by the Councils of the two bodies, providing for the formation of an Aeronautical Section by any branch of the Institute. These sections have joint membership and consist of such corporate members and juniors of the Institute and technical members of the R.Ae.S. as applied for membership therein. Several of these sections were formed. The papers presented before them were published in a special section of *The Engineering Journal*, copies of which were forwarded to London for distribution to R.Ae.S. members. In return Institute members of our Aeronautical Sections received copies of the R.Ae.S. *Journal*. The Society recognized such Aeronautical Sections as local sections of its own, an arrangement which worked well and made for co-operation and joint interest in aeronautical work in Canada.

The agreement is still in force and functioned until quite recently. In fact the latest Aeronautical Section Reprint was issued in November, 1941. War conditions, however, caused a complete upheaval of our aircraft industry, an immense development in aircraft production, the building up of an air force to which some 150,000 men have been added since 1940, and the employment of a host of engineers and technically trained men in the industry, the Department of Munitions and Supply, and the Royal Canadian Air Force. These stirring events have left our members and those of the Royal Aeronautical Society who are now in Canada but little time or opportunity for meetings or discussions other than those connected with their special duties. This, and the frequent transfer of people from place to place, have, for the present, made it impossible to carry on the activities of the Aeronautical Sections. We look forward, however, to the time when this state of things will be remedied and the joint sections will again be able to make their contributions to aeronautical progress in Canada.

### FEES OF MEMBERS OVERSEAS

It might be appropriate to remind members that follow in the practice established in the last war, Council has authorized the remission of fees, upon request, for all members serving in the overseas forces. The official minute reads as follows:

"The remission of annual fees of members normally resident in Canada, appointed to or enlisting in His Majesty's Armed Forces, will be considered by Council upon written request, and on the following basis:

"The fee which is applicable at the first of the year is the amount for which the member shall be liable, and for which he shall be billed. If, subsequently in that year, conditions change, allowance will be made on the following basis:

"When service requires the member to leave Canada his fee will be remitted for the balance of the year, and his account credited accordingly.

"Members in the Naval or Air Services, who are intermittently absent from Canada because of the war, will be considered as eligible for this privilege.

"In computing the 'balance of the year' only half year periods will be considered, and the remission will date from January 1st or July 1st, whichever is nearest to the date at which notice of change is received at Institute Headquarters.

"Under such conditions all Institute services cease, except that it is the desire of Council to assist overseas members in any way that may be possible, and opportunities to render special services to such members will be welcomed. Members on active service are requested to keep Headquarters informed of their movements, as this is the only means by which a proper accounting can be rendered. This detailed information is also desirable as it is proposed to keep at Headquarters a record of all members who are on active service."

\*See *The Engineering Journal*, December, 1930.

It should be noted that members whose fees are thus remitted and who are on active service overseas may have *The Engineering Journal* sent to them on payment of one dollar per year.

If it is not found convenient to have some one here make the remittance, the amount will be left in members' accounts until such time as they return to Canada.

The Institute is honoured by the national services of its members, and this remission of fees is but a modest expression of appreciation which Council feels it is making on behalf of all members who remain in Canada.

### LETTER FROM WASHINGTON

The following article was contributed by E. R. Jacobsen, M.E.I.C., Engineering and Technical Assistant to the Director General, Commonwealth of Australia War Supplies Procurement, Washington, D.C. Mr. Jacobsen is on loan from the Dominion Bridge, Company, Limited of Montreal. It is hoped that his contributions will become a monthly feature of the *Journal*—EDITOR.

#### THE ALL ENGINEERS DINNER

It was recently my privilege to attend the largest all-engineering dinner ever held in Washington, D.C. The affair was arranged under the auspices of no less than sixteen national engineering societies—both civil and military. The subject was "The Engineer's Job in War Production." Over twelve hundred people sat down to dinner in the main ball room of the Mayflower Hotel—that rendezvous of politicians, statesmen, Hollywood celebrities and, now, a meeting place for interesting people from all over the world. Uniforms of all descriptions were very much in evidence. The three speakers were Lt. Gen. Brehon Somervell, Commanding General of the Services of Supply, Donald M. Nelson, Chairman of the War Production Board, and William L. Batt, Joint Chairman of the Raw Materials Board. The chairman of the evening was James W. Parker, President of the American Society of Civil Engineers.

It strikes me as particularly significant that the three men who head the three most important bodies in the field of supply and production should all be engineers. A few words about their background should be of interest.

General Somervell served in France in the last war as second in command of the 15th U.S. Engineers and was decorated three times. He has remained in the U.S. Corps of Engineers ever since. He made extensive surveys of the Rhine and the Danube under special commission from the League of Nations. At the request of the Turkish Government he carried out an economic survey of Turkey. Later, he was WPA Administrator for the City of New York. Recently, he was in charge of the construction of Army cantonments and completed in just over a year the construction of housing facilities for over one million men.<sup>1</sup> As Commanding General of the Services and Supply, he now holds one of the really important jobs in the U.S. Army.

At the last moment, Donald Nelson was prevented from attending in person. It is not always remembered that Donald Nelson is an engineer. He graduated in 1911 as a chemical engineer from the University of Missouri and worked for ten years as a chemist in the testing laboratories of Sears-Roebuck before he transferred to the merchandising side of the business. He eventually became executive vice-president of Sears Roebuck. He first came to Washington to work for the Treasury Department and was then made head of the purchasing division of the Office of Production Management. His present job as chairman of the War Production Board makes him the second most powerful man in the United States—second only to the president.

William L. Batt graduated as a mechanical engineer in 1907. He eventually became president of the SKF Company

<sup>1</sup>See "Citadels of Democracy" published by the U.S. War Department.

and is a past president of the American Society of Mechanical Engineers. He has been decorated by the King of Sweden for his contributions to international trade. He is now chairman of the Requirements Committee of the War Production Board and joint chairman, with Sir Clive Baillieu, of the Raw Materials Board which was set up as one of the direct results of the Churchill-Roosevelt Conference.

The following notes are the result of jottings made during this interesting evening.

The American productive machine should shortly be running full out. Never before has this machine been allowed to run without periodic stoppages and without the handicaps caused by financial considerations, political exigencies, and labour intrigue. We are about to discover the real measure of the productive capacity of the American people. Once this capacity is known, the long term implications cannot be ignored. If we take the national income as a measure of the productive capacity of the United States, we begin to see the trend. The national income for the best pre-war year was 85 billion dollars. This year the national income will be between 110 and 120 billion, with a further considerable increase expected in 1943.

Much of the present difficulty in the United States is the result of overlooking the fact that, though they were the largest consuming nation, they were also the largest importing nation in the world. Mr. Batt suggested that in future days the United States should guard against any repetition of the errors of this war by the constant maintenance of stock piles. He also stated that American industry had been ill equipped to meet certain specific military demands and argued that specialized war plants should not be dismantled after the war but maintained as part of the national defence.

It was argued that the supply of materials would be the deciding factor in the war and, while confidence in our position was expressed, the meeting was gravely warned that our supply problems could only be met by stern and drastic measures. The limit of available natural resources in many categories has already been reached and from now on we must rely upon what Mr. Batt called "mines above the ground." These fall into two classes. The first is in the elimination of waste. He said that it is impossible to overestimate the importance of scrap of all kinds—scrap will probably win the war. This is going to involve hard lessons for an extravagant people. The second "mine above ground," is in the field of specification and standardization and here can be found full scope for engineering ingenuity, skill, originality, and even audacity. Twenty-five per cent of our nickel consumption has been saved largely by a revision of specifications. The savings of both critical materials and productive capacities which have been effected by the railway standardization programme is an exciting story in itself.

*Fortune* recently listed the causes of production lags without mentioning bad management. Mr. Batt said that, while management had done a wonderful job, it has a bigger job still to do and much to learn. As examples, he pointed out, that if the thirty manufacturers of aeroplane engines were all as good as the top three, total production would be up 25 per cent; if the hundred and fifty machine tool manufacturers were all as good as the first three, production of machine tools would be up 45 per cent.

We were urged to pay even more attention to engineering and scientific laboratories. Considerable stress was laid on the importance of engineering education in war time. In the United States industry will require about 80,000 new engineers this year and the army about 12,000.

Mr. Batt did not feel that the engineering profession as a unit was fully in harness—engineers still had to learn to think and act and plan as a body. General Somervell asserted that America is now building tanks and planes in numbers that would astound and dismay the dictators but warned that transport afloat and ashore is still our greatest

bottleneck. The engineer who devises a scheme for increasing our transportation efficiency will be "as great a hero as the general who wins a battle in the field."

Speaking to the point that this is an engineers' war, General Somervell said that while the "road ahead may be dim with the dust of battles yet to fight" the ultimate result was not in doubt. "When Hitler put this war on wheels he ran it straight down our alley. When he hitched his chariot to an internal combustion engine he opened up a new battle front, a front that we know well. It's called Detroit. When Hitler took this war into the skies he rose into our own element. We'll meet him there on even terms. We're meeting him there already. From Brest to Berlin he feels our strength, and as the days of summer lengthen he'll feel it again and yet again without respite."

## CORRESPONDENCE

To the Editor:

Sir: Please allow me a few lines in your correspondence column to offer as a gift 21 bound volumes of the *Engineering News Record* from January 1920 to June 1930. They cover admirably a period of great technical progress and are being released only because a gain of space compensates for the trouble of consulting the company set on the same floor.

Delivery would be made at my office. The preferred recipient would be the library of a small university.

J. B. MACPHAIL,

16th June, 1942.

P.O. Box 6072,  
Montreal.

The following letters have been received from the students who have been awarded the Institute prizes in the various faculties of engineering:

—Editor.

Duparquet, Que.,  
June 6th, 1942.

The Editor,

The *Engineering Journal*, Montreal, Que.

Dear Sir:

I wish to thank very sincerely the Engineering Institute of Canada for the honour it has conferred upon me.

This award means really more to a student than a simple prize. It is an indication that he might be an asset to the engineering profession and be able to follow in the footsteps of all those engineers who have contributed to make our country what it is today, by bringing in his own efforts to its future development. I hope to be able, with your assistance, to keep up to it.

I always have had an interest in the Institute activities and desire to co-operate with it in every possible way. Would you be kind enough to inform me of which way I could actually participate and keep in touch with the Institute.

Yours very sincerely,

(Signed) CYRILLE DUFRESNE.

Saskatoon, Sask., June 7th, 1942.

The Editor,

The *Engineering Journal*, Montreal, Que.

Dear Sir:

Thank you very much for your letter and the honour you have bestowed upon me by your award of "The Engineering Institute of Canada Prize."

I would also like to thank you for your good wishes and hope that in the future I can continue to live up to the high standards of the engineering profession in Canada.

Yours truly,

(Signed) WILFRED GRAHAM.

R.C.O.T.C. "A 21"  
Barrie, Ont., June 9th, 1942.

The Editor,  
The Engineering Journal, Montreal, Que.

Dear Sir:

Your letter of May 29th has been forwarded to me and I was pleased to receive it.

I was quite surprised to be awarded "The Engineering Institute of Canada Prize" and may I take this opportunity to say that I greatly appreciate the prize.

Although I am not a registered member of the Institute now, I should like to become a Student member next year. I have attended a number of the Institute meetings in Winnipeg and hope that I shall be in a position to continue in the future.

My present address is hardly permanent as I am a student officer at the Ordnance Army Camp here in Barrie. I shall return to the University of Manitoba next year and after graduation will be a member of the Armed Forces.

I hope that this letter will prove satisfactory and again I will express my appreciation of the prize.

Yours truly,  
(Signed) J. R. WALDRON.

Galt, Ont., June 15th, 1942.

The Editor,  
The Engineering Journal, Montreal, Que.

Dear Sir:

On behalf of the junior students of Nova Scotia Technical College I thank you for the prize which you generously donate each year to a member of our class. As I was awarded the prize this year, I also wish to express my personal thanks.

Yours sincerely,  
(Signed) Wm. H. BOWES.

Toronto, Ont., June 16th, 1942.

The Editor,  
The Engineering Journal,  
Montreal, Que.

I wish to thank you for your recent letter regarding the award of "The Engineering Institute of Canada Prize" for 1942 at the University of Toronto.

As you must realize, this, my first direct contact with the Institute, is indeed a pleasant one. During my course I have often found the publications of the Institute of great assistance, and this present award will certainly serve as a lasting encouragement in the work that lies ahead.

I am aware of the invaluable contribution that the Institute is making in the engineering profession, and I look forward to the time when, through further associations with the Institute, I may direct a personal effort towards its success.

Yours sincerely,  
(Signed) J. M. HAM.

### THE ENGINEERING INSTITUTE OF CANADA PRIZE AWARDS 1942

Twelve prizes known as "The Engineering Institute of Canada Prizes" are offered annually for competition among the registered students in the year prior to the graduating year in the engineering schools and applied science faculties of universities giving a degree course throughout Canada.

Each prize consists of twenty-five dollars in cash, and having in view that one of the objects of the Institute is to facilitate the acquirement and interchange of professional knowledge among its members, it has been the desire of the Institute that the method of award should be determined by the appropriate authority in each school or university so that the prize may be given to the student who, in the year prior to his graduating year, in any department

of engineering has proved himself most deserving as disclosed by the examination results of the year in combination with his activities in the students' engineering organization, or in the local branch of a recognized engineering society.

The following are the prize awards for 1942:

Nova Scotia Technical College.....	William Henry Bowes
University of New Brunswick.....	G. Herbert Loane, S.E.I.C.
McGill University.....	Saul Bernstein
Ecole Polytechnique.....	Henri Audet, S.E.I.C.
Queen's University.....	Kenneth Morgan Clarke
University of Toronto.....	James Milton Ham
University of Manitoba.....	John Ross Waldron
University of Saskatchewan.....	Wilfred Graham
University of Alberta.....	Henry T. Steverson
University of British Columbia.....	C. Gordon Rogers
Laval University.....	Cyrille Dufresne
Royal Military College of Canada.....	No award—regular course discontinued during the war.

### RECENT GRADUATES IN ENGINEERING

Congratulations are in order to the following Juniors and Students of the Institute who have completed their courses at the various Universities:

#### McGILL UNIVERSITY

##### HONOURS, MEDALS AND PRIZE AWARDS

Cholette, Albert, Quebec, Que., B.Eng. (Chem.); British Association Medal; Honours in Chemical Engineering.  
Davis, John Frederick, Montreal, Que., B.Eng. (Elec.); British Association Medal; Honours in Electrical Engineering; Montreal Light, Heat and Power Consolidated First Prize; The Institute of Radio Engineers' Prize; The Engineering Institute of Canada Prize (1941); The Engineering Undergraduates' Society Second Prize for Summer Essay.  
Findlay, Allan Cameron, Westmount, Que., B.Eng. (Mech.); Honours in Mechanical Engineering.  
Mason, Vere Karsdale, Bridgetown, N.S., B.Eng. (Ci.); British Association Medal; Honours in Civil Engineering.  
Ouellette, Robert Pascal, Montreal, Que., B.Eng. (Ci.); The Robert Forsyth Prize in Theory of Structures and Strength of Materials.  
Simpson, Francis William, Montreal, Que., B.Eng. (EL.); Honours in Electrical Engineering; Montreal Light, Heat and Power Consolidated Second Prize.

##### DEGREE OF BACHELOR OF ENGINEERING

Anderson, John MacDonald, Ottawa, Ont., B.Eng. (Mech.).  
Anglin, Thomas Gill, Westmount, Que., B.Eng. (Mech.).  
Bain, Frederick Archibald, Montreal, Que., B.Eng. (Chem.).  
Baxter, John Frederick, Saint John, N.B., B.Eng. (Chem.).  
Bennett, John Robert Gordon, Montreal West, Que., B.Eng. (Elec.).  
Bogert, Frank Godard, Pointe Claire, Que., B.Eng. (Mech.).  
Bowie, Ralph Allen, Lachine, Que., B.Eng. (Elec.).  
Brett, John Edward, Montreal, Que., B.Eng. (Ci.).  
Cantwell, Edward Marcel, Outremont, Que., B.Eng. (Mi.).  
Chapman, Harris James Wesley, Sackville, N.B., B.Eng. (Mech.).  
Dunbar, George Gray, Stellarton, N.S., B.Eng. (Chem.).  
Garton, John McConnell, Boissevain, Man., B.Eng. (Chem.).  
Grant, Frank Alexander, Lachine, Que., B.Eng. (Elec.).  
Griesbach, Robert Johnston, Hampstead, Que., B.Eng. (Ci.).  
Griffin, Vincent Oswald, Brighton, Ont., B.Eng. (Mech.).  
Harkness, Andrew Dunbar, Lancaster, Ont., B.Eng. (Mech.).  
Holland, Henry Alfred Nelson, Montreal West, Que., B.Eng. (Ci.).  
Hudson, George Waugh, Montreal, Que., B.Eng. (Elec.).  
Hunter, Douglas David, Lachine, Que., B.Eng. (Mech.).  
Iliffe, Francis Henry, Montreal West, Que., B.Eng. (Elec.).  
Kennedy, Robert William, Montreal, Que., B.Eng. (Elec.).  
Lindsay, Gerald Alec Edwin, Westmount, Que., B.Eng. (Elec.).  
McCulloch, Urban Francis, Montreal West, Que., B.Eng. (Ci.).  
Martin, William Stormont, Montreal, Que., B.Eng. (Elec.).  
Norton, Howard William, Montreal, Que., B.Eng. (Mech.).  
Richardson, George William, Montreal, Que., B.Eng. (Mech.).  
Rogers, Frank Knox, Winnipeg, Man., B.Eng. (Chem.).  
Routly, William James, Montreal West, Que., B.Eng. (Mech.).  
Shaw, Douglas Thomas, Montreal, Que., B.Eng. (Elec.).  
Simpson, William Tyrie, Montreal, Que., B.Eng. (Elec.).  
Stapells, Robert Frederic, Montreal, Que., B.Eng. (Mech.).  
Stoppes, Reginald Edward, Cochrane, Ont., B.Eng. (Elec.).  
Ward, Walter George, Peterborough, Ont., B.Eng. (Elec.).  
Webster, John Alexander, Town of Mount Royal, Montreal, Que., B.Eng. (Elec.).  
Wells, James Edwin, Montreal, Que., B.Eng. (Chem.).  
Wilson, John Howard, Hudson Heights, Que., B.Eng. (Elec.).  
Wilson, William Henry, Farnham, Que., B.Eng. (Mech.).

#### UNIVERSITY OF MANITOBA

##### HONOURS AND MEDALS

Laird, David William, Winnipeg, Man., B.Sc. (Ci.); University Gold Medal; Honours in Civil Engineering.  
Pink, John Frederick, St. James, Man., B.Sc. (Elec.); University Gold Medal; Honours in Electrical Engineering.

## DEGREE OF BACHELOR OF SCIENCE

Anderson, Clarence Arthur, Winnipeg, Man., B.Sc. (Elec.).  
Bateman, Leonard Arthur, Winnipeg, Man., B.Sc. (Elec.).  
Beresford, Morris Maskew, Winnipeg, Man., B.Sc. (Elec.).  
Bowman, William Arthur, Hudson, Ont., B.Sc. (Ci.).  
Bradshaw, Thomas Earl, Winnipeg, Man., B.Sc. (Elec.).  
Buhr, Richard Kenneth, Winnipeg, Man., B.Sc. (Elec.).  
Dudych, Daniel, Winnipeg, Man., B.Sc. (Ci.).  
Galli, Joseph Nicholas, Winnipeg, Man., B.Sc. (Ci.).  
Gregory, Arthur Herbert, Winnipeg, Man., B.Sc. (Elec.).  
Hand, Dennis Herbert, Winnipeg, Man., B.Sc. (Elec.).  
Harvie, John Duncan, Winnipeg, Man., B.Sc. (Ci.).  
Lawson, Glenn William, Brandon, Man., B.Sc. (Ci.).  
Marantz, Oscar, Winnipeg, Man., B.Sc. (Ci.).  
Macfadyen, Allan Burt, Flin Flon, Man., B.Sc. (Elec.).  
Pratt, James Crawford, Winnipeg, Man., B.Sc. (Elec.).  
Schofield, Stewart Macleod, Winnipeg, Man., B.Sc. (Ci.).  
Smith, Robert Lovelace, Winnipeg, Man., B.Sc. (Elec.).

## UNIVERSITY OF ALBERTA

### HONOURS AND PRIZE AWARDS

D'Appolonia, Elio, Edmonton, Alta., B.Sc. (Ci.); High distinction in Civil Engineering.  
Ford, George, Edmonton, Alta., B.Sc. (Ci.); High Distinction in civil engineering; First Class General Standing in Applied Science; Association of Professional Engineers of Alberta Prize in Civil Engineering.  
Hall, Albert Henry, Edmonton, Alta., B.Sc., in Engineering Physics with High Distinction; First Class General Standing in Applied Science.

### DEGREE OF BACHELOR OF SCIENCE

Blackstock, William John, Edmonton, Alta., B.Sc. (Ci.).  
Charyk, Joseph Vincent, Lethbridge, Alta., B.Sc. in Engrg. Physics with High Distinction.  
Davies, Richard Llewelyn, Lusco, Alta., B.Sc. (Ci.).  
Grimble, Louis George, Edmonton, Alta., B.Sc. (Ci.).  
McManus, Ralph Norman, Edmonton, Alta., B.Sc. (Ci.).  
Martin, John Henry, Edmonton, Alta., B.Sc. (Elec.).  
Mitchell, Maurice Stephen, Foothills, Alta., B.Sc. (Ci.).  
Moseson, Stanley Gustav, Wetaskiwin, Alta., B.Sc. (Ci.).  
Phillips, Ronald Edward, Edmonton, Alta., B.Sc. (Elec.).  
Preboy, Joseph William, Fox Valley, Sask., B.Sc. (Mi.).  
Smith, Allen Cedric, Edmonton, Alta., B.Sc. (Ci.).  
Swallow, Murray Gordon, Edmonton, Alta., B.Sc. (Ci.).  
Willis, Lloyd Everett, Edmonton, Alta., B.Sc. (Ci.).

## UNIVERSITY OF TORONTO

### HONOURS

Extence, Alan Barr, Toronto, Ont., B.A.Sc. (Mech.); Honours in Mechanical Engineering.  
Livingston, Charles Burton, Toronto, B.A.Sc. (Engrg. Physics); Honours in Engineering Physics.  
Prideaux, Norman Llewellyn, Toronto, Ont., B.A.Sc. (Ci.); Honours in Civil Engineering.

### DEGREE OF BACHELOR OF APPLIED SCIENCE

Glynn, Walter Sylvester, Toronto, Ont., B.A.Sc. (Ci.).  
Quist, Jack Ernest, Peterborough, Ont., B.A.Sc. (Elec.).  
Shearer, Charles William, Windsor, Ont., B.A.Sc. (Elec.).

## QUEEN'S UNIVERSITY

### HONOURS AND MEDALS

Pasquet, Pierre Auguste, Kingston, Ont., B.Sc. (Ci.); Honours in Civil Engineering; Governor-General's Medal; Departmental Medal.

### DEGREE OF BACHELOR OF SCIENCE

Armstrong, Howard Elgin, Rodney, Ont., B.Sc. (Ci.).  
Carmichael, Douglas Alfred, Fort William, Ont., B.Sc. (Mech.).  
Chilman, William Richard, Hamilton, Ont., B.Sc. (Ci.).  
Haacke, Ewart Mortimer, Deloro, Ont., B.Sc. (Elec.).  
Hamilton, John Charles, Westport, Ont., B.Sc. (Chem.).  
McCallum, John Francis, Port Arthur, Ont., B.Sc. (Ci.).  
Seymour, David Llewellyn, Ottawa, Ont., B.Sc. (Ci.).  
Thomas, Jack Arthur, Belleville, Ont., B.Sc. (Mech.).

## NOVA SCOTIA TECHNICAL COLLEGE

### DEGREE OF BACHELOR OF ENGINEERING

Lewis, George Donald, Louisburg, N.S., B.Eng. (Mech.).  
MacAulay, Roy Daniel, Sydney, N.S., B.Eng. (Mech.).  
Macdonald, Ian Malcolm, Hopewell, N.S., B.Eng. (Mech.).  
Rossetti, Anthony Bruce, Sydney, N.S., B.Eng. (Mech.).  
Thompson, Alvin Henry, Pictou, N.S., B.Eng. (Mech.).

## THE UNIVERSITY OF BRITISH COLUMBIA

### DEGREE OF MASTER OF APPLIED SCIENCE

Breeze, John Ellis, Ottawa, Ont., M.A.Sc. (Elec. Engrg. and Physics).

## UNIVERSITY OF SASKATCHEWAN

### HONOURS AND SCHOLARSHIP

Buchanan, James Charles, Saskatoon, Sask., B.Sc. (Mech.); Distinction in Mechanical Engineering.  
Fast, Morris, Blaine Lake, Sask., B.Sc. (Mech.); Distinction in Mechanical Engineering.  
Garrett, Cyril, Wilkie, Sask., B.Sc. (Engrg. Physics); Great Distinction in Engineering Physics.  
MacCoy, Gerald Bates, Regina, Sask., B.Sc. (Mech.); Distinction in Mechanical Engineering.  
Mitchell, Jasmin Lewis, Orkney, Sask., B.Sc. (Ci.); Great Distinction in Civil Engineering.  
Seowcroft, Gordon Caverly, Bowsman, Man., B.Sc. (Ci.); Distinction in Civil Engineering.  
Staples, William Robert, Oxbow, Sask., B.Sc. (Mech.); Great Distinction in Mechanical Engineering; Association of Professional Engineers of Saskatchewan Scholarship.  
Thomson, Walter Barron, Regina, Sask., B.Sc. (Ci.); Great Distinction in Civil Engineering.

### DEGREE OF BACHELOR OF SCIENCE

Auld, Frank Mantle, Regina, Sask., B.Sc. (Mech.).  
Batanoff, George Boris, Blaine Lake, Sask., B.Sc. (Mech.).  
Bryce, Ronald Campbell, Drinkwater, Sask., B.Sc. (Mech.).  
Cox, Wilbur John, Landis, Sask., B.Sc. (Mech.).  
Giauque, Louis Frederick, High Point, Sask., B.Sc. (Mech.).  
Hall, William Francis, Regina, Sask., B.Sc. (Ci.).  
Hargrave, Herbert Thomas, Walsh, Alta., B.Sc. (Agric.).  
Hughes, Gordon Lyall, Broderick, Sask., B.Sc. (Mech.).  
McElroy, George Robson, Ormiston, Sask., B.Sc. (Mech.).  
Olafson, Ellaf Arni, Eston, Sask., B.Sc. (Mech.).  
Reynolds, Donald Doane, Biggar, Sask., B.Sc. (Mech.).  
Traynor, John Clair, Regina, Sask., B.Sc. (Ci.).  
Turner, Leslie Charles, Hudson Bay Jct., Sask., B.Sc. (Mech.).  
Tyerman, John Alexander, Prince Albert, Sask., B.Sc. (Mech.).  
Webster, Gordon Frederick, Elbow, Sask., B.Sc. (Ceramic).  
Wellington, John Richard, North Battleford, Sask., B.Sc. (Chem.).

## ECOLE POLYTECHNIQUE

### DISTINCTIONS ET PRIX

de Villers, R. Albert, Montréal, Qué., B.Sc.A., I.C., avec distinction. Médaille de Son Exc. le Lieutenant-Gouverneur de la Province, décernée au premier de sa promotion pour toute la durée des études. Médaille d'Argent de l'Association des Anciens Elèves de l'Ecole Polytechnique, décernée à l'élève classé premier de cinquième année. Médaille offerte par le Docteur Eugène Saint-Jacques pour succès dans les travaux d'application offerte à l'élève classé premier aux cours de Physique et d'Electrotechnique.  
Marsolais, Irénée, Montréal, Qué., B.Sc.A., I.C., avec distinction.  
Dansereau, René, Montréal, Qué., B.Sc.A., I.C., Médaille d'Or de l'Association des Anciens Elèves de l'Ecole Polytechnique, offerte à l'étudiant ayant présenté la meilleure thèse.  
Letendre, Lucien, Montréal, Qué., B.Sc.A., I.C., Médaille de Bronze de l'Association des Anciens Elèves de l'Ecole Polytechnique.  
Valiquette, Maurice, Montréal, Qué., B.Sc.A., I.C. Prix Paul D'Aragon pour succès en Mines.  
Rousseau, Jean-Melville, Montréal, Qué., B.Sc.A., I.C. Médaille de Bronze de l'Association des Anciens Elèves de l'Ecole Polytechnique.  
Saint-Jacques, Maurice, Outremont, Qué., B.Sc.A., I.C. Prix Ernest Cormier pour succès au cours d'Architecture.  
D'Amours, Albert, Montréal, Qué., B.Sc.A., I.C. Prix de la Cinquantième Promotion de l'Ecole Polytechnique, offert à l'élève finissant qui a présenté la meilleure thèse industrielle.

### DEGRES

Brazcau, Lucien, Montréal, Qué., B.Sc.A., I.C.  
Boisclair, Robert, Montréal, Qué., B.Sc.A., I.C.  
Tétreault, Jacques, Montréal, Qué., B.Sc.A., I.C.  
Martin, Adolphe, Montréal, Qué., B.Sc.A., I.C.  
Lefebvre, Gérard, Montréal, Qué., B.Sc.A., I.C.  
Dancose, Léon, Lévis, Qué., B.Sc.A., I.C.  
Boileau, Charles-Antoine, Montréal, Qué., B.Sc.A., I.C.

## THE UNIVERSITY OF NEW BRUNSWICK

### PRIZE AWARDS

Bishop, Percival William, Three Hills, Alta., B.Sc. (Ci.); Ketchum Silver Medal for the highest standing in fourth year Civil Engineering.  
Peabody, Gerald Stead, North Devon, N.B., B.Sc. (Elec.); Brydone-Jack Memorial Prize for the highest standing in fourth year Electrical Engineering.

### DEGREE OF BACHELOR OF SCIENCE

Baird, Robert Gordon, Saint John, N.B., B.Sc. (Elec.).  
Cox, Kenneth Victor, Fredericton, N.B., B.Sc. (Elec.).  
Jewett, Arthur Earle, Fredericton, N.B., B.Sc. (Elec.).  
Skelton, Eric Tudor, Fredericton, N.B., B.Sc. (Ci.).  
Smith, Walter Marshall, Fredericton, N.B., B.Sc. (Elec.).

### ELECTIONS AND TRANSFERS

At the meeting of Council held on June 20th, 1942, the following elections and transfers were effected:

#### Members

**Hale**, Frederick John, asst. colonial engr., Public Works Dept., Roseau, Dominica, B.W.I.  
**Hunt**, Edwin Harold, chief geologist i/c exploration dept., McColl-Frontenac Oil Co. Ltd., Calgary, Alta.  
**Lambert**, Noel Dudley, B.Sc. (Univ. of B.C.), Director of Engineer Services (Army), Dept. of National Defence, Ottawa, Ont.  
**Schmelzer**, Hans, Mech. Engr. (Staatl. Technische Hochschule, Karlsruhe, Germany), mech. engr., Robert A. Rankin & Co., Montreal, Que.

#### Junior

**Hailey**, Arthur Roberts Trail, B.A.Sc. (Univ. of B.C.), testman, Can. Gen. Elec. Co. Ltd., Peterborough, Ont.

### Affiliates

**Allen**, Charles Harry, sales engr., Montreal Office, Canadian Westinghouse Co. Ltd., Montreal, Que.  
**Both**, John, resident engr., No. 5 Manning Depot, Lachine, Que.  
**Hargreaves**, Welsford Thomas, asst. engr. and senior instr'man, aerodrome constrn., Scoudouc, N.B.

#### Transferred from the class of Junior to that of Member

**Benjafield**, Philip Grant, B.Sc. (Civil) (Queen's Univ.), instr'man, International Nickel Co. Ltd., Copper Cliff, Ont.  
**Malby**, Arthur Leslie Ernest, B.Sc. (Elec.) (Univ. of Man.), asst. industrial control engr., Can. Gen. Elec. Co. Ltd., Peterborough, Ont.

#### Transferred from the class of Student to that of Junior

**Giauque**, Louis Frederick, B.Sc. (Mech.) (Univ. of Sask.), design engr., B. Greening Wire Co. Ltd., Hamilton, Ont.  
**McCrary**, Donald Carman, B.Eng. (McGill Univ.), asst. gen'l. engr., Can. Gen. Elec. Co. Ltd., Peterborough, Ont.  
**McGregor**, Douglas Robert, B.Eng. (McGill Univ.), industrial control engrg. dept., Can. Gen. Elec. Co. Ltd., Peterborough, Ont.  
**Taylor**, Charles Gray, B.Sc. (Civil) (Queen's Univ.), instr'man, H.E.P.C. of Ont., Toronto, Ont.  
**Vatcher**, Chesley Holmes, B.A.Sc. (Elec.) (Univ. of Toronto), sales engr., carbon sales division, Canadian National Carbon Co. Ltd., Toronto, Ont.

#### Students Admitted

**Barchyn**, Donald Edward, B.Sc. (Elec.) (Univ. of Alta.), 313 Maitland Ave., Peterborough, Ont.  
**Brown**, George Henry, 1692 Leclair Ave., Montreal, Que.  
**Cunningham**, Carl Norman, B.Eng. (Nova Scotia Tech. Coll.), 46 Harding St., Fairville, N.B.  
**Keays**, Bryce Fraser, B.Sc. (Civil) (Univ. of N.B.), Newcastle, N.B.  
**Ross**, Gordon William (Univ. of N.B.), 513 King Street, Peterborough, Ont.  
**Watt**, John Simmons (Univ. of N.B.), 261 First Avenue, Ottawa, Ont.

## Personals

**W. F. Drysdale**, M.E.I.C., has recently been appointed executive assistant to the Hon. C. D. Howe, Minister of Munitions and Supply at Ottawa. Mr. Drysdale has also been named president of Machinery Service Limited, a Government-owned company employing skilled civilian refugees from enemy countries.

Mr. Drysdale joined the department in May, 1940, as director of munitions. Upon the expansion of the Munitions Production Branch, he became joint director-general of munitions production. Subsequently, he was named director-general of the industrial planning branch. From August, 1940 to February, 1942, Mr. Drysdale was chairman of the central committee of Sorel Industries Limited.

A highly trained mechanical engineer, Mr. Drysdale is a graduate of McGill University. He received his practical mechanical engineering training at the Pointe St. Charles shops of the Grand Trunk Railway, and seven years' experience in manufacturing and engineering with the American Locomotive Company were followed by three years of railroading with the United Fruit Company in Central America.

Mr. Drysdale was with the Steel Company of Canada, Limited, when the Great War broke out and he was responsible for designing and superintending much of the munitions production of that company. In 1916, he went to France in charge of the locomotive work undertaken there by the American Locomotive Company and the Montreal Locomotive Works. Following the war, he became managing director of the Worthington Pump & Machinery Company interests in Europe. In 1923 he founded the Brazilian Portland Cement Company in San Paulo. He has been vice-president and director of the Montreal Locomotive Works since 1932.

## News of the Personal Activities of members of the Institute, and visitors to Headquarters

**Arthur Duperron**, M.E.I.C., was elected president of the Canadian Transit Association at the annual convention held in Toronto last month. Mr. Duperron is the recently appointed assistant general manager of the Montreal Tramways Company.

**D. E. Blair**, M.E.I.C., vice-president and general manager of the Montreal Tramways Company, has been elected a member of the executive of the Canadian Transit Association.

**E. L. Cousins**, M.E.I.C., general manager of the Toronto Harbour Commission, has been appointed wartime administrator of the port of Halifax. He will report to the war committee of the Cabinet through the Minister of Munitions and Supply.

It will be his responsibility to direct the institution of any measures he deems necessary to assure the security of port facilities and of ships from time to time in or about the port, to assure the proper movement of traffic through the port, and to co-ordinate shipbuilding, ship repair, and salvage operations in or about the port with other port activities.

**Ira P. Macnab**, M.E.I.C., of Halifax, has recently been re-elected for ten years to the Board of Commissioners of Public Utilities for Nova Scotia.

**W. P. Dobson**, M.E.I.C., of Toronto, chief testing engineer of the Hydro-Electric Power Commission of Ontario, and former president of the Association of Professional Engineers of Ontario, was elected president of the Dominion Council

**W. P. Dobson, M.E.I.C., President, Dominion Council of Professional Engineers.**

**Dr. C. A. Robb, M.E.I.C., who recently joined the Aluminum Co. of Canada, Montreal, Que.**

**C. G. Cline, M.E.I.C., newly elected chairman, Niagara Peninsula Branch.**

of Professional Engineers, at the annual meeting held in Saint John, N.B. at the end of May. Born at Ballinafad, Ont., he received his education at the University of Toronto where he was graduated in 1911, at which time he joined the staff of the Toronto Hydro Electric System. From 1912 to 1914 he was an alumni research Fellow at the University of Toronto where he obtained his degree of Master of Applied Science. He then joined the staff of the Hydro Electric Power Commission of Ontario as a laboratory engineer. Mr. Dobson is a past vice-president of the American Institute of Electrical Engineers.

**de Gaspé Beaubien, M.E.I.C.,** vice-president of the Institute, is chairman of the Montreal Citizens' Recruiting Committee for Home Defence.

**Lieut.-Colonel G. E. Cole, M.E.I.C.,** who has been in Ottawa for the past year, on loan from the Department of Mines and Natural Resources, Manitoba, to the Wartime Bureau of Technical Personnel, returned to Winnipeg on June 1st to resume his duties as Director of Mines.

**Group Captain D. C. M. Hume, M.E.I.C.,** has been loaned by the Department of National Defence for Air to act as national director of the Air Cadet League of Canada. He was director of technical training at R.C.A.F. headquarters, Ottawa.

**F. C. Meehin, M.E.I.C.,** has been appointed director for the protection of oil reserves. Mr. Meehin, who is manager of the Montreal refineries of the Imperial Oil Company, has been technical adviser to the Departments of Munitions and Supply and National Defence since the outbreak of war.

**Frank L. Mitchell, M.E.I.C.,** operating manager of the Alliance Paper Mills Ltd., at Merriton, Ont., has been appointed technical adviser to the pulp and paper administration of the Wartime Prices and Trade Board. Born in Jamaica, West Indies, Mr. Mitchell came to Canada in 1912 and studied engineering at the University of Toronto. He was graduated in chemical engineering from McGill University in 1921. Since then he has had extensive experience in the technical and managerial field of the pulp and paper industry.

**W. G. McBride, M.E.I.C.,** head of the department of mining engineering and metallurgy at McGill University, has been appointed a member of the advisory committee to co-operate with G. C. Bateman, metals controller of the Department of Munitions and Supply.

**R. A. Strong, M.E.I.C.,** has been appointed director of the Munitions Contract Branch of the Department of Munitions and Supply. He had been consultant to the contracts branch since early in 1940 when he was loaned to the Department of Munitions and Supply by the Bureau of Mines of the Department of Mines and Resources.

**C. M. Gibson, M.E.I.C.,** has recently joined the staff of the R. F. Walsh Co. Ltd., Montreal, as chief engineer of the Lithcote Division. Born in Farnham, Que., Mr. Gibson started his engineering career with MacKinnon-Holmes Steel Co., Ltd., Sherbrooke, Que., as a structural steel detailer. From 1915 to 1932 he was with the Canada Cement Company Ltd., Montreal, and was engaged on general plant engineering. In 1933 he joined the staff of Jeffrey Manufacturing Co. Ltd., Montreal, as sales engineer. Since 1938 he had been with Link-Belt Ltd., at Toronto and Montreal.

**D. G. Geiger, M.E.I.C.,** transmission engineer, western area, Bell Telephone Company of Canada, has been re-elected a member of the Council of Queen's University for a six-year period. The chief function of the Council is to act in an advisory capacity to the administrative organizations of the University.

**O. W. Ellis, M.E.I.C.,** director of the department of engineering and metallurgy, Ontario Research Foundation, Toronto, was elected president of the Affiliated Engineering and Allied Societies of Ontario at the annual meeting of the Council held in Hart House, University of Toronto, on April 28th. Mr. Ellis had served previously as vice-president.

**Professor E. A. Allent, M.E.I.C.,** department of mechanical engineering, University of Toronto, has been elected vice-president of Affiliated Engineering and Allied Societies of Ontario.

**P. E. Doncaster, M.E.I.C.,** has been representing the Government interests since March 1st on the Dominion Magnesium Ltd. project near Renfrew, Ont. Mr. Doncaster is district engineer for the Department of Public Works of Canada at Fort William, Ont., and is a past councillor of the Institute.

**H. B. Stuart, M.E.I.C.,** who had been located in Toronto, lately has moved to Montreal with the intention of continuing a consulting practice in this city. Mr. Stuart is retired from the Canadian National Railways.

**A. R. Moffat, M.E.I.C.,** is now employed as reconnaissance engineer in the Naval service of the Department of National Defence at Halifax, N.S. Lately he had been employed with H. G. Acres Company at Kenogami, Que. Previously he was chief surveyor with Lamaque Gold Mines Ltd., Bourlamaque, Que.

**J. G. D'Aoust, M.E.I.C.,** has left his position with Consolidated Paper Corporation at Port Alfred, Que., to join the staff of Price Bros. & Co. Ltd., at Riverbend, Que. He had been employed for several years with Powell River Company Limited, at Powell River, B.C.

**B. G. Flaherty**, M.E.I.C., formerly chief engineer of Consolidated Marine Companies Ltd., and later of Marine Industries Ltd., Montreal, has been with Aluminum Company of Canada Ltd., since last February and has been travelling on the Carribean Sea.

**G. J. T. Gunn**, M.E.I.C., is employed with the James Stewart Associates Company, Inc., at Trinidad, B.W.I.

**John A. Ferrier**, Jr.E.I.C., formerly of the engineering department of the Ford Motor Company at Windsor, Ont., has been commissioned as a lieutenant in the special branch of the R.C.N.V.R. and has taken up duties at Halifax.

**John Kazakoff**, Jr.E.I.C., has now returned to Canada after four years spent in La Paz, Bolivia, with the Bolivian Power Company a subsidiary of Montreal Engineering Company Limited.

**Paul MacNeil**, Jr.E.I.C., is now residing in Arvida, Que., where he is employed by the Aluminum Company of Canada, Limited. He graduated from the Nova Scotia Technical College in the class of 1936. He was employed at Sydney and Glace Bay, N.S., with the Dominion Steel and Coal Corporation until early in 1940 when he came to Montreal to work in the mechanical department of the Steel Company of Canada.

**Jean Asselin**, M.E.I.C., has been appointed city manager at Three Rivers, Que. Upon his graduation from Ecole

**Jean Asselin, M.E.I.C.**

Polytechnique in 1929, he joined the staff of Frederick B. Brown, consulting engineer, Montreal, and was engaged in field and office work until 1932 when he went with the Quebec Streams Commission, Montreal. In 1934 he was appointed city engineer and manager at La Tuque, Que., a position which he occupied until his recent appointment.

**John F. Davis**, S.E.I.C., who was graduated in electrical engineering from McGill University this spring is now employed in the radio branch of the National Research Council at Ottawa. Mr. Davis was the recipient of the Engineering Institute of Canada Prize at McGill last year.

**L. F. Giaque**, S.E.I.C., has joined the staff of B. Greening Wire Company Ltd., at Hamilton, Ont. He was graduated in mechanical engineering this spring from the University of Saskatchewan.

**J. G. Pierce**, S.E.I.C., has been commissioned as a second lieutenant in the Royal Canadian Engineers and is at present stationed at Petawawa, Ont. He had been employed with Falconbridge Nickel Mines at Falconbridge, Ont., since his graduation from Queen's University in 1941.

**W. R. Staples**, S.E.I.C., has joined the staff of Dominion Engineering Works at Lachine, Que., and is employed in the hydraulic department. He was graduated this year from the University of Saskatchewan with the degree of B.Sc.

This photograph is of particular interest to members of the Institute. It shows Brigadier J. E. Genet, M.E.I.C., Chief Special Officer, Canadian Army, addressing employees of the Northern Electric plant in Montreal. On his left are P. F. Sise, M.E.I.C., president of the company, C. A. Peachey, M.E.I.C., works manager and A. B. Hunt, M.E.I.C., manager, special products division of the company.

**L. C. Turner**, S.E.I.C., has been commissioned as a sub-lieutenant in the R.C.N.V.R., and is stationed at Esquimalt, B.C. He was graduated in mechanical engineering from the University of Saskatchewan this spring.

**Paul A. Verdier**, S.E.I.C., who has lately been employed in the engineering department of Aluminum Company of Canada, has received his commission as sub-lieutenant in the R.C.N.V.R.

#### VISITORS TO HEADQUARTERS

**Roland Saint-Pierre**, M.E.I.C., division engineer, Roads Department, Beauceville, Que., on May 28th.

**John Kazakoff**, Jr.E.I.C., superintendent, Bolivian Power Company, Limited, La Paz, Bolivia, S.A., on May 28th.

**Y. R. Anderson**, M.E.I.C., ceramic engineer, The Cooksville Company, Limited, Toronto, Ont., on May 28th.

**Marcel Lamoureux**, M.E.I.C., district engineer, Department of Transport, Parry Sound, Ont., on May 29th.

**R. Donald McKay**, M.E.I.C., engineer, Department of Public Health, Halifax, N.S., on May 29th.

**Donald Ross**, M.E.I.C., Foundation Company, Mont Laurier, Que., on May 30th.

**C. C. Kirby**, M.E.I.C., secretary, Association of Professional Engineers of New Brunswick, Saint John, N.B., on June 1st.

**Fred R. Duncan**, S.E.I.C., Toronto, Ont., on June 2nd.

**A. D. Creer**, M.E.I.C., registrar, Association of Professional Engineers of British Columbia, Vancouver, B.C., on June 4th.

**W. B. Haselton**, S.E.I.C., Beebe, Que., on June 4th.

**G. L. Dickson**, M.E.I.C., engineer, Canadian National Railways, Moncton, N.B., on June 12th.

**A. Peebles**, M.E.I.C., Department of Civil Engineering, University of British Columbia, Vancouver, B.C., on June 19th.

**A. B. Rossetti**, S.E.I.C., Sydney, N.S., on June 19th.

**K. M. Cameron**, M.E.I.C., chief engineer, Department of Public Works, Ottawa, Ont., on June 20th.

# Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

**Lieut.-Colonel William Edward Andrewes, M.E.I.C.**, was killed last month in a traffic accident in England, while on active service. He had recently been promoted to Lieut.-Colonel and had assumed command of the 4th Regiment, Royal Canadian Engineers.

Born at Beamsville, Ont., on October 28th, 1902, he was educated at the local public school and at the Lake Lodge School at Grimsby, Ont.; then he went to the Royal Military College at Kingston where he received his diploma in 1924. He attended McGill University during the 1926-27 session and received his degree of B.Sc. in civil engineering in 1927. From 1927 to 1929 he attended courses at the School of Military Training, Chatham, England. Returning to Canada in 1929, he became an instructor at the Royal

Canadian School of Military Training at Halifax, N.S., and later was employed on engineer services and works in the district.

For some time in 1933 he was acting district engineer officer of M.D. No. 3 at Kingston, Ont. From 1934 to 1935 he occupied the same position in M.D. No. 2 at Toronto. He was appointed district engineer officer of M.D. No. 1 at London, Ont., in 1935.

At the outbreak of war he was stationed for some time at Petawawa, and Camp Borden and he went overseas in December, 1940. He attended Khaki College in England and was later attached to Canadian Military Headquarters in London. Early this year he was assigned as a major to the 2nd Field Company, R.C.E., and a few weeks ago he was promoted to the post which he occupied at the time of his tragic death.

Colonel Andrewes joined the Institute as a Junior in 1930. He was transferred to Associate Member in 1937 and became a Member in 1940.

## News of the Branches

### BORDER CITIES BRANCH

J. B. DOWLER, M.E.I.C. - *Secretary-Treasurer*  
W. R. STICKNEY, M.E.I.C. - *Branch News Editor*

Mr. A. E. Davison, transmission engineer with the Hydro Electric Power Commission, was the guest speaker at the monthly dinner meeting of the branch held in the Prince Edward Hotel on April 10th. He was introduced by Mr. A. H. McQuarrie, and spoke on **220,000-Volt Lines in Ontario—1941**, illustrating his paper with slides and films.

The principal problem of the transmission engineer is to keep electricity from escaping from the wires. Lightning troubles are the most prolific source of outages on transmission lines, but mechanical characteristics of the line are extremely important. Because they are continuously exposed to the elements, the fatigue problem becomes of prime consideration, and if the aluminum, copper and steel portions of a transmission line are not kept within recognized endurance limits, it is only a matter of time till incipient failures are evident.

Fatiguing comes from two sources, a small, continuous aeolian vibration and a dancing or galloping vibration which is less frequent but more strenuous. The latter is due to the effect of wind on ice coatings on the conductors.

Steel grillages are generally used for anchoring steel transmission towers to earth. These were formerly set by templates while backfilling was being done, but recently an alternative method of setting each leg and grillage independently by using a surveyor's instrument and reference stakes has been found more accurate and economical.

Films were then shown of methods of setting grillages and bases, also of erection of towers using horses and gin poles. Details of the stringing and splicing of conductors and installation of so called shock absorbers were shown on slides, as well as the effect of frost on footings. A moving picture film was then given showing the erection of a wood pole line in northern Ontario during winter, and the various problems encountered in setting footings and stringing conductors.

After an interesting discussion period, a vote of thanks was moved by Mr. S. E. McGorman and the meeting adjourned.

The May meeting was held on Friday, May 22nd in the Prince Edward Hotel. Mr. W. H. Furlong, K.C., chairman of the Sandwich, Windsor and Amherstburg Railway Com-

### Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

pany, and transportation controller of the Windsor Civilian Defence Committee, spoke on Canada's war effort as shared by the S.W. & A. Railway Company.

He gave first a brief history of the company since his appointment as chairman in 1938. The existing equipment was out of date, wires and tracks were badly worn and it was found, on investigation, that the operating and maintenance costs were more than the returns. To remedy this the fares were raised and new vehicles purchased which would operate at a lower cost. Before purchasing these a careful study of other transportation systems was made, and after consultation with the American Transit Association and Mr. W. R. Campbell of the Ford Motor Company, four buses were purchased and put on the Amherstburg line. These were carefully checked for two weeks and found to be satisfactory. More buses were purchased, and daily records of all passengers carried on every line at all times of the day were kept. This led to the establishment of a time table giving economical operation and efficient service.

The maintenance and repair of buses was difficult at first as there was no proper building for this nor men to do the work. Qualified motor mechanics were hired, tracks ripped up, buildings rearranged, lights, heating systems and modern machinery installed. A service department was set up which allows straight line service from terminal to garage, to gas and air pumps, to wash racks to street. Buses are checked over every night and washed inside and out. The walls of tires are whitewashed to prevent drivers from scraping curbs. Last but not least the drivers are urged to be courteous and helpful, as it is really they who sell the transportation for the company.

As regards the war effort, the S.W. & A. Railway Company have now assumed the obligation of carrying thousands of passengers to their daily work in essential war industries. Recently, to save gas and rubber, alternate stops on several main routes have been eliminated which on one route alone has resulted in about fifteen percent saving in gasoline.

Due to the increase in passengers being carried to essential war industries, at the instigation of the Transit Controller, an attempt was made to stagger working hours and avoid capital expenditure of buying more buses. The large automobile companies in the city have co-operated splendidly in this matter, and as a result, the S.W. & A. Railway Company have been able to save seven buses which other-

wise would have been required at on- and off-shift hours, and the plan is still uncompleted.

In cases of blitz when evacuation of the city would be necessary, the company now has over one hundred buses which could completely move the population of Windsor out of the city in thirty-six hours. With the street railway system this would have been impossible. There are also many cars, trucks and smaller buses strategically located in the city to aid as ambulances, etc., in cases of air raids.

In conclusion, Mr. Furlong proudly stated that many cities in both Canada and the United States have sent representatives enquiring about the success of our transportation system, and are considering the installation of a system patterned on exactly the same lines as the S.W. & A. Railway Company.

Mr. Furlong was introduced by Mr. G. Medlar and was heartily thanked for his interesting address by Mr. C. G. R. Armstrong.

### HAMILTON BRANCH

A. R. HANNAFORD, M.E.I.C. - *Secretary-Treasurer*  
W. E. BROWN, J.E.I.C. - *Branch News Editor*

On Tuesday evening, May 5th, members of the Hamilton Branch and visitors had the privilege of hearing Dr. L. M. Pidgeon speak on **Magnesium, Lightest Commercial Metal**. The meeting was held in the Lecture Theatre, McMaster University, and the attendance was 75.

Dr. Pidgeon is metallurgist for the new Dominion Magnesium Company, located at Haleys. The speaker, who is outstanding in the world of magnesium, prefaced his talk with a brief history of metals, dividing it into three parts. First; when only "native metals" were available, i.e., those found in nature as a metal, not ore. Platinum and gold come under such a heading and are soft and heavy.

The second phase came when the art of smelting was discovered. This resulted in the industrial world, as we know it to-day, enabling us to build steel structures, locomotives, etc. Such metals are heavy and strong. The third, and present epoch, surrounds the subject matter of the paper, i.e., metals that are strong and light.

The speaker pointed out that aluminium is relatively heavy when compared to magnesium; the densities being 2.7 and 1.7, respectively, and that because of this, members of a structure may be massively designed and thus have a high rigidity, in fact magnesium structures weight for weight are the most rigid of any metal. Generally speaking, magnesium is not pure, but in the form of an alloy with aluminium. The alloys run from 90 per cent to 98 per cent magnesium, the balance being aluminium with up to 3 per cent zinc and about 1.5 manganese. The alloying is carried out in crucibles, using a flux on top to prevent burning of the metal. In considering some of the metal's properties, burning was mentioned because as a powder it is very dangerous but in pieces such as form part of a machine it is perfectly safe. In a thermite bomb it burns readily after the thermite melts it. The metal is produced in several ways, depending upon what magnesium deposits are found in the district.

In the state of Nevada, U.S.A., the oxide is used which is treated with chlorine to form magnesium chloride which in turn is electrolysed to produce the metal. Sea water is also utilized, the magnesium chloride present being the source. In Canada large deposits of dolomite which is a type of limestone containing about 50 per cent magnesium carbonate, are utilized. The stone is first calcined to produce oxide which is then treated with a reducing agent to produce the metallic vapour, which is colled and collected. Research in various reducing agents has been one of the main phases of the work carried on by Dr. Pidgeon and his efforts have been rewarded with considerable success.

A very lively discussion followed the lecture.

The speaker, who had been introduced by Norman Eager,

was accorded a very hearty vote of thanks by Harold Cooch. In closing the meeting the chairman, Stanley Shupe, paid special tribute to the speaker for his informative address.

### KINGSTON BRANCH

J. B. BATY, M.E.I.C. - - *Secretary-Treasurer*

A very interesting address on **Aircraft-in-War** was given by Wing-Commander Morgan Keddie of the Norman Rogers Air-Training School at a branch meeting held at the Badminton Club, on March 20th.

Commander Keddie began his address with a discussion of the forces acting on an aircraft. He emphasized that the resultant from the total lift and the total drag are, to a certain extent, concepts in the mind of the aeronautical engineer and cannot be said to exist at any one place. The actual forces are the innumerable pressures and suction distributed over the whole area of the wing and fuselage. The resultant force and consequently, the lift and drag components are to be regarded chiefly as convenient ways of representing the aggregation of very small individual forces. The speaker differentiated between the induced drag which always accompanies the lift and the parasite drags on the airplane.

The lift which must equal the weight of the machine for static equilibrium is the product of the air density, the wing area, the velocity relative to the air squared and the coefficient of lift. The relationship among these quantities was very clearly explained and deductions made therefrom. Wing loading and engine horse power for the necessary thrust to maintain the lift required with heavy bombers was considered by the speaker. Commander Keddie predicted that the aircraft of the future, particularly fighter aircraft, would have engines approaching 2000 hp. each.

The speaker explained the outstanding details of propeller design and the characteristics of certain types. An airplane air-screw, using the name the speaker preferred (whereas the military authorities insist on its being called a propeller), at a given altitude, forward speed and pitch setting, absorbs power very nearly in proportion to the cube of its r.p.m. The intersection of the rated-power curve and the propeller-power curve gives the speed at which the combination will run at rated engine power to good advantage. The propeller is selected so that it will absorb the rated engine power at normal r.p.m. in level flight. Changing the speed by climbing or diving will move the propeller curve to the left or right and will alter the maximum engine speed at rated horse power accordingly.

The speaker gave descriptions of personal experience with propellers that failed to bite the air as an air-screw until certain speeds were attained. He explained that this was due to the blade angle and pitch being incorrect for the speed and power. This difficulty is eliminated by using controllable-pitch propellers. The propeller usually runs with this type at constant speed and the varying pitch takes care of the many variable factors involved. However, for purposes of design and aeronautical calculations pertaining to flight it is usual to use the curve of power required by a fixed-pitch propeller, and when this is plotted against engine speed the propeller-load curve is obtained. Though there is a slightly different propeller-load curve for each forward speed, the difference between the curves is slight, and since level flight is more usual, the propeller-load curve for normal level flight is the one generally used in airplane-engine power and fuel-consumption calculations.

After the formal address was completed, the meeting was given over to discussions and the answering of specific questions. These were many and varied. One question that was of interest was about the matter of using airplanes to spread poisonous gases over areas of country. The speaker explained that the airplane, according to his view, would not be used for this purpose to any extent, as it would be very inefficient and the results obtained would be insignificant.

## LONDON BRANCH

H. G. STEAD, J.E.I.C. - *Secretary-Treasurer*  
A. L. FURANNA, J.E.I.C. - *Branch News Editor*

On Thursday, May 21, the chairman of the Branch, Mr. F. T. Julian, presided over a complimentary dinner meeting to Mr. W. C. Miller, M.E.I.C. at the London Hunt and Country Club.

Mr. Miller is the city engineer of the city of St. Thomas, and was recently elected president of the Association of Professional Engineers of Ontario.

Following the dinner several speakers preceded Mr. Miller's address. Representing St. Thomas, Mr. Rowe, the city treasurer, and Alderman Curran, chairman of the Board of Works, both told of Mr. Miller's work in St. Thomas. Colonel I. Leonard, one of the first presidents of the Association of Professional Engineers of Ontario, gave an outline of the history of the Institute and the origin of the Association. Mr. J. A. Vance, a councillor of the Institute spoke of the ever increasing part engineers are playing in the war effort. Mr. H. F. Bennett summed up his tribute to Mr. Miller by saying that the London Branch honours itself in honouring Mr. Miller. The speaker was introduced by Mr. E. V. Buchanan.

Mr. Miller's chosen subject was **A Philosophy of Engineering.**

Opening his address the speaker showed how, in spite of the fact that men are daily reaping the harvest of the engineers' efforts, they fail to recognize in engineering, the personal man to man relationships which they readily see in the other professions. Even great engineers of our own time such as Harry Acres, designer of the Queenston Power Development, Professor Price who made it possible for us to have our electric clocks, and Col. Wm. J. Wilgus, designer of the New York Grand Central Station, receive little or no thought from those who enjoy the results of their labours.

What then has the engineer in common with other professions, or what right has his work to be raised to the dignity of a profession? The common bond is the great principle of trusteeship. Each is entrusted with the great values of our lives, even life itself, and the only security that he demands of his trusteeship is his professional integrity.

The desired recompense from any job is the fundamentals of life. But we may be thankful that there are other great satisfactions from the practice of engineering, far surpassing the pay cheque, which makes the difference between a laborious effort and a happy accomplishment.

The first of these is experienced at the conclusion of any job we do. We see traffic moving smoothly and rapidly over a newly channelized highway intersection we have designed. Or we watch a street lighting system come on for the first time. The joy of creative effort is one the engineer shares with the artist.

Another of the great rewards of the engineer is the abiding mental satisfaction in solving a complex problem.

The engineer is very keen for the rendering of that kind of service to mankind which expresses itself not so much in words, as in deeds. The definite consciousness that his work is making a positive contribution to mankind in helping to create a new order, is the third great satisfaction of the engineer.

The employer or client entrusts his wealth, his very life to the engineer. The appreciation of this responsibility of exalted trust, is characteristic of the profession, and is the fourth great satisfaction of engineering.

Mr. Miller's philosophy of engineering is best summarized in his own verses "The Road Builder".

I've never wished to sit aloof  
In a cottage by the roadside bare  
And watch the race of men go by  
Toiling and stumbling with their care.

I wish to be a friend to man  
But not in a quiescent mood  
To rest myself while others toil  
Along the dry and dusty road.

A helpful and kindly word  
Is good, and man, since time began  
Has been encouraged on his way  
By kindly word from brother man.

But words cannot compare with deeds  
When man is chafing at his goad.  
A helping hand is better far,  
Than ready tongue when dragging load.

So, I will build a highway broad  
And straight and level, where men ride  
From town and hamlet carrying  
The commerce of the countryside.

Man's load will thereby be made light  
And I will help each toiler grim  
Along his way by building roads  
That ease the path of life for him.

## NIAGARA PENINSULA BRANCH

J. H. INGS, M.E.I.C. - *Secretary-Treasurer*  
C. G. CLINE, M.E.I.C. - *Branch News Editor*

The annual meeting of the Niagara Peninsula Branch was held at the Leonard Hotel, St. Catharines, on May 21st. Mr. A. L. McPhail, branch chairman, presided and there was an attendance of 75. The members of the Branch Executive Committee, elected by the recent ballot, were introduced by the secretary. Appointments by the committee for the coming year were: Chairman, C. G. Cline; Vice-Chairman, G. E. Griffiths; Secretary, J. H. Ings. The guest speaker, Dean C. R. Young, president of the Institute, was then introduced by the chairman. After a few preliminary remarks about his recent trip to the Western Branches and about the affairs of the Institute in general, the President proceeded to speak generally on **The Engineer and the War.**

This is a war of the engineer and the scientist. For every fighting man at the front, it takes 18 persons to furnish him with the necessary supplies. The demand for technically-trained men is very great; by the end of 1943 several thousand additional engineers and technologists will be required. To meet this demand, it will be necessary to take engineers from non-essential industries and to draw back into the profession engineers who have drifted into other lines of work. Students will be graduating each year from our engineering faculties, but undergraduates in engineering should not be drafted into industry until they have completed their courses. In addition, it may be necessary to train men in short, special courses for particular lines of work.

The engineer is in demand during this war because of his special technical qualifications and also because he has been trained to clear thinking and exact measurement. In this war, industry must be as fluid as the battlefield. It requires engineers who can adapt themselves to frequent changes in design and who have sufficient imagination to think out new methods of increasing production and of improving the finished product. Engineers are filling important positions both in the armed forces and in industry. Of 3,500 graduates of the University of Toronto in the armed forces, 19 per cent are from the Faculty of Applied Science and Engineering, whereas engineers form only about 10 per cent of the total adult male population of comparable educational qualifications. A large number of Institute members are serving in the armed forces, including the Commander of the Canadian Army overseas and some of his most distinguished officers; many are in ordnance, the engineers, signals, the airplane detection service

and in the navy. At home, the engineer is found in war industry and in normal industry, in the public service and in vital research work. Thus the engineering profession is playing an important part in Canada's war effort, both at home and abroad. Truly, as Pythagoras said, "In the theatre of man's life, it is given only to God and the angels to be lookers-on."

The Institute, as a body, is also contributing to the war effort. The secretary, Mr. L. Austin Wright, has been loaned to the Wartime Bureau of Technical Personnel and later to National Selective Service to act as executive assistant to the director, Mr. E. M. Little. The Institute has interested itself in the engineering features of civilian defence and has sponsored courses of lectures on this subject by Professor Webster. Members of the Institute are taking an active part in the work of the sub-committee on Post-war Re-construction Projects, of which Vice-President K. M. Cameron is chairman. Mr. Wills Maclachlan is the chairman of an Institute committee recently set up by Council to study Industrial Relations, a matter of particular import in time of war and in the years following it.

The Engineering Institute of Canada is a comprehensive organization of engineers, respected and highly regarded by professional men throughout Canada. It fathered the provincial Associations of Professional Engineers and continues to back them up. However, there is still plenty of work to be done by the parent organization. As Col. Willard Chevalier has said, "There is more in the professional relationship than anything you can write into a statute." The professional man should have a broad education, catholic sympathies, should be devoted to the public welfare and should be able to appear in any society and to represent any cause with credit. The greatest contribution the Institute could make would be to foster this ideal among the members of the engineering profession in Canada.

A vote of thanks to the speaker was proposed by past-president A. J. Grant. The concluding feature of the programme was a showing of the moving pictures of the collapse of the Tacoma bridge.

### PETERBOROUGH BRANCH

A. R. JONES, J.E.I.C. - - Secretary-Treasurer  
J. F. OSBORN, S.E.I.C. - - Branch News Editor

The Peterborough Branch held its annual meeting at the Kawartha Golf and Country Club on May 20th, at which 34 members were present. Preceding the business meeting in the evening, the members participated in golf matches, and after the business meeting three motion and sound films were shown, followed by refreshments.

The following Executive was elected for the coming year:

C. R. Whittemore	D. J. Emery
F. R. Pope	A. J. Girdwood
I. F. McRae	J. Cameron (Ex-Officio)
R. L. Dobbin	H. R. Sills (Ex-Officio)

At an Executive meeting held on June 4th, the following members were elected for the coming season:

Chairman: D. J. Emery.  
Secretary-Treasurer: A. R. Jones.  
Meetings and Papers Committee: A. J. Girdwood.  
Social and Entertainment Committee: J. Cameron.  
Membership and Attendance Committee: A. L. Malby.  
Branch News Editor: J. F. Osborn.  
Branch Auditor: E. R. Shirley.  
Representative on Nominating Committee: W. T. Fanjoy.  
Students' Guidance and Counselling Committee: G. R. Langley.  
Committee on Post-War Problems: G. R. Langley.

### SAGUENAY BRANCH

D. S. ESTABROOKS, M.E.I.C. - Secretary-Treasurer  
J. B. D'AOUST, M.E.I.C. - Branch News Editor

A meeting of the Saguenay Branch of the Institute was held in the Protestant school at Arvida on the evening of May 18th.

It was the privilege of the members, on this occasion, to hear an address by Professor F. Webster, deputy chief engineer, of the Ministry of Home Security, London, England, on the subject of **Air Raid Shelters**. Professor Webster is considered one of the foremost authorities on the subject of air raid shelters for protection against high explosive bombs.

The various types of bombs used by the Germans in their raids on England were described and their characteristics discussed. This was followed by a detailed account of the experiments with various types of shelters and the evolution of the most satisfactory designs—work which was seriously hampered by the shortage, at that time, of the most commonly used structural materials.

The effects of bombs on structures, as discussed by Professor Webster, was very well illustrated by a film, after which the speaker answered a number of questions raised by the members. It was reassuring to Canadians to learn that the frame house common in this country could be expected to stand up comparatively well under a bombing raid and that the injuries and loss of life due to falling debris would in all probability be small as compared to that experienced in England.

Mr. N. F. McCaghey, branch chairman, called upon Mr. S. J. Fisher to express the thanks and appreciation of the members present to Professor Webster for his most interesting address.

### SAINT JOHN BRANCH

G. W. GRIFFIN, M.E.I.C. - Secretary-Treasurer

The Saint John Branch tendered a luncheon on the 22nd May at the Admiral Beatty Hotel, Saint John, to the Dominion Council of the Association of Professional Engineers of Canada on the initial day of their recent visit to New Brunswick. Thirty-three members of the branch attended.

The visit was the result of an invitation extended by the New Brunswick Association in October, 1940, to the Dominion Council that they hold their 1942 annual meeting in this province.

D. R. Smith, chairman of the branch, presided at the luncheon and other speakers were D. A. R. McCannel, M.E.I.C., of Regina, and W. H. Golding, president and councillor of the Association of Professional Engineers.

A report of the year's activities was delivered by President McCannel. He noted that the work of the Association was most important, particularly in war-time. He felt that the war presented a challenge to the Council in that "we must take our place in aiding with post-war problems."

Among those present at the luncheon were F. W. MacNiell, A. D. Creer, Vancouver; J. B. deHart, Calgary; P. Burke-Gaffney, Winnipeg; W. P. Dobson, Major M. Barry Watson, Toronto; C. L. Dufort, Montreal; F. W. W. Doane, Halifax; Professor E. O. Turner, W. J. Lawson, Fredericton; G. L. Dickson, A. R. Bennett, T. H. Dickson, Moncton; and J. M. M. Lamb and C. C. Kirby, Saint John.

### VANCOUVER BRANCH

P. B. STROYAN, M.E.I.C. - Secretary-Treasurer  
A. PEEBLES, M.E.I.C. - Branch News Editor

The Vancouver Branch concluded a particularly successful programme at a meeting on May 27th, in the Medical-Dental Building, when Professor Frank Forward, professor of metallurgy at the University of British Columbia, spoke on **Metallurgical Progress in the War**.

The measure of our future success depends upon those working on advances in technical knowledge. "The spirit of an age must not be judged on the finality of its achievement, but on the seriousness of its effort."

Metallurgy was an art up to the end of the last century, before which it had advanced but slowly, depending upon the wisdom of plant operators rather than upon any serious attempts to discover new methods or to improve processes. Such men as did carry on research work received little co-operation from those in the operation field and each tended to deprecate the efforts of the other. After 1870, there was a gradual change in which scientific research began to play a more important part in the direction of metallurgical processes, and a number of notable improvements came into use. One of the first great scientists in this field was Charles Benjamin Dudley, who set up chemical analysis specifications for metal products purchased by the Pennsylvania Railroad. These were soon copied by other railroads and later adopted by the steel manufacturers themselves. Andrew Carnegie enlisted scientific research in his steel mills, as did other operators, but progress was slow, and in 1890 the United States Steel Company employed only one research metallurgist.

More rapid progress was made in non-ferrous metals than in the iron and steel industry. In the early part of this century, chloride processes, flotation, and chemical composition were introduced. During the last war, very rapid developments took place in all branches of the field of metallurgy. Dural was discovered, and the electrolytic process for zinc and nickel were put into practice. Alloy steels were required for war purposes and by the end of the war, their production was on a thoroughly scientific basis. Efficiency and output increased very rapidly, and the quality of carbon steels improved tremendously. Alloyed and stainless steels were made available, and controlled grain size was made standard production practice. Soon after 1930 the continuous strip mill was developed, which

greatly increased the output of sheet steel for automobiles and many other products. The average life of steel products was increased by more than 100 per cent. The Bessemer process, which had remained rather stationary after the introduction of the open hearth furnace, was developed and brought under scientific control.

In the non-ferrous field the purity of metals was greatly increased, an important factor since extremely small amounts of impurities have pronounced effects upon the physical properties of metals.

In the present war the necessity has arisen to produce some metals no longer available, as a result of loss of imports and the increased demands. A limited amount of tin is being produced in British Columbia and low grade tungsten is being refined by new processes. Magnesium is now being made in several different ways to meet the tremendous demand for this metal. The expansion in the aluminum industry is well known. Electric furnace steel is being made in larger quantities for work requiring high quality control. Silver is being used as a tin substitute in many cases. Boron steels are being used, and carbide tools are playing a large part in the machining of parts. Induction heating, or a means of localized heat treatment is now quite common. Powdered iron is now used, eliminating much machine work, and resulting in a product of pure iron. The present trend in steel metallurgy is the improvement of hardenability, and good results are being achieved in steel and alloy metals.

There is still plenty of room for further knowledge in the field of metallurgy, and in several new phases which have recently been opened up. The chief gain in recent decades is that complete co-operation between the scientist and the operating engineer has been achieved.

The meeting was under the chairmanship of W. O. Scott, branch chairman, and closed with a vote of thanks proposed by P. Buchan.

## Library Notes

### NEW C.E.S.A. SPECIFICATIONS

The Canadian Engineering Standards Association has recently issued the following new standards:

#### A23 Concrete and Reinforced Concrete. 2nd ed.

The first edition of this specification was published in 1929 and the second edition has been revised extensively to take cognizance of the many developments that have taken place in concrete and reinforced concrete construction since the first edition was published. This specification is intended to cover the use of concrete and reinforced concrete in general. In such structures as arches, tanks, reservoirs, chimneys, etc., where specialization relates principally to the mechanics of design and details of construction, the general provisions of the specification may be applied with the modifications necessary to suit the special conditions. An extensive cross-reference index has been added for the convenience of the users of this specification. \$1.00 per copy.

#### A72T Alkali Sulphate Resisting Cement

This specification covers alkali sulphate resisting cement which is a modified Portland cement that resists to a considerable degree, the deteriorating action of alkali sulphate on concrete. This specification is published in tentative (mimeographed) form to provide for trial in the field prior to future publication as a formally adopted CESA standard. \$0.50 per copy.

### Book notes, Additions to the Library of the Engineering Institute, Reviews of New Books and Publications

#### C22.2 CESA Electrical Standards. Part 11 of the Canadian Electrical Code No. 14 Industrial Control Equipment for Use in Ordinary (non-hazardous) Locations. 2nd edition.

This specification applies to control and protective devices for electric motors and for industrial-heating apparatus, for potentials up to and including 2500 volts between conductors on ungrounded systems and 4500 volts between conductors on grounded-neutral systems, and intended to be employed in accordance with the Rules of Part 1 of the Canadian Electrical Code. Equipment for higher voltages shall be made the subject of special investigation. Fuses, circuit-breakers, snap switches, and transformers will only be judged under this specification in relation to their assembly as part of a control appliance. Individually they shall conform to the particular specification covering the type of device to which they belong. It should be noted that electrical instruments, such as meters, which may be mounted along with control apparatus as part of control equipment, are not covered by this specification. \$0.50 per copy.

#### No. 42 Receptacles, Plugs and Similar Wiring Devices. 2nd edition.

This specification is intended to apply to: 1. Attachment-plugs (caps and adapters) cord connectors, motor attachment-plugs

and current taps, rated at 20 amperes and less, at 250 volts and less, designed to be employed in accordance with the rules of Part 1 of the Canadian Electrical Code. 2. Receptacles and plugs rated at 200 amperes and less at 750 volts and less designed to be employed in accordance with the rules of Part 1 of the Canadian Electrical Code.

It should be noted that lampholders and pull-off plugs for electrothermal appliances are not included in this specification. \$0.50 per copy.

Copies of these standards may be obtained from the Canadian Engineering Standards Association, National Research Building, Ottawa.

### ADDITIONS TO THE LIBRARY TECHNICAL BOOKS

#### Industrial Statistics:

H. A. Freeman. N.Y., John Wiley and Sons, Inc., 1942. 6 x 9 in., \$2.50.

#### Electric Motors in Industry:

D. R. Shoults and C. J. Rife. Edited by T. C. Johnson. N.Y., John Wiley and Sons, Inc., 1942. General Electric Series. 6 x 9 1/4 in., \$4.00.

**Engineering Drawing and Mechanism:**

Harold J. Brodie. N.Y., Harper and Brothers Publishers (c. 1942). Rochester Technical Series. 8½ x 11 in., \$2.25.

**Bibliography on Circuit-Interrupting Devices 1928-1940:**

American Institute of Electrical Engineers, Committee on Protective Devices, N.Y., 1942. 26 p., \$0.80.

**Canadian Engineering Standards Association:**

Canadian Electrical Code pt. 2, Essential requirements and minimum standards covering electrical equipment. C22.2 No. 3, Construction and test of electrical equipment for oil-burning apparatus 2nd ed.—No. 64, Construction and test of cooking and liquid-heating appliances (domestic and commercial types)—No. 72, Construction and test of heating and heater elements replacement types.

**PROCEEDINGS, TRANSACTIONS****American Institute of Consulting Engineers:**

Proceedings of the annual meeting held January 19, 1942.

**The Institution of Mechanical Engineers:**

Proceedings July-December 1941. Vol. 146.

**University of Toronto—Engineering Society:**

Transactions and year book 1942.

**REPORTS****Association of Professional Engineers of Nova Scotia:**

Year Book 1941.

**Canada. Department of Labour:**

Report for the fiscal year ending March 31, 1941.

**Canada. National Harbours Board:**

Report for the calendar year 1941.

**Australia. Council for Scientific and Industrial Research. Bulletin No. 145:**

Friction and lubrication, report No. 1.—Part 1: The theory of metallic friction and the role of shearing and ploughing.—Part 2: The friction of thin metallic films.

**Alberta. Department of Lands and Mines:**

Report for the fiscal year ended March 31, 1940 and for the year ended March 31, 1941.

**U.S. Bureau of Standards. Building Materials and Structures Report No. 81:**

Field inspectors' check list for building construction.

**U.S. Bureau of Mines: Technical Papers:**

Collecting and examining subsurface samples of petroleum: No. 629—Technical and economic study of drying lignite and sub-bituminous coal by the fleissner process: No. 633—Design of air-blast meter and calibrating equipment: No. 635—Production of explosives in the United States during the calendar year 1940: No. 636—Index of coals tested in the Bureau of Mines survey of carbonizing properties of American coals: No. 637—Coke-oven accidents in the United States during the calendar year 1940: No. 640.

**Cornell University—Engineering Experiment Station: Bulletin:**

The buckling of compressed bars by torsion and flexure: No. 27—Flexural-torsional buckling of bars of open section: No. 28.

**University of Minnesota—Engineering Experiment Station—Bulletin:**

Pulp paper and insulation mill waste analysis. No. 19.

**University of Minnesota. Engineering Experiment Station. Technical Papers:**

Lightning discharge investigation: No. 38—The effect of fine aggregate on the durability of mortars: No. 39—Effect of surface resistance on thermal conductivity by the hot plate method: No. 40.

**Bell Telephone System—Technical Publications:**

Improved ceramic dielectric materials.—Programme-operated level-governing amplifier.—Stereophonic sound-film system.—Trajectories of electrons in an arbitrary field.—Monographs No. 1325-1328.

**Bell Telephone Laboratories:**

Your voice and the telephone by Franklin L. Hunt: Feb. 1942.

**Electrochemical Society:**

The use of statistical control in corrosion and contact resistance studies:—Principles of microelectrophoresis cells: Conversion of magnesite to periclase: Preprints no. 81-26 to 81-28.

**Edison Electric Institute:**

Specification for strand-eye anchor rods approved by Transmission and distribution committee. TD—2, 1942.

**Low-Frequency Shielding in Telephone Cables:**

Joint subcommittee on development and research, Edison Electric Institute and Bell Telephone System. Engineering report No. 48.

**Bonneval, Henri A. de:**

Review of the direct-current compound generator as used aboard ship. Reprinted from Marine Engineering and Shipping Review, March 1942.

**The Use of Air-Locks:**

George Oswald Boulton. Reprinted from the Journal of the Institution of Engineers, Australia, Vol. 14, No. 1, January 1942.

**Aluminium Research Laboratories:****Technical Paper:**

Typical tensile and compressive stress-strain curves for aluminium alloy 24S-T, Alclad 24S-T, 24S-RT and alclad 24S-RT products. No. 6.

**AIR RAID PRECAUTION****What the Citizen Should Know about Civilian Defense:**

Walter D. Binger and Hilton H. Railey. N.Y., W. W. Norton and Co., Inc. (c. 1942). 5½ x 8 in. \$2.50.

**Ministry of Home Security—Research and Experiments Department. Bulletin:**

Shelter design by Professor J. F. Baker. No. 27.

**BOOK NOTES**

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet the books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

**ACID-BASE CATALYSIS**

By R. P. Bell. Oxford University Press, New York; Clarendon Press, Oxford, England, 1941. 211 pp., diags., charts, tables, 9 x 5½ in., cloth, \$3.50.

A general account of the phenomena of catalysis by acids and bases is presented in

this book. The earlier chapters contain a systematic description of the laws governing catalysis in aqueous solution, with special reference to the work of Brønsted on salt effects and general acid-base catalysis. After a section on non-aqueous solutions, the last part of the book deals with recent attempts to obtain a molecular picture of the mechanism of catalysed reactions and their bearing on modern theories of reaction kinetics.

**ALLOY CONSTRUCTIONAL STEELS**

By H. J. French and F. L. Laque. American Society for Metals, Cleveland, Ohio, 1942. 294 pp., illus., charts, tables, 9½ x 6 in., cloth, \$4.00.

Based on a series of lectures, this discussion of the utilization of alloys in constructional steels illustrates the importance of the alloy steels and is also intended to provide help in the selection of steels for different classes of service. Following a general survey of the subject of alloy steels, both unhardened and heat-treated, the author covers service at sub-atmospheric and elevated temperatures, wear, corrosion and special treatments. The methods of identification of S.A.E. and A.I.S.I. steels are explained.

**DRILL PRESS, Job Training Units SHAPER and PLANER, Job Training Units**

(Dunwoody Series Machine Shop Training Jobs). 103 pp.

(Dunwoody Series Machine Shop Training Jobs). 115 pp.

American Technical Society, Chicago, Ill., 1942. Illus., diags., charts, tables, 11 x 8½ in., paper, \$1.25 each.

As in previous volumes of this set of manuals for machine tool training, the material consists of instruction sheets for jobs covering the setting up and operation of various types of machines as in actual practice. The jobs are progressively more difficult, and each is accompanied by a check sheet containing questions to be answered by the learner. Each manual contains hints on blueprint reading.

**EMPLOYMENT TESTS in INDUSTRY and BUSINESS, a Selected, Annotated Bibliography. (Bibliographical Series No. 67)**

Prepared by H. C. Benjamin. Princeton University, Industrial Relations Section, Princeton, New Jersey, 1942. 32 pp., 9 x 6 in., paper, \$0.25.

To aid war industries and agencies in canvassing the possibilities of employment tests this selected, annotated bibliography of the best available literature in the field has been compiled. The two largest sections cover material concerning specific types of tests, and reports of company experience and of research in the use of tests.

**ENGINEERING DRAWING AND MECHANISM**

(Rochester Technical Series)

By H. J. Brodie. Harper & Brothers, New York and London, 1942. 241 pp., diags., charts, tables, 11 x 9 in., cloth, \$2.25.

This textbook is one of a series developed as part of a programme for developing practical teaching materials which will be closely related to the actual requirements of various jobs in industry. The two sections of this book provide a sound foundation in the general phases of mechanical drawing and in the drafting of cams, gears and mechanisms.

**Fairhurst Manual of HIGH EXPLOSIVES, INCENDIARIES and POISON GASES, for Home Defense Workers and Wardens**

By J. Fairhurst. Fairhurst Book Co., Greenfield, Mass., 1942. 110 pp., tables, 7½ x 5 in., paper, \$1.00.

This pamphlet is intended for wardens and laymen interested in civilian defence, for

whom it provides a simple, understandable description of various explosives, incendiaries and poison gases, with instructions as to methods of protection.

### FIRE PROTECTION IN REFINERIES 3 ed. 1941

*American Petroleum Institute, Division of Refining, 50 West 50th St., New York. 116 pp., illus., diagrs., charts, tables, 10½ x 8 in., paper, \$1.00.*

A comprehensive review is presented of the principles underlying adequate measures for fire prevention, control and extinguishment, with the emphasis on prevention. An appendix contains detailed information and tabular data illustrative of the manner in which these principles have been applied in some typical refineries.

### (The) FIRST CENTURY and a QUARTER of AMERICAN COAL INDUSTRY

*By H. N. Eavensen. (Privately printed, Koppers Bldg., Pittsburgh, Pa., composed and printed at the Waverly Press, Baltimore, Md.), 1942. 701 pp., tables, charts, maps, 10½ x 7 in., cloth, \$8.00.*

Compiled mainly from original documents, this comprehensive history of the American coal industry presents an authentic picture of its development. The bulk of the material is arranged by states, with a brief section on the very early history and a general summary. Direct quotations from many sources and reproductions of original maps preserve the feeling of the early periods. 160 pages are devoted to an extensive compilation of production statistics, and there is a large bibliography.

### FLUORESCENT LIGHTING MANUAL

*By C. L. Amick. McGraw-Hill Book Co., New York and London, 1942. 312 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$3.00.*

This practical manual gives authoritative information on the construction and performance of all types of fluorescent lamps, covers principles and methods of calculating illuminating requirements and designing luminaires, and furnishes methods and special pointers for installation and maintenance. Working data are given, and a comparison of the economic factors of fluorescent and incandescent lighting is included.

### FOUNDRY SAND CONTROL

*By H. W. Dietert. Great Lakes Foundry Sand Co., United Artists Bldg., Detroit, Mich., 1941. 54 pp., illus., charts, tables, 11 x 9 in., cardboard, \$4.00.*

This book is designed to provide the detailed information on core and molding sands which every foundry needs, and to act as a reliable guide to the precautions needed to prevent defects in castings, and to the methods of discovering their causes and applying corrections when defects occur. Complex relationships have been simplified by charts, graphs and formulae to facilitate finding and applying the information given.

### FOUR TREATISES OF THEOPHRASTUS VON HOHENHEIM CALLED PARACELSUS, translated from the original German, with introductory essays

*By C. L. Temkin, G. Rosen, G. Zilboorg and H. E. Sigerist. Johns Hopkins Press, Baltimore, 1941. 256 pp., illus., 9½ x 6 in., cloth, \$3.00.*

In commemoration of the four hundredth anniversary of the death of Paracelsus, these four works by the great Renaissance physician are presented in English translation. Of these treatises the second, "On the Miners' Sickness and Other Miners' Diseases" is an interesting contribution to mining literature. This is the first monograph ever written on the diseases of an occupational group. The diseases of miners, smelter workers and metallurgists are discussed and treatments recommended.

### FUNDAMENTALS OF INDUSTRIAL PSYCHOLOGY (Industrial Series)

*By A. Walton. McGraw-Hill Book Co., New York and London, 1941. 231 pp., diagrs., charts, tables, 7½ x 5 in., cloth, \$2.00.*

This book has been prepared primarily for use as a text for foreman training in industrial plants. It states the essential concepts and principles of psychology and explains their application in industrial management. Topics discussed include aptitude and ability tests, psychological factors in production, fatigue problems and morale.

### GENERAL TRADE MATHEMATICS

*By E. P. Van Lewen. McGraw-Hill Book Co., Whittlesey House Dept., New York, 1942. 575 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$3.50.*

The mathematics needed to solve actual shop problems in manufacturing and mechanical operations is presented in a step-by-step manner for quick grasp and practical use. Beginning with various straight arithmetical operations, the book works through simple algebra and geometry to specific industrial calculations. A wealth of practical problems furnishes useful practice material.

### HANDBOOK OF CIVILIAN PROTECTION

*Edited by L. L. Snyder, R. B. Morris and others. McGraw-Hill Book Co. (Whittlesey House), New York, 1942. 184 pp., illus., diagrs., tables, 7½ x 5 in., fabricoid, \$1.25.*

This little book provides the basic information concerning protection in air attacks which the general public should have. In simple language it gives definite advice on air-raid conduct and services, fire fighting, incendiary bombs, poison gas, first aid, civilian conservation and salvage, and wartime nutrition. There is a bibliography.

### HOW TO READ ELECTRICAL BLUEPRINTS

*By G. M. Heine and C. H. Dunlap. American Technical Society, Chicago, 1942. Paged in sections, illus., diagrs., charts, tables, 8½ x 5½ in., cloth, \$3.00.*

The major part of this book is devoted to an explanation of the symbols used to represent the various pieces of electrical equipment which must be indicated on a blueprint. Owing to the diversified character of the electrical industry, separate sections are used for such major branches as house wiring, automobile wiring, motor and generator diagrams, etc. The book is copiously illustrated, including nine large sample blueprints as a practical aid.

### ILLUMINATION ENGINEERING

*By W. B. Boast. McGraw-Hill Book Co., New York and London, 1942. 274 pp., diagrs., charts, tables, 9½ x 6 in., cloth, \$3.00.*

The purpose of this text is to give electrical engineering students a detailed treatment of the fundamental concepts of illumination, their historical background and the interrelationships among them. Following a consideration of the present electrical sources of light, the book takes up the design and testing of illumination systems. A long list of recommended standards for commercial, industrial and public interior illumination is included.

### INTRODUCTION TO CHEMICAL THERMODYNAMICS

*By L. E. Steiner. McGraw-Hill Book Co., New York and London, 1941. 516 pp., diagrs., charts, tables, 9½ x 6 in., cloth, \$4.00.*

The author of this new text aims to acquaint the student with the fundamental theory of thermodynamics and of the relations between the thermodynamic functions; to prepare him

to utilize the various tables of thermodynamic data and the data found in chemical literature; and to give him a sound background for more extended work in thermodynamics. To this end the book deals with the basic laws and concepts of thermodynamics and with their application both to relatively simple chemical systems and to nonideal systems where the concepts of partial molal quantities and activities are useful.

### INTRODUCTION TO HEAT TRANSFER

*By A. I. Brown and S. M. Marco. McGraw-Hill Book Co., New York and London, 1942. 232 pp., diagrs., charts, tables, 9½ x 6 in., cloth, \$2.50.*

In this book the authors' purpose is to present the essential fundamentals of heat transmission in a treatment that is readily comprehensible and at the same time fairly comprehensive. Emphasis is placed upon acquiring a clear conception of the manner in which heat is transmitted and upon development of the fundamental mathematical expressions which apply to calculations of heat transfer through clean surfaces.

### MECHANICS OF FLUIDS

*By G. Murphy. International Textbook Co., Scranton, Pa., 1942. 329 pp., illus., diagrs., charts, tables, 8½ x 5 in., fabricoid, \$3.25.*

In this introductory textbook on the behaviour of fluids, the approach and techniques are those which have proved successful in the mechanics of solids. The basic method of analysis is that of the free-body, used in conjunction with the fundamental principles of mechanics, expressed in Newton's laws of motion. Numerous practical applications of the theory are cited, and numerical and laboratory problems are provided.

### METALLURGY

*By C. G. Johnson. American Technical Society, Chicago, 1942. 262 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, \$2.50.*

The purpose of this textbook is to present information on the subject of metals in such a way that the average untrained person will be able to obtain some working knowledge of the manufacture and behaviour of metals and their alloys. The questions at the end of each chapter help the student to check his understanding of the material covered, and a list of books and magazines useful for further reference is provided.

### MILLING MACHINE Job Training Units (Dunwoody Series, Machine Shop Training Jobs)

*American Technical Society, Chicago, Ill., 1942. 110 pp., illus., diagrs., tables, 11 x 8½ in., paper, \$1.25.*

This book covers jobs in connection with setting up and operating various types of milling machines, and forms part of a series of six manuals for training on different machine tools. A job check-sheet accompanies every job in order to test the learner's understanding before he starts on the job itself. Hints on blueprint reading and a list of useful shop knowledge items are included.

### MODERN SMALL ARMS

*Compiled by "Steel," Panton Publishing Co., Cleveland, Ohio, 1942. 66 pp., illus., diagrs., charts, tables, 11½ x 9 in., paper, \$1.00.*

This third of a series of handbooks on armament production compiled by the magazine "Steel" contains reprints of articles describing the construction and operation of various types of semi-automatic, machine and sub-machine guns. The types of small arms ammunition and representative manufacturing processes for cartridge cases are also described.

## (The) MUNICIPAL YEAR BOOK, 1942

Edited by C. E. Ridley and O. F. Nolting.  
[International City Managers' Association,  
1313 East 60th St., Chicago. 685 pp.,  
maps, charts, tables, 10 x 6½ in., cloth,  
\$8.50.

The Year Book provides an accurate picture of municipal conditions each year, discussing new developments, trends and the various activities, and providing much statistical information, directories of officials, etc., Maps showing all cities of over 5,000 population are included in the present issue, as is information upon metropolitan districts. Other new sections deal with city planning, city-owned parking lots and wartime organization.

## OPTICAL MINERALOGY (published formerly under the title "Thin-Section Mineralogy")

By A. F. Rogers and P. F. Kerr. 2nd ed. McGraw-Hill Book Co., New York and London, 1942. 390 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$3.75.

Part I of this volume deals with the preparation of thin sections of minerals and rocks, the use of the polarizing microscope, the optical principles which apply and the procedure for the identification of minerals in thin sections. Part II contains descriptions of the optically important properties of practically all the common minerals found in igneous, sedimentary and metamorphic rocks, and of the most important vein minerals. Microscopic identification of minerals in other than thin sections is also covered in this revised edition.

## OUTLINES OF FOOD TECHNOLOGY

By H. W. von Loesecke. Reinhold Publishing Corp., New York, 1942. 505 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$7.00.

The purpose of this book is to outline the more important processes used in preparing, preserving and storing all kinds of foodstuffs. Detailed descriptions have not been attempted, owing to the breadth of the field, but suggestions for further reading are appended to each chapter. Analyses and many other technical data are included, but no attempt has been made to discuss nutritive values.

## PRACTICAL CONSTRUCTION OF WARSHIPS

By R. N. Newton. Longmans, Green & Co., London, New York and Toronto, 1941. 318 pp., illus., diagrs., charts, tables, 10 x 6½ in., cloth, \$6.00.

This textbook is based on courses at the Royal Naval Engineering College and the Royal Naval Dockyard, and replaces an older text by N. J. McDermid, "Shipyard Practice as applied to Warship Construction." It deals with the principles of construction and erection of the structure and the more important

ships' services of modern warships. Chapters on launching, docking and undocking, and on the prevention of corrosion are included.

## PREVENTING FATAL EXPLOSIONS IN COAL MINES

By E. A. Wieck. Russell Sage Foundation, New York, 1942. 156 pp., 9½ x 6 in., paper, \$0.75.

This book presents a study of recent major disasters in coal mines in the United States as accompaniments of technological change. Six major disasters from explosions in 1940 are described and analyzed, explosion hazards and principles of safety with particular reference to mechanized mines are discussed, and the various agencies currently involved in or responsible for the promotion of safety in coal mines are designated.

## (The) RECOVERY OF VAPORS with Special Reference to Volatile Solvents

By C. S. Robinson. Reinhold Publishing Corp., New York, 1942. 273 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$4.75.

This work is an enlarged, revised edition of an earlier book, "The Recovery of Volatile Solvents." It aims to present, as simply and completely as possible, the fundamental principles involved in the recovery of vapors, with numerous illustrative examples, to discuss briefly the various factors entering into the design of recovery equipment, and to describe the standard forms of apparatus in more common use. It is intended for engineers and others in search of a course of study in the basic theory of the recovery of vapors, not as a reference book for experts.

## Short Course in TENSOR ANALYSIS for ELECTRICAL ENGINEERS

By G. Kron. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 250 pp., diagrs., charts, tables, 9½ x 6 in., cloth, \$4.50.

This volume contains a series of lectures delivered to students in the Advanced Course in Engineering of the General Electric Company. It provides a short outline of the tensorial method of attack of certain problems in electrical engineering and shows its application to those confronting the power engineer.

## SURFACE FINISH

### Report of the Research Department

By G. Schlesinger. Institution of Production Engineers, London, W.1, 1942. 231 pp., illus., diagrs., charts, tables, 9 x 5½ in., cloth, 15s. 6d.

In 1939 the Institution of Production Engineers began an investigation of the problem of surface finish. The present report covers the initial stage of the work. It gives the results of a study of limits of surface roughness already in use and as inspected by the

existing surface measuring appliances, undertaken as a first step toward the establishment of standards for measuring surface finish. These results are presented in detail. There is a bibliography.

## SURVEYORS' FIELD-NOTE FORMS

By C. E. Bardsley and E. W. Carlton. 2 ed. International Textbook Co., Scranton, Pa., 1942. 127 pp., diagrs., charts, tables, 7½ x 4½ in., fabrikoid, \$1.00.

This book offers a sample set of field notes for use with classroom lectures and a text on plane surveying, and is intended especially for students beginning that subject.

## TABLE OF NATURAL LOGARITHMS, Vol. 4, Logarithms of the Decimal Numbers from 5.0000 to 10.0000.

Prepared by the Federal Works Agency, Work Projects Administration for the City of New York. Published by the National Bureau of Standards, 1941, Washington, D.C. 506 pp., tables, 11 x 8 in., cloth, \$2.00 (payment in advance).

This last volume of a series of four contains the sixteen decimal place values of the natural logarithms of the decimal numbers from 5 to 10 at intervals of 0.0001. The previous three volumes contained the sixteen decimal place values of the natural logarithms of the decimal numbers from 0 to 5 at intervals of 0.0001 and of the integers from 1 to 100,000.

## (The) TECHNIQUE OF EXECUTIVE CONTROL

By E. H. Schell. 5th ed. McGraw-Hill Book Co., New York and London, 1942. 252 pp., 7½ x 5 in., cloth, \$2.00.

This book defines the tools of executive control, outlines the factors involved in the successful handling of others and gives practical methods for getting a maximum output of work with a minimum amount of friction. The equally important factors of maintaining cordial and mutually helpful relations with associates and superiors also receive detailed consideration. A new chapter, "Executive conduct and the national effort," shows the influence of the war on executive technique.

## (The) TECHNOLOGY OF NATURAL RESINS

By C. L. Mantell and others. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 506 pp., illus., diagrs., charts, maps, tables, 9½ x 6 in., cloth, \$7.00.

While the literature on synthetic resins is extensive, material on natural resins is not so readily accessible. This volume is designed to provide a summary of information on the latter group. The properties of the various resins and the methods of collecting and purifying them are described, and their uses in varnishes, paints, printing inks, etc., are presented in detail. A chapter is devoted to methods of testing.

# PRELIMINARY NOTICE

of Applications for Admission and for Transfer

June 27th, 1942.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.\*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

**Communications relating to applicants are considered by the Council as strictly confidential.**

The Council will consider the applications herein described at the August meeting.

L. AUSTIN WRIGHT, General Secretary.

\*The professional requirements are as follows:—

A Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupillage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

## FOR ADMISSION

BAINBRIDGE—ARTHUR STANLEY, of Hamilton, Ont. Born at Sunderland, England, June 2nd, 1899; Educ.: Two years mech. engrg., Sunderland Technical School; 1915-21, ap'ticeship in marine engrg., Wm. Duxford & Sons Ltd., Sunderland; 1922-28, mtce. (mech.), and shift engr., I.C. engines for power plant supply, James A. Jobling & Co. Ltd., Sunderland; 1930 to date, plant engr., respons. for mech., elec. & steam equipment, mtce. alterations & additions, development of special equipment, Porritts and Spencer (Canada) Co. Ltd., Hamilton, Ont.

References: J. T. Thwaites, C. H. Hutton, A. C. Macnab, A. R. Hannaford, P. Ford-Smith.

## FOR ADMISSION—Continued

BROOKS—KENNETH MAHR, of Welland, Ont. Born at Ottawa, Ont., April 22nd, 1906; Educ.: B.Sc. (Mech.), N.S. Tech. Coll., 1929; 1927-28 (Summers), Topographic Survey of Canada, Ottawa Suburban Roads Commission; 1929, Foundation Co. of Canada (Maritime); 1929-30, sales engr., Riley Engineering & Supply Co.; 1931-39, asst. engr. & master mechanic, Canadian National Carbon Co., Toronto; 1939-42, with National Carbon Co., 6 mos. in Edgewater plant checking equipment for new plant to be built in India, and from 1940 chief engr./i/c of organization of this plant in Calcutta; at present, gen. engrg. dept., Electro-Metallurgical Company, Welland, Ont.

References: A. Hay, T. C. Agnew, M. B. Watson.

DILLON—ELDRIDGE ARTHUR, of 467 Downie St., Peterborough, Ont. Born at Round Island, C.B., N.S., Jan. 17th, 1915; Educ.: B.Eng., N.S. Tech. Coll., 1941; 1941 (June-Aug.), junior instructor in radio, Dalhousie Univ.; Sept. 1941 to date, student, test dept., Can. Gen. Elec. Co. Ltd., Peterborough, Ont.

References: F. Cameron, G. R. Langley, D. V. Canning, B. I. Burgess, W. M. Cruthers, W. T. Fanjoy, H. R. Sills.

HARVEY—ERIC WILLIAM, of Montreal, Que. Born at North Sydney, N.S., July 16th, 1906; Educ.: 5 years ap'ticeship, marine & mech., Newfoundland Dockyards Ltd., St. John's, Nfld. Two additional years ap'ticeship drfsmen., same company; Three years as engr. at sea, passed exams, and obtained Board of Trade Engrs. Cert.; Seven years, shop supt., Jeffrey Mfg. Co. Ltd., Montreal; With paper company in Cornerbrook, Nfld., in engrg. dept., on design & layout of new boiler plant; With Canadian International Paper Co. Ltd., Three Rivers, on gen. engrg. design, etc.; March 1941, loaned by C.I.L. as co-ordinator, Wartime Machine Shop Board, Canadian Pulp & Paper Assn., i/c all war work in paper mill shops.

References: A. Cunningham, G. F. Layne, E. Cowan, L. Sterns, W. T. Bennett, J. Frisch, C. H. Champion.

LETTERICK—CAMERON JOHN, of 345 Robinson St., Moncton, N.B. Born at Keavan's, Scotland, June 7th, 1888; 1909-11, i/c steam plant, cheese factory, Dalreage, Scotland; 1912-18, asst. city electrician, and 1918 to date, city electrician and wiring insp., City of Moncton, N.B.

VAN DEN BROEK, Jan. A., of 785 Arlington Blvd., Ann Arbor, Mich. Born at Middelharnis, Holland, March 6th, 1885; Educ.: B.Sc., Univ. of Kansas, 1911; Ph.D., Univ. of Mich., 1918; R.P.E. State of Mich.; 1911, surveyor on rly. location; 1911-12, bridge engr., dftsman., Kansas City; 1911-12, detailer, Boston Bridge Works; 1912-14, designer, bridge dept., C.P.R.; 1914 to date, professor of engrg. mechanics, University of Michigan. Also consultant for various firms, and research for U.S.A. Govt.

References: C. M. Goodrich, P. B. Motley, P. E. Adams, A. Duperron, L. Trudel, L. A. Wright.

WATTS—THOMAS ORD, of Lampton Mills, Ont. Born at London, England, Sept. 18th, 1907; Educ.: B.Sc., Queen's Univ., 1933; 1928-31, Otis-Fensom Elevator Co. Ltd.; 1934-39, plant supt., E. L. Ruddy Co.; 1939-40, mgr., Claude Neon Company; 1940 to date, works mgr., Sutton-Horsley Co. Ltd., Toronto, Ont.

References: D. M. Jemmett, L. M. Arkley, E. G. Wyckoff, O. W. Ellis, W. J. W. Reid.

## FOR TRANSFER FROM JUNIOR

CHARLEWOOD—CHARLES BENJAMIN, of London, England. Born at Toronto, Ont., Aug. 10th, 1908; Educ.: B.Sc. (Mech.), McGill Univ., 1931; Assoc. Member, Inst. Mech. Engrs.; 1929, instr'man., C.P.R.; 1930, student engr., Canada Power & Paper Corp.; 1931, production foreman i/c coil winding, R.C.A. Victor Corp., Montreal; 1931-32, service engr., Canadian Diesel Engine Corp., Montreal; 1932-36, underground pumpman, mechanic, dftsman., lubrication foreman, boiler & turbine operator, Noranda Mines Ltd.; 1936-37, contract, proposition and service work on steam boiler plant, Babcock-Wilcox & Goldie-McCulloch Ltd., Galt, Ont.; 1937-40, design of steam boilers and related equipment, operation & service, also charge of erection, Foster Wheeler Limited, London, England; At present, Lieut., R.C.A. (St. 1931, Jr. 1937).

References: C. M. McKergow, C. W. Crossland, F. B. Rolph, A. R. Roberts, E. A. Allcut.

PETURSSON—HANNES JON, of Longlac, Ont. Born at Foam Lake, Sask., Oct. 24th, 1908; Educ.: B.Sc., Univ. of Man., 1930; R.P.E. Ont.; 1928-29, (summers) chairman, rodman, res. engr., highway constn., Dept. Public Works, Man.; 1931-36, instr'man. & res. engr. on location & constn. of highways, Ont. Dept. of Northern Development; 1937, gen. concrete design & dftng. for J. C. Krumt, constg. engr.; 1937-40, instr'man. i/c constn. & location, Dept. of Highways of Ont.; 1940-41, res. engr. i/c constn., Gananogue Airport, Dept. of Transport; March 1941 to date, instr'man. i/c constn., Dept. of Highways of Ontario, Longlac, Ont. (Jr. 1932).

References: G. H. Herriot, R. O. Paulsen, C. K. S. Macdonell, T. F. Francis, J. A. McCoubrey.

## FOR TRANSFER FROM AFFILIATE

HALTRECHT—ARNOLD, of Ottawa, Ont. Born at Berlin, Germany, Aug. 11th, 1902; (Naturalized British subject July 1935); Educ.: M.E., Technical University, Darmstadt, Germany; R.P.E. Ont.; 1928, testing high voltage apparatus, Voigt & Haefner, Frankfurt; 1928-29, designing radio equipment, Kramolin & Co., Berlin; 1930-31, estimating, designing, etc., chief elec. engr's office, C.N.R.; 1932-41, own business—Electroradio Engineering Co., Montreal. Designing & bldg. testing equipment and public address systems; April 1941 to date, elect. engrg. lab., National Research Council, Ottawa, Ont. (Affiliate 1940).

References: R. W. Boyle, B. G. Ballard, R. G. Gage, H. J. Roast, W. H. Cook, N. B. MacRostie.

# Employment Service Bureau

## SITUATIONS VACANT

**MECHANICAL DRAUGHTSMAN** experienced in piping and equipment layout, or heating and ventilating work for war work in Montreal. Apply to Box No. 2375-V.

**MECHANICAL ENGINEER** for Mackenzie, British Guiana. Man with machine shop experience preferred. Apply to Box No. 2441-V.

**MECHANICAL ENGINEER** for British Guiana. Some experience on diesels and tractors preferred. Apply to Box 2432-V.

**ELECTRICAL ENGINEER**, construction and maintenance of diesel electric locomotives for work at Mackenzie, B.G. Apply to Box No. 2536-V.

**MECHANICAL DESIGNING DRAUGHTSMAN**, on permanent moulds and die casting dies. Apply to Box No. 2537-V.

**CIVIL ENGINEER**, with actual pile driving and heavy construction experience required for work in British Guiana. Apply to Box No. 2538-V.

**YOUNG GRADUATE ENGINEER** required by machinery supply firm located in Montreal. Some selling experience preferred. State military status. Apply to Box No. 2539-V.

**CIVIL ENGINEER**, supervising construction operations in Mackenzie, B.G. Apply to Box No. 2549-V.

**MECHANICAL DRAUGHTSMAN**, for important war work in Montreal. Apply to Box No. 2550-V.

**ELECTRICAL ENGINEER** with ten to fifteen years experience. Theoretical electrical engineering. To undertake the various electrical engineering studies requiring ability to handle theoretical problems combined with knowledge of actual system requirements. Apply to Box No. 2557-V.

**MINING ENGINEER** with operating experience for work in Newfoundland. Single man preferred. Apply to Box No. 2558-V.

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to **THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.**

**ELECTRICAL ENGINEER** for Arvida. Testing and maintenance of system relays. Short circuit studies. Preparation of wiring diagrams, etc. Apply to Box No. 2559-V.

**ASSISTANT WORKS MANAGER** with machine or boiler shop experience, or both, by engineering firm in western Ontario. Permanent job for progressive man not afraid of work. Apply to Box No. 2560-V.

## SITUATIONS WANTED

**GRADUATE MECHANICAL ENGINEER**, military exempt. Age 33, married. Detail experience in mechanical departments of paper-making, construction and foundry work. Available immediately. Location immaterial. Desirous of executive or production position with prospects of advancement. Apply to Box No. 1650-W.

**DESIGNING DRAUGHTSMAN**, M.E.I.C. Age 47. Married. Location immaterial. Experienced in estimates, design, layouts and details of industrial buildings. Presently employed but desirous of change with prospects of advancement. Apply to Box No. 2439-W.

**GRADUATE CIVIL, STRUCTURAL ENGINEER**, M.E.I.C., middle age. Twenty years' experience estimator, designer, and sales engineer. Excellent references. Open for engagement. Apply to Box No. 2440-W.

**CIVIL ENGINEER**, Jr.E.I.C., age 28, Canadian, married. McGill graduate '37. Employed since graduation with large industrial concern. Enthusiastic, energetic, seasoned with five years shop experience. Understands labour. Study made of management from the shop floor. In responsible position but desirous of following natural bent for organizing. Opportunities available with present employers unsuitable. Work leading to development as planning engineer, administrator, manager or personnel representative desired. Good background, strong, clean character, excellent health, best of references. Home city, Montreal. Work near a city preferred. Location and salary considered but type of work to be determining factor. Apply to Box No. 2441-W.

**ELECTRICAL ENGINEER**, age 34, twelve years experience in design, manufacture and application of fire protection systems. Good general knowledge of mechanical engineering, experience with tool design machine tools and shop practice. Trained in business administration and accustomed to responsible charge of large staff. Available immediately. Apply to Box No. 2442-W.

## FOR SALE

Transit, Buff and Buff Mfg. Five-inch circle, brass telescope and sliding leg tripod. One nick in the vertical half-circle, but no other damage. Thirty-year old instrument, but not much used. Would sell for \$225.00. Apply Box No. 45-S.

## RADIO BROADCASTS

on "THE ENGINEER AT WAR"

Dr. R. L. Sackett, of The American Society of Mechanical Engineers, announces that beginning Thursday, July 16, the National Broadcasting Company will broadcast from 6.30 to 6.45 p.m., over its nationwide network and possibly also by short wave a series of eleven radio programmes dealing with the contributions of engineers to the prosecution of the war.

The idea of telling the world by radio about engineers and their war activities came from a series of radio programmes put on the air in 1941 by the American Institute of Electrical Engineers. The success of this series led the American Society of Civil Engineers, The American Institute of Mining Engineers, The American Society of Mechanical Engineers, The American Institute of Electrical Engineers and The American Institute of Chemical Engineers to appoint three representatives of each society to form a committee to consider a possible programme and report to each society. Dr. Sackett is a member of this committee.

The programme selected is one which is intended to reflect the

varied contributions of engineers to the prosecution of the war. The committee began its deliberations before Pearl Harbour was attacked and had scripts under way on blackouts, bombs, and damage to structures.

The National Broadcasting Company and the Office of Civilian Defense enthusiastically endorsed the committee's proposal and have been generous in their help and approval of scripts so far submitted. Controversial matters are included in the broadcasts and changes will be made when requested by OCD up to the minute that a programme goes on the air. In this way the latest authoritative information will be given.

The material has been prepared by eminent men or by those selected from their staffs because of special knowledge. The scripts have then been woven into a story which presents a few of the striking features of the part played by engineers in some of the more important fields.

### PUMPING CONTROL

"Rotax" electric-operated control as employed in pumping applications is described in an 8-page bulletin, No. B-294, just issued by Foxboro Company, Montreal, Que. This bulletin shows "Rotax" controllers of the recording and indicating type, together with specimen chart records and installation photographs. The text is largely devoted to waterworks and sewage engineering but also covers pumping applications which are common in various industrial fields. Schematic diagrams of typical pumping installations are also given.

### PACKING RING

Joseph Robb & Company, Limited, Montreal, Que., have just issued a 4-page folder which gives sectional views showing component parts of "Hunt-Spiller" duplex sectional lip type packing ring for locomotive service and also describes its construction. This folder also tells how to determine when renewals should be made, and gives directions for renewal, and methods of application of this type of packing ring.

### SCIENTIFIC INSTRUMENTS

A 20-page catalogue has been issued by Frederick C. Baker & Company, Toronto, Ont., featuring tachometers, thermo switches, hydrometers, thermometer dials, recording and indicating thermometers, laboratory instruments, pressure gauges, vacuum and compound gauges, thickness and speed indicators, stack thermometers and magnifiers. The catalogue also gives descriptions, specifications, performance applications and price of each.

### REFERENCE LIST

Mussens Limited, Montreal, Que., have made available bulletin No. 10, 16 pages, which is a ready reference list of all types of new, used and rebuilt machinery and supplies for coal yards, contractors, factories, lumbering, paper mills, mines, railroads and municipalities, handled by this company.

### SOLDERING IRONS

Canadian General Electric Co. Ltd., Toronto, Ont., have issued a 2-page leaflet, CGEA-2619A, giving tables of specifications and renewal parts for types I and CI General Electric soldering irons of various sizes. Construction details and reasons for their popularity are also included.

### NICKEL IN OIL REFINING

The International Nickel Company, Inc., New York, N.Y., have published a 30-page bulletin, C-2, which describes how nickel, Monel metal and Inconel are specially useful in resisting refinery corrosives such as sulphuric and hydrochloric acid, solvents, caustic soda and brine. Illustrations are given of many types of refinery equipment, along with tables and graphs showing corrosion rates in different metals; details of small parts are also illustrated. Properties of Monel, "S" Monel, nickel, Inconel castings and nickel-clad steel are given, together with notes on fabrication and technical service by the company.

### INDUSTRIAL INSULATION

A 14-page bulletin issued by Fiberglas Canada Limited, Oshawa, Ont., illustrates Fiberglas products including insulating blocks, "PF" insulation in bats and panels, metal mesh blankets, insulating and finishing cements, mastic and wool. Performance and applications of each are given and their advantages for ventilating, heating, air conditioning, plumbing and weatherproofing are shown. Also included are photographs illustrating how the product is handled and cut to fit.

## The Geologists' Paradise

The province of Nova Scotia is the geologists' paradise because all ages of rocks from Mesozoic down to Precambrian are predominately displayed within a relatively small area.

Fossil ferns and stems found in the coal measures are the palaeo-botanists' delight.

Pitching anticlines, synclines and anticlinal domes are prominently displayed in the Precambrian sediments.

The rock exposures around Minas Basin are the museum curators' favourite hunting ground for zeolites.

Shortage of gasoline and tires may curtail your proposed motor trip—but come just the same—the province is well served by the two largest railway systems on the North American continent, and inter-connecting bus lines.

### THE DEPARTMENT OF MINES

HALIFAX, NOVA SCOTIA

L. D. CURRIE  
Minister

A. E. CAMERON  
Deputy Minister

### ABRASIVE CUT-OFF WHEELS

Norton Company of Canada Limited, Hamilton, Ont., have issued a 28-page booklet illustrating and describing uses of abrasive cut-off wheels in industry, telling of their advantages over metal saws and comparing various bonds. The booklet also explains the selection of the right type of wheel and how to use it and what speeds are suitable, and tables of recommendations of wheels for dry and wet cutting are added for a hundred materials.

### AIR RAID SYRENS

A 6-page folder is being distributed by Burlec Limited, Toronto, Ont., illustrating the Burlec-Carter twin-note air raid syrens and controls, and gives sizes, capacities and performance, with descriptions of controls and directions for setting them up. Also included are interconnection diagrams, wiring diagrams, control dimensions, wire size tables and dimension tables.

### ASBESTOS SUIT

Mine Safety Appliances Company of Canada, Limited, Toronto, Ont., have issued Bulletin No. CF-7, illustrating and describing the "M.S.A." one-piece asbestos protective suit. Details are given of its construction and also lists industries or services where fire hazards call for its use.

### CARBON TOOL STEEL

Jessop Steel Company, Limited, Toronto, Ont., have published an 8-page booklet outlining the history of the Company, and describing each step in the manufacture of its products, from ingot to finished tool. Analysis, tempers and applications for each tool are given and critical range diagrams are also added. A tempering diagram listing step by step directions for hardening is also included.

### CONNECTION DIAGRAMS

Canadian Westinghouse Company, Limited, Hamilton, Ont., have issued, in bulletin form, a reprint from Factory Management and Maintenance, October, 1941, by E. B. Ankerman, Westinghouse Electric & Manufacturing Company. This reprint, H-210, shows connection diagrams for pushbutton circuits, with explanations. Definitions of terms used with pushbutton applications are given, together with fundamental rules for obtaining control sequence for low-voltage protection.

### PRESSURE INSTRUMENTS

Taylor Instrument Companies of Canada Limited, Toronto, Ont., have available for distribution Catalogue 76 JF, 28 pages, which fully describes the bourdon spring, bellows and manometer type instruments for indicating, recording and controlling pressures. All the latest information on gauge, differential and absolute pressure and vacuums can be found in this catalogue. The Taylor indicating mercury gauges for absolute pressures and vacuums are listed, as well as complete information on Taylor charts for pressure recorders and controllers.

### SCREWS AND BOLTS

A folder recently issued by The Steel Company of Canada Limited, Montreal, Que., and Hamilton, Ont., entitled "A New Head Takes Half the Work Out of Screw Driving," accompanies the announcement that this Company have been appointed sole licensees for manufacturing "Phillips" recessed head screws in Canada. The folder describes and illustrates these products, at the same time features the advantage of this type of recessed head for screws and bolts. Four types of Stelco Phillips head screw drivers and power bits are also described.

### CORRUGATED PIPE

The Pedlar People Limited, Oshawa, Ont., have published a folder illustrating and describing the various uses for Pedlar's "Metal Built" products. Views are shown of processes in manufacture of culvert pipe and of the methods of shipment and installation.

### WHEEL DRESSING MANUAL

"For Grinder Men Only" is the title of a 24-page booklet issued by Canadian Koebel Diamond Tools Limited, Windsor, Ont. This is a wheel dressing manual for grinder operators and combines concise statements of informative facts with attention-directing headings and humorous drawings which help to emphasize each point. It is virtually a treatise on the dressing of grinding wheels and contains much information of special importance to operators in shops where there is such a variety of work that it is not practical to have a special tool for each kind of work.

### RESUSCITATION AFTER ELECTRIC SHOCK

Canadian Line Materials Limited, Toronto, Ont., have published a 6-page bulletin, No. 4245, which is a reprint of an article by Mr. Charles F. Dalziel appearing in Volume 20, No. 2, of the company's house-organ, "The Line." It reviews the mechanisms of death due to severe electric shock and deals with methods of resuscitation including the "prone pressure method" and the "pole top method."

### DIAL-INDICATING THERMOMETERS

Catalogue 1170, 18 pages, just issued by C. J. Tagliabue Manufacturing Company, Brooklyn, N.Y., features "Tag" standard dial-indicating thermometers. The catalogue is illustrated and gives performance, dial ranges and specifications and lists and describes the thermometers' various uses; also gives illustrated descriptions, with dimensions, specifications and capacities, of electric contact alarms, connecting tubes, standard all-stainless steel bulbs, plain capillary bulbs, adjustable connection bulbs, fixed-stem indicating thermometers and bakelite cases. Other catalogues of "Tag" instruments are listed.

# CONSTRUCTION FEATURES ON THE EXTENSION OF THE SANTURCE STEAM PLANT, PUERTO RICO

J. T. FARMER, M.E.I.C., and E. A. GOODWIN, M.E.I.C.  
*Montreal Engineering Company, Limited, Montreal, Que.*

Paper presented before the Montreal Branch of The Engineering Institute of Canada on March 19th, 1942.

**NOTE**—The information contained herewith supplements the paper on "The Modernization of a Puerto Rico Steam Plant," by the same authors, published in the June issue of the *Journal*.

In carrying out the latest extension of the power plant of the Puerto Rico Railway, Light & Power Company, in San Juan, Puerto Rico, a number of problems of construction arose which are of some interest.

A construction schedule was drawn up in Montreal, but as is often the case, could not be followed exactly as planned. The matter was of some urgency as the power company needed the new unit as soon as possible.

It was known that a number of changeover jobs and dismantling operations had to be done in sequence, before the real work of new construction could begin. The old steel chimney had to be removed to allow for the extra bay necessary on the north end of the building, and before this could be done it was necessary to construct a new breeching from the old low pressure boiler system into the new concrete stack. The low pressure steam main had to be re-routed to make way for the new high pressure boiler. Also, the station switchboard which was located at the extreme north end of the building had to be removed and re-located. Each one of these operations had to be done in such a way as to reduce the period of shut-down to a minimum.

But on December 29th, 1940, the 5,000 kw. unit No. 5, the largest and latest addition to the station stripped its blading and disarranged the whole carefully arranged schedule. It became impossible to shut down any of the low pressure units or boilers until No. 5 was on the line again. The two old boilers and the 500 kw. turbo-generator that were about to be dismantled were therefore put back in service and the steel stack had to remain until stoppage for changeover was possible.

Due to the conditions at the hydro plants at this time, the steam plant was being called on to carry a base load of about 8,000 kw., and this with a nominal capacity of 12,000 kw. all told. With the largest unit out of commission this nominal capacity was reduced to 7,000 kw. For the time being the maintenance of the supply became a hand-to-mouth performance. It is to the credit of the operating staff that they managed to carry the load through this critical period, without any dislocation of the service.

It was therefore necessary to change the order of procedure, early in February, 1941, and while the completion of the contract took somewhat longer than originally estimated, it would seem that after allowing for the breakdown, the load conditions, the weather, the war and its effect on labour conditions and delivery of materials, a very expeditious job was carried out and the final results were not too unsatisfactory.

It was found that in general, the unskilled labour available was willing and hard working, but of a low order of education. Racially the labourers ranged from jet black to sunburned white, being composed of Negroes, Indians, Spanish and mixtures of all these races. Most of them were illiterate and lived under the poorest conditions in squatters' huts, build at the edge of the bays and inlets around San Juan. They were, however, a happy crowd and responded very quickly to decent treatment. Tempers, however, were quick and quarrels between them not infrequent. Many a morning showed the results of "a few words" in the form of cuts and bruises. The skilled workers, such as carpenters, fitters, etc., were intelligent and, when relieved from the fear of unemployment, were willing to work hard.

The Puerto Rican engineers and technical men are of quite a high order and take a keen interest in the work. At Rio Piedras they have a University consisting of modern buildings set in a spacious campus, and staffed with American professors. It is quite evident that the engineer graduates have been very thoroughly grounded and are very keen to use the knowledge gained there. The only criticism which might be levelled at them would be a slight lack of initiative and a tendency to look for leadership to any one in authority who might be working with them.

The Puerto Ricans really excel in the making of concrete structures, and if properly watched, make a very good job of it indeed. They seem to have a natural instinct for formwork and make and install it in double quick time. They have to be carefully watched, however, when it comes to mixing concrete, as they appear to be great believers in using plenty of water in the mixing, without any regard to the cement water ratio. The consequence is that unless some engineer is placed over them at the mixer, great variation in the batches occurs, some being wet and others much wetter. One of the contractors' foremen told me, at the beginning of the job "that concrete always cracks," and this became one of the problems of the job—to see that the mix was such that the risk of cracking was at least reduced to a minimum.

Labour of any kind, skilled and unskilled, on this particular contract was very difficult to obtain, owing to the tremendous activity on the Island due to war work. The construction of many naval and military projects together with civilian extensions and alterations to docks, etc., caused a scarcity of available men, and the best of them were all snapped up long before we began our project.

The contractor, who incidentally carried out the extensions in 1936 and 1938 became inundated with new work. After the signing of the contract in November 1940, he obtained a contract from the Waterman Lines to build a new wharf and buildings, and another one from the Navy of some million and a quarter dollars, both of which contracts had very binding clauses regarding progress. As this man, although very capable, was at best only equipped for work under ordinary conditions it will be realized that his lack of equipment and his limited ability to give full personal attention to our work tended to hamper progress.

An interesting difference between this project and the ordinary run of construction lay in the erection of the new extension over the top of the old building and then, after all sheeting had been put in place, removing the old structure from the inside. (Fig. 1). This, of course, had to be done whilst retaining continuous electrical service. Some very careful planning was necessary when removing the old roof trusses, but we were fortunate enough to completely dismantle everything without any mishap and without stopping a machine.

The foundations for the new building, lying well outside the boundaries of the old structure, presented no particular difficulties. The turbine room pit floor, located 13 ft. below turbine room floor level made it necessary to sheet and shore, but as the ground there consists of, in the main, good sharp sand, the driving of the sheet piling was easy and quickly done. One trouble, however, was experienced at the north end of the building where there is a concrete tank 16 ft. 6 in. deep. This tank is very important as the cooling water for all the low pressure units is drawn from here. On excavating for the north wall it was discovered that the tank was leaking from an old crack about 9 or 10 ft. down. Excavation had to be stopped, sandbags placed and pumps

operated to keep the water out of the excavation for the east wall. A form was made and placed inside the tank. No. 1, 2 and 3 units were then shut down, the tank emptied and a concrete liner 8 in. thick extending from the bottom of the tank to the top was cast. This work was carried out very expeditiously, as the whole job was completed inside of 48 working hours and the shut-down was less than 24. It was fortunate, however, that No. 5 unit had just been brought into operation again and made a shut-down possible.

In the centre of the building some difficulty was experienced in underpinning the centre columns. The old foundations were only about 6 ft. below turbine room floor level and it was necessary to excavate down to below the 13 ft. level, propping up the steel columns B<sub>1</sub>, B<sub>2</sub> and B<sub>3</sub>, forming a concrete foundation column under them, and a continuous wall between them.

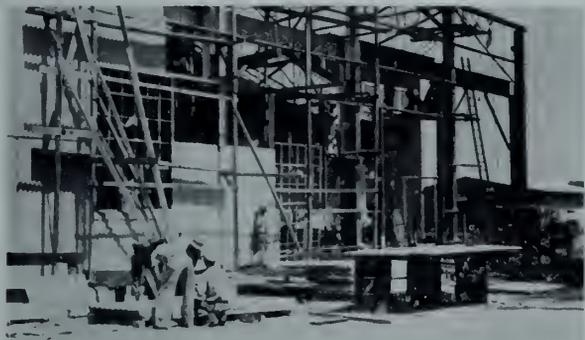

Fig. 1—East wall of turbine room looking towards northwest.

The piping and equipment both on the east and west side of the columns were very close indeed and the sheet piling had to be driven almost touching the formwork. Water trouble was experienced as two streams came in, in such quantities that a three inch centrifugal pump had to be kept going all the time.

The subsoil was not too good here and as it was not possible to get in with a pile driver, it was decided instead of piling under the columns to make a spread footing for the pit wall and put in enough reinforcement that some support would be given to the column foundations.

One of the greatest difficulties met with during the building of the turbine room pit was water. Being so close to the bay and so much below sea level this had to be coped with as well as some small streams that were flowing from south to north.

As mentioned before, the contractor was very short of reliable equipment and his pumping equipment was the most unreliable of all. Two three-inch antiquated gasoline driven clack pumps were installed but never at any time were both operating due to breakdowns and finally we had to lend him a three inch motor driven centrifugal.

After the floor of the pit was cast the pump had still to work continuously to keep the water anything like under control.

It was finally discovered that most of this leakage was coming up through the bottom of the sump which up to this time had been unsuspected.

In making this sump, a steel box without a bottom had been forced down into the sand and the inside excavated. The concrete sump was then formed, but it was finally discovered that water was coming in from two places close to the bottom. In order to cure this a form was finally put in about 6 in. from the bottom, with 2½ in. pipes coming out above floor level. Over the form the sump was filled with rock and sand and a 6 in. concrete slab laid over the top at floor level. Four holes were then punched in the floor outside the box. When the concrete was set a cement gun was attached to one of the pipes and a thick grout was forced down under air pressure until the

grout appeared at the top of the other pipe, which was then capped and pressure re-applied. After some time the grout appeared at two of the holes made in the floor. We then changed the gun over to the second pipe, capping the first one. When grout appeared at the other two holes in the floor, the form was removed and the grout allowed to set; after which the top slab was broken out. This appears to have cured the trouble and the whole floor was afterwards surfaced.

The pumphouse was an interesting structure to build and as it was an extension of the one built in 1936, care had to be taken to keep the building looking symmetrical.

The work consisted in sinking six concrete piles 10 x 10 in. x 35 ft. long, cutting off the tops after they had been driven to refusal and capping them with reinforced concrete beams. On top of and integral with the beams was cast a 6 in. floor with a rectangular hole 14 ft. 10 in. x 7 ft. in it to receive the precast pump suction box.

The piles were located by falsework attached to the existing building, the pile driving barge approaching the falsework and when in position allowing the pile to sink as far as it would by its own weight. This appeared to be an average of about 12 ft., after which it was driven by means of a three-ton steam driven pile driver. When all were driven the supports for the formwork consisting of 3 x 12 in. planks were bolted in exact position on the piles and using the planks as a platform support, the tops of the piles were cut off and their reinforcing rods laid over. The floor—or rather, under-floor, was then formed and cast and after setting, a temporary plank floor was laid down. On this the form for the suction box was made, care being taken to make the form as nearly as possible over the hole that the box had to go through. As the box, when finished weighed approximately 19 tons, it will be seen that too much lateral movement was not advisable.

At the bottom of the box stirrups were cast in each corner for lowering purposes. These stirrups were an afterthought put in on the job, but they saved quite a lot of work and avoided the use of a diver to release the tackle after the box was lowered into place.

#### TURBINE FOUNDATION

Due to the delay in completing the turbine room pit, it was decided to construct the formwork for the turbine foundation outside in the open and so save some time. Accordingly, a flat piece of land was chosen and the work laid out and constructed there in such a manner that it could easily be taken down and re-erected in place.

The foundation was 15 ft. high by 10 ft. 4 in. wide, by 30 ft. long. The generator end was a complete structure as was the turbine support, the two portions being joined at the top by two main steel beams 25¾ in. deep cross-tied by channels, all the steel being set in concrete. The form was made by one carpenter and two helpers and took three weeks to complete. It took one day to dismantle and four days to re-assemble in place. The concrete, about 90 cu. yd., was placed in one day up to the underside of the steel beams. The beams were placed the following morning and the balance of the concrete work completed the same day.

Although perhaps a little unusual, this method of construction worked out very well, because after the formwork was removed and the position of the foundation re-checked it was found to be less than ¼ of an inch out in any direction.

The formwork also, because of its method of construction was found after removal to be in such good condition that it was decided to save it for use in the next extension job (which is at present proceeding).

Before placing the formwork in the pit however, it was necessary to place the condenser roughly in position and assemble the formwork around it. This was something of a problem as the condenser weighed 35 tons and the capacity of the crane was only 20 tons. It was therefore decided to

construct a moveable skidway and this was done in the following manner: Two 15 in. "I" beams, 32 ft. long (which fortunately we had on the site, having salvaged them from the old building structure) were tied together with cross channels to form a frame of a width equal to the supporting feet of the condenser. A crib formed of rail ties was made at one side of the building to the full height of the pit and at the other side to a height about half that of the pit. The frame was set on this and the condenser was skidded down, being controlled by four sets of chain blocks, two in front and two behind.

When the condenser had been thus lowered about half-way down, the framework was attached to the crane at the high end and the cribwork removed the crane slowly lowering the framework to the pit floor, the condenser meanwhile being held from sliding by two sets of chain blocks. The operation of skidding was then repeated in the

Fig. 2—Boiler foundation. Note the temporary supports for the centre building columns in the background.

opposite direction until the condenser was practically at pit floor level, when the crane was attached to the other end of the skids and the other crib removed. The crane was then used on each end of the condenser in order to turn it 90 deg. into its position and block it up to the proper height. It was found possible to set the condenser within half an inch of its final setting.

The whole operation took two days and worked very smoothly. The main difficulty was that the condenser was very cumbersome and top-heavy, but before any work was done at all, three men were chosen to act as leaders, one in charge at either end and one located centrally to control all movements. A rough sketch was laid out and the three men rehearsed in every move to be made, and fortunately everything worked out exactly as planned.

#### BOILER FOUNDATIONS

A change in the construction under the boiler had to be made after excavation started.

A design for a two ft. thick reinforced concrete mat had been made in Montreal, but it was found that after dismantling the old boilers and taking out the mat constructed under them, there was another old foundation below, which in turn had to be removed. The excavation, when this was done was about four ft. six. in. deep and the condition of the ground such that 30 piles, 25 ft. long had to be driven. (Fig. 2).

On top of this it was decided to build a kind of wall construction, the outside walls forming a box, with cross walls joining wherever there was any heavy loading. These walls extended to the underside of the designed mat, and after being made, the spaces between the walls were filled with good firm sand tamped down, the whole forming a good bottom for the mat. The whole excavation could, of course, have been filled with solid concrete, but as the contract was based on a price per cubic yard about \$500.00 was saved by the method carried out.

The erection of the boiler was carried out by the boiler manufacturers and calls for no special comment, except for a curious accident which, while serious enough and the cause of a second accident, had no fatal results and occasioned no very serious delays.

After the mat was finished, the mud drum was placed in position on its saddles and the steam drum was placed on the mat ready for lifting.

Two 30 ft. power poles were selected as single sticks, either of which should have had ample strength to carry the whole drum load of nine tons. When the drum was about 12 ft. up in the air, the pole taking the front end of the drum began to slowly give at the centre. There was no noise of breaking at first and the front end seemed to come down quite slowly. Two men who were handling the hoisting chains on the top of the drum almost had time to slip down the chains to the floor before the pole cracked off short, letting the load go. The front end of the drum hit the mud drum and slid over, trapping one of the men by the foot and the other was just pinned at the soft part of the leg. This man released himself, but the drum had to be jacked up to release the other who was found to have a very badly lacerated foot indeed.

A light truck was brought into service as an ambulance, and it was here that the second accident occurred. The men were placed lying down on the bottom of the truck whilst another man sat on the side of the truck holding the injured foot high in the air.

The truck driver, a coloured man, appeared to think that he was driving a real ambulance and dashed off towards the gates at top speed. The gates were only about half open when he reached them and the latch of the gate caught the man sitting on the side of the truck in his side, breaking two ribs and lacerating him badly. He, also, was left in the hospital and was indeed there when the man with the lacerated foot was discharged.

The only other accident was a shock received by a man who tried to saw through a conduit on the lighting circuit without first making the line dead.

#### DIVERSION WALL

During the 1941 extension it was decided to go ahead with the construction of a diversion wall in the Condado bay. This had been under consideration for some time, and city drainage which had recently been led into the bay close to the pumphouse depositing silt and offal, made it necessary to do something soon or have trouble with the pumps. It was decided to construct a diversion wall extending about two ft. above high tide and for a distance of 300 ft. into the bay. This would have the effect of carrying all drainage well past the pumphouse before spreading. It also had the advantage of conducting the warm water from the circulating water discharge canal to a point where it would not be re-circulated.

Concrete piles about 30 ft. long x 12 x 10 in. were precast on the shore. They had a groove 4 x 4 in. cast in on two sides for the reception of 12 x 3 in. precast slabs which were laid horizontally. The piles were driven to refusal, and measurements were then taken for the horizontal slabs. After the slabs had been laid in to the necessary height, formwork was set up on the top and a 10 x 12 in. concrete beam was cast continuous along the top. Soffits set in the beam allowed a handrail to be easily erected. No attempt was made to make a tight joint between the slabs as it was felt that shellfish would soon do all that was necessary in the way of jointing. As a matter of fact, there was very little opening observed after the slabs were originally laid.

The results of this installation have been highly satisfactory in every way. Not only was the debris kept clear of the pumps, but the temperature of the cooling water, at certain directions of the wind became noticeably cooler with a beneficial effect on the vacuum at the condensers.

The machinery, such as the turbo-generator and boiler,

was erected by contract under the supervision of manufacturers' erectors, such skilled and unskilled help as they needed being supplied by the light company.

The erection of the steam piping and auxiliary equipment was carried out by the light company staff and it was very pleasing to note that, thanks to the care taken in setting out the various foundations and main equipment, every flange on the whole job came to its companion, straight and square and not one pipe had to be changed.

The whole job was completed about ten weeks later than

originally estimated, but in view of the breakdown mentioned, this was fairly satisfactory. In order to do this, it was necessary to work long hours and very often Sunday was forgotten. This, in war time is not a great hardship, but to work the hours necessary to complete the job in the time taken, in the hot and humid climate of Puerto Rico was something of a trial. Great credit is due to the regular staff of the Puerto Rico Railway, Light and Power Company, for the unceasing efforts they made to do this work in addition to their regular maintenance duties.

## WATER WHEEL DRIVEN GENERATORS IN THE U.S.A.

C. M. LAFFOON

*Manager, A.C. Generator Engineering Department, Westinghouse Electric and Manufacturing Company, East Pittsburgh, Pa., U.S.A.*

**Paper presented before the Hamilton Branch of The Engineering Institute of Canada on April 9th, 1942.**

During the past decade the U.S.A. government has undertaken a broad scale development of the water power resources of the nation. The development programme is long range in scope, and embraces navigation, flood control, irrigation, and power production. At the present time power production is of major importance, whereas in the future the other aspects may be of equal or greater importance. Water power projects that fall under these classifications come under the jurisdiction of the United States Army, Bureau of Reclamation, Special Authorities set up by Congress, states and municipalities.

The United States Army Engineers Corps has been engaged for many years in developing navigation and flood control projects for our principal rivers. Two of the most important recent projects are Fort Peck on the upper Missouri river and Bonneville on the lower Columbia river. When completed, the Bonneville Power Plant will have approximately 500,000 kw. generating capacity.

Two of the largest and most important power, flood control, and irrigation projects under the jurisdiction of the Bureau of Reclamation, are Boulder and Grand Coulee Dams. The Boulder Dam power house has space for 15-82,500 kw. units and two 40,000 kw. units with a total capacity of 1,277,500 kw. Nine 82,500 kw. and one 40,000 kw. units with a total capacity of 782,500 kw. are now in operation. Three 82,500 kw. units are now under construction. The unapplied space will accommodate three 82,500 kw. and one 40,000 units for future installation.

Grand Coulee will have an ultimate capacity of approximately 2¼ million kw. involving 18-108,000 kw. and two 12,500 kva. generating units. Three 108,000 kw. and the two 12,500 kva. units are now in commercial operation, and six additional units are on order. These 108,000 kv., 120 r.p.m. generators are the largest capacity water-wheel generators built to date.

The Tennessee Valley Authority (T.V.A.) has under development and near completion, a most comprehensive and complete flood control, power generation and distribution programme for the Tennessee river and its tributaries. This programme includes 27 dams which will have an aggregate capacity of 2½ million kw. when completed.

Other recent hydro-electric developments of this type are Shasta in upper California, Parker Dam on the Colorado river below Boulder Dam, Grand river in Oklahoma, Santee-Cooper in South Carolina, Dennison Dam in Texas, and numerous others.

The major items in connection with waterwheel generators at present are associated with manufacturing and production problems. The following units are either under construction or are being installed by the Westinghouse Company at the present time. Additional projects and additional generating capacity for existing projects are being actively negotiated.

TABLE I

WATER WHEEL GENERATING UNITS ON ORDER OR BEING INSTALLED BY THE WESTINGHOUSE ELECTRIC & MFG. CO.

Units	R.P.M.	Kva- Unit	Total Kva.	Customer
6	120	108,000	648,000	U.S. Bu. of Reclam.—Grand Coulee
3	81.8	40,000	120,000	TVA.—Pickwick Station
3	150	75,000	225,000	TVA.—Fontana Station
2	150	33,333	66,666	TVA.—Wautauga Station
2	138.5	27,778	55,556	TVA.—South Holston
1	200	26,667	26,667	TVA.—Ocoee
2	225	40,000	80,000	TVA.—Appalachia
2	94.7	33,333	66,666	TVA.—Watts Bar
1	150	16,000	16,000	Grand River
2	90	36,842	73,684	U.S. Eng., Dennison Dam
2	180	82,500	165,000	Bu. of Reclam.—Boulder Dam
1	94.7	30,000	30,000	Bu. of Reclam.—Parker Dam
1	300	11,000	11,000	Pacific Gas & Elec. Co.
2	300	40,000	80,000	Pacific Gas & Elec. Co.
1	600	31,000	31,000	Mexican Fed. Commission
3	300	32,000	96,000	Cachapool Elec.—Chili
1	600	35,000	35,000	Rio de Janeiro
1	138.5	16,500	16,500	Sao Paulo
Total			2,082,739	Kva.

Since hydro-electric plants are usually remote from the utilization centres and transmission problems are involved in the disposal of the power, the stability characteristics of the generating units for each plant must be determined from the conditions existing on the systems involved or contemplated for the future. The desired characteristics are usually determined by analytical studies and calculating board investigations. The characteristics normally associated with rating can, and do conform to accepted standards. Most units are designed for operation at 13,800 volts, a few at 16,500 volts, and very few at higher voltages.

Usually waterpower projects of major scope are designed and built for long time service. It has thus become standard practice for the generating equipment to be designed on the same premise. Class B insulation (mica, glass and asbestos), are therefore used for both the conductor and ground insulation for both the stator and rotor windings. The temperature rises are limited to 60 deg. C. in order to obtain generators of long life and which will have low maintenance. The performance record of this type of unit has been further improved by using the closed circuit ventilating system with surface type of air coolers. This insures a continuous supply of clean air free of excessive moisture. In many cases the housing enclosure is made sufficiently tight that the CO<sub>2</sub> can be economically injected into the system and an inert gas mixture obtained for extinguishing internal fires. When CO<sub>2</sub> fire extinguishing is required, protection against excessive internal pressure is provided for by using spring or pressure loaded relief doors, which open automatically when the pressure reaches

a pre-determined value. The customary procedure is for the generator manufacturer to provide and install suitable nozzles for the introduction of the CO<sub>2</sub> and the fire-extinguishing companies to supply the piping and equipment external to the generator.

In order to utilize most effectively the entire available water head, vertical type units are used almost universally. The weight of turbine and generator rotating parts and the water thrust are supported on a single thrust bearing which is normally furnished by the generator builder and mounted on generator parts. The most widely used thrust bearing is the Kingsbury adjustable shoe type with pivoted supports for the individual shoes. In the case of low speed, large diameter, short core-length units, it is rapidly becoming accepted practice to use only one guide bearing and to locate it and the thrust bearing below the rotor spider. The design, construction, and lubrication of the bearings has been greatly simplified by using the adjustable shoe type for both guide and thrust bearings, and mainly there is a common oil pot which forms an integral and standard part of the supporting bracket. Water-cooling coils are usually located in the oil pot and no pump or piping are required for circulating the oil. Waterwheel generators with this type of construction are slightly less costly and easier to maintain than the conventional unit with two guide bearings, one located above and the other below the rotor spider. Over 2 million kva. of single guide bearing (umbrella type) units are in service giving satisfactory performance.

The overall performance of the Kingsbury type thrust bearing has been remarkably good. Two recent unexplained cases of trouble occurred during the initial starting-up period after completion of erection. Two other cases of bearing trouble developed in which the trouble first manifested itself as vertical vibration of the thrust bearing support, at a frequency equal to the product of the speed and the number of thrust shoes. An investigation disclosed that the trouble was caused by distortion of the thrust bearing runner. It is believed that the distortion was caused by a gradual release of residual stresses in the runner material.

The development in the welding art has resulted in the use of fabricated construction instead of castings for the major mechanical parts. The shipping dimension limitations are such that the stator frame and rotor spider must be shipped in parts or sections. The rotor core is usually built from laminations and since it must withstand stresses due to rotation, it is imperative that it be assembled at destination as a complete circle. In the case of the stator core, only static forces are involved and its laminations can be assembled complete in the individual frame sections, shipped as individual unit parts, and bolted together to form a complete frame. This type of construction is less costly than building the core in a complete circle at destination and is being used almost universally for modern units. It is recognized that the separate core section must be solidly clamped together to avoid movement between adjacent sections. Provision is made in modern design to increase the bolting force between the frame section at definite time intervals as a part of normal maintenance.

#### ELIMINATION OF CORONA ON STATOR END WINDINGS

The elimination of corona from the entire stator winding and wiring connectors of high voltage rotating machines at operating voltages has been desired by both manufacturer and user for many years. Since 1929, successful elimination of corona on the straight or buried part of the coil has been accomplished by applying a semi-conducting material known commercially as Aquadag to the outer surface of the coil. This high resistance conducting material in contact with the stator iron, brings the potential of the coil surface to ground potential and thus completely eliminates corona.

With the conventional two-coil-side-per-slot type of

windings, two adjacent coils, or two coils within the same slot, may differ in potential by full line voltage. The amount of corona existing in the end winding zone depends on the distance between coil surfaces, condition of the surface with respect to smoothness, and the type of bracing used. The corona situation can be appreciably improved by obtaining smooth surfaces free of projections or sharp corners, and avoid small spacing between coil sides which have high potential differences. Generally speaking, such coils should be sufficiently insulated so that the surfaces can be brought firmly together, or the spacing made great enough to prevent appreciable corona. Further reduction of corona can only be accomplished by applying a semi-conducting material to the surfaces of the parts in question. The end winding problem is essentially different from that of the part in the slots due to the fact that the electrical charges on the end turns must be conducted over the surface of the coil to ground (stator iron). The surface coating of each section of the coil must permit the total charge on the coil beyond this section to flow across the surface without overheating. With the present state of the art it is not deemed advisable to use relatively low resistance material such as Aquadag over the entire end winding due to the fact that it would fix the entire surface of the coil at ground potential and thus puts full line to neutral voltage on the insulation. This is undesirable because the end turns due to bends and joints cannot be insulated as effectively as the slot portion.

An ideal solution to the end-turn problem would be to grade the resistivity of the semi-conducting treatment applied. That is, start with a low resistance value (Aquadag) in the slots and gradually increase to high values at the loops of the winding. This would uniformly decrease the voltage stress on the end turn insulation. This uniform grading of the resistance is not easy to accomplish commercially. It has been found that a single compromise resistance value can reduce the voltage stress sufficiently to eliminate the corona. Such a semi-conducting material, called Coronox, has been applied to windings during the past year. Actual experience indicates that complete visual elimination of corona at operating voltages can be obtained by using a single value of surface resistance.

During the past year, Coronox has been applied to 11, 13.8, and 16.5 kv. windings for the following ratings:

2 Units	9,000 kva.	Turbine Generators
2 Units	18,750 kva.	Turbine Generators
1 Unit	20,000 kva.	Synchronous Condenser
1 Unit	30,000 kva.	Synchronous Condenser
1 Unit	31,250 kva.	Turbine Generator
1 Unit	40,000 kva.	Waterwheel Generator
1 Unit	43,750 kva.	Turbine Generator
1 Unit	50,000 kva.	Turbine Generator
1 Unit	62,500 kva.	Turbine Generator
1 Unit	75,000 kva.	Turbine Generator
1 Unit	81,250 kva.	Turbine Generator
2 Units	82,500 kva.	Waterwheel Generator
1 Unit	100,000 kva.	Turbine Generator
3 Units	108,000 kva.	Waterwheel Generator

Of these ratings, one unit has been in continuous service for the past ten months, and other units have been in service over six months. Three of the largest waterwheel generators received their Coronox treatment on customer's property.

Application of Coronox has been made to existing machines in the field, but such consideration should be given only where actual damage from corona has been observed. Not only must the winding surface be clean and dry before application can be made, but the rotor usually needs to be removed. These steps cause delay and great expense, and are generally not necessary as the entire winding of machines built in recent years are protected against corona attack by mica shielding. Corona damage of these machines has been limited to oxidation or pitting of the surface varnishes.

# DISCUSSION ON ACCIDENT PREVENTION METHODS AND RESULTS

Paper by Wills Maclachlan,<sup>1</sup> M.E.I.C., published in *The Engineering Journal*, January, 1942, and presented before the General Professional Meeting of The Engineering Institute of Canada, at Montreal, Que., on February 6th, 1942.

J. A. BEAUCHEMIN,<sup>2</sup> M.E.I.C.

Further explanations by the author on the following points would be much appreciated:—

1. Who investigates the causes of the accidents included in the statistics, as affecting the interests of:

- (a) The Utilities
- (b) The Compensation Board
- (c) The Electrical Employers' Association of Ontario.

Are the results of these investigations made known to the employees with the view of further accident prevention?

2. What importance is given to near-accidents, their warning and educational values?

3. Has any relation been established between the size of companies (as indicated by their annual output) and the frequencies of accidents?

4. What are the comparative frequencies of accidents affecting unskilled, semi-skilled and skilled labour classified under the headings temporary, permanent and fatal.

5. What have been the most general causes of accidents under the same headings?

J. H. BRACE<sup>3</sup>

I fully endorse the author's views and suggestions on the subject of Accident Prevention Methods and Results.

The experience we have had in telephone work is similar to his own, and confirms his view that accident prevention is initiated, and must be continued, by higher management. The man on the job and especially the first line supervisor must also be sold on accident prevention, or the effort will not reach maximum effectiveness.

At one time in our experience we used to give awards in the form of pocketbooks, silver trophies, etc., to those foremen whose vigilance had prevented accidents. It was soon found that this did not produce the desired results. The next step was to make accident prevention and the safe conduct of the job the direct responsibility of the foreman or supervisor in charge of the work. As the theory of this principle commended itself to supervision the ratio of accidents was reduced. After this had been made generally effective the next step was to educate the line employee and the new employee in these ideas. This has been done in various ways and, of course, includes supervision. Motion pictures and sound slides are used to demonstrate safe methods of performing the work. The design of tools and equipment is looked at from the safety angle as well as the utility or economic one. Methods of operation and construction are designed to perform the job the safe way and are under review continuously to reduce any possible accident hazard.

Some years ago a Safety Code was developed and has since undergone two or three revisions. In each instance employees were selected from different lines of occupation to suggest, consider and approve the information to go into this safety code. In this way the employee feels that it is his safety code.

Posters, bulletins, etc., are issued periodically drawing attention to safe methods of doing work. Demonstration boards illustrating the various phases of the safe way of work have been used to good advantage. Safety inspectors

are also used in this way. These men spend enough time with the foreman and his gang to be looked upon as part of the gang, and they continue their regular working habits. In this way they are in a position to point out any undesirable habits or to commend the men on safe practices.

Throughout all of this effort the safe conduct of the work is considered just as much as quality or production.

Some years ago an extensive First Aid programme was started with a view to improving the accident situation. This is a continuous programme and employees are encouraged to take refresher courses at short intervals. The results obtained have been quite satisfactory. At the present time we have about 90 per cent of our outside forces trained in first aid. In numbers we have between 2,000 and 2,500 people who take first aid during the year.

In all of our accident prevention work we discuss and show the safe and correct way of doing the work rather than to emphasize what should not be done. We feel that this is the more effective method.

ANGUS D. CAMPBELL,<sup>4</sup> M.E.I.C.

This paper is particularly important at this time when a casualty in Canadian industry is as much a gain to Hitler as a casualty in the armed forces. The paper demonstrates conclusively that accident prevention methods, based on engineering, do get results. Figure 2 with its steadily downward curve of frequency of accidents shows an achievement in safety of which the Electrical Employers' Association and its engineer, Mr. Maclachlan, may well be proud. It is an achievement that has favourably affected each of us as private or industrial users of electricity, and we are grateful for it.

The paper gives a clear exposition of how this increasing safety in public electrical utilities is being obtained. Accident prevention methods for all industries are here charted. But there is a real danger that we members of The Engineering Institute of Canada may not take this paper as personally as we should. The conclusion says "the sincere leadership of management is vital to the whole matter." That puts it right up to each of us. Canadian engineers have done and are doing much for safety, but can achieve a much greater measure of industrial and highway safety than Canada now has. A plan for accident prevention is presented by Mr. Maclachlan. Let's get on with the job.

R. N. COKE,<sup>5</sup> M.E.I.C.

I should like to add the following notes to Mr. Maclachlan's able paper.

In sub-stations and power houses safe operating conditions are obtained by:

1. Design which allows safe clearance between live parts and to ground.

2. The use of gang-operated disconnecting switches and the locking of same.

3. Clear marking of the disconnecting switches and other equipment so that the operator can definitely see which switch he is going to operate.

4. The use of barriers between disconnecting switches when installed indoors.

5. For smaller stations where switching may be done by other than experienced operators, proper interlocking of

<sup>1</sup>Secretary-Treasurer and engineer, Electrical Employers' Assoc. of Ont.

<sup>2</sup>Chief engineer, Public Service Board of the Province of Quebec.

<sup>3</sup>Vice-president, Bell Telephone Co. of Canada.

<sup>4</sup>Manager, Omega Gold Mines Ltd., Larder Lake, Ont.

<sup>5</sup>Vice chief engineer and general superintendent, Montreal Light, Heat & Power Co.

the oil circuit breakers and the sectionalizing disconnecting switches is advocated to compel the following of a definite sequence of operation.

6. Operators are carefully trained with the idea implanted in their minds that operations must be carefully performed and that the operations must be definitely and deliberately done without undue hurry. Many of the mistakes made by experienced operators are due to either misunderstanding the instructions or attempting to unduly hurry the operations.

7. When shifts are changed the operating set-up of the station is discussed by the off-going and incoming operators. Any change in operation which has taken place from the usual routine is clearly pointed out.

8. The entire operation of the system is under the control of one man, in our case the system supervisor, and no operation is allowed without his knowledge and sanction.

#### DISTRIBUTION

Lines with voltages up to and including 4,000 volts between phases are worked on alive, weather permitting. Lines with voltages above 4,000 volts are always killed before work is performed on them.

By proper engineering, adequate clearance is allowed between different lines and phases, also between lines and cables. Sufficient working clearance is also arranged so that the workman may safely perform his duties.

All senior men are taught first aid and resuscitation work, with the result that many lives have been saved and accidents quickly treated until a doctor's care could be obtained.

Linemen are instructed that before attempting to climb a pole they must be properly equipped with rubber gloves, rope, etc., and that they are to stay at the foot of the pole until they have figured out the best and safest way to climb the pole and actually do the work on the pole.

Where men work in close proximity to live wires, rubber protectors are placed on 550 volt, 2,300 and 4,000 volt wires to protect the man.

Belts and rubber protecting equipment, etc., are supplied and maintained by the company.

The question of grounding transformers is one that has occasioned a great many discussions with regard to the policy of the different companies. One school of thought is that if the transformer case is grounded and the man is accidentally in contact with a live wire, and at the same time his foot touches the case of the transformer, then a short circuit will occur. The other school of thought is that if the case of the transformer is not grounded and there is an insulation breakdown in the transformer, the case of the transformer will probably be energized with the result that if the man comes in contact with the transformer case and contacts either live wires or grounded wires he will cause a short circuit.

#### DISTRIBUTION—OVERHEAD

Tree trimming—Particular care must be taken in tree trimming to not only protect the man who is doing the tree trimming, but also the lines which will probably be below the trees, and the pedestrian who will probably attempt to walk under the trees which are being trimmed.

No trees are trimmed in the vicinity of 12,000 volts and higher voltage lines unless those lines are made dead if there is any possibility of the limb coming in contact with the wires.

#### METHOD OF GIVING CLEARANCE

Where lines and equipment have to be made dead to allow work to be performed on them, it is essential that the apparatus or lines be kept dead while men are working. One man is responsible for "taking the clearance" and to see that the equipment or lines are dead before men attempt to work. The same man is responsible to see that the clearance in the form of a pass, signed by him after he has personally made himself responsible to see that the

line or apparatus is clear of grounds and men, is returned to the operator of the station. Wherever possible, apparatus and lines are grounded before men work on them.

#### HANDLING OF EXPLOSIVES

All work performed with explosives is handled carefully in accordance with instructions issued by the Dominion Government, Explosives Division of the Department of Mines.

The operation of ice-breaking tugs is carried out under the jurisdiction of the Department of Transport, Marine Service, and all the necessary precautions with regard to safety are taken.

All emergency patrols are equipped with special light emergency trucks whose crews are thoroughly trained in first aid and resuscitation methods.

Particular care should be taken in allotting different types and mentalities of staff to the various duties which they have to perform. Naturally, certain men are better adapted to perform certain types of work than others.

The question of safety to the worker and equipment is at all times a very important one. It is especially so to-day during war time when so much depends on the public utilities maintaining uninterrupted service to war plants. Without electric power to-day our system of civilization practically stops.

We are particularly interested in the author's handling of the problem of the re-establishment of the electrical worker who has been hurt and cannot continue the work he has been doing. Further study is needed as to the re-establishment of the injured, handicapped worker. We hope Mr. Maclachlan will continue his work on this matter.

#### T. NORMAN DEAN<sup>6</sup>

This splendid paper is perhaps the finest presentation the writer has seen in an experience of thirty years. The portion dealing with cost of accidents is especially striking. Too often comparisons are made without any examination of underlying conditions and much so-called statistical evidence is based upon figures rather than facts. The conclusion which Mr. Maclachlan has drawn from his carefully discovered facts,<sup>6</sup> namely, that there has been a reduction of costs which can, in part at least, be attributed to accident prevention efforts, is sound from the statistical point of view. His ingenious method of applying the facts is likewise sound. Emphasis could be placed upon the substitution of payroll for man-hours in expressing frequency rates: the use of man-hours connotes equal distribution of hazard over each hour worked and to my mind this is *reductio ad absurdum*. The obvious shift from serious to less serious accidents over the period is important: the bettering of medical service and technique may be a factor as well as accident prevention methods, but the important thing is, that the decrease is real. The continuous decrease in frequency and cost perhaps indicates hope for the future—that the ultimate in reduction has not yet been reached and that continuous and co-ordinated effort will result in lessening further the burden of industrial accidents.

#### R. L. DOBBIN,<sup>7</sup> M.E.I.C.

The accomplishments of the Ontario Electrical Employers' Association and particularly of Mr. Maclachlan, are well known to those connected with the transmission and distribution of electrical power. But the public generally is not so conversant, and this paper is valuable because it brings out the facts in connection with the work of accident protection for the past twenty-five years.

Mr. Maclachlan's efforts have not been wholly confined to methods of work on electrical lines and apparatus. He has gone further, and has been able to beneficially influence

<sup>6</sup>Statistician, The Association of Workmen's Compensation Boards of Canada, Toronto, Ont.

<sup>7</sup>General manager, Utilities Commission, Peterborough, Ont.

the design of electrical materials and apparatus, thus making them safer to work with.

His figures show that not only has the number of fatal accidents been reduced by two-thirds, but accidents of all kinds have been reduced. This shows what can be done by patience and assiduity in promulgating safe procedures and methods.

The financial saving has been large, as is pointed out in the paper, but there has also been the great decrease in suffering and anguish attendant on serious and fatal accidents.

If one can judge by the rates imposed by the Ontario Workmen's Compensation Board, working for an electrical utility is only one-half as hazardous as for a waterworks utility. The rates are \$1.00 and \$2.00 per \$100 of payroll, respectively.

The author is to be congratulated on the results of this quarter of a century campaign for safety in the electrical business.

G. H. FERGUSON,<sup>8</sup> M.E.I.C.

The paper presented by Mr. Maclachlan, (with whom I was in much closer contact during the construction of the transmission lines of the Hydro-Electric Power Commission between Niagara Falls and Toronto than in recent years) is a splendid record of accomplishment in a very important field of work. The value of his work seemed so striking to the writer, that it was brought to the attention of Dr. C. F. Blackler, the acting chief medical officer of the Division of Industrial Hygiene of the Department of Pensions and National Health at Ottawa. Dr. Blackler regards Mr. Maclachlan's resumé as an "excellent report on the common accidents in the electric public utility industry and the methods adopted in their prevention."

The paper indicates a significant and commendable reduction in fatal accidents. Thus in the last five years fatal accidents were less than one third of what they amounted to in the period included between 1915 and 1919. So also permanent partial disabilities were so reduced that in the last five years their total was only 15 per cent of the total for the 1915-1919 period.

A preventive policy like that adopted in regard to linemen's belts, is an excellent example of a simple though effective safety measure. In this particular instance the replacement of malleable belt snaps with snaps of forged steel has had the desired result.

Workers in occupations where hazards are great should be carefully selected; they should be well-balanced individuals with definite aptitude for the work in which they are engaged. Indeed, it would be to everybody's great advantage if some form of aptitude test could be given to men who are to be exposed to great hazards. In this connection the halt which a lineman makes four feet below the lowest cross-arm is an excellent "pause and think" measure. But no amount of aptitude can meet the risk to which a worker is exposed when a supposedly dead transmission line accidentally comes back into service operating at 44,000 volts.

It is most desirable that Mr. Maclachlan and his colleagues should continue to "carry on."

E. D. GRAY-DONALD,<sup>9</sup> M.E.I.C.

I would like to compliment Mr. Maclachlan on his paper, and on the work that he and all others engaged in the promotion of safety are doing. We all realize that it is uphill work, but it is worthwhile.

There is one point in the paper that I think would stand amplification. It is said that discipline develops fear, and frequently results in more accidents. What is the alternative to discipline? Education may be, but only up to a point, because most accidents are due to flagrant disregard of

safety rules. I would be interested to hear more about this matter of discipline. Another point I wish to stress, and it has been mentioned by Mr. Maclachlan, is the necessity for simplicity in safety rules. Keep them simple and based on plain common sense. If there are too many rules they cannot all be known, and if such a situation develops the workmen, and very often the supervisor will lose interest. It is possible to get so many rules that they defeat their own purpose.

Mr. Maclachlan's remarks on habit training deserve more attention. There is no doubt that a man of careful habits is much less likely to get into trouble, and such training is worth a lot of educational effort.

R. B. MORLEY<sup>10</sup>

My thanks, first of all, are extended to Mr. Maclachlan and to the Institute for the opportunity to follow him in the comprehensive story of the work in which he is engaged. I wish that the concluding paragraph of his paper might be read by every employer, every superintendent and every foreman in Canada.

Mr. Maclachlan has dealt with engineering revision, with the provision of suitable tools and equipment, with work methods and with the human factor, all of these things looking to straight accident prevention. Those of us who have been in the work for any length of time, realize with him, that accident prevention work to be fully effective, must include a certain amount of follow-up after an accident has happened, in order to see, first, that the injured employee has received proper treatment, and, second, that the conditions which caused the accident are corrected.

The prime requisite for any machine is that it should turn out work quicker, more easily and more cheaply than could be done by hand. The designer of the machine probably had this always in mind and the safety of the operator was a subsequent development brought about, in my opinion, in industry at least, by two things, Workmen's Compensation and ordinary humanity. Workmen's Compensation served to bring into sharp focus the cost of accidents and it became evident that it was cheaper and better to prevent accidents than to pay compensation for them. Engineers have a responsibility to design tools with a wide factor of safety for the protection of the operator, as properly guarded equipment will make production easier and cheaper and quicker. The story of safeguarding is the old story of "trial and error." Some found out by cruel experience that unguarded gears spelt sorrow, suffering and expense. Someone found out that the law of gravity was a good reason for foot protection; someone found that, not only did goggles protect eyes and save costs, but the man wearing those goggles stood up better to his job, I remember a man telling me, some years ago, that a hammer-man had said to him that he had never really seen a forging made until he began wearing goggles.

When management and supervisors have accepted responsibility for accident prevention work, when working conditions have been made reasonably good and safeguarding has been carried out, industry is then faced with the problem of getting the interest of the worker, and that is not a problem to be solved in an afternoon.

Responsibility is something no one of us can shirk. The worker in a plant has a responsibility for doing good work in a safe manner, a responsibility for using the safeguards provided and for keeping them in place. He has the responsibility for applying for First Aid for any cut or scratch and a responsibility to follow plant safety rules as part of his regular work. There is, too, a responsibility to be clean and orderly and to work well with others.

Fixing the responsibility from the viewpoint of accident prevention must be quite independent of any investigation connected with the liability for compensation. If safety

<sup>8</sup>Chief, Public Health Engineering Department, Department of Pensions and National Health, Ottawa, Ont.

<sup>9</sup>General superintendent, Quebec Power Company, Quebec, Que.

<sup>10</sup>General manager Industrial Accident Prevention Association of Ontario, Toronto, Ont.

rules have been broken and guards have not been used, if orders have been disobeyed, the responsibility for the accident must rest, in part, on the supervisory force. Consciences may possibly be eased by blaming the injured workman, but, from the viewpoint of accident prevention that is futile.

Last year, in Canada, there were 314,514 accidents reported to The Workmen's Compensation Boards in eight provinces (Prince Edward Island has no Workmen's Compensation Act). Those figures included 1,217 fatalities. With the standard charge of 6,000 days for a fatality, you will see that the time lost, in fatal cases, would run to more than seven million man days in 1941, or, the equivalent of more than twenty thousand men working 300 days in the year. The actual days lost in temporary disability cases alone, would probably run to 1,500,000 days and when you are thinking in terms of production and working against time, these figures represent colossal losses; losses that in many instances, could be controlled to an even greater degree than is now being done, but which would have been many times greater had there not been organized accident prevention throughout the country.

The author's story of control of accident experience in the public utilities of Ontario is a practical demonstration of the sound common sense of intelligent accident prevention work and I quote from statements made in 1941 by Mr. T. N. Dean, statistician of The Workmen's Compensation Board of Ontario, to indicate that industry, generally, has done good work, but work that can be further extended.

"From 1915 to 1940 the benefits paid to or on behalf of injured workmen steadily increased as revision upward was made by legislative enactment. The general rate of compensation was increased from 55 per cent of earnings to 66 $\frac{2}{3}$  per cent. Pensions to widows and children were doubled. A minimum compensation for low wage earners was introduced. Rehabilitation was added; burial expenses were increased, and above all, the Act, which provided for no payment of medical aid at its inception, now provides for full and complete medical aid without stint or limitation of quality or kind except the needs of the workman. In a general summing up, benefits under the Workmen's Compensation Act have at least doubled in the twenty-six years of existence . . . These, and other amendments and interpretations, have increased the coverage of the Act probably thirty per cent and are in addition to the increase in benefits provided by the Act itself. In other words, the Act is probably 130 per cent more liberal as far as benefits are concerned than it was at the time of its introduction. The cost of these increased benefits is best measured by the rates of assessments charged the employers on the payrolls under the Act. In 1915, when of course rates were experimental and very conservative as benefited the situation when there was no considerable body of experience for rate-making, the average general level of rates was \$1.24. In 1939 (the last complete year for which figures are obtainable as a large number of accidents occurring in 1940 are not yet finally disposed of and hence costs, therefore, are not yet obtainable), the average general rate-level was \$1.06 for each \$100.00 of payroll. This represents a straight decrease of nearly 15 per cent. . . . The fact, then, stands boldly forth. During the twenty-five years Workmen's Compensation has been in force in Ontario, benefits have been doubled, coverage has been increased one-third and rates have decreased by one quarter. It is, of course, entirely obvious that this situation might have been brought about if the individual claim cost had decreased but this is not so."

Mr. Dean also released some figures showing the average cost of medical aid only cases in 1921 at \$5.19, as an average, compared with 1939, at \$6.03. Temporary Disability cases in 1921 averaged \$80.77, and in 1939, \$141.69; Permanent Disability cases in 1921 averaged, \$1,163.90, while in 1939, the average was \$2,033.51, and death cases in 1921 averaged \$4,352.43, against \$4,558.87 in 1939.

JOHN MORSE,<sup>11</sup> M.E.I.C.

The subject discussed by Mr. MacLachlan is very timely and one in which we have been greatly interested for some years.

As one of the large public utility systems in Canada, we would like to submit our views on certain phases of some of the points brought out from the viewpoint of a public utility operating high voltage lines up to 220 kv., hydro-electric generating stations having a gross capacity in excess of 1,000,000 hp., and a number of substations with transformer units as large as 50,000 kv.a.

#### DESIGN

Modern design, particularly of substations, tends to dictate outdoor stations with gang-operated disconnecting switches usually operated by means of a crank, so that the operator is in little danger from an arc, and with ample clearance so that he has many ways of getting clear in case of trouble, which is not possible in the case of many indoor stations.

Three-phase grounding switches are provided in all cases on transmission lines, which switches must be closed and locked closed before clearance for work may be given to any employee. This is in addition, of course, to the portable grounds which will be placed on the conductors by the linemen.

In many cases to guard against incorrect switch operation, signal lights are placed near important disconnecting switches to indicate the position of the oil circuit breaker controlled by such disconnecting switches which should never be opened unless the signal light shows a green indication.

In some of the older indoor stations where a large number of single-pole-operated, high current capacity, disconnecting switches are installed side by side, not only are insulating barriers placed between phases, but distinguishing insulating barriers of a different shape and colour are installed to isolate each three phase circuit from its neighbour. Together with proper designation, this serves, when doing switching, to restrict the operator to a particular group of disconnecting switches on the same circuit. In addition, portable barriers are often used which are set in place by the foreman in front of apparatus which is to be worked on, and this again serves to prevent the workman from carelessly or otherwise becoming involved with neighbouring equipment which looks identical but which may not be dead.

#### TOOLS AND EQUIPMENT

All tools and equipment used must be of standard design and approved by the company. Furthermore, our procedure is that such equipment must be inspected at definitely determined intervals of time, and reports made out so that all such equipment is kept in good working condition at all times. This is the responsibility of the electrical or mechanical foreman, as the case may be, and applies to such matters as ropes, slings, hand-lines, grounding sticks, switch sticks and testing devices.

We do not make use of any equipment for working on high voltage lines alive. As a matter of fact, we are trying to design our system so that any line may be taken out for work and service maintained over a duplicate channel.

Special attention is also given to the condition of rubber gloves and fire-hose. Chains and insulated wire must not be used as grounding mediums, but rather an ample capacity braided and bare copper conductor is used for temporary grounding.

#### METHODS OF WORK

A Standard Operating Code and Safety Rules have been prepared and have been in use for many years. This was originally intended as a collection and standardization of a

<sup>11</sup>General superintendent, Shawinigan Water & Power Company, Montreal, Que.

number of operating practices and safety rules which had existed in many of the component parts of the company. This standardization has worked out very well and has been of definite value in reducing accidents to a minimum and improving service. In order that employees may know these operating rules and safety practices thoroughly, an operating instructor is employed for this purpose. Such operating instructor must be a well-qualified man, well sold on the matter of safety and reporting to the Head Office.

Without going into the details of the clearance system, our general rule is that before a Clearance Card is given to a foreman or workman, the apparatus on which he is to work must be made dead, securely grounded (or blocked in the case of mechanical work) and every reasonable safeguard taken before the clearance card is delivered to the foreman. This, of course, is in addition to any safety measures which the foreman must or wishes to take for the protection of himself and the men working under his direction.

The foreman is made directly responsible for the safety of men under his supervision. In case of new apparatus going into service or extensive testing being undertaken, a competent man is always detailed to supervise the whole job from the point of view of safety only. We find that this is a very necessary and valuable precaution to take.

Another point of interest is a rule which makes it obligatory that where mechanics, painters, cleaners, or other laymen are to begin work near electrical apparatus where an element of danger may exist, a watchman must be appointed to do nothing else but supervise the men on that job. The watchman's job is concerned with safety only. He is not there to dictate how the job is to be done but to dictate between what limits the men are to work and to see that men who leave the job for any reason, return to the proper area. In case the watchman has to leave for any reason, work must stop while he is absent, unless another watchman relieves him.

To insure that every effort is being made to perform switching operations properly and in the proper sequence, a Switching Order Form has been prepared which must be filled out by the shift operator and checked by the control operator before any switching is started. The shift operator does the switching with the control operator staying on the control board.

From experience it has been found out that most switching errors occur during normal operation when time is not a deciding factor. Every effort is made to direct the operator's attention to following the sequence as outlined on the Switching Order, doing switching deliberately and taking sufficient time so that the operations will be properly done. It is most essential that an operator make a final short pause immediately before operating switch controllers, to read the designation of the switch he is about to operate, see that it corresponds with the Switching Order and that the switch is in normal position, and to realize what to expect when he operates the controller.

Mental reminders are often used in the way of signs near the controller where some abnormal condition exists.

#### THE HUMAN FACTOR

Statistics indicate that it is not the highest grade men or the poorest men who get involved in accidents, particularly electrical accidents. In many cases, the man cannot give a plausible explanation as to why he performed an incorrect operation. This is the most difficult problem to cope with, and we are always interested to know what other companies have done or are doing to try to prevent accidents due to this cause. We have succeeded in reducing the number of controllable electrical accidents to negligible quantities, and in several cases which have been investigated, we are at a loss to know what we as a company could have done to avoid the accident.

As far as possible, we believe in the theory of *preventing* the accident if at all possible, but we realize that accidents may happen, and, therefore, it is essential that every employee knows how to conduct himself as far as first aid and resuscitation are concerned. All employees in the field are given frequent examinations in their knowledge of these principles of first aid and resuscitation.

In case of accidents, a careful investigation is made by the safety engineer with a view to finding a method of avoiding a repetition and working out a solution which might result in changes to our safety regulations which would be beneficial to the company's staff in general.

In cases of operating mistakes, disciplinary measures are not taken except where the operator deliberately withholds information or does not tell a truthful story, or in case the accident involves an infraction of the Clearance or Hold-off System.

J. E. PATTERSON<sup>12</sup>

We would like to congratulate Mr. MacLachlan on the excellent manner in which his subject is presented. The examples and graphs make it particularly interesting.

As a matter of interest we would like to list a few practices which Gatineau Power Company follows in its accident prevention work.

It is our policy to investigate all accidents requiring medical attention and also some accidents which have not required medical attention, but which might have been more serious under less fortunate circumstances.

The primary object of the investigation is to determine the cause or causes of the accident being investigated. When the cause or causes have been determined the blame is usually embodied therein.

Employees have been disciplined in a few rare cases and the results have been encouraging. The discipline apparently has reduced repetition by fellow employees.

All accidents and causes are later discussed with all employees engaged in similar classes of work and construction methods are altered when it is in the interests of safety.

For the past few years an annual questionnaire has been prepared and linemen are questioned individually on safe practices in carrying out their work.

We believe that this has resulted in a decline in the frequency and severity of certain types of accidents.

L. H. URMSON<sup>13</sup>

The author, gives graphs showing the frequency and cost of accidents in the public utilities in Ontario over a twenty-five year period. These show very substantial, steady improvement, particularly in the past ten years since the construction companies' accident records have not been included in the electrical industry class.

The Quebec Public Utilities Safety Association has been in existence since 1931 only. During this entire time the construction companies have been included in Class 22, and for this reason, frequency and costs are not comparable with the electrical industry in Ontario. The cost of accidents for installation and operation of electric power plants only (apart from construction works, telephone and telegraph systems) averaged \$1.35 per \$100.00 of payroll.

In an effort to reduce the accident toll amongst member companies, the Quebec Public Utilities Safety Association sends out educational literature such as bilingual safety posters, safety instruction cards, material for superintendents' safety talks, accident history bulletins, etc. The Association has eight motion picture films, with bilingual titles, which are available to members.

Histories of fatal and serious accidents to employees of member companies are sent out in the form of accident

<sup>12</sup>Safety engineer, Gatineau Power Company, Ottawa, Ont.

<sup>13</sup>Shawinigan Water & Power Company, Montreal, Que.

history bulletins, and contain a warning and how to overcome hazard. These are bilingual, and sufficient copies are sent to give each workman a copy.

In addition to the above, posters are sent to non-members of the Association.

Since 1933 a Safe Driving Competition, for men driving company automobiles, trucks, buses and street cars, and private automobiles used on company business, has been carried on. Medals and certificates are awarded each year to men driving motor vehicles a minimum of 5,000 miles without accident, and 10,000 miles per year for drivers of street cars.

Speaking for the companies I am directly connected with, The Shawinigan Water & Power Company and subsidiaries, for many years have had safety rule books for the different industries, which are distributed to all the men. These are brought up to date and revised from time to time.

All Shawinigan workmen are trained in first aid to the injured, particular stress being laid on resuscitation from asphyxiation by electric shock, gas or drowning. A first aid man is employed, whose entire time is given to first aid and safety instruction in the field. On large construction works, where it would be impossible to train casual labour, there is a hospital and resident plant doctor, and special crews of men are trained in first aid and resuscitation.

Our experience has shown that, with proper direction, the foreman can do most to prevent accidents to the workmen. On two of the large Shawinigan construction jobs, where accident frequency and severity were high, the foremen were told they would be held responsible for all accidents to their men. They were given to understand that upon the keeping down of accidents to their men depended their usefulness to the company. As a result of this the accidents were cut down by forty per cent almost immediately, and the improvement was maintained throughout the jobs.

The method used to keep the figures before the foremen was, first, by the posting of a large board in a prominent spot on the jobs, which had the names of all the foremen. Each month a record was posted which showed the accumulated number of accidents chargeable to each foreman. Each month a record was sent to superintendent, general foreman and sub-foremen showing accidents, and to whom chargeable.

At the generating and sub-stations the superintendents give the men weekly safety talks, using the General Operating Code and Safety Practices and aforementioned bulletins as material for the talks.

Frequent plant inspections are made in search of physical hazards, which are removed or guarded against when discovered.

By the means outlined above our accidents, in which are included accidents in non-electrical industries, were substantially reduced in frequency and cost, and this reduction has been maintained.

#### THE AUTHOR

The discussion of the paper, by members of the Institute and others is very gratifying to the author and to the officers of the Electrical Employers' Association of Ontario. The interest evidenced and the details given in amplification by various senior officers of large organizations, add very considerably to the general outline given in the paper.

There are certain specific points raised which should be answered.

Mr. Beauchemin, asks specific questions and the following are the answers:

1. The statistics used as a basis of the graphs were developed from data prepared by the Workmen's Compen-

sation Board of Ontario. The injury to the man usually defines whether the accident is temporary, permanent or fatal. Other statistics are prepared by the Electrical Employers' Association of Ontario and by some of the utilities.

2. Near-accidents at times are used in drawing lessons, which of course are not as effective as accidents that cause an injury. Where a similar accident results in one case in no injury and in another case a serious or fatal injury, the lesson is presented to the men.

3. There is no doubt that the increased exposure of a large company may result in more accidents but there are so many other factors present, such as interest of senior management, concentrated or scattered employment, type of work, etc., that no definite relation can be developed.

4. No definite ratio can be given. Generally men have accidents in the first six months of their employment and after five years employment. This general statement has many variations and exceptions. Recently, serious accidents have been occurring to trained and experienced men.

5. In the electrical public utility industry, electrical shock and burns have been responsible for more serious and fatal injuries than from any other agency.

In the discussion by Mr. Morse it is very interesting to note that the Shawinigan Water & Power Company is not carrying out hot-line maintenance of high tension lines but is providing a duplicate service so that lines can be taken out of service for maintenance. Further in his discussion Mr. Morse develops a method for watchmen while mechanics, painters, cleaners and other laymen are working near live apparatus. This method is receiving more and more consideration in large utilities and the results obtained are well warranted.

In the discussion of Mr. Brace, he points out that the Bell Telephone Company in developing its rules or safety code, used the suggestions and criticisms of experienced employees. "In this way, the employee feels that it is his safety code." This is a most important point, for people are only interested in things in which they take part.

Both Mr. Gray-Donald and Mr. Patterson raise the question of discipline, the point being that "accidents are due to flagrant disregard of safety rules."

A number of years ago, four senior supervisors examined into the details of one hundred serious accidents. Of these accidents very complete information was available, as careful investigation was made in each instance. At that time, it was thought that placing the responsibility of the accident was important. These supervisors placed 54 per cent of the accidents to the responsibility of the supervisor; 36% per cent to the responsibility of the workman and 10 per cent to the responsibility of design or material. Similar investigations have been carried out by other organizations with very comparable results. It would therefore appear that many accidents are not primarily due to flagrant disregard of rules but to lack of adequate supervision.

As is pointed out in the paper, there is no doubt that quick results can be obtained by the use of discipline, but these results are not lasting. The whole effect of discipline has as its motive, fear; fear of being fined, fear of being reduced in the job; fear of losing the job. Fear is always sickening and leads to a sub-normal man, who is more likely to have accidents. Education and leadership take longer but the results are well worth-while. Dictation and domination for a time get quick results but only postpone the solution of the problem.

It is sincerely hoped that the paper and discussions may be taken to heart by some of our war industries and save unnecessary waste of men and material.

# RECONSTRUCTION AND RE-ESTABLISHMENT

**NOTE:** The following is a summary of the evidence presented by Dr. F. Cyril James, Principal of McGill University and Chairman of the Cabinet Committee on Reconstruction before the Select Committee of the House on Reconstruction and Re-Establishment. It has been prepared, at the request of Council, by Warren C. Miller, M.E.I.C., Chairman of the recently established Institute Committee on Post-War Problems and is published in order to keep members informed of the work that is being done in that field.

On March 24th, 1942, the Dominion Parliament appointed a Select Committee of the House to report upon the general problems of Reconstruction and Re-establishment which may arise at the termination of the present war. On May 14th and 19th Principal James of McGill University who is the Chairman of the Cabinet Committee on Reconstruction gave evidence before the House Select Committee.

Principal James described the general approach which his committee has been making to the problem of reconstruction since its appointment and the sequence of ideas upon which its work has been based. This he did under three general headings: first, the basic assumptions or ideas on which the committee has worked; second, a description of the broad outline of the probable sequence of events at the end of the war; and third, the breaking down of the problem into nine sections so as to be sure that nothing would be overlooked.

## BASIC ASSUMPTIONS

Dealing first with basic assumptions the committee believes that the essential requirement for Canadian prosperity and Canadian progress at the end of this war is, that the individual who is able to work and wishes work should have a decent opportunity to work. All our financial, fiscal, political, economic, agricultural and other policies should be designed to produce that ultimate result. A solution of the problem of demobilization should be included. Workers in munition factories who will presumably be released from that employment must also be considered along with all other members of the community. Many people feel as well, that in addition to full employment, a definite increase in the standard of living should be contemplated.

Reconstruction is not something that begins one second after the last gun is fired. It is intimately related to the present and the past. We should not assume that the end of the war will automatically bring us closer to Paradise. We will not be in a position to start afresh with a full new plan. Circumstances at the end of the war will be those that result from all of the long traditions of this Dominion. All the things that have happened in the past and which are happening during this war will leave an impress on that moment of time. Reconstruction is something which must be thought of in advance, partly for the purpose of recognizing exactly the influence of wartime activities, controls and regulations on the post-war Canadian scene. Many people are acutely interested in this great problem. It is not that they are not interested in the war itself, or consider the post-war period as more important than the epochal events that are taking place from day to day. They have a vision of that future which they hope will be Canada's, and this vision inspires them to even greater efforts at the present time. They begin to see the possibility of realizing many of the things that they have dreamed of in the past. The psychological importance of our approach to the problem of reconstruction may contribute just as directly to the war effort as clearcut and carefully planned development of reconstruction policies will contribute to the solution of immediate war problems.

We should attempt to preserve as far as we may, compatibly with the attainment of full employment, the basic Canadian tradition of free enterprise and personal initiative

in both political and economic life. Principal James' committee is not envisaging the creation of a completely new society nor is it writing a Utopian programme of what society might be if there were no traditions. They are attempting to envisage a situation in which there will be carried on all of the basic traditions embodied in the phrases "personal liberty" and "democratic institutions."

The underlying philosophy on which the committee has been working, therefore, includes the assumptions of full employment, reconstruction as a continuing aspect of present policy and the maintenance as far as possible, of basic Canadian political and economic traditions.

## THE SEQUENCE OF POST WAR EVENTS

In addition to a philosophy it is necessary to have some sort of idea continually in mind as to what is likely to happen at the end of the war. While we have no precise idea of what is going to happen, each of us has some picture in his mind which, while it is clear at any given moment, is always subject to revision. Without such a picture we are likely to flounder around in an uncomfortable morass.

Examining the situation which followed the armistice of 1918, three sets of factors may be seen. First there was a great accumulation of consumer purchasing power. Substantial profits were earned by certain industries and high wages were being paid to many groups of workers in those industries. During the war there was a shortage of goods so that this large accumulation of consumer purchasing power was itching to be spent. Second, returning soldiers were paid substantial cash bonuses which provided an immediate fund which was often spent rather extravagantly. Third, there was a very general desire to get back to business as usual, a restlessness against restraint arising from the feeling that the war had ended and that the world was now going to be able to get back to the good old days of 1914.

No one of these factors will be equally important at the end of the war. Taxes are already higher than they were at any time during the last war. We have imposed price and wage controls and other regulations to preclude the possibility of excess profits in war industries or sharp increases in the wages paid to workers at the present time. We have controlled consumer prices. The only substantial sums available for immediate post-war expenditures will consist of the funds now invested in war savings certificates, together with forced savings accumulated under the new budget. Both of these amounts, however, will be smaller and more easily controlled than the amounts that were involved in 1918 and 1919. With respect to returning soldiers, the plan contemplated by the government will involve some small cash bonuses distributed by means of periodic payments during re-education, re-training, unemployment, or interrupted education. Thus there will be little possibility of any sudden splurge in consumer expenditures from this source. With regard to the third point, the average man on the street today has less desire to get back to business as usual than the average man on the street had in 1918. The war has changed fundamentally the pattern of our economic structure. Certain developments, changes and plans will have to be carried out and the experience of the 1921 and 1929 depressions have made them rather cautious about suddenly wanting to get rid of all restrictions and to return to the idea of operating business in the old way. At the end of this war the business boom will be less intense than it was after the last war, but it is likely that there will be a boom. Such a boom will provide a slight breathing spell. We ought, during that period, to be ready to accelerate the rehabilitation of industry, agriculture and commerce to the greatest possible extent. We should be able to accelerate the changeover of factories from wartime

to peacetime production both for the purpose of absorbing unemployed workers whether soldiers or others, and also for the purpose of providing a maximum supply of those consumer goods which the people of this and other countries will need.

Such a period of prosperity will come to an end. We must admit the possibility that there may not be a period of prosperity at all. We are compelled, therefore, to look to the fact that there will inevitably be a post-war depression, either immediately after the war, or at the end of this period of prosperity. That depression will show itself first by local unemployment in certain areas where private enterprise has not been able to meet the needs of the situation satisfactorily. We must have in reserve some supplementary programme of government activity. That presumably will take the form of publicly financed construction projects. It is too early to say whether they will be financed by the Dominion, the provinces or the municipalities. It will, however, be financing and organization by some governmental authority, in the interests of solving the whole problem of re-employment and rehabilitation throughout the community.

#### THE FRAMEWORK OF THE PROBLEM

In order that progress can be made at more or less the same rate on all fronts, the committee has attempted to develop a broad picture of what reconstruction actually means in several different fields. The problems were divided between: first, those purely domestic to the Dominion of Canada, problems in regard to which Canada can go ahead and do practically what she wants without consulting anyone else; second, those that are domestic to Canada in the sense that they have to be decided by the Dominion Government but in which the freedom of action of the government is conditioned by events and activities in other parts of the world; and third, those of vital importance to Canada, but in regard to which Canada can do nothing at all because their solution depends on international action.

Dealing with the first subdivision we can further subdivide it into three parts:

- (a) employment opportunities within the Dominion;
- (b) the conservation and utilization of natural resources; and
- (c) the development of plans for publicly financed construction projects.

#### EMPLOYMENT OPPORTUNITIES

The first thing to be done was to see whether there existed or could be developed in the Dominion, machinery by which unemployed individuals in any part of the Dominion could be brought into touch with jobs requiring their particular skills in some other part of the country.

There is also the question of the size of the labour force retiring from and entering the labour market. At the end where labour leaves gainful employment, there is the whole question of old age pensions, retiring allowances, unemployment relief, sickness compensation and other associated factors. We need to know how nearly uniform is the treatment of these matters across the Dominion. Are any variations appropriate to the differences in economic conditions and living standards within several provinces where improvements can be made? How well can we take care of those who through no fault of their own have to withdraw from active competition for available employment? At the other end of the scale the inflow of labour depends on the ordinary school leaving age which varies according to our ideas of minimum educational requirements for all and on the question of specialized education where access to particular professions and trades is conditional on adequate training, either in colleges, technical schools, or by apprenticeship. The place of education in this picture is a difficult one, since it is clearly under provincial control. The Dominion Government has no direct responsibility. The committee is, however, exploring the question and is bring-

ing together a small group of outstanding educators from several of the provinces to discuss the general aspects of the problem in regard to primary, technical and higher education. It is hoped that as a result of the work of this committee, another will be formed on which the provinces will have direct representation, and which will have the confidence of the provinces as well as the various educational groups, and which will be able to make constructive recommendations.

#### CONSERVATION AND UTILIZATION OF NATURAL RESOURCES

The conservation and utilization of natural resources is another purely domestic problem. Forests, fisheries and mines not only contribute a substantial proportion of the needs of our industries, but have been one of the great amenities of the continent. They contribute to the aesthetics of our standard of living and have attracted tourists from all parts of the world. Their conservation and constructive utilization is apt to provide substantial employment opportunities in the immediate post-war period. Principal Wallace of Queen's University is chairman of a subcommittee on conservation and natural resources with members representative of Dominion and provincial governments and private enterprise in the various important fields of natural resources.

#### CONSTRUCTION PROJECTS

A programme of publicly financed construction projects is the third field of purely domestic activity. At some stage of the post-war period it is going to be necessary for government to step into the picture in order to provide employment in an area where business has become slack. Well laid plans should therefore be available long before that moment comes. It has been the experience of many countries that have used publicly financed construction projects to cure unemployment during the last ten years, that the difficulties arise, not at the stage where labour is employed and materials purchased, but rather at that earlier stage when it is necessary to prepare plans, to determine quantities of materials, and types of men to be employed, estimates of cost and above all to determine the exact type of project and its location. This must, in its very nature, be local. Unemployment in British Columbia requires projects in British Columbia, not Ontario. Otherwise, we are confronted with the task of trying to move substantial numbers of workers from one section of the country to another, something that in Britain was found to be very unsatisfactory when an attempt was made to move people from the distressed parts of Wales to certain other parts of the country where new industries were developing. It is necessary therefore, that there must be close co-operation between any Dominion organization and the provincial and municipal organizations that are responsible for the most of such projects. Long before the war ends we must have available carefully developed plans for a variety of possible projects. A sub-committee to study this phase of the problem is working under the chairmanship of Mr. K. M. Cameron, M.E.I.C., Chief Engineer of the Department of Public Works, Ottawa.

Mr. Cameron's sub-committee is trying to do two things. First, there is the problem of plans that will enable it to recommend the creation of a public works reserve in Canada. In the United States this is a Federal organization, with an elaborate technical staff which is at present engaged in discussions with the several states, encouraging them to prepare specific plans for post-war projects of this kind. At the present stage there is no suggestion of financial commitments of any kind. The big problem is the determination of what ought to be done. What are desirable projects that contribute to the social good? What will they cost in terms of labour and materials? How long will they take to construct? If a complete list of projects can be compiled for each area, it can be the subject of subsequent financial discussions between the municipalities and the

provincial governments or between the provincial and Dominion Governments. We shall then have progressed a long way toward the solving of our problem. Even if Canada should never have to use publicly financed projects for the purpose of meeting unemployment, it still would have been time well spent to develop such an insurance against a conceivable unemployment situation.

Secondly, Mr. Cameron's sub-committee is trying to develop certain criteria or standards by which such projects can be appraised. It is necessary that there should be certain clear-cut methods of accounting and documentation, certain standards of the drawing of plans and the preparation of specifications. This is absolutely essential to the building up of any large group of construction projects and to the putting of those projects into effect at the moment it becomes necessary.

#### RELAXATION OF WARTIME CONTROLS

The second broad group of subjects are those within the control of the Canadian Government in the sense that Canada can develop and carry out a specific policy, but in which the effectiveness of that policy is going to be affected by developments in other parts of the world. The relaxation of war time controls is one of these problems. Canada has, since the commencement of the war, instituted a very elaborate series of controls of practically every aspect of economic life. At the end of the war, if we are going to get back to a less controlled economy, it is obvious that those controls will have to be relaxed gradually and wisely. There would be chaos if they were suddenly abandoned on the day after the armistice. That chaos would extend to many other countries because the controls are to-day geared to the economic activities of other countries. For instance, in the field of foreign exchange control, our regulations and operations are tightly meshed together between this country, the United States and Great Britain.

We have to face a serious psychological problem. At the end of this war, in terms of the Atlantic Charter, we are trying to create a world in which there will be reasonable prosperity, individual freedom, and full employment. There will, however, be a completely different set of circumstances on this continent from that in Great Britain. Canada will have a surplus over and above everything we could eat, and also over and above what we can send to Europe in available shipping bottoms. England will receive for consumption only those materials for which there are ships. Consideration must be given as well to the re-vice of Europe. It will be easier in this country to relax controls than it will be in Britain. The question will arise whether there should be some joint policy in timing the relaxation of controls.

This whole problem is one of the most complicated that the community will confront at the end of the war. Everyone will want to get rid of the controls that worry him personally, although many people believe that Canada should keep all of the controls that do not seriously inconvenience them. However, each group of controls will be under attack from some sections of the community. The desirable procedure to be followed should be that of attempting to find out now the way in which particular controls can be modified, step by step, in a sensible and coordinated fashion. We ought first to make a study of the exact facts of the relaxation of comparable controls, in the case of particular industries during and after the last war. On the basis of those two sets of data, we should try to develop a programme for progressive relaxation of controls, as far as may be practicable after the war.

#### THE REHABILITATION OF AGRICULTURE

It is probable, although we cannot be sure, that we might expect a slump in Canadian agriculture at the end of the present war. Other nations will come into competition for British and United States markets. To complicate the picture, there is the whole question of land settlement, since

it is to be expected that a good many returned soldiers, under the option given them in proposed legislation will want to settle on the land.

Agriculture depends also on another very interesting recent development, nutrition. It has been said that in the western world, including Great Britain, Canada and the United States, if we were able, either by education or public assistance, to develop a satisfactory standard of nutrition for all people below age 20, we would require all the agricultural output of this continent and that of Argentina. The problem of Canadian agriculture is not only one of foreign trade, but it is also governed by our approach to good nutritional standards and adequate feeding. Both of these are intimately related to full employment and a decent standard of living for the people of Canada.

Agriculture, during the past fifty years, has been greatly mechanized. A farmer with a tractor and appropriate equipment, is able to look after many more acres of land than his predecessor with two horses and a plough. It is necessary, therefore, to obtain some clear idea of the number of people that are necessary to meet our agricultural demands and the number that can attain a decent standard of living with reasonable prosperity and comfort through farming.

#### INDUSTRIAL REHABILITATION

A third aspect of these domestic problems that depends partly on world affairs, is the rehabilitation of Canadian industry. There are probably more workers in factories, in proportion to the total population, than ever before. The total output of manufactured goods is greater, the number of factories is greater, and the number of machines in those factories is probably greater. That industrial equipment is now necessarily devoted to the production of a large number of things that are not very useful in times of peace. It is easy to switch over from the manufacture of aeroplane radios for the combat service, to the making of civilian radios. It is not so easy to rehabilitate a shell making factory which has, mainly, single purpose tools, or a factory designed for making cartridges. It is probable that we have more shipbuilding capacity of the simple freighter kind than we will need, and not enough capacity for passenger liners.

Canada will face two serious problems at the end of the war. In the first place we must decide early what factories ought to be scrapped. At the end of the last war we gave ourselves lots of grief by trying to keep in operation factories that were neither necessary or useful for peacetime operation, and so contributed to the general depression. Secondly, since no factory ought to be scrapped if it is of any conceivable use to the community, we should also develop clear plans for rehabilitating the rest of the factories in such a way that they can promptly and effectively begin to manufacture appropriate civilian goods of a kind that are needed.

By and large, the problem of rehabilitation, of switching factories over, putting in new machines where necessary, and reorganizing assembly lines is something that must be done promptly. If not, there will be a great deal of unemployment as well as a great scarcity of many kinds of goods which people want and which they might reasonably expect to be able to get.

#### THE WORLD ECONOMY

The international aspect of the problem may be divided into three sections, first, the study of the probable world economy; second, the study of monetary and fiscal policies; and third, a study of Canada's foreign trade.

The general structure of the world economy is not a Canadian problem in the narrow sense, but what happens outside the frontiers is of vital importance to any policy that may be adopted in this Dominion. The general monetary system of the world and its effect on foreign trade and capital movement, the attitude of this country and other countries toward international migration, the policies that are adopted for the maintenance of world peace; all of these things are of tremendous significance to what we do, and

no matter how ideal Canadian policy may be in the purely domestic field, that policy could be completely wrecked by unsatisfactory developments outside our borders.

There seems to be only two conceivable types of organization for the post-war world; either the world must attempt to build up some integrated economic organization, or it must divide into a series of regions each of which is integrated within itself and protected by barriers of tariffs against other parts of the world.

If we accept the possibility of economic regionalism, there are many possibilities. There have been those who have suggested that Canada might become part of an integrated economic region based on Great Britain and the other British Dominions, a sort of Empire Federation economically integrated much more closely than at present along the lines foreshadowed in the Ottawa Agreements. On the other hand there is a group who suggest that the economic position of Canada should be integrated with a Pan-American region focussing on the United States. Economic regionalism along these lines would necessarily extend to the rest of the world. There would be a far eastern region under the hegemony of China; there would certainly be a central Asiatic and eastern European region under the control of Russia. If Canada should move into the orbit of the United States as part of a western hemisphere region, the position of Great Britain would be such that it would be compelled to link itself up with western European countries, Scandinavia, Holland, Belgium, etc.

All of these suggestions are random hypotheses. Unfortunately, any such division of the world into regions suggests the possibility of war, since nobody has yet suggested any regional grouping which is completely free from friction. The Committee on Reconstruction has come to the tentative conclusion that the ideal for the future structure of the world is an organization that is world embracing in its scope. The centre or nucleus of such an organization would necessarily be some broad economic affiliation between the British Commonwealth of Nations and the United States around which other countries might be induced to co-ordinate their economies, and not develop into isolated competitive regions.

#### MONETARY AND FISCAL POLICIES

Certain broad conclusions have been reached in connection with monetary and fiscal policies. It appears essential to the committee that if there is to be a world economy, there should be throughout the area of that world economy a co-ordination of monetary policies. This does not imply a restoration of the pre-'39 or still less the pre-'14 gold standard. It is recognized by a very large number of monetary theorists that monetary policy is the handmaid of commerce, industry and agriculture, and not itself the governing factor by which basic economic activities should be regulated. There is a widespread recognition of the idea that the post-war aim of monetary policy must be the attainment of full employment, so that the standard of living of the nation may be as high as it can conceivably be.

In practice there are difficulties especially in connection with the differences that may exist in the rate at which production expands in each of the several countries. This would offer opportunity for those who are not socially minded and encourage them to move their capital funds from one country to the other, to the detriment of both the losing and the gaining country. The committee has agreed that foreign exchange controls in something like their present form will have to continue during the post-war period. They will have to be administered in such a way as

to interfere as little as possible with normal commercial and industrial operations in the international field. It is also felt that there will need to be close and continuous consultation between the monetary authorities and the leading economic powers.

It is apparent that the fiscal policy in regard to taxation and borrowing will be much more closely and intimately related to the monetary policy than it has been at any time in the past. Full employment implies, at certain periods, an unbalanced budget. It implies a programme of publicly financed construction projects. When this is put into operation the government will be spending more than it will be collecting in the form of taxes. Taxation will continue to be heavy for some years. Government expenditure will probably be higher than it was before the war, since the ideals that we expect to attain and the several problems that will confront us for solution, are going to demand a very high level of governmental expenditure.

It is necessary to study very carefully the standards or criteria by which monetary policy will be judged. Monetary policies directed toward the attainment of full employment are comparatively new things, and the only historical examples that have not ended in chaotic inflation are those which have been tried out in a few countries in the past ten years. The ultimate danger of excess of monetary expansion is obvious, but it is difficult in a democratic community, to explain the reasons why expansion cannot continue beyond a certain point. We must endeavour therefore to maintain the position of the monetary authority on the highest line of prestige and assist it in its task by a willing recognition of the standards by which its policy must be determined.

#### CANADA'S FOREIGN TRADE

Foreign trade is intimately linked up with many of the things that have been already discussed. There has never been a period at which Canadians were uniformly prosperous and happy unless the export market was sound and reasonable profits were being earned. This generalization may not, however, be as true after this war as it was before the war. There will be a larger domestic demand for our agricultural foodstuffs and raw materials, together with a smaller comparative demand for foreign industrial products. However, despite these changes, Canada will depend on international trade for many of the things that she needs for that higher standard of living which we wish to attain, as well as for the raw materials of some of our essential industries.

We can export goods only to the extent that we are willing to import goods and services from abroad for the payment of our exports, or to the extent that we are willing to send capital abroad. Canada either must take payment for exports in goods, or services produced in other countries, or it must frankly express its willingness to supply such goods as a long term capital investment to be paid either by principal and interest in traditional fashion or to be repaid intangibly by better relations and a better ordered world. We must study carefully the extent to which we are willing to export goods on either of these hypotheses; either in the case of a comprehensive world economy, or within the frontiers of any economic region of which Canada may be a part. Such a study, which is basic to any further discussion of Canada's foreign trade, cannot be made until we have decided upon the probable nature of the world economy, but it cannot be too much emphasized that the basis should be that we need things from other parts of the world, rather than that the other nations ought to buy Canadian goods.

# PROFESSIONAL DEVELOPMENT AND RESPONSIBILITY

ROBERT E. DOHERTY

*Chairman, Engineers' Council for Professional Development*

An address presented before the 1941 Annual Meeting of the American Society of Mechanical Engineers\*

At the annual meeting of the American Society of Mechanical Engineers in 1966, someone will present a paper on what has happened during the twenty-five years since the United States entered World War II. It may recite how engineers, along with professional men from other fields, broke away from their traditional attitude of professional self-sufficiency, stepped into the rapidly widening breach on the social and economic front, and helped to save America. Or, it may recite how engineers, along with other professional men, kept their eyes so steadily focused on *status quo*, clung so tenaciously to their traditional and interesting business of giving the country a technological joy ride, that they completely lost sight of facts that were vital. They forgot that they were, after all, living in a democracy; they overlooked the fact that if the people do not determine policy affecting their welfare, democracy must vanish; they did not recognize that the activities and interdependence of groups in the national community had become so complex that the nation could no longer entrust its destiny as completely as in the past to emotional oratory and ignoble politics; they forgot that society had given them the privilege of higher education, and thus presumably greater competence to struggle with problems, and that therefore they had a commensurate responsibility for active interest and leadership. They lost sight of these vital facts. In other words, that paper—if indeed one can be given at all in such a case—may accuse our generation bitterly and with justice. It may say, "These men took things for granted. They forgot that they were trustees. They let us down. They forfeited freedom."

I do not know which of these papers will be read twenty-five years from now. It will depend upon what professional men do in practice and in education during the years immediately ahead. The engineer's part is a very important one, and it is my purpose here to outline my view of the situation and indicate what seems to be the clear responsibility of his profession.

After the war we shall live in a new world. It will be a world requiring fundamental readjustments in our thinking and in our way of national life. Indeed we are already well into that world and are advancing further into it day by day. To understand that all of this is so, we need not depend wholly upon the almost unanimous conclusions of serious students; we need only to look about us. Intense social stresses, widespread confusion of purpose, and gross abuse of privilege are all too evident. National action has leaped far beyond national thinking. The simple fact is that this country is set up under a theory—the theory of individual rights and democratic procedures—and there is, after all, a limit to the extent to which that theory may be contravened. To go too far is to crack up. Flexible as history has shown the theory to be, there is yet a limit, as was demonstrated, for instance, in 1861. And since we have been rushed from our simple beginnings into the new, complex world, impelled first by technological development and now thrust headlong by the demands of war, we have got to accelerate our thinking to keep pace with our actions or we shall again stretch our theory beyond the breaking point. We must readjust our thinking and our attitudes regarding national and community life to bring these again into workable accord with our theory of democratic government; else there can be no lingering remnant of justification for the assumption that, as a nation of once-free people, we are still capable of intelligent action, or worthy of freedom.

\*Reproduced through the courtesy of the American Society of Mechanical Engineers.

How can these readjustments be initiated? Whose responsibility is it to plan them? From what I have already said my answer is clear. Professional men must undertake the task. One need not labour the point that, as a matter of right, they *should* do so because they have had privileges of education denied to others. The fact is that nobody else *can* do it. The problems are too complex. They involve the establishment of new interconnections—lines of communication and understanding—between fields of human activity that in the past have been held separate. The problems of sociology, economics, and technology are no longer merely technical in nature. The technical aspects of the problems in each of these fields are indeed difficult enough, but there are new elements to be recognized, new complications beyond those considered in the past. One is the imperative necessity now of recognizing more fully the interdependence of situations in these different fields. For instance, the technical problems of economics and the technical problems of engineering involved in the design of a piece of apparatus have of course usually been coordinated in the past, but the sociological problem created by the introduction of the apparatus into social use has not been adequately taken into account. Or, the other way round, a sociological problem—say, the employment of idle people who want to work—may not be solved because the technological or economic problems concerned are not solved. In other words, we have reached a stage, as I understand it, where the interdependence of situations in these different fields must be recognized. Human life is not divided into subject matter compartments; we can't continue solving one part of the problem and thinking we have solved the whole; we must actually *solve* the whole. Then another complication is the necessity of readjusting our philosophical base. Merely recognizing the interdependence of situations is not enough. The solution of these problems, if there is to be one, must be geared into a principle. That principle is not new; it is just forgotten—the principle of individual rights and democratic procedures. If our national problems are to be solved the parts must be related to the whole and this relationship must be made to accord with this fundamental principle of our existence as a political unit. And the intellectual task involved in the initiation and consummation of such a complex national readjustment is one in which professional men in all fields—including the social and physical sciences, the learned professions, business, engineering, industry, labour—are obliged to assume leadership, and obliged also to recognize, even in this process of assuming leadership, the principle of democratic procedures.

Among the professional men who should undertake such a task, the engineer has a heavy responsibility. I have said elsewhere: "A technological war is raging in a technological civilization. It is based on the engineer's work. He is conversant with the mechanical, chemical, electrical, and structural bases of both civil life and war. He plans mills and machines; he executes their construction; he employs and manages the men who do the work. He is responsible, in other words, for seeing that plans on paper become actual material things that work, and also that the job is done on time within estimated cost. On the other hand, he has not had in the past either responsibility or great interest as to what the social effects of his work would be. It is idle to censure him, as some do; and it is equally idle, I might add, to censure social scientists and business and political leaders, who did have the responsibility and presumably also the interest. That water is over the dam. But in the future the engineer must enlarge the scope of his view and take an

active interest, both as an educated citizen and as a professional man, in the problems of national and community life where his creations have so completely changed the environment and way of life."

"There are two things he can help to do, both of them immediately urgent. One is to create employment for the post-war period. After ten years of increasing population and increasing invention and discovery, yet of curtailment in most areas except government activity, the possibilities of constructive enterprise appear boundless: new materials, new products, new homes, new structures, new machine tools and methods, new services, and so on. Every engineer in the country, whether he be at the design table, in the field, in the laboratory, or in the plant; whether he be superintending construction, managing a factory, or running a business—wherever he is, every engineer should be figuring out what he can do on his job to provide constructive employment. His position may or may not carry decision, but he can at least think and suggest, and in many cases he can decide upon action. Seventy-five thousand trained minds turned upon the problem can bring results; and those minds can be reached and oriented through the professional engineering societies."

The other thing engineers can do is an educational job. It is to develop in their younger brothers and themselves a new understanding of their professional obligations to society, and the capacity and knowledge to discharge those obligations. This is a long-run undertaking, but time is nevertheless an element. One hopes that in the next generation of engineers there will be more who through education and interest are in a position to sit in policy-making bodies and thus help to guide the use of the engineers' creations, more who as teachers can help young engineers acquire the broader view of their professional responsibility, more who as educated men can recognize and support constructive political measures and oppose destructive ones, and help other citizens to understand complicated situations and issues. We cannot wait two or three generations; we must begin now, because the educational undertaking to which I have referred properly should begin in college. The foundation of knowledge and of incentive must be laid there. But the educational process we are considering, like the student's other professional studies, cannot end with college; it must continue afterward. Hence, in our emergency the process of education to prepare the young engineer for his new obligations should be begun at once both in the colleges and among practicing engineers, especially those recently graduated.

It is here that the responsibility of the organized engineering profession is absolute. Engineers individually cannot be expected to assume, on their own, these new responsibilities. I think I am right in saying that to bring about readjustments in interests and attitudes requires, even in younger people, unremitting guidance and attention, and in mature minds I have not yet fully learned what it requires. But if we are going to help the younger generation of engineers to prepare themselves for the job that is ahead of them, we must provide an organized educational movement. This movement will necessarily sweep across the entire range of functional organizations of the engineering profession, including the educational, legal, and practicing. In other words, to accomplish the purpose, it would appear that nothing less than a co-operative movement on a grand scale is required.

What, then, are the necessary steps in such a movement? The first is to bring about a full understanding of the problem, its vital importance and urgency, among the boards and executive officers of those national organizations concerned with engineering, and the acceptance by them of a plan of action. The second is to put the plan into execution. May I outline to you how I think these steps might be carried out?

Fortunately, the machinery already exists for doing the job; no new organization is necessary. The national engi-

neering societies, The Engineering Institute of Canada, and the Society for the Promotion of Engineering Education have local organizations through which the individual engineer and the individual student are reached. The National Council of State Boards of Engineering Examiners represents the local State Boards that deal with the legal side of engineering. Then there is the central conference body of all these groups, the Engineers' Council for Professional Development, which can provide such co-ordination among the groups as may be necessary. As I see it, the role of this central Council of twenty-four members in the whole undertaking would be thinking, planning, and conference. The undertaking is distinctly one of professional development. The members of the Council would bring to the conference table the best of what each group has to offer and what the Council's own Committees can contribute, and then by debate and deliberation and by consultation of Council members with their own organizations, work out for the purpose we are considering a co-ordinated plan that will fit into the existing programmes and machinery of the Council and that will have the support of the constituent groups.

The support of the several groups is absolutely essential, not only because they must approve any important project before it is put into effect, but also because the constituent bodies are the ones that will have to do the job. Although there are a few undertakings which the Council itself has been authorized to administer—the accrediting programme, for instance—it seems perfectly clear that an educational programme such as the one here contemplated must be carried out by the constituent organizations. The function of E.C.P.D. would be merely co-ordination of the effort through the Council's standing committees.

In short, then, the role of the Council would be co-ordination of planning and effort, and the role of the constituent bodies, the execution of plans. May I now say a more specific word regarding these roles?

I visualize in some detail a picture that has been taking form during the past few years of the machinery of national professional development. Some parts of the machinery are already in place and in motion, and others are being constantly added and put in motion. The problem is to complete the picture—to provide the links that are still missing, get all the parts in motion, and then gear them together in one effectively co-ordinated movement. Need I add, incidentally, that not an insignificant part of the problem is to accomplish all of this without stripping any of the gears? I have come to visualize this picture in increasing detail because several hard-working members of E.C.P.D. and its standing committees have been sketching in those details. And among these people, there is one who has been especially active and helpful in sketching the whole. I refer to that Socratic catalyzer, Dr. Charles F. Scott. From his unique vantage point—having served as head of American Institute of Electrical Engineers, Society for the Promotion of Engineering Education, National Council of State Boards of Engineering Examiners, Engineers' Council for Professional Development, and of the Connecticut State Board—he has dreamed professional development, pondered its problems, hammered unremittingly with searching questions his associates in all of these widespread interests, and made them—if by no other means, then by exhaustion—give him an answer. One phase of his genius is the bringing of miscellaneous ideas into constructive combination and seeing that people know them. And partly out of this catalytic process has emerged a picture of how the existing machinery of engineering organizations can be utilized to accomplish professional development in general, and therefore also the specific purpose we are here considering.

One visualizes lines of flow for ideas and plans from the several headquarters of the engineering societies to engineering students through the respective student branches, and to practicing engineers through the local sections; and from the S.P.E.E. headquarters to the engineering teachers

through its local sections. Also one sees crossflow on campuses between the several student branches and the local S.P.E.E. sections or groups, and in industrial centres between local sections of the engineering societies. Then there is the possible line to engineers entering practice through the licensing bodies. And the headquarters of all these agencies are tied together for co-ordination in the E.C.P.D. Thus the machinery exists all the way through. It needs only to be put to greater use for the purpose of professional development, including our present problem of cultivating a new understanding of professional obligation.

Can we not begin at once to utilize these available means to bring about this new understanding among engineers of the problems that face the country and of their responsi-

bility to take a hand? Can we not bring them to realize that all of them can help individually by thinking and planning how to create employment after the war and then doing what they can to get their thoughts adopted? And can we not—must we not—look ahead at least a generation and take responsibility for helping the younger generation to understand and prepare for the professional life and service that are ahead of them? Cannot the responsible heads and boards of engineering organizations take the necessary initiative to get this thing going? Then perhaps the paper at the annual meeting in 1966, reviewing the twenty-five years since we entered World War II, will say, "Engineers recognized their responsibility and did a magnificent part in saving America."

## Abstracts of Current Literature

### INDIA MEETING THE DEMANDS OF WAR

From *Trade & Engineering*, JUNE, 1942

The success achieved in the past twelve months in expanding India's industrial output has been substantial but does not justify complacency. Dr. Henry Grady, the head of the United States Technical Mission which arrived in India in April, declares indeed that India's industry is not yet in its war stride.

It must be remembered that India's engineering industry in peace-time was comparatively limited and was not designed for production in the accepted sense, though it had a capacity for structural, mechanical, electrical, and civil job work. Before the war there was practically no production of machine tools in India, though a few firms made a small number of special machines for their own requirements. There are now a substantial number of firms making, under licence, lathes (including small capstans), drilling, shaping, planing, slotting and hack-sawing machines presses, furnaces, power blowers, and sand-blasting plant. It has been estimated that the approximate output of machine tools and ancillary plant in India amounts to over 400 units a month, and this figure is rapidly increasing. The production of precision gauges, previously imported, has reached 1,000 units weekly in railway workshops alone. On the output of the machine-tool industry must in great part depend the pace of factory expansion.

The Government of India is doing its utmost to train labour, and by March last plans were made to provide for some 15,000 technicians (with expectations of 48,000 by March, 1943), quite apart from the training of personnel for the Government ordnance factories.

Another determining factor in the pace of industrial effort has been the capacity of the steel industry. Before the war India had an important steel industry, but it produced only plates, sheets, rails, tinplates, and bars. In the past twelve months there has been further progress in the production of high-grade steels. Among new types of special steels now being produced are bullet-proof armour plate for vehicle bodies, bullet-proof plate for howitzer shields and gun turrets; various kinds of alloy steels; a chrome-molybdenum alloy steel needed for aircraft, spring steels high carbon sheets, and a stainless steel. By the middle of this year steel production in India should attain a rate of  $1\frac{1}{4}$  million tons a year, by no means a final figure, for a further substantial increase in total production may be expected.

So far the manufacture of motor engines or chassis has been regarded as involving an unwarranted diversion of highly specialized factors of production urgently wanted elsewhere, and there has consequently been concentration on the manufacture of bodies, armour, and armament for imported chassis. By the end of last year many thousands of armoured vehicles of various types had been completed and delivered.

All shipbuilding yards in India are now working to full

### Abstracts of articles appearing in the current technical periodicals

capacity on the construction of naval vessels of various types. Over 300 such vessels are under construction, including trawlers, corvettes, minesweepers, motor-launches, lifeboats, cutters, and other seagoing and coastal craft, and floating docks. Altogether well over 30,000 men are engaged in the various new shipbuilding and repairing yards in the country. In addition to new naval construction, shipbuilders are engaged on extensive repairs to merchant ships, and in fitting degaussing equipment, gun mountings, and bridge protection. Approximately 4,000 sea-going ships have been repaired at Indian yards since the outbreak of war.

Engineering works in India are manufacturing components for main propelling and auxiliary machinery, and it is hoped that complete marine engines of indigenous manufacture will soon be produced. Many other ship fittings which had to be imported before the war are now being manufactured locally. Among these are anchors, windlasses, mine-sweeping winches, ventilating fans, prismatic glasses for portholes, and a large number of electric fittings. India, however, has not yet been able to undertake the manufacture of boilers, while other equipment such as electric generators and apparatus, submarine-detecting gear, navigating instruments, solid drawn steel, brass and copper tubes and pipes, and non-magnetic plating and armament have also still to be imported.

So far as aircraft manufacture is concerned India, owing to the same considerations as those applying to motor manufacture has not yet got beyond the stage of assembly plant. Several heavy chemical factories have made progress in the past twelve months, and the manufacture of T.N.T. has been started at an ordnance explosive factory. Another notable new product recently reported is ammonia—also at an ordnance factory.

Last year there was something like a four-fold increase over the greater part of the war supply field, and this year the demands on India may well prove gigantic.

### NEW A.A. GUN PLATFORM

FROM ROBERT WILLIAMSON\*

In twelve days a workshop in the English Midlands has produced an anti-aircraft gun platform of simplified design which has now been accepted as standard.

The original design was a riveted construction of rolled steel sections, demanding many man-hours to make. A simple design of sheet metal construction, arc-welded instead of riveted, was suggested. The Government asked how long it would take to turn out a test platform.

It was promised within 14 days. Four draughtsmen, working under the chief designer, produced the drawings

\*London correspondent *The Engineering Journal*.

overnight. Construction began in the morning and went on continuously day and night.

In ten days the components were ready for assembly, and in two days more the completed platform was towed off for test—48 hours before the stipulated date.

After official tests the simplified platform was accepted, within a month, as the standard design, with much saving to Britain in man-power, materials, machine hours and money.

### DRYING WITH INFRA-RED LAMPS

*From Trade and Engineering, APRIL, 1942.*

The infra-red radiant-heat lamp is a new industrial tool which promises to have a wide field of usefulness. It has been used in America chiefly for baking finishes on metal, but is being applied in other ways because of its advantages over more conventional methods of heating and for the solution of problems which cannot be tackled by other means.

Radiant heating is not new in principle, but when applied by suitably designed and disposed electric lamps it offers a convenient, easily-controlled, and, above all, fast method of heating. Two types of lamps are made, having tungsten and carbon filaments, in 250, 500 and 1,000 watt sizes. In order to provide the maximum proportion of heat radiation the lamps operate at a somewhat lower temperature than ordinary incandescent lamps, and have a life of up to 10,000 working hours. The carbon filament lamp is said to emit a higher proportion of useful heat radiation, but has the disadvantage that the glass blackens sooner.

The use of the flame-proof radiant-heat lamp enables heating to be used for drying finishes where before only air-drying was possible. Some remarkable reductions of drying schedules have thereby been effected. A New York firm producing advertising signs found that whereas with air-drying the paint took 12 hours to dry, the work could be done in  $7\frac{1}{2}$  minutes by using infra-red lamps. The finish was much better because there was little time for dust to settle on the surface.

Even where convective heating was previously used, the change to infra-red lamps can often cut down drying times considerably, partly because the maximum temperature differential can be brought to bear on the work and also because special new finishes have been introduced to take advantage of this method of heating. Cases have been quoted where times have been reduced from 1-4 hours by oven drying to 2-15 minutes by radiant-heat lamps. For finishing local repairs, where several coats of paint may be required, the saving in time may run into days.

Radiant heating lends itself admirably to continuous operation. In the usual method the articles to be dried, providing they are not too irregular in shape, are hung from a conveyor and passed through a circular tunnel of lamps which completely surround the work. Motor-car bodies and other massive parts are pushed into the oven and left for the necessary time. If desired the lamps can be arranged to be switched on automatically as the work passes beneath them. Where flat sheets have to be heated from one side only they are carried in a horizontal position below a long bank of lamps. Some very long ovens have been constructed on this principle. The Ford Motor Company, which pioneered the use of radiant heat lamps in America, recently installed a tunnel 300 ft. long and 10 ft. wide, containing 8,500 260-watt lamps.

### MODERN TIMBER CONNECTOR CONSTRUCTION

L. P. KEITH

*Structural Engineer, Timber Engineering Company,  
Washington, D.C., U.S.A.*

The shortage of materials and the scarcity of labour in Europe after World War I led to a critical analysis of construction methods and building materials.

Wood was a structural material more available than many, so it is no wonder that it and its use were carefully

scrutinized. Why were timber structures less economical than they should be? The material itself, pound for pound, is one of the strongest; it is easily worked by local labour; it adapts itself to varying conditions more readily than other materials; impact up to 100 per cent can be ignored, which is not so in other material; allowable working stresses may be increased a greater percentage for wind loads than for any other structural material; and structures made of it are easily altered to meet new use-conditions.

The chief indictment against the timber truss was the joint. Expensive metal fittings were required. Bolts transmitting loads from one piece to another were used with low design stresses, because of the concentration of load on a relatively small portion of the wood—that surrounding a bolt and only a short distance in from a contacting surface. The result was so much face area required at a joint in order to place all the needed bolts, that between joints there was much more wood than necessary to carry the load. Over-design is never economical.

The first step, then, was to strengthen the offending joint. This was accomplished by magnifying the area available around a bolt with a ring, concentric with the bolt and extending half the depth of the ring into each of the mutually contacting surfaces. Splitting the ring at some point in the circumference produced even greater load capacity because of bearing against both the inside and outside walls of the groove.

Thus, from the simple expedient of placing the metal where it counts the most, a new system of construction—modern timber connector construction—came into practice. Europe readily adopted it, and there were many fine examples of its use. Among these was the Stuttgart railway station. Outstanding and perhaps astounding was a 600-ft. radio tower erected in Germany. A Russian engineer passing through the Lumber Industry House at the Century of Progress Exhibition told me in his broken English of his use of connectors in Russia in 1927 in a building 800 ft. long with a clear span of 200 ft. Incidentally, the glued laminated timber arch was another development. Both were advances in the use of wood and both helped to solve the rehabilitation programme by carrying it on in spite of scarcity of material and labour.

Meanwhile on this continent, we were enjoying the extravagant twenties. Timber construction was practically ignored by the engineering profession and was left to carpenters; engineering schools devoted a minimum of attention to timber design.

In the depression of the early thirties the lumber industry realized that the best way to increase the sale of wood was to make its use more economical. The Department of Commerce of the U.S. suggested connected construction, so successful in Europe during the previous decade, as the best means of accomplishment. Accordingly, the National Lumber Manufacturers Association organized the subsidiary, Timber Engineering Company, a wholly owned industry company, to make connectors available in this country. Never, however, was it felt that merely so much hardware was being offered; rather, with vision and imagination, it was realized from the start that it was a system of construction which was being presented to the building public.

Progress was slow. There was none too much building. Engineers were still skeptical about the modernity of any wood construction. Vast educational work had to be done. There were many, many discouragements.

Time went on, and results, meagre at first, appeared. In 1934, a radio tower for Edgeworth Tobacco Company was built outside of Richmond, Virginia. This was a self-supporting, three-legged tower, 323 ft. high with all members, both tension and compression, of wood. Last year five organizations and thirty universities and laboratories tested timber connectors or conducted special studies, and requests from heads of engineering departments were for

some six thousand complimentary copies of the National Lumber Manufacturers Association publication *Wood Structural Design Data* to be placed personally in the hands of senior engineering students.

Timber design was revolutionized by this new system of construction. Characteristics of it are:

Tension members of wood. The material was always strong in tension, but pieces could not be connected to develop this strength.

The spaced column principle: two or more members separated by blocks at each end held in place by connectors and a centre length spacer block, bolted, form a spaced column. The end blocks so connected give restraint to the column ends, thereby increasing the load capacity as a column over what it would have as simple column of equal length, least dimension and cross sectional area.

The elimination of expensive hardware, such as shoes, heel plates, etc., and the labour to place these items.

The system lends itself either to prefabrication at a distant plant or to fabrication at the site. Unskilled and untrained labour can easily fabricate or erect it, so it was regarded favourably by relief agencies.

When fabricated at the building site, trusses are generally laid out in a horizontal position with the members held in place either by tacking or clamping. Holes are bored, with care being taken to keep the drill plumb. The truss is then either taken apart to cut the grooves for types requiring this treatment or toothed types inserted between the members before applying pressure to bring them into place. Where grooves are to be made for split-rings or shear plates, a pilot is inserted in the hole, and a cutter head then cuts the groove to the necessary depth and size. The diameter of the split-ring groove is slightly more than that of the ring when closed so that when in place there is bearing against both the inside and outside walls irrespective of whether the timbers shrink or swell.

This operation is suitable for a relatively small job. Obviously when many trusses are to be made the going would be somewhat slow. One defence plant is at present inquiring for 2,000 trusses involving the use of 5,000,000 ft. of lumber.

A large job can be prefabricated more economically, either by the contractor in his own plant on the premises or by sawmill or roof truss company even at a distant point. In either case the truss is shop detailed just as a steel fabricator might do, with grooves indicated far-side, near-side, or both sides as may be required. Multiple drills and other arrangements then permit rapid manufacture.

Leading up to our present contribution to the war programme, in which one pound of steel in the form of connectors, bolts, etc., used with wood, releases about twelve pounds of structural steel for tanks, guns, ships, etc., were two large governmental programmes in which modern timber construction established itself favourably with Federal agencies destined to become responsible for our war construction programme.

The first of these was the C.C.C. programme. Major Andre Violante, C.Q.M., reviewed this work in articles appearing in the *Quartermaster Review* in May-June, 1940. The portable camp buildings were designed with the roof panels a combination of the functions of a roof surface and the upper chord of a truss. The rafters were thus both integral parts of roof panels and the upper chords of trusses ten feet on centres. The truss connections required more strength than could be developed by bolts, so timber connectors were indicated. The system lent itself to prefabrication, and this meant speed in completion. In 1934, these buildings were on trial and their performance was being compared to that of conventionally-built buildings of the same size but without connectors. Major Violante recites instances of where portable structures with men inside have been lifted by wind off foundation posts with

no resultant damage except for the labour incidental to re-erecting them on the foundations. Five C.C.C. camps were in the path of a Florida hurricane; two were of rigid construction and three were connected prefabricated camps. The two of rigid construction were seriously damaged, many of the buildings collapsing, whereas the three connected camps escaped practically unharmed, although many trees several feet through the bole within these portable camps were blown down. Because of performance the connected type was adopted as standard in 1935, and Major Violante states the Quartermaster Corps of the Army accomplished the biggest prefabricated job of the country, if not in the world.

The other programme which provided evidence of the merit of the connector system of timber construction was the construction of hangars by the Canadian Department of National Defence, accounts of which were duly recorded in both the *Military Engineer* (July-August, 1941) and the *Quartermaster Review* (July-August, 1940). Prefabricated connected hangar units (112 by 160 ft.) were erected, and the governmental department announced that the savings were estimated at \$2,500,000. Incidentally, connectors were shipped to New Zealand for a similar purpose.

## CADMIUM IMPORTANT IN INDUSTRY

FROM *Trade & Engineering*, JUNE, 1942

A scarcity in the last war focused attention on the use of cadmium in solders and took the price of American supplies of the metal to 6s. 8d. a lb. Today there is a similar increase in its importance, with a trebling of its price. It has proved invaluable as a substitute for tin in bearing metals for taking heavy loads, for resisting wear and distortion, and for use at temperatures at which tin-base bearing alloys would be useless. Yet though cadmium is rather like tin in mechanical properties, other commercial uses are reminders that it is the brother of zinc both in chemistry and in the electromotive series of metals, which explains the superiority of zinc and cadmium in plating iron and steel.

America, Upper Silesia, Canada, and Australia are producers of cadmium, the New World being predominant with an annual output of 4,500,000 lb. The metal is chiefly a by-product of zinc extraction, the more volatile cadmium coming over first and appearing in the "blue powder" collected before the zinc distills. Apart from the well-known methods of production, like those used in the electrolytic refining of zinc and in separating cadmium from subsidiary dusts from the lead blast-furnace, interest now centres chiefly on the modern distillation and refining processes used at New Jersey and on the continuous vertical retorts used at Avonmouth, where the cadmium sponge extracted is cast into anodes of 99.95 per cent purity.

Before cadmium plating assumed such importance and when the new bearing and brazing alloys were unheard of, cadmium was somewhat of a "pretty" metal, providing pigments for pottery and paints. Cadmium found other commercial outlets in alkaline batteries, in fusible plugs for automatic fire sprinklers, and in alloys with copper for giving resistance to abrasion in electrical overhead conductors, such as trolley wires. A recent addition to the list of alloys having high electrical and tensile properties is a bronze containing 0.9 per cent, of cadmium and 0.35 per cent of zirconium.

Tin-lead-cadmium and cadmium-zinc alloys constitute solders useful for many purposes. In the first of these cadmium reduces the amount of tin, while in the second it completely replaces it in a solder containing 40 per cent of cadmium and 60 per cent of zinc, which gives joints of satisfactory strength and the highest shear strength of any alloy of the two metals.

Cadmium has won a prominent place in electroplating. While both cadmium and zinc are superior to copper, nickel, and chromium in protecting iron, cadmium surpasses zinc

in non-accumulation of corrosion products to hinder the smooth working of exposed mechanisms; in the ease with which cadmium plate can be soldered (hence its use in the electrical industry); and in resistance to alkalis, which makes it invaluable in textile machinery and domestic washing appliances.

## LONDON'S TRAM LINES

### Wrenched Up to Build Tanks and Battleships

ROBERT WILLIAMSON\*

Britain's old tram rails, tons of which are going into the melting-pot every day, will soon roll out of war factories all over the country in the shape of tanks, guns and other arms.

The eighty miles of tram rails abandoned in London since trolley-buses have taken the place of trams are made of high grade steel. All over London they are being wrenched up from the roads and more than half the work has been completed. Since it began last year, some 16,000 tons of metal have been recovered, and one London borough alone has taken up more than 2½ miles of track and sent it off to the scrap metal depots. Other materials taken up are being used to restore the roads. Old granite paving, for example, is broken up to make asphalt.

Apart from tram lines, railings and iron gates all over Britain are yielding a steady flow of metal for arms production. More than 200,000 tons of metal have been recovered, the equivalent in weight of about 12,500 Valentine tanks; or enough for the steel of thirteen 35,000-ton battleships.

Just under one-half of the total is from London.

## MOLYBDENUM INDUSTRIAL APPLICATION

FROM *Trade & Engineering*, APRIL, 1942

Though molybdenum has been known as a metallic powder for 150 years, it remained a curiosity until, on the one hand, it proved important in guns, armour plate, aircraft steels and special constructional steels, and, on the other, the pure metal plate and wire found wide use in radio valves and X-ray equipment. Regarded at one time as an unknown factor in metallurgy, its true role in high-class constructional steels, saw steels, die steels, propeller shafts, permanent magnets, and steel rolls has now been fully established.

Molybdenum is not a deoxidizer but an enhancer of the mechanical properties of steel, reducing the softening effect of tempering so as to widen the range of mechanical properties. In the general view it is classed with vanadium and tungsten, although a study of its properties will show considerable divergence from the characteristics of these two metals. In high-speed steels, however, it has been used as a substitute for tungsten, like which it commands uses in the pure form, as ferro-alloy, and in chemical compounds.

While the demands of warfare will increase the use of the metal for radio work, this increase will not be comparable to the upward curve of consumption in alloy steel for aircraft and motor-vehicles, in nitriding steels, in improving grey iron castings, and, especially in the United States, in rolls for both iron and steel. Indeed, in that country its use in iron rolls seems as common as in steel rolls, while it is also included in rolls for brass, copper, bronze and other non-ferrous metals. It is claimed that it produces a stronger roll, reduces breakages, and ensures a smoother and better finish in the rolled product. To these wide applications must be added its use in alloys for pressing bakelite; as a substitute for diamonds in wire-drawing; in alloys with copper for contact terminals; in alloys with platinum to replace iridium alloys for thermo-elements; and in Hastelloys in which from 17 to 20 per cent of molybdenum is included along with nickel, iron, chromium, tung-

sten or manganese for plant requiring strong resistance to corrosive chemicals.

The unalloyed metal was commonly regarded as rare. It was first prepared by Moissan and is now produced by reducing in hydrogen an oxide which has been previously volatilized from the the roasted ore and condensed in special receivers in a crystalline form. The crude grey molybdenum from an electric furnace containing 6 per cent carbon and some iron is useless for high-grade electrical work, as was the early German commercial form prepared from calcium molybdate by reduction with carbon. The reduced metal powder is pressed into bars, sintered, swaged, and drawn into wire in a manner similar to that used in treating tungsten. The metal is softer and more easily worked than tungsten, and the sheet can be bent cold and stamped into shape by ordinary steel tools even when manufacturing the hemispherical cups used in X-ray reflectors. The average tensile strength determined by the Fansteel Products Company is 260,000 lb. per sq. in., though when measured parallel to the direction of rolling it is appreciably higher.

## ELECTRICAL USES

Molybdenum wire is largely used in radio valves, the metal proving pliable enough for weaving the small screens and maintaining its properties at the high temperatures at which the valves operate. Thoriated molybdenum with a high electron emissivity may be produced by including thorium nitrate before the reduction process; uranium oxide has been specified as an alternative activating agent. Molybdenum wire is of value as a heating element in electric furnaces for temperatures up to 2,000 deg. C. provided that a suitable refractory of a porous nature is used to permit diffusion of hydrogen into the tube (a hydrogen atmosphere must be maintained in the furnace). The Fansteel Company has found zirkite a suitable packing material and alundum trustworthy for making the tubes of the wire-wound furnaces used in many operations. Molybdenum has appeared also in spot-welding, having greater strength than copper and showing little tendency to wear and to stick to the work under treatment.

While calcium molybdate has long been known as intermediate between the ore and the steel bath, other salts of molybdic acid have proved valuable. The ammonium salt, the well-known reagent for phosphorus determination, is a germicide for cloth, a fire-proofing agent, and an intermediate in dyeing wool and silk, as also is the sodium salt. Molybdates impart a blue colour to pottery and to glazes; molybdenum tannate is applied in colouring rubber and leather; and other molybdenum products have appeared in lakes and pigments. As a catalyst for converting toluene into benzaldehyde, anthracene into anthraquinone, and naphthalene into phthalic acid, the anhydride of molybdic acid seems to have gained an established position.

## BOMB DAMAGE TO A TUNNEL

FROM *Aeronautics* (LONDON), JUNE, 1942

Railways have from the first attracted all those who plan bombing offensives. And a great deal of pertinent information has been amassed upon the vulnerability of metals and marshalling yards, of junctions, and of other nodal points in modern railway systems. The general inference to be drawn from experience to date is that railways are less vulnerable than had originally been supposed. It has been found that permanent-ways can be repaired with great swiftness by specialized gangs of workpeople who move to the spot in transport vehicles equipped with appropriate tools. Some astonishing feats of repair have been successfully completed by the British railway companies. More recently the railway companies have been studying the repair of tunnels damaged by bombs, for here the impression was fairly general that a direct hit would put a railway line out of action for an extended period. Once again experience tends to show that the powers of repair and recuperation

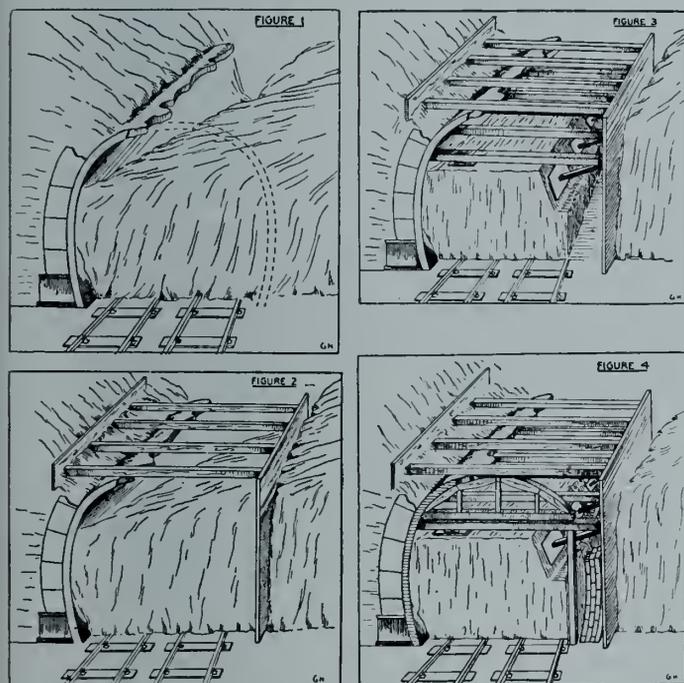

\*London correspondent of *The Engineering Journal*

are equal to the powers of such bombs as have been used up to the present. The cautionary remark is here necessary that this does not necessarily mean that the damage done by the larger bombs which may be used in the future will not be more extensive and more difficult to put right.

No better means of indicating to the Royal Air Force and all who are interested in the vulnerability of targets to aerial bombardment, and particularly the case of the railway tunnel, can be devised than by giving an actual case, and for this special diagrams have been prepared, based on published work and especially that which appeared in *The Engineer* of April 3, 1942 (page 281). In the diagrams there set out the factual basis for the illustrations which accompany this article was given. A case which provides a good foundation of reasoning on the subject is that of Knight's Hill tunnel on the electrified double-line that runs from Peckham Rye to Tulse Hill and Streatham, which is a tunnel of brickwork through London clay. A high explosive bomb penetrated this tunnel and exploded behind the up-side wall, forming a crater and breaking in the tunnel ground inside wall.

About 40 feet of the tunnel were completely filled in with clay.

The sequence of events can then be followed from the diagrams. The first step of the repair was the driving of sheet steel piling behind the damaged wall, this piling being then strutted to the opposite slope, the struts being arranged above the level of the tunnel roof. Excavation was the next step, with further strutting of the piling and trenching along the damaged side. The side wall was

These figures illustrate the damage done to a railway tunnel by air bombardment and the successive stages of repair.

Fig. 1.—Above is shown the result of a direct hit which penetrated several feet of earth and exploded behind the up-side tunnel wall, blocking both lines for a distance of over 40 feet. The debris in this instance was clay.

Fig. 2.—Having enlarged the crater and stabilized the sides, steel sheet piling is driven into the earth just behind the site of the shattered wall and strutted across to the opposite wall with 12 in. by 12 in. timber joists.

Fig. 3.—The clay is then excavated to the level and shape shown above, and a trench taken out against the damaged side wall. Additional support is given to the dumping of clay and 12 in. by 12 in. timber strutted across to give maximum strength to the opposite undamaged wall.

Fig. 4.—The new wall is then rebuilt just clear of the steel piling and timber centres erected to the lower main struts to receive the wooden templates on which the tunnel crown will be built.

rebuilt and all the brickwork repaired. The clay was cleared from the inside of the tunnel and the line reopened to traffic. The last move was the filling of the crater to the original ground level.

This case is of particular interest, inasmuch as there is a popular idea that a railway tunnel constitutes the most vulnerable of all transport targets for the air bomber. It has already been said that it may happen that newer and bigger bombs may come into service which do increase the vulnerability of these tunnels, but it is also clear that during the sustained and heavy raiding of England by Germany a railway tunnel, even after a direct hit, could be repaired with remarkable and unexpected rapidity.

The general and bigger lesson to be learned is that appropriate equipment, competent staffs, sound planning, and energetic and loyal workers enable miracles of repair work to be achieved under the stress of war. The case of the Knight's Hill tunnel is one of many, and in all of them proof was given of this power of recuperation.

## PLASTICS USE IN "LITTLE SHIPS"

FROM *Trade & Engineering*, MAY, 1942

Details have been recently published in America of the part played by plastics in the construction of small fast surface craft. A writer in the current issue of *Modern Plastics* states: "To-day a New Orleans boat-builder is using resin-bonded plywood where solid timbers were used yesterday, and providing the United States Navy with motor torpedo patrol boats, landing boats, and vehicle carriers which will write a new chapter in the history of the little boat."

In the construction of the new craft the technique developed for the use of plastics in aeroplane construction has been very closely followed. Side panels, deck planks, bulkheads, partitions, etc., are in plastic-bonded plywood while for wind shields and port lights transparent acrylic sheet replaces the heavier glass. The entire sides of these boats from the sheer to the chine are single panels of plywood, Honduras mahogany is the basic material, and a special phenolic resinoid is the bonding agent. The laminated panels produced are 84 ft. by 8 ft. and are stated to be the largest known to the industry. These sheets are cut by the template and applied directly to the sides of the boats. The transom, which has rounded corners, is moulded in one piece, as are also the machine-gun turrets, in which it is claimed it is almost impossible to detect a joint. The high-speed triple-screw motor torpedo-boats thus constructed are 70-80 ft. in length, capable of carrying four 21 in. torpedo tubes, two twin 50-calibre anti-aircraft machine-guns, and eight depth charges. They are manned by a crew of 10 men and can do up to 50 knots.

## POSITION FINDING BY WAVES

FROM *The Engineer*, MAY 1, 1942

The perception of the presence of an object by its effect on waves sent to it by an observer has been practised in many aspects and for many purposes. Leaving out the most universal of applications, namely, the manner in which we use light for seeing objects, there are two branches of physics, namely, acoustics and wireless, in which reflected waves have entered practical affairs. But long before human beings studied physics, the echoes of sound waves were employed by animals. For instance, a bat, it is thought, may sense obstacles confronting it in its flight by means of the echo from them. Similarly, a blind man or a man in a black-out senses the presence of a wall as he approaches it by subtle echoes of his footfalls. Everyone must have noticed how, when walking past a row of shop windows in the dark, it is easy to distinguish window fronts from doorways by aid of these muffled echoes. A more refined instance of the same phenomenon is afforded by those blind persons who can come into a room and after speaking a few sentences give a fairly accurate estimate of its length, height, and breadth.

This feat clearly involves "position finding," for the direction and distance of each wall—that is, its position relative to the observer—have been determined.

The same skilled blind person who can size up a room may be unable to detect a lamp-post which he is approaching. Evidently the size of the reflecting surface has something to do with success. This raises an extremely important point in both range finding and direction finding by waves. The mathematical laws of the matter were worked out more than a century ago, and applied to optical phenomena, by Fresnel, and about sixty years ago they were applied to acoustical problems by Rayleigh. An abbreviated summary of these laws will be useful for the purposes of this article.

#### THE GENERAL PRINCIPLE

Fresnel's main principle may be described by supposing that we set up a flat circular board or target in a vertical plane several yards away from an observer situated on its axis. If the observer blows a short blast on a whistle he will hear an echo. The intensity of the echo depends on the target's distance and size. According to Fresnel, the best size of target, the size that gives the strongest echo, is such that a line drawn from the observer to the periphery of the target is longer than the line drawn from the observer to its centre by a quarter wave length of the sound being employed. This may be called the optimum relationship between distance, size of target and wave length. To illustrate, let us send sound of wave length 4 ft., about 275 vibrations per second, against a target placed 800 ft. away. Then the rule indicates that the diameter of target which gives the best echo is 80 ft.

What happens if the optimum target is varied in size, other things being kept the same? First, if the target is reduced the intensity of the echo gradually falls, until when the diameter becomes of the same order as the wave length the wave is scattered rather than reflected, and the rule breaks down. Secondly, if the target is enlarged, say by having a relatively small ring placed in its plane round its edge, the intensity of the echo will again fall. This paradox is explained by noticing that the path of the rays to and from the added ring is longer than the path of rays to the corresponding central area of the target by half a wave length, and the waves to the ring and to the centre therefore annul each other. As the target is enlarged steadily, the intensity of the echo goes through maxima and minima, but never again reaches the optimum value, however big the target becomes.

The above rule may be put in algebraic form as follows, when the distance to the target is much greater than a wave length:—(Diameter of target)<sup>2</sup> = 2 × wave length × distance. In addition, good reflection demands that the wave length should be smaller than the diameter of the target.

Although the theory has been worked out only for a target of circular shape, the general conclusion may be used as a guide to the behaviour of a reflector of any shape. So used, it explains why the pedestrian in a black-out walks so easily into the lamp-post. Sound waves made by footfalls are not short enough to deal with lamp-posts. For suppose the target is, say, ½ ft. diameter and we require a good echo at, say, 3 ft. Then the formula shows that the optimum wave length is ½ in., which corresponds to a pitch of 26,000 vibrations per second—a very high frequency, inaudible except to the very young and certain small animals. It is said that bats when flying, emit shrill supersonic waves and so steer clear of quite small obstacles. Perhaps the pedestrian could help himself by jingling a bunch of keys as he walks along.

#### APPLICATION AT SEA

One of the earliest engineering applications of echo principles was to the detection of obstacles submerged in the sea and dangerous to shipping. The idea seems to have been suggested after the disaster to the "Titanic" in 1912.

Thereafter, numerous inventors attacked the problem of producing sound waves under water and detecting them by submerged microphones. By applying Fresnel's principle to the case of detecting an object 50 ft. in diameter at a distance of 10,000 ft., we find that the optimum wave length is ⅓ ft., corresponding to a note of frequency 40,000 vibrations per second. Thus for underwater reflections at distances of more than a mile a supersonic frequency is desirable when the object is of the above order of magnitude. On the other hand, when the reflecting surface is large—for instance, when it is the sea bottom—waves of any frequency will serve. Therefore, in depth sounding by sound a musical note is often used; indeed, very often the "note" is merely the thud of a hammer on a steel plate bolted on the bottom of the hull. The echo from a normal sea bottom is excellent whatever the length of the sound waves used. In operating the method, the note is emitted as a short pulse, and the times of emission of the pulse and of the return of the echo are recorded by means of the same microphone on a chonographic drum. Knowing the velocity of sound in water, the depth is easily calculated from the observed time of go and return.

The distance to the reflecting surface is the only quantity sought in depth sounding, but when the obstacle is small, like a submerged wreck, its bearing is also desired. Two alternatives are in common use. In one the sender is directive, in the other the receiver. When using a directive sender a beam of sound radiation is swept round a horizontal circle like a searchlight, and an omni-directional receiver is used for listening for the echo. The echo only comes when the sender points to the obstacle. In the other method a sender that emits sound waves in all directions is used and a directional receiver is rotated until an echo is picked up. The receiver must then be pointing to the obstacle. It should be noted that for accurate directional work, either sending or receiving, the shortest possible waves should be used. This fits in with the requirement taught by Fresnel's principle. A very successful apparatus was developed by Langevin in 1918-19. In this, one and the same quartz plate is electrically vibrated at supersonic frequency, and is also used for reception, a switch being employed to connect the quartz plate to the transmitting and receiving circuits in rapid succession. In this apparatus the sender and the receiver, being identical, are both directional, and the echo is obviously picked up only when the plate faces towards the obstacle.

#### ECHOES OF ELECTRIC WAVES

The principles set forth above apply to waves of all kinds, including electric waves. They were applied by early investigators of Hertzian waves to the design of mirrors for projecting the short waves then used in laboratories—for a mirror is, of course, a reflecting obstacle which is placed rather near the source. But as short waves were gradually discarded by communication engineers in favour of long, the phenomena of reflection were studied less and less. Still, the Zeppelin raids of 1917-18 provoked proposals to detect airships by reflection of wireless waves—with what success was never published. Investigators returned to the study of reflection, however, after Barkhausen and Kurz opened up a new method of generating waves less than a metre in length by means of thermionic valves. Later, the magnetron was invented in America and developed to great efficiency in Japan. Everything was ready by the year 1930 for the application of short electric waves to the detection and placing of small objects by echo methods.

An interesting description of a prolonged research on short wave propagation appears in the "Proceedings" of the Institute of Radio Engineers for March, 1933, at page 464 *et seq.* The paper is by Carl Englund and others, of the Bell Telephone Laboratories, New York, and gives the results of experimental studies extending over several years. The main feature is the investigation of the effects of the reflections from the ground, from hills, trees, buildings, and

other obstacles, and with disturbances of the field due to moving objects. The wave lengths used varied from 3 m. to 12 m. The transmitter was stationary and the receiver movable, being usually accommodated in a car. It was found that when the car moved in the neighbourhood of the transmitter the strength of the received signals varied through maxima and minima. In fact, the waves reflected from surrounding obstacles were strong enough to combine with the outward-going waves and form energetic standing waves—that is to say, stationary loops and nodes of electric force. The whole area for miles round any short-wave transmitter is, it seems, covered with a fixed interference pattern, like the fringes seen in certain optical demonstrations. A car movement of 1 ft. could easily be detected on the meter of the receiving set. As the receiving set was carried slowly past trees and houses, the strength of signal indicated their presence. Moving obstacles produced movements in the loops and nodes and could thus be detected by a stationary receiver. Thus while surveying the nodal pattern in open country on a certain occasion, the observers noticed that an aeroplane flying above them at an altitude of 1,500 ft. produced a flutter in the signals. Going to a neighbouring airport it was found that incoming aeroplanes could easily be detected at a distance, sometimes before they came into sight. The strength of these reflection effects is understandable, say the authors, because at a distance of some five miles an elevated object is exposed to a field intensity about ten times that existing at the ground beneath it.

A method of estimating the distance of an aeroplane in flight can be based upon the phenomena just described. For the number of loops and nodes between the sender and receiver can be counted. This number depends on the wave length in use, and by slowly changing the wave length of the sender and counting the number of maxima and minima experienced at the receiver, an estimate of the total number of loops and nodes can be made. Hence the distance can be measured. An elaboration of this principle is seen in British patent No. 457,737, of date May 18th, 1935, granted to the Telefunken Gesellschaft, of Berlin. In this improved method a modulated short wave is employed and the modulation frequency, not the carrier frequency, is altered.

#### ECHO-SOUNDING IN THE AIR

Observing the movement of loops and nodes is only one way of utilizing the echo from a reflecting obstacle. A simpler way is to pick up the echo direct and estimate the time of travel. It is easy and has become standard for sound waves in water, but is difficult for electric waves because they travel half a million times faster than sound waves in water. Thus while in water a distance of 10,000 ft. involves measuring an echo time of about 4 sec., in the electrical case it involves an echo time measurement of

about 8 micro-seconds. However, by 1930 the technique of "depth sounding" the ionosphere had reached a high state of development, and apparatus for measuring micro-seconds was available. The usual apparatus employs a cathode ray tube and operates as follows: a sending apparatus generates a short train of waves a few metres long, lasting about one ten-thousandth of a second and emits this pulse fifty times per second. This is reflected at the upper layer being "sounded," and the echo is picked up by a receiver near the sender. After amplifying and rectifying, the pulse is applied to one pair of deflecting plates of the cathode ray tube. To the other pair of deflecting plates a rising electro-motive force is applied which carries the spot across the fluorescent screen to form a line, called the time base. The emission of the pulse from the sender is synchronized with the starting of the time base by aid of the commercial A.C. supply. The direct pulse from the sender also affects the receiving apparatus, and therefore this and the echo pulse are both exhibited as perpendicular flicks on the time base. When dealing with high levels of the ionosphere the time interval to be measured is of the order of a milli-second; when applied to an obstacle at only a few miles distance, the time interval is in micro-seconds; but by 1935 this could be measured with fair accuracy.

For fixing the position of an object its bearing as well as its distance must be measured. An interesting example of bearing finding is seen in British patent No. 478,456, of date January 31st, 1936, granted to E. Montu, of Milan. The invention is for obtaining the bearings of aeroplanes and the like. Leaving out details, it consists of two rotating directional aerials, each with receiving apparatus, amplifier, rectifier, and cathode ray tube. In each of these twin sets the time base is synchronised with the rotation of its aerial and therefore when the aerial points to an aeroplane a flick appears at a point on the line across the screen. The position of the flick can be translated into angular position of the aerial, and therefore of the aeroplane. Now one of the aerials rotates on a vertical axle and the other on a horizontal one. Thus the elevation and the azimuth of the aeroplane are determined. Applying Fresnel's rule to an object 100 ft. in diameter at a distance of 50,000 ft., we find the optimum wave length is about one-tenth of a foot.

In the years following 1936 the possibilities of wireless position finding have become of military importance, and an intense study of the matter has been carried forward in many countries. Naturally, the results of this study and the particulars of the apparatus developed have been kept secret. We may look forward to learning the details of the methods and means adopted in different countries when the war is over. Doubtless, great technical advances will then be put on record.

## STRUCTURAL DEFENCE AGAINST BOMBING

The summary of the lectures delivered under the auspices of the Institute last April at Hart House, by Professor F. Webster, was issued last month and copies have been sent to all those who were in attendance at Toronto.

Owing to the technical nature of the subject, it was necessary to have Professor Webster revise the notes which had been taken at the meeting. In fact, the author undertook to completely rewrite the lectures, a task which necessitated a great intellectual and physical effort in view of the short time available before the professor's return to England. The Institute is all the more grateful to him for this additional service which provides those who had the privilege of listening to him with a record of the information conveyed as well as a convenient reference book.

The summary covers 129 pages of 8½ x 11 in. format. In addition there are 136 figures grouped at the end with a few tables. The text is mimeographed and the figures are reproduced by the photo-engraving process.

A limited number of copies have been made and each copy is identified. This was done in accordance with Professor Webster's desire to restrict the distribution to those who attended the lectures, plus a few other persons whom he has specifically mentioned.

Comments which have been received indicate that the Institute has been doing a national service by sponsoring these lectures and providing a printed record. It is expected that the special committee established by Council to implement the information thus obtained will further the usefulness of the undertaking, and that we shall be better prepared should the time come when it will be necessary to make use of the information so generously supplied by the Deputy Chief Engineer of the British Ministry of Home Security.

## COMMITTEES AT WORK

General approval has been expressed of Council's decision to establish three new committees to deal with matters of particular concern to members. The following notes on the progress of the organization work and on the membership of these committees will supplement the information already published in the *Journal*.

### CIVIL DEFENCE

The special committee set up to implement the information obtained through the lectures delivered under the auspices of the Institute by Professor Webster, is to be known as the Committee on the Engineering Features of Civil Defence. Mr. J. E. Armstrong, chief engineer of the Canadian Pacific Railway and councillor for the Montreal Branch, has consented to serve as chairman. The following list of members who have already accepted to serve on the committee is representative of the entire profession and should be a guarantee of the thoroughness of the work which is to be done:

- J. N. Anderson, managing director, Wm. N. O'Neill Co., Ltd., Victoria, B.C.
- S. R. Banks, Aluminum Company of Canada, Limited, Montreal, Que.
- H. F. Bennett, district engineer, Department of Public Works of Canada, London, Ont.
- R. S. Eadie, assistant chief engineer, Dominion Bridge Co., Montreal, Que.
- E. V. Gage, president, A. F. Byers Construction Co., Montreal, Que.
- G. A. Gaherty, president, Montreal Engineering Co., Ltd., Montreal, Que.
- A. Gray, chief engineer and port manager, National Harbours Board, Saint John, N.B.
- J. L. Lang, consulting engineer, Lang & Ross, Sault Ste. Marie, Ont.
- R. F. Legget, assistant professor of civil engineering, University of Toronto, Toronto, Ont.

## News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

I. P. Macnab, commissioner, Board of Commissioners of Public Utilities, Halifax, N.S.

J. A. McCrory, vice-president and chief engineer, Shawinigan Engineering Co., Ltd., Montreal, Que.

The membership of the committee will also include the chairmen of the Civil Defence committees being set up by the various branches of the Institute.

Terms of reference have been drafted by the chairman of the committee and circulated among members of Council for criticism and suggestions. In accordance with those terms, contact has been established and is being maintained between the chairman of the committee and the Director of Civil Air Raid Precautions at Ottawa.

Special committees have been set up in most of the branches and are generally made up of the chairman and the councillor of the branch and those persons who attended the lectures. The committees are expected to meet from time to time to discuss the local situation and determine methods of adapting the Webster material to the particular needs of the community.

As reported in another column, the printed notes of the Webster lectures have now been sent to those who were in attendance. Sub-committees of Mr. Armstrong's committee have been appointed: one of these is preparing a summary of the lectures which will bring out the essential points for general use; others are studying specific problems like design of shelters and structures as applied to Canada.

### POST-WAR PROBLEMS

The article on Reconstruction and Re-Establishment which appears on page 465 of this issue is a summary of the evidence presented before the Select Committee of the House by Principal James of McGill University, who is chairman of the Cabinet Committee on Reconstruction. It was prepared at the request of Council by the chairman of the Institute's Committee on Post-War Problems, Mr. Warren C. Miller, city engineer of St. Thomas, Ont., and president of the Association of Professional Engineers of Ontario. This article is intended to present, in a form convenient for all members to read, the information available on the subject.

- Mr. Miller's committee includes the following members:
- Frederick Alport, engineer, Works and Buildings Branch, Department of National Defence, Halifax, N.S.
  - deGaspé Beaubien, consulting engineer, Montreal, Que.
  - A. L. Carruthers, engineer, Department of Public Works, Victoria, B.C.
  - J. M. Fleming, president and general manager, C. D. Howe Co., Ltd., Port Arthur, Ont.
  - E. R. Jacobsen, engineering and technical assistant to the director general, Commonwealth of Australia War Supplies Procurement, Washington, D.C.
  - G. R. Langley, Canadian General Electric Company, Peterborough, Ont.
  - G. L. MacKenzie, engineer, Prairie Farm Rehabilitation Administration, Regina, Sask.
  - D. A. R. McCannel, city engineer, Regina, Sask.
  - A. W. F. McQueen, hydraulic engineer, H. G. Acres, Co., Ltd., Niagara Falls, Ont.
  - G. McL. Pitts, Maxwell and Pitts, architects, Montreal, Que.
  - D. C. Tennant, Dominion Bridge Co., Ltd., Toronto, Ont.

It is suggested that members who have suggestions to offer for the consideration of the committee voice them through the nearest committee man.

It will be recalled that a draft questionnaire entitled "Considerations for Evaluating Projects" was submitted to the Institute by the Sub-Committee on Construction

Projects of the Cabinet Committee on Reconstruction for an expression of opinion. This draft form has been circulated in the branches of the Institute and several suggestions have been received from all parts of the country. These have been turned over to Mr. Miller's committee on Post-War Problems and a consolidated report is being prepared which, it is believed will present the opinion of the Institute as a whole.

#### INDUSTRIAL RELATIONS

As reported before, this committee is headed by Mr. Wills Maclachlan, secretary-treasurer and engineer, Electrical Employers Association, Toronto, Ont. Acceptances to serve on this committee have been received from the following persons:

- E. A. Allcut, professor of mechanical engineering, University of Toronto, Toronto, Ont.
- J. C. Cameron, head of the Industrial Relations Section, Queen's University, Kingston, Ont.
- E. R. Complin, executive director, National War Labour Board, Ottawa, Ont.
- J. A. Coote, assistant professor of mechanical engineering, McGill University, Montreal, Que.
- W. O. Cudworth, assistant engineer, Maintenance of Way, Canadian Pacific Railway Company, Toronto, Ont.
- F. W. Gray, assistant general manager, Dominion Steel and Coal Corporation, Sydney, N.S.
- E. G. Hewson, office engineer, Canadian National Railways, Toronto, Ont.
- A. M. Reid, Bell Telephone Co., of Canada, Ltd., Toronto, Ont.
- W. J. W. Reid, works manager, Otis-Fensom Elevator Co., Ltd., Hamilton, Ont.
- A. Ross Robertson, manager, Ontario Division, Dominion Bridge Co., Ltd., Toronto, Ont.

One of the duties of the committee is to see that adequate attention is given in the engineering press to matters associated with the field in which the committee will work. Accordingly, material for publication in the *Journal* is being prepared and will appear in the September issue.

#### PRINCE RUPERT-TERRACE-CEDARVALE HIGHWAY

The construction of this road, which has been designated as necessary for National Defence purposes, is now well under way under the supervision of the Surveys and Engineering Branch of the Department of Mines and Resources. The total distance between Prince Rupert and Cedarvale is 136.3 miles, of which 97 miles are to be completed under the existing contracts. The work has been divided into eight sections, ranging from 11 miles to 18 miles each, and these have all been awarded to contractors, as follows:

- Sections 1 and 8—E. J. Ryan Construction Co. Ltd., Vancouver, B.C.
- Section 2—Rayner Construction Limited, Leaside, Ontario.
- Section 3—Tomlinson Construction Co. Ltd., Toronto, Ontario.
- Section 4—Standard Paving Limited, Toronto, Ontario.

- Section 6—Dufferin Paving Co. Ltd., Toronto, Ontario.
- Section 7—General Construction Co. Ltd., Vancouver, B.C.

When it was decided to build this highway late in February last, the road had not been surveyed, and it was necessary to rush location survey parties into the field. By the end of March seven of these parties were at work, and most of the final location through difficult country was completed by the end of May.

Work has begun on all sections and has been under way from three to four weeks. Contractors are bringing in heavy equipment as the construction involved ranks among the most difficult in British Columbia.

Between Hazelton and Cedarvale, particularly at the Cedarvale end, the existing road, while passable, has not been graded to standard and Dominion engineers are

making inspections to see just what work should be done on this section.

After exhaustive surveys it was decided that the Highway would be routed on the north side of the Skeena River between Prince Rupert and Terrace and from Terrace easterly would follow the south side.

The estimated distance between Prince Rupert and Hazelton by highway is 172 miles. Of this distance 97 miles is new work and improvement work will likely be required over another 10 or 15 miles. The cost of grading will range from \$45,000 to \$65,000 per mile.

Approximate estimates of cost for a 20-foot Highway run from \$5,500,000 to \$6,000,000.

#### A.S.C.E. COMES TO CANADA

The American Society of Civil Engineers is holding its annual autumn meeting during the week of October 11th, in Niagara Falls, Ontario. The details of the programme are not yet available, but it is expected that a very complete programme will be arranged.

The Society has invited The Engineering Institute of Canada to participate fully in the meeting, and particular emphasis has been placed in the invitation to supply papers on the technical subjects, and speakers for other occasions.

This will afford another excellent opportunity for Canadian engineers to extend their contacts with members of the profession south of the border. The Institute is very pleased at the decision to come to Canada, and will certainly co-operate to the full extent.

Meetings have been arranged between the officers of both societies, to discuss details, and it is expected that the complete programme can be announced in the September number of the *Journal*. In the meantime, members of the Institute are asked to make a note of the dates, so that plans may be made to attend.

#### ENGINEER STUDENTS TURN LITERARY

The poem reproduced herewith was written by a third year engineering student at the University of New Brunswick, and it appeared in a recent issue of the University paper. This number of *The Brunswickian* deserves special mention as it was prepared entirely by the engineering students and indicates the interest shown by the young engineer of today in subjects outside his own field.

#### FUNDY

*Have you ever been down to Fundy,  
Down to the rolling swell,  
Have you seen the fogs of Fundy,  
Have you heard the warning bell?*

*When deep fog horns are blowing,  
And the spray is flying free,  
As the waves roll in on Fundy—  
Have you ever longed for the sea?*

*There are ships that come to Fundy,  
That will take your heart away,  
When they slip from Saint John Harbour  
And head out down the Bay.*

*There's a smell of oil and oakum,  
Of tar and fish and brine,  
There's a warship in from Britain,  
And a sloop from Tormentine.*

*There are tankers, trawlers, schooners,  
And a swarm of fishing smacks,  
A corvette fresh from a convoy,  
And a freighter from Halifax.*

*If you like big ships and salt spray,  
And a sea that's running high—  
You'll like the Bay of Fundy  
When the storm flags start to fly.*

JOHN SIMMONS WATT, S.E.I.C.

## LETTER FROM WASHINGTON

The decisions arising out of the Oliver Lyttleton-Donald Nelson conversations may well come to be regarded as of major importance—not only in winning the war but in shaping the peace. Lyttleton's visit may hold more promise for the future than even Churchill's or Molotov's recent Washington visits. Many of the decisions were not made public but even the announced results are very significant. The most important was the formation of the Combined Production and Resources Board. Munitions, Shipping, Aircraft and even Raw Materials have already been brought under joint control, but this recent Board carries with it the implication of international control of industrial production and resources. This control has always been considered as a jealously guarded national prerogative. The second body set up was the Combined Food Board. This Board is important, not only because it sets up the machinery necessary to ensure the food supplies of the United Nations at war, but because of the strategic importance, in respect to both the war and the post-war period, of a global control of food resources. The four existing boards are the Combined Munitions Assignment Board, the Combined Shipping Assignment Board, the Joint Aircraft Board, and the Combined Raw Materials Board. With the creation of the Combined Production and Resources Board and the Combined Food Board, the pattern of a new world order begins to emerge. Recent press releases indicate that Mr. Nelson is reorganizing the War Production Board to conform more closely to the emerging pattern. His newly appointed Vice-Chairman, Mr. J. S. Knowlson, besides being responsible for all programme determinations, will act as Mr. Nelson's deputy on the Combined Production and Resources Board. He will also be Chairman of the U.S. Requirements Committee. It is also interesting to note, throughout the reorganization, a tendency to separate policy-determining and administrative functions.

---

One of the most interesting controversies in Washington recently has been raging round synthetic rubber. It is bewildering for a layman to try to keep up with the rapid developments but it is also extremely interesting. Not the least interesting feature of the story has been provided by the Senate Agricultural Committee which is pressing the claims of grain alcohol against those of petroleum as a potential source of synthetic rubber. I have attended several hearings of this committee which is chaired by the colourful and dynamic Senator Gillette of Iowa. When the Senate Committee went to Philadelphia to investigate a new process for producing butadiene from alcohol, Senator Gillette invited me to join the party as an observer. We had our own car on the train and a police escort in Philadelphia! The particular process under investigation is being sponsored by a large Philadelphia industrial alcohol firm. The inventor operated his process in Poland for several years before the German invasion and his escape and subsequent arrival in the United States reads rather like an Oppenheim thriller.

The magnitude of the whole synthetic rubber programme is tremendous. Plans are going forward for the production of 800,000 tons of synthetic rubber a year. In addition to formidable technical difficulties, the programme will cost about eight hundred million dollars and, according to releases by Mr. Nelson, will require 330,000 tons of steel, 7,000 tons of copper, bronze and brass, and 170,000 hp. of compressor capacity. Another interesting sidelight of the synthetic rubber programme is the fact that there will be no more beverage alcohol produced in the United States after the beginning of next year.

---

Sir Earle Page, convalescing from an attack of pneumonia, was recently in America on his way back to Australia from London in order to get two summers in a row to regain

his health. Sir Earle, who has been representing Australia on the British War Cabinet, was once Prime Minister of Australia and was co-head of the Bruce-Page Government. As leader of the Australian Country Party, Sir Earle has been interested in power and irrigation developments in Australia. He was therefore most anxious to inspect the work of the Tennessee Valley Authority. A visit was arranged and it was my privilege to accompany him on the trip. The T.V.A. project is only incidentally the largest single construction programme ever attempted—essentially it is a great social experiment based on agricultural considerations and directly affecting the welfare of four States and the lives of three million people. The project will have the vitally important secondary function of helping to control the hitherto devastating floods on the lower Mississippi. It was flood control on the Mississippi which first made control of the Tennessee Valley necessary. The valley comprises very hilly country and is an ideal water shed. Tennessee had always produced row crops and the top soil was being constantly washed off the sharply tilled ploughed fields. Run-off was rapid and the soil of the whole State was being impoverished. The original conception of the Muscle Shoals development, one of the forerunners of the T.V.A., was to use cheap power to produce nitrogen from the air and then to use the nitrogen to restore the land. It was Dr. Harcourt Morgan who pointed out the fallacy of this. Cheap nitrogen would make possible more row crops; more row crops would increase the run off and soil erosion and hasten a cycle by which Tennessee was being turned into barren land. His conception of flood control rested on the necessity of controlling water *where it falls*. To this end, he said, row crops must give way to alfalfa and blue grass which would both hold the soil and conserve the water and incidentally, take nitrogen from the air and restore it to the soil. For this purpose phosphates, rather than nitrogen, were necessary and here again a new type of electric furnace made possible the conversion by cheap power of mineral phosphorus deposits into fertilizing phosphates. Tennessee is to become a rich grazing country. Dr. Morgan presented his idea personally to the President. Back in 1933, at the age of 61 he resigned as President of the University of Tennessee to undertake the direction of the T.V.A. project. For eight years, as the senior member of a board of three directors, he has acted as the guiding genius of a project which now employs about 45,000 persons. Since power has become important for such industrial developments as the vast Alcoa plant outside of Knoxville, the project is being rushed on a full war-time basis. From an engineering point of view the T.V.A. project includes 28 dams, 16 completed and 12 now being rushed to completion. The total cost will be about one and one-quarter billion dollars or considerably more than the cost of the Panama Canal. The power output will be about three million kilowatts. Controlling the drought-flood cycles, furnishing power and irrigation, the project will also add 650 miles of navigable water with a nine foot draft to the Mississippi system from the conjunction of the Ohio all the way up to Knoxville.

---

A few weeks ago, a party of us were invited to attend a church parade at Annapolis Naval Academy. We were subsequently shown over the whole academy by a very personable lieutenant. To say that we were impressed with the size and "ship shapeness" would be a presumptuous understatement. After visiting the dining hall at which 4,000 "Middies" can be served at one sitting, we asked to see the kitchens—they must be seen to be believed with their tiled walls and long batteries of burnished equipment. My wife found herself standing near a large piece of equipment into which two men were pouring baskets full of peeled apples which were emerging all finely sliced. "For apple pie?" asked she, "No," said the attendant haughtily, "Salad Supreme."

July 21, 1942.

E. R. JACOBSON, M.E.I.C.

H.Q. First Canadian Army,  
20 May, 1942.

L. Austin Wright, Esq., M.E.I.C.,  
General Secretary, The Engineering Institute of Canada,  
2050 Mansfield Street, Montreal, Canada.

Dear Mr. Wright,

I have just received your letter of 13 April, 1942, and I am indeed grateful to you for your kind thoughtfulness in sending me the pictures taken in the course of the E.I.C. banquet in February last and also the copy of the March number of *The Engineering Journal* with the record of that, for me very memorable, occasion, for neither my wife nor I will ever forget the warmth of the reception which you gave us.

Back again with the Canadian forces in England, it hardly seems that we have been away at all. Army Headquarters is developing steadily and the other parts of our organization are progressing—training goes on at a high pitch—the physique and the morale of the men is marvellous, and I have no doubts as to their performance when the time for action comes. Meanwhile, we hold our patience and try to make the best use we can of this period of waiting and of the pause before the storm.

With kindest regards to all, and again very many thanks for your letter.

Very sincerely yours,

A. G. L. MCNAUGHTON.

L. Austin Wright,  
Secretary, Engineering Institute of Canada,  
Mansfield Street, Montreal, P.Q., Canada.

Dear Mr. Wright,

Your letter of June 1st was much appreciated. It was very good of you to write to me. I believe I paid last year's subscription, so am in credit for the time being anyway.

I enjoy reading the monthly *Journals*, and occasionally send them to associated engineers. The personal photographs interest me immensely as I so often get a glimpse of long lost friends, such as Colonel Donald White and Hugh Lumsden. The latter's father gave me my first engineering appointment with the C.P.R. in Winnipeg.

I had the pleasure and honour of meeting General McNaughton at the Vimy Anniversary Service held in Westminster Abbey last April, which was a most impressive affair. He is held in very high esteem in this country.

I am continually meeting Canadians serving in the various branches, particularly those connected with the Naval and Fleet Air Arm branches, some of whom are members or honorary members of the Royal Thames Yacht Club.

Some few years ago, I made a suggestion that the E.I.C. should be represented in the British Isles. It is a pity there is not an English Branch of the Institute.

I have not visited Canada since 1934, and on that occasion was in Montreal from a Friday only until Monday, so it was difficult to fit in a call on the Institute.

I should always be pleased to meet any friends coming this way.

With kind regards,

Yours sincerely,

E. VICTOR COLLIER.

The following letters refer to Council's recent action in granting remission of fees again this year to all members in the combatant areas. *Editor.*

20, Eyre Court, St. Johns Wood, N.W.S.

June 27th, 1942.

Dear Mr. Wright,

Your letter of the 1st instant received today and I reply to it at once as I feel guilty at not having acknowledged a similar letter last year. You will forgive me I hope, when I remind you we lead busy lives in this little island, but rather wonderful ones. It is wonderful to watch the unfolding of good and this omnipotent power is destroying the evil we are fighting.

Please convey to the Council my grateful thanks for their kind thought and action.

I am so proud of Canada, my country (almost) by adoption. In 1937 I set down a plan of world betterment, the motive power of which is giving. "Give and it shall be given unto you", is an immutable law and Canada has set the example amongst the nations, as I knew she would. There is spiritual power in a gift that for all the friendship expressed, lies not in a loan. In the future—*now*, it must be "give, give" not "lend, lease". I have thought much of sending you the plan to present to the Council and membership, much of it has already come into operation and Canada has given it the spiritual impulse I have awaited.

Congratulations on your new job—I have read of it in *The Journal* which I much enjoy reading. May I ask you to remember me to my friends and fellow members.

All best wishes to yourself and many thanks for your services.

Yours sincerely,

R. EWART CLEATON.

L. Austin Wright, Esq., M.E.I.C.,  
General Secretary, The Engineering Institute of Canada,  
2050 Mansfield Street, Montreal, Quebec.

The Editor,

*The Engineering Journal*, Montreal, Que.

I note that Mr. S. R. Banks, M.E.I.C., in the fourth part of his splendid paper on the Lions' Gate Bridge, records the failure of the spray paint shop coat on this structure that gradually developed before the field coats were applied and that much repainting had to be done in the field.

As the author and those in charge of fabrication and erection seem to be in doubt as to the cause of the failure of this shop coat, may I refer to my own experience with similar applications.

I happened to be in engineering supervision of the erection of one of Toronto's early sky-scraper buildings about 1914. Spray painting had just come in, and as one machine did the work of seven men, we jumped at the opportunity of the saving this meant and started our painting by machine. After two or three days work, the architect forbade spray painting absolutely. While I was awaiting the explanation of the prohibition, into my office walked the sales agent of the company supplying the paint, and, as he was an intimate friend of mine, by way of teasing I reproached him with advising the architect against spray painting. He gasped a little and then said "I'm sorry, but I really had to. Have you seen the micro-photographs we have taken of this coat of paint?" No, I hadn't so he showed them to me. They clearly showed that the painted surface was not a complete surface or skin but a series of superimposed discs like small shingles and frequently there were gaps and spaces between the discs so it was not a waterproof skin but a porous shingled surface and rust was bound to develop. He also expressed the opinion that the

oxygen of the air, under high pressure, not only volatilized the oil of the paint, but oxidized and set it almost as it contacted the steel surface and so prevented the blending of the drops into a skin.

On a certain very large Canadian bridge, this action of spray painting machines in creating a porous paint surface has been confirmed. Formerly the maintenance coats were applied at high cost, by hand and blistering usually followed. When spray painting was adopted, the blistering stopped. A little thought will show the reason. Blistering is caused by volatilization of liquids or oils under an air-tight skin, the gas pressure lifting the skin surface. If the skin is porous, the gases escape and no blistering occurs.

Many will point out that autos, etc., are spray painted—no not painted—they are enamelled. A varnish does not seem to oxidize as suddenly as an oil paint, and the drops tend to fuse and form a skin.

However, I am not a paint expert and these remarks are made in the hope that the whole, very vital, subject may be opened for discussion.

It is very interesting to me to see results recorded in connection with the Lions' Gate Bridge that correspond to my experience of 28 years ago.

C. S. G. ROGERS, M.E.I.C.,

*Bridge Engineer, Canadian National Railways.*

### MEETING OF COUNCIL

A meeting of the Council of the Institute was held at Headquarters on Saturday, June 20th, 1942, at ten-thirty a.m.

*Present:* President C. R. Young in the chair; Vice-President K. M. Cameron; Councillors J. E. Armstrong, J. G. Hall, R. E. Hertz, W. G. Hunt, T. A. McElhanney, C. K. McLeod, A. W. F. McQueen, and G. McL. Pitts; Secretary-Emeritus R. J. Durley, General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel.

The general secretary reported that when in New York recently, he had discussed informally with the secretaries of the American Founder Societies the suggestion that the Institute might act as a distributing agent in Canada for their publications. While the opinions expressed were entirely those of the secretaries, it appeared that the American Society of Mechanical Engineers would be interested in any proposition the Institute might submit. That society has a very extensive list of publications, and publishes a comprehensive catalogue every year, a copy of which could be made available to every member of the Institute. They would also be willing to consider sending a supply of the various publications to Headquarters, the Institute to distribute them and collect the money for transmission to the American society.

The American Society of Civil Engineers has very little to offer in the way of literature other than *Civil Engineering* and their Transactions, but would be very willing to co-operate in any way possible. The situation with regard to the American Society of Electrical Engineers and the American Institute of Mining and Metallurgical Engineers would require some further investigation.

The general secretary's statement was noted and accepted as a progress report with the understanding that the matter would be kept continually in mind. It was also suggested that it might be desirable to commence negotiations with any of the societies that were willing to co-operate.

Mr. Hall, chairman of the Institute's Membership Committee, reported that his committee had under consideration the various matters which had been referred to it previously by Council. Considerable thought had been given to the question of a new name for Branch Affiliate, but the committee was not yet ready to make a recommendation. The qualifications for Institute Affiliate, as prescribed in the By-laws, were also receiving consideration.

The resolutions from the Toronto Branch regarding the

method of considering applications for admission, were receiving further consideration. Mr. Hall pointed out some of the difficulties of the present method, and outlined briefly a line of procedure being considered by his committee. It was felt that the branches were in a better position than the Council to verify the information presented in an application, but the Membership Committee or the Council should interpret this information in terms of qualification for membership. The committee was very anxious that any suggested change in procedure would not involve a change in the By-laws. The question of membership in a provincial professional association as a qualification for membership in the Institute was also receiving attention. A short discussion followed which Mr. Hall would be very helpful to his committee.

The general secretary had received from the Executive of the Montreal Branch a copy of a draft of a suggested agreement between the Institute and the Corporation of Professional Engineers of Quebec which, he understood, Mr. Armstrong had been asked to present to the meeting. Mr. Armstrong stated that at a meeting of the Montreal Branch executive, held the previous evening, he had been asked to speak on behalf of the branch. The branch felt that the present was an appropriate time to make some progress towards co-operation with the Corporation and, accordingly, has prepared a draft of a possible agreement. The other branches in the province or the Corporation had not yet been consulted. The Montreal Branch executive had approved of this preliminary draft and presented it to Council with a request for authorization to discuss the matter informally with the other Institute branches in the province, to develop the draft and then discuss it with representatives of the Corporation, all with a view to preparing it for submission to Council. The present preliminary draft was not presented for formal action by Council but rather as an indication of what the Montreal Branch would like to discuss informally with the other branches and the Corporation. The branch would also like permission to lay the draft before the Institute's Committee on Professional Interests.

Following some discussion, on the motion of Mr. McLeod, seconded by Mr. Armstrong, it was unanimously resolved that the Montreal Branch executive be authorized to discuss informally the draft agreement with the chairman of the Institute's Committee on Professional Interests, the other Institute branches in the province and the Corporation of Professional Engineers of Quebec.

The president outlined briefly the relations between the Institute's committee, Dr. Manion's Committee on Air Raid Precautions, and the Canadian Engineering Standards Association.

Dr. Manion had advised the president that certain printed material which he was receiving from the C.E.S.A. would be distributed to the Provincial A.R.P. committees, and had asked if it would be in order for these committees to consult with the Institute branch committees which were being set up. The president had assured Dr. Manion that this would be entirely in order; had undertaken to supply him with the names and addresses of the chairmen of the branch committees, and had informed him of Mr. Armstrong's appointment as chairman of the co-ordinating committee.

Mr. Armstrong had been in touch with Dr. Manion's office in an endeavour to secure copies of the C.E.S.A. material which was being sent to the Provincial A.R.P. committees, but had been informed that as Dr. Manion would be absent from his office for some weeks, this would have to be held over until his return. It was suggested that if Mr. Armstrong was in Ottawa in the near future, it might be desirable for him to discuss this with the secretary of the C.E.S.A.

It was noted that the financial statement to May 30th, 1942, had been examined and approved by the Finance Committee.

A copy of the minutes of the last meeting of the Advisory Board of the Wartime Bureau of Technical Personnel was presented, from which it was noted that Mr. H. W. Lea, M.E.I.C., had been appointed Director of the Bureau, replacing Mr. Little who is now Director of National Selective Service. Mr. Wright reported that the Bureau is now acting as a division of the National Selective Service, doing excellent work in a greatly expanded field.

A communication was presented from the Engineers' Council for Professional Development announcing that Dr. Surveyer's term as representative of the Institute on E.C.P.D. expired this fall. On the motion of Mr. McLeod, seconded by Mr. Heartz, it was unanimously resolved that Dr. A. Surveyer be re-appointed as the Institute's representative on E.C.P.D. for a further period of three years.

A cablegram had been received from the Institution of Mechanical Engineers, from which it was noted that the 1942 award of the James Watt International Gold Medal had been made to the Institute's nominee, Mr. A. G. M. Michell, of Australia.

Mr. Pitts called Council's attention to the workings of Order-in-Council P.C. 638 (Scientific and Technical Personnel) as it affected architects. He explained that it is now necessary for a client, as well as the architect, to secure a permit before work could be undertaken for a client. He thought this might frequently put the client in an awkward position, particularly when it was someone who is not well versed in business transactions. He thought the legislation was too restrictive.

Mr. Wright, as Assistant to the Director of National Selective Service, explained the purpose of the legislation and expressed the hope that not many cases would arise such as the one which Mr. Pitts described.

The president was of the opinion that little could be done

about it now, but asked Mr. Wright to keep note of it in case any adjustment could be made subsequently.

The president reported that he had attended the annual meeting of the National Construction Council of Canada in Toronto on May 28th. A very excellent meeting had been held. There were good discussions on several important matters including post-war problems. Mr. D. C. Tennant, the Institute's representative on the Council, had also been present and would, no doubt, submit a report on the meeting.

The president stated that he was planning to attend the annual meeting of the Society for the Promotion of Engineering Education to be held in New York on June 27th to 29th.

A number of applications were considered and the following elections and transfers were effected:

ADMISSIONS	
Members.....	15
Juniors.....	2
Students.....	7
Affiliates.....	3
TRANSFERS	
Juniors to Members.....	2
Student to Member.....	1
Students to Juniors.....	5

The president reported that he expected to leave Toronto on July 29th for a two weeks' visit to the Quebec and Maritime branches. It was suggested that if satisfactory arrangements could be made, it would be very desirable to hold a regional meeting of Council in the Maritimes during the president's visit. It was left to the president and the general secretary to decide, after consultation with the branches concerned, whether such a meeting should be held.

The Council rose at one o'clock p.m.

## Personals

**Lieut.-General A. G. L. McNaughton**, C.B., C.M.G., D.S.O., M.E.I.C., commander of the Canadian Army in Britain, received the honorary degree of Doctor of Laws on July 4th, from Birmingham University, England.

**J. L. Morris**, M.E.I.C., has recently retired from the Department of Lands and Forests of the province of Ontario. He was the first graduate of the School of Practical Science in the University of Toronto in 1881 and in 1885 he received the first degree of C.E. from the same university. In 1927 his *Alma Mater* conferred on him the degree of Doctor of Engineering.

Dr. Morris began his engineering career with the Canadian Pacific Railway Company as an assistant on construction work. In 1886 he commenced a private practice at Pembroke, Ont., and carried out many important works throughout Ontario and Quebec. For a number of years he was town engineer of Pembroke, Ont., and up until March, 1928, he was senior partner of the firm of Morris and Moore, surveyors and engineers at Pembroke. He joined the Department of Lands and Forests in 1928 and the following year became inspector of surveys with the same Department.

**Brigadier Noel D. Lambert**, M.E.I.C., formerly director of engineer services has been recently promoted from the rank of colonel and appointed deputy quartermaster-general (engineering), Department of National Defence at Ottawa, as a result of a reorganization in the quartermaster-general's branch.

Brigadier Lambert is a graduate of the University of British Columbia and previous to joining the Department of National Defence he was vice-president and general

## News of the Personal Activities of members of the Institute, and visitors to Headquarters

manager of the Northern Construction Company and J. W. Stewart Limited, Vancouver, B.C.

**Lieut.-Colonel E. C. Thorne**, M.E.I.C., who was assistant director of Chemical Warfare in the Department of National Defence in Ottawa, has been promoted from the rank of major and appointed acting director and engineer of the Department. He returned last year from England where he was officer commanding the 2nd Field Company, R.C.E. Before the war Colonel Thorne was with the operating department of the Southern Canada Power Co., Ltd., Montreal, Que.

**Lieut.-Colonel R. A. Logan**, M.E.I.C., who has been attached lately to Royal Canadian Air Force Headquarters at Ottawa, has been transferred to the Air Staff, Plans Division, at Washington, D.C.

**H. J. Crudge**, M.E.I.C., building engineer of the Canadian National Railways at Moncton, N.B., is the newly elected chairman of the Moncton Branch. Mr. Crudge has been located in Moncton since 1915, but prior to this was connected with the engineering department of the Canadian Pacific Railway in Montreal. He has served as a councillor of the Institute and is past president of the New Brunswick Association of Professional Engineers. In 1938 he was appointed to the advisory committee of the National Research Council of Canada in the preparation of a national building code.

**John McHugh**, M.E.I.C., who retired last March from the Dominion Department of Fisheries after 28 years service, accepted an appointment in May with the Wartime Prices and Trade Board as regional representative for the controller of supplies at Vancouver, B.C.

**Elizabeth M. G. MacGill, M.E.I.C.**

**Elizabeth M. G. MacGill**, M.E.I.C., is the newly elected chairman of the Lakehead Branch. She holds the position of chief aeronautical engineer with the Canadian Car and Foundry Co. Ltd., at Fort William, an appointment which she accepted in 1939.

**Roy W. Emery**, M.E.I.C., has recently returned from British Guiana, S.A., and he is now employed in the design department of H. G. Acres and Company at Niagara Falls, Ont.

**Herbert R. Davis**, M.E.I.C., is at present employed as an engineer with the R.C.A.F., Western Air Command at Victoria, B.C. He was previously located at Saskatoon where he was a partner in the firm of Davis-Fisher Limited, design and construction engineers.

**E. M. Nason**, M.E.I.C., is resident engineer of the R.C.A.F. Station at Boundary Bay, B.C. He was previously located at No. 3 Training Command at Moncton, N.B.

**D. R. McGregor, Jr.**, E.I.C., has left his position with the Canadian General Electric Company, Limited, Peterborough, Ont., to join the R.C.N.V.R. as a sub-lieutenant. He graduated from McGill University in 1935 and has been with the company ever since.

**Robert T. Tamblin**, S.E.I.C., enlisted with the Royal Canadian Engineers shortly after graduating from the University of Toronto this year.

**E. T. Skelton**, S.E.I.C., has accepted a position with the Demarara Bauxite Company, Mackenzie, S.A. He graduated this spring in civil engineering from the University of New Brunswick.

**Carl Norman Cunningham**, S.E.I.C., of Fairville, N.B., graduated this spring from Nova Scotia Technical College with the degree of B.Eng., in mechanical engineering.

**Bryce Fraser Keays**, S.E.I.C., of Newcastle, N.B., graduated this spring from the University of New Brunswick with the degree of B.Sc., in civil engineering.

**Arnold William Dyck**, S.E.I.C., of Vancouver, B.C., graduated this spring from the University of Saskatchewan with the degree of B.Sc., in mechanical engineering.

**Wilbert Hunter Tate**, S.E.I.C., of North Battleford, Sask., graduated this spring from the University of Saskatchewan with the degree of B.Sc., in mechanical engineering.

**John S. Lochhead, Jr.**, E.I.C., has recently joined the staff of Defence Industries Limited, Montreal, Que. Since his graduation from McGill University in 1937, he has been employed with the Dominion Bridge Company, Montreal.

**Irving I. Sweig**, S.E.I.C., obtained his B.Sc. degree from Sir George Williams College, Montreal, in May.

**Walter M. Smith**, S.E.I.C., who graduated in electrical engineering this spring from the University of New Brunswick, has joined the staff of the Bell Telephone Co. of Canada in Montreal.

**Leon A. Duchastel, M.E.I.C.**

**Leon A. Duchastel**, M.E.I.C., has been elected chairman of the Montreal Chapter of the Illuminating Engineering Society. Mr. Duchastel who is power sales engineer with the Shawinigan Water and Power Company, is the secretary-treasurer of the Montreal Branch of the Institute.

#### VISITORS TO HEADQUARTERS

**J. A. Van den Broek**, professor of engineering mechanics, University of Michigan, Ann Arbor, Mich., U.S.A., on July 3rd.

**Flight-Sergeant Eric Grant**, M.E.I.C., R.C.A.F., Eastern Air Command Headquarters, Halifax, N.S., on July 4th.

**E. R. Jacobsen**, M.E.I.C., Commonwealth of Australia, War Supplies Procurement, Washington, D.C., on July 8th.

**Major J. H. McIntosh**, M.E.I.C., R.C.A., Victoria, B.C., on July 11th.

**René Dupuis**, M.E.I.C., director, Department of Electrical Engineering, Faculty of Applied Science, Laval University, Quebec, Que., on July 16th.

**Professor R. F. Legget**, M.E.I.C., assistant professor, Department of Civil Engineering, University of Toronto, Toronto, Ont., on July 20th.

**T. M. Moran**, M.E.I.C., vice-president, Stevenson & Kellogg, Ltd. Toronto, Ont., on July 23rd.

**H. A. Lancefield**, S.E.I.C., Defence Industries Limited, Montreal, Que., on July 23rd.

**Sidney Hogg**, M.E.I.C., designing engineer, St. John Dry Dock & Shipbuilding Co., Ltd., Saint John, N.B., on July 24th.

**Guy Thibaudeau**, S.E.I.C., Quebec, Que., on July 24th.

**Jean L. Lacombe**, S.E.I.C., Quebec North Shore Paper Co., Baie Comeau, Que., on July 27th.

# Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

**Harry Wendell Mahon**, M.E.I.C., passed away at Halifax, N.S., on June 8th, 1942, after a short illness. He is survived by his widow the former Marion Reid Smith, a son and a daughter, and his brother Arthur S. Mahon.

He was born at Great Village, N.S., on April 26th, 1889, the son of Captain James A., and Mrs. Mahon, and he received his education in his native province. He graduated in engineering from Dalhousie University, and from the Nova Scotia Technical College in 1914 in civil engineering. Except for three years overseas during the First World War, his life work has been the investigation of the water power resources, and the development and operation of hydro-electric power in Nova Scotia.

His engineering work commenced in 1915 with the Dominion Water and Power Bureau of the Department of Mines and Resources. He continued with the Nova Scotia Water Power Commission and then with the Nova Scotia Power Commission when organized in 1919. With the latter Commission, he was engineer of investigation, for which Department he continued to be responsible for twenty-three years, and, in addition, administered the Nova Scotia Water Act for the Minister.

His engineering memorial remains in the foundations which he laid for the power industry of Nova Scotia. It was on his engineering surveys and studies that a great number of the hydro-electric plants were built and operated, including most of the plants of the Nova Scotia Power Commission. His reports will continue to be basic for future development of provincial water resources.

Professionally, he was a member of The Engineering Institute of Canada, and of the Association of Professional Engineers of Nova Scotia. His was an active life, and the engineering profession of Nova Scotia has lost a leading figure who is deeply mourned.

Mr. Mahon joined the Institute as a Junior in 1916. He was transferred to Associate Member in 1918 and became a Member in 1940.

**Lieut.-Colonel Henry Fairweather Morrisey**, M.E.I.C., district engineer for the Department of Transport of Canada at Saint John, N.B. and a councillor of the Institute, died in the hospital at Montreal on June 25th, 1942.

He was born at Saint John, N.B. on June 14th, 1890, and received his preliminary education in the local public schools and the Saint John high school. He studied engineering at the University of New Brunswick where he graduated in 1912 as a B.Sc. In 1915 he received the degree of M.Sc. from the University. During the summers of 1909 to 1911 he was engaged in engineering work for the Department of Public Works of Canada on construction of wharves and breakwaters at Saint John. Except for the time which he spent in service overseas in the last war, he served as assistant engineer on the River St. Lawrence ship channel from 1912 to 1920.

In 1920 he was appointed district engineer at Saint John, N.B. for the Marine Department of Canada and occupied the same position with the Department of Transport until his death.

Before the First World War Colonel Morrisey had served in the Corps of Guides and at the outbreak of hostilities he enlisted in the Royal Canadian Engineers but was transferred later to the Royal Navy with the rank of lieutenant. He was stationed at the St. Lawrence ship channel during the first years of the war and was in charge of arrangements to block the channel in the event of enemy craft entering the river. He had oversight of the clearing of the way for transports and was on guard duty for the safety of submarines, drifters and trawlers which had been built at Montreal, Sorel and Three Rivers. For the last two years of the war he served with the Royal Navy in the

Mediterranean aboard H.M.S. Endeavour and H.M.S. Caesar.

On his return to Canada in 1919 he joined the non-permanent militia. He was commissioned in the 3rd New

Lieut.-Colonel H. F. Morrisey, M.E.I.C.

Brunswick Medium Brigade, Canadian Artillery, (The Loyal Company of Artillery), now the Royal Canadian Artillery. He commanded the 15th Medium battery, a crack battery of the brigade for a time and later took command of the brigade and held that responsible position for some years. Since the outbreak of the present war he had assumed command of the 3rd New Brunswick Coast Brigade, Reserve, R.C.A., and played an important role in the organization for local defence.

Colonel Morrisey joined the Institute as a Junior in 1913. He was transferred to Associate Member in 1922 and became a Member in 1940. He was very active in Institute affairs and had been elected a councillor of the Institute for the Saint John Branch last year.

**John Earle Porter**, M.E.I.C., died suddenly at Windsor, Ont., on June 28th, 1942. He was born at Wingham, Ont.,

J. E. Porter, M.E.I.C.

on December 6th, 1891, and received his education at the University of Toronto where he graduated in 1915.

Upon graduation he joined the staff of the Department of Public Works of Canada as assistant engineer in the district of western Ontario, and was connected with harbour and river development and improvement work until 1915 when he joined the staff of the Canadian Steel Corporation, Limited at Ojibway, Ont., as field engineer and inspector. In this capacity he was in charge of surveys, lay-out and construction of harbours and piers.

In 1922 he joined the staff of the Ford Motor Company

of Canada, Limited at Windsor, Ont., and was in charge of the civil engineering branch. Later he became in charge of all engineering activities of the company and in July 1941, he was appointed general superintendent of the company. A few weeks ago he had been elected vice-president and director of the company.

Mr. Porter joined the Institute as a Student in 1914 and was transferred to Junior in 1917. In 1919 he was further transferred to Associate Member and he became a Member in 1940. He was a councillor of the Institute representing the Border Cities Branch in 1926.

**Sir Charles Ross**, M.E.I.C., died at Passagrille, Florida, on June 28th, 1942, after a short illness. Born at Balnagown, Rosshire, Scotland, on April 4th, 1872, he was educated at

Eton and Trinity College, Cambridge. He served as a lieutenant in the 3rd Battery, Seaforth Highlanders, retiring in 1894. In the Boer War he served as a captain.

In 1896 he became connected with the West Kootenay Power & Light Company, B.C., as a construction engineer and contractor. In 1902 he organized the Ross Rifle Company for the production of the weapon which he had designed and which had been adopted for the Canadian Militia. During the First World War he was advisor on small arms to the Canadian Government and also conferred confidentially with the American Government.

Sir Charles joined the Institute as a Member in 1918 and kept an active interest in Institute affairs as revealed by an exchange of correspondence with Headquarters only a few weeks before his death.

## News of the Branches

### LAKEHEAD BRANCH

W. C. BYERS, JR., M.E.I.C. - - *Secretary-Treasurer*

The annual dinner meeting of the Lakehead Branch was held at the Port Arthur Golf and Country Club on June 10th commencing at 7.00 p.m.

Miss E. M. G. MacGill presided at the meeting.

Grace was said by R. B. Chandler.

A resolution regarding the status of the engineer in the armed forces was discussed by several members and unanimously passed.

Reports were received from the finance, membership, entertainment and nominating committees.

At the conclusion of the business meeting the members took part in a golf game and putting contest.

There were thirty members and guests present.

### MONCTON BRANCH

V. C. BLACKETT, M.E.I.C. - - *Secretary-Treasurer*

A dinner meeting of the branch was held in the Brunswick Hotel on Monday, June 1st. The attendance was the largest for some years and included members of the staffs of the Robb Engineering Works and the Canada Car & Foundry Co., who motored from Amherst to attend the meeting. H. J. Crudge, vice-chairman of the branch presided.

A very interesting address on **Plastics** was delivered by H. Franklin Ryan, B.Sc., M.E.I.C., of the Canadian General Electric Co., Halifax. In his opening remarks, the speaker stated that while the tremendous need for war time substitutes had brought plastics into prominence, they are not of recent origin. As far back as the middle of the last century the scarcity of large elephants gave rise to a need for a suitable substitute for ivory made from the tusks of these animals. A solution to the problem was found by an American Chemist, John Wesley Hyatt, who discovered that by mixing cellulose with alcohol, there was produced a substance which later became known as celluloid. That, Mr. Ryan said, was the first plastic. A plastic consists essentially of a resin blended with a filler and molded either with heat alone or by means of heat and pressure combined. In the former case the structure of the materials is not altered, and the plastic can be again liquified and re-molded. Where, however, both heat and pressure are required, chemical changes take place, and the plastic cannot be re-melted. Phenol is the most common resin and wood flour is among the fillers used. Other resins are petroleum, coal, natural gas, urea, vynal, glycerine and milk. The uses that have been found for plastics are many and varied and include radio cabinets, optical glass, aeroplane parts and electrical equipment of all kinds. It must be kept in mind that modern plastics are not substitutes in the sense of inferior replacements but are rather replacements that are of greater value than the original products. Nylon is an

### Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

example. It is a substitute for silk and is superior to silk. A notable achievement has been the development of a plastic with a tensile strength of 100,000 lb. per sq. in.

Mr. Ryan's remarks were illustrated by lantern slides. He also placed on display samples of materials and finished products of the plastic art. One that aroused special interest was the nose cap of an anti-aircraft shell.

Following a period of questions and answers, a vote of thanks to the speaker was moved by G. L. Dickson and seconded by A. S. Donald.

At this meeting nominations were made for branch officers for 1942-43.

### SAGUENAY BRANCH

D. S. ESTABROOKS, M.E.I.C. - - *Secretary-Treasurer*

J. G. D'AOUST, M.E.I.C. - - *Branch News Editor*

A meeting of the Saguenay Branch was held in the Protestant School in Arvida on Thursday, June 11th. Two industrial films were shown, one by Mr. C. A. Booth of Fiber Glass, Canada Ltd., and the other by Mr. Paul LeBel, M.E.I.C., of the Imperial Oil Company.

The use of glass insulation has in many cases solved the problems created by wartime demands on electrical equipment, and Mr. Booth's film explained the principal uses and advantages of this material as class B insulation. After sketching the history and manufacturing of fiber glass products the speaker answered questions raised by the members and demonstrated by means of samples, the many forms in which glass fibres can be used.

Raw material is produced in the United States and at present only electrical insulation is manufactured in Canada. The raw material comes in the form of small glass spheres which are melted down in an electric furnace. The molten glass then flows through tiny holes in a platinum bushing and the very fine glass fibers so produced are twisted into a strand of 204 fibers and are then wound on bobbins ready for the process of weaving into the many forms of cloth used.

Six times as strong as cotton, this product will withstand higher temperatures and more severe acid conditions than other forms of class B insulation. The cost is about the same as other materials in use.

The second film of the evening, a colour film depicting the construction of the Portland-Montreal pipe line, was taken by Mr. LeBel of the Imperial Oil Co. who was closely associated with the work.

The various phases of the project were well illustrated and Mr. LeBel's remarks in answer to the many questions

asked gave an interesting picture of the problems which had to be overcome.

Construction of this pipe line greatly reduced the distance which the tankers had formerly to travel in going to Montreal via the St. Lawrence, the oil now being pumped from Portland by eight pumping stations through the 236 miles of pipe to Montreal. Twelve inch pipe was used throughout excepting under the larger rivers where two ten-inch pipes were laid in a common trench in the riverbed and connected by manifolds on either bank to the main twelve inch line. This arrangement permits of uninterrupted service when cleaning the line at these points, and insures against a stoppage should trouble be experienced on one of the branches.

An interesting feature of the pumping system is the use of diesel driven pumps which take their oil fuel direct from

the pipe line, at the Highwater station, at which point electrical power was not available.

The work was done by two contractors who made extensive use of diesel tractors, not only for handling materials and excavating, grading, etc., but also for the actual bending and placing of the pipe in the trench. The pipe lies two to four feet below grade and in the more favourable terrain was placed at the rate of three miles a day, the total time for the job constituting a record for this kind of work. In the rivers the twin ten inch pipes lie fifty feet below low water in the navigable portions, the trench in the remaining parts being twenty feet deep.

Mr. McCaghey, branch chairman, conveyed the thanks and appreciation of the members to the speakers for their contributions.

## Library Notes

### NEW C.E.S.A. SPECIFICATION

The Canadian Engineering Standards Association has recently issued the following new standard:

#### C83 Pole Line Hardware. 1st. ed.

This specification covers the purchasing requirements for pole line hardware used by utilities engaged in power supply, electric traction or communication transmission. It is divided into three parts: 1. General—2. Material and Manufacture—3. Drawings. This specification is being issued for the purpose of benefiting producers, distributors and consumers of pole line hardware and of helping the war effort: 1. By restricting steel to a few grades. 2. By substituting a large production volume of the standard item in place of relatively small volumes of many types and sizes of equivalent articles. 3. By permitting any of the three above mentioned groups to assist a particular user of such hardware when affected by an acute supply shortage or abnormally large construction and maintenance programme. 4. By permitting a considerable reduction in stocks in warehouses and storage. In order that review of new information and drawings on new or existing standard hardware items can be added from time to time this specification is issued in loose-leaf form under a special binder. Copies of this standard may be obtained from the Canadian Engineering Standards Association, National Research Building, Ottawa. Price 75c. a copy.

### ADDITIONS TO THE LIBRARY

#### TECHNICAL BOOKS

##### Industrial Furnaces:

Vol. 2, 2nd ed., W. Trinks. N.Y., John Wiley and Sons, Inc., 1942. 6 x 9 in. \$5.00.

##### Practical Aerodynamics:

3rd ed., Bradley Jones. N.Y., John Wiley and Sons, Inc., 1942. 6 x 9 in. \$3.75.

##### Structural Theory:

3rd ed., Hale Sutherland and Harry Lake Bowman. N.Y., John Wiley and Sons, Inc., 1942. 6 x 9 in. \$3.75.

##### Definitions of Electrical Terms:

American Standard C42. Sponsor the American Institute of Electrical Engineers. 7 3/4 x 11 in. \$1.00 in the U.S.A. \$1.25 outside the U.S.A. \$1.00 in Canada if ordered through the Canadian Engineering Standards Association.

##### Prize Bridges 1928-1941:

American Institute of Steel Construction, Inc., 1942.

### Book notes, Additions to the Library of the Engineering Institute, Reviews of New Books and Publications

#### Fatigue of Metals:

2nd ed., D. Landau. N.Y., The Nitralloy Corporation, 1942. This booklet will be ready for distribution after August 1st, 1942.

#### REPORTS

##### Hydro:

Ontario's successful experiment in public ownership by Thomas H. Hogg. Address delivered before Princeton University on December 10, 1941. The Guild of Brackett Lecturers, 1941.

##### The Royal Aeronautical Society:

Aims, work, membership and rules. Revised February 10, 1940.

##### Extraction not Conversion:

The answer to the refiners mercaptan problem. Universal Oil Products, Booklet No. 251. Reprinted from World Petroleum Vol. 13, No. 2, February, 1942.

##### Handbook of Scientific and Technical Societies and Institutions of Canada:

National Research Council, Ottawa, 1942. 50c.

##### Trade and Professional Associations of the United States:

U.S. Department of Commerce, Bureau of Foreign and Domestic Commerce, 1942. For sale by the Superintendent of Documents, Washington, D.C., 70c.

##### Science and Mathematics and the War:

A progress report by the Philadelphia Regional Committee on Science and Mathematics Teaching.

##### National Bureau of Standards:—Building Materials and Structures:

Water permeability of walls built of masonry units. Report 82:—Strength of sleeve joints in copper tubing made with various lead-base solders. Report 83:—Survey of roofing materials in the South Central States. Report 84.

##### Canada—Department of Mines and Resources—Mines and Geology Branch:

Industrial waters of Canada. Report on investigations 1934-1940. Ottawa, Bureau of Mines publication No. 807, 1942. 25c. Petroleum fuels in Canada. Publication No. 808, 10c.

##### Canada—Department of Mines and Resources—Surveys and Engineering Branch:

Surface water supply of Canada. St. Lawrence and Southern Hudson Bay drainage Ontario and Quebec. Ottawa, Water Resources Paper No. 79, 1942. \$1.00.

Altitudes in Northern Ontario. Geodetic service of Canada publication No. 45, 25c.

##### Bell Telephone System—Technical Publications:

Performance of ground-relayed distribution circuits:—Viscosity-molecular weight of rubber:—The Thermal expansion of pure metals pt. 2:—Determination of antimony in lead-antimony alloys:—Fractionation and molecular weight of rubber and gutta-percha:—A more symmetrical fourier analysis:—L type impedance transforming circuits:—Monographs 1329-1335.

##### The Electrochemical Society:

The electrodeposition of hard nickel:—A strange phenomenon in plating:—Electrodeposition of nickel-tungsten alloys from an acid plating bath. Preprints 82-1, 2 and 3.

#### BOOK NOTES

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet the books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

##### A.S.T.M. STANDARDS ON ELECTRICAL INSULATING MATERIALS, prepared by A.S.T.M. Committee D-9 on Electrical Insulating Materials; Specifications, Methods of Testing, December, 1941.

American Society for Testing Materials, Phila., Pa., 448 pp., illus., diagrs., charts, tables, 9 x 6 in., paper, \$2.25.

This volume contains the specifications and test methods covering this field in their latest form as well as the current report of the committee on electrical insulating materials. The report outlines its work and gives proposed revisions of standards. Several appendices discuss the significance of various tests.

##### AIR RAID PRECAUTIONS HANDBOOK No. 14 (1st ed.) THE FIRE GUARDS HANDBOOK.

Great Britain, Ministry of Home Security and Scottish Home Department. Publ. by His Majesty's Stationery Office, London, 1942. 45 pp., diagrs., 6 1/2 x 4 in., paper, (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, \$.05).

The specific duties of a fire guard in connection with air raids are outlined. The approved methods for dealing with incendiary bombs and fires caused by them are described,

and some consideration is given to the organization of fire guards for the most efficient action.

#### AIRCRAFT ENGINE DESIGN

By J. Liston. McGraw-Hill Book Co., New York and London, 1942. 486 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$4.50.

The component parts of an aircraft engine are described and discussed in detail, with emphasis upon fundamentals of mathematics, mechanics and machine design necessary for successful designing. Suggested design procedures, problems and references to further reading accompany each chapter. A large section of useful engineering data, including brief specifications of American marine, vehicle and aircraft engines, is appended.

#### AIRCRAFT INSPECTION

By E. E. Wissman. McGraw-Hill Book Co. (Whittlesey House), New York and London, 1942. 268 pp., illus., diagrs., tables, 9½ x 6 in., cloth, \$3.00.

In this volume an experienced inspector presents practical information on the factory inspection of aircraft. Every step, from fabrication and sub-assembly to preflight and delivery inspection, is covered in detail, with full information.

#### AUDELS MECHANICAL DICTIONARY for Technical Trades, Arts and Sciences

By N. Hawkins and E. P. Anderson. Theo Audel and Company, 49 West 23rd St., New York, 1942. 948 pp., 8 x 5½ in., fabrikoid, \$4.00.

This dictionary published about thirty years ago, is reissued with a supplement nearly one-half as large as the original work. It contains about seventeen thousand technical words and terms with definitions and explanations.

#### ELECTRIC MOTORS IN INDUSTRY

Dr. D. R. Shoults and C. J. Rife, edited by T. C. Johnson. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 389 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$4.00.

Written for the industrial engineer, this book presents information on the characteristics and control of electric motors which will aid in the efficient selection and installation of the proper equipment for typical jobs. Enough description of the mechanical construction of motors is given to aid in understanding their operation. Two chapters deal with the principles and applications of electronic devices, but no attempt has been made to cover the generation, transmission or distribution of power.

#### ELECTROMECHANICAL TRANSDUCERS AND WAVE FILTERS

By W. P. Mason. D. Van Nostrand Co., New York, 1942. 333 pp., diagrs., charts, tables, 9½ x 6 in., cloth, \$5.00.

It is the purpose of this book to set forth the fundamental analogies and interconnections between electrical theory and mechanical theory. Electrical network theory is first analyzed and then applied to lumped mechanical systems; acoustic equations and the vibration of membranes and plates are discussed; and the final chapters take up the form and design of electromechanical elements and systems of which the piezoelectric effect is an example.

#### ELEMENTS OF HEAT TRANSFER AND INSULATION

By M. Jakob and G. A. Hawkins. John Wiley & Sons, New York, 1942. 169 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth, \$2.50.

The basic principles of heat transfer and insulation and their application to simple problems are presented as a course suitable for undergraduates. Conduction, convection and radiation are first treated separately and then

in combinations. Unsteady state equations, dimensional analysis and certain other more advanced phases are dealt with in a very elementary manner but with an equally rigorous adherence to the accuracy of fundamental details as in the rest of the text.

#### FOUNDRY WORK

By R. E. Wendt. 4th ed. McGraw-Hill Book Co., New York and London, 1942. 261 pp., illus., diagrs., charts, tables, 8 x 5 in., cloth, \$2.00.

This book is intended for use as a textbook by college students and apprentices in shops, and aims to present the fundamental principles and give a general working knowledge of foundry practice. The fourth edition contains new exercises in molding and discusses the causes of defective castings.

#### 14,000 GEAR RATIOS

By R. M. Page. Industrial Press, New York; Machinery Publishing Co., Brighton England, 1942. 404 pp., diagrs., tables, 11½ x 8½ in., fabrikoid, \$5.00.

The four sections of this book give: Common fractional ratios and their decimal equivalents; Decimal ratios, their logarithms and equivalent pairs of gears; Total number of teeth with equivalent gear pairs and ratios; Numbers and equivalent gear factors. The tables cover all ratios from 1/120 to 120/2, thus providing over fourteen thousand ratios. The various uses of the tables are illustrated by examples. The book will be of practical value to engineers and designers.

#### INDUSTRIAL STATISTICS

By H. A. Freeman. John Wiley & Sons, New York, 1942. 178 pp., diagrs., charts, tables, 9 x 6 in., cloth, \$2.50.

This book is based upon a one-semester course in the subject given at the Massachusetts Institute of Technology, and is intended for students without any previous training in statistics. It gives examples of the use of elementary statistical methods in the design and analysis of experiments carried out in industrial plants and scientific laboratories, and also deals with the problem of establishing a systematic programme for studying and controlling the quality of industrial output. A final chapter discusses some of the statistical aspects of the relationship of sampling to the risks incurred by producers and buyers.

#### (An) INTRODUCTION TO ELECTRO-CHEMISTRY

By S. Glasstone. D. Van Nostrand Co., New York, 1942. 557 pp., diagrs., charts, tables, 9½ x 6 in., cloth, \$5.00.

The object of this book is to provide an introduction to electrochemistry in its present state of development. In accordance with this idea the author has incorporated in the book the following four important and relatively recent developments: the activity concept; the interionic attraction theory; the proton-transfer theory of acids and bases; and the consideration of electrode reactions as rate processes. A chapter on electrokinetic phenomena is included.

#### MACHINE TOOLS AT WORK

By C. O. Herb. Industrial Press, New York; Machinery Publishing Co., Ltd., 17 Marine Parade, Brighton, England, 1942. 552 pp., illus., diagrs., 9½ x 6 in., fabrikoid, \$4.00.

Applications of modern machine tools of various types are illustrated by selected examples from actual practice. These examples are accompanied by close-up photographs and condensed descriptions, including the outstanding features of each job, with speed, feed, and other practical shop data. The emphasis is on the more unusual operations performed by modern machine tools, and a fair knowledge of shop practice is assumed.

#### (The) MARINE POWER PLANT

By L. B. Chapman. 2 ed. McGraw-Hill Book Co., New York and London, 1942.

401 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$4.00.

Intended for the practical man as well as for the student, this book is restricted to fundamental principles, with a minimum of descriptive matter and details. It presents the thermodynamics of the marine power plant and the types of machinery used for ship propulsion, and gives a comprehensive idea of the layout and function of the various pieces of auxiliary machinery. Complete calculations for boilers and auxiliaries of a typical plant are included.

#### MERCHANT MARINE OFFICERS' HANDBOOK

By E. A. Turpin and W. A. MacEwen. Cornell Maritime Press, New York, 1942. 740 pp., illus., diagrs., charts, tables, 7½ x 5 in., cloth, \$5.00.

This handbook has been prepared to give the essential information required for the new examinations of the Bureau of Marine Inspection and Navigation, and also to serve as a practical reference book for use at sea. Navigational instruments, piloting, tides and currents, cargo, shiphandling, signals and other important subjects are covered. The rules of the road are included. Appendixes contain mathematical formulae and tables.

#### MODERN CORE PRACTICES AND THEORIES

By H. W. Dietert. American Foundrymen's Association, 222 West Adams St., Chicago, Ill., 1942. 532 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$5.00 to members; \$8.00 to non-members.

This volume presents a series of lectures delivered at the 1941 and 1942 conventions of the American Foundrymen's Association. It aims to make available in one place all the existing technical and practical information on coremaking. Core ingredients and the methods of mixing them, core forming and baking, preparing cores for the mould and their setting and holding are described. Casting defects caused by the core are discussed and remedies suggested. There is a bibliography.

#### THE "PARTICLES" OF MODERN PHYSICS

By J. D. Stranathan. Blakiston Co., Phila., 1942. 571 pp., illus., diagrs., charts, tables, 9½ x 6 in., fabrikoid, \$4.00.

This book presents the material essential to an appreciation of modern physics and the newer concepts of atomic structure. The experimental evidence upon which each concept is founded has been stressed throughout. The book is intended both as a fundamental text in its field and as a reference work for advanced students, for which purpose a large number of specific references have been included as footnotes.

#### PETROLEUM AND NATURAL GAS ENGINEERING, Vol. 1, 536 pp., \$3.00

#### PETROLEUM REFINING, Vol. 2, 522 pp., \$3.00

#### PETROLEUM REFINING, Vol. 3, 419 pp., \$3.00.

By M. M. Stephens. Pennsylvania State College, Division of Mineral Industries Extension, School of Mineral Industries, State College, Pa. Vol. 3, 1939; Vols. 1 and 2, 1941. Illus., diagrs., charts, maps, tables, 9 x 6 in., fabrikoid.

These volumes present a three-year course of study for men employed in petroleum refining and allied industries, which is adapted for use by employee groups under teachers or for self instruction. It represents the extension course of Pennsylvania State College. Volume one contains the fundamental mathematical, physical and chemical principles necessary for the later volumes; Volume two discusses the basic refining processes, and Volume three describes their more technical phases.

## FOR TRANSFER FROM JUNIOR

GRANT—WILFRID JOHN, of 2228 Souvenir Ave., Montreal, Que. Born at Toronto, Ont., August 8th, 1899; Educ.: B.A.Sc., Univ. of Toronto 1922; Summer work: 1918, research and testing lab., Canadian Aeroplanes Ltd., Toronto; 1919, batch instr., milling dept., Goodyear Tire & Rubber Co. Ltd., New Toronto; supply correspondent, Can. Gen. Elec. Co. Ltd., Toronto; 1920, sub-foreman, Canadian Electro Products Ltd.; 1921, engrg. dept., British American Oil Co. Ltd.; 1922-25 (three sessions), demonstrator, Faculty of App. Science, Univ. of Toronto; 1923 (summer), Connaught Labs., process development, commercial production of insulin, i/c actual production; 1924 (summer), junior asst. testing engr., H.E.P.C. Research & Testing Lab., Toronto; Portland Cement and concrete research; 1926-33, instructor, physics, chemistry, maths., Central Technical School, Toronto; Sales Engr. with the following companies: 1934 (May-Aug.), Commercial Chemical Co. Ltd., Leaside; 1937 (Mar.-Sept.), Bruce Ross Ltd., Toronto; 1938 (Jan.-May), Roydes & Edwards Ltd., Toronto; 1939 (July-Aug.), Beverage Supply Co. Ltd., Montreal; 1934 (Aug.-Oct.), asst. chemist, Crosse & Blackwell Ltd.; 1935 (Feb.-May), chemist i/c of production, E. F. Houghton Co. Ltd. of Canada, Toronto; 1935 (Jan. and July-Oct.), chem. engr., asst. to Dr. Knapp, engr. i/c plant constrn., Carbo Ice Ltd., Leaside; May, 1938, to May, 1939, research studies, experimental work, product development 1921-22, geologist, White Beaver Oil Co., Canada; Consulting Geologist, 1923-24, ment, process equipment, development for oil refinery patents; 1939-40, instructor in dftng., Montreal Technical School; 1940 (July-Oct.), mech. dftsmn., Montreal Welding Works; Nov. 1940 and 1942 (Feb.-Mar.), mech. dftsmn. and designer, Associated Clock Industries, Montreal; 1941 (May-Nov.), mech. dftsmn. i/c of tracer squad and redesign of fixtures, John Inglis Co. Ltd.; Dec. 1941-Jan. 1942, dftsmn., Otis-Fensom Elevator Co. Ltd., Hamilton; 1942 (Mar.-May), design and layout of wood room, Brompton Pulp & Paper Co. Ltd., East Angus; 1942 (May-July), designer, punches, dies, cutters, Harrington Tool & Die Co. Ltd., Lachine, Que.; at present, engrg. dept., Fraser Brace Ltd., Montreal. (St. 1921, Jr. 1931).

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.\*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the September meeting.

L. AUSTIN WRIGHT, General Secretary.

\*The professional requirements are as follows:—

A Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

# Employment Service Bureau

## SITUATIONS VACANT

**MECHANICAL DRAUGHTSMAN** experienced in piping and equipment layout, or heating and ventilating work for war work in Montreal. Apply to Box No. 2375-V.

**MECHANICAL ENGINEER** for British Guiana. Some experience on diesels and tractors preferred. Apply to Box 2482-V.

**ELECTRICAL ENGINEER** with at least five years practical experience for work at Mackenzie, British Guiana. Apply to Box No. 2536-V.

**YOUNG GRADUATE ENGINEER** required by machinery supply firm located in Montreal. Some selling experience preferred. State military status. Apply to Box No. 2539-V.

**CIVIL ENGINEER** supervising construction operations in Mackenzie, British Guiana. Apply to Box No. 2549-V.

**MECHANICAL DRAUGHTSMAN**, for important war work in Montreal. Apply to Box No. 2550-V.

**ELECTRICAL ENGINEER** with ten to fifteen years experience. Theoretical electrical engineering. To undertake the various electrical engineering studies requiring ability to handle theoretical problems combined with knowledge of actual system requirements. Apply to Box No. 2557-V.

**MINING ENGINEER** with operating experience for work in Newfoundland. Single man preferred. Apply to Box No. 2558-V.

**ELECTRICAL ENGINEER** for Arvida. Testing and maintenance of system relays. Short circuit studies. Preparation of wiring diagrams, etc. Apply to Box No. 2559-V.

**ASSISTANT WORKS MANAGER** with machine or boiler shop experience, or both, by engineering firm in western Ontario. Permanent job for progressive man not afraid of work. Apply to Box No. 2560-V.

**JUNIOR MECHANICAL ENGINEER** wanted at Arvida, recent graduate with machine shop experience to act as assistant to shop superintendent. Apply to Box No. 2572-V.

**CHEMIST** wanted for Arvida technical control department with a few years' general analytical experience, supervisory work in routine chemical or spectrographic laboratory. Apply to Box No. 2573-V.

**METALLURGIST** or chemical engineer wanted at Arvida with at least one year's manufacturing experience. Apply to Box No. 2574-V.

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.

**CHEMICAL engineer** for work at Shawinigan Falls with general plant or process work experience. Apply to Box No. 2575-V.

**JUNIOR MECHANICAL ENGINEER** for general mechanical work at Shawinigan Falls. Apply to Box No. 2576-V.

**TWO GRADUATE ENGINEERS** or men with sufficient experience in draughting to act as squad leaders of four to six men on reinforced concrete detailing, general equipment layout or mechanical drawing. These men to work along with other draughtsmen but be able to head up the job, lay out the work and check the drawings for issuing. Apply to Box No. 2577-V.

## SITUATIONS WANTED

**MECHANICAL DRAUGHTSMAN, JR.**, graduate of the University of Toronto in Electrical Engineering. Some six years of practical experience with accent on electric motor design, instruments and small tools. Has a background of two years in electric instrument laboratory. Desirous of making a change where his services will be fully utilized and better appreciated. Apply to Box No. 1486-W.

**GRADUATE MECHANICAL ENGINEER**, military exempt. Age 33, married. Detail experience in mechanical departments of paper-making, construction and foundry work. Available immediately. Location immaterial. Desirous of executive or production position with prospects of advancement. Apply to Box No. 1650-W.

**CIVIL ENGINEER**, B.A. sc. Age 33, married. Experience covering heating, air conditioning, mining. Design, construction and maintenance of sewers, aqueducts, streets and highways, including surveying, location, estimating, inspections, drainage and

soundings. Presently employed, but desires advancement. Apply to Box No. 1859-W.

**GRADUATE CIVIL ENGINEER, S.E.I.C.**, experience in surveying and in teaching same, location surveys for roads and railroads, 2 years as construction engineer in oil fields in tropics in charge of roads, earth-moving machinery, anti-malarial drainage, etc. Experience in construction of bituminous pavements. At present engaged in airport construction. Available from September first. Age 30 years. Apply to Box No. 1860-W.

**GRADUATE CIVIL, STRUCTURAL ENGINEER, M.E.I.C.**, middle age. Twenty years' experience estimator, designer, and sales engineer. Excellent references. Open for engagement. Apply to Box No. 2440-W.

**ELECTRICAL ENGINEER**, age 34, twelve years experience in design, manufacture and application of fire protection systems. Good general knowledge of mechanical engineering, experience with tool design machine tools and shop practice. Trained in business administration and accustomed to responsible charge of large staff. Available immediately. Apply to Box No. 2442-W.

**GRADUATE ELECTRICAL ENGINEER, M.E.I.C.**, with twenty-nine years experience in operation construction, repairs and maintenance of paper mill and hydro electric system. Bilingual. Available September first. Apply to Box No. 2443-W.

## FOR SALE

Transit, Buff and Buff Mfg. Five-inch circle, brass telescope and sliding leg tripod. One nick in the vertical half-circle, but no other damage. Thirty-year old instrument, but not much used. Would sell for \$225.00. Apply Box No. 45-S.

## LIBRARY NOTES

(Continued from page 488)

### PHYSICS FOR ENGINEERS

By Sir A. Fleming. Chemical Publishing Co., Brooklyn, N.Y., 1942. 232 pp., illus., diags., charts, tables, 9 x 5½ in., fabricoid, \$3.00.

Present-day knowledge in the realm of physics is summarized with special reference to the requirements of practical engineers. The book starts with the fundamental physical units and ends with atomic transformations, having dealt with various aspects of energy, electricity, electronic emissions, radiation, optics and sound in between.

### PRECISION MEASUREMENT IN THE METALWORKING INDUSTRY

Issued by the New York State Education Department, a reprint of "Measuring Instruments," a Manual of Instruction prepared by the Education Dept. of the International Business Machines Corp., Enlicott, N.Y., 1941. 496 pp., illus., diags., charts, tables, cloth, \$3.75, apply to Roy F. Johncox, Vocational High School, Rochester, N.Y.

This manual was prepared for use in the Factory Training programme of International Business Machines Corporation. Opening with a general statement on measurement, successive chapters are devoted to non-precision line-graduated instruments, precision gauge blocks, plug, ring and snap gauges, thread gauges, dial gauges and test indicators, micrometers and verniers, surface plates and accessories, angle measuring instruments, comparators, optical instruments and surface finish measurement, and measuring machines and hardness testers. The construction and uses of these devices are explained in clear, simple language, profusely illustrated by admirable photographs and drawings, providing an excellent course of instruction.

### PROTECTIVE AND DECORATIVE COATINGS, Vol. 2. Raw Materials, Pigments, Metallic Powders and Metallic Soaps

By J. J. Mattiello. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 653 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$6.00.

This, the second of four volumes in which various authorities will present a comprehensive survey of the protective and decorative coating industry, is devoted to the pigments, metallic powders and metallic soaps. The chemical compositions, manufacturing processes, properties, uses and methods of identification are dealt with in detail. The work is well adapted for use as a textbook, and is also a convenient, complete reference book.

### (The) STORY OF THE AIRSHIP (Non-Rigid), a Study of One of America's Lesser Known Defense Weapons

By H. Allen. Goodyear Tire & Rubber Co., Akron, Ohio, 1942. 74 pp., illus., diagr., maps, tables, 9½ x 6 in., cloth, \$1.00.

This volume, published by the Goodyear Tire & Rubber Company, reviews the history of the airship and the part it played in the first world war. Improvements since that time are also described, and the ways in which airships can be of special use today are pointed out. Attractive photographs add to the interest of the work.

### TABLES OF PHYSICAL AND CHEMICAL CONSTANTS and Some Mathematical Functions.

By G. W. C. Kaye and T. H. Laby. 9 ed. Longmans, Green & Co., New York, London, Toronto, 1941. 191 pp., tables, 10 x 6½ in., cloth, \$5.00.

This well-known publication aims to fill the need for an up-to-date, moderately priced collection of physical and chemical tables which will meet the usual needs in teaching and laboratory work. The new edition has been thoroughly revised and expanded.

### THORPE'S DICTIONARY OF APPLIED CHEMISTRY, Vol. 5

By J. F. Thorpe and M. A. Whiteley, 4th ed. Longmans, Green & Co., London, New York, Toronto, 1941. 610 pp., illus., diags., charts, tables, 9½ x 6 in., lea., \$25.00 (70s.).

Abridged Index to Vols. 1-5 of new edition of Thorpe's Dictionary of Applied Chemistry, paper, \$1.00.

The fifth volume of this standard encyclopedia of chemical technology contains monographs on various important subjects. Fermentation, fertilizers, fibers, the finishing of textile fabrics, fireproofing, food preservation, fuel, the gas industries and glass are given extensive treatment. Minor topics are also covered adequately. The book is indispensable in chemical and technical libraries.

### TIN SOLDERS: a Modern Study of the Properties of Tin Solders and Soldered Joints. (Research Monograph No. 1)

By S. J. Nightingale with an introduction by R. S. Hutton. 2 ed. revised by O. F. Hudson. British Non-Ferrous Metals Research Association, Euston St., London, N.W.1, 1942. 117 pp., illus., diags., charts, tables, 10 x 6 in., cloth, 10s. 6d. (in U.S.A., \$2.75).

Since the appearance of the first edition of this book in 1932, further investigations have been carried on by the Association, mainly upon the creep properties of solders and soldered joints, the results of which are incorporated in this edition. The first section of the book deals with the constitution of the tin solders; their structure; the mechanical properties of the solder alloys; the strength of soldered joints; creep properties of solder alloys and soldered joints; and alloying between the solder and the joint members. The second part discusses such practical considerations as fluxes, spacing, and wiped joints, and the choice of a solder.

### AIR BLAST CIRCUIT BREAKER

The English Electric Company of Canada Limited, St. Catharines, Ont., have issued a 12-page bulletin, No. 112, describing the "Delle System" air blast circuit breakers having the general designation of type AV. These breakers are designed for operation from an external source of compressed air and their field of application lies principally in generating stations and supervised distribution sub-stations. The bulletin, containing diagrams and illustrations, also gives specifications, construction, operation and methods of control. Installation, assembly, disassembly and inspection are described, and every part is illustrated separately showing how they fit together. A table of ratings is also added.

### AUTOMATIC CONTROL FOR BLACKOUTS

"Blackout Control" is the title of a 4-page bulletin being distributed by Burlec Limited, Toronto, Ont., featuring the positive photo-electric blackout control of the United Cine-phone Corporation. Photographs, dimensional drawing and detailed descriptive data are given covering Model 77 for outdoor installation and Model 57 for indoor installation. These units are designed to automatically control any individual lighting circuit in the event of a blackout.

### BRAZING AND WELDING

Issued in single sheet form, "Low Temperature Brazing", Volume 4, No. 3, by Handy & Harman of Canada, Limited, Toronto, Ont., is of particular interest to those engaged in the brazing and welding industry. Two illustrated short articles are presented on speeding munitions production with "Easy-Flo" silver brazing alloy and on rapid training of brazing operators.

### CRUSHERS, PULVERIZERS AND SHREDDERS

Jeffrey Manufacturing Company, Limited, Montreal, Que., have available for distribution a bulletin, No. 722, entitled "The Answer to Your Reduction Problems", which illustrates and describes "Jeffrey" crushers, pulverizers and shredders and shows every unit "on the job".

### ELECTRICAL CONNECTORS

A 4-page bulletin, No. 4243, has been published by Canadian Line Materials Limited, Toronto, Ont., featuring "Burndy" connectors for any electrical connection, with special descriptions and illustrations of four types of connectors, namely, the "Versi-Top" type QPX; the "Versi-Lug" type EA; the "Hottap" type HET and the "Servit" type KS. Tables of specifications are given and a page of illustrations shows a number of other types of connectors.

### FEED WATER HEATING

"Heat Engineering", Volume XVII, No. 2, published by Foster Wheeler Limited, St. Catharines, Ont., features the installation for feed water heating at Oswego Station, which is part of the Niagara Hudson steam and power system of the Central New York Power Corporation. This is followed by several short articles dealing with (a) the construction of tankers, (b) new applications of the "Dowtherm" heating systems, (c) plastic fan blades, and the installation of "S-A" boilers in petroleum refineries.

### FILES

"New Files Perfected" is the title of a new folder being distributed by the Nicholson File Company, Port Hope, Ont., which describes what the company states is "the greatest improvement in file construction in a generation." These hand files are so designed that as the tops of the teeth wear down other cutting edges come in contact with the work to give the file a much longer life. The new tooth construction is said to eliminate side slip.

## The Geologists' Paradise

The province of Nova Scotia is the geologists' paradise because all ages of rocks from Mesozoic down to Precambrian are predominately displayed within a relatively small area.

Fossil ferns and stems found in the coal measures are the palaeo-botanists' delight. Pitching anticlines, synclines and anticlinal domes are prominently displayed in the Precambrian sediments.

The rock exposures around Minas Basin are the museum curators' favourite hunting ground for zeolites.

Shortage of gasoline and tires may curtail your proposed motor trip—but come just the same—the province is well served by the two largest railway systems on the North American continent, and inter-connecting bus lines.

### THE DEPARTMENT OF MINES HALIFAX, NOVA SCOTIA

L. D. CURRIE  
Minister

A. E. CAMERON  
Deputy Minister

### NEW EQUIPMENT

The feature articles in the *Power Specialist*, May and June, 1942, by Canadian Johns-Manville Company, Limited, Toronto, Ont., cover new equipment in use at the plant of the Algoma Steel Corporation Limited at Sault Ste. Marie, Ont., the use of "J-M Transite" in the Leslie Salt Refinery at Newark, California, Cornell's School of Chemical Engineering; the fabrication of a giant castable refractory-lined furnace door, built of "J-M Firecrete" in a 3-ton steel frame; the new "Rawson" couplings for industrial equipment. Editorial items and illustrations of defence jobs complete the issue.

J. A. M. GALILEE,  
VICE-PRESIDENT, N.I.A.A.

J. A. M. Galilee, Assistant Advertising Manager, Canadian Westinghouse Company, Limited, Hamilton, Ont., was elected a vice-president of the National Industrial Advertisers Association, at the annual convention recently held in Atlantic City, N.J.

### INSULATING CONCRETE

Webster & Sons Limited, Montreal, Que., have for distribution a leaflet entitled "Tartan Insulating Concrete", which features this product's use for roof and floor insulation. It is a fireproof, rotproof insulation that is said to fit in with the other permanent type of materials, to have a satisfactory bond to a concrete slab, and to make an ideal base for roofing materials. "Tartan" insulating concrete is mixed and placed like ordinary concrete and weighs only 26 lbs. per cubic foot.

### LIQUID DENSITY RECORDERS

The Foxboro Company, Montreal, Que., have issued an 8-page bulletin, A-264, illustrating and describing Foxboro instruments for the automatic measurement and recording of densities of process liquids. In place of periodic readings by hydrometer and still samples, the Foxboro density recorder records the continuous direct measurement of the flowing liquid. For processes where automatic control of density is important for operating efficiency, the Foxboro Stabilog density controller is supplied. The instruments have identical measuring systems and both use standard Foxboro charts, which may be read in specific gravity, Baume, Brix or other recognized scales.

### PORTABLE ELEVATORS

Mahaffy Iron Works Limited, Toronto, Ont., have published a 24-page catalogue, No. 12E, illustrating and describing the "Revolator" portable elevators. It contains diagrams, dimensions, specifications, capacities and code names for sizes for various models, and action pictures showing a number of different types of applications are also included. Complete data are given for hand and motor powered units with revolvable and non-revolvable bases, and with standard or telescopic frames.

### POWER LINE EQUIPMENT

The leading article in Volume 20, No. 3 of "The Line", published by Canadian Line Materials Limited, Toronto, Ont., deals with the features of C-L-M lightning arresters, which make possible a thorough inspection of arresters while in service. The second article features wired radio controls on street-light circuits, where radio signals, transmitted over telephone-dispatching wires, actuate "on and off" for eight outlying circuits—offering "blackout" potentiality. Other articles include—protecting metal in areas of severe rusting, "Primalite" luminaires, and improvements in street-lighting maintenance.

### REFRACTORY LAGGING

Bulletin No. 327-E, eight pages, being distributed by Quigley Company of Canada, Limited, Lachine, Que., is devoted to a description of "Insulag", a refractory lagging for use on high or low temperature equipment up to 2,200°F. Full details of the properties of "Insulag" are given and its applications are illustrated and described covering the petroleum industry, metallurgical furnaces, ceramic plants and power plants. Its use for general purposes, fire-proofing and weather-proofing are covered and design data are also included.

### SAFETY CANS

Aikenhead Hardware Limited, Toronto, Ont., have issued a folder containing specifications, construction, tables of weights and capacities and various features of two types of "Justrite" safety cans for industrial purposes. These include the "Justrite" automatic oily waste cans and the "approved" safety cans for inflammable liquids.

(Continued on page 492)

(Continued from page 491)

## SNAP GAUGES

A leaflet is being distributed by Bridge Machinery Company, Montreal, Que., illustrating and describing four styles of M-G snap gauges and presenting such outstanding features of these gauges as the locking device, the square measuring pins, the single adjustment and the strength of the gauge frame.

## SHIPPING AND PACKING EQUIPMENT

"Guide to Shipping and Packing Equipment" is the title of a 32-page catalogue just published by Canadian Steel Strapping Company, Limited, Montreal, Que. A varied line of equipment and supplies for packing and shipping is featured, including the "Signode" system of tensional steel strapping from light parcel post to heavy carload shipments. Many applications are shown followed by illustrations and data covering "Signode" stretchers, sealing tools, steel strapping, and accessories. Stencilling machines, inks, brushes and markers are included; also stitching, tacking, stapling and sealing machines and accessories.

## INGLIS MAKES NEW WORTHINGTON DEAL

Back in 1939 Worthington Pump & Machinery Corporation appointed John Inglis Co. Limited, of Toronto, Ontario, as Canadian representatives with the right to manufacture some of the Worthington products in the Dominion. These include reciprocating and centrifugal pumps, condensers, stationary diesel engines and many other lines of industrial equipment.

Within the past few weeks an announcement has been made indicating that the two companies have been drawn still closer together. Worthington Pump & Machinery (Canada) Ltd., has now obtained a ten percent interest in John Inglis Co. Limited and in return has given Inglis a long-term contract to make or sell all of its products in Canada.

Three years ago the John Inglis Co. Limited made agreements with a number of internationally-known organizations, both in Great Britain and the United States, which enabled the Company to offer products which theretofore had not been manufactured in Canada. Included among these companies are Yarrow & Co. Limited, Glasgow, Scotland, makers of Yarrow Marine Boilers, and Parsons Marine Steam Turbine Co. Ltd., Wallsend-on-Tyne, England, makers of Marine Steam Turbines. These connections together with the fact that the original John Inglis Co. Limited had for years been known for its production of Triple Expansion Marine Engines and Boilers of many types, enabled the new Inglis Company under the leadership of Major James E. Hahn and his associates to supply a large amount of equipment for the Canadian Navy and Merchant Marine.

The Inglis Company also made agreements with Aetna-Standard Engineering Co., of Youngstown, Ohio; Lake Erie Engineering Corporation, of Buffalo, N.Y.; Lobdell Car Wheel Company, of Wilmington, Del.; A. O. Smith Corporation, Milwaukee, Wis.; and Erie City Iron Works, of Erie, Penn., thus enabling the Company also to produce equipment for the Oil industry and heavy industries in various fields. Foreseeing the possibilities of war the Company obtained a contract for the manufacture of Bren Machine Guns, which was secured after some years of negotiations in London, England. This, however, proved only a beginning for Inglis becoming a vital factor in the munitions business of Canada. It later obtained additional contracts from both British and Canadian Governments for Bren Machine Guns, Browning Machine Guns, and Boys Anti-Tank Rifles. It is safe to say that the ordnance end of the Inglis business is ten times as large as was envisaged in the beginning.

## DOMINION RUBBER APPOINTMENTS

Mr. George B. Rutherford has been appointed General Manager, Mechanical and Sundries Division, of the Dominion Rubber Company. He was formerly Sales Manager of the company's Mechanical and Sundries Division in Western Canada with headquarters at Winnipeg, Man., and came to Montreal in 1938 as Manager, Special Products' Division. Successively, he became Assistant General Sales Manager, General Sales Manager and in his new appointment will have control of both sales and manufacturing activities of Mechanical and Sundries Division.

Mr. J. A. Porteous was recently appointed Assistant General Sales Manager, Mechanical and Sundries Division of Dominion Rubber Company, Montreal, Que. Mr. Porteous joined the Company seventeen years ago in the General Laboratory, Montreal, subsequently spending several years in field work for the company. In 1938 he was appointed Assistant Sales Manager, Mechanical and Sundries Division, Toronto, and returned to Montreal in 1940 as Manager, Moulded Goods' Division, which position he held to the time of this latest appointment.

## STEEL INDUSTRY IN WAR WORK

Volume 14, No. 2 of "The Steel Constructor" issued by the American Institute of Steel Construction, New York, N.Y., gives examples of war work being done by the steel industry that indicate a trend, and illustrate the unusual service that can be obtained from an industry of such distinctive and versatile talents. Illustrations show the use of steel in fabricating heavy naval guns, field repair cranes, overhead cranes, steel trusses, pontoons, tanks, hammerhead cranes, radio towers, transmission towers, electric furnaces, lock gates and ships.

## MACHINE TOOL MOTORIZING

Drive-All Manufacturing Company, Detroit, Mich., have issued an 8-page catalogue which is fully illustrated and contains the full treatment of a simplified technique of mounting individual motorizing units with standardized brackets on any type of machine tool. It points out the advantages of individual motorizing of belt-driven machines from standpoints of economy, production increase, shop flexibility and appearance and improved working conditions. The catalogue is practical and informative with the kind of application pictures and engineering data that shop men find useful.

## HIGH SPEED ADJUSTABLE HOLLOW-MILLS

Catalogue No. 15, containing eight pages, has just been issued by Carl Wirth & Son, Rochester, N.Y., which illustrates and describes various types of "Kutmor" high speed adjustable hollow-mills, with full specifications for each. The types described are the "Kutmor" Midget; 4-Blade Light Duty; 4-Blade Heavy Duty; 6-Blade Light Duty; and 6-Blade Heavy Duty. "Kutmor" re-sharpening fixtures for the hollow-mill blades are also illustrated and described.

## CONDENSATE CORROSION CONTROL

"H.O.H. Lighthouse", issued by D. W. Haering & Company, Inc., Chicago, Ill., features an article which is devoted to condensate corrosion control and provides a complete case history of the solution of a difficult corrosion problem by the "Haering Development of Steam Treatment" by direct introduction into steam. Photographs of test sections and analytical data conveniently charted for the reader round out this interesting report; considerable space is devoted to seasonal factors in scale and corrosion control.

## PERFORATING DIES

A 4-page folder has been issued by S. B. Whistler Inc., Buffalo, N.Y., which illustrates and describes this Company's new "U-375" adjustable perforating dies, which permit minimum perforating centres of  $\frac{7}{8}$  inch. This folder lists important features and describes special introductory unit, with full size blueprint of the die holder. This unit is compact and up to 25 holes from  $\frac{1}{32}$  inch to  $\frac{3}{8}$  inch diameter can be pierced in  $\frac{1}{16}$  inch mild steel in a single operation on a working surface of 10 inches by 12 inches.

## DORMANT AND SURPLUS STOCKS

With countless plants swinging from peacetime production to war purposes, large amounts of miscellaneous articles are now lying idle in stock rooms or assembly shops. Supplies, of certain metal goods especially, for civilian use, are tapering off and those who need such articles must, therefore, seek them from every available source. Retailers and wholesalers saddled with stocks, dead due to a change in consumer demand, are in a similar position.

Confronted with a situation calling for immediate action, the management-service section of the Wartime Prices and Trade Board's Division of Simplified Practice have set up a dormant stock department which is acting as a clearing house for surplus stocks needed elsewhere. It has already diverted to direct war use many items which might otherwise have gone into the scrap heap. It is a non-profit service, its only objective being to bring buyer and seller together. Sales are made directly between the two principals involved, and no commissions are expected or accepted.

The inventories of many manufacturers contain a host of items for which the owners have no immediate use and of which someone else is probably in pressing need. When supplies cease to be current, they are more often than not disposed of as scrap. The Department deals only in excess or surplus stocks. Its activities do not involve what is known as junk items, but only materials for which the present proprietor has no further use.

Any manufacturer, wholesaler, or retailer who has a list of items lying idle in his factory, warehouse or store, is urged to communicate with the Dormant Stock Department, Management Service Section, Division of Simplified Practice, Wartime Prices and Trade Board, 1903 Metropolitan Building, Toronto, Ont.

**Keep Cylinders at Work**

Return empty cylinders promptly to assure an adequate supply of oxygen and acetylene for use in production for victory

THIS CYLINDER CONTAINS OXYGEN

THIS CYLINDER CONTAINS ACETYLENE CLOSE VALVE

Return Empty Cylinders Promptly

# MECHANICAL FEATURES OF 220-KV. LINES IN ONTARIO, 1940 AND 1941

A. E. DAVISON

*Transmission Engineer, The Hydro-Electric Power Commission of Ontario, Toronto, Ont.*

Paper presented before the Toronto and Border Cities Branches of The Engineering Institute of Canada on March 19th and April 10th, 1942

The additions which were made to the 220-kv. system of the Hydro-Electric Power Commission of Ontario during 1940 and 1941 have been quite thoroughly reviewed by Messrs. A. H. Frampton and E. M. Wood, especially from an electrical standpoint. Their statement will be found in the January, 1942, issue of *The Engineering Journal*. In that discussion, features of mechanical interest, such as the effects of winds on ice coated conductors, and the fatiguing of conductor and other materials by vibration, are mentioned.

While the principal problem of the transmission engineer is that of keeping conductors clear of electrical faults, and while it is a fact that lightning troubles, very largely having to do with insulation and air clearances of conductors, are the most prolific source of outages of transmission lines, nevertheless, mechanical characteristics are extremely important.

Any type of transmission structure or transport vehicle which is continuously exposed to the elements is almost certain to get into some sort of difficulties sooner or later, or get out of control from time to time because of extreme weather conditions. This is particularly true of long transmission lines because of the extensive and varying territory through which they pass. A transmission line may be 300 to 400 miles long without any intervening controls or sectionalization, with the result that some portion of the line may be surviving an extremely heavy storm

Fig. 1—Transposition tower for double circuit 220 kv. line.

Fig. 2—Anchoring a grillage in soft ground by backfilling with rock.

of some sort while the ends are in comparatively normal weather.

Because transmission works are continuously exposed to the elements, engineers have become familiar with conductor fatigue problems quite as intimately and quite as strenuously as have the makers of high-speed transportation equipment. The result is that it is necessary to think in terms of the fatigue strength or endurance limit of the materials used. Fatigue strength may be of the order of 25 per cent of the ultimate strength. Yield point or elastic limit which frequently is of the order of 50 per cent or more of the ultimate strength should no longer be a unit of reference. If the aluminum, copper, and steel portions of a transmission line are not kept within recognized endurance limits, then it is only a matter of time until incipient failures are evident. As a result of this, some sort of suppressor, tending to limit or absorb this fatiguing energy must be introduced, in order that the useful life of the material may be expected to be increased two or three times. This extension of physical life sought by the introduction of absorbers should, for some of the comparatively taut cables, extend to and beyond the obsolescent life of the works. This overtaking of the physical life of works by obsolescence often happens both with and without suppressors, since engineers cannot always anticipate correctly the locations of load centres and supply centres for a period of 30 years.

Fatiguing, in the case of transmission wires and cables, comes from two sources. First, there is a small almost unobservable aeolian vibration which is insidious. It is slow in creating evident fatigue, but may continue for a considerable part of each day.

The second type of fatigue, sometimes called dancing or galloping, is much less frequent but more strenuous, and men who are about when it happens realize that some mechanical trouble almost immediately may be expected. This other type is due to the effect of wind upon ice coated conductors. These ice coatings may be very thin, and the conductors may be only partially covered. One interesting thing about glaze troubles is that, under war conditions

especially, electricity may be carried in such quantities that the dissipation of energy losses in the form of heat has been found to be sufficient to prevent the formation of ice on the conductors during at least one-third of the glaze storms. The upper sky or ground cables cannot be so warmed.

A number of engineers have spent some time and money trying to establish special routings of power over lines, at times when they may be exposed to glaze storms, by which formations of ice may be prevented. This has been done with some success, and appears to be about the only way this trouble can be effectively countered.

If added heat cannot be supplied until after the glaze has formed, then the air temperatures may be so low for long periods that it would take a great amount of electrical loss to melt the ice.

Conditions for the formation of glaze, like that of the formation of certain types of ice in water as described in a very interesting way by the late Professor Howard T. Barnes in his text-book "Ice Engineering," are very critical. Also, it has been shown that water in a glass container, without any jarring, can be cooled, to a temperature below 32 deg. F. without ice formation, but if the container is jarred slightly, it is possible to have 30 per cent of the water change into ice suddenly. Similarly, it has been shown that a fraction of a degree change in temperature in the vicinity of ice racks changes the ice forming characteristics very materially. So it is in the formation of glaze. It appears that during the glaze-forming period only of most storms the temperature of the water and of the air at the surface of the cable is such that, if there is any appreciable radiation of heat, this critical ice-forming condition can be avoided. In other words, conditions for most storm glaze formation are critical.

So far as the most recently constructed 220-kv. lines in Ontario are concerned, their mechanical stability depends first on their mechanical safety ratios and on the normal radiation of electrically generated heat for protection against loss of circuit in many (35 to 40 per cent) of the storms accompanied with wind at the time of or following the formation of glaze. This was the case during a series of storms during 1941-42. Winds across the line of say 20 miles per hour during the glaze-forming period or shortly afterwards may be expected to cause mechanical, and in all probability electrical, disturbances at some point on the line. Frequently, only one conductor of several performs in one span.

Discussing safety ratios, it has been customary for building designers to use 16,000 lb. per sq. in. or more in tension when steel having an ultimate strength of 64,000 lb. is used. This ratio is sometimes erroneously called a factor of safety of four.

Transmission structures provide safety ratios under test close to that found in buildings as above, assuming of course dynamic pressures.

Wind loadings taken at eight lb. per sq. ft. on the projected area of smooth cylinders compare favourably with 30 lb. on large flat surfaces. Wind pressures in excess of these figures may be found. For instance, the Florida Coast-line train, moving out along the Keys, was blown and washed away a few years ago.

The resistance of transmission structures to winds greater than 60 miles per hour and of the order of 100 or more miles per hour, because of the low incidence of such storms, is within the safety ratio just as is the carrying of eight inches, and in some cases greater, diameter of glaze or rime by a single 1/8-in. or less diameter telephone wire.

There are in Ontario a considerable number of 110-kv. to 132-kv. double-circuit steel-supported transmission lines. There are also on the continent a few 220-kv. structures supporting two circuits and the necessary sky cables. The 220-kv. lines in Ontario are generally single-circuit construction; however, the new line from metropolitan Toronto area (Leaside) to Burlington is double-circuit construction.

It conforms in general to the more orthodox types of double-circuit construction at lower voltages but with greater phase-to-phase and phase-to-ground cable.

The transposition structure differs from most other transpositions at this voltage and for the particular type of construction, in that much greater than usual clearances are provided where one of three phase wires passes under the other two in making a one-third roll. When in this position, it is provided that there shall be as great clearances as there are throughout the more standard spans.

Steel grillages have survived many alternative schemes for anchoring steel transmission structures to earth. Among other schemes there are the "Malone" anchor, a concrete bulb poured around a steel stub set in an eight-inch post hole, at the bottom of which a small charge of explosive creates the area for the 20-in. diameter bulb or anchor; the inverted plate steel disc; and many types of reinforced concrete placed around a steel stub.

The amount of grillage steel is sometimes equal to one-third of that in the super-structure. There is still room for designers to discover a safe less expensive anchorage.

Until recently, a number of organizations have been using templates to fix the four legs and grillages in an excavation while they are being set and while backfilling is being done. This was thought to be an insurance that the foundation would be in such condition that there would be no delay when men had to start work on the super-structure. Latterly it has been found that if there is any careless work, the foundations may sink, or be made otherwise irregular while the backfilling is going on, with the result that the alternative method of setting each leg and grillage independently by using a surveyor's instrument and reference stakes has

Fig. 3—Difficulties of working in the air on a hot day.

been introduced. Apart from the facts that it is found that this procedure is economical, and is in general leaving the foundation members quite as correctly in position, it does have another advantage. In very wet ground, pumps and workmen may be concentrated on one corner, finishing that corner up at the end of one day, thereby eliminating the necessity of pumping out one, two, or three excavations upon completion of work on the fourth so as to set all four legs with a template at one time.

For footings on rock, if two steel channels are secured in a horizontal position to the foundation leg members, and if these members are so punched or bored that they can be adjusted up or down the tower leg, then if two rock bolts, "foxed" and grouted in, placed either side of the main leg member and holding down with a plate or cross angle the upper flanges of the two channels, the result will be a satisfactory anchorage. All nuts of these anchor bolts should be locked. Foundations of this type should preferably be erected by instrument also.

Experience leads to setting tower legs by instrument, especially if there is good superintendence.

There are two prevalent methods of erecting the superstructure. Some organizations, in an attempt to cut down

on the number of man-hours, use elaborate erecting equipment, portable cranes and the like, requiring five to seven men per crew. Others use one team of horses to hoist assembled parts of a tower, and have, as in the alternative above, four men in the air and others to serve them below. In this method a gin pole is erected in the centre of the tower with tackle from its base to the tops of the four erected leg members. The gin pole can then be raised by steps about equal to the individual height of the sectional lengths of leg members. It is not fair to say that for the same man-hour rating the two erection costs are equal; however, that type of erection requiring a large number of man-hours is usually used where man-hours are less expensive, with the result that cost per tower or per ton of superstructure erected is in general the same for these two erection methods.

For the 365 circuit miles of construction finished in 1941, involving over 1,500 structures and requiring approximately 100,000 man-hours of work in the air, accidents were very few indeed, none of these were serious. One which accounted for more than a week of lost time was due to an employee being accidentally struck on the head by the handle of a falling maul.

## TIN CONSERVATION

Four papers presented before a Joint Meeting of the Affiliated Engineering and Allied Societies in Ontario at Toronto, Ont., on May 27th, 1942.

**NOTE**—The four speakers who took part in this important discussion were K. H. J. Clarke, Office of the Metals Controller, Department of Munitions & Supply, Ottawa, Ontario; J. S. Fullerton, Development Engineer, Handy & Harnan of Canada Ltd., Toronto, Ontario; I. I. Sylvester, Chief Inspector, Diesel Equipment, Canadian National Railways, Montreal, Quebec; G. E. Tait, Assistant Manager, Dominion Engineering Co., Ltd., Montreal, Quebec.

### THE METAL SITUATION

K. H. J. CLARKE

Non-ferrous metals in this country are divided into those which Canada produces and exports on a large scale, and the much smaller but extremely important group which we import and of which we are in short supply.

In the former group are copper, nickel, zinc, and lead.

Aluminum, of which we are large producers and exporters, is in a class by itself due to the fact that all the ore must be imported.

The supply picture of this group, which must be reviewed in the light of the overall needs of the United Nations, is not as reassuring as we would like.

Due to the now very urgent armament programmes of the United Nations, shortages of aluminum, nickel, copper, and zinc, already exist in varying degrees.

What may well be one of the most important of Canada's contributions to the combined war effort, is the supply of large quantities of those urgently needed base metals.

Practically all metals and strategic minerals are now under direct allocation in Canada and, as conditions have become increasingly more serious, so, proportionately, have the controls tightened. For example, starting June 1st every single order for wrought copper or copper alloys in such forms as sheet, strip, tubes, pipe and rod placed with a Canadian fabricator must be submitted to the Office of

the Metals Controller for investigation. Orders may not be scheduled without the approval of the Copper Control.

Excellent co-operation on the part of manufacturers and distributors has been shown and Canadians are well satisfied in forgoing the use of Canadian metals in order that they will be available for their allies.

Very important differences exist between the geography and economy of Canada and those of the other allied nations and the few differences in the controls which do exist, mainly in more simplicity of procedure, are based on studies of those factors.

It may be said with assurance that not only will civilian use of these metals decrease very rapidly from this time on, but that also, before many months have passed, many substitutions will have to be made even in war applications to take care of the most pressing war needs.

So much for that which we have; the real troubles, however, exist in that which we have not. Some of the more important of such metals are manganese, chromium, tungsten, vanadium, molybdenum and tin.

### MANGANESE

Manganese is best known by virtue of the fact that it is universally used in the manufacture of steel where it is used both as a scavenger and as an alloying element.

The decision of the present conflict rests in the balance between quantity and quality of the opponents' fighting machines in almost all of which steel is the backbone. A supply of manganese is absolutely vital for the prosecution of the war.

The manganese problem is mainly one of shipping. Aside from a relatively small production in the U.S.A., the sources of supply are the Gold Coast of Africa, Brazil, Cuba, Russia and India. The bulk of supplies for the United Kingdom and Canada come from the Gold Coast where they are subject to the hazard of submarine attack.

## CHROMIUM

It is well known that chromium is one of the most important steel alloying elements in use to-day. From the low alloy engineering steels to the high alloy high temperature alloys chromium is playing a very important part in the war effort.

Supplies were formerly drawn principally from Southern Rhodesia, Union of South Africa, the Philippines, New Caledonia, India and Turkey. There now remain as our chief sources of supply, Rhodesia and South Africa. Shipping again is the problem.

Our increased demand for manganese and chromium is indicated by the fact that since the war began consumption of power in Canada for the production of ferro alloys has increased by more than 650 per cent.

## TUNGSTEN

The most important use of tungsten is in the production of high speed cutting tools which play such an important part in the production of war equipment. Sources are scattered, small quantities being produced in the United States, Australia, and New Zealand, Portugal, Malaya and Burma. By far, however, the largest quantities have been produced in China, reaching the allies over the Burma Road.

## TIN

And now we come to the main subject, which has been the cause of much work and worry during the last few months. More than any other non-ferrous metal, tin seems to be interwoven into the entire fabric of every-day life. First, we have the common *tinplate* container or "tin can" which has contributed so much to the modern bride's peace-of-mind. In pre-war days, tinplate consumed almost 50 per cent of the tin used in Canada. To-day this application, due to the urgent need for food preservation, is a factor of considerable concern.

Since December 7, 1941, intensive research has made tremendous strides in the production of lacquered blackplate and bonderized containers. In the not too distant future it is expected that it will be possible to preserve many of the not too highly acidic foods in these tinless containers. All non-essential uses have, of course, been eliminated, can sizes for essential food stuffs have been enlarged and the use of tinplate for many foodstuffs has been prohibited.

*Solders* are the next largest tin user. All grades are severely rationed and many revisions in specifications to lower tin contents have been made. Scrap solders must be carefully preserved because supplies will become increasingly scarce.

*Babbitt metals* as bearings perform the important function of transmitting mechanical power. The demands made on our supplies for use in naval vessels will leave little high grade material for industrial use.

In the *bronze* field remarkable strides have already been made. The old standby gun metal or 88/10/2 containing 10 per cent of tin has been largely replaced by lower or tin-free alloys and an excellent reduction of tin consumption in this field has already taken place.

The use of tin in *foil* except for special ordnance use has been eliminated and in collapsible tubes is now negligible.

The facts to be faced in the tin situation are very serious. As an indicator and using 1939 statistics, world production of tin was 181,000 tons of which the Malay States, Netherland Indies, Thailand, Indo China and China contributed approximately 115,000 tons or 70 per cent. The Belgian Congo, Nigeria, Bolivia and the small production of the United Kingdom totalled 50,000 tons or 27 per cent. Now there is available to the United Kingdom and Northern

America less than  $\frac{1}{3}$  of the world's supply *providing the ships get through*.

Fortunately Government and consumer stockpiles will help fill the gap until substitutions have been made. The answer, however, is just that. The use of tin must be drastically reduced during the next twelve months.

Canadian technicians, engineers, and artisans can do that job, and meetings such as this one will help speed their efforts.

## SUBSTITUTE SOLDERS

J. S. FULLERTON

The question of substitutions is a vexing one, and will require a great deal of intensive study. Just where to start will be a problem, and the answers may come from unusual places. When the French peasants rioted for lack of bread, Marie Antoinette's flippant suggestion that they eat cake touched off many changes. Now, manufacturers who are having trouble securing brass, copper, stainless steels and certain other materials, especially for non-defence needs, may well give thought to silver. Silver has been available in large quantities in world markets, and a reasonable supply is still assured. Its cost is less than that of several other metals being used in large quantities. Silver is easily worked, and can be had in such forms as sheets, strips, rod, tube and wire, etc. A variety of alloys having diverse and useful properties are also available, as are certain metals clad with silver.

Silver is a by-product; from the production of other heavy metals—gold, copper, nickel, lead, etc., come most of the silver stocks, and as the production of these metals increase, so will production of silver. Greatly accelerated consumption of silver has been noted in the past year. The estimated total for 1941 in the United States and Canada was 80,000,000 ounces of pure silver, against 41,000,000 in 1940, an increase of almost 95 per cent. The quantity to be consumed this year will be far in excess of any previous estimates.

Turning for a moment to the casting procedures, considerable work in research has been done on the inclusion of silver in varying quantities in non-ferrous alloys, and the data on these tests shows potent alloying effect, similar to the benefits obtainable by the addition of nickel to carbon steels. Copper has been improved by the addition of small percentages of silver. This addition adds hardness, which obtains even after soldering operations. In commutator bars, for example, a small percentage of silver insures that hardness will be maintained. Fractional percentages of silver in photo-engravers' plates prevent the softening of cold-rolled copper sheet while it is processed at high temperatures. The addition of silver to copper increases its conductivity. The research work has been on alloys including cupro-nickel, brass, bronze, aluminum bronze, beryllium bronze, everdur, etc. Of interest to the foundrymen may be the fact that silver alloys have been used as a filler material for blowholes in castings. The cost has been low, and the alloys surrounding unchanged by the low heat.

In the case of many articles and small parts requiring extensive fabrication, material costs are often a small part of the total, even though the unit cost of material is high. Silver often fits in well in such cases, and may even enable manufacturing to continue when it would otherwise have to stop for lack of other metals. Silver always has a high reclamation value, and correspondingly increases the intrinsic value of the product in which it is used.

One of the principal items of interest is the question of a substitute for tin-lead solders. Many of the places in industry where these soft solder alloys are being used have been investigated and substitute solders were initiated years and months ago, with better joints resulting. Metals which will stand the heat of low temperature silver brazing alloys can generally be joined by those alloys, and the

Fig. 1—Silver-brazed detonator exploder and threaded collar.

results have been so favourable that the manufacturers have regretted the delay in the use of the new jointing alloys. The following are a few instances where soft solders have been replaced by silver alloys, to advantage:

- Tank spuds and seams.
- Electrical work: bus bars, terminal connections.
- Plumbing work: streamline fittings.
- Refrigeration: vibration proof, corrosion proof, leak proof joints.

These are a few of the places in everyday commercial production where silver makes the joint just as cheaply, more efficiently, and certainly a lifetime job. The flow point of these low temperature alloys runs from 1175 deg. F. to 1600 deg. F. Controlled heating methods, induction heating, spot welders, etc., and a certain amount of design changes, coupled with the use of such insulating materials as spun glass, have made it possible to make joints in places formerly deemed impracticable for any such heats. While the silver alloy cost is high per pound compared to other base metal alloys, yet the cost per joint will generally be comparable, and in many cases will be less. Several examples are cited in the following notes.

In war industries, a great many jobs have come to silver brazing as the production answer to a serious problem.

Figure 1 shows an exploder container for medium calibre shells. The specification for joining this threaded collar to the drawn tube called for either pure tin, brazing, or copper brazing in controlled atmosphere. This worked out as follows:

Pure tin was used by one manufacturer. The production rate was in the vicinity of 30 units per operator per hour. Tin used as a filler cost around 2c per unit.

Copper brazing in hydrogen atmosphere, furnace heat

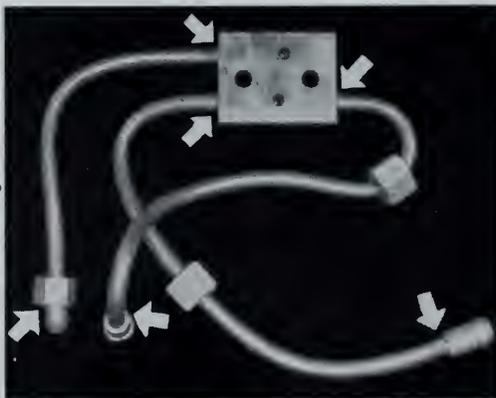

Fig. 2—Oil cooling part for Bofors gun (silver-brazed).

approximately 2100 deg. F. was employed by another manufacturer. Production rate was higher; 75 units being brazed per hour. Unfortunately the high heat and time in heat ruined some of the threaded collars; 25 per cent were rejected unfit, and 35 per cent had to be reconditioned before inspection.

Silver brazing in an atmosphere furnace, with a travelling belt and electric heating, was tried by another manufacturer. The parts were degreased, fluxed, pre-placed rings of the alloy inserted, alloy cost being 1/2c per unit, and the parts entered the furnace without any preheating at a temperature of 1680 deg. F. The time in furnace heat was finally set at two minutes, then into an atmosphere cooling chamber and the assembly, perfectly brazed, emerged clean and ready to be lacquered. The present production schedule is set at 480 per hour, with two operators, and the percentage of rejects is in the vicinity of 1/2 to 1 per cent. Examination of the rejects has shown in every case that it was improper cleaning or fluxing which led to the faulty braze, and as the attention paid to these very important operations, particularly the cleaning, is increased, so do the rejects decrease.

Many other operations for the Department of Munitions and Supply have gone through for silver brazing. Bren guns, Sten guns, Lee-Enfield rifles, Boys guns, etc., etc., have all stood up under exceptionally severe tests, and have proved efficient and both time and money saving. Figure 2 shows the oil cooling chamber for a Bofors anti-aircraft gun. A great many of the parts on radio locators being built here have switched to silver brazing.

The Universal Carriers being manufactured by Ford at

Fig. 3—Oil-relief valve for universal carrier (silver-brazed).

Windsor, generally called Bren Gun Carriers, were originally designed with the fittings to be soft soldered. The two test units made up were taken out to the proving ground, and under the vibration of the vehicle, and the heat of hot motor oil, proved unsuitable, leaking and slipping out of the fittings. The fittings were then ordered silver brazed, and have stood up under every test. The oil relief valve shown in Fig. 3 was originally threaded, the wings positioned, and the joint sealed with silver solder. An improved design was suggested and approved. The fittings are now made with a slot in the wing, in which silver brazing alloy is preplaced, the whole assembly fluxed, slipped into place, positioned, heated until the alloy shows, then the braze is complete. Many of the tank fittings in Valentine and Mark III tanks are being silver brazed.

In munitions work, the alloys have found a very necessary place in the fabrication of carbide-tipped tools for machining. The use of the alloys has permitted rapid inexpensive manufacture of these tools, in special shapes or sizes where necessary, right in the munitions plant. Operators are quickly trained for this type of brazing.

In the short space of this article it is necessary to pass over many of the other places where the alloys have found definite use in war industry, mentioning only the aircraft field, where the use of the alloys has permitted absolutely

sound, leakproof, vibration proof joints to be made, doing away in many places with heavy expensive fittings, and yet making the braze at temperatures far below any chance of embrittlement in the copper tubing. A new method of making up a thermocouple illustrates the joining of dissimilar metals with silver brazing alloys. In the part, we have a copper base, brass ferrule, constantan wire and copper wire, bound with monel wire. All five are united at the base, by means of incandescent carbon heating, and silver alloys.

In the field of the high bronze rods, such as tobin bronze, etc., a number of uses have been found for the silver alloys. A great deal of the strength of the bronze brazing is due to the large mass of cast alloy which surrounds the brazed area. Because of the adherence of bronze to steels and iron, a heavy amount of alloy can be built up, which in itself gives strength. Silver alloys do not depend on bulk to get strength; a bonding of the metals joined is effected by the silver alloy. In non-ferrous metals, this strength is in excess of the parent metal; and in ferrous metals, generally equal to, or slightly below the metals joined. With proper type of joints, amazing results can be achieved with a minimum amount of brazing alloy, and with very low heat, thus protecting the metals joined from the damaging effects of high temperatures.

An example of this is an instrument panel from the Bren Gun Carrier. This panel is formed after punching, and several spuds are affixed for bolting to the carrier frame. They were formerly welded, then the weld cleaned up. Welding time consumed was 88 hours per 1000 units, plus 53 hours for cleaning, scratch-brushing, etc., total 141 hours. Welding material cost \$3.50. Now these spuds are jigged in place, with a ring of the silver brazing alloy preplaced, and heat applied to flow the alloy. Cleaning time is eliminated, and the entire operation takes 53 hours, with a brazing alloy cost of \$6.50 per 1000 units.

Ship-building in Canada has started to use silver alloys in place of spelter and bronze. Many pipe flanges, some ranging up to 14 inch diameter, have been brazed with silver alloys, and have stood up under every test, including some tests too severe for high temperature brazing. Costs have been comparable, time has been saved. More important, material has been saved. A twelve-inch flange, brazed with spelter, requires one pound of brazing metal. The same flange, properly designed, requires one-fifth of a pound of silver brazing alloy.

There are many places however, where neither low temperature silver brazing alloys, bronze brazing alloys or welding rods may be considered, and where the use of the 50-50 tin lead solders, and their various alloys has been, and still is necessary. Some work has been done on substitute alloys for commonly used soft solders, and a brief review of this development seems appropriate.

Silver and lead, in the eutectic of 2½ per cent silver-97½ per cent lead forms quite an efficient solder, which melts and flows at a temperature of 572 deg. F. Tests of silver-lead alloys have shown that they will make joints that have a higher tensile than 50-50 solder. For comparison, at room temperature the shear strength of 50-50 solder is 2580 lb. p.s.i. against 3820 lb. p.s.i. for silver-lead. At elevated temperatures, say 350 deg. F, 50-50 solder has a shear of 441 p.s.i. against 1556 p.s.i. for silver lead. One outstanding improvement of the silver bearing alloys is the increase in creep resistance. Silver-lead alloys, as is the case in tin-rich alloys, are capable of extrusion. Alloys are also available containing lead and silver, with percentages of tin and bismuth, which have low flow points, and are comparable with tin-lead solders. Silver-lead alloys are used to some extent in the construction of airplane radiators.

Two low temperature alloys have been developed, one with silver, zinc and cadmium, melting at 480 deg. F, and flowing at 600 deg. F, and the other with silver and cadmium, melting at 640 deg. F, and flowing at 740 deg. F.

These alloys were developed for special uses, such as soldering electrical terminals, but have certain characteristics which make them suitable for consideration in the present emergency. A comparison of tensile strengths between these alloys and 50-50 lead-tin solder shows some interesting figures:

	Ag-Cd	Pb-Sn
Room Temperature	16,400 lb.	2,500 lb. p.s.i.
300 deg. F.....	4,400	650
400 deg. F.....	2,600	100

These alloys however, while strong under tension, exhibit the brittleness characteristic of all soft solders under bending stresses. One of the principal considerations in the use of either silver-lead or silver-zinc-cadmium is the use of the proper flux. Soft soldering fluxes may be used, but at the temperatures required, which are higher than most of the soft solders, many of these fluxes carbonize, or are not sufficiently stable to be effective. Incidentally, in discussing these solders, it is interesting to note that 2½ per cent silver-97½ per cent lead alloys are cheaper than 50-50 tin-lead alloys.

Having considered the manufacturing field for substitutions and for metal joining, it is desirable to mention the place that silver plating can play in a substitution programme. Many parts that are nickel, chrome, zinc or cadmium plated can be given a silver flash, which will provide a coating that is just as protective, and just as decorative as any of the other metals previously used. A bright finish will be brought up by buffing, and the dull finish that is required on many munitions parts is quite easy to produce. Application of silver on transparent plastic sheeting has possibilities, and such coatings have brilliant lustre when viewed through the plastic, making the plastic sheeting applicable in place of tin and aluminum foils, for example, at least in some places. Transparent molded plastics can be plated on the inside or on reverse with a thin silver film, giving the appearance of silver, yet be light in weight with all the properties of the plastic. Silver is displacing aluminum in reflectors and in surfaces under vacuum. Silver can be coated onto refractories having dielectric properties to form condensers, many of which are needed in radio and related applications. Silver is a metal which has few if any peers in the corrosion-resisting field. Thin, pore-free coats of silver can be applied quickly and at surprisingly low costs.

Silver has found a very prominent place in the field of bearing metals. Research work done in this field has classified the commonest bearings as follows, starting with the least effective all round metals, and finishing with the most effective: babbitts—cadmium base-copper-lead—pure silver—and silver-lead. Pure silver is not entirely trustworthy, and the failures were traced to lack of oiliness. Bearings made of a 3 to 4 per cent lead, balance silver alloy are extremely seizure resistant, and have the necessary physical properties to enable them to carry high loads without mechanical failure. The best method of bonding lead-silver alloys to steel is by electrodeposition. The plating of the alloys is done simultaneously, and then a heat-treating period provides the diffusion and grain structure necessary. Silver-faced steel is highly resistant to galling when in sliding contact with steel, and the process has developed so rapidly that it has multiplied at least 100 times in the past five years. Orders for silver for this purpose are now being placed in millions of ounces. The biggest single field has been the aircraft bearing manufacturers, for aircraft engine bearings subject to high specific loading. Other fields are rapidly examining the possibilities.

In the electrical field, where the alloys have been widely used, and where pure silver is a very essential metal, a leading electrical authority has said that fine silver has been found to be the best all-round material for such lines as contacts, because of the combination of high electrical conductivity, which produces minimum heat due to

the resistance of the contacts, and the high thermal conductivity, which rapidly dissipates such heat as is generated. Contrary to quite widely accepted statements, silver oxide is probably never formed in the operation of the silver contacts. The presence of silver sulphide, which is rapidly formed and commonly present, does not interfere with contact operations, because silver sulphide is of itself a reasonably good conductor, and as soon as moderate heat is generated on the contacts, the sulphide becomes metallic silver again. For medium and high loads, silver is far less likely to stick, due to welding, than are the alloys of platinum and other expensive noble metals.

Silver is one of the most ductile and workable metals known, and combines readily with other metals to make useful alloys that have unusual properties. Research work, followed by actual manufacture, indicates that the addition of several tenths of a per cent of silver to 18/8 stainless steel greatly reduces the pitting action due to salt water corrosion. It gives the stainless much better machining properties, as well as enabling the surface of the steel to attain a much higher polish. Silver provides high thermal conductivity, and high electrical conductivity, has high reflectivity and is the whitest of metals. Some four years ago, a number of the silver producing companies in the United States financed a comprehensive research programme covering silver and silver alloys for general and specific industrial uses. A great deal of valuable data has been accumulated, and of interest may be the mention that much of this data is available in a publication which is on the market entitled *Silver in Industry* by Lawrence Addicks. This research development is still being carried on and its services are available to anyone interested in the application of the alloys.

Some of these applications range over such fields as:

- Silver additions to storage battery grids.
- Sliding electrical contacts.
- Silver-silicon alloys for chemical equipment.
- Silver foil for "spots" in bottle caps.
- Silvering non-metallic bodies (synthetic plastics, etc.)
- Silver-clad metals.

In conclusion, an intriguing thought to most people is the idea of getting tin cans with silver linings. Research work has developed silver plating and practice to the point where metal cans may be produced commercially with a lining of silver in the order of two or three millionths of an inch. This lining is reasonably pore-free, and suitable for the packaging of foods. It is more expensive than tin-plate, but can be considered where the high cost of a quality product would absorb the increase. Heavy metal containers, carrying gallons of fluids, have been manufactured with coating of silver one-thousandth thick, and have been in service for months, with satisfactory results. Tin-lead solders have already been replaced in Canada by silver-lead for the joints on lacquered steel cans. While we in Canada have not yet had the advantages, if any, of canned beer, it made quite a flurry in the States, and a number of silver-lined cans were produced and marketed, for tests. Just to show how a substitute gets in where it was not intended, the bottle people found that if they were to line the interior of the bottle with a millionth of an inch or so of silver, that the beer was not affected by light rays, and would keep cooler longer after removal from refrigeration. So instead of being a competitor to the bottle trade, silver became an ally.

Along with gold, silver long held a special place as a "precious" metal, by contrast with the "base" metals used for everyday purposes. But now silver has shed its party clothes, and has got into overalls. Silver, and silver alloys, which have been used since prehistoric times for the production of silverware, ornaments, religious articles, etc., and as coinage or a medium of exchange, now finds itself a very necessary adjunct to a modern civilization.

The subject of alternative babbitts, in its practical and economic aspects, covers a very broad field, and many factors have to be dealt with in eliminating the tin content, or at least reducing it to an absolute minimum. Tin has been used so generally in the white metal linings which are employed for the surfaces of bearings and so much was written a few years ago regarding its suitability for this purpose that considerable effort will now have to be made to popularize substitute metals. It is hardly necessary to point out that the period when tin base babbitt bearings were in universal use were the days when bearings were not

required to carry the extreme loads met with in engineering to-day.

High tin babbitts were found to be unsatisfactory in some fields such as the development of the internal combustion engine for aircraft propulsion. The need for bearings of greater strength, particularly at high temperatures, led to the development of bearings made of copper-lead, lead-bronze, and cadmium alloys, and it would seem that a more extensive use of these would result in a considerable reduction of tin consumption. It is impossible, in such a paper as this, to give an accurate summary of world-wide, or even continent-wide experience, but mention can be made with regard to the lines of improvement which have been worked out in railway motive power with which the writer has been directly connected.

In this field we have had some rather extensive experience with arsenical lead babbitt and details are given of its application on a heavily loaded engine crankshaft bearing as well as on a locomotive crosshead. These two involve both rotary and sliding action commonly found in engines and machinery.

These applications in 1927 were not developed as a result of tin shortage but rather in an effort to remove the cause of bearing failure, or at least improve on the performance of these. A great deal of the credit for the compositions which we employ goes to Mr. Harold Roast, M.E.I.C., consulting chemist and metallurgist of Montreal. Mr. Roast has carried out valuable research on lead base babbitt with additions of antimony and arsenic, which has permitted tin consumption on the Railway to be cut to a small percentage of previous requirements.

Canadian National specifications, which cover three grades of babbitt, are shown in Table I. When this work

was undertaken the number one babbitt, which has a high tin content, was being used very generally. The number three Durite was developed first on diesel engine bearings and its use has been extended to many other applications. The most recent development is the number five Durite which is employed on the crosshead applications above mentioned.

TABLE I

Composition	No. 1	No. 3 Durite	No. 5 Durite
Copper	7.75%	0.25 to 0.50%	None
Tin	87%	1.5 to 2.5%	1.5 to 2.5%
Antimony	5.25%	18 to 19%	5 to 6%
Arsenic	None	0.75 to 1.25%	0.75 to 1.25%
Lead	None	76.75 to 79.5%	90.25 to 92.75%

New bearing metals, in which lead is a much larger constituent than formerly, have been developed and are meeting the exacting demands of modern engineering. These new alloys are mainly of three types, arsenical lead and calcium-lead base alloys containing fractional percentages of other elements and copper-lead alloys.

The first two types, which are in reality alternative babbitts, have been used by the railroads for engine truck and trailer brasses, car journals, bearings, lateral plates in engine trucks, trailer and driving boxes, crosshead gibs and other applications. Until quite recently these types were often used only where there was some special problem of temperature connected with the application. Undoubtedly their use will now be extended to many applications involving normal loads and operating conditions. These alternative babbitts are characterized by a low co-efficient of friction and since the melting point is higher, the metal is harder and stronger at running temperature than the older type, and it is able to stand up better under higher temperatures and pressures.

The other new type of bearing alloy (copper with large quantities of lead) has been used for a number of years on aircraft engines. New designs of automobile motors, placing harder service on bearings, have led to its adoption by some of the leading motor car manufacturers. This also permits higher bearing load, although they are generally employed in connection with crankshafts which are also harder, being of 250 or over Brinell hardness. This type is more of a mechanical mix of bronze and lead and may be thought of as a sponge of bronze in which the cavities are filled with lead, rather than a true alloy of these metals.

#### ARSENICAL LEAD BABBITT APPLIED TO ENGINE SHAFT HAVING HIGH VELOCITY WORK FACTOR

The advent of the high speed diesel engine for railway traction work some seventeen years ago, brought with it many new problems which required solution and one of the most troublesome, related to big end bearing failures. The most common explanation of this is, repeated flexing of the bearing metal with resulting fatigue. The first sign of failure appeared as a small crack in the lining metal and this would continue and extend until most of the babbitt in the high pressure area was loose and broken in small pieces. If this condition was not detected, the detached pieces pounded out, interfering with lubrication, causing excessive heating and final complete collapse of the bearing. Cracking never occurred in the bottom half of the bearing and the main bearings were also practically trouble free. It was realized, however, that the improvement which would correct the trouble with the heavily loaded bearing would also correct the tendency toward weakness in the other bearings. This investigation covered a period of several years and related to a complete line of engines in which the piston speeds were 15 to 18 hundred feet per minute, the rubbing speeds of the big end bearings 15 to 21 feet per second, and the connecting rod loading 2,200 to 3,200 pounds per square inch. As a consequence of the poor results obtained from the bearings in the early days, attempts were made to manufacture bearings in the railway

shops. At first these were not very successful, but the use of a special babbitt with a high lead content together with improved practice regarding its application, has resulted in bearings which operate for an average of about 100,000 miles without replacement.

Those of us who have had to deal with the application of bearings in diesel engines where the load and working conditions are severe, think at once of the proper application of the metal as an important factor, and as this brings up other points where tin could be conserved they will be dealt with briefly.

We learned of certain fundamental essentials which must be observed if a reliable bond is to be obtained between babbitt and steel or babbitt and bronze, the neglect of any of which will produce unsatisfactory results.

(a) It was found that thick layers of babbitt were not as efficient as thin layers and the thickness of 1/32 in. even on a large shaft seemed to be adequate.

(b) Although a sand-blasted metal surface may appear clean to the eye, in reality it is coated with a thin film of foreign material which must be cleaned further with chemicals before it can be tin-plated successfully.

(c) The steel or bronze surface must be absolutely clean and bright before tinning, free from any oxide or foreign matter.

(d) The tin-plated steel or bronze base metal, must at the time the babbitt is poured, be at a temperature higher than the liquefaction temperature of the tin (or tin alloy), in order to secure amalgamation of the tin with the molten babbitt.

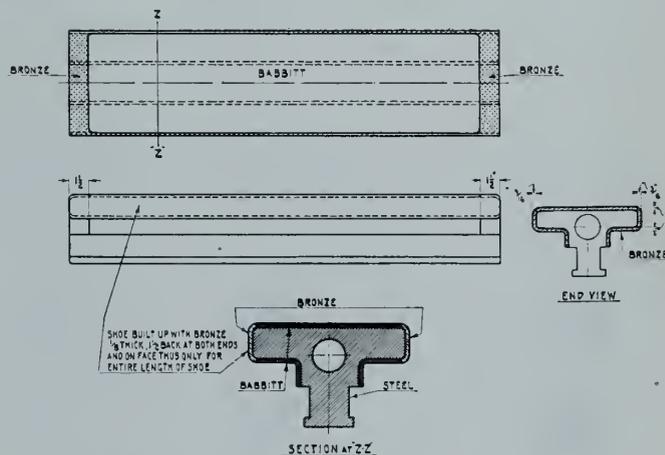

Fig. 5—Method of applying bronze in crosshead wearing face to prevent breakage at edges of arsenical-lead babbitt.

(e) The tin-plate surface must be free from any oxides at the time the babbitt is poured.

(d) A clean steel, bronze or tin-plate surface can finally be assured only by cleaning with the proper flux. The flux, to be effective, must be applied immediately prior to the succeeding operation.

(g) It is advisable to allow the shortest time interval possible between the tinning and pouring operations.

It is recognized that several of the foregoing statements are widely known fundamental precepts for securing a successful babbitting job, but the degree of skill with which they are carried out is of the most vital importance.

The effect of each of several variables involved in the various steps necessary in the pouring babbitted bearings, was studied and evaluated. By changing only one variable during each successive run its individual effect was determined, with the result that by combining or rejecting various variables, a babbitting procedure was developed which resulted in a strong bond.

It was quite evident that tin base metals would adhere

Fig. 6—Failure in high-tin base babbitt bearing.

more easily than lead base combinations. However, when the proper conditions for the application of the lead base metals were established, the bond was actually stronger than with the various tin base babbitts employed heretofore. It was always easier to get a stronger bond with bronze than with steel, and in connection with the bronze it was learned that phosphorus content was found to be unsuitable for the application of lead base babbitt and the best results were obtained with a composition as shown in Table II.

TABLE II

Element	Babbitt Per Cent	Lead-Bronze Per Cent
Copper.....	1.00	77
Lead.....	78.75	15
Tin.....	1.25	8
Antimony.....	18.00	—
Arsenic.....	1.00	—

The application of babbitt to the wearing surfaces of locomotive crossheads is important, both from the quantity of babbitting metal involved and also because of the rather abusive conditions to which this part is subjected. High

speed diesel engine bearings are examples of enclosed operation under flooded lubrication conditions, whereas the crosshead of a locomotive involves sliding action under abrasion with a certain amount of impact and uncertain lubrication.

For many years, babbitts with high tin content, similar to the first item on Table I, were used and the early experiences with arsenical lead babbitt in this application were not entirely successful. There was a feeling that the good ductility of the No. 1 babbitt was necessary. However, a careful consideration of the nature of the failures when No. 3 Durite was used, led to important changes in the crosshead shoes, and finally the development of No. 5 babbitt and improvement in the babbitting process gave the desired results. The arsenical lead babbitts are considerably harder than high tin alloys and there may be a tendency for breaking at the unsupported corners or edges, especially in applications subjected to impact. This appeared to be the case regarding locomotive crossheads and the edges and ends of the shoes were built up by depositing bronze to provide an edge to take the shock and support the babbitt. The bond was also improved as a result of the bronze and this was a factor in obtaining successful operation with No. 5 babbitt which has about 92 per cent lead.

The writer feels that the matter of slight changes in wearing parts, such as the above examples, is likely to be interesting to those contemplating the use of these alternative alloys. We can hardly expect that all applications will be entirely successful at first and it may be necessary to carefully examine the results of the early efforts to determine the improvements which will permit of a drastic reduction in the use of tin.

The wearing parts of crossheads are rebabbitted many times and the dirty and oil saturated metal of these used parts has to be dealt with. These require a more careful cleaning, the use of stronger fluxes and greater care in securing a properly tinned surface before babbitting.

The summation of our experience indicates that alternative bearing metals and alloys are available, and considerable reduction can be expected in tin consumption by extending the use of these to the large variety of bearings which do not have a particularly high velocity load factor.

In the majority of cases, it is a definite advantage to have a thin, rather than a thick, layer of bearing metal and this should result in a further conservation of tin.

Investigation into babbitting procedure, to provide a more perfect bond, will undoubtedly prolong the life of bearings and thus effect a saving in tin.

It is hoped that the review of our experiences in changing over from tin base bearings on the examples above mentioned will be of some value to others who are now faced with this problem.

## ALTERNATIVE BRONZES

G. E. TAIT

It is now well known that there is only a limited supply of tin available for Canada and that this must be conserved for applications where its use is essential to the successful prosecution of the war.

The title of this paper, "Alternative Bronzes," was selected with a purpose. To many people the word "substitute" means using something inferior and they hesitate to change from a conventional material.

It seems appropriate to quote from an editorial entitled "The Shadow of Ersatz" which appeared in "Light Alloys" for May, 1942.

"As was foreseen in Germany and Italy seven or eight years ago, no matter what the problem may be, what the machine must do or how it must do it, there is always more than one way of constructing and designing it.

"For privileged nations and privileged industries, the

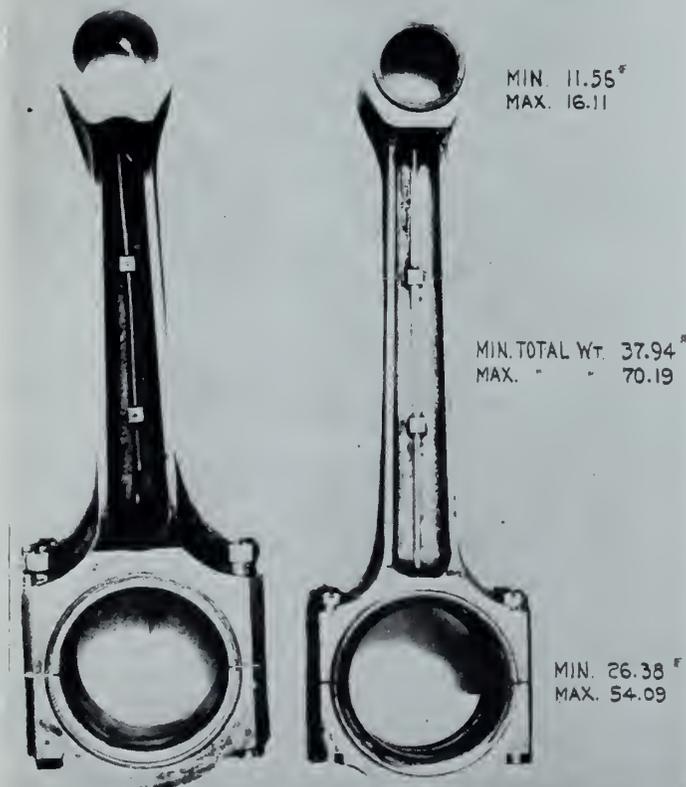

Fig. 7—Original (high-tin babbitt) and improved (arsenical-lead babbitt) design for connecting rod bearings.

easiest way lay in the choice always of the finest materials, conferring, as it were, ante-natal factors of safety proof against all minor errors of design and misapplications in use which are to be expected. But when plant is born under such conditions that its creators know from the beginning that there will be no silver spoon in its mouth, then solid hard thinking must be done.

"The designer or constructor who 'believes' that he cannot do without this or that material is, in a sense, guilty of an insidious form of sabotage. If the machine be required and a traditional material for its construction be not available, then some other composition must replace that which is lacking.

"Again, it is true that, for a number of jobs, one material and one only appears to offer any possibilities of utilization. For much work, however, tradition alone decides whether this or that shall be used. The first reaction to substitution, or, to use a better word, 'replacement,' is that the newer material is considered an understudy to that formerly used; in other words, it is somewhat inferior.

"This attitude is wrong and certainly in no wise contributes to the efficiency required for the successful waging of total war. It appears essential that for self-sufficiency to be progressive it must not be considered as a type of sublimated improvisation. Alternatively, improvisation must be given a higher social status than at present it possesses."

In the field of cast bronzes there are many applications where the use of tin can be dispensed with entirely and many more where the quantity used can be reduced. Also there are certain applications for which we have as yet found no satisfactory alternative to tin bronzes. However, as the development of the alternative bronzes proceeds, these problems are being solved.

It is not intended to go very deeply into the characteristics and properties of these alternatives as this information has been presented in some very complete papers by T. E. Kilgren ①, H. J. Roast and E. G. Jennings ②, A. E. Cartwright ③ and others.

In addition to this information the manufacturers of the alloys used as alternatives to gunmetal have available considerable data on their manufacture, properties and applications. As our knowledge of these alloys is steadily increasing, engineers can obtain up-to-date information from this source when considering suitable applications. It must always be kept in mind that the suitability of an alloy for a certain casting depends to a large extent on the design of the part and its operating conditions. It follows, therefore, that the selection of suitable alternative materials calls for close co-operation between the metallurgist and engineer, and an appreciation of all the factors involved.

Large tonnages of cast bronzes are used in ordnance and marine work, and it is the purpose of this paper to discuss the savings in tin bronzes which can be made in these fields. Many of the remarks will also apply to general engineering applications.

In these fields practically all castings were originally specified as manganese bronze or gunmetal. Manganese bronze is essentially an alloy of copper with 25 to 40 per cent zinc and small amounts, generally under 3 per cent, of iron, aluminum and manganese. The exact proportions of these elements vary widely, depending on the physical properties required and the preferences of the manufacturer. Tin is frequently added in amounts from .25 to 1.0 per cent, principally for the purpose of increasing the yield strength. The same effects can be obtained, however, by varying the other elements, and very satisfactory manganese bronzes are being made which do not contain any tin. Tin-free manganese bronzes can be used as alternatives to copper-tin bronzes under certain conditions to be discussed later.

Gunmetal, essentially an alloy of copper and tin, is made to a variety of specifications. One widely used on war work is B.S.S. 383 specifying approximately 88 per cent copper, 10 per cent tin, 2 per cent zinc, with a maximum of 0.5 per cent lead and 1.0 per cent nickel. The minimum tensile strength is 36,000 lb. p.s.i. and the elongation in 2 in. is 12 per cent.

When it became apparent that we were going to be short of tin the main question was to decide on the most satisfactory alternative for gunmetal. As a matter of fact, there are several satisfactory alternatives from which to make a selection.

While the object of this paper is to discuss those special alloys which differ considerably in some respects from gunmetal, and incidentally effect greatest savings in tin, it might be as well to briefly mention others to which it is more closely allied.

For a number of years the alloy 88 per cent copper, 8 per cent tin and 4 per cent zinc has been used in the United States. It has been applied for the same purposes as the 88-10-2 used by British manufacturers and found to be equally satisfactory for practically all purposes. It has the further advantage of being easier to manufacture.

While the 88-8-4 alloy could be applied to cases where the use of gunmetal is considered essential, it cannot be truly classed as an alternative bronze because of its high tin content.

For a great number of applications the specifications have been changed from 88-10-2 by reducing the tin and raising the limits on lead and zinc. In many cases nickel is added up to about 2 per cent to compensate for the lower tin and maintain the strength. Typical alloys being used are 79 per cent copper, 5 per cent tin, 9 per cent lead, 5 per cent zinc, 2 per cent nickel; and 85 per cent copper, 5 per cent tin, 5 per cent lead, 5 per cent zinc.

Such alloys preserve many of the characteristics of gunmetal and will give satisfactory service on many applications. The tensile strength is usually above that specified for gunmetal, 36,000 p.s.i., although actually these alloys are a little softer and will not pass the specification by such a wide margin as good gunmetal. From the foundry angle they are by far the easiest to handle of the alternative bronzes.

When surfaces are in rubbing or sliding contact, as in the case of bearings, alloys of this type offer the most satisfactory alternative to gunmetal available at present. In fact in some cases, particularly where lubrication may be inadequate, they will prove superior to gunmetal.

These alloys are made largely from secondary metal, of which the supply is limited. It is therefore desirable to use one of the tin-free bronzes wherever the characteristics of the alloy will meet the operating conditions.

The principal alternatives to gunmetal, outside of the two types mentioned above, are as follows:

1. Silicon bronze.
2. Manganese bronze.
3. Aluminum bronze.
4. Nickel bronze.

The silicon bronzes are alloys of silicon with one or more other elements in small amounts and copper. They are available in several types, distinguished by the other principal element present. While the silicon bronzes as a class can be compared with the other alloys listed, each type possesses certain characteristics of its own which may make one more suitable than another for a specific application.

Silicon bronzes are sold under a variety of trade names for reasons best known to their manufacturers. The principal types and the more widely known trade names are the following:

- a. Iron-silicon type . . . . . PMG and Cansilloy
- b. Manganese-silicon type Everdur
- c. Zinc-silicon type . . . . . Tombasil and Olympic Bronze
- d. Tin-silicon type . . . . . Hereculoy

While silicon bronzes have only recently been brought to the fore, they are not a new development. Some of the types date back to the Great War. They are being widely used in place of gunmetal, and with certain exceptions to be discussed, they are highly satisfactory.

Manganese bronze has been mentioned before. It is an old established alloy and its characteristics are generally well known.

Aluminum bronze is an alloy of copper with approximately 10 per cent aluminum. Iron is usually included in amounts up to 3 per cent. It is also an alloy which has been well known for a number of years and used successfully for numerous applications. The fact that it has not been more generally applied is due to the foundry difficulties encountered in making castings.

Nickel bronze contains approximately 88 per cent copper, 5 per cent tin, 5 per cent nickel and 2 per cent zinc. It is generally regarded as a gunmetal in which 5 per cent of the tin is replaced by 5 per cent nickel, but its characteristics and properties are considerably altered by the substitution.

In applying any of the above alloys as an alternative to gunmetal, or in fact any regular bronze, most consideration should be given to the manner in which the alloy will behave in service. As far as tensile strength, hardness and resistance to impact are concerned, all four alloys possess properties superior to those of gunmetal. Therefore in applications where strength and toughness are the principal requirements, any of them can be used. Such applications are brackets, bases, gear boxes, levers, cranks and hand-wheels.

Machinery bearings represent probably the largest single application for bronze castings, and it is in this field that some care is required when selecting an alternative material.

Gunmetal is widely used for bearings in English practice, though not as highly regarded as a bearing metal by engineers in this country. Our usual practice is to use a leaded phosphor bronze, an alloy of 80 per cent copper, 10 per cent tin and 10 per cent lead being considered one of the best. As mentioned above the best alternative bearing metals are tin bronzes with the tin content reduced to around 5 per cent. These alloys are softer than the conventional ones but will give satisfactory service for most applications.

None of the four bronzes mentioned as alternatives to gunmetal possess comparable properties as a bearing material. The nickel bronze is the closest to gunmetal, and this material as well as aluminum bronze and some of the silicon bronzes can be used for bearings under certain conditions. Suitable applications are where loads are light and adequate clearance and lubrication can be provided. Design of oil grooves should receive special attention.

Manganese bronze is not suitable for bearings.

There have been some reports of good results being obtained with an iron-silicon bronze containing 0.5 per cent lead, but the limitations of this material have not yet been published.

Bronzes used for worm gearing must possess the same general characteristics as a bearing metal, plus high strength and resistance to fatigue. While all four of the alternative bronzes give satisfactory results if the operating conditions and loads can be arranged to suit their limitations, none of them can be considered as replacing the phosphor bronzes usually used.

Mr. Chester B. Hamilton <sup>④</sup> has done considerable work on this problem during recent months and announced the

development of a couple of promising alloys for this work. One is an alloy of 90 per cent copper, 8 per cent antimony and 2 per cent nickel. The other contains 90 per cent copper, 5 per cent nickel, 3 per cent silicon and 2 per cent silver.

In marine work corrosion resistance is always a factor to be considered. The manganese, aluminum and nickel bronzes all have satisfactory resistance to sea water.

As far as the various silicon bronzes are concerned, there seems to be insufficient data available on which to base conclusions as to their performance. The U.S. Navy has used large tonnages of some of the silicon bronzes in previous years, but the specific applications and results obtained do not appear to be generally known. From the information presently available it would appear that the silicon-manganese type is one of the best for resistance to sea water corrosion.

Gunmetal has been widely used for pressure castings although it is not an ideal alloy for the purpose. Where the use of a tin bronze is necessary better results will be obtained and a saving in tin effected by the use of alloys such as 85 per cent copper, 5 per cent tin, 5 per cent lead, 5 per cent zinc; or 88 per cent copper, 4.5 per cent tin, 1.5 per cent lead, 4.5 per cent zinc, 1.5 per cent nickel.

Excellent pressure castings can be made in any of the silicon bronzes, although consideration should be given to the remarks following on foundry technique, and an alloy selected from which sound castings can be poured with the least trouble.

Manganese and aluminum bronzes make good pressure-tight castings provided that they can be obtained free from porosity and dross. Both of these alloys have a characteristic of forming large quantities of dross during the pouring. This dross gets trapped in the casting and causes leakers. For this reason these alloys are not widely used for pressure castings.

Good pressure castings can be made in the nickel bronze although some foundries have had trouble with porosity. This appears to be chiefly due to the melting practice employed, as the nickel bronze has a greater tendency to pick up gases in the furnace than some of the other bronzes. Good melting furnaces and attention to the recommended procedure for this alloy is necessary.

In selecting an alternative to gunmetal for any particular casting, the foundry technique required must be considered. The average foundryman is familiar with gunmetal, and the gates, risers, and melting technique required. The four alternatives being discussed vary widely in shrinking characteristics and drossing tendencies, and the foundry practice must be modified to suit.

The nickel bronze is the easiest to make, although the melting practice does require some attention. The International Nickel Company has developed a melting procedure for this alloy which should be followed as closely as possible. Considering the moulder's problems, gates and risers only need to be increased slightly, and the alloy has no more tendency to form dross than has gunmetal.

Manganese bronze, and to a still greater extent, aluminum bronze, both present difficulties in the foundry due to their high liquid shrinkage and tendency to form dross when the metal is agitated. Patterns to be cast in these alloys must be made with a greater allowance for contraction than on ordinary bronze. Also machining allowances should be increased by as much as 50 to 100 per cent so that dross on the surface can be machined off. Special provision will usually have to be made for the adequate feeding of heavy sections by the use of risers or chills.

As far as foundry difficulties are concerned, silicon bronzes are generally regarded as midway between gunmetal and manganese bronze, although they tend to act

more like manganese bronze. Extra precautions should be taken to trap dross and to feed heavy sections when changing from gunmetal to silicon bronze.

The melting and pouring practice should be carefully controlled on silicon bronzes, as they are rather more sensitive to variations in temperature than the ordinary alloys.

The different types of silicon bronzes have different founding characteristics. Experience with the iron-silicon, manganese-silicon and zinc-silicon types indicates that the manganese-silicon and zinc-silicon types have the least liquid shrinkage, and therefore require less provision for feeding than the iron-silicon type. The zinc-silicon type possesses the greatest fluidity and is therefore the best for thin-sectioned castings. On the other hand, the zinc-silicon alloy forms the most dross, a characteristic which may lead to trouble on complicated castings.

While the characteristics of nickel bronze, 88-5-5-2, have been discussed as an alternative to gunmetal, it has been included chiefly because it is mentioned in several specifications. From the point of view of metal conservation it is not a satisfactory alternative, in spite of being the easiest to make. This is because its manufacture requires the use of 5 per cent virgin tin and 5 per cent nickel, and we are trying to save both of these materials.

Since the tin shortage developed, there have been numerous changes in specifications made by the naval, army and air force authorities.

For certain types of equipment blanket permission has been given to use an alternative such as silicon bronze wherever gunmetal was specified. In other cases various alternatives are approved for different castings, depending on the operating conditions each will encounter in service.

For army ordnance and aircraft applications there were some specifications such as the T3-A already in effect, which permitted the use of the iron-silicon bronze as an alternative to gunmetal. In a number of individual cases, the use of an alternative material has been approved where the specifications originally called for a copper-tin bronze. Further consideration should be given towards making the use of alternative bronzes more general in this class of work, however.

Instructions have been issued by the British Admiralty Technical Mission, that on castings for naval gun mounts, no tin is to be used except with special permission. The various types of silicon bronze are being used for most applications, although in some cases, manganese bronze, malleable iron or cast steel are considered suitable.

The use of phosphor bronze is generally being continued in worm wheels and bearings. However, for some bearing applications alloys such as 85-5-5-5 have been approved.

On castings for anti-submarine apparatus permission can be obtained to use any suitable alternative, depending on the function of the particular part.

For naval vessel machinery coming within their jurisdiction the British Admiralty Technical Mission has approved the use of the red brass alloy 85-5-5-5 for valves and similar pressure castings. The same alloy and others like it may be used for bearings and similar applications. The nickel and manganese bronzes may be used for such parts as the shells of babbitt-lined bearings, and other parts

where bronze is used on account of its corrosion resisting properties or toughness. The use of silicon bronzes for these applications is also to be developed.

The Royal Canadian Navy has approved the use of three alloys for valves and similar castings. These are 89 per cent copper, 5 per cent tin, 1.5 per cent lead, 4.5 per cent zinc; the 85-5-5-5 red brass and the nickel bronze 88-5-5-2. These alloys may not be used indiscriminately, however, as maximum limits have been set on the pressures and temperatures at which they may be used.

For most unlined bearings 85-5-5-5 can be used as an alternative to gunmetal. Castings for lined bearings and other parts where mechanical strength is the main consideration may be made of one of the silicon or manganese bronzes.

With the proviso that it shall not be used for bearings, aluminum bronze may be used wherever gunmetal was formerly specified. It will usually be more practical, however, to use one of the other alloys due to the foundry difficulties in making good aluminum bronze castings.

In the cases where the use of gunmetal is considered essential on Canadian naval vessels, the 88-8-4 alloy may be used instead of 88-10-2.

For the machinery of cargo vessels a bronze containing 79 per cent copper, 5 per cent tin, 9 per cent lead, 5 per cent zinc and 2 per cent nickel is to be used for all bearings and rubbing surfaces. For the majority of other castings, manganese bronze may be used instead of gunmetal.

This list of alternatives is not intended to be complete, but merely shows the progress that has been made in arranging for the use of alternative bronzes.

It is desirable that the use of other alloys for gunmetal shall cause as little dislocation to the manufacturing processes as possible. While approval of certain alloys has been published for a number of specific applications, the manufacturers have been invited to study the equipment which they are making in the light of their own experience and facilities, and suggest suitable alternatives to the specification authorities concerned. It has been the author's experience, that while all suggestions cannot be accepted, any means of saving tin will be considered.

There is a need for further study of the problems involved in making bronze without tin. Our knowledge of the characteristics of the newer alloys is not yet complete, and there is much work to be done in the development of a tin-free alloy for parts such as bearings. The solution of this problem is not an impossibility, and will contribute much towards our war effort.

# PSYCHOLOGY AS APPLIED TO ENGINEERING

CHARLES SAMUEL MYERS, C.B.E., M.A., M.D., Sc.D., F.R.S.  
Principal of the National Institute of Industrial Psychology, England

James Forrest Lecture delivered before The Institution of Civil Engineers, London, Eng. on January 13th, 1942  
and published in the February issue of *The Journal of the Institution*.

NOTE: This address is reproduced through the courtesy of the *Journal of the Institution of Civil Engineers* and at the request of the Engineering Institute Committee on Industrial Relations, for the benefit of our members. In the words of the president of the Institution, the James Forrest Lectures are "designed to give members an opportunity of absorbing the wisdom of authorities on subjects which, although related to engineering, might perhaps be a little outside the everyday path trodden by engineers when pursuing their normal activities." The author, Dr. Myers, is the outstanding authority on industrial psychology in Great Britain.

## INTRODUCTION

The first of the annual James Forrest Lectures, established in honour of one who, throughout a period of 58 years, was successively Secretary and Honorary Secretary to this Institution, was delivered in 1893. That which I am privileged to give to-day would therefore have been the fiftieth lecture of this series, had it been continued every year without interruption. By a strange coincidence this year signalizes also the jubilee of the teaching of one of the youngest branches of natural science in Great Britain: the first systematic course of instruction in this country provided in experimental psychology was given likewise in 1893, by the late Dr. W. H. R. Rivers at Cambridge. Of course, the study of the human mind dates from much earlier times, but it was then seldom undertaken in an experimental manner. Contemporary knowledge of psychology had also long before been applied—but again not by scientifically controlled methods—to relevant problems in the fields of medicine, education, and aesthetics.

## AESTHETICS AND ENGINEERING

To aesthetics, in its psychological relations to engineering, I first turn, partly because the Institution of Civil Engineers has of late shown a special interest in this subject, realizing more fully than before that it is a function of the engineer to provide the community with objects which are not merely useful and efficient, but are also, as far as possible, beautiful in appearance and in harmony with their surroundings. I have given this subject first place in my Lecture also because the psychologist has long been engaged in endeavouring to ascertain—it must be admitted with far from complete success—the nature of beauty and the conditions, both mental and environmental, under which our individual experiences of beauty occur.

The psychologist has come to recognize the unique, specific nature of beauty, and, at the same time, its several varieties and the vastly different kinds of "objects" that may evoke it, these "objects" ranging from a warm bath, a glass of vintage port, a surface of uniform colour, an expert's bodily movements, a moral act or state (for example, of heroism, forgiveness, love, or gratitude), a mathematical solution, a scientific experiment, a bridge, engine or machine—ranging from all these to a picture, statue, building, symphony, opera, ballet, piece of prose, poem, or drama. Every one of them may, under certain conditions, be experienced as beautiful, endowed with sensual, perceptual, intellectual, or moral beauty according to the nature of the "object."

What is merely agreeable or pleasing is, of course, not necessarily beautiful: indeed probably by large numbers of people beauty is but rarely—at all events intensely—experienced. They often confuse beauty with other, humbler, experiences such as prettiness; or they may apply to an object the term "beautiful" not because it does, but because it might, arouse the feeling of beauty, just as a

given situation is often termed "interesting" without at the moment actually exciting interest. And what appears to us as constructed with amazing simplicity or technical perfection, or as frankly and clearly expressing the function for the performance of which it has been designed—this also is not necessarily beautiful. Our experience of beauty seems to depend rather upon the presence in us of a specific "aesthetic" mental "set" or "attitude," of the nature and conditions of development of which we know as yet little. We can, however, at once recognize one psychological result of that attitude, namely, our projection of the feeling of beauty into the external object that has evoked it, so that the beauty seems to us to reside in that object and not, as it really resides, in ourselves in consequence of our internal mental activity. Herein beauty differs from most other feelings; for example, we do not regard our emotions of fear or anger as resident in the external object or situation that provokes them.

It is true that we may enumerate in the physical world certain aesthetic "principles," for example, of formal proportion, balance, rhythm, harmony, symmetry, contrast, and unity—even mathematically describable relations—which experience shows to be favourable for the arousal of perceptual beauty. In a certain sense, therefore, but with little regard for strict accuracy, the perceived object may be said to carry to the percipient potentially a "message" of beauty. In some respects these aesthetic principles resemble the metrical and other classical rules of poetical composition: they may all be obeyed and yet the object may fail to evoke beauty, partly because obedience to rules may be aesthetically insufficient or even unnecessary, and partly because the percipient lacks that peculiar aesthetic set or attitude in which alone the actual experience of beauty is possible. Beauty, therefore, cannot be assured by specified external devices: indeed—alike in creation and in appreciation—it may come to us unsought through unpremediated mental activity.

Adopting this aesthetic attitude, we frequently also project, besides beauty, other of our experiences into the "object." We come to endow it with other human qualities and characters, to "personalize" it and to regard it as something existing, as it were, for itself alone—that is to say, as an independent, self-active "subject," rather than as an inanimate "object" of practical worth. Thus we may ascribe to it the human traits of dignity, sincerity, joviality, daintiness, etc. (or the reverse). In this sense it has been said<sup>1</sup> that we "distance" the art-object. And having thus "distanced" it, we proceed, to a varying extent, to become aesthetically "absorbed" in it, to steep ourselves in it—it may be to lose ourselves so completely as to fall into a state bordering on ecstasy.

These acts of "distancing" and subsequent "absorption" are only perfectible when all notions of the serviceableness of the object to us are banished. The sense of beauty, for example, felt for the fair body of a nude woman tends to disappear as soon as sexual desires are roused. So, too, we come to regard the architect as a craftsman rather than as an artist, when the use and purpose of his building for our own ends obtrude themselves too strongly. On the other hand, when we "personalize" the art-object; when we treat it as an independent "subject" endowed with human characters; when, for example, we think how gracefully, majestically, or easily an engineering product fulfills its

<sup>1</sup>Edward Bullough, "Psychical Distance' as a Factor in Art and an Aesthetic Principle," *Brit. J. of Psychol.*, vol. v, pp. 87-118 (1912).

own life-like functions; such thoughts may well conduce to the experience of beauty—as indeed, conversely, will the realization of its unfitness impede the experience of beauty. Their help is clearly illustrated in the beauty that can readily be evoked in us by the modern locomotive, the modern aeroplane, or the modern motor-car, especially when contrasted with their earlier and more clumsy forms. In the evolution of the present designs of these objects, generations of engineers have, usually at least, had no aesthetic interests. They have merely employed with increasing success the most efficient material that they have available, in fitter, neater, and more economic ways, gradually eliminating needless excrescences and obtaining the maximum of power and function with apparently the minimum of effort, whilst at the same time unwittingly improving the form of their structure as they “feel” more intimately and with greater knowledge—even “feel themselves into”—the properties, possibilities, and demands of their everchanging medium which, in so far as such self-subjection occurs, becomes, in a sense, their master.

If, as I have urged, the scientific or practical and the aesthetic attitudes are simultaneously inimical to one another, the engineer may escape from this difficulty by designing a structure initially from the engineering aspect, and then submit his design to the architect, asking him—or he may himself consider sooner or later—what changes in form are desirable in order to make it at least more agreeable to the eye. But the dangers of such patchy, last-minute “tinkering” are avoidable if the architect and the engineer are in close, uninterrupted partnership from the start, or if the engineer has some aesthetic “talent,” or often merely a knowledge of aesthetic principles and some experience of their use. Then, by repeated oscillations between the two attitudes, he will receive some aesthetic guidance throughout the development of his original design. More or less intuitively, but also in part deliberately, he will far better succeed in producing a structure that is both efficient and, at least, not unsightly: he may indeed produce one that appears even beautiful to himself and others.

Alike in the creation and in the appreciation of the beautiful, the development of the aesthetic attitude depends partly also upon other and deeper unconscious mental activities of which at present we have far from complete knowledge. These play a specially important role in the creation of the beautiful. Ordinarily it results, as I have just said, from the more or less intuitive or deliberate use of aesthetic *talent*. But artistic creation arises also as an unexpected uprush of aesthetic *genius* from the unconscious—a sudden “inspiration,” as we call it. If the engineer is endowed with this creative genius of the true artist, he will have long ruminated consciously upon the scientific conditions and practical needs that have to be satisfied in his intended structure; and then, after a period of “incubation,” he will suddenly receive an inspiration of beauty that reveals the form which his design should take. Like other artists, he will thereupon set himself skilfully to express his inspiration, paying due regard to the properties and limitations of his “material” and to practical needs of other kinds. These, of course, differ widely in kind and complexity for the engineer from their significance for the painter, sculptor, poet, or musician.

Although they are simultaneously inimical to one another, we may oscillate, as I have indicated, between the scientific or practical attitude, on the one hand, and that of aesthetic appreciation, on the other. Therefore their incompatibility does not justify us in regarding the aims of engineering and aesthetics as belonging to two distinct vocations. For better or for worse in its long history, artistic production has usually had to serve two masters, the artist who is “out” for self-expression and for “art for art’s sake,” and the receptive society in which he lives. There are many well-known instances where the artist’s products have been unintelligible to his own generation, hide-bound by social culture, tradition, and convention; and their beauty, there-

fore, has not been appreciated until later. But in other ways the artist has always been called on to render social service. In prehistoric times the marvellously beautiful cave-paintings of animals were in all probability designed with the magical purpose of obtaining food. In mediaeval times artistic creation often served, under Church patronage, a religious purpose. At the present day social needs demand the co-operation of artistic and engineering ability. In their abstract forms, the conflict between art and science must be eternal. Just as the pure scientist carries out his laboratory research regardless of its social value, so the pure artist will work solely for his “selfish” expression. But in the more applied, social, forms of art and science, a compromise must be somehow effected without too serious loss to either.

It is true that a knowledge of the principles of aesthetics will not make the engineer an artist unless he be endowed with aesthetic creative ability—with aesthetic “genius” or merely “talent”; but neither will a knowledge of pure and applied physical science suffice to make him an engineer unless he have innate engineering ability—of which I shall have something to say later. The engineer cannot therefore regard aesthetics as something quite foreign to his own profession. For its welfare and ethical development humanity demands from him more than his merely mechanical utilization of the pure and applied physical sciences. This alone is no longer adequate for the satisfaction and contentment of the community—any more than the community is satisfied to-day with the old notion that the function of a successful business concern is merely to provide a fortune for its owners and a living for its employees. It may not always be easy to make, say, a gas-holder or a petrol-pump beautiful; but every product of the engineer can be so designed that at least it presents not an unpleasing appearance in itself, and one that will harmonize agreeably with the environment in which it is to be set up.

#### THE MACHINE AND ITS OPERATIVE

From the psychology of aesthetics I pass to a problem which concerns the youngest branch of applied psychology, known as industrial (or, more accurately, as occupational) psychology, in its relation to engineering. However efficient from the mechanical standpoint, machines and implements designed for industrial use may nevertheless be unsatisfactory from the standpoint of the physical health and fatigue of the operatives and of the ease and comfort of their work. Curiously enough, this defect is less common in machines devised for the use of the general public or the highly skilled expert, for example, the motor-car, the aeroplane, and, I am informed, engineering machine-tools, with the use of which the designer is himself familiar. The engineer needs, however, to pay more consideration to the “human factor” in his design of machines for the factory, where the operatives, very often women, are semi-skilled or virtually unskilled—especially in the case of machines used in the textile industry, boot-and-shoe manufacture, box-making, tobacco-cutting, laundry work, etc.

One of the commonest defects here encountered is the unsatisfactory position or action of the pedal, the operative being forced to sit in a contorted posture to use it, or the pedal descending with rapid acceleration to a sudden stop which sends a harmful jar, with each such stoppage, through the limb and body of the operative. Another equally common defect is the wrong position of controlling levers of the machine, which may be placed needlessly distant, thus involving a fatiguing stretch of the operative’s arm in order to reach them. Often, too, the appropriate height of the working-level is neglected: the feeding-end of the machine may be too high for the comfort and efficiency of the operative, necessitating the use of steps; or the delivery-end may be too low, causing needless stooping. Again, the engineer may fail to consider in his design the height to which heavy raw material will have needlessly to be lifted

on to the machine by the operative, or the equally avoidable noise and vibration to which he will be subject.<sup>1</sup> Psycho-physiological considerations of this kind may clearly call for closer collaboration between the engineer-designer and the industrial psychologist.

#### THE PHYSICAL ENVIRONMENT OF THE OPERATIVE

There is not infrequently need also for such collaboration in problems that confront illuminating, heating, and ventilating engineers. For here again various factors of a psycho-physiological nature affect the success of their work. Satisfactory illumination, for example, depends not merely upon physical candle-power or lumen-output, but also upon appropriate spacing of the lamps in relation to the position of the operative, upon the absence of glare, glitter, contrast, and shadows, upon adaptation, etc.

#### ENGINEERING AND MANAGEMENT

It is not surprising if, until quite recently, the engineer has tended to neglect the "human" aspects of his work. Not so many years ago in this country, the professional engineer was interested mainly in his own ideas, in formulas and diagrams, and in invention and design, concerned with lifeless material and mechanisms. Save in relations with his client, when, of course, clear disinterested exposition, persuasive powers, and regard for the latter's interests are of prime importance, the "human factor"—the thoughts, feelings, and actions of his fellow-beings—relatively seldom occupied his attention. Through environment and habit, and doubtless by inherited inclination, his mental "type" must have approximated to what is now (rather loosely) called "introvert" by the psychologist. The introvert is one ego-centrally "wrapped up" in his own fantasies and ideas, averse from making social contacts, self-critical, easily taking offence, and giving little immediate and outward expression to his feelings. By means of questionnaires, rating-scales, and even tests, psychologists have made frequent attempts to evaluate quantitatively the degrees and directions of introversion—or of its antithesis, extraversion—which different persons may exhibit. And some have aimed at thus giving objective proofs that certain occupational groups, especially engineers and scholars, are more introvert, less extravert, than other occupational groups, notably actors and salesmen. Accepting this distinction, one American psychologist, Dr. W. V. Bingham, has accounted for it on the ground that an "early introversion of personality leads to the development, *through disproportionate exercise*, of one's native interest in mechanism or ideas, at the expense of interest and proficiency in social contacts."<sup>2</sup> But a converse influence is also possible: introversion, or extraversion, may conceivably be, if not initiated, certainly fostered by an individual's innate occupational interests, with their different "drives" and talents. Or again, each may be fundamentally the effect of some common, hereditary, cause.

However this may be, the scope of the engineering profession is unquestionably far wider to-day than it has ever been before. And probably it demands, attracts, and turns out now men of more widely varying personality than formerly. Large numbers of engineers, especially in the United States, are now concerned with salesmanship, a subject to which psychologists have devoted considerable and valuable attention. Moreover, not only the engineering apprentice, but also the engineering undergraduate, tends in later years more and more frequently now to come into touch with administrative or managerial problems under

<sup>1</sup>Fuller details are to be found in Report No. 36 of the Industrial Fatigue Research Board, "On the Design of Machinery in relation to the Operator," by L. A. Legros and H. C. Weston; and in a Paper by G. H. Miles and A. Angles, "Psychology and Machine Design," Journal of the National Institute of Industrial Psychology, vol. iii, pp. 159-61 (1926).

<sup>2</sup>"Personality and Vocation," *Brit. J. of Psychol.*, vol. xvi, pp. 354-62 (1926).

State or Municipal employment or in public utility or private engineering works; here, it has been variously estimated, the chief engineer spends one-half or even more of his time in the human problems and details of Board and Committee meetings and of administration and management. And some of the various daughter-institutions of this Institution, in their respective examinations for Associate Membership (or Graduateship), now include papers in the fundamentals of industrial administration and/or in engineering organization and management<sup>1</sup>. In the syllabuses of these examinations the "human factor" is definitely mentioned<sup>2</sup>. A large proportion of engineer apprentices taking them already hold the Higher National Certificate in mechanical or electrical engineering; and evidence, of satisfactory attendance at these courses in administration, organization, and management can be endorsed on this Certificate. Courses in these subjects are to-day provided by the majority of the Technical Colleges in Great Britain, the Manchester College of Technology having been the first in this country to establish a department of industrial administration (in 1918), and carrying out post-graduate research in the application of the subject to engineering works. Some Colleges also offer one or two years' training in industrial administration to engineers and others who have been already engaged by an employer and are sent there by him for special instruction in business management.

I have read that a wall in the library of the vast building of the American National Engineering Societies bears the following legend:—"Engineering—the art of organizing and directing men and of controlling the forces and materials of nature for the benefit of the human race." In Germany, we were told as far back as 1929 "the teaching of management-subjects *under engineering auspices* is making rapid headway on every hand. Problems of industrial personnel are being approached through scientific research in psycho-technical institutes in the Technical Universities and with *an intimate union of engineering and psychology*, rather than as a personal art to be expounded by practical executives" (p. 231). "*Researches on such problems* are considered as properly belonging to the *Technical Universities* and requiring" the collaboration of engineers and psychologists (p. 259)<sup>3</sup>. In Great Britain, however, administration and management still seldom enter into the curricula of University engineering courses, and, as I shall show, little attempt has been so far made to bring engineering and psychology into relations with one another.

#### INDUSTRIAL PSYCHOLOGY AND SCIENTIFIC MANAGEMENT

The United States was the earliest country to realize the importance of managerial problems for the modern engineer. It was first stressed in that country by the late Dr. Frederick W. Taylor, an engineer of consummate genius, but signally devoid of tact, and by many others who have since endeavoured further to develop what Taylor called "scientific management" and are themselves now, especially in America, termed "industrial" or "efficiency" engineers. These "scientific managers" did some very useful pioneer work on the subject; but almost invariably they failed to pay sufficient regard to the *human* aspects of the problems which they attacked. They tended, from their engineering training and outlook, to regard the operative as a mere

<sup>1</sup>I gratefully acknowledge the ready help and useful information which I have here received from the secretaries of the Institutions of Civil, Mechanical, Electrical, and Production Engineers.

<sup>2</sup>In the syllabus prepared by the Institution of Production Engineers, this term occurs only in the preamble:—"The Council of the Institution feel that although one of the major problems of Production Engineering is that of the human factor... too little attention has been given to this important subject in the Curricula (*sic*) of Technical Schools. In certain Papers, therefore, some questions will be framed....."

<sup>3</sup>"The Investigation of Engineering Education." Bulletin No. 16 of the American Society for the Promotion of Engineering Education. The italics in this paragraph are mine.

machine whose efficient working was to be won through material considerations. They set about to discover what work the operative had to do and the one best and speediest way of doing it, treating him almost as if he were a "robot" mechanism, capable, as it were, of revolving at a uniform speed, in a uniform manner, throughout the hours of his working spell. Consequent on their researches in movement- (or motion-) study, they established "rigid rules for every motion," and they forced each operative into what they termed "the *one* best way of work," regardless of individual human differences that demand differences in the style of expert skill; he was thus allowed no freedom in carrying out the details of his operations. The industrial unrest and strikes produced by these and other unpsychological procedures are now well known; they persisted until, as an experienced American engineer has recently pointed out, "Management... finding that their introduction was always the signal for labour troubles, finally recognized that the problem was, in its essence, psychological<sup>1</sup>."

#### PSYCHOLOGY AND INCENTIVES

Such ignorance, or neglect, of psychological factors on the part of the "efficiency engineer" is again well illustrated in his attitude towards "incentives." Alike in America, in Great Britain, and elsewhere, the term came to be regarded—and indeed is still generally regarded—as equivalent to financial reward. Perhaps this arose from the adoption of the false psychology of the early economist—that in his business life man is actuated solely by the desire for monetary gain. In any case, financial reward, like movement-study, offered a subject readily amenable to measurement. And so, in the early days of "scientific management," Taylor and most of his successors busied themselves in devising many different and rival methods of payment, including "straight" and "differential" piece-rates, bonus and premium systems, "individual" and "group" piece-rate and bonus schemes, etc.

The fixation of the piece-rate, bonus, or premium depends largely upon the amount of pay that the operative may be expected to earn, and the latter involves time-study of the output that may be expected of him—again a subject easily amenable, it seemed, to exact measurement. But in reality the scientific methods of such time-study are only apparent. For after analysing the operative's movements and timing them to a small fraction of a second, the rate-setter has to add "allowances," as he calls them, for delays such as must inevitably arise owing to waiting for raw material or for inspection of the finished product, or because of occasional breakdowns of machinery or of rest-pauses voluntarily taken to dissipate fatigue, etc. But the size of these allowances can only be very roughly guessed at.

Few will deny the necessity and importance of financial incentives. But the psychologist has conclusively shown the complex causes of the demand for them and their uncertain effects. He has shown, too, that financial incentives are a dangerous, and not the most important, form of incentive. They tend, when solely stressed, to develop an atmosphere, inimical to good and loyal service, in which the employee is "out for himself," trying (as he imagines his employer also to be trying) to grab as much money from the business as he can—to *get* as much, and to *give* as little, as he can. Besides financial incentives, praise and interest in, and knowledge about, the work are at least of equal importance, and of psychologically greater value. These are all, however, in great part, "selfish" incentives. The psychologist has established the importance and effectiveness of "social" incentives. The operative is not to be regarded as a "lone hand" in his daily work, but as a member of an industrial group of fellow-workers which has its own psychological characteristics and its own codes of conduct profoundly affecting their every-day thought and act. As a member of

his group, the operative demands security of employment, congenial colleagues, and, above all, sympathetic treatment both by his immediate overseers and by administration and management generally. These comprise, perhaps, the most powerful incentives to efficient work.

Two further incentives are psychologically noteworthy—the willingness of managers to consider and to reward suggestions from the operative that make for more efficient and happier work, and their willingness to inquire into and to consider grievances, often unknown to them—some due to misunderstanding or rumour, but many well-justified and rectifiable. The industrial psychologist finds that the worker is influenced not so much by the actual satisfaction of his grievances as by the evinced willingness of management to investigate them. What the worker resents is indifference to the human and social outcome of mechanically planned administrative policy.

#### PSYCHO-NEUROSES AND OCCUPATIONAL LIFE

Such indifference cannot fail to produce general industrial unrest, due to mental worry, irritation, conflict, and maladjustment, which, if sufficiently severe, results individually in a condition of psycho-neurosis. There is no sharp line dividing the normal from the pathological features of these consequences. For successful management a broad acquaintance with this branch of medical psychology is essential.

#### PSYCHOLOGY AND TIME-STUDY

Yet another illustration may be helpful of the contrast which I have, doubtless in too crude colours, been depicting between the "mechanistic" and the "humanistic" approaches to problems of industrial management. Whereas the industrial engineer employs time-study primarily for the purpose of rate-fixing and for the discovery of the "one best way" of the operative's movements, the industrial psychologist has seen the value of time-study when used for other purposes which do not in the same way cast on the operative any suspicion or aspersion of idleness or involve any attempt to cajole or press him to increase his output.

Time-study has proved invaluable to the psychologist in enabling him to obtain continuous records of output throughout the working spell—"work curves," as he calls them—which reveal to him the presence of boredom, fatigue, or other undesirable features. It is also used by him to estimate the amount of the worker's "unproductive time," so that he may study its causes. And it is used by him to detect bad methods of performing some particular part of the novice's work during his training. In each of these uses the industrial psychologist will repeat his time-study after he has introduced changes, so as to obtain definite objective evidence of the improvements which he may have effected.

By the psychologist time-study is not regarded as an *essential* accompaniment of movement-study. The latter he may be quite content to base merely upon the general principles of good movements already known to him. For him the ultimate purpose of movement-study is rather to train and instruct the novice so that he may avoid the adoption of bad habits of movement, than to force all workers into a single common mould of movement, regardless of their individual mental and physical differences.

#### PSYCHOLOGY AND INDIVIDUAL DIFFERENCES

In every direction the distinctive aim of applied psychology is to study and to take into practical consideration, so far as is possible, individual differences among the operatives. It is, for example, now known that some persons are exceedingly prone to accidents; in one case 50 per cent of a large group of motor-drivers were found to be responsible for more than 80 per cent of the occurring accidents. Accident-prone workers should obviously be removed to less dangerous situations where the risk of injury is less not only to themselves but often also to their fellow-creatures. Or, more effectively, selection tests will be introduced so as to avoid the future engagement of the accident-

<sup>1</sup>Prof. Albert Watson, "The New Techniques in Supervisors and Foremen." London: McGraw-Hill Publishing Co., Ltd., 1940, p. 104.

prone: in one case in the course of 10 years this procedure is said to have reduced the average number of accidents per operative from 1.53 to 0.27 per annum.

We now know, too, that different operatives achieve their best quality and quantity of output under different rates of machine-speed; consequently, the speed of each machine should be variable, so that it may be set to conform to the optimal working conditions of the particular operative who controls it. The irrefutable standpoint of industrial psychology is that the machine is made for the operative, not vice versa.

The psychologist has come to adopt a corresponding standpoint in regard to production-planning: in every case the plan must be fitted as far as possible to those who will have to operate it, not vice versa. Each works, therefore, needs to be studied, as a sick patient is studied, at close quarters, not from the distant, hypothetical, arm-chair. Fixed rules of planning, however useful as affording a theoretical basis, are to be avoided in actual practice, if a maximum smoothness is to be attained in the flow of work. The rigid, quasi-military regime—a standardized type of organization applicable to every individual works of the same class—so dear to the “efficiency engineer,” must be leavened by a large measure of flexibility that will allow for the particular personnel who will be required to follow it, for future variations in quantity and kind of product, for periods of rush and slackness, etc.

#### VOCATIONAL GUIDANCE AND SELECTION

But the most important study of individual differences in occupational life relates to vocational guidance and to vocational selection. The former helps the young person to choose the career for which he is best fitted; the latter helps the employer (or other person) to choose the best applicants for available vacancies. Despite the vast wastage of time and effort and the disappointment caused by the present methods of admitting lads to the engineering profession or industry who later utterly fail to succeed therein, vocational psychology—never so important as at the present day—has not hitherto received great encouragement from the engineer. This is partly due to his natural misunderstanding of its methods. Engineers have commonly regarded psychological tests as they regard many of their own physical instruments of measurement—as only needing a mechanical routine application to provide them with accurate data. They have not taken into consideration the insistent claims of the psychologist that his tests can yield only a part of the information that is required for satisfactory guidance or selection; that the actual score at a test may be of less value than observation of the way in which it is performed; and that the assessment of qualities of character and temperament is fully as important as, if not more important than, the assessment of mental abilities. Up to now no satisfactory tests have been devised for the assessment of such traits of personality. This can be done only by observing the conduct of the applicant while performing the tests, and especially by the interviewer with the help of information received by him from others. The psychologist has, however, undoubtedly improved the interview by making its conduct more systematic and less liable to be influenced by accidental circumstances.

I cannot, of course, enter here in any detail into a description of, and into the principles underlying, the tests which have been devised for guidance and selection in regard to occupational work. But the following brief remarks with special reference to engineering are perhaps worth making. It is widely recognized now that in very varying degrees a single “general” factor of intelligence is involved in all forms of purposeful activity; and that there are also a considerable number of “group” factors, each of which is common to a particular group of activities, and of “special” factors, each of which is peculiar to a single, simple, form of activity. There is undoubtedly a group factor underlying “mechanical” and certain other abilities, which concerns

the readiness to perceive the sizes, shapes, and spatial relations of objects. With this “spatial” factor certain tests that have been devised prove by mathematical analysis to be highly saturated. In the daily work of the engineer this factor is involved in his translation of two-dimensional diagrams into three-dimensional objects, and vice versa (as in the reading and making of drawings), in the pattern-maker's and moulder's ability to imagine the “inverse” of a pattern or object, etc. There is reason to believe that it is also involved in the engineer's “machine sense,” as shown in his ability to realize how a machine works—how its parts fit together, how, if one of the parts is set in motion, another part will move, etc. Tests have also been devised to assess manual dexterity, hand-and-eye co-ordination, and the different abilities required in the different engineering trades; but research is still needed to establish their value more precisely. Little has yet been done to devise tests of creative imagination that are likely to have engineering value.

In one large British engineering works during the past 3 years, the present apprentice supervisor, Mr. Frank Holliday, has been taking an exceptionally active interest in the most recent developments and applications of psychological methods which are likely to be of value in the selection of his company's engineer- and trade-apprentices. He has been employing a group test<sup>1</sup> devised several years ago by Prof. Cyril Burt for the National Institute of Industrial Psychology in order to assess “general intelligence,” and also a battery of several group tests devised by later members of its research staff to assess what is broadly termed “mechanical ability.” In the course of three articles published by Mr. Holliday in *Occupational Psychology* (vols. xiv-xvi, 1940-42), he gives the following results:—Agreement between (i) the gradings based on the candidates' scores at the battery of tests, and (ii) the gradings made about fifteen months later by the Apprentice Supervisor (at that time not Mr. Holliday) occurs five times as frequently as disagreement. But when observations, made during the testing and the subsequent interview, on the candidates' methods of procedure in performing the tests, and on their traits of personality, are taken into account, “the agreement becomes of the order of 95 per cent.” (p. 176).

Results almost identical with these were obtained in an investigation carried out during the previous decade by Miss E. P. Allen and Mr. Percival Smith, on behalf of the Birmingham Education Committee in a junior day Technical School and at the Central Technical College of that city. In these two institutions agreement in 74 and 80 per cent respectively of the 108 pupils tested was found between the scores at the tests<sup>2</sup> and the instructors' independent grading of their pupils in respect of “apprentice ability”; and these figures were raised to 92 and 93 per cent respectively when allowance was made for unsatisfactory temperamental traits observed at the interview or later, such as impulsiveness, unreliability, or the lack of self-confidence, perseverance, initiative, ingenuity, or co-operativeness, which the mere scores at the tests could not indicate. These tests have now been introduced as a routine measure in the selection of boys for entry into the junior Technical Schools of Birmingham. Many boys have been since followed up in their subsequent engineering (or non-engineering) careers and very satisfactory results have been obtained.

For example, in a follow-up, over 2½ years, of 157 boys after leaving a junior Technical School, both the boys and their employers were asked independently and confidentially to report on the suitability of the former for their jobs

<sup>1</sup>A “group test” is applicable to several persons simultaneously; an “individual test” is applied to only one person at a time.

<sup>2</sup>The battery used consisted of seven tests devised by the National Institute of Industrial Psychology. If not less than five of these agreed with the instructors' ranking, the divergence of the other test or two tests was ignored. Since this battery was constructed, some of the component tests have been replaced by others which later research has shown to be of greater predictive value.

under one of three grades—"very satisfactory," "satisfactory," and "unsatisfactory." Of the boys (69 per cent) found to have entered *engineering* (and allied) trades, whose suitability was reported on as "very satisfactory" both by their employers and by the boys themselves, 81 per cent, while at the junior Technical School, had obtained scores in the upper half, and only 19 per cent in the lower half of the scores made at the test battery. On the other hand, of the boys (31 per cent) found to have entered *non-engineering* jobs (clerical, chemical, woodwork, selling, etc.), whose suitability was also reported both by employers and boys as "very satisfactory," only 30 per cent had obtained scores in the upper half, and 70 per cent in the lower half, of the scores made at the test battery. Neither the scores at the intelligence test, nor jobs at which a boy stayed for less than six months, were included in these striking results.<sup>1</sup>

Mr. Holliday's investigations have proved unquestionably (a) the importance of the intelligence test in predicting success in engineering mathematics and in the more theoretical aspects of engineering, and (b) the equal importance of good scores at his battery of tests for success in engineering drawing and in practical work in the shops. After at least a year's knowledge of thirty engineer-apprentices, the apprentice supervisor (then not Mr. Holliday) graded them according to a five-point scale of "excellent," "good," "average," "fair," and "poor." Their scores at the battery of tests, which had been applied earlier by Mr. Holliday, were similarly graded, and this grading was compared with the apprentice supervisor's independent grading. In only six of the thirty cases was there more than one grade-point of difference. A similar comparison, made among forty-one trade apprentices, showed a corresponding difference in only five cases. For these few divergencies, no doubt temperamental unsuitability for engineering, not measured by the test scores, was largely responsible.

Mr. Holliday further concludes that a low score on the battery of tests indicates probable unsuitability for engineering, and that this prediction becomes more certain if the candidate obtains a relatively high score at the intelligence test. On the other hand, if the candidate is to succeed in his theoretical and examination work, his intelligence score must not be too low. A lad with a high score at the test battery and with a very low score at the intelligence test may, however, be excellent in his shop-work—even at such a skilled trade as tool-making.

As supplementary evidence of the promising value of vocational tests for engineering, I will only cite a statement which I have received from the chairman of another well-known engineering company—that psychological testing has proved highly useful both in revealing at the outset pupils of exceptional promise who merit special training, and in drawing deserved attention to cases of disparity between test-scores and the reports received from the school and workshop. These tests, he has also said, "give us within an hour a measure of the boy's suitability which it would take from three to six months to obtain in the works under the control of a foreman." I hope that I have said enough to indicate the remarkable progress recently made in Great Britain towards perfecting psychological methods of engineering guidance and selection. Much, of course, remains to be done. Their future progress, like that of new surgical operations, depends largely upon their actual use: "practice makes perfect."

#### PSYCHOLOGY AND TRAINING

The conclusions which have been reached from investigations conducted in industrial training from the psychological standpoint can hardly be without interest to the engineer. The industrial psychologist's recommendation is that the tasks of workshop training and of production should be

<sup>1</sup>Cf. the three Reports of Research on "The Selection of Skilled Apprentices for the Engineering Trades," published by the City of Birmingham Education Committee, 1931, 1934, and 1939.

isolated, so far as possible, from one another. However unselfish the expert industrial operative may be, his need to maintain his normal output must inevitably reduce his opportunities for giving instruction. Not uncommonly he is found to yield to the temptation of using the novice for his own ends—to aid him in the simpler operations concerned with his own output, instead of training him as he might. Moreover, the experienced operative does not necessarily make a good teacher: sometimes he is innately unfitted to teach, and sometimes he has himself acquired bad habits of work. Investigation has also shown that he may not know the precise movements that he employs, and that, when he performs movements at a lower speed for demonstration purposes, they are often different from those employed by him at his normal rate of movement. The novice is apt to be distracted from learning by the noise and bustle of the shops. Unless unusually intelligent, he may fail to observe and to imitate correctly his instructor's movements. He may become bored because he is too often idle, waiting for the words of explanation that fall too rarely from his instructor's lips.

For all these reasons, the industrial psychologist advises that a specially selected teacher be appointed, qualified by his temperament, intelligence, and skill to give instruction, and that a suitable environment should be chosen for a "school," apart from that of normal production. He regards it as essential that a systematic course of instruction should be planned, comprising two sections: (a) technical knowledge and (b) actual performance of the work. A standardized method of performing the work can easily be devised with the initial help of expert assistance. Complicated time-studies and apparatus are usually unnecessary. The general principles that have guided this standardization of performance must be explained to the novice; laboratory experiments in training in assembly work have shown that if skill is acquired merely by routine practice, it is not transferable to other operations, whereas such transfer occurs when the novice has grasped the reasons for the methods in which he has been instructed.<sup>1</sup>

#### A CONCLUDING PROBLEM

I have tried to make it clear that there is ample room, indeed rather a crying need, for closer co-operation in the future between the engineer and the psychologist. This raises the question whether, how far, and if so, at what stage, the engineer should receive instruction in the principles of aesthetics and in those of industrial psychology. There are some who take the line that, in our Universities at least, the programme of teaching the engineering student is already so overloaded, and his ability to absorb knowledge has so nearly reached its upper limit, that, if any additions to the programme or other changes in it are made, they will be at the cost of sacrificing his opportunities for acquiring, during his undergraduate years, a sound grasp of the physical principles of his subject. Adherents to this school of thought have also urged that at so early a stage of his educational career the engineering student is not mature enough to appreciate instruction in the broad principles of aesthetics and industrial psychology, when he has had but scant experience in designing and is little familiar with workshop conditions. Such subjects, they urge, should find their place in "refresher" courses and be taught considerably later—in post-graduate life.

In contrast to this "stern physical drill" school of thought stands a school demanding from the Universities a far more "liberal culture." Its adherents urge that, especially at the Universities, every vocational education should be broadened, so far as possible, to become (as in every instance it can become) also of general culture value. They ask whether it is wise that, after obtaining his school-leaving certificate, say, at the age of fifteen, the future professional engineer (or indeed any future scientist) should officially receive

<sup>1</sup>Cf. J. W. Cox, "Manual Skill." Cambridge: University Press, 1934. Pp. 162-177.

instruction henceforth solely in those materialistic, scientific, and technical subjects which are most intimately and directly related to the exercise of his future profession. But surely the relative values of the antagonistic principles of "rigid discipline" and of "liberal culture," respectively underlying these two schools of thought can be exaggerated: surely a highly civilized society demands a school in which, by mutual understanding and sympathy, a compromise has satisfactorily blended them. Such a compromise must be different in the case of those who are destined to become (as, in his recent remarkable Address on engineering education to this Institution<sup>1</sup>, the President has aptly termed them) "officers in the army of civilian engineers," and in the case of that far more numerous, but equally important, class who, instead of a broader education adapted to a wider vision, need more specialized instruction and training to become "non-commissioned officers" in this "army."

The study of the "human factor" in occupational life already figures, as I have pointed out, in the examinations established by certain Institutions of Engineers for their Associate Membership (or Graduateship), and as a subject for endorsement on the Higher National Certificate in these branches of engineering. I have, however, advanced grounds for the hope that, in the not too distant future, both syllabuses and teaching may be so revised as to give greater prominence to the psychological—as contrasted with the mechanistic—treatment of problems of administration and management. Since 1931, industrial psychology has been taught as a separate subject in but one English Technical College—that of the County of Staffordshire. Here it has been taken mainly by students of about twenty years of age who have attended evening lectures for the previous five years and have already obtained either the Higher National Certificate in Mechanical Engineering or the City and Guilds Certificate in Machine Shop Engineering. In regard to this course, I am informed by Mr. T. G. Bamford, Principal of the College, that "some of the men find it exceptionally difficult, but the more wide-awake type of mind is keenly interested in it." "As a whole," he concludes, "the class is one which has always been most successful." But the subject serves another purpose. In the first James Forrest Lecture,<sup>2</sup> the late Dr. William Anderson, M. Inst. C.E., alluded to the "tendency among the young and inexperienced to put blind faith in formulas, forgetting that most of them are based on premises which are not accurately reproduced in practice. . . ." So, too, describing in 1936 this

<sup>1</sup>Journal Inst. C.E., vol. 17 (1941-42), p. 2 (Nov. 1941).

<sup>2</sup>Min. Proc. Inst. C.E., vol. cxiv (Session 1892-93, part iv), p. 255.

just-mentioned course of Lectures in industrial psychology in the "Human Factor," Mr. W. G. Emmett, who then conducted it, regards it as having "special value in introducing the student to the so-called 'inexact' sciences," as it dispels the notion held by "the student of physical science, at least in his early stages," that "events in Nature conform with exactness to certain simple laws," (p. 150).

I know of but one other instance where industrial psychology can be taken as a separate subject in engineering examinations, namely, in Glasgow University, where it may be chosen as a graduating subject for the B.Sc. honours degree in mechanical and electrical engineering, among the optional additional subjects prescribed by that University. Both in Scotland and in England, as I have already indicated, the subject finds some place in Technical Colleges in their courses on workshop organization and management when these are provided. For example, at the Royal Technical College, Glasgow—so Mr. James Smith, its Organizer, kindly informs me—an evening class in the subject is offered, attended in 1941 by sixty-three students of the average age of twenty-seven years, the syllabus of which includes such psychological topics as accident-prevention, fatigue-study, and vocational selection, besides the subjects usually comprised under "scientific management." The same college provides a course of instruction in engineering production for day students, the syllabus of which specifically mentions "industrial psychology."

It is clear that the industrial psychologist must similarly receive some training in the special problems of the engineer, if they are to collaborate satisfactorily. At present it is for the engineer to call in the applied psychologist if he thinks that he can be useful to him. It would be as absurd to wish to aim at making the engineer an industrial psychologist as to wish to make him an artist. But so often, when an outside expert's advice can be useful, it is sought too late. This mistake can be prevented only by some knowledge of what the expert can do and when he should best do it. Quite recently, the Education Committee of the Architectural Science Group of the Royal Institute of British Architects issued a report on "The Place of Science in the Architectural Curriculum." In this address I seem to have raised a closely analogous problem for the Engineer—"The Place of Aesthetics and of other fields of Psychology in the Engineering Curriculum." It is one, I am glad to understand, to which the Council of The Institution have already given close and favourable attention, not only envisaging a high educational ideal, but also taking a first and generous step towards carrying it into practical effect.

# A CONTRACTOR'S CLAIM FOR EXTRAS

The King vs. Paradis & Farley Inc.

A CASE OF INTEREST TO ENGINEERS AND CONTRACTORS

The following notes form a synopsis of the "reasons for judgment" in a case recently decided by the Supreme Court of Canada respecting a contractor's claim for extras arising from unforeseen difficulties. The judgment was delivered by Mr. Justice Taschereau, and the case may well prove to be a leading one.

In February, 1937, the tender of the contractor (Paradis & Farley Inc.) for the construction of a wharf at Rimouski, Que., was accepted by the Minister of Public Works acting on behalf of His Majesty the King, and a contract was entered into, embodying the terms and conditions under which the work was to be done.

In May, 1938, the contractor claimed by petition of right the sum of \$160,000, for damages and for additional compensation, and in due course the case was tried by the Exchequer Court, which has jurisdiction in all cases in which the claim arises out of a contract entered into by or on behalf of the Crown. That Court accepted the argument submitted by the contractor, that the plans and specifications were misleading, that the soil in which a certain number of piles were to be driven, was of a different nature and harder than indicated in the boring sheets prepared by the Department, and that a certain portion of the works performed was not covered by the contract. The learned trial Judge reached the conclusion that, for these additional works, not included in the amount of the tender, the contractor was entitled to \$119,597.22. Of this amount, however, he deducted one-third, because he thought there had been loss of time, delay and incompetence attributable to the suppliant. As a result of this deduction, judgment was given for \$79,731.48 with interest and costs.

Both parties then appealed to the Supreme Court of Canada, the Crown asking to have the claim dismissed, and the contractor, as respondent, asking for an increase in the amount awarded by the Court below.

The major item of the contract was the furnishing and driving into the soil at an average depth of 42½ ft. below the river bed, of a number of steel piles of interlocking type, on a double parallel row of 700 ft. long and 100 ft. wide. The unit price for this specific work, tendered by the suppliant, was \$1.95 per sq. ft., and it was submitted that this price was based upon the assumption that the soil into which the piles were to be driven, was of "sand, gravel, few stones, loose clay, stiff and sticky clay, tough clay," as revealed by the boring plans and specifications which were declared to be part of the contract. The driving of these piles into a relatively soft material, as described in the boring indications, did not, it was claimed by the respondent, involve work of a very difficult nature and the unit price of \$1.95 was sufficient to cover the furnishing and the driving of the piles leaving a reasonable profit.

But the respondent submitted that instead of encountering the material it had been led to expect, it encountered what is called "hard-pan", a substance dry in its natural state, devoid of lubricating properties, and plentifully interspersed with large boulders therein embedded, requiring continuous driving for very long periods, and in certain occasions drilling and blasting. And it follows that having done the work after protesting, the respondent was put to very large additional expenses. The claim was not for compensation for works contemplated by the parties and covered by the contract, but was for compensation for other works not foreseen in the agreement, performed *hors du contrat*, under an implied contract; it was for works accepted by the Crown for which no compensation had been paid on a *quantum meruit* basis.

It was particularly on the ground of *quantum meruit* for works unforeseen in the agreement that the respondent sub-

mitted its case, and it was on that ground also that the learned trial Judge allowed an additional compensation.

The specifications contained the following clauses which are the most important and most relevant to the present issue:

"2 (b). STEEL SHEET PILING: Driving interlocking steel sheet piling, where and as shown on plan and as shall be directed by the engineer.

"4. SOUNDINGS AND BORINGS: Soundings, levels and borings have been carefully taken but intending contractors are required to take, before they tender, the soundings, levels and borings they may deem necessary to satisfy themselves as to the accuracy of the information conveyed by plans and specifications.

"SHOULD THE CONTRACTORS find, on the site of the proposed work, any obstruction not shown on the plan, they shall remove such obstruction at their own cost.

"THE CONTRACTORS ARE WARNED that they shall be held entirely responsible and liable for any increase in the cost of the proposed work, if obstructions have to be removed to permit the driving of the steel sheet piles in correct alignment where and as shown on the plan.

"TENDERERS ARE HEREBY GIVEN NOTICE that it shall be taken for granted that the above has been given due consideration in the preparation of their tender.

"6 (3). THE UNIT PRICE TENDERED shall include the cost of purchasing, transporting, painting, driving and boring the piles, and the cost of the removal of obstructions impeding the driving of the piles, if any.

"35. AS IT IS KNOWN THAT DRIVING will be unusually severe, before the Engineer gives authority for the use of any type of steel piling for this work he will require to be provided with satisfactory evidence as to the driving qualities of the section suggested derived from actual experience in practice.

"37. NOTWITHSTANDING THIS, the contractor shall be entirely responsible for the correctness and accuracy to the satisfaction of the Engineer, in spite of all difficulties including risk of piles meeting obstructions of any kind in the course of the pile driving.

## TENDERS AND GENERAL CONDITIONS (FOR UNIT PRICES)

"4. CONTRACT: The contractor would be required to sign a contract similar to the form exhibited at the same time as the plans and specifications.

"7. NO CLAIM FOR EXTRA work or materials of any nature will at any time be recognized or entertained by the Department unless the contractor has first obtained a written order therefor from the Engineer.

"10. PARTIES INTENDING to tender for these works are especially requested to visit the place and site of the proposed work, and make their own estimates of the facilities and difficulties attending the execution of the work, including the uncertainty of weather and all other contingencies.

"37. NO CLAIM FOR EXTRAS will be entertained by the department on account of unforeseen difficulties in the carrying out of the works herein specified."

As already stated, an Order in Council was passed on February 10, 1937, accepting the tender of Paradis & Farley, and on February 23, 1937, a contract was signed between the suppliant and His Majesty the King. In the contract there were the following clauses:

"4. THE WORKS SHALL BE CONSTRUCTED by the contractor, and under his personal supervision, of the best materials of their several kinds and finished in the best and most workmanlike manner and in the manner required by and in strict conformity with this contract, the said specifications and special specifications and the plans and drawings relating thereto, and the working or detailed drawings which may from time to time be furnished (which said specifications and special specifications, plans and drawings are hereby declared to be part of this contract), and to the complete satisfaction of the Engineer.

"45. It is distinctly declared that no IMPLIED contract of any kind whatsoever by or on behalf of His Majesty shall arise or be implied from anything in this contract contained, or from any position or situation of the parties at any time, it being clearly understood and agreed that the express contracts, covenants and agreements herein contained and made by His Majesty are and shall be the only contracts, covenants and agreements upon which any rights against His Majesty are to be founded."

And the last two clauses of the contract read as follows:

"56. This contract is made and entered into by the contractor and His Majesty on the distinct understanding that the contractor has, before execution, investigated and satisfied himself of everything and of every condition affecting the works to be executed and the labour and material to be provided, and that the execution of this contract by the contractor is founded and based upon his own examination, knowledge, information and judgment, and not upon any statement, representation, or information made or given, or upon any information derived from any quantities, dimensions, tests, specifications, plans, maps or profiles made, given or furnished by His Majesty or any of His officers, employees or agents; and that any such statement, representation or information, if so made, given or furnished, was made, given or furnished merely for the general information of bidders and is not in anywise warranted or guaranteed by or on behalf of His Majesty; and that no extra allowance will be made to the contractor by His Majesty and the contractor will make no claim against His Majesty for any loss or damage sustained in consequence of or by reason of any such statement, representation or information being incorrect or inaccurate, or on account of unforeseen difficulties of any kind.

"57. In the event of any inconsistency between the provisions of this contract and the provisions of the specifications forming part hereof the provisions of the specifications shall prevail."

The stand taken by the Crown was that the borings and plans were only indicative of the works which were to be performed, and that the tenderer, under the terms of the specifications, was required to take the necessary soundings, levels and borings to satisfy itself as to the accuracy of the information conveyed by the appellant. It was further alleged that there could not be any additional compensation on a basis of *quantum meruit*, the works executed having been contemplated by the parties and covered by the contract. The obligation assumed by the contractor was not to drive the piles in a SPECIFIED SOIL, but to drive them in a SPECIFIED PLACE, "Where, and as shown on the plan," whatever the unforeseen difficulties might be. It was agreed, that the prices would be held rigidly inclusive, and would cover all contingencies that may happen, and it is obviously for that purpose that clause 37 of the specifications stipulated that "no claim for extras would be entertained by the department on account of unforeseen difficulties in the carrying out of the works herein specified."

It was also said in the specifications, that if the suppliant did find any obstructions not shown on the plans, it was its obligation to remove them at its own cost. And in order to facilitate its task, additional information was made

available as to the conditions of the soil, but one of the officers of the suppliant refused this information, stating that he had a perfect knowledge of the soil at that particular place. But clause 56 of the contract stated that the information given in the plans and the boring sheet was not "guaranteed or warranted by or on behalf of His Majesty," and made a further stipulation that the contractor will make no claim against His Majesty "for loss or damage sustained or on account of unforeseen difficulties of any kind."

It was suggested that the contract contained clauses that should be considered as non-existent, because they went beyond the authority given by the Order in Council. This would have left the respondent free to rely on an implied contract to claim on a *quantum meruit* basis, and would have considerably reduced the devastating effect of clause 56, which in a milder form was also found in the specifications.

But the tender duly signed by the respondent contained a specific clause which precisely covered the point and defeated the objection. This read as follows:

"CONTRACT: The contractor will be required to sign a contract similar to the form exhibited at the same time as the plans and specifications".

The signing of a contract exhibited with the plans and specifications, was a condition of the tender and, therefore, all its clauses were duly authorized by the Order in Council of February 10th and were binding upon the parties, who had a complete knowledge of its contents.

The suppliant tendered to furnish and drive these piles in a soil the nature of which it agreed to investigate, and which the appellant did not guarantee, but merely indicated with the reserves above mentioned, as being of "sand, gravel, few stones, loose clay, stiff and sticky clay, tough clay". The risk was upon the suppliant, and having assumed this risk, it must necessarily bear all the consequences, financial and others, if it misjudged the works to be performed and miscalculated the cost of the enterprise. Expenses incurred for unforeseen difficulties must be considered as being included in the amount of the tender, and the respondent had the legal obligation to execute the contract, for the price agreed upon, in the same way as would have been its indisputable right to benefit, if the soil had been more favourable and easier than foreseen.

In the "reasons for judgment" the learned Judge held that:

"The Court is bound by the terms of the contract, which is the law of the parties. And there is also the statutory law which supports the stand taken by the Crown, and which to my mind has the effect of thoroughly destroying the suppliant's submission. The Exchequer Court, under s. 18 of the EXCHEQUER COURT ACT, R.S.C. 1927, c. 34, has exclusive original jurisdiction in all cases in which the claim arises out of a contract entered into by or on behalf of the Crown. And s. 48 of the same Act limits the jurisdiction of the Court, and does not allow it to grant any additional compensation. This section reads as follows:

"48. In adjudicating upon any claim arising out of any contract in writing the Court shall decide in accordance with the stipulations in such contract, and shall not allow.

"(a) Compensation to any claimant on the ground that he expended a larger sum of money in the performance of his contract than the amount stipulated for therein.

"Having come to the conclusion that the works performed are covered by the contract, it seems impossible to allow any additional compensation, without doing violence to the unequivocal terms of this section."

For these reasons the Court decided that the appeal of the Crown should be allowed, and that the contractor's petition of right as well as his cross appeal should be dismissed, with costs throughout on both issues.

## TWO-STROKE OIL ENGINES

From *Trade & Engineering*, July 1942

### NEW SUPERCHARGED DESIGN

In recent years the application of supercharging, and particularly exhaust gas pressure charging, to four-stroke oil engines has become general. By its adoption the continuous rated output from a given cylinder may be increased by 50 per cent, and in spite of the comparatively high cost of the accessory equipment most marine four-stroke engines and a fair proportion of stationary units are now pressure-charged. This expedient has increased the competitive power of the four-stroke engine in relation to the two-stroke design, and therefore it is natural that attention should be directed to the possibilities of supercharging the latter type. With this end in view, a great deal of experimental work has been carried out in Switzerland by Messrs. Sulzer, and the results, which will undoubtedly lead to important practical progress, have now become available.

The main object of the new system is to reduce the size, weight, and cost of internal-combustion machinery by increasing the mean effective pressure, and hence the specific output. This cannot be accomplished by delivering the exhaust gases to an independent turbine driving a rotary compressor supplying scavenging and charging air on analogous lines to pressure-charging in four-stroke engines. The volume of air would be insufficient at light load, and the engine could not be started.

### USE OF EXHAUST GAS TURBINE

The Sulzer method is to drive the rotary compressor directly or indirectly by an exhaust gas turbine which is coupled to the engine crankshaft through gearing. The unit may then receive energy from the crankshaft, as when starting, or on light load, or may transmit energy to it when the load rises. High supercharging pressures may be employed, but normally the figure will vary between 20 lb. and 70 lb. per sq. in. If raised to between 70 lb. and 85 lb. per sq. in. the output of the engine becomes equal to the power absorbed by the compressor, so that the turbine may be uncoupled from the engine and compressor. The energy is then delivered by the turbine for whatever external purposes may be required, and not by the engine and compressor which together form a unit supplying exhaust or power gas to the turbine. Such a unit thus becomes a power-gas generator, and several plants may be incorporated delivering gas to one common turbine.

As an alternative system the total quantity of scavenging and supercharging air may be obtained from engine-driven reciprocating pumps. The exhaust gas is delivered to a turbine which transmits its energy to the crankshaft by bearing.

After a considerable amount of experimental work, the first industrial engine was built, designed for a supercharging pressure of about 2 atmos. abs., or about 28.5 lb. per sq. in. It is of the opposed piston type with four horizontal cylinders. The exhaust gases are discharged to a turbine, the output from which is transmitted to the crankshaft through gearing. Reciprocating engine-driven pumps supply scavenging and charging air to the cylinders, which have a bore of 190 mm. with a combined piston stroke of 300 mm. The speed is 750 r.p.m., and the rated output of the engine 1,370 B.hp., with a mean effective pressure of 12 kg. per sq. cm., or 170 lb. per sq. in. The fuel consumption of this unit which has run for more than 3,000 hours, is 0.35 lb. per B.hp. hour. The thermal efficiency is thus equal to that of the normal Diesel engine. The turbine runs at 13 times the speed of the engine crankshaft.

In order to demonstrate that equally satisfactory results could be obtained with single-piston engines of large

## Abstracts of articles appearing in the current technical periodicals

diameter, tests were made on a unit of this class of normal design with a diameter of 420 mm., the supercharged pressure being 2 atmos. abs., or 28.4 lb. per sq. in. The output at 450 r.p.m. was 692 B.hp. the mean effective pressure being 10 kg. per sq. cm., or 142 lb. per sq. in.

### LARGE INSTALLATION DESIGNED

In consequence of the results obtained Messrs. Sulzer are now adapting their normal single-piston two-stroke engines of medium and large bore to supercharging on the principle mentioned, and they have also developed a new design to take full advantage of the potentialities of supercharging in various applications. This is also of the opposed piston type, with two shafts, having six cylinders. The cylinder diameter is 180 mm. and the stroke of each piston 225 mm. At 850 r.p.m. the output at one-hour rating is 1,560 B.hp., with a supercharging pressure of 2 atmos. abs. An eight-cylinder engine with the same cylinder dimensions has a one-hour rating of 2,750 B.hp. at 1,000 r.p.m. when supercharged to 2.5 atmos. Its overall length is 17 ft. and maximum height 8 ft.

Plans have been prepared for engines of large size operating on this principle. For a passenger liner similar to the *Oranje* with 37,500 B.hp. machinery, a plant is proposed comprising 10 generators each driven by a supercharged two-stroke two-shaft opposed piston engine running at 450 r.p.m. and having cylinders 320 mm. in diameter with a combined piston stroke of 800 mm. The supercharging pressure is 2.5 atmos. abs., and the mean effective pressure 12.1 kg. per sq. cm.

### CARGO AIRCRAFT

FROM *The Engineer*, (LONDON), JULY 31, 1942

We do not know what is the total current tonnage output from Allied shipyards, but it is possible to get some rough idea of it from the fact that in the United States alone ships are now being launched at an average rate of well over two per day and that before long it should reach three. The majority of these ships are of the "Liberty" type, single-screw vessels of about 14,000 tons displacement, driven by reciprocating steam engines and designed to have a very moderate speed. Contracts for more than 1,500 "Liberty" ships have been placed, all to be delivered by the end of 1943. Nineteen new yards with 171 slipways in all are engaged upon the work. Our American allies have reacted in a characteristic manner to the fact that this output of new ships, supplemented by that of the British Commonwealth, is insufficient to compensate the depredations of the enemy's submarines. A recent suggestion made by Mr. Andrew Higgins, of Louisiana, and Mr. Henry Kaiser, of California—both leading personalities in American wartime shipbuilding circles—that the United States should switch over from the building of ships to the construction of large cargo aircraft has attracted great attention. Certain prominent representatives of the aircraft industry, including Mr. Glenn Martin, are said to be warmly in favour of it.

In detail the suggestion, as ascribed to Mr. Kaiser, is that the nine largest shipyards in the United States should be converted for the mass production of 70-ton cargo-carrying aircraft. The assembly lines, Mr. Kaiser asserts, could be in production within six months and maximum production, at the rate of 5,000 aircraft a year, could be reached in ten months. This programme may appear highly optimistic, but it has to be noted that, according to reports received from America, some of the new wartime shipbuild-

ing yards—and specifically those controlled by Mr. Higgins—have been planned from the outset with the idea that later on they might be employed on the construction of large cargo-carrying aircraft as well as upon that of ships. To the objection already raised by the War Production Board that the scheme would divert materials from factories building aircraft for the armed forces, its advocates reply that an increased use of wood could be resorted to in the construction of the cargo machines. In any event it would have the compensating advantage of setting free a large tonnage of steel for use in the tank, gun, and shell factories. From the operational point of view advocates of the scheme will derive encouragement from the success which has attended the flying of bombers and flying boats from the United States to Great Britain. At the end of a year's working the R.A.F. Ferry Command announces that the aircraft lost on the way across have amounted to less than one-half of one per cent of the total handed to it for delivery. It should, however, be remarked that if the United Nations resorted wholly or in large measure to aerial, instead of sea, transport across the Atlantic, the enemy, finding his submarines deprived of their prey, would in all probability greatly intensify his air activity over the ocean, a step which we would have to counter by providing increased fighter protection, at least in the areas nearest our shores. One important tactical advantage of the scheme would lie in the fact that munitions from the United States would be borne by air right into the heart of this country and would not require transshipment at a comparatively small number of vulnerable ports and subsequent carriage by our hard-pressed railways.

The proposal has undoubtedly a number of attractive features about it, but it requires to be demonstrated that it could "deliver the goods." It must not be overlooked that to be fully effective as a substitute for sea transport it would involve the building of several types of aircraft or at least of one type which could be readily converted for a variety of duties. In particular there would be required machines capable of carrying troops, heavy equipment, such as tanks and guns, food, oil and general cargo. From the aeronautical point of view it is not easy to see how a single design of aircraft could be made adaptable at will for the transport of these varying categories of load, while from the armaments standpoint it seems probable that modifications of design would be required to meet the exigencies of air transport—as, for example, the subdivision of heavy tanks into readily handled sections. The crucial factor is, however, the quantitative one. A 70-ton aircraft would probably have a disposable load of about 35 tons, of which about half would perhaps have to be assigned to the fuel required for the crossing. If an indirect route with intermediate landing and refuelling stations were followed—as would probably be the case—less of the disposable load would have to be assigned to fuel, but it seems doubtful whether the net cargo-carrying capacity could be increased beyond, say, 25 tons. The cargo-carrying capacity of a 14,000-ton "Liberty" ship is about 10,000 tons or a little less, but it would take about four or five times as long as the aircraft—flying indirect—to perform the trip. Quite roughly we may therefore say that in effective cargo-carrying capacity one hundred 70-ton aircraft would be required to replace one "Liberty" ship. On this basis 150,000 aircraft, or, taking Mr. Kaiser's figure, the equivalent of thirty years' output from the converted shipyards, would be required to replace the 1,500 "Liberty" ships now being built or for which contracts have been let. It can therefore be concluded that as a means of providing a complete substitute for sea transport the scheme is impracticable. It seems scarcely more attractive as a means of providing a useful supplement to sea transport. The annual output of 5,000 aircraft would be equivalent in carrying capacity to about fifty "Liberty" ships. This addition would be a useful addition were it really an addition. Actually it would be achieved only by sacrificing the aggregate output of ships from the

nine largest yards in the United States. Those yards, we feel assured, are at present contributing more than the capacity of fifty "Liberty" ships annually to the Allied transportation resources.

## ECONOMIC CONTRIBUTION OF THE COLONIES

From *Trade & Engineering*, July, 1942

Mr. H. Macmillan, Under-Secretary of State for the Colonies, has made a comprehensive statement to the House of Commons on the subject of the economic contribution of the Colonial Empire to the war effort. He said that the West African Produce Control Board had been developed out of the original Cocoa Control Board. It would arrange a steady and consistent buying and price policy for West Africa; and would deal not only with cocoa but with oilseeds, ground nuts, and other commodities. The merchants had become the agents of the Board.

Rubber output in Ceylon had been intensified. Steps had been taken to obtain the maximum possible production in East and West Africa. Neglected plantations were being revived. Abandoned areas of Ceara rubber, mainly situated in Tanganyika, were being exploited. Special officers were being appointed; and they were able to get the assistance of some of the Malayan planters. All types of wild rubber, both in East and in West Africa, were being tapped. Prices had been fixed which it was thought would bring the maximum production. All territories were co-operating in the drive for more rubber. By these means he hoped they might help to fill the gap before the great production of synthetic rubber began in the United States.

## VARIED MINERAL RESOURCES

Minerals—bauxite, wolfram, tin, graphite, copper, zinc, mica, manganese, chrome, iron ore, industrial diamonds—from vast territories in the Gold Coast, Sierra Leone, Nigeria, Northern Rhodesia, Ceylon, British Guiana, and Cyprus, all these were helping in the world drive. The chief anxiety about the production was not so much to increase by every means the productive power of the territories as to secure the transport, harbour accommodation and shipping to take away the products.

Food production had been immensely stimulated. In West Africa they were concentrating chiefly upon rice, vegetables, and dairy produce. In East Africa they were increasing wheat, maize, rye, and other foodstuffs as well as rice. In the West Indies they were trying to diversify agriculture. Twenty-five per cent of the estate lands in Barbados and some other territories were being compulsorily turned over from sugar to food crops, and all other means taken throughout the islands to increase local production. In British Guiana rice was being swiftly extended. In Jamaica they were hoping to help producers to stop growing bananas and start growing foodstuffs for local consumption.

Ceylon, Palestine, and the East African Dependencies which fell within the area of the Eastern Group Conference, were making every possible effort to increase their resources for local manufacture as were all other Colonial territories. In Palestine spare parts were being made and repairs carried out for the Army of the Middle East.

On the subject of the needs of the Colonies Mr. Macmillan said that things, not money, were wanted. Englishmen must do without shirts in order that Africans might have cotton piece-goods. Everything possible was being done to help the transport authorities in the Colonies as regards both equipment and personnel, but it was hard to get either. Progress in procuring locomotives and rolling stock was, however, being made, and by insisting on a reasonable measure of standardization they could be turned out on something approaching mass production lines. Bicycles were needed not only to take Colonial workers to and from their work, but also in some cases for the direct transport of produce. Port facilities too were a great problem as soon,

he hoped, as much tonnage would be handled in a single day as was in peace time handled, in a month.

Apart from the claims of production, there were other great claims upon the man-power of the Colonies. In addition to a magnificent contribution to the fighting services, large numbers had been recruited for the Labour Corps both from West and East Africa as well as from other Colonies, and were performing splendid service.

### THE "BRISTOL" FLYING BOAT

From *The Engineer* (LONDON) July 3rd, 1942

It has now been made known that the Prime Minister made his recent voyage to the United States, also the return journey, in the Royal Mail aircraft "Bristol," of British Overseas Airways. The commander was Captain J. C. Kelly Rogers, who was in command of the "Berwick" when it brought back the Prime Minister from his previous visit to America, and the second in command was Captain A. C. Loraine, who was second in command of the "Berwick." The "Bristol" is a Boeing 314A flying boat, and is one of three such aircraft which operate the British Airways' Atlantic services to the United States and also, in conjunction with other flying boats, to West Africa. These Boeings, it is claimed, are among the largest flying boats in commercial service in the world. The wing span of these machines is more than 150 ft., with a length of 105 ft., and a height of more than 27 ft. When fully loaded they weigh almost 40 tons, and the four engines have a total output of 6,400 B.hp. These aircraft are designed to carry up to sixty-six passengers, according to the length of the voyage, and the crew is ten in number. They have a cruising range of over 4,000 miles. At present they are carrying over thirty passengers on their Atlantic voyages. The passengers are carried in a number of commodious cabins, which can be converted into sleeping berths at night. There is a private suite aft, and other accommodation includes a purser's office, a cooking galley, and a pantry. Dining accommodation is provided for fourteen passengers at one time. The crew of each flying boat comprises the captain, second captain, first officer (who acts as navigator), two engineer officers, the purser, and two stewards.

### AVRO MANCHESTER

From *Trade & Engineering*, July 1942

One of the newer British-made aircraft which is playing its part in the R.A.F.'s bomber offensive against Germany is the Avro Manchester. Designed by the firm of A. V. Roe and Co., of Manchester, it has been produced in some of the most up-to-date plants in the country, partly by a considerable range of sub-contractors.

#### LARGEST TWIN-ENGINEED BOMBER

The Manchester is probably the largest twin-engineed bomber at present in service in the world. As is usual, it was originally designed to an Air Ministry specification, and production on a large scale was preceded by the manufacture of two prototypes. Perhaps the outstanding feature of the new bomber is its great weight-lifting capacity, but in spite of its size and weight it is extremely manoeuvrable. It is a mid-wing twin-engine cantilever monoplane, with retractable undercarriage.

The engines are two Rolls-Royce Vulture liquid-cooled engines. The maximum power rating is as follows:—1,845 hp. at 3,000 r.p.m. at 5,000 ft. in the low supercharger gear and 1,710 hp. at 3,000 r.p.m. at 15,000 ft. in the high supercharger gear. Fully feathering, three-bladed airscrews of 16 ft. diameter are fitted. Overall dimensions are as follows:—Span, 90 ft. 1 in.; length 68 ft. 10 in.; height, 20 ft.; cross wing area, 1,131 sq. ft.; fuselage, 8 ft. 2 in. wide; length of bomb compartment in fuselage, 33 ft.; undercarriage wheels, 5 ft. 6 in. diameter. Weight is approximately 25 tons all up; maximum speed is stated to be about 300 m.p.h., and maximum range approximately 2,000 miles.

The machine can lift over five tons of bombs, though over what range that great weight can be carried cannot be stated. Armament consists of a total of eight 0.303 Browning machine-guns, carried in three turrets, one in the nose, one mid-upper, and one in the tail. A crew of six or seven is normally carried, dependent on the operation. The larger crew consists of two pilots, one observer (who is also navigator and bomb-aimer) two W/T operators-air-gunners, and two air-gunners.

#### SECTIONAL CONSTRUCTION

The Manchester as a whole has been specially designed in a number of sections to facilitate production, transport, maintenance, and repair. The aircraft structure throughout is skinned with aluminium alloy sheets with flush riveting, which provides a smooth external surface. The fuselage is built up of transverse formers with continuous longitudinal stringers. A canopy is fitted over the pilot's cockpit which gives an excellent view in all directions, including aft. The fighting controller's position is also situated inside this canopy immediately aft of the pilot's seat and affords an excellent view in every direction. A little aft of this position is the navigator's station, and he is provided with a spacious table and adequate stowage for charts, &c. In the roof of the cabin is an astral dome. The W/T operator's station is at the rear end of the navigator's table, just forward of the front spar. At this point an armour-plated bulkhead is fitted across the centre section portion of the fuselage and so arranged as to open up for access on either side of the centre line. Additional armour-plating is provided at the back of the pilot's seat and head and special bullet-proof glass is fitted to give added protection to the fire controller. Certain other vulnerable parts of the aircraft structure and of the turrets are armour-plated. Within the fuselage centre section there is a comfortable rest chair for the general use of the crew. In the fuselage aft the rear spar a mid-upper turret is fitted and various equipment stowages for flares, emergency rations, Thermos flasks, etc. Also in this portion of the fuselage the ammunition boxes are located which carry ammunition by means of tracks to the tail turret.

A walk-way is provided from the tail turret forward to the other crew stations, and the main entrance door to the fuselage is situated on the starboard side just forward of the tailplane, a ladder being provided for easy entrance, this ladder being stowed in the fuselage during flight. Escape hatches for all the crew are provided at suitable points. The bomb-aimer's station is in the nose of the fuselage below the front turret and forward of the pilot's cockpit. The bomb-aimer is surrounded by all his equipment, which is arranged so that it can be easily operated, and he takes his sights through a special clear vision window. The bomb compartment is contained within the fuselage form, the cabin floor above it being specially designed to take housing to carry the various types of bombs employed. Two large doors are fitted to the compartment, and are operated hydraulically. In cases of emergency or in the case of a failure of the hydraulic system the doors can be opened by means of an emergency air system. An interesting point is that provision is made in the electrical circuits to prevent the bombs being released until the bomb doors are open.

All the gun turrets are hydraulically operated. Readily accessible stowages for parachutes are provided at all the crew stations, and oxygen points are likewise provided. Complete communication between the members of the crew is provided by means of "inter-com." De-icing equipment is fitted to the airscrews. The undercarriage is completely retractable and is operated hydraulically. Here again an emergency air system is provided. Fuel is carried in self-sealing tanks in the wings. The main wing is of two-spar construction, each spar consisting of a top and bottom extruded boom bolted on to a single thick gauge web plate. The ribs are aluminium alloy pressings, suitably flanged and swaged for stiffness. A dinghy is carried in the centre

section trailing edge portion of the wing and is automatically operated in a crash landing, and can also be operated by hand. The tail-plane is built up in a similar manner to the wing, with two fins and rudders at the extremities.

#### THE ENGINE

The Rolls-Royce Vulture is a 24-cylinder, liquid-cooled poppet-valve engine, 5 in. bore by 5.5 in. stroke. The cylinders are arranged in four blocks of six on a common crankcase with an angle of 90 deg. between the blocks. The piston, cylinder, and valve gear assembly follows normal Rolls-Royce practice, four valves being used for each cylinder, operated by overhead camshafts. Ignition is by two independent screened magnetos arranged so that the engine will continue to function satisfactorily in the event of a failure of one magneto. A down-draught carburettor is used, which delivers mixture through a two-speed supercharger to two main trunk pipes, each feeding two blocks of cylinders. Electrical starting is used, a generator is fitted, and drives are provided for all the necessary aircraft auxiliary pumps.

### MAGNESIUM PRODUCTION IN THE UNITED STATES

FROM *The Engineer*, (LONDON), JULY 31, 1942

Expansion of the magnesium output to approximately a hundred times the pre-war record has been announced officially by an official of the American War production Board, since it is one of the vital light metals used in aircraft construction, bombs and other munitions. This capacity is expected to be reached in 1942 or early in 1943, the programme calling for rapid expansion of the necessary works, as in the case of aluminium, although the magnesium expansion is on a much larger scale. About 70 per cent of the total output will be produced by electrolytic processes, 20 per cent by the ferro-silicon process, 7 per cent by the carbothermal process, and 3 per cent by processes which at present are in the experimental stage. A large increase in ferro-silicon production is also necessary, since about a pound of this metal is required for each pound of magnesium produced by this method. Some of the new plants will be similar to—but larger than—plants now in operation with electrolytic treatment of sea water, the supply of raw material being unlimited, although its content of magnesium is only 0.13 per cent. Other large plants under construction will use magnesite quarried from inland deposits to produce magnesium oxide sinter in roasters. Calcined magnesia is ground and made into briquettes with coke and peat. This latter material makes the mass spongy or porous, which facilitates the penetration of the chlorine and thus aids the chlorination reaction. Other plants will use calcined dolomite as raw material. Inland salt wells are also being developed as a source of raw material, some of these striking large deposits of sand saturated with rich magnesium chloride brine. A large proportion of the total product will come from the electrolysis of fused magnesium chloride made in various ways from a number of different sources.

### EUROPE VERSUS AMERICA

From *Trade & Engineering*, July 1942

"To-day we own Germany, to-morrow we shall own the world." The declamatory folly of this song of Hitler Youth was the Nazi way of popularizing among the German people a new theory of economics—new as a declared theory, that is to say, for the practice of loot is as old as the cave man. Dr. R. H. M. Worsley submits the doctrine and its application by Germany's "master minds" (to use a phrase increasingly adopted in criminology) to a careful scientific examination in *Europe Versus America* (Cape). It is a book of absorbing interest. Also, it is an astonishing book, for, accustomed as we are becoming to a world turned topsy-turvy, it is still difficult to adjust the mind to the spectacle

of a learned economist scrutinizing bulletins from Bedlam. Alas! That it should be necessary.

Perhaps aloofness from Europe better defines the American attitude between the two wars than the word "rejection" used by Dr. Worsley. The chief interest of the book to English readers, however, dwells less in its chief theme, important as that is in showing the effect of the "new order" on United States economy, than in its account of the methods and world-wide aims of Nazi economics. Even if in their genesis these aims had no world-wide ambitions they inevitably would have acquired them; Hitlerism is caught in its own coils and, running athwart human right and reason, must pursue its fatal course, as Macbeth was driven on from crime to crime. Let any misguided apologist of Nazi economics, if any now exist in the Western Hemisphere, never forget the pronouncement made by Dr. Schacht, its leading doctrinaire and active operator, in 1934, as reported in Ambassador Dodd's "Diary."

"The whole modern world is crazy. Everybody is crazy. And so am I. Five years ago I would have said it would be impossible to make me crazy. But I am compelled to be crazy."

Whence the compulsion? The question need not be answered now that the exponents of craziness for craziness' sake have plunged the world into chaos. Another point to show the inevitability of the "new order" driving over the borders of Europe. If the American people as a whole were unaware of the menace to themselves they must be grateful to Mr. Roosevelt for seeing it in time. It was not only implicit in Nazi behaviour: it was made explicit in Walter Darré's frank declaration in May, 1940: "The economic plans of the 'new order' will cause the United States to have from 30,000,000 to 40,000,000 unemployed." No business deals can be made with people with those designs, and no appeasement satisfy them short of surrender. As Dr. Worsley says, Hitler's Europe "must try with all its might to defeat America, to prevent her from wrecking the very foundations of the 'new order' by demonstrating the prosperity and happiness of a free and democratic union of free men, in contradistinction to the misery of Europe under the Swastika."

National-Socialist economy is essentially a "martial economy," to use Dr. Worsley's name for it. Being predatory, it can operate only in close and constant collaboration with a war machine. Dr. Worsley's book, in its early stages, makes a detailed survey of the principles and practice of this economy past and present, before passing on to answer such questions as: Does Hitler's economy provide for any scheme on which peaceful collaboration can be based? (The answer is emphatically that collaboration is impossible: there can only be defiance, which means war, or acquiescence, which means slavery). What lessons can be derived from its operation in Europe to-day? Is it possible to neutralize the aggressive character of this new Europe-to-be by utilizing the economic technique it has devised for "international collaboration"? The author shows that many of the special proposals of the Schacht-Funk currency plans are already in operation and the effects may be summarized as follows:—

(1) An initial stabilization of the European currencies in their relation to the Reichsmark has been achieved.

(2) The Reichsmark has been made the leading European currency.

(3) Berlin has been made the financial centre of Europe by the setting up of the "Multilateral Clearing" where inter-European payment and exchange control are concentrated.

The German War Economic General Staff occupies to-day a dominating position in European mining, in the heavy industries, in metal and metallurgical works, in chemistry, hydro-electric generation and synthetic production based on substitute materials. It also manages most of the supplies of raw material and is the biggest customer of the European market. If Germany were able to consolidate this

position in Europe there would be no need to ask what place the United Kingdom would hold as a "collaborating Power." The United Kingdom's part in the "new order" would be that of a reservoir of serf labour, and nothing more. Dr. Worsley devotes separate chapters to examining the working of the new economy in France, Belgium, Holland, Norway, and Denmark, and to its effect on Sweden, before dealing with the preparations to organize a Prussianized Europe for an economic offensive against America in order to achieve the aim of world hegemony.

It might appear from the successes so far achieved that this dream, though abominable, is not so crazy as suggested at the beginning of this review. But Dr. Worsley adds a postscript. Hitler has buried the prime of Europe's youth on the Russian front. Instead of rolling in the wealth of grain and oil in Russia he has created a huge desert. The destruction of the scorched earth policy will be felt by all Europe for many years to come. Instead of receiving Russian surpluses, Europe will have to send Russia food to keep off starvation. The Nazi concept of Europe based on Russian resources has been frustrated before the war has ended. Hitler's armies are destroying wealth as well as freedom, and threaten to destroy the wealth of all the world.

## REFUGEES AND INDUSTRY

From *Engineering* (LONDON) July 10, 1942

Engineers, as a class, are not conspicuously enthusiastic students of economic history. Those who are engaged in manufacture may make a fairly close study of the immediate circumstances of their own time and industrial environment, but they do not regard these circumstances, as a rule, in the light of history in the making; their interest extends forward, because they are concerned to predict as accurately as possible the trends upon which their future prosperity depends, but, if it extends into the past at all, beyond the period covered by personal recollections, their views and impressions are commonly bounded by that somewhat vaguely defined and frequently misunderstood sociological transformation known as the Industrial Revolution. The term is a convenient one, but its convenience ought not to lead to misinterpretation of its meaning or the character of the change that it implies. The so-called Industrial Revolution was not a sudden upheaval, comparable to the violent changes in the established order of States to which the word revolution is applied in the political field. It was, in fact, no more than an accelerated evolution; and evolution is an essential condition in any healthy society, continuing inevitably, and not to be delimited by arbitrary divisions of time.

There have been other accelerations of evolution, in plenty, apart from that associated with the advent of the steam engine; some international in their scope, but others of hardly more than local significance. The unknown inventors of the wheel and axle, the windmill, sail propulsion of ships, methods of extracting and working metals, and the early devices for irrigation, have produced changes in the lives of nations quite as important and far-reaching, in their day, as any deriving from the work of Savery, Newcomen and Watt. These are fundamental developments which have become international so long ago that they are now part of the common inheritance of useful knowledge. At some time and place, however, they were not international or even national, but purely local; and an important branch of the studies of the specialists among economic historians is the determination of the means of their dissemination and the courses which it took from one inhabited part of the globe to another. Some part of this diffusion of knowledge is traceable to the influence of trade; but there

must have been still earlier stages in the process, by which the foundations of that trade were first laid, and there is little doubt that the enforced migrations of refugees, both singly and in large communities, played a great part in widening the field of application of most of the industrial arts on which modern civilization is based.

This is a process to which the development of British industry has been particularly indebted in the past. The weaving industry owes much to the Twelfth Century onwards; the exodus from France of the Huguenots, about 100,000 of whom settled in this country, marked the beginning of many local industries in the districts where they settled, glass manufacture being one of particular note; and the foundation of many British families of Dutch origin is traceable to the disturbed conditions obtaining in the Low Countries in the Seventeenth and Eighteenth Centuries. It is not too much to claim that an appreciable part of the long-standing commercial supremacy of Great Britain is attributable to the attraction which the relative freedom of British living conditions has exercised upon men of skill and acumen who have found it impossible to apply their abilities in security on the Continent. The process has developed even more markedly, of course, in the United States, as is evidenced by the diverse nationalities represented by the names of prominent American industrialists, especially during the past half-century or so. As Sir John Hope Simpson, formerly vice-president of the Refugee Settlement Commission at Athens, has observed, there is no instance of a country which has suffered by the assimilation of refugee immigrants.

At the present time, these islands contain a more than usually large population of refugees from the northern and central parts of Europe, whose coming created problems of some complexity in the years immediately preceding the outbreak of war. Their arrival began at a time when the country was only beginning to recover from the prolonged depression and unemployment was still widespread; hence the conditions imposed by the Government that the refugees must re-emigrate as soon as possible, and that they must not engage in many forms of paid employment. In the light of subsequent events, it is open to question whether this latter condition was so wise as it appeared, no doubt, to its sponsors; certainly, it resulted in the departure to other countries, notably the United States, of many skilled scientists and others whose services might have proved a valuable asset in present circumstances. Other refugees, however, did succeed in establishing themselves in this country without infringing the discouraging regulations and have shown once again the value of initiative and determination in overcoming obstacles that might well have been accepted as insuperable in rendering themselves self-supporting and productive members of the community.

Something of what they have accomplished is set forth in a pamphlet\* recently published under the auspices of the Christian Council for Refugees from Germany and Central Europe, and bearing the title which heads this article. Reasons of national security are responsible, presumably, for the anonymity with which the various establishments are veiled, but the illustrations cover the manufacture of leather belting, electric torches, leather and fabric gloves, cotton fabric, and cigarette papers, as well as the printing of silks by a special process. Reference is made, also, to a variety of plastic goods, paint brushes, varnishes, paints and enamels, industrial chemicals, springs, valves, metal tubing and optical glass, among a number of products of less directly engineering interest.

\**Refugees and Industry*. By C. C. Salway, London; Williams and Norgate, Limited.

# From Month to Month

## THE PRESIDENT'S EASTERN TOUR

On a trip that took him as far as Sydney, N.S., the president visited last month all branches of the Institute east of Montreal. With the nine branches that were included in his western tour last spring, Dean Young has now met with sixteen of the twenty-five branches across the country. He expects to visit the remaining branches in central Canada between now and the end of his term of office.

Everywhere he stopped, the president found enthusiastic and active groups, and he in turn left with members the impression that the Institute could not have been happier in its choice of its chief officer this year. His message to the membership, delivered in a forcible manner, painted a striking picture of the engineers' accomplishments and of the responsibilities that lie ahead of a great professional society in these trying times.

Several officers of the Institute accompanied the president again this year on the whole of the trip, or part-way. The fact that these engineers, occupying positions of importance, take of their time to make these visits is a tribute to the work of the Institute; their presence at these meetings is a contribution to the cause of professional unity. The national character of the Institute was once more illustrated by the fact that at all the meetings there were in attendance members of the Institute from other distant parts of the country whose work had taken them to the particular locality and who cheerfully joined with their confreres in welcoming the president.

Vice-President K. M. Cameron of Ottawa made the complete trip and his knowledge of the country provided for the group a perfect cicerone. Vice-President deGaspé Beaubien of Montreal, joined the party at Moncton and visited all branches from there on. The assistant general secretary also accompanied the president; the personal contacts thus established will certainly be of great help to him in carrying out his work at Headquarters.

The journey began under the best auspices as Councillor J. E. Armstrong of Montreal, chief engineer of the Canadian Pacific Railway Company, acted as host to the group in his private car for that part of the trip to the St. Maurice Valley and to Quebec. The presidential party at these branches also included Past President O. O. Lefebvre, who initiated the presidential visits to all branches of the Institute in 1933, and Past Councillor Huet Massue of Montreal.

In Quebec City, Dean Young and Mr. Cameron were entertained over the week-end by Past President A. R. Decary. The presence at Moncton of Past President H. W. McKiel and Vice-President G. G. Murdoch of Saint John contributed towards a very substantial representation.

At Sydney, members of the branch were the guests of the contractor at the naval base now under construction and, in true engineering fashion, the meeting was held in the cook house. This created an atmosphere of informality and friendliness which accounted for the success of the gathering.

The regional meeting of Council held at Halifax, in conjunction with the president's visit to the branch, holds the distinction, unique it is believed for such a gathering away from Headquarters, of having brought together the immediate past-president, Dean Mackenzie, and vice-presidents from three different zones, Messrs. Beaubien of Montreal, Cameron of Ottawa and Murdoch of Saint John. In addition there were present from outside, Councillor F. W. Gray of Sydney, Mr. G. A. Gaherty of Montreal, chairman of the Committee on Western Water Problems, and General Secretary L. Austin Wright whom business on behalf of National Selective Service had taken to Halifax. It is interesting to recall that during his visit to

## News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

the western branches last April, Dean Young also presided over a regional meeting of Council at Vancouver.

Past Councillor W. E. Bonn of Toronto joined the party at Saint John where an enthusiastic meeting was held.

The tour successfully ended at Arvida, Que., where the presidential visit coincided with the annual meeting of the Saguenay Branch. Past Councillor Massue of Montreal joined the group again here and Past Councillor Otto Holden made an unexpected appearance at the meeting and brought greetings from the Toronto Branch.

## PROFESSIONAL RECOGNITION IN THE SERVICES

For a long time the Council of the Institute has been interested in the possibility of engineers in the army securing the same professional recognition as is given to doctors of medicine and dentistry. There has been much personal investigation by officers of the Institute, particularly by presidents who have close contacts with officials at Ottawa, and by official correspondence between the Department of National Defence and the General Secretary.

At first glance it appears ridiculous that medical men and dentists should receive extra pay and rank as professional allowances when the engineer does not. The work of one is as professional as the other, in addition to which the engineer takes all the risks that go with the combatant forces. From all parts of Canada protests from individuals and from branches have come to Headquarters, and the Council has been very much concerned about it all.

The correspondence has been spread over a period of three years. There have been sympathetic and encouraging replies, but eventually the answer has been that nothing could be done about it. Throughout all these negotiations there has been close contact with the Association of Professional Engineers of Ontario and the Corporation of Quebec, and lately with the Dominion Council, so that no stone would be left unturned in the endeavour to support the interests of the profession.

The services rendered to the army by engineers are different from those rendered by the other professions. It is difficult to describe or define this professional work because engineers go on from one activity to another and frequently end up in a senior appointment that has nothing to do with engineering. On the other hand the medical man and the dentist stay in the special fields for which they were recruited. They seldom, if ever, leave these fields to take on the added responsibility of leadership and administration which so frequently is assumed by engineers. If a doctor left the medical field to take on other responsibilities he would not continue to receive his professional allowance—nor would the dentist.

Doubtless, considerations such as these have confused the case for the engineer, and have prevented the authorities from setting up allowances comparable to those given for other services. Making due allowance for all this, it still seems possible that for many appointments something could be done to reward for special services rendered.

The serious effect of the failure to distribute these extras equitably is that many excellent young engineers are choosing to go into services other than those requiring their special skill. It has been shown over and over again that an engineer makes much quicker progress and reaches greater heights through the other services. In fact there is a tendency for engineers already in such branches as Ordnance and Engineers to transfer to other branches in order to hasten promotion.

In the Imperial forces professional allowances are made to many engineers. It would seem to be reasonable that similar treatment should be given to Canadians. The case is not simple, but the Institute feels that it should be studied further before it is dismissed entirely.

1943 ANNUAL MEETING

For some time there has been some discussion among officials of the Institute as to the advisability of holding an Annual Meeting next year, other than the formal business meeting required by the by-laws.

During the last war, it was not possible to hold the professional meetings, but present conditions are not at all similar, and the experience both in Canada and the United States, has been that such meetings are unusually well attended. The great majority of the engineers are now engaged on work of primary importance to the war effort and they welcome the opportunity of assembling and discussing their mutual problems. The great success of the last annual meeting, in February, has made it evident that such functions serve a useful purpose at this time.

Acting upon these considerations, Council, at its last meeting held in Halifax, decided that the Annual Meeting of the Institute would be held next year and would be of usual length and nature. In view of the necessity of curtailing transport and of the little time that members can divert from their normal occupations it was further agreed that such a meeting should be held in one of the larger centres, such as Montreal or Toronto. An invitation from the Toronto Branch having been accepted, it is now definite that the Fifty-Seventh Annual General and Professional Meeting of the Institute will be held at the Royal York Hotel, in Toronto, on February 11th and 12th, 1943.

AN OPPORTUNITY FOR MEMBERS' HOSPITALITY IN WAR-TIME

At a recent meeting of Council attention was drawn to the considerable number of sons (and daughters) of members of the Institute who are serving in the Dominion's armed forces. Many of them are stationed in Canada, but away from their homes. It was thought that the wide extent of our membership and our comprehensive branch organization might be utilized to help these young people by providing some measure of hospitality at members' homes, affording a welcome change from the regular routine of army, navy, or air force life. The idea met with general approval.

At most stations in Canada some provision has already been made, both by government and private action, for recreation centres, hostels, and social facilities. The idea in the minds of councillors, however, was something different from this. They thought rather of the suggestion that our members in or near military centres might entertain in their homes the relatives and connections of their fellow-members elsewhere. In this way the young soldiers or airmen would meet people whose calling and social outlook were like those of their own parents. Actually in many of such homes the presence of such visitors would help to make up for the absence of a son or daughter also serving in the forces. How can the introductions needed for this hospitality best be arranged?

It seems plain that such matters would have to pass through the hands of someone at each of our branch centres who has personal knowledge of most of the Institute members living in that branch area. Our branch secretaries have this qualification. No one knows better than the general secretary the indispensable part which these officers take in the activities of the Institute, and the sacrifices of time and energy which they make in doing so. If they are willing to shoulder this additional burden, they will be helping in the war effort, indirectly it is true, but in a very effective way.

Considerable progress has been made in the arrangements for the joint meeting between the American Society of Civil Engineers and The Engineering Institute of Canada. A rough draft of the programme is presented herewith. The details of the technical sessions have not been fully determined, but it has been agreed to include such subjects as structures, construction, highways, power, civilian protection, surveying and mapping.

One whole morning will be devoted entirely to the discussion of manpower controls. Negotiations are under way to secure both from Canada and the United States, the best informed officials in this field. It is expected that following the principal addresses, there will be an extensive discussion.

At the time of going to press, the names of most speakers and authors have been determined, but are being withheld until the complete programme is prepared. Eventually this programme will be sent to all members so that they may be fully informed.

Draft of Programme for Joint Meeting

American Society of Civil Engineers and The Engineering Institute of Canada at Niagara Falls, Ont., October 11th-15th, 1942.

**Sunday, October 11th,** Committees of the Board of Direction, American Society of Civil Engineers.

**Monday, October 12th,** Board Meeting, American Society of Civil Engineers.

**Tuesday, October 13th,** local sections conference, American Society of Civil Engineers delegates from 26 local sections in northeastern part of the United States. Regional meeting of the Council of the Engineering Institute.

**Wednesday, October 14th**

A.M. Greetings from officers of each society followed by a conference on "Manpower Control" based on (a) experience in the United States, (b) experience in Canada.

Luncheon—Address by Dean C. R. Young, President of The Engineering Institute of Canada.

P.M. Technical sessions

Dinner — Dance.

**Thursday, October 15th**

A.M. Technical sessions.

Luncheon—

P.M. Technical sessions.

WEBSTER LECTURES

Headquarters has lately received several requests from members and other sources for copies of the book "Structural Defence Against Bombing" containing the lectures delivered last April by Professor F. Webster, under the auspices of the Institute.

Unfortunately, it has not been possible to comply with those requests on account of the author's own restrictions. The question of distribution of the lectures was discussed at length with Professor Webster before his return to England. The professor insisted that circulation of copies of his notes be limited to those who attended the lectures, in addition to a few other persons whom he mentioned specifically.

A sub-committee of the Institute Committee on the Engineering Features of Civil Defence is preparing an abridged edition of the notes which should be available for wider distribution in the near future. This edition will contain all the original illustrations and the substance of the information given by Professor Webster in the lectures. In some respects, it will be more valuable than the complete edition which had to be issued in a hurry. The information contained in the abridged edition will be classified in such a manner as to make it a useful reference book.

The selection of a dean for a large school of engineering is not an easy matter, especially at a time of stress like the present. Such an officer should possess professional competence, ripe experience in university teaching work, marked administrative ability and a sympathetic knowledge of students and their many difficulties. He should be familiar with the needs of university research work, be something of a financial wizard, and, in addition to a number of other admirable qualities, should have an inexhaustible supply

Dean J. J. O'Neill, M.E.I.C.

of patience and tact. There are not many men who fill such a specification, but the new dean of the engineering faculty at McGill is like his distinguished predecessors in having a good supply of these desirable qualifications.

Realizing the University's responsibility to the large classes of students who are now enrolling in the faculty of engineering to qualify themselves for taking an effective part in Canada's war effort, Dr. Ernest Brown, M.E.I.C., has resigned as Dean of Engineering to devote himself to instruction. During his term as dean, from 1930 to the present, he has had to contend with many difficulties mainly due to the dislocation of economic and industrial conditions and to the violent changes caused by war. He dealt with these promptly and acceptably and now takes a well earned rest from administrative work.

He is succeeded by Dr. J. J. O'Neill, M.E.I.C., a McGill graduate who has had extensive experience in the fields of teaching, administration and research, and has already held two deanships in the university, having been Dean of Science in the Faculty of Arts and Sciences from 1935 to 1939, and Dean of Graduate Studies and Research for the past three years. He now takes up an equally arduous task which is of even greater importance to our supply of men qualified for technical service in the armed forces or in industry.

Dr. O'Neill's early training as a mining engineer was followed by a period of work for the Geological Survey of Canada (he was geologist with the Canadian Arctic Expedition in 1913-16), and by years of practice as an economic geologist in India, Canada and elsewhere, dealing with the geological aspect of engineering work in the production of oil, coal, and metals. After a period of service at McGill as assistant and associate professor, he became Dawson professor of Geology in 1929, and later held the two deanships previously mentioned.

The school of engineering at McGill is fortunate in securing as Dean a man whose long and successful collaboration in engineering work has given him wide knowledge of the problems of engineering education and engineering practice.

In spite of the appalling debit balance of war, there are many significant items on the credit side. Under the stimulus of war, all human activity is greatly speeded up. Political evolution and scientific development stride forward in a few months over new territory which it might ordinarily take decades to capture. For instance, the patient discoveries of medical research are now provided with a testing laboratory which is global in scope. One of the interesting aspects of this accelerating process is the growing interdependence and interrelation of agriculture and engineering. With the critical shortage of raw materials, engineering and chemistry are turning more and more to agriculture. An ever growing portion of the synthetic rubber programme is being based on agriculture; several new processes for the production of high test aviation gasoline from grain alcohol are being closely studied and pilot plants are being rushed to completion; many of the ever widening range of plastics are based on agricultural products. The new methods for the processing of foods such as dehydration, crystallization and quick freezing, coupled with the latest researches in nutrition and scientific farming, are opening up new and exciting possibilities. My associations, as an engineer, with the Department of Agriculture and the Quartermaster Corps have been among my most interesting contacts in Washington. But there is an even more direct way in which engineering and agriculture are working together. Last month, this letter discussed the agricultural and social implications of great construction programmes such as the T.V.A. A week or so ago, I attended an extensive and carefully planned demonstration of mechanized agricultural equipment. The demonstration took place on an experimental farm just outside Washington and lasted about four hours. There are only about ten or twelve visitors at each demonstration and, over the course of several months, most of the important government officials concerned and the representatives of most of the agricultural countries have attended. The day I was there, Canada, Russia and Australia were represented. Most people have heard of the Ford-Ferguson "Unit Type" of agricultural tractor. One of Mr. Henry Ford's defeats was the failure of his Fordson tractor to live up to his expectations. He took it off the market in the United States in the late twenties. Thanks to the invention by an Irishman named Ferguson of an hydraulic linkage and thanks to over ten years of study and experiment, it has now been possible to develop a piece of apparatus which Mr. Ford claims will overcome the hitherto cramping difficulties in the way of mechanized agriculture on a large scale. When tractors were operated by dragging implements behind them, heavy machines were necessary to supply the traction and to counteract the tendency of the tractor to turn back about its own drivers. In the unit system, the plough, or harrow or other equipment is part of the tractor, operated by a finger tip hydraulic control and connected by a triangular linkage so designed as to transmit the thrust against the plough (etc.) into a downward thrust over all four wheels of the tractor. In this way the weight of the tractor and the equipment can be considerably reduced. It is claimed that the reduction would be sufficient to merit, as a wartime measure, the substitution of new light tractors and equipment for old, over-age, heavy types which could be used as much needed scrap metal. The tractor is light enough and the hydraulic control simple enough that young boys and women can replace men operators. Included in a vast and carefully worked out programme are the saving of about a million tons of scrap, the release of just under a million agricultural workers for the services or factories and the saving of a quarter of a billion gallons of gas a year. The demonstration was under the personal direction of Mr. Ferguson. The several little lectures, which interspersed the demonstration, developed the full wartime implications of the programme and then went on to show that, since agriculture would probably be the basic con-

sideration in post-war reconstruction, the future happiness and welfare of mankind was not unconnected with the future of the Ford-Ferguson Unit Tractor. In spite of occasional lapses and in spite of his seventy-nine years, the "Wizard of Detroit" has not lost his touch! Seriously, though, and apart from the merits of this particular programme and equipment, it was borne in upon me that engineers have not done nearly as well for the farmer as they have for his city brother and that agricultural mechanization has been allowed to lag behind industrial mechanization. If agriculture and industry are to pull with equal weight in the double harness of human progress, the balance must be speedily redressed.

Many important positions in Washington are held by women whose names seldom get into print but who wield considerable power and do a great deal of important work. There were several such women as guests at a small luncheon which I attended recently. Miss Vera Michaels Dean, Research Director of the Foreign Policy Association and author of numerous pamphlets and books was there. She talked about American foreign policy in respect to Russia. Miss Bernice Lotwin, Assistant Legal Counsel for the Manpower Board, told us of trends in the mobilization of both manpower and womanpower. Miss Mary Craig McGeachy, who is the representative of the Ministry of Economic Warfare at the British Embassy, is a Canadian whom I had known for some years. Previously, she was the British Dominions Liaison officer on the League of Nations Secretariat at Geneva. The fourth guest was Miss Barbara Ward, the Foreign Editor of the London *Economist*. She graduated in 1935 from Oxford where she took first class honours in three majors—Politics, Economics and Philosophy! She had been to tea at the White House with Mrs. Roosevelt the previous afternoon and was featured in "My Day." During the discussion, a number of interesting points emerged. For instance, support of Russia is important not only from the point of view of maintaining a front against Germany but also in view of the future necessity of a land front against Japan and aid to China. The subjugation of Japan by the tortuous process of reconquering lost Islands, step by step was felt to be an extremely difficult alternative. It was interesting to have explained how the facts and techniques of economic warfare, while serving their present purposes, were being organized to serve as the guide and framework for the reconstruction of the post-war world. It was thrilling to hear of the complete mobilization in Britain of manpower and womanpower and also of time and money. It was good to be told that the controls of total war had lead, not to totalitarianism, but to a new understanding of democracy—not the social service conception of the state caring for the individual—but the vital conception of the state depending upon the total efforts of every individual—in a vast communal effort for survival.

August 24, 1942.

E. R. JACOBSEN, M.E.I.C.

### CORRESPONDENCE

195 Maple Avenue,  
Quebec, Que.

L. AUSTIN WRIGHT, Secretary,  
Engineering Institute of Canada,  
2050 Mansfield Street, Montreal, Que.

Dear Sir:—

A little has been written and much more will be written about rehabilitation after the war. I would like to make an observation to the Committee on Post-War Problems.

In western Canada any rehabilitation will have to be connected directly or indirectly with development in agriculture. It has been proposed by Mr. P. M. Sauder, M.E.I.C., that more land in the southern part of the Prairie Provinces be opened up by the use of irrigation. This is an

excellent project and would provide employment for engineers as well as providing more farm land.

By opening up more agricultural land the engineer should realize that to make this project a success the man placed on the farms must be competent to operate them, as nothing will wreck an irrigation project more thoroughly than incompetent farmers. After the last war many returned soldiers were placed on farms by the Government. Many of these men had no farm training and went through trying times and eventually, had to abandon their land.

The present Government has expressed its intention of placing veterans of the present war on the land. Any new irrigation project would be the obvious place to send these men. With these facts in mind it would be well if the advisers to the Government on any new irrigation project would point out that farmers are skilled in their trade and that farms, especially farms in irrigation areas, are not places for people with no skill at farming.

Engineers are too often guilty of forgetting everything but the technical aspects of projects in which they are interested. In rehabilitation particularly, the human element is, in the final analysis, the only element to be considered. We, as engineers, should be sure that the works of our heads and hands are of real benefit to Canada. By following in the footsteps of C. D. Howe, Hon. M.E.I.C., and taking a vital interest in the problems of Government, we will assure Canada of the answers to her post-war problems.

Yours truly,

(Signed) C. K. HURST, M.E.I.C.,  
R.C.N.V.R.

### MEETING OF COUNCIL

A Regional Meeting of the Council of the Institute was held at the Nova Scotian Hotel, Halifax, N.S., on Friday, August 7th, 1942, convening at ten o'clock a.m.

Present: President C. R. Young (Toronto) in the chair; Past-President C. J. Mackenzie (Ottawa); Vice-Presidents deGaspé Beaubien (Montreal), K. M. Cameron (Ottawa), and G. G. Murdoch (Saint John); Councillors F. W. Gray (Sydney) and J. R. Kaye (Halifax); General Secretary L. Austin Wright, and Assistant General Secretary Louis Trudel. There were also present by invitation—Past-Vice-Presidents F. A. Bowman (Halifax) and S. C. Miffen (Sydney); Past Councillors W. P. Copp, F. W. W. Doane, H. S. Johnston, I. P. Macnab and Harvey Thorne, of Halifax; P. A. Lovett, chairman, S. L. Fultz, immediate past-chairman, and Dr. A. E. Cameron, A. E. Flynn, J. D. Fraser and J. A. MacKay, members of the executive of the Halifax Branch; G. A. Gaherty (Montreal), chairman, Committee on Western Water Problems, and member of the Committee on Professional Interests and the Finance Committee.

The president extended a cordial welcome to all councillors and guests, and asked each person present to rise and give his name, place of residence, and Institute affiliation. He invited everyone to take part in the discussions, as the opinions and advice of past officers would be very helpful to Council.

The general secretary read resolutions which had been submitted by eight of the Institute branches in response to a resolution passed and circulated by the Saint John Branch, urging Council to take immediate action with a view to obtaining for engineers in the armed forces the same recognition in regard to rank and pay as that accorded to members of the medical and dental services.

Mr. Wright pointed out that this matter had been receiving the attention of Council for over three years. Strong representations had been made to the Department of National Defence on several occasions. Considerable correspondence and many interviews had culminated in a letter from the Department dated January 2nd, 1942, stating that no action could be taken. Recent correspondence between the president of the Dominion Council of

Professional Engineers and the Minister of National Defence for Air, indicated that the matter had again been considered by the Defence Council and that the same decision had been reached "that it is not possible to take action to increase the rates of pay for Engineer Officers."

The general secretary outlined briefly some of the difficulties in the way of obtaining such recognition for Engineer Officers. One of the greatest troubles was to define the term "engineer" and to find any officer whose work was restricted to that field. Moreover, enlistment of engineers is not restricted to any one branch of the service. Frequently, members of the profession are in positions where they are not doing professional work. In the case of medical doctors there is no difficulty in defining their work. If a doctor in the active services were not practising his profession he would not receive the professional allowance.

Mr. Wright stated that there were many difficulties in the way, but suggested that the matter might be taken up once more with the Department and if it is found definitely that nothing can be done, an announcement to that effect should be made in the *Engineering Journal*, so that members of the Institute may know that the matter had received the attention of Council.

Past-President Mackenzie was entirely in sympathy with the purpose of the resolutions, but from a personal knowledge of the situation felt that little more could be done at the moment. In his opinion the Defence Council would have no objection to an announcement being made in the *Journal*, but suggested that the matter might be discussed with Major-General Letson.

Following further discussion, it was decided that the general secretary, after consultation with Major-General Letson, should prepare an item for the *Journal*.

A letter was presented from Councillor J. G. Hall, chairman of the Institute's Membership Committee, advising that he had nothing definite to report on at the moment, but his committee would be very glad to have any further suggestions which the members from the Maritime provinces might care to submit.

The main point under consideration by the committee was the method of considering applications for admission to the Institute. In the brief discussion which followed it appeared that members present felt that Council was right in giving weight to the branch recommendation. It was pointed out that under present procedure Council does not make a decision contrary to the branch recommendation without first referring the case back to the branch for further consideration. The discussion was noted for transmission to Mr. Hall.

A brief report was presented from Dr. J. B. Challies, chairman of the Committee on Professional Interests, from which it was noted that satisfactory progress was being made by the Manitoba group in the preparation of a final draft of an agreement between the Institute and the Association of Professional Engineers of Manitoba.

The general secretary submitted comparative figures on the membership in the provinces of Nova Scotia and New Brunswick before and after the signing of the co-operative agreements. These figures showed a substantial increase in both provinces.

The general secretary read a progress report from Mr. W. C. Miller, chairman of the Institute's Committee on Post-War Problems. The membership of the committee to date was noted, seven additional members having been appointed by the president since the last meeting of Council.

It was noted that the committee was now studying the replies received from the Institute branches regarding the questionnaire sent out by Mr. K. M. Cameron's sub-committee on construction projects of Dr. F. Cyril James' Committee on Reconstruction. It was also noted that a summary of the evidence presented by Dr. James before the Parliamentary Committee on Reconstruction and Re-Establishment had been prepared by Mr. Miller, and had

been published in the August number of the *Journal*. The report was accepted and approved.

Mr. Cameron commented briefly on the work of his sub-committee, the principal function of which would be to advise on the machinery that might be set up in connection with construction projects as a means of employment after the war, and consideration of the value of such projects. Mr. Cameron felt that this work offered a splendid opportunity to help in the re-establishment of engineers after the war.

Copies of a progress report of the Special Committee on the Engineering Features of Civil Defence were distributed to the meeting. This report outlined briefly the sequence of events leading to the appointment of the committee. The committee at present consists of thirteen appointed members, five of whom are also branch committee chairmen, and nine branch committee chairmen, who are ex-officio members of the committee. In anticipation of Council's approval, the programme was being carried on under the various headings of the "terms of reference," a revised draft of which was submitted for approval.

Mr. Macnab, chairman of the Halifax Branch committee, reported on the progress being made in Nova Scotia. He had received splendid co-operation in getting his committee organized. With copies of Professor Webster's lectures now available, the committee would be able to start its active work.

The president reported that additional members had been appointed to the committee since the last meeting of Council. In his opinion it was important to note that this committee was working in close co-operation with the Government's A.R.P. Committee under Dr. R. J. Manion.

The general secretary read a report from Mr. Willis MacLachlan, chairman of the Committee on Industrial Relations, from which it was noted that an organization meeting had been held in Toronto on July 25th. Additional members had been appointed to the committee by the President.

The report recommended that certain articles be published in the *Engineering Journal* and that during the year each branch of the Institute should have presented before it a paper dealing with either the broad subject of industrial relations or some phase of it. The committee stands ready to assist branches, if so desired in obtaining suitable speakers to present such papers. The committee has decided on four subjects for study and later report.

The general secretary read a letter from the Institution of Mechanical Engineers, confirming their cabled advice of the award of the James Watt International Medal to Mr. A. G. M. Michell, F.R.S., of Melbourne, Australia, and advising that as it is not likely that Mr. Michell will be able to receive the award personally, it is proposed to ask the High Commissioner for Australia to receive the medal on his behalf at a ceremony to be held at the Institution headquarters some time in January 1943, to which the Institute will be asked to appoint an official delegate.

After some discussion it was decided to ask Lieut.-General A. G. L. McNaughton to represent the Institute on that occasion, or, if he is unable to be present, some other person to be appointed by him.

As chairman of the Finance Committee, Vice-President Beaubien reported that the finances of the Institute were in a sound condition, although he would not recommend any new undertakings at the present time.

Council noted with sincere regret the death of Councillor H. F. Morrissey, of Saint John, N.B., which had occurred in Montreal on June 25th, 1942.

On the motion of Vice-President Murdoch, seconded by Mr. Macnab, it was unanimously resolved that Mr. A. O. Wolff be appointed as councillor to represent the Saint John Branch until the next annual election.

The general secretary read a brief progress report from Mr. H. F. Bennett, chairman of the Committee on the Training and Welfare of the Young Engineer, from which

it was noted that fourteen of the Institute branches had appointed Committees on Student Counselling. The committee hoped that the remaining branches would appoint their committees before the opening of the school year in September. The distribution of the booklet "The Profession of Engineering in Canada" had been extended to cover every English speaking high school in the Dominion. Further copies are being distributed through the branch Student Counselling Committees. The committee emphasizes the necessity of increased activity among the younger members, and further studies of the possibilities in this field are being continued. The committee hopes to make a further report on this phase of its activity before the next annual meeting.

The president reported that a French version of the booklet "The Profession of Engineering in Canada" was nearing completion and would be ready for distribution shortly.

At the annual meeting held in February 1942 the question of prizes for Students and Juniors of the Institute had been referred by Council to Mr. Bennett's committee for consideration, and the committee now presented the following report:

*To the President and Members of Council:*

At the meeting of Council at the Annual Meeting of the Engineering Institute of Canada at Montreal in February, 1942, the question of prizes for Student and Junior members was discussed and the whole matter of these prizes was referred to the Committee on the Training and Welfare of the Young Engineer for their report.

The present prizes consist of the Martin Murphy prize for the Maritime Provinces, the Ernest Marceau prize and the Phelps Johnson prize for the Province of Quebec, the John Galbraith prize for the Province of Ontario, and the H. N. Ruttan prize for the Western Provinces.

This matter was referred to the members of this committee and the twenty-five branches of the Institute on April 8th. Again on July 4th a circular was issued to this same group, especially dealing with this matter of Institute Student and Junior prizes.

Replies have been received from about 50 per cent of the branches, and not one reply has indicated that these prizes should be discontinued. Hearty approval of the prizes was general. Suggestions were made as to the administration of these prizes, and based on this information your Committee is ready to report at this time.

(1) It is recommended that the five Student and Junior prizes be continued with extension if it is financially possible.

(2) The following programme of publicity should be carried out each year in order that every member of the Institute who might be a competitor may be advised of the terms and time of the competition:—

(a) Editorial notice on the subject should be published in the *Journal*.

(b) The President and General Secretary, on their visits to Branches, should emphasize these prizes.

(c) The General Secretary should issue a special letter to each Branch in September of each year, drawing the attention of the Branch Secretary to the prize competition and instructing him as to the circularization of all Junior and Student members of the Branch.

(d) The special branch committee having to do with Junior activities should be urged to follow up this competition and see that papers are presented before the Branch in time for entry.

(e) As far as it is possible, every Branch should hold at least one meeting each year for the Junior members, at which meeting papers entering for these prizes could be read, and in addition, branch prizes given to the extent possible in the separate branches.

(3) It is evident from our investigations that those branches which have specialized in Junior activities have

had considerable success in the presentation of papers suitable for these prizes. This is especially true in the Peterborough Branch where in five successive years a member of that Branch has won the John Galbraith Prize.

Respectfully submitted on behalf of the Committee.

(Signed) HARRY F. BENNETT, M.E.I.C.,  
*Committee Chairman.*

July 30th, 1942.

The general secretary reported that the American Society of Civil Engineers is planning to hold its Fall Meeting in Niagara Falls, Ontario, during the week of October 11th. The first two days would be devoted to committee meetings of the A.S.C.E., and the professional meetings would be held on Wednesday and Thursday, the 14th and 15th. The Society had invited the Institute to participate with it in the meeting, making it clear that the Institute would not be involved in any expense, but would participate by providing speakers for the luncheons and the dinner, and for some of the technical sessions. At a recent conference in Montreal, Mr. Wright and Mr. Seabury had discussed the matter in detail and had drawn up a tentative programme.

The proposal was received with enthusiasm, and it was unanimously agreed that the Institute would participate in and support the joint meeting in every way possible.

By way of recognition of the splendid service rendered to the Institute by Professor Webster during his recent visit to Canada, it was proposed that an Honorary Membership be given to him. Professor Webster, through the medium of lectures to certain branches of the Institute and a series of lectures on "Structural Defence against Bombing," given under the auspices of the Institute in Toronto, as well as by special services rendered to the active service forces and specific industries, had rendered an unusual service both to the Institute and to Canada. The notes of his lectures, which had been published and circulated by the Institute, perhaps constituted the best and most up to date publication on this vital topic. Therefore, on the motion of Past-President Mackenzie, seconded by Vice-President Beaubien, it was unanimously resolved that the name of Professor Frederick Webster, Deputy Chief Engineer, Ministry of Home Security, London, England, be submitted to the next meeting of Council for nomination to Honorary Membership in the Institute. Subsequent to the nomination a ballot will be submitted to all councillors.

Attention having been drawn to the fact that Mr. H. C. Burchell, of Windsor, Nova Scotia, had been a Member of the Institute since 1887, it was unanimously resolved that the greetings of this Council be sent to Mr. Burchell.

A number of applications were considered and the following elections and transfers were effected:

*Admissions*

Members.....	10
Junior.....	1
Students.....	4
Affiliates.....	3

*Transfers*

Juniors to Members.....	2
Students to Members.....	2
Students to Juniors.....	3

A letter was read from Mr. A. A. Turnbull, President of the Association of Professional Engineers of the Province of New Brunswick, expressing regret at his inability to attend the meeting, and extending greetings and best wishes.

On behalf of the past officers present, Colonel Doane expressed sincere thanks to Council for its courtesy in affording them the privilege of attending this meeting.

It was left to the president and the general secretary to decide on the date for the next meeting of Council.

There being no further business, the Council rose at one o'clock p.m.

## ELECTIONS AND TRANSFERS

At the meeting of Council held on August 7th, 1942, the following elections and transfers were effected:

### Members

- Finlayson, Harold Musgrave**, B.Sc. (Civil), (McGill Univ.), hydraulic engr., Shawinigan Water & Power Company, Montreal, Que.  
**Loomis, Dan McKay**, B.Sc. (Mech.), (McGill Univ.), sources officer, tank production bl., Dept. of Munitions and Supply, Montreal, Que.  
**Matte, Raymond E.**, B.A.Sc., C.E., (Ecole Polytechnique), engr., sales dept., Canadian Tube and Steel Products Ltd., Montreal, Que.  
**Millman, Joseph Malcolm**, B.Eng. (Mech. and Civil), (Univ. of Sask.), 12 Ontario Street So., St. Catharines, Ont.  
**O'Neill, John Johnston**, B.Sc. (Mining), M.Sc. (Geol.), (McGill Univ.), Ph.D. (Geol.), (Yale Univ.), Dean of the Faculty of Engineering, McGill University, Montreal, Que.  
**Smith, James Morrison**, B.A.Sc. (Univ. of Toronto), dftsman., Dept. of Highways of Ontario, Toronto, Ont.  
**Steven, James Harry Alexander**, locating engr., Dept. of Public Works, Kamloops, B.C.  
**Walters, Paul W.**, B.A.Sc. (Univ. of Toronto), investigator, organization branch, Civil Service Commission, Ottawa, Ont.  
**Wilson, John Shaw** (Royal Tech. Coll.), president and gen. mgr., Tye Machinery Co. Ltd., Vancouver, B.C.

### Junior

- McQuarrie, Alexander Macrae**, B.Sc. (Elec.), (Univ. of Alta.), aircraft instrument engr., Can. Gen. Elec. Co. Ltd., Peterborough, Ont.

### Affiliates

- Davis, Robert** (Royal Tech. Coll.), hull engr., Wartime Merchant Shipping Ltd., Montreal, Que.  
**Hamel, Joseph Henry** (St. Dunstan's Univ.), supt. and engr. for E. G. M. Cape & Company, at St. John's, Nfld.  
**Hinton, Ralph**, mtce. engr., Queen's University and Kingston General Hospital, Kingston, Ont.

### Transferred from the class of Junior to that of Member

- Gaudefroy, Henri**, B.A.Sc., C.E. (Ecole Polytechnique), B.S. (Elec.), (Mass. Inst. Tech.), asst. professor of mathematics, Ecole Polytechnique, Montreal, Que.

**Roy, Joseph Eugene Leo**, B.A.Sc., C.E. (Ecole Polytechnique), B.Eng. (Elec.), (McGill Univ.), power sales engr., Quebec Power Company, Quebec, Que.

### Transferred from the class of Student to that of Member

- Chapman, Stuart M.**, B.Eng. (Chem.), (McGill Univ.), research associate, Pulp & Paper Research Institute of Canada, Montreal, Que.  
**Harrigan, Mayo Arthur Perrin**, Lieut. (SB), B.Sc. (Elec. & Mech.), (N.S. Tech. Coll.), asst. to the chief engr., H.M.C. Dockyard, Halifax, N.S.

### Transferred from the class of Student to that of Junior

- Leroux, Fred Clements**, B.Sc. (Agric.), (Univ. of Sask.), field and agric. engr., British Columbia Plywoods Ltd., Vancouver, B.C.  
**Peterson, Robert**, B.Sc. (Civil), (Univ. of Sask.), S.M. (Harvard Univ.), asst. engr., P.F.R.A., soil mechanics lab., University of Saskatchewan, Saskatoon, Sask.  
**Watson, John Crittenden**, B.Eng. (Mech.), (McGill Univ.), service engr., Combustion Engineering Corporation Ltd., Montreal, Que.

### Students Admitted

- Campbell, George I.**, B.Sc. (Queen's Univ.), testman, Can. Gen. Elec. Co. Ltd., Peterborough, Ont.  
**Flemming, William Dunlap** (McGill Univ.), asst. field engr., Can. Dredge & Dock Co. Ltd., 67 Queen St., Truro, N.S.  
**Molyneux, Thomas Emmet**, B.Sc. (Civil), (Univ. of Sask.), c/o U.S. Public Roads Administration, Muskwa, B.C.  
**Ormiston, Russell Willson** (Univ. of Sask.), c/o U.S. Public Roads Administration, Muskwa, B.C.

By virtue of the co-operative agreements with the Provincial Professional Associations, the following elections and transfers have become effective:

### Member

- Phillips, George L.**, mining engr., Saint John Dry Dock & Shipbldg. Co. Ltd., East Saint John, N.B.

### Transferred from the class of Junior to that of Member

- Carey, Roger Packard**, B.Eng. (N.S. Tech. Coll.), instr'man., Dept. of Highways, Sackville, N.B.

### Student

- McNally, Reginald Winnett**, B.Sc. (Mech.), (Univ. of Sask.), 2nd Lieut., O.T.C. (W.C.), C.A.A. Wing, Gordon Head, B.C.

## Personals

**H. W. McKiel**, M.E.I.C., past president of the Institute, took office in July as district governor of Rotary International, the world-wide organization which has more than 5,000 clubs with 210,000 members devoted to service to their communities and their countries. Mr. McKiel is Dean of the Science Faculty of Mount Allison University in Sackville, N.B. He is a former president of the Association of Professional Engineers of New Brunswick and the Maritime Chemical Society, vice-president of the Canadian Institute of Chemistry and chairman of the Maritime Branch of the Canadian Institute of Chemistry.

Unanimously elected at Rotary's recent convention in Toronto, Ont., by delegates representing Rotary clubs in more than 50 countries of the world, Mr. McKiel will devote much of his time during his year in office to visiting the 33 Rotary clubs in Nova Scotia, New Brunswick, Newfoundland, Prince Edward Island, Quebec and Maine, U.S.A., which comprise the 192nd district of Rotary International, and advising officers and committeemen on the activities of their clubs. He will serve as district governor until shortly after Rotary's 1943 convention in Philadelphia, Penna., in June.

**A. O. Wolff**, M.E.I.C., district engineer, Canadian Pacific Railway, Saint John, N.B., has been appointed councillor to represent the Saint John Branch of the Institute until the next annual election, replacing Lieut.-Colonel H. F. Morrissey who died recently. He joined the Canadian Pacific Railway Company in 1908 as an instrument man and in 1913 he became an assistant engineer on field work. In 1915 he was appointed division engineer at Brownville Junction, Maine, U.S.A., and in 1929 he was transferred to London, Ont., as a division engineer. In 1930 he became

## News of the Personal Activities of members of the Institute, and visitors to Headquarters

assistant district engineer at Toronto and a year later he received his present appointment.

Mr. Wolff was chairman of the London Branch of the Institute in 1937.

**G. H. Rogers**, M.E.I.C., has been appointed secretary of the Bell Telephone Company of Canada and has moved

G. H. Rogers, M.E.I.C.

from Toronto to Montreal to take over his new duties at the company's head office. He was born and educated in England where he began his career with the National

H. W. McKiel, M.E.I.C.

A. O. Wolff, M.E.I.C.

S. W. Gray, M.E.I.C.

Telephone Company in 1902. He came to Canada in 1906 as a draftsman with the Bell Telephone Company of Canada. A year later he became development engineer and in 1910 he was appointed transmission engineer. From 1913 to 1916 he was on construction work with the company and during the years 1917 to 1920 he was engaged on rate studies and surveys. In 1921 he was appointed general commercial engineer at Montreal, and in 1930 he was named first general commercial manager of the newly established western area, with headquarters in Toronto, a position from which he has just been promoted.

**W. R. Fricker, M.E.I.C.**, has been appointed district engineer of Canadian Westinghouse Company at Montreal. Born in England, he graduated from the Swansea Technical College, Wales, and served his apprenticeship with the Western Engineering Company at Swansea. From 1923 to 1929 he was successively employed as electrical engineer with the Torque Electrical Engineering Company and the Mond Nickel Company, Limited, at Swansea. He came to Canada in 1929 as a district service engineer with Canadian Westinghouse Company at Regina, Sask.

**Paul E. Cooper, M.E.I.C.**, manager of the Thames Board Mills, Limited, at Warrington, Lancashire, England, has recently been appointed president of the local Chamber of Commerce. Born in Ottawa, Mr. Cooper graduated in civil engineering from McGill University in 1923. Upon graduation he joined the Singer Manufacturing Company as a topographical engineer in charge of surveys on the company's limits north of Ottawa. Later he became location engineer in connection with the construction of a standard gauge railroad in the vicinity of Thurso, Que. In 1926 he joined the Canadian International Paper Company and was engaged on mill construction at Gatineau. Later he was resident engineer on construction of the Hydro Electric Development at Kent's Falls, N.Y., for the same firm. In 1930 he became plant engineer in charge of maintenance and construction work at the Piercefield Mill in northern New York State. His services later were transferred to a subsidiary company—the Continental Paper and Bag Corporation—and subsequently he became plant engineer and then manager of the Rumford mill.

Mr. Cooper's association with the Thames Board Mills began in 1936, when he went to Warrington, England, in charge of construction.

**H. M. Howard, M.E.I.C.**, who has been with the Eldorado Gold Mines, Limited, Port Hope, Ont., since the spring, has been appointed mill superintendent of the mine at Great Bear Lake, Port Radium, N.W.T.

**W. I. Shuttleworth, M.E.I.C., R.C.A.F.**, who has been stationed at Gander, Newfoundland, since December, 1941, has been promoted to Flight-Lieutenant and transferred to St. John's, Newfoundland.

**S. W. Gray, M.E.I.C.**, assistant hydraulic engineer of the Nova Scotia Power Commission, has been appointed maritime regional representative of the Wartime Bureau of Technical Personnel with offices at Halifax. He will be assisted by G. F. Bennett, M.E.I.C., and A. D. Foulis, M.E.I.C., who will both act in an honorary capacity.

Mr. Gray, who is on leave from the Nova Scotia government is a councillor of the Institute representing the Halifax Branch. He is also joint secretary of the Halifax Branch and the Association of Professional Engineers of Nova Scotia. He is a past-president of the Association of Professional Engineers.

**G. McL. Pitts, M.E.I.C.**, has been unanimously elected a Fellow of the Royal Institute of British Architects by a special resolution of the Council of the Institute. He was at the same time elected a member of the Council. Mr. Pitts is a councillor of The Engineering Institute of Canada representing the Montreal Branch, is president of the Royal Architectural Institute of Canada, president of the Graduates' Society of McGill University, past-president and councillor of the Province of Quebec Association of Architects and a member of the firm of Maxwell and Pitts, architects, Montreal.

**Flight Lieutenant Cyril G. Carroll, M.E.I.C.**, formerly at the Directorate of Works and Buildings, R.C.A.F. Headquarters, Ottawa, is now Camouflage Officer at Western Air Command of the R.C.A.F., Victoria, B.C.

**H. B. Dickens, M.E.I.C.**, has recently been appointed supervising engineer in the Department of Public Works at Ottawa. He returned to Canada from England last year, after having filled a two-year appointment with the British War Office at Woolwich Arsenal. Later he was attached as a consultant to the General Engineering Company at Toronto.

**C. Neufeld, M.E.I.C.**, has taken a position as assistant engineer in the Bridge Department of the Canadian Pacific Railway at Montreal. He was previously on the staff of the Dominion Bridge Company at Calgary as designing engineer. Mr. Neufeld, who graduated from the University of Saskatchewan in the class of 1935, was the winner of the H. N. Ruttan Prize of the Institute in 1938.

**T. C. Thompson, M.E.I.C.**, has recently returned from overseas, having been invalided out of the army. He had been in England with the Royal Canadian Ordnance Corps. Before enlisting in 1940 he was with the Bell Telephone Company of Canada in Montreal.

**M. M. Price, M.E.I.C.**, has recently been transferred from Port Arthur, Ont., to Prince Rupert, B.C., as assistant division engineer with the Canadian National Railways. He was previously assistant bridge and building master at Port Arthur.

# Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

**W. L. Kent**, M.E.I.C., has recently returned from Nevada, U.S.A., where he was employed with Basic Magnesium Incorporated, and has taken a position with the Northern Construction Company and J. W. Stewart Limited at Vancouver, B.C.

**J. P. Estabrook**, Jr.E.I.C., has recently joined the staff of the Aluminum Company of Canada, Limited, at Shawinigan Falls, Que. He was previously employed with Price Bros. & Company, Limited, at Riverbend, Que., after having graduated from Queen's University in 1939.

**Edward Ryan**, Jr.E.I.C., has taken a position in the Works and Buildings Branch, Naval Service, Department of National Defence at Ottawa, as assistant engineer in charge of progress reports.

**J. G. Belle-Isle**, S.E.I.C., has recently been granted a commission as pilot officer in the navigation branch of the R.C.A.F. He has left for western Canada to attend a course in aerial navigation to qualify as an instructor. Before enlisting he was an engineer in the plant engineering department of the Bell Telephone Company of Canada at Montreal.

A graduate of the Ecole Polytechnique, Montreal, he was the winner in 1938 of the Ernest Marceau Prize of the Institute.

**G. R. McElroy**, S.E.I.C., who graduated from the University of Saskatchewan this year, has accepted a position with the Demerara Bauxite Company, Mackenzie, British Guiana.

**L. J. Ehly**, S.E.I.C., has accepted a position as resident engineer with the Department of Transport, Lethbridge, Alta. He was previously employed with the Royalite Oil Company at Turner Valley, Alta., after graduating from the University of Alberta with the degree of B.Sc., in 1941.

**C. E. McLean**, S.E.I.C., graduated from the University of Alberta this spring with the degree of B.Sc. in civil engineering.

**M. A. Phelan**, M.E.I.C., who has been manager of the Noranda Office of Peacock Bros., Limited, has been transferred to the Toronto office of the company.

**Flying Officer André Aird**, S.E.I.C., has been stationed at No. 9 Repair Depot, St. John's, Que., since last June, after having previously spent several months at No. 6 Depot at Trenton, Ont. Flying Officer Aird is a graduate of the Ecole Polytechnique, Montreal, from the class of 1938.

## VISITORS TO HEADQUARTERS

**Lieutenant Mayo Harrigan**, M.E.I.C., R.C.N.V.R., H.M.C. Dockyard, Halifax, N.S., on August 4th.

**Jules Mercier**, S.E.I.C., Canadian General Electric, Peterborough, Ont., on August 5th.

**N. R. Crump**, M.E.I.C., assistant to the vice-president, Canadian Pacific Railway, Montreal, Que., on August 11th.

**G. H. Thurber**, M.E.I.C., Department of Public Works of Canada, Ottawa, Ont., on August 20th.

**W. C. Wilkinson**, Jr.E.I.C., National Research Council, Ottawa, Ont., on August 21st.

**Major C. B. Bate**, M.E.I.C., R.C.E., St. Johns, Newfoundland, on August 26th.

**J. A. Mersereau**, M.E.I.C., Woodstock, N.B., on August 27th.

**G. A. Campbell**, S.E.I.C., Port of Spain, Trinidad, on August 28th.

**John Maurice Evans**, M.E.I.C., assistant manager of the Department of Development, Shawinigan Water and Power Company, died in the hospital at Montreal after a brief illness on July 28th, 1942. He was born at London, England, on October 7th, 1905, and came to Canada as a youth. He studied engineering at McGill University, Montreal, and he graduated in 1929 with the degree of Bachelor of Science in electrical engineering.

He spent his holidays in the summer with the Canadian Marconi Company one year and another on a field party with the Canadian International Paper Company. He joined the Shawinigan Water & Power Company in June, 1929, and after spending two years on system planning and equipment designing, he was transferred to the Department of Development, devoting his attention to industrial location studies and the development of new loads.

J. M. Evans, M.E.I.C.

During the summer of 1939 he went to England as a member of the delegation representing the Canadian Manufacturers' Association to discuss the possibility of Canadian industry giving assistance to Great Britain in time of war.

Last year when the Department of Trade and Commerce sought a man to act as chairman of the executive sub-committee on export control, Mr. Evans was chosen for this post. A department was organized under the direction of Mr. Evans, whose recommendations remedied an uncertain condition in connection with the issuance of export permits and effected a smooth co-ordination of effort. At the conference held in Toronto of the Canadian Manufacturers' Association on June 9th this year on manufacturing materials and shipping controls, Mr. Evans gave a resumé of the situation affecting export control in Canada. Two weeks later he went into hospital.

Mr. Evans joined the Institute as a Student in 1929, becoming a Junior in 1931. He was transferred to Associate Member in 1937 and in 1940 he became a Member.

**Fred Henry Kester**, M.E.I.C., died suddenly in Detroit, Michigan, on August 6th, 1942. He was born at Richland, Michigan, on September 5th, 1885, and studied engineering at the University of Wisconsin. He entered the employ of The Canadian Bridge Company Limited at Walkerville, Ont., in May, 1907, and with the exception of a short period in 1908-1909 when he left to continue his studies, he remained in that service until June 1, 1941, when because of ill health he retired.

During his active career he performed ably all the tasks connected with the engineering and contracting departments, and rose steadily to become president and general

manager in 1937. The designs which he made and the contracts he took, are distributed throughout Canada and overseas as well. In 1937 he became general manager of

F. H. Kester, M.E.I.C.

the Canadian Steel Corporation Limited at Ojibway, Ont., and of The Essex Terminal Railway. All of these companies prospered under his management.

Mr. Kester's leaving was mourned by his associates, with whom his relations were informal and friendly. His services were highly valued by the directors of the companies he served, and they insisted on his remaining on the active list as consultant.

Death came by heart failure at a time when he was again visiting the companies which he formerly managed. He was a life-long member of the Presbyterian Church of Richland, a member of The Engineering Institute of Canada, the Engineering Society of Detroit, the American Society of Civil Engineers, the New Zealand Institution of Engineers, and of various other organizations. His wife, two daughters, Mrs. E. W. Driedger of Cleveland and Mrs. R. W. Stickney of Windsor, Ont., and a son, William H. Kester of Pittsburgh, an able young engineer, survive him.

Mr. Kester's thorough understanding of all phases of his business and his friendly and effective helpfulness will not pass from the memory of those privileged to have been associated with him.

Mr. Kester joined the Institute as an Associate Member in 1918 and he was transferred to Member in 1926. He was one of the charter members of the Border Cities Branch of the Institute.

**Alexander M. Kirkpatrick**, M.E.I.C., died in Toronto, Ont., on July 1st, 1942. He was born at Chatham, Ont., on April 18th, 1889, and was educated at Queen's University, Kingston, where he graduated in 1911 with the degree of Bachelor of Science in civil engineering. Upon graduation he went for a few months as assistant engineer with the International Commission on the River St. John. From 1912 to 1914 he was in charge of a hydrometric survey party on the Ottawa river. In 1914 he joined the Department of Public Works of Canada and was engaged on surveys for the location of storage and dam sites on the North Saskatchewan river.

He served for eight months with the Royal Air Force in 1918, returning to the Department of Public Works at Ottawa after the war. In 1921 he was transferred to the London, Ont., office and in 1927 he went to the Winnipeg district.

Mr. Kirkpatrick was promoted to the position of district engineer at Charlottetown, P.E.I., in 1936. In October, 1937, he returned to Winnipeg and since then to the time of his death was district engineer for the Department of Public Works in the districts of Manitoba, Saskatchewan, Alberta and Northwest Territories.

Mr. Kirkpatrick joined the Institute as a Junior in 1914 and he was transferred to Associate Member in 1919. He became a Member in 1940.

**Edwin Reginald Millidge**, M.E.I.C., died in Winnipeg on October 20th, 1941. He was born at Antigonish, N.S., on December 22nd, 1881, and received his education at the local St. Francis Xavier University. He began his engineering career with the Nova Scotia Steel and Coal Company at Sydney Mines, N.S., in 1902. Two years later he joined the Transcontinental Railway and until 1910 he was employed in the maritime provinces and Ontario. After a few months in private practice as manager and member of the firm of Robert Grant and Company, engineers and contractors at Edmonton, Alta., he returned to railway engineering with the Canadian Northern Pacific Railway at Kamloops Lake, B.C. in 1911 and remained with the company until 1916 when he became assistant engineer with the Town of New Glasgow, N.S. From 1918 to 1922 he was engaged in farming in Saskatchewan and in June, 1922, he joined the Canadian National Railways as a roadmaster at Albreda, B.C. In 1923 he was transferred to Wabamun, Alta., and from 1927 to the time of his death he was division engineer of maintenance for the Canadian National Railways at Winnipeg.

Mr. Millidge joined the Institute as a Student in 1902, transferring to Associate Member in 1909. He became a Member in 1915.

## News of the Branches

### EDMONTON BRANCH

F. R. BURFIELD, M.E.I.C. - *Secretary-Treasurer*  
L. A. THORSSSEN, M.E.I.C. - *Branch News Editor*

In view of the importance of the Webster Lectures it was felt by the Executive of the Edmonton Branch that the members should have an opportunity to share in some of the information given. Professor Morrison, one of our delegates, kindly consented to address the branch on the subject and accordingly on July 20th, a meeting was arranged and held in Room 14, Medical Building of the University of Alberta. About 35 members and engineering friends were present.

In introducing his subject Professor Morrison read the General Secretary's warning that Professor Webster's Lectures were intended for the engineering profession only and went on to say that he was satisfied that anything he

### Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

would say could not infringe official secrets as it had already appeared in print. He stated that he had only received the notes of the Webster Lectures that afternoon and consequently he had been unable to study them. His slides which were both numerous and well selected were taken from various publications.

The degrees of danger and the effects on morale when taking up various positions during an air raid were illustrated by one slide. The intensity of the blast and of its secondary suction effect were shown and discussed. Various types of shelter were shown and it was noted that the British appeared to find an above ground shelter preferable

Tea for two—Vice-President de Gaspé Beaubien and Councillor Dr. F. W. Gray.

Below: Chairman J. A. MacLeod welcomes the visitors.

## PRESIDENTIAL VISIT TO CAPE BRETON BRANCH

The dinner meeting was held in the cook house on a construction job at Sydney.

At the head table, from left to right: T. L. McCall, C. H. Wright, H. J. Kelly, Vice-President and General Manager of Dominion Coal and Steel Corporation, C. V. Dunne, Dean Young and J. A. MacLeod.

to buried ones. Possibilities of strengthening existing buildings and designing new ones with greater resistance to collapse were pointed out.

At the conclusion of Professor Morrison's talk the meeting was thrown open for questions and then a vote of thanks was moved by Mr. A. W. Haddow, who stated how much the members present enjoyed the lecture and appreciated the time that Professor Morrison had given to its preparation.

### HALIFAX BRANCH

S. W. GRAY - - - - Secretary-Treasurer  
G. V. ROSS - - - - Branch News Editor

President C. R. Young, on his tour of Institute branches, paid a visit to Halifax on August 7th. He was accompanied by Past-President McKenzie, Vice-Presidents K. M. Cameron, Ottawa; deGaspé Beaubien, Montreal; and G. D. Murdoch, Saint John; General Secretary L. Austin Wright, Assistant General Secretary, Louis Trudel, and Mr. G. A. Gaherty.

A Council meeting attended by twenty-three officers was held at the Nova Scotian Hotel in the forenoon, followed by a luncheon. Through the courtesy of the Royal Canadian Navy, the visitors were entertained during the afternoon by a launch trip around "An Eastern Canadian Port."

A dinner meeting was held in the evening at the Nova Scotian Hotel. President Young's address, **The Institute and the Engineering Profession**, was heard with keen interest by ninety members.

Other speakers were Deputy-Mayor G. S. Kinley, who

welcomed the visitors on behalf of the City, C. J. Mackenzie, K. M. Cameron, deGaspé Beaubien, and L. Austin Wright. P. A. Lovett was chairman of the meeting.

### MONCTON BRANCH

V. G. BLACKETT, M.E.I.C. - Secretary-Treasurer

On August 3rd the Moncton Branch received an official visit from Dean C. R. Young, president of the Engineering Institute of Canada, accompanied by Vice-President K. M. Cameron and Assistant General Secretary Louis Trudel. The presidential party was greeted, on arrival, by branch officers. They were then taken on a motor tour of the surrounding country, viewing the incoming tidal bore of the Petitcodiac river and later visiting Moncton's Magnetic Hill, where so many eminent members of the profession have temporarily lost faith in the infallibility of the law of gravitation.

In the evening a dinner meeting was held in honour of the president. H. J. Crudge, chairman of the branch presided and twenty-five members and guests were present. F. O. Condon extended a welcome to the visitors, and he was followed by Councillor G. L. Dickson and A. A. Swinerton, secretary-treasurer of the Ottawa Branch.

The first of the guest speakers, Vice-President Cameron, stressed the need for the study of post-war problems. It will be the duty of the engineer and the Engineering Institute, he said, to see what can be done in the future development of the great resources of the country in order that work may be provided when the armed forces are demobilized.

# THE PRESIDENT VISITS THE HALIFAX BRANCH

*Above:* The head table at the dinner meeting: Vice-President K. M. Cameron, Councillor J. R. Kaye, President C. R. Young, Chairman P. A. Lovett, Past-President C. J. Mackenzie.

*Left:* L. M. Allison, Sub-Lieut. R. G. McFarlane, O. S. Cox, R. L. Norman, Sub-Lieut. I. M. Fraser, R. G. Shatford.

*Right:* A. G. Mackay, W. G. Macdonald, A. D. Nickerson, P. C. Hamilton, G. J. Currie, E. S. Henrikson.

*Below:* Jeffrey Marshall, J. E. Forbes, Deputy Mayor G. S. Kinley, L. Austin Wright.

*Right:* G. A. White chats with C. D. Martin.

*From left to right:* F. A. Bowman, W. P. Copp, F. H. Sexton, C. S. Bennett, A. E. Flynn, S. L. Fultz.

*Left to right:* F. Alport, H. M. Davy, G. G. Dunbar, D. G. Dunbar, R. B. Stewart, D. C. Duff.

## PRESIDENTIAL VISIT TO THE QUEBEC BRANCH

Dr. O. O. Lefebvre, J. E. Armstrong and Major E. D. Gray-Donald.

Past-President A. R. Decary, President Young and Chairman L. C. Dupuis.

Jean Morency, Gustave St-Jacques, Huet Massue and G. B. Mitchell.

Mr. Trudel spoke of the work the Institute is doing and stated that the membership has now reached 5,575, an all time high.

The president in his address told of the part that engineers are playing in the war. War is full of emergencies and crises and engineers are the persons who are most accustomed to meeting emergencies. When the end of the war is in sight, engineers must not slacken their efforts. The Institute must prepare to be stronger and more useful than ever before. It will be necessary for the welfare of the country to look after the selection and guidance of young men who are interested in engineering and see that those with the right qualifications are encouraged.

At the conclusion of the address, Dean H. W. McKiel spoke in appreciation of the president.

The meeting closed with the singing of the National Anthem.

The following morning H. A. Fuller took the visitors on an inspection of the new coal unloading facilities at Pointe du Chene.

### SAGUENAY BRANCH

A. T. CAIRNCROSS, M.E.I.C. - *Secretary-Treasurer*

The Annual Meeting of the Saguenay Branch of the Institute was held at Arvida on August 13th, 1942.

During the afternoon a party of about sixty members was conducted in small groups on a tour of inspection of the 1,000,000 hp. development at Shipshaw, about five miles distant from Arvida. Motor cars and guides were provided through the courtesy of Mr. A. O. Hawes of the Aluminum Company of Canada, Ltd.

At 7.00 p.m. seventy-three members gathered at the Saguenay Inn for the Annual Dinner Meeting, which was held in the Grill Room.

The meeting was opened by the retiring chairman, Mr. N. F. McCaghey, who proposed a toast to the King and the President of the United States.

The annual reports were read by the acting secretary, Mr. J. G. D'Aoust, and were approved by the meeting.

The chairman then called upon Dean C. R. Young, president of the Institute, to address the gathering.

Dean Young thanked the Branch for the welcome extended to himself and his party. He regretted that Mr. L. Austin Wright, the general secretary, was unable to be present, but said that in his absence Louis Trudel, the assistant secretary, was carrying on in an able manner.

The president in his address emphasized the need for the Institute to carry on its activities in a vigorous way during the war period. He said that the United States Societies were all active and showed no signs of folding up. At the present time the demand for engineers is unusually great because engineers are required to head up new enterprises and assume important posts in the armed forces.

The president told about the co-operative agreements entered into by the Institute and the Professional Societies in the provinces of Nova Scotia, New Brunswick, Alberta, and Saskatchewan, and outlined the advantages to be obtained through them.

An outline was given of the work being done by the Committee, appointed by the Institute, under the chairmanship of Mr. Bennett, to study the Training and Welfare of the Young Engineer. The Committee has issued to English secondary schools across Canada a booklet entitled "The Profession of Engineering in Canada," and within a short time a similar booklet will be issued in French to all French secondary schools.

The tour of Professor F. Webster, sponsored by the Institute, was recalled, and Dean Young said that it was of inestimable value to the Institute and to Canada at large. In Toronto, Professor Webster gave a course of lectures to a group of about one hundred and eighty engineers, and the Institute printed, at its own expense, the technical information presented. As some of the information submitted in this course was considered to be of a confidential nature, it has not been made public in the printed form.

Dean Young told about the formation of the Federal-appointed Committee on Post-War Reconstruction Problems, under the chairmanship of Dr. F. Cyril James, principal of McGill University. In this line of endeavour the Institute is not taking a directly active part, but indirectly it is supporting the movement whenever possible. On the James Committee and its Sub-committees are prominent members of the Institute who are in close touch with headquarters on all matters in which they may be of help.

In closing his remarks the president said that all engineers should recognize the doctrine of trusteeship and have a full understanding of their social obligations. The duty of the engineer is not to drive a hard bargain for his own or his employer's immediate benefit, but it is to act fairly under all circumstances. The engineer, to arrive at his just recognition, has to learn that all technological advances must be introduced only after the good of the whole population has been considered.

Following the talk by Dean Young, the chairman called upon several of the visiting members to say a few words.

Mr. K. M. Cameron, vice-president of the Institute, and chief engineer of the Department of Public Works, Ottawa, spoke about the James Committee and said it was totally independent of any political party. Mr. Cameron, chairman of the Sub-committee on Construction Projects, said that it was the duty of this committee to study projects that would be available after the war to take up the slack in unemployment. The Sub-committee had distributed questionnaires asking members and Branches of the Institute to report on the lines which they considered post-war reconstruction should follow.

## SAGUENAY BRANCH ANNUAL MEETING

*Top left:* F. W. Bradshaw, James Shanly and M. G. Saunders.  
*Top right:* W. R. Mackay, Roland Marcotte, M. Luscombe, W. J. Thompson, D. P. MacNeil and E. W. McKernan.  
*Centre left:* J. G. D'Aoust, A. T. Cairncross, Otto Holden of Toronto and J. W. Ward.  
*Centre right:* E. G. Allwright, G. B. Moxon and H. Sirson.

*Bottom left:* The younger set, starting at 6 o'clock in a clockwise direction, Jean Flahault, H. T. Kummen, Yvon Cousineau, Gaston Dufour, L. P. Cousineau, R. S. Bleakley, H. A. Estabrook, B. L. Davis, J. E. Pepall and B. E. Surveyer.

*Bottom right:* Jacques Vinet, Rosaire Saintonge, H. J. Lemieux, Noel Dixon, R. B. Brosseau and Gilbert Proulx.

Vice-president de Gaspé Beaubien, who accompanied Dean Young on his tour of the Eastern Branches, expressed his pleasure at being a member of the visiting party, and said that the knowledge gained through the travel more than compensated for the time spent away from his professional duties.

Mr. Otto Holden, chief hydraulic engineer of the Hydro-Electric Power Commission of Ontario, expressed his pleasure at being present and wished the Branch every success in its endeavours.

Mr. McCaghey invited Mr. R. H. Rimmer, chairman-elect, to take charge of the meeting. The new chairman thanked the members for the honour conferred upon him, and introduced the 1942-43 executive.

### SAINT JOHN BRANCH

G. W. GRIFFIN, M.E.I.C. - Secretary-Treasurer

A dinner meeting in honour of Dean Young, president of the Institute, was held by the branch on August 10th at the Admiral Beatty Hotel. David R. Smith, chairman of the branch, presided.

In his address, the president said that never before had the engineer played so important a part or gained so much recognition as he has in to-day's important events. In either peace or war he must be a man of sound, straightforward thinking with rigorous standards and principles.

The scarcity of trained technicians which confronted the government in many fields, including engineering, worried the government considerably and it has now begun to finance worthy students while in college. The task which the Institute has been called on to perform, he stated, has been to select and guide the men who are to enter engineering colleges so that those suited to the profession may go on and those unsuited may be directed into other professions.

In regards to post-war reconstruction, Dean Young said that now was the time for the engineers to plan, and plan wisely for the future, or "we shall again find ourselves in as bad a mess after the war as we were before it."

K. M. Cameron and deGaspé Beaubien, vice-presidents; Louis Trudel, assistant general secretary of the Institute, and G. A. Gaherty of Montreal, also spoke.

Left—In the background: G. M. Brown of Saint John. In front: R. M. Scrivener and W. E. Bonn of Toronto. Right: C. D. McAllister, F. A. Patriquen and A. O. Wolff, all of Saint John.

Mr. Cameron appealed for better recognition for students and junior members, who should be stirred to greater action.

Mr. Trudel told of the work the Institute is doing and revealed that the membership had reached the high figure of 5,575. He extended an invitation to all members to visit the headquarters of the Institute in Montreal.

### ST. MAURICE VALLEY BRANCH

J. B. SWEENEY, S.E.I.C. - *Secretary-Treasurer*

Mr. R. N. Fournier, Industrial Heating Specialist with Canadian General Electric was guest speaker to the St. Maurice Valley Branch at a dinner meeting held at the Chateau de Blois in Three Rivers on June 25th.

Mr. Fournier gave an illustrated talk on the subject **Electric Heat in Industry**. The first part of the lecture was devoted to electric heat treating furnaces, their types and common applications. Mr. Fournier pointed out some of the applications in which these furnaces are being used in direct munitions manufacture. The speaker also covered the various types of control equipment which is available and the types of gas atmosphere used in furnaces as a protection of the work against oxidation and decarbonization.

The second part of the lecture included a discussion of various small heating devices and their many applications in industrial plants.

The last part of the lecture was devoted to a discussion and demonstration of the fundamentals of the Infra Red method of heat treating, a spectacular development, in this field which has received much publicity in recent years.

Infra Red heating and drying is the name given to the technique of using reflectors to control the radiation of incandescent lamps and directing this radiation against the work to be heated. The principle involved is that any incandescent body will emit energy in the form of radiation, the most efficient way of transferring heat energy. In travelling through the air from a hot body, the electromagnetic rays lose very little of their heat in the air and give up their energy only when they strike and are absorbed by some object.

The percentage of radiation that is absorbed by a surface is usually described as the absorption factor which varies from 5 to 95 percent. This radiation gives its heat up to the work as quickly as the work will absorb it and as a result the work temperature is higher than the surrounding atmosphere. Insulation therefore serves no useful purpose. Draft shields are used, however, to redirect radiation which is not absorbed by the work or reflected by it.

Due to limitations in the design of the lamps and reflecting equipment it has been found that ten watts per sq. in. is the maximum amount of radiation that can be directed on any work and owing to the absorption limitations 600 deg. F. is about the maximum working temperature which has been obtained successfully.

The great majority of Infra Red applications have been

made for paint baking at a work temperature of from 300 to 400 deg. F. In this connection, there are two types of paints, one having an oil base and the latest type with a synthetic resinous base. The former dries mainly by oxidation which is only slightly affected by heat. In the latter the drying takes place by a polymerization process, a chemical change which takes place very rapidly at the baking temperature.

The colour has a great influence on the rapidity with which the baking temperature may be reached, black and other dark paints being the best, as a result it is often advantageous to apply the heat to the unpainted side of the work. Similarly the fastest drying will take place on light gauge material rather than on castings.

Infra Red is also being used for drying photographic prints, blue prints, plastic parts, glue and for curing thin rubber sheets. Some work is also being done in speeding up the drying of printing inks on the modern high speed presses.

Mr. J. H. Fregeau, branch councillor, thanked the speaker for his very interesting talk.

The St. Maurice Valley Branch met on July 30th, to welcome President Young and his party on their tour of Eastern Branches. Convening at the Laurentide Club in Grand'Mère, all members of the branch and our guests, the district members of the Association of Professional Engineers of the Province of Quebec, were given the opportunity of meeting members of the Headquarters Party.

The body then assembled for dinner at the Laurentide Inn, after which several members of the Presidential Party spoke on the various activities of the Institute.

In introducing Dean Young to the meeting, Chairman Viggo Jepsen dwelt on the president's high professional standing both in a civil and military capacity.

The president proceeded to outline the various Institute committees which were actively engaged in furthering Canada's war effort and of the assistance which council was giving to the various governmental departments, and the part that Canadian engineers led by General McNaughton are playing in winning the war.

Speaking to members of the Association of Professional Engineers who were present, Dean Young discussed the Institute's committee for professional advancement which co-operated with the former body. Bearing in mind the

Huet Massue explains it to H. J. Ward and J. H. Fregeau, while Dean Young gauges the lumber stock pile at Grand'Mère.

common interests of our two professional bodies, President Young felt that the present move for joint membership was commendable and would present a broader view of the term "professional engineer" to the general public.

In closing, mention was made of the excellent work which is being done by H. F. Bennett's Committee for Student Guidance, which intended to offer its assistance to post-graduate engineers, to point out the value of developing the individual personality and assist in making professional connections.

Dr. A. H. Heatley, thanked the president for his message and was pleased to say that the organization of Student Guidance Committees in the St. Maurice Valley had been completed.

Chairman Jepsen introduced Past-President Lefebvre who commented on some of the president's remarks and pointed out to the junior engineers present that a degree simply gave him the right to continue his studies without supervision. In closing Dr. Lefebvre spoke in French pointing out the value of Institute connections as a continuing

common ground of understanding among French and English engineers of the province.

Vice-President Cameron reported on the progress of his Committee on Post-War Reconstruction and asked the body to give some serious thoughts to a works programme which would continue employment in the probable post-war recession period.

Councillor Armstrong of Montreal gave a brief account of the progress made to date in the newly formed Committee on Engineering Features of Civil Defence which is working in close co-operation with Dr. Manion of the Dominion Government.

Louis Trudel, assistant general secretary, gave an excellent review of all current activities of the Institute with emphasis on internal affairs.

Mr. H. Massue, past-councillor of the Montreal Branch, also accompanied the party.

An exceptionally large number of members of the branch were on hand to renew acquaintance with the Headquarters party, and contributed to a very successful meeting.

## Library Notes

### ERRATUM

#### Definitions of Electrical Terms American Standard C12

Under Additions to the Library in the August Issue of the *Journal* the price of this volume was quoted as \$1.00 in Canada. The correct price is \$1.15 in Canadian funds if ordered through the Canadian Engineering Standards Association. It is 8 x 11 in., containing over 300 pages.

### ADDITIONS TO THE LIBRARY TECHNICAL BOOKS

#### Analytic Geometry:

Charles H. Lehmann. N.Y., John Wiley and Sons, Inc., 1942. 6 x 9¼ in., \$3.75.

#### Molecular Films, the Cyclatron and the New Biology:

Essays by Hugh Stott Taylor, Ernest O. Lawrence and Irving Langmuir. New Brunswick, Rutgers University Press, 1942. 6¼ x 9¼ in., \$1.25.

#### National Building Code:

Prepared under the joint sponsorship of the National Housing Administration, Department of Finance and the Codes and Specifications Section, National Research Council of Canada. Ottawa, National Research Council publication No. 1068 (1942). 6 x 9 in., \$1.00.

#### Mathematics of Modern Engineering:

Vol. 2, *Mathematical Engineering*. Ernest G. Keller. N.Y., John Wiley and Sons, Inc., 1942. 6 x 9¼ in., \$4.00.

#### Machine Shop Yearbook and Production Engineers' Manual:

Editor H. C. Town. London, Paul Elek Publications (1942). 5¼ x 8½ in., 25/ plus 9d postage.

#### Canadian Engineering Standards Association:

Standard Specification for Oil Circuit-Breakers: C77-1942, \$0.50—Standard Specification for Pole Line Hardware: C83-1942, \$0.75.

### BOOK NOTES

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet the books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

#### AIRCRAFT ENGINE AND METAL FINISHES

By M. A. Coler. Pitman Publishing Corp., New York and Chicago, 1942. 128 pp., illus., diags., tables, 8½ x 5½ in., cloth, \$1.50.

A brief description of current American practice in finishing the exterior surfaces of aircraft engines and similar parts is provided in this small book. It is intended for readers confronted by real problems, but who have little knowledge of finishing procedures. Therefore, much of the text is devoted to the principles underlying these procedures, with particular attention to organic finishes.

#### AIRCRAFT RIVETING, a Guide for the Student

By E. B. Lear and J. E. Dillon. Pitman Publishing Corp., New York and Chicago, 1942. 118 pp., illus., diags., charts, tables, 8½ x 5½ in., cloth, \$1.25.

The subject of riveting is covered broadly, with emphasis upon certain practical aspects of its most important functions, and is presented in a volume of handy size.

#### ANALYTIC GEOMETRY

By C. H. Lehmann. John Wiley & Sons, New York, 1942. 425 pp., diags., tables, 9 x 6 in., cloth, \$3.75.

A textbook for a first course in plane and solid analytic geometry. Special features are the completeness of the investigations of each topic, the construction of tables summarizing closely related results, a fuller treatment of solid analytic geometry than is usual in elementary texts, and the large number of exercises included.

#### **CHEMICAL REFINING of PETROLEUM** (American Chemical Society Monograph Series No. 63)

By V. A. Kalichevsky and B. A. Stagner. rev. ed. Reinhold Publishing Corp., New York, 1942. 550 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$7.50.

This monograph is a comprehensive review of the literature of the chemical treatment of petroleum and its products. Treatment with sulfuric acid and with alkaline reagents, the use of absorbents and solvents, antideionants and inhibitors of oxidation and gum formation are included. There are many bibliographic footnotes and extensive lists of patents. The new edition has been revised and in part rewritten.

#### **ELECTRIC POWER STATIONS, Vol. 2**

By T. H. Carr, with a foreword by Sir L. Pearce. D. Van Nostrand Co., New York, 1941. 440 pp., illus., diagrs., charts, tables, 9 x 5½ in., cloth, \$9.00.

The aim of this two-volume English book is to provide an account of the general principles that govern the design, construction and operation of electric power stations, which will assist the designer to choose, from the plant available, that which best fulfills the conditions to be met, and to arrange it in the most economical way. The present volume deals with the electrical equipment and station organization and costs.

#### **ELECTRICAL TRANSMISSION and DISTRIBUTION REFERENCE BOOK**

By Central Station Engineers of the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., 1942. 570 pp., illus., diagrs., charts, tables, 12 x 8½ in., cloth, \$5.00.

This book, offered as a successor to William Nesbitt's "Electrical Characteristics of Transmission Circuits," brings together, in convenient form for reference, a large amount of practical, up-to-date information on the design and operation of transmission and distribution systems. Each chapter is by a specialist in the subject, and nearly all chapters have bibliographies. Appendices contain tabulated statistical data on transmission lines, power systems and transformer circuits.

#### **ELEMENTARY STRUCTURAL ANALYSIS and DESIGN, Steel, Timber and Reinforced Concrete**

By L. E. Grinter. Macmillan Company, New York, 1942. 383 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$3.75.

A brief, simple treatment of the subject, intended for students of architecture and mechanical and electrical engineering and others interested in buildings and miscellaneous structures, but not in bridge design. While greatest emphasis is placed on steel structures, considerable attention is given to reinforced concrete, and timber is treated adequately. Special chapters on timber roof trusses and on column footings are included.

#### **ELEMENTS of PRACTICAL AERODYNAMICS**

By B. Jones. 3 ed. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 459 pp., illus., diagrs., charts, maps, tables, 9½ x 6 in., cloth, \$3.75.

This is a simple exposition of the subject, intended for classroom use. This edition has been revised and rearranged, and new material has been added.

#### **Great Britain, Department of Scientific and Industrial Research**

#### **FOOD INVESTIGATION Special Report No. 52. The MODE of OCCURRENCE of FATTY ACID DERIVATIVES in LIVING TISSUES, a Review of Present Knowledge**

By J. A. Lovern. His Majesty's Stationery Office, London, 1942. 36 pp., 9½ x 6 in., paper, (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, \$0.25).

This pamphlet is a review of the investigations of lipoidal matter which have appeared during the last ten years or so. An extensive bibliography is involved.

#### **Great Britain, Ministry of Works and Buildings. FIRST REPORT of the COMMITTEE on the BRICK INDUSTRY**

His Majesty's Stationery Office, London, 1942. 24 pp., maps, tables, 9½ x 6 in., paper, (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, \$0.15).

This report presents the state of the industry in Great Britain, considers war-time and post-war probable demands, and makes recommendations toward increased efficiency and economy in manufacture.

#### **Great Britain, Ministry of Home Security, Home Security Circular No. 75/1942**

#### **SHELTER DESIGN and STRENGTHENING—CONSOLIDATING CIRCULAR**

His Majesty's Stationery Office, London, 1942. 21 pp., diagrs., 13 x 8½ in., paper, (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, \$0.30).

Modified designs for "standard" shelters are given, which afford a much greater degree of protection at small increase in cost. Methods of strengthening existing shelters are also described.

#### **Great Britain, Ministry of Works and Buildings. STANDARD SCHEDULE of PRICES, January, 1942.**

His Majesty's Stationery Office, London, 1942. 87 pp., tables, 8½ x 6 in., paper, (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, \$0.30).

Schedule covers building and civil engineering work in the erection of camps, stores, factories and similar structures within the Government scheme of building operations.

#### **HANDBOOK of MECHANICAL DESIGN**

By G. F. Nordenholt, J. Kerr and J. Sasso. McGraw-Hill Book Co., New York and London, 1942. 277 pp., diagrs., charts, tables, 11 x 8½ in., cloth, \$4.00.

This volume, the material of which has appeared previously in *Product Engineering*, presents practical methods and procedures which have been in use in engineering designing departments. Chapters cover: Charts and tables for general arithmetical calculations; the Properties of materials; Beams and structures; Latches, locks and fastenings; Springs; Power transmission elements and mechanisms; Drives and controls; and Design data on production methods. The information is chiefly presented as charts, monograms and tables and in several hundred excellent drawings.

#### **HANDBOOK of SHIP CALCULATIONS, CONSTRUCTION and OPERATION**

By C. H. Hughes. 3 ed. McGraw-Hill Book Co., New York and London, 1942. 558 pp., illus., diagrs., charts, tables, 7 x 5 in., lea., \$5.00.

This reference work brings together conveniently a large amount of practical inform-

ation frequently wanted by those who design, build and operate ships. The new edition has been thoroughly revised and largely rewritten.

#### **HEAT TRANSMISSION**

By W. H. McAdams. McGraw-Hill Book Co., New York and London, 1942. 459 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$4.50.

In this volume which is sponsored by the National Research Council, the fundamentals of heat transmission are presented in form for study and for reference. The available data have been collected from all sources, reduced to a common basis and correlated, and the results presented in formulas and graphs for use in engineering design. This edition incorporates much new material accumulated during the last decade. There is a bibliography of nearly eight hundred papers.

#### **HOW to PLAN a HOUSE**

By G. Townsend and J. R. Dalzell. American Technical Society, Chicago, 1942. 525 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, \$4.50.

The steps in planning a dwelling, from the selection of the type of house to the choice of plumbing and heating fixtures, are described in detail, in clear, simple language. Structural design, planning, etc., are considered. The book is intended for those intending to build homes and for professional builders.

#### **HYDROLOGY. (Physics of the Earth—IX)**

Edited by O. E. Meinzer. McGraw-Hill Book Co., New York and London, 1942. 712 pp., illus., diagrs., charts, maps, tables, 10 x 7 in., cloth, \$7.50.

This is the final volume of a series of monographs prepared under the direction of a committee of the National Research Council. The series covers the physics of the earth and aims "to give to the reader, presumably a scientist but not a specialist in the subject, an idea of its present status, together with a forward-looking summary of its outstanding problems." The present volume on hydrology first describes the two basic processes, precipitation and evaporation. The processes of storage and transfer of the water are then treated at length and followed by a chapter on the physical and chemical work done by the natural waters in the course of their circulation. Chapters are devoted to the hydrology of limestone and lava-rock terranes. Each chapter has a bibliography.

#### **INDUSTRIAL CAMOUFLAGE MANUAL**

By K. F. Wittmann. Reinhold Publishing Corporation, New York, 1942. 128 pp., illus., diagrs., tables, 11 x 8½ in., paper, \$4.00.

This interesting book presents experiments and experiences developed in the classrooms and camouflage laboratory of Pratt Institute. The presentation is largely by drawings and photographs. Principles, methods and materials are described and demonstrated on models and by actual installations.

#### **INDUSTRIAL FURNACES, Vol. 2**

By W. Trinks. 2 ed. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 351 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$5.00.

As in the first edition of this well-known treatise, this volume is devoted primarily to practice and is intended especially to aid in the selection, installation and operation of furnaces. The discussion covers Fuels and sources of heat energy, Combustion devices and heating elements, Control of furnace temperature and atmosphere, Labor-saving appliances and the Comparison of fuels and types of furnaces. Much of the book has been rewritten, to include new developments.

## INDUSTRIAL MANAGEMENT

By A. G. Anderson, M. J. Mandeville and J. M. Anderson. Ronald Press Co., New York, 1942. 612 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$4.50.

This text is a revision of "Industrial Engineering and Factory Management," in which the emphasis has been shifted from technical and labor problems to the relations that exist between industry and society as a whole. Starting with a presentation of the contacts of a company with the public, the work describes the development of industrial management, the organization of a company, the location, construction and equipment of the plant, product simplification and standardization, relations with employees, and control devices for waste elimination and co-ordination of activities.

## (An) INTRODUCTION to CONTROL ENGINEERING

By E. S. Smith. Apply to author, 114-57 176th St., St. Albans, Long Island, N.Y., 1942. Paged in sections, diags., charts, tables, 11 x 8 in., paper, \$2.00, including separate pamphlet of figures.

These notes represent lectures on control and its applications in the process industries, given by the author for an Engineering, Science, Management and Defence Training course at Pratt Institute. The book is intended for those actively working with industrial measuring and controlling instruments and is intended as an introduction to the basic principles that underly the solution of specific problems.

## Introduction to the THEORY of ELASTICITY for Engineers and Physicists

By R. V. Southwell, 2 ed. Oxford University Press, New York, 1941. 509 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$10.00.

The first edition, which appeared in 1936, was intended to provide a text for students pursuing advanced studies in elasticity and for engineers who needed a wider knowledge of elastic theory than was demanded formerly, to deal with the problems arising from higher speeds in machinery, the use of light metals in structures, etc. This edition is substantially a reproduction of the first, with the correction of a few errors and some minor additions.

## The LINEMAN'S HANDBOOK

By E. B. Kurtz, 2 ed. McGraw-Hill Book Co., New York and London, 1942. 650 pp., illus., diags., charts, tables, 7½ x 5 in., lea., \$4.00.

This work gives a clear presentation of procedure and methods of line construction, accompanied by an introductory explanation of electrical principles and electric systems. The new edition has been thoroughly revised, and new chapters have been added on rural lines, tower-line erection, pole-top resuscitation, safety and rural-line operation and maintenance.

## MARINE DIESEL HANDBOOK

By L. R. Ford. Diesel Publications, New York, 1942. 896 pp., illus., diags., charts, tables, 9 x 6 in., fabrikoïd, \$7.00 (\$8.00, foreign countries).

The machinery of a modern motorship is described and explained in this hand-book, designed for those in charge of operation and maintenance. The principles of the Diesel engine, the types in use and their construction are explained. Chapters deal with fuel, propulsion methods, Diesel-electric drives, supercharging, propellers, speed regulation, suppression of vibration and noise, electricity on the motorship, and accessory equipment.

## MASS SPECTRA and ISOTOPES

By F. W. Aston. Longmans, Green & Co., New York; Edward Arnold & Co., London, 2 ed., 1942. 276 pp., illus., diags., charts, tables, 9 x 5½ in., cloth, \$7.00.

This book, by the leading worker in the field, has been revised in the light of developments since 1933. It opens with an historical review, describes the apparatus and methods used in producing and analyzing mass spectra, the elements and their isotopes, and discusses the theoretical conclusions. A complete account of the analyses of all the elements and the ways in which they were obtained is included for the first time.

## MATHEMATICS DICTIONARY, compiled from the literature and edited by G. James and R. C. James.

The Digest Press, Van Nuys, Calif., 1942. 259 pp.+22 pp. of tables, formulas and symbols, diags., charts, 9½ x 6 in., cloth, \$3.00.

This dictionary is based upon modern textbooks, and aims to give the meaning of the basic mathematical words and phrases, and to cover exhaustively all terms from arithmetic through the calculus, including the technical terms commonly used in the application of these subjects. Many illustrative examples and figures are included, and an appendix provides a number of useful mathematical tables.

## MECHANICS of AIRCRAFT STRUCTURES

By J. E. Younger, 2 ed. McGraw-Hill Book Co., New York and London, 1942. 396 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$4.00.

The fundamental principles and methods involved in the construction of all-metal airplanes are presented in organized form and as simply as possible for student use. The data upon design and structural analysis are recent. The first edition, published in 1935, was entitled "Structural Design of Metal Airplanes."

## METALLURGY of COPPER

By J. Newton and C. L. Wilson. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 518 pp., illus., diags., charts, maps, tables, 9½ x 6 in., cloth, \$5.00.

The aim of this book is to present the various methods used in extracting copper from its ores and refining it to commercial grade. Related subjects, such as ore dressing and the properties and uses of copper, are outlined briefly. Some examples of modern practice are included to illustrate the application of the methods described.

## MOTION and TIME STUDY APPLICATIONS

By R. M. Barnes. John Wiley & Sons, New York, 1942. 188 pp., illus., diags., charts, tables, 11 x 8½ in., paper, \$1.75.

This volume supplements the author's "Motion and Time Study" by providing case material and research data illustrative of that text. Much of the material here is the result of researches in the application of motion and time study to specific problems, as carried out at the University of Iowa.

## National Physical Laboratory, Metrology Department, NOTES on GAUGE MAKING and MEASURING.

Great Britain, Department of Scientific and Industrial Research, London, January, 1942. 68 pp., diags., charts, tables, 10 x 7 in., paper (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, \$0.60).

This pamphlet has been prepared by the National Physical Laboratory for the assistance of firms who are entering the field of gauge making, as a guide in overcoming initial difficulties. It includes notes on the manufacture and measurement of gauges, together with descriptions of suitable measuring apparatus. The text covers the simpler

types of plain and form gauges, but does not consider screw gauges.

## PETROLEUM ENCYCLOPEDIA, "Done in Oil"

By D. D. Leven, edited and revised by S. J. Pirson. Ranger Press, New York, 1942. 1084 pp., illus., diags., charts, maps, tables, 9 x 6 in., fabrikoïd, \$10.00.

A comprehensive presentation of the whole oil industry, with emphasis upon the economic and financial aspects. The place of petroleum in world economics; methods of finding, producing, transporting, refining and marketing oil; oil industry financing; the oil royalty business; and the regulation of securities and markets are described in clear, non-technical language.

## PRINCIPLES of MAGNAFLUX INSPECTION

By F. B. Doane, 2 ed. Magnaflux Corp., Chicago, Ill., 1942. 288 pp., illus., diags., charts, tables, 9 x 6 in., cloth, \$2.50.

The principles of this method of inspection, its advantages, its fields of use and its technique are presented. This new edition has been enlarged and improved. More photographs of Magnaflux patterns have been included; new material has been added on detectable defects, interpretation and welding; and the bibliography has been enlarged.

## PRINCIPLES of RADIO

By K. Henney, 4 ed. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 549 pp., illus., diags., charts, tables, 8 x 5 in., cloth, \$3.50.

The aim of the author has been to present the principles of radio in a form adapted to students with little electrical or mathematical background. The book is intended primarily for trade schools and for self-instruction. This edition has been revised and brought up to date.

## RATIONED RUBBER, What to Do About It

By W. Haynes and E. A. Hauser. Alfred A. Knopf, New York, 1942. 181 pp., diags., charts, 8 x 5 in., cloth, \$1.75.

In this small book, intended for the man in the street, two experienced chemists give a clear, readable account of the rubber situation to-day. The story answers most of the questions that every one is asking.

## Report of a Conference on the ORIGIN of OIL, conducted by the Research Committee of the American Association of Petroleum Geologists, April 5th, 1941, Houston, Texas.

Publ. by American Association of Petroleum Geologists, P.O. Box 979, Tulsa, Okla., 1941. 81 pp., illus., tables, manifold, 11 x 8½ in., paper, \$1.00.

The pamphlet is a stenographic report of an informal round-table discussion at Houston, Texas, on April 5, 1941, which was attended by thirty-six well-known geologists and chemists interested in the subject.

## REPORT WRITING

By C. G. Gaud, H. F. Graves and L. S. S. Hoffman. Revised edition. Prentice-Hall, New York, 1942. 332 pp., diags., blueprints, charts, tables, 9½ x 6 in., cloth, \$2.75.

This is an excellent presentation of certain principles of composition and rhetoric to the special field of the report, intended for use as a college text and for independent study. No fundamental changes have been made in the new edition, but the illustrative material and specimen outlines and reports have been replaced by recent items, the rules for abbreviations have been changed to standard ones, and a section on letters of application has been added.

**REPORTS on PROGRESS in PHYSICS, Vol. VIII (1941), edited by W. B. Mann**

*Physical Society, Exhibition Road, London, S.W.7, England, 1942. 372 pp., illus., diags., charts, tables, 10 x 7 in., cloth, \$5.25, postage included.*

The purpose of these valuable reports is to help the physicist to keep himself informed of the advances constantly being made in those departments of physics in which he has not specialized. To this end, each annual volume contains papers by specialists upon various important fields, accompanied by extensive bibliographies. This volume deals with advances in physics up to the middle of 1941.

**ROTARY DRILLING HANDBOOK**

*By J. E. Brantly. 3 ed. rev. Palmer Publications, New York, Los Angeles and London, 1942. 420 pp., illus., diags., charts, tables, 7½ x 5 in., fabrikoid, \$5.00.*

Presents, in a very practical manner, the equipment and methods used in the oil industry. The book is intended as a manual for those actually engaged in drilling and is confined to methods used in the more difficult fields of this country. This edition has been thoroughly revised.

**SHEET-METAL PATTERN DRAFTING**

*By F. J. O'Rourke and edited by J. A. Moyer. McGraw-Hill Book Co., New York and London, 1942. 189 pp., diags., charts, tables, 9½ x 6 in., cloth, \$2.00.*

This text is intended to familiarize the reader with the basic principles that must be applied in laying out patterns on sheet metal. These principles are illustrated by application to many practical problems of the various kinds that arise in everyday shopwork.

**SOURCE BEDS OF PETROLEUM**

*By P. D. Trask and H. W. Patnode. American Association of Petroleum Geologists, Box 979, Tulsa, Okla., 1942. 566 pp., diags., maps, tables, 9½ x 6 in., cloth, \$4.50.*

This book is the report of an investigation carried out jointly by the American Petroleum Institute and the U.S. Geological Survey during the last ten years, upon the origin and environment of source beds of petroleum. The properties of individual samples of sediments from many oil fields in most of the producing regions of the United States were studied in order to ascertain whether or not any of these properties were related to the distance of the sediments from known oil zones. The regional studies are presented in detail, with the conclusions reached.

**STRATIGRAPHIC TYPE OIL FIELDS, edited by A. I. Levorsen**

*American Association of Petroleum Geologists, Box 979, Tulsa, Okla., 1941. 902 pp., illus., diags., charts, maps, tables, 9½ x 6 in., cloth, \$5.50.*

This volume contains detailed descriptions of thirty-seven American oil pools of the stratigraphic type, contributed by various petroleum geologists. "It is intended as a factual background on which a further approach may be made to the causes of oil and gas accumulation and also as a basis for the reasoning necessary to future oil-field discovery." (Preface). An extensive bibliography is included.

**STRUCTURAL THEORY**

*By H. Sutherland and H. L. Bowman. 3 ed. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 368 pp., diags., charts, tables, 9½ x 6 in., cloth, \$3.75.*

The basic conceptions and principles of structural theory relating to trusses, rigid frames and space frameworks are presented in this texthook, which covers the subject as commonly taught in our technical schools. In this edition there has been considerable revision and enlargement in the parts devoted to rigid-frame construction and, to a lesser extent, in other sections.

**THEORETICAL NAVAL ARCHITECTURE**

*By E. L. Attwood, revised by H. S. Pengelly. Longmans, Green & Co., New York, London, Toronto, 1942. 526 pp., diags., charts, tables, 8 x 5 in., cloth, \$5.00.*

The purpose of this well-known textbook is to provide students and draftsmen with an explanation of the calculations that continually have to be performed, and of the principles underlying them. Copious examples illustrate the rules. This issue of the book is the nineteenth printing, apparently of the revised edition which appeared in 1931.

**THIS FASCINATING RAILROAD BUSINESS**

*By R. S. Henry. Bobbs-Merrill Co., New York and Indianapolis, 1942. 526 pp., illus., diags., charts, 9 x 6 in., cloth, \$3.50.*

A very readable, yet unusually detailed and comprehensive account of American railroading, is provided in this volume, which should be of interest both to laymen and to railroad men. Every aspect of railroading as a business is covered, and while the subject is primarily the railroad companies of to-day, much historical information is included. The author is an experienced railroad man.

**UNITED STATES TENNESSEE VALLEY AUTHORITY. The Chickamauga Project**

*(Technical Report No. 6) Tennessee Valley Authority, Treasurer's Office, Knoxville, Tenn., 1942. 451 pp., illus., diags., charts, maps, tables, 9½ x 6 in., cloth, \$1.00.*

Facts concerning the planning, design, construction and initial operations of the Chickamauga project of the Tennessee Valley Authority are presented in this report. Unusual and unprecedented features and methods are described in some detail, while common procedures and practices receive rather brief treatment. Chapter bibliographies, a section on costs and a statistical summary are included.

**VOLUMETRIC ANALYSIS, Vol. 1. Theoretical Fundamentals**

*By I. M. Kolthoff and V. A. Stenger. 2nd rev. ed. Interscience Publishers, New York, 1942. 309 pp., diags., charts, tables, 9½ x 6 in., cloth, \$4.50.*

The theoretical considerations underlying the methods of volumetric analysis are comprehensively discussed. Basic principles are stated for neutralization, ion combination and oxidation-reduction reactions. The operation and utilization of various types of indicators are considered. The later chapters deal with special considerations, such as absorption and coprecipitation phenomena and various methods for the determination of the equivalence-point.

**WHAT STEEL SHALL I USE?**

*By G. T. Williams. American Society for Metals, Cleveland, Ohio, 1941. 213 pp., illus., diags., charts, tables, 9 x 6 in., cloth, \$3.50.*

The many factors which bear upon the selection of the best available steel for any given purpose are briefly and clearly presented. These factors include physical properties, metallurgical aspects, availability of proper treatment, considerations in fabrication and economic aspects. Suggestions for further reading accompany each chapter.

**WHAT THE CITIZEN SHOULD KNOW ABOUT CIVILIAN DEFENSE**

*By W. D. Binger and H. H. Railey. W. W. Norton & Co., New York, 1942. 183 pp., diags., 8½ x 5½ in., cloth, \$2.50.*

This book presents the advice of an experienced civil engineer and a writer upon military affairs as to proper methods of dealing with the civil problems arising out of enemy air action. The various types of bombs are described, and instructions as to protection against them given. Construction of shelters, preparation of blackouts, fire control and gas are dealt with, as well as other matters.

# PRELIMINARY NOTICE

of Applications for Admission and for Transfer

FOR ADMISSION

COLE—DONALD LORNE, of 185 Crescent St., Peterborough, Ont. Born at Lansing, Mich., U.S.A., June 25th, 1918; Educ.: B.Sc. (Elec.), Univ. of Toronto, 1941; 1937-40 (summers), with the H.E.P.C. of Ontario, asst. to elec. supt., operation staff, etc.; 1941-42, test course, and April 1942 to date, junior engr., aircraft instrument engrng., Can. Gen. Elec. Co. Ltd., Peterborough, Ont.

August 28th, 1942.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.\*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the October meeting.

L. AUSTIN WRIGHT, General Secretary.

\*The professional requirements are as follows:—

A Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

**PATTERSON—WILFRED ERNEST**, of 4578 Lambert Ave., Montreal, Que. Born at Vancouver, B.C., Jan. 16th, 1900; Educ.: B.Sc. (Chem. & Met.), Queen's Univ., 1924. R.P.E. of Ont.; 1918-19, British Chemical Co.; 1919-20, Canadian Westinghouse Co.; 1920-21, North American Cyanamid Co.; 1921-26, with G. F. Sterne & Sons Ltd.; 1926-40, G. F. Sterne & Sons Ltd. & Sternon Laboratories Ltd., as constg. chem. engr.—i/c all plant development & mfg. control, serving as chief chemist to G. F. Sterne & Sons Ltd., and managing-director, Sternon Laboratories Ltd.; 1940-42, Allied War Supplies Corporation, i/c technical group of Ammunition Filling Divn.; at present, technical director, Merck & Co. Ltd., Montreal.

## SITUATIONS VACANT

**MECHANICAL ENGINEER** for British Guiana. Some experience on diesels and tractors preferred. Apply to Box 2482-V.

**ELECTRICAL ENGINEER** with at least five years practical experience for work at Mackenzie, British Guiana. Apply to Box No. 2536-V.

**JUNIOR MECHANICAL ENGINEER** wanted at Arvida, recent graduate with machine shop experience to act as assistant to shop superintendent. Apply to Box No. 2572-V.

**METALLURGIST** or chemical engineer wanted at Arvida with at least one year's manufacturing experience. Apply to Box No. 2574-V.

**CHEMICAL engineer** for work at Shawinigan Falls with general plant or process work experience. Apply to Box No. 2575-V.

**TWO GRADUATE ENGINEERS** or men with sufficient experience in draughting to act as squad leaders of four to six men on reinforced concrete detailing, general equipment layout or mechanical drawing. These men to work along with other draughtsmen but be able to head up the job, lay out the work and check the drawings for issuing. Apply to Box No. 2577-V.

**PERMANENT POSITION** in Toronto or Montreal areas with a large industrial fire insurance organization. Previous experience in this work is not necessary. Applicant must be a technical graduate with manufacturing or engineering experience and possess a good personality. Several months training with full pay will be given. Please send photograph with letter. Apply to Box No. 2588-V.

**JUNIOR MECHANICAL ENGINEER** wanted at Kingston, Ontario, recent graduate. Apply to Box No. 2589-V.

**GRADUATE MECHANICAL ENGINEER**, preferably a man with paper mill experience to specialize in sale and installation of material handling equipment. Apply to Box No. 2590-V.

## SITUATIONS WANTED

**INDUSTRIAL ENGINEER**, M.E.I.C., Age 40, Canadian, Married, desires position as production manager or other executive capacity. Presently employed but desires change to plant on war work. Understands layout thoroughly. Location, Toronto area. Salary dependent on responsibility, minimum \$3,600. Apply to Box No. 717-W.

**MECHANICAL DRAUGHTSMAN**, J.R.E.I.C., graduate of the University of Toronto in Electrical

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.

Engineering. Some six years of practical experience with accent on electric motor design, instruments and small tools. Has a background of two years in electric instrument laboratory. Desirous of making a change where his services will be fully utilized and better appreciated. Apply to Box No. 1486-W.

**GRADUATE MECHANICAL ENGINEER**, military exempt. Age 33, married. Detail experience in mechanical departments of paper-making, construction and foundry work. Available immediately. Location immaterial. Desirous of executive or production position with prospects of advancement. Apply to Box No. 1650-W.

**CIVIL ENGINEER**, B.A. sc. Age 33, married. Experience covering heating, air conditioning, mining, Design, construction and maintenance of sewers, aqueducts, streets and highways, including surveying, location, estimating, inspections, drainage and soundings. Presently employed, but desires advancement. Apply to Box No. 1839-W.

**GRADUATE CIVIL ENGINEER**, S.E.I.C., experience in surveying and in teaching same, location surveys for roads and railroads, 2 years as construction engineer in oil fields in tropics in charge of roads, earth-moving machinery, anti-malarial drainage, etc. Experience in construction of bituminous pavements. At present engaged in airport construction. Available from September first. Age 30 years. Apply to Box No. 1860-W.

**ELECTRICAL ENGINEER**, age 34, twelve years experience in design, manufacture and application of fire protection systems. Good general knowledge of mechanical engineering, experience with tool design machine tools and shop practice. Trained in business administration and accustomed to responsible charge of large staff. Available immediately. Apply to Box No. 2442-W.

**GRADUATE ELECTRICAL ENGINEER**, M.E.I.C., with twenty-nine years experience in operation construction, repairs and maintenance of paper mill and hydro electric system. Bilingual. Available September first. Apply to Box No. 2443-W.

**GRADUATE B.Sc., S.E.I.C.**, Age 26, enthusiastic and energetic. Keenly interested in fields of industrial engineering and chemistry. Bilingual. All round technical training and three years of engineering office experience. Presently employed but desirous of change where services will be more fully utilized. Apply to Box No. 2445-W.

## TRANSITS AND LEVELS WANTED

The Department of Munitions and Supply at Ottawa is desirous of procuring:

15 transits 5" with vertical circle theodolite including tripod case and accessories.

19 8" telescopic levels—Dumpy including tripod case and accessories.

Second-hand instruments will be acceptable providing they are in good condition and have the following:

Transit

- (a) Not less than 5 in. horizontal circle.
- (b) Vertical circle.
- (c) Read to minutes.
- (d) Carrying case tripod.
- (e) Plump bob, objective shade.
- (f) Adjusting keys.

Level

Dumpy pattern preferred but not absolutely essential, must have:

- (a) Telescope not less than 8 in.
- (b) Carrying case and tripod.
- (c) Objective shade.
- (d) Adjusting keys.

Please communicate direct with: L. L. Price, Director, General Purchasing Branch, Dept. of Munitions and Supply, Ottawa.

## PRELIMINARY NOTICE (Continued from page 542)

**CAMPBELL—GERALD ARTHUR**, of Port of Spain, Trinidad. Born at Montreal, August 25th, 1915; Educ.: B.Sc. (Civil), Univ. of N.B., 1938; 1937 (summer), surveying, mill location & water supply, Fraser Companies, Ltd.; 1937-38, asst. instructor in surveying, Univ. of N.B.; 1938 (summer), power line location, N.B. Electric Power Commn.; 1938-39, dftsmn., Dept. of Lands & Mines, N.B.; 1939, highway location, Caribbean Constrn. Co., Trinidad; 1938 (July-Oct.), inspr., asphalt paving, Milton Hersey Co.; 1939-41, asst. civil engr., civil & constrn. section, United British Oilfields of Trinidad, Ltd.; At present, airport constrn., gen. field engrg. work, Walsh & Driscoll Company, Port of Spain, Trinidad. ## BOILERS, RADIATORS AND WATER HEATERS

Warden King Limited, Montreal, Que., have issued a 32-page catalogue entitled "1942 Heating Catalogue," which is thoroughly illustrated throughout and data are presented in an attractive and convenient manner. The catalogue describes only those hot water and steam boilers, radiators and radiator hangers, and domestic hot water heaters which are still being manufactured by the company. The boilers include the "Viking" series for low cost and small homes to large buildings and the "Daisy" type. Dimensional drawings and tables of dimensions and capacities are used throughout; two pages of heating data and conversion equivalents are also included.

## CARBIDE CUTTING TOOLS

A 48-page booklet, vest pocket size, entitled "Instructions for Users of Kennametal Steel Cutting Carbide Tools," is being distributed by Kennametal of Canada Limited, Hamilton, Ont. This contains information and illustrations dealing with the selecting, designing, using, brazing and grinding of Kennametal tools.

## CARBOLOY CARTRIDGE CASE DIES

Bulletin No. D-113, 12 pages, being distributed by Canadian General Electric Company, Limited, Toronto, Ont., covers standardized carboloy dies for small arms ammunition. Specifications are given of all standard carboloy die sizes for .30 and .50 armor piercing jackets, tracer and ball jackets, cartridge cases, etc., and a section is devoted to operator training covering the finishing and servicing of carbide dies. Details on equipment required, etc., are also included.

## ELECTRIC SWITCHES

Canadian Line Materials Limited, Toronto, Ont., have published a bulletin, No. 4246, four pages, featuring the company's type "MK-39" switches and illustrating the principle of design that ensures high pressure at both blade ends. Dimensional drawings, tables and specifications are included.

## GRINDING WHEELS

A 4-page folder is being distributed by Canadian Fairbanks-Morse Company, Limited, Montreal, Que., which consists mainly of a handy list of "Norton" grinding wheels, with their designating numbers, for use in sharpening various types of tools including cutters, reamers, drills, taps, dies, broaches, thread chasers, dies, etc. Three types of wheels are featured, namely, the "Norton" metal bonded diamond wheel for offhand grinding of single point tools; the "Norton" resinoid bonded diamond wheel for tool and cutter grinding of multiblade carbide tools; and the "Norton" Crystolon for those who prefer a vitrified wheel.

## HIGH SPEED STEEL

Jessop Steel Company, Limited, Toronto, Ont., have just issued a 12-page bulletin, No. 242, describing the new Jessop "TCM" high speed steel. Information regarding its advantages and performance, analysis, typical applications and heat treating procedure are covered in detail.

## LIGHTING FOR AIRCRAFT INDUSTRY

"Lighting for the Aircraft Industry" is the title of a bulletin being distributed by The Holophane Company, Limited, Toronto, Ont. This bulletin contains comprehensive information on the subject and features the economies resulting from adequate lighting in aircraft plants. Accurate tables are given for arriving at costs and economic comparisons of various lighting methods. Also included are easy-to-use illumination charts which give predetermined information of expected lighting results.

## Industrial development — new products — changes in personnel — special events — trade literature

### JENKINS APPOINTMENTS

Mr. John J. Bancroft was recently elected Vice-President and Managing Director of Jenkins Brothers Limited, Montreal, succeeding Mr. James H. Webb, retired. Mr. Bancroft joined this organization in 1922 as a junior clerk and in 1930 was appointed Accountant and Office Manager. In 1940 he became a Director of the Company, with the position of Comptroller and in December of the same year was appointed Treasurer and Assistant Manager.

Mr. Herbert H. Gee has been appointed Vice-President in charge of sales and re-elected Secretary of Jenkins Brothers Limited, Montreal. Mr. Gee is one of the "Diamond Associates" of this organization, having served in many capacities during the past thirty-four years. In 1920 he was transferred to Toronto as Sales Representative and later was made Manager of Sales for the province of Ontario. He was elected a Director of the Company in 1931 and two years later returned to Montreal as Secretary and Director of Sales.

Mr. Walter S. Beazley has been appointed to the position of Assistant Manager of Jenkins Brothers Limited, Montreal. Mr. Beazley joined the Company nineteen years ago and has served in several capacities. In 1926 he was appointed Purchasing Agent and remained in this position until his recent appointment as Assistant Manager.

### LEATHER BELTING FOR SHORT-CENTER DRIVES

Canadian Fairbanks-Morse Company, Limited, Montreal, Que., have just issued a leaflet describing the "Research" leather belts of the Canadian Graton & Knight Limited, with particular reference to their use for short-center drives. The advantages of leather belting are listed and opposite each item the additional advantages of "Research" belting are also listed.

### NEW COMPANY FORMED

Until recently Gunit & Waterproofing Limited have been the sole licensees in Canada for the "Preload System" of concrete construction, and it has just been announced that a separate company has been formed under the name of The Preload Company of Canada Limited, with offices at Montreal, Toronto and Halifax. The company will specialize in designing and building "Preload" tanks, silos, domes, pressure vessels and all containers and carriers of liquids and dry materials.

### POLE LINE HARDWARE

Canadian Engineering Standards Association, Ottawa, Ont., have issued Specification C83-1942-Pole Line Hardware, covering purchasing requirements for pole line hardware used by utilities engaged in power supply, electric traction, or communication transmission. It is divided into three parts: I—General, II—Material and Manufacture, III—Drawings. In order that review of new information and drawings on new or existing standard hardware items can be added from time to time, this Specification is issued in loose-leaf form under a special binder.

### PRECISION MILLING MACHINE

A 4-page bulletin being distributed by Bridge Machinery Company, Montreal, Que., describes, with large illustrations, the "Jefferson" milling machines. These include the screw and power feed, and the hand lever feed machines in both floor and bench mounting types. Complete details are given with full specifications. Attachments for these machines are also illustrated and described.

### MANUFACTURING RIGHTS

The Meehanite Metal Corporation, Pittsburgh, Pa., has announced that the Otis Fensom Elevator Company, Limited, Hamilton, Ont., has been granted manufacturing rights for Meehanite castings.

### STEEL STRAPPING

Acme Steel Company of Canada, Limited, Montreal, Que., have issued an 8-page folder, Form Ad32, entitled "Steel Strapping Shipments," and is reprinted from the company's 1942 Packaging Catalogue. Included are tables of sizes, weights and footages for both nailed and nailless types of strapping; tables of recommended sizes of strap for given package weights. A series of sketches reveal shipments of various types being reinforced for safe arrival and photographs illustrate strap applications to a variety of items ranging from salt pork to army trailers, chemicals, crated planes, pulleys, tile, metal tubes and textiles. Various "Acme" accessories, designed to speed up strap application, are illustrated and described.

### TAPS AND TAPPING

Greenfield Tap & Die Corporation of Canada, Limited, Galt, Ont., have prepared in manual form a 128-page book entitled "Facts About Taps and Tapping," which is divided into three parts. Part I, 32 pages, is a glossary of screw thread terms and description of taps and their uses; each type of tap is illustrated. Part II, 30 pages, presents factors governing the proper selection and use of taps. Part III, 66 pages, contains a series of tables with dimensional drawings, showing tap dimensions and tolerances, thread forms, etc.

### TEMPERATURE REGULATORS

A 14-page bulletin, No. 600, just published by Sarco Canada Limited, Toronto, Ont., features the company's self-operated temperature regulators for water heaters and industrial process applications. Operating and construction details are shown by cut-away sketches. Installation recommendations, applications and specifications are also included.

### VOLTAGE REGULATORS

Ferranti Electric Limited, Toronto, Ont., are distributing a 4-page reprint of an article by H. R. Osborne, B.Sc., Designing Engineer of the company, which appeared in the June 15th, 1942, issue of Electrical News and Engineering. The article is entitled "Increasing Line Capacity with Voltage Regulators." The company invites requests for its Bulletin No. 398 on Voltage Regulators which includes regulation charts for distribution lines, and replaces former Bulletin No. 397.

### APPOINTED CANADIAN DISTRIBUTORS

Hope Machinery Company, 21 King Street East, Toronto, Ont., have been appointed Canadian distributors for Drive-All Manufacturing Company, Detroit, Mich. Drive-All specializes in the manufacture of individual drives for machine tools, and is widely represented throughout the United States.

### WATER METER TESTING AND REPAIRING

A 16-page booklet and cover, entitled "Economies of Water Meter Testing and Repairing," has been issued by Neptune Meters Limited, Toronto, Ont. This booklet was planned and issued by the company with the idea that the information it contains would be of value to the water works engineer in his effort to conserve equipment. All details covered by the title of the book are clearly and concisely dealt with and are supported by a number of photographs.

# AN ENGINEER LOOKS AT MUSIC

S. T. FISHER, M.E.I.C.

Development Engineer, Special Products Division, Northern Electric Company, Limited, Montreal, Que.

Paper presented before the Montreal Branch of The Engineering Institute of Canada on March 12th, 1942

Music is an art, not a science; our appreciation of it is emotional and not intellectual. We must resist any suggestion that music should or could be trained into a mechanical mode, but music is the art of producing agreeable sounds, and sound is the subject with which acoustics, a science, is concerned. The production and transmission of sound, and the physiology of the sense of hearing are topics in which engineers may be interested, without presumption and it is these which will be considered.

This paper is intended to demonstrate that:

Musical theory where it touches on the intervals employed in harmony is in a state of great confusion;

The scale universally used for keyboard instruments, the tempered (diatonic) scale, inadequately translates musical conceptions, and its weaknesses should be recognized;

The just (diatonic) scale is in full accord with the spirit of music and the letter of physical laws, and in the light of modern instrumentalities, could now be adopted; and that

Electrical musical keyboard instruments can be designed in a practical form to play the just scale in all keys.

Tones separated by discrete pitch intervals are a universal tradition in modern Western music. An octave of seven notes is usually employed and this is the diatonic scale.① In addition, in accordance with an almost universal tradition, five additional intervals are inserted, which break up the five larger intervals of the seven-note scale. Most music—particularly music by the classic masters—is written in the seven-note scale. In modern music there is an occasional tendency to write in the twelve-note scale. This scale has its most familiar embodiment in the piano and it is not an exaggeration to say that the keyboard mechanism of the piano has been made the basis of the modern system of music. The scale can be conveniently thought of as it appears on the piano keyboard. If we take the note C as the starting note for an octave, then the seven notes of the diatonic scale are played by the white digitals of the piano and the five additional tones which divide the larger intervals of the diatonic scale are played by the black digitals.

It is advisable to guard at the outset against a common misconception; this is the idea that scales are made first, and music afterwards. *Scales are made in the process of creating music.* If music consisted only of single-note melodies, the requirements to be met by a scale would allow the widest latitude in choosing the intervals. Modern Western music, however, employs harmony as its most important feature, and it is necessary therefore that certain groups of notes of our scale, sounded simultaneously, should form harmonious chords. The physical criterion for harmoniousness in a chord is that the ratio of the frequencies of its component tones may be expressed as the ratio of small integers. The smaller the integers the more marked is the consonance. The application of this law to the diatonic scale fixes the intervals between the notes as seen in Table I:

TABLE I

Note.....	C	D	E	F
Ratio.....	1	9/8	5/4	4/3
Name.....	Unison	Second	Third	Fourth
Interval ..		9:8	10:9	16:15
				9:8
Note.....	G	A	B	C
Ratio.....	3/2	5/3	15/8	2
Name.....	Fifth	Sixth	Seventh	Octave
Interval ..	10:9	9:8	16:15	

In the first line are the letter names of the notes of the scale, in the key of C, in the second line are the ratios of their frequencies to the leading note, and in the third are the musical names of the intervals obtained by sounding

together each of the notes of the scale with the leading note. These intervals form a version of the diatonic scale called the *just scale*. The fourth line shows the pitch or frequency ratios between adjacent notes. It will be noted that three sizes of intervals exist, those represented by pitch ratios of 9:8, 10:9 and 16:15.

In Western music three triads or groups of three notes are considered the foundation of the system of harmony. These chords are the triads having frequency ratios 4:5:6 formed with their lowest note a fifth below the key note, the sub-dominant; on the keynote, the major triad; and a fifth above the key note, the dominant. In the octave shown above, these triads are CEG, FAC, and GBD, giving this arrangement:

C D E F G A B C D	
4—5—6	Major
4—5—6	Subdominant (raised an octave)
4—5—6	Dominant

It will be seen that these three triads define every note in the diatonic scale and fix the ratios at the values listed above. Each triad has a total compass of a fifth.

The major diatonic scale includes no other notes than these, but we have a tradition of centuries standing which divides the five larger intervals 10:9 or 9:8 approximately in half, so that a scale is formed of twelve approximately equal intervals. It is therefore necessary for the playing of modern music to insert a note between C and D, a note between D and E, a note between F and G, a note between G and A, and a note between A and B. The note between C and D for instance is called either C# (C sharp) or D<sup>b</sup> (D flat); which of these two names is used need not concern us at this point.

The major diatonic scale is that given above and can be thought of as being formed on the three major triads. Another scale also is in general use, the minor scale. This is supposed to be derived from the Greek Aeolian mode, just as the major diatonic scale is said to be derived from the Greek Lydian mode.

Table II shows what seems a less academic but more realistic suggestion as to the origin of the minor scale. If the intervals of the major scale are reversed, that is, if a descending scale is set up with the intervals in the same order as they occur when ascending the major scale, then we have a new scale, and it is found that this rigorously meets the requirements of harmony.

TABLE II

MINOR							
Note..	C	D <sup>b</sup>	E <sup>b</sup>	F	G	A <sup>b</sup>	B <sup>b</sup>
Ratio	1/2	8/15	3/5	2/3	3/4	4/5	8/9
	1	16/15	6/5	4/3	3/2	8/5	16/9
Interval	16/15	9/8	10/9	9/8	16/15	10/9	9/8
MAJOR							
Note.....	C	D	E	F	G	A	B
Ratio.	1	9/8	5/4	4/3	3/2	5/3	15/8
Interval		9/8	10/9	16/15	9/8	10/9	9/8
							16/15

By definition, a minor triad is an inversion of a major triad; that is to say, the major triad 4:5:6 which has a ratio of 5:4 (major third) between the two lower notes, and a ratio of 6:5 (minor third) between the two upper notes, becomes in the minor 10:12:15. The ratio of 6:5 (minor third) now exists between the lower notes and the

ratio 5:4 (major third) between the two upper notes. This is shown in Table III.

TABLE III

Note.....	B <sup>b</sup>	C	D <sup>b</sup>	E	F	G	A <sup>b</sup>	B <sup>b</sup>	C
Ratio.....	8/9	1	16/15	6/5	4/3	3/2	8/5	16/9	2
		10	12	15					
		10	12	15					
				10	15	12			

This table defines four more notes of the scale and the only one now missing is that lying between F and G which we could call F<sup>#</sup>. F<sup>#</sup> does not belong in either the scale of C major or the scale of C minor, and therefore probably need not be defined in these keys; since, however, it may be necessary occasionally as a decorative note it is well to add it.

The only two possible ratios which meet the requirement that the notes must bear the ratio of small integers to the key note are 11/8 and 17/12; of these two 11/8 is preferable. Another reason for choosing this interval would be that the scale should provide as many as possible harmonics to the key note, and it will be seen that the 11/8 value provides the 11th harmonic. This then is the value that should be used.

Fig. 1—The effect of changing key in the just scale is to shift the frequencies of some of the notes; this is necessary because of the unequal intervals. Logarithms of the ratios are plotted.

It is apparent that none of the possible ways of setting up a scale—progressions by fifths, by fourths, or by thirds—will give the octave note, since all these ratios are prime to one another. The extremely complicated treatment of diatonic scale structures that exists in musical literature is brought about solely by the fact that the tone sources of traditional instruments can not be adjusted in frequency to form a new scale for each key change. Figure 1 shows the difficulty graphically.

Throughout the ages musicians have ascribed definite characteristics to different keys. It will be realized that in theory this is quite a mistaken idea, but that in practice, due to the inability to shift keys in any of our scales without also revising the scale intervals, there is some justification for the idea that different keys have different characteristics. Something which is equally wide spread is to ascribe definite characteristics to each note in the octave; this is nothing but superstition, and has no physical basis whatever. The Chinese apparently initiated this custom and the character they ascribed to each note of the scale is as follows:

- do —Heavy but easy, like a cow lowing at drinking water.
- re —Clear and quick, like a sheep having lost its companion.
- mi —Defensive and careful, like a pheasant lighting on a branch.
- so —Overflowing and quick, like a pig screaming.
- la —Scattered and hollow, like a horse neighing in the desert.

If this appears to be funny it is no more so, and much more poetic, than the description current in the teaching of music to school children in English to-day:

- do —Strong and firm.
- re —Rousing or hopeful.
- mi —Steady or calm.
- fa —Desolate or awe-inspiring.
- so —Grand or bright.
- la —Sad or weeping.
- si —Piercing or sensitive.

Three other scales beside the Just Scale are of importance—one of them, the Tempered Scale, of outstanding importance. They are:

1. Pythagorean Scale. This scale is obtained as a succession of perfect fifths; by going up in pitch intervals of a fifth, the following notes are obtained:

- C G D A E B F<sup>#</sup> C<sup>#</sup> G<sup>#</sup> D<sup>#</sup> A<sup>#</sup> F

This gives a twelve-note scale and was quite satisfactory for the limited range of Greek music; the more so because harmony as we know it was not employed. For modern music, this scale is defective because the next fifth above F is not, as it should be, C. Despite the deficiencies of this scale, it is today in use in a modified form, since the stringed instruments of the orchestra tune their strings in fifths.

2. The Pythagorean Scale was followed by the Mean-Tone Scale in which the octave is tuned in a series of perfect major thirds and the note which comes between the notes of each major third is half-way between them. The Mean-Tone Scale was largely used during the Middle Ages and in fact was in general use for keyboard instruments up to the time the Tempered Scale was introduced, which in England was about 1850, and on the continent about 70 years earlier. The Mean-Tone Scale had several advantages, but permitted modulation into only a limited number of keys and this led to its eventual abandonment.

3. Tempered Scale. This is the scale universally used today for keyboard instruments and therefore nominally by all musicians. It is based on the simple arrangement that an octave is divided into twelve equal intervals of a semi-tone, each of which, therefore, has a frequency ratio of the 12th root of two. This scale has the great virtue that it permits modulation without limitation. This is shown graphically by Fig. 2. It has the disadvantage that many of the harmonic intervals are quite inaccurate. Fortunately, the interval of a fifth (nominal frequency ratio 3:2) is very close and this is the most important interval in harmony. However, the intervals of a third and a sixth, which are also of frequent occurrence, are very poor, being about a third of a semi-tone too large. The Tempered Scale, therefore, presents the disadvantages that many subtle effects in music which depend on variations in consonance of different intervals, are largely obscured by the fact that intervals which should sound quite consonant, such as thirds, are somewhat dissonant. By virtue of its make-up, the Tempered Scale has the same harmonic intervals in any key. In the Mean-Tone Scale or the Just Scale, when an instrument is tuned in one key, the harmonic structure is changed perceptibly for the other keys, if the scale is not retuned. In the Tempered Scale a change of key means only a change of pitch. The graphical comparison of the Tempered and Just Scale intervals is shown in Fig. 3. Table IV gives the frequencies (cycles per second) of twelve notes in the two scales, and in the triads, and indicates the amount of dissonance which may occur.

Fig. 2—The effect of changing key in the tempered scale is simply to shift the pitch of the music. No readjustment of scale intervals is involved. Logarithms of the ratios are plotted.

The shortcomings of the Tempered Scale have been familiar to musicians and physicists alike since it was first adopted. Helmholtz in 1860 pointed out its serious defects and suggested that in a generation or two the Tempered Scale might have a very marked effect on the acuteness of appreciation for harmony. It appears that his predictions have been fulfilled to a large extent and that the return of a strict perception of harmony is only possible by replacing the Tempered Scale with the Just Scale. Helmholtz' comments on the differences between the Tempered and the Just Scale are worth quoting at some length because they outline clearly the reasons leading up to the work described in this paper. These paragraphs show that the deficiencies

of the Tempered Scale have been fully recognized, as has been the excellence of the (7-note) Just Scale. And yet until the present, no practical solution has been obtained for the application of the Just Scale to keyboard instruments.

TABLE IV

The following excerpts are from the 4th English edition of Helmholtz's "Sensations of Tone":

"As regards musical effect, the difference between the just and the equally tempered, or the just and the Pythagorean intonations, is very remarkable. The justly intoned chords, in favourable positions . . . possess a full and, as it were, saturated harmoniousness; they flow on, with a full stress, calm and smooth, without tremor or beat. Equally tempered or Pythagorean chords sound beside them rough, dull, trembling, restless. The difference is so marked that everyone, whether he is musically cultivated or not, observes it at once. . .

"Modern musicians who, with rare exceptions, have never heard any music executed except in equal temperament, mostly make light of the inexactness of tempered intonation. . . .

"There can be no question that the simplicity of tempered intonation is extremely advantageous for instrumental music, that any other intonation requires an extraordinarily greater complication in the mechanism of the instrument, and would materially increase the difficulties of manipulation, and that consequently the high development of modern instrumental music would not have been possible without tempered intonation. But it must not be imagined that the difference between tempered and just intonation is a mere mathematical subtlety without any practical value. That this difference is really very striking even to unmusical ears is shown immediately by actual experiments with properly tuned instruments. . . .

"Finally, we cannot, I think, fail to recognize the influence of tempered intonation upon the style of composition. The first effect of this influence was favourable. It allowed composers as well as players to move freely and easily into all keys, and thus opened up a new wealth of modulation. On the other hand, we likewise cannot fail to recognize that the alteration of intonation also compelled composers to have recourse to some such wealth of modulation. For when the intonation of consonant chords ceased to be perfect, and the differences

between their various inversions and positions were, as a consequence, nearly obliterated, it was necessary to use more powerful means, to have recourse to a frequent employment of harsh dissonances, and to endeavour by less usual modulations to replace the characteristic expression, which the harmonies proper to the key itself had ceased to possess."

It must be realized that the Tempered Scale has been adopted solely because it will permit changing into different keys without any change in the melodic or harmonic structure. Since the intervals in the Just Scale or the Mean-Tone Scale are unequal, if a modulation from one key to another is to be made, then of necessity the scale must be readjusted so that it can maintain the exact sequence of intervals in the new key. With conventional keyboard instruments, this is not possible and the Tempered Scale is the only practical solution. At various times proposals for new keyboards have been made. A complication of the keyboard is not, however, a practical approach to the problem because of the considerable difficulty it adds to the work of the performer. It is, however, the only possible approach to a solution, in the case of traditional instruments.

With the introduction of electrical methods of producing musical tones we have, for the first time, the facility offered to us of key changes which will be strictly harmonious on an instrument tuned in the Just Scale. This is true only because the frequencies of the tone generators of electrical instruments can be instantaneously and accurately readjusted.

Modulation from one key to another in music always takes place in some integral number of fifths. The usual plan on which modulation progresses in a piece of music is to move upwards in pitch—or in the musical phrase, in the dominant direction—by some number of fifths, say four or five, less an exact number of octaves, and then to progress downwards in pitch one fifth at a time until the starting point is reached. It is apparent that no number of modulations by fifths, by thirds, by fourths, or any other interval within the octave can exactly equal any number of octaves since the ratios involved are all prime to one another. It is, therefore, an artificial arrangement in the piano keyboard which makes twelve fifths equal to seven octaves and involves the approximation  $128 = 129.75$ . This approximation results in the limitation of Tempered Scale music to twelve keys, using as the key notes the twelve notes of the octave. This again is an artificial limitation, and any number of keys are theoretically possible in the Just Scale.

The musical theories of harmony are largely obscured and confused by the fact that they are predicated on a series of ideas based sometimes on the Just Scale, sometimes on the Mean-Tone Scale, and sometimes on the Tempered Scale. For instance, in piano music the key of six sharps, F<sup>♯</sup>, and the key of six flats, G<sup>b</sup>, use the same notes in the Tempered Scale and yet the chords of these two keys are given different names and different characteristics are ascribed to them. A violin is tuned with its strings in the Pythagorean scale, that is perfect fifths apart, and yet violinists ordinarily play in the Tempered Scale. The horns and some other wind instruments in the orchestra obtain their tones as a series of harmonics and to this extent their instruments are tuned in the Just Scale; but the intermediate notes that are inserted by means of valves are tuned to agree with the Tempered Scale. It is well established that singers with accurate ears singing without accompaniment strike just intervals quite accurately, but when they sing with a keyboard instrument accompanying them, change their intonation to suit the Tempered Scale intervals.

These anomalies and inaccuracies are not generally recognized by musicians; as a result, the existing theory of harmony merely classifies existing habits without any factual or scientific basis. Existing harmonic usage has three defects:

1st—It has not explored all harmonic possibilities;

2nd—Due to the inaccuracy of many of the intervals as sounded on conventional instruments, the exact consonance of many combinations is missed and the difference between good consonance and poor consonance is very much less marked than it should be.

TEMPERED	{	1	$(\sqrt[12]{2})^2$	$(\sqrt[12]{2})^4$	$(\sqrt[12]{2})^6$	$(\sqrt[12]{2})^8$	$(\sqrt[12]{2})^{10}$	$(\sqrt[12]{2})^{12}$	2
		1.000	1.122	1.260	1.350	1.498	1.692	1.888	2.000

		1.000	1.125	1.250	1.333	1.500	1.667	1.875	2.000

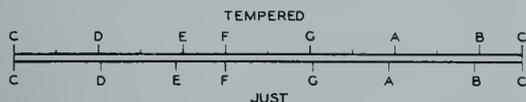

Fig. 3—Comparison of tempered and just scales. Logarithms of the ratios are plotted.

3rd—The substitution of one triad for another to which it is approximately equal has led to a meagreness in the harmonic structure of modern music which has resulted in non-harmonic writing, such as modern chromatic music.

That complications will be introduced into an electrical musical instrument by the use of the Just Scale is demonstrated by Fig. 1. It is seen that a digital on the keyboard must have access to a considerable number of slightly differing frequencies if exact harmonic ratios are to be preserved in all keys. In conventional instruments, this is an insurmountable obstacle. It has been judged so by Helmholtz, and all other writers in the field.

For example, Sir Hubert Parry in his monumental "Art of Music" says, "An ideally tuned scale is as much of a dream as the philosopher's stone. A scale system may be fairly tested by what may be done with it and that scale which afforded Bach, Beethoven, Schubert, Wagner and Brahms ample opportunities to produce the works they did is as perfect as their musical art required. It will probably be a good many centuries before any new system is justified by such a mass of great artistic works as the one which the instincts and efforts of our ancestors have evolved for our advantage."

Sir William Bragg has this to say on the subject: "The composer who tries to write in a perfect scale fights with the laws of arithmetic in a battle which he could never win."

Electrical instruments are not new in themselves but the idea of tuning them in the (twelve-note) Just Scale and providing means by which this scale can be adjusted correctly for each key signature appears to be original. On reading Helmholtz's comments it is entirely credible that such an invention will make a profound impression on musicians. Development of practical forms of instruments appears to be of importance. One of the most obvious ways to approach the problem is to take a highly-developed instrument such as the Hammond (Electric) Organ and redesign it in such a way as to make this proposal workable.

The Hammond Organ<sup>®</sup> consists of a number of rotary generators driven from a single synchronous motor. There is one generator for each note of the keyboard plus some extra generators for harmonics that lie beyond the keyboard range. All these generators produce tones which lie almost exactly on the Tempered Scale. It should be noted that the Hammond instrument in its harmonic make-up differs from conventional pipe organs because all the frequencies used in the synthesis of any musical quality lie on the Tempered Scale; in other words, natural harmonics are entirely suppressed and tempered harmonics are substituted. This avoids the serious clash that occurs in conventional pipe organs between natural harmonics and tempered fundamentals which lie very close together. In no instrument other than the Hammond Organ, to the author's knowledge, are tempered harmonics used, and while the results may not be immediately perceptible to

the lay ear, the characteristic harmoniousness of the Hammond Organ, which becomes apparent after some familiarity with it, must be ascribed to this basic improvement.

The application of the Just Scale to the Hammond Organ<sup>®</sup> or to other instruments of this general character is carried out as follows: The tone wheels and gears are changed so that the frequencies of the generators lie on the Just Scale. The usual synchronous driving motor is replaced by a much larger synchronous motor, in the case of the standard Hammond Organ by, say, a one-quarter horse-power motor, with a heavy flywheel. This motor is coupled to the main drive shaft through a 15-position gear set, including 15 magnetic clutches. Thus the drive can be at any one of 15 speeds, depending on which clutch is operated, and the speed may be instantaneously changed by operating any other clutch. The clutches are operated from a row of 15 pushbuttons arranged along the base of the instrument and intended to be actuated by the left foot. These pushbuttons are marked with key signatures from C<sup>♯</sup> to C<sup>b</sup> and (including the natural key) permit the playing in 15 major and 15 minor keys. This appears to be adequate for practically all music now existent. When the pushbutton for the key of C is operated—that is, the natural major key—the motor speed is such that middle A is 440 cycles per second and all other tones on the keyboard are exactly in the Just Scale. The instrument then can be played in the key of C in the Just Scale. There is no question of the use of tempered or natural harmonics. A number of additional generators must be added in each octave to take care of some harmonics of notes other than the key notes. If it is wished to change the instrument so that it can be played in the key of E, then the pushbutton marked "E" is depressed. This will release the "C" clutch and operate the "E" clutch and the speed of the main drive shaft will be changed to 5/4 of its former speed. The instrument will therefore, be raised in pitch in the ratio 5/4 and upon playing on the white notes as before, i.e., in the key of C major, the instrument will sound in the key of E. Since all the harmonics and added generators are changed in the same ratio, the organ is still in the Just Scale and this scale is correctly tuned for the pitch in which it is being played. It will be noted that except for accidentals, in major keys the performer need only learn to play on the white notes. The instrument then always plays as though the music were in the natural key and it sounds in the key corresponding to the pushbutton which is operated.

It will be noted from Table II that there is always a minor key which uses the same frequencies as each of the major keys. Each pushbutton therefore would be labelled with two names and a single key signature. For instance one of the pushbuttons—that for the key of D, say—would be labelled "D—2<sup>♯</sup> major—1<sup>b</sup> minor." To each of these pushbuttons would be wired a small illuminated indicator with the same label as the pushbutton. These indicators would be mounted in a row between the two manuals so that the organist is always aware what key his instrument is tuned for.

It will be seen that this organ is a transposing instrument and that existing music could not be readily played on it unless it were written in the key of C. All organ music would have to be transcribed to this key, with the key signature in which it is to sound marked separately. Minor keys would have to be transcribed to the naturally corresponding minor. The key-signature indication could very well take the form of an added note below the bass staff and as far as the performer is concerned would be simply one more note to be played, which he could play with his left foot. To avoid confusion with the bass notes, the key-note names could be used. Such an instrument as this would be learned much more readily than present day conventional keyboard instruments. The student would no longer be obliged to master the complicated and cumbersome scheme of key signatures which music has evolved. The playing position of his hands on the keyboard would

never be changed and the black notes would only be necessary for accidentals or for minor keys. The student, therefore, would devote the major part of his energy to the artistic development of his music rather than to the mastering of the mere mechanics of notation. That this instrument could not be put into use immediately is fully appreciated; that an instrument of this general character should eventually become widely used is, however, maintained. A sufficient interval of time must elapse to permit the transcription of a large amount of existing music into the natural key before such a scheme could be of much use. The ultimate advantages are beyond argument. Such a transposing instrument is readily evolved from a Hammond Organ or similar device because of the simple nature of the mechanism for speed changing. It will be apparent that the transposing feature can be readily applied also to the instrument to be described next.

Another instrument which is adaptable practically is the Hammond Novachord<sup>4</sup>; this is typical of all instruments which obtain their tones from vacuum-tube oscillators. In the Novachord twelve oscillators forming the top twelve notes of the keyboard are employed, and all other tones are obtained through a frequency-dividing and harmonic-generating system. The addition of an elaborate control system allows tones of any general form to be obtained. The instrument not being restricted to steady-state tones as is the Hammond Organ, it will, with reasonable accuracy, imitate most of the conventional instruments. Using this sort of an instrument as a basis, the author would suggest a new instrument<sup>5</sup> tuned in the Just Scale as follows:

A row of pushbuttons will be provided along the base of the instrument intended to be operated by the left foot. These buttons, of which there will probably be 15, will be labelled with 15 key signatures from C $\sharp$  to C $\flat$  which, in the major keys is from seven sharps to seven flats and in the minor keys from four sharps to ten flats. Each of these pushbuttons will operate a 12-contact relay and the circuit is so arranged that only one relay can be operated at a time. Above the manual appear 15 illuminated signals which indicate which relay is operated. To each of the 12 contacts of each relay is wired a small condenser and these condensers are the tuning condensers of the 12 oscillators. When any relay is actuated, therefore, the 12 oscillators are adjusted to frequencies corresponding to the 12 condensers that are cut into the circuit. Since all other tones on the instrument are derived from the 12 tones of the top octave, it follows that all the frequencies on the keyboard are governed by each pushbutton.

It is readily seen what possibilities are provided. This instrument can be made a transposing instrument such as the organ already described, if the tuning condenser is chosen of such a value as to step the whole octave upwards or downwards by a uniform amount as different relays are operated. It can also be arranged to be played exactly as conventional instruments are played by merely adjusting the frequencies of the notes of the octave so that for any desired key the frequencies will occur in the correct sequence. We should find ourselves with an instrument which is played exactly as a piano or an organ is played today, but which will sound in the Just Scale. It will be possible on this instrument to have an additional pushbutton which would tune the instrument in the Tempered Scale if for any reason this were desired, as for example, in order to play chromatic music.

A third type of instrument which would provide a typical application of the Just Scale is as follows. This is a new instrument, which would use a keyboard exactly as does the Novachord for example, and could only be constructed to operate on the Just Scale. It would not be feasible for the Tempered Scale and apparently for that reason nothing similar has been devised before. The basic idea in this instrument is that all tones are obtained from a single generator. This may be a vacuum tube oscillator, a commutator device, a magnetic generator or simply a 60-cycle

wave obtained from the power mains. All other tones are derived from this single frequency by means of harmonic generators or multivibrators—that is, frequency multipliers or dividers. For example, if the 60 cycle power supply is used as a source then A 440 in the key of C is obtained as the third sub-harmonic of the 22nd harmonic, and all other notes on the keyboard can be obtained by similar multiplications and divisions which are possible by well-known circuit arrangements.

In order to change key, two possibilities are open:

1. If it is desired to make a transposing instrument, then the frequency of the single source can be increased or decreased by the factor required for the key change, and all tones in the keyboard can be shifted accordingly.

2. If it is desired to make a non-transposing instrument, another scheme can be used. In this scheme the frequency of the key note in some octave on the keyboard is obtained from the single-frequency source by a process of multiplication and division, and all other notes on the keyboard are obtained from this key-note frequency. In order to change key it is necessary to set again the new key note from the single-frequency source and to switch control of the other keyboard notes to the new key note. It will be realized that the switching problem is not severe since it is only necessary to reset frequencies of a single octave and all the other octaves will fall into step.

One of the serious design difficulties in electrical musical instruments is that the nominal power rating of the amplifier-loudspeaker system, which is based on negligible distortion for a sine wave, cannot be approached when complex waves formed from many harmonic components in random phase relation are transmitted. This reduction in power output is due to the possibility at any instant of the amplitudes of all the components adding arithmetically, so that the voltage or current peak is the arithmetical sum of all the components, while the loudness of the power output is only the root-mean-square sum. In an instrument tuned to the Just Scale, such as any one of the three described, it is possible to fix the phase of all the components of a tone so that the peak amplitudes of all the waves could never add up at any instant. Even in an instrument tuned in the Tempered Scale this is worth doing, since the octave components, that is the sub-harmonics, and the second, fourth and eighth harmonics, are exactly correct and a precise phase relation can be maintained.

Let us look at some of the considerations involved in any scale arrangement other than those already discussed.

1st—The theory of harmony as taught in the schools says that in any key, a triad can be set up on each of the seven notes of the scale. This is supposed to hold for either the major or the minor scale. Tables V and VI list these triads in one major key, and one minor key.

It is seen that, in the major, two triads are incorrect, and that one (D Min.) must be set two fifths higher in D major and the other (G seventh) must be set one fifth higher, in G Major. Of the triads of the minor scale, four can be left in this key, and three must be shifted: G seventh to E minor, D minor to B minor, and E seventh to C $\sharp$  minor. It is thus apparent that the classical theory is not correct for any scale arrangement whatever.

2nd—In modulating, apparently the usual pattern is to move several steps in the dominant direction, and then to return to the starting point, or a fifth below it, one step at a time. This means that as much as possible, chords should be unchanged in moving into adjacent keys. For example, it would be desirable to have the chords of the following keys use notes of the same frequencies.

F Major	C Major	G Major
D Minor	A Minor	E Minor

This is particularly true of the 7th chords, which seem to be largely used in modulation.

3rd—These choices should be checked against one of the previous criteria: that in order to permit expansion of musical ideas and to enrich the composers' harmonic resources, there should be as many as possible harmonics of the tonic present in the scale.

TABLE V  
TRIADS OF C MAJOR

Name	Notes	Desired Ratios	Actual Ratios in C Major A Minor	Key necessary for Desired Ratios
C	C E G	4: 5: 6	4: 5: 6	C Maj. A Min.
D Min.	D F A	10: 12: 15	10-1 8: 12: 15	D Maj. B Min.
E Min.	E G B	10: 12: 15	10: 12: 15	C Maj. A Min.
F	F A C	4: 5: 6	4: 5: 6	C Maj. A Min.
G	G B D	4: 5: 6	4: 5: 6	C Maj. A Min.
A Min.	A C E	10: 12: 15	10: 12: 15	C Maj. A Min.
G 7	(G) B D F	(4): 5: 6: 7	(4): 5: 6: 7-1/9	G Maj. E Min.

4th—From the foregoing it can be deduced that a minor key must use the frequencies of the major with the same name. It is apparent that so far as the listener is concerned, the harmonic structure of the music must be the same, whether produced by a transposing or by a non-transposing instrument.

It would seem appropriate at this point to emphasize that the Just Scale must not be considered an ideal scale; it is simply the best scale to fit our existing tradition of music played in the seven-note diatonic scale, with the conventions we have evolved regarding modulation and harmony. The Just Scale does not, and no scale ever did, fit the classical theory of music. Everything here proposed is in some degree a compromise and the only way in which conclusive decisions can be obtained as to whether these compromises are the correct ones is by a statistical analysis of a representative amount of existing musical compositions. That this work should be undertaken there is no question; by whom and when are very different queries. Whoever does it must possess a sound knowledge of music as it is written and played. It is not arithmeticians who make musical scales; scales are made by those who write and play music. Our new scale must make musical literature, as it now exists, possible and pleasing; and if our changes are to be justified, must add new meaning now obscured by the Tempered Scale. This latter motive might be better phrased by saying that it must allow instrumental music to reproduce physically the plain intention of the written work, written by composers whose conception of musical intervals was subjective, and who were not influenced by the inexactnesses of the instruments on which,

TABLE VI  
TRIADS OF A MINOR

Name	Notes	Desired Ratios	Actual Ratios in C Major A Minor	Key necessary for Desired Ratios
A Min.	A C E	10: 12: 15	10: 12: 15	C Maj. A Min.
G 7	(G) B D F	(4): 5: 6: 7	(4): 5: 6: 7-1/9	G Maj. E Min.
C Aug.	C E G#	16: 20: 25	16: 20: 25	C Maj. A Min.
D Min.	D F A	10: 12: 15	10-1/8: 12: 15	D Maj. B Min.
E	E G# B	4: 5: 6	4: 5: 6	C Maj. A Min.
F	F A C	4: 5: 6	4: 5: 6	C Maj. A Min.
E 7	(E) G# B D	(4): 5: 6: 7	(4): 5: 6: 7-1/5	E Maj. C#Min.

in fact, the music was performed. That the great masters were not much influenced by the theory of music as taught in the schools, there seems no doubt. It appears to the author, from a limited knowledge of present-day teaching of the theory of music, that such teaching is largely classifications of prejudice and habit, having no scientific basis, and what in fact is much the same thing, no basis in music as it is played and written.

From such an analysis we want to know what modulation sequences are used, and how commonly; what are the chords used, and in what keys should they sound, so that the texture, the continuity and the feeling for tonality, are best preserved. From these data, collected from the great mass of important and commonly-played compositions, properly evaluated, the best possible arrangement of the Just Scale, thoroughly in accord with our tradition of music, could be evolved. Without such information we can only examine some possible scales and form conjectures as to the correct solution of the problem.

The paper as delivered was followed by a demonstration of oscillograms showing major and minor chords in the just and tempered scales. The tones were generated by oscillators, and were made audible through an amplifier and loudspeaker.

Grateful acknowledgement is made to Prof. B. deF. Bayly of the University of Toronto for his untiring assistance backed by an extensive knowledge and deep understanding of both music and acoustics; to Dr. and Mrs. L. C. Marsh of Ottawa and Mr. W. C. E. Wiseman of Toronto; to Mrs. E. A. Laporte of Montreal; to Mr. E. M. Hill of Bell Telephone Laboratories, New York; to Mr. C. B. Fisher of Washington and Mr. H. M. Smith of Sackville; and to Mr. André Durrieux of Montreal.

# CAN PROFESSIONAL EDUCATION BE LIBERALIZED?

C. R. YOUNG, M.E.I.C.

*Dean of the Faculty of Applied Science and Engineering, University of Toronto and  
President of The Engineering Institute of Canada*

An Address delivered at the Second Canadian Hazen Conference, Chaffey's Locks, Ont., on June 25th, 1942

There is in the subject that has been assigned to me an implication of existing narrowness of professional education. No one having at least a passing acquaintance with professional or educational literature can deny either the implication, or the frequency of the question in which it is embedded.

As a representative of one of the professions at which the questioner's shaft is aimed, may I at once admit some justification in his selection of a target. In Marcus Aurelius there is much to promote humility, but for an engineer never more than in his query:

"Dost thou not see, how even those that profess mechanic arts, though in some respects they be no better than mere idiots, yet they stick close to the course of their trade, neither can they find in their heart to decline from it."

Some little comfort is left to the engineer, however, in the realization that he is not the sole object of the current castigation. The charge of serving narrow and ruinous ends has been met fairly by President Willard E. Hotchkiss, of the Armour Institute of Technology, in his observation that

"Whether the machine is an instrument of advance or of retrogression depends not upon the machine but upon those who determine the ends for which the machine is employed."

I am afraid that many of those who speak of liberalization of professional education believe that everything would be very satisfactorily and quickly adjusted if the recipients of it would merely acquire some of the techniques of the critics. That would be very simple—no more than a shift from one narrowness to another.

One has only to read the summaries of theses presented to our universities for the degree of Doctor of Philosophy to perceive the extraordinary specialization in many of the investigations. It would be strange indeed if some of those here present had not been bored beyond measure by persons expounding intricate specialties under the guise of high culture. There are philosophical, literary, and artistic bores as well as scientific ones.

Students engrossed in the detail of professional courses may find comfort in an observation of John C. Parker, at one time President of the American Institute of Electrical Engineers:

"Courses in the liberal arts are neither liberal nor art if they fail to get beyond the mechanics of preparation or the minutiae of research. Too often this is precisely what does happen. The invasion of the scientific method into the humanities has done wonders for research but often at the expense of the liberalizing and human values in the subject matter. Too often the attractions of scholarship have resulted in slovenly and frightfully mechanical processes in the elemental preparatory courses, perhaps with the thought that scholarship is great and elemental teaching only a painful incident thereto."

Lest it be charged that this is but the view of an apologist for an upstart amongst the professions, consider the testimony of Nicholas Murray Butler. In his opinion, the decline and fall of classical scholarship in American education has been brought about largely by the teachers of the classics supplanting an understanding of the ancient world with unimportant specialization thereby pushing "far into the background the vitally important art of interpretation which is the essential element of real teaching."

In the search for an adequate answer to the question that has been posed, it will be necessary to discover, if such be

possible, not only the objectives of professional education, but, as well, the characteristics of present-day professional education, and, if the scope and methods be inadequate, means by which the situation may be bettered.

## OBJECTIVES OF LIBERALIZATION

It is, of course, very generally assumed that liberalization in itself is desirable. For what reasons is this true? Of those who might be called upon for an answer, most would doubtless reply that the justification of liberalization is the development amongst persons in the professions of a greater awareness of the universe and of the problems that will confront them in dealing with it; a more sympathetic understanding and juster appreciation of life; an increased mental and emotional flexibility and capacity for performing one's full duty to society.

There is, too, the seldom admitted but important factor of pure enjoyment. Without a wholesome satisfaction in life and what it has to offer, the professional worker, in common with others, will be unable to discharge his full duty to the society of which he forms a part. One cannot suppress a feeling of pity for Darwin, who confessed that although in early life he found delight in literature and art he came, through too intense scientific preoccupation, to the point where he could not endure a single line of poetry and found Shakespeare so intolerably dull that it nauseated him. His taste for pictures and music almost vanished. With supreme regret he acknowledged that the loss of these tastes means a loss of happiness, which may be injurious to the moral character by enfeebling the emotional part of one's nature.

## WHAT IS A PROFESSION

Notwithstanding the never-ending debate as to what constitutes a profession, no one has been able to formulate a compact definition of it. There are, however, certain characteristics that by common consent attach to this type of vocation.

Manifestly, one who undertakes to serve his fellows as a practitioner in a specialized field must be technically competent. However broad his education, his advice will be useless, if not dangerous, unless his knowledge and experience of the art that he practices is sound and thorough.

Society expects to find unimpeachable moral character in its professional personnel. The conduct of the practitioner should not be merely good enough to satisfy the law.

He must be a man of sound education, with evidences of learning in at least one direction. Despite the pretensions of certain callings, there are no unlearned professions. Abraham Flexner has pointed out that a profession must of necessity have its roots deep in cultural and idealistic soil. Its essence is free, unhampered, resourceful intelligence applied to the comprehension and solution of problems. Its primary objectives are intellectual and altruistic.

Perhaps the most vital element of a profession is the principle of trusteeship. One who seeks the services of a physician, a lawyer, or an engineer puts his whole case, possibly involving his financial security, or even his life, into the hands of his adviser. He is not qualified to judge of the sufficiency of the measures that will be taken in his behalf. He must repose complete trust and confidence in his adviser. Upon the latter rests the burden of discharging the trust with strict regard to the long-range welfare of the client or patient. No substitutions, shortcuts, or savings of time or effort are admissible. Upon the faithfulness of observance of this principle of trusteeship the status of a profession largely rests.

One expects of a professional man a wholesome and conscientious regard for the welfare of the community and the country in which he resides. The objectives of liberalization do not, of course, necessarily require that a member of a learned profession should participate extensively in public activities that have no association with his profession. The great British journal *Engineering* some years ago put the matter thus:

"The status that attaches to the professions of arms, of law and of medicine . . . can owe but little to the excursions of individuals from these professions into directive commercial or legislative offices, such as have long been whole-time occupations to those who have achieved any eminence therein."

Of those whose eminence in the professions is universally recognized, comparatively few owe it to notable participation in general public activities. The development of that supreme mastery of professional technique now demanded by the client or patient requires the full time and energy of even the most robust of men.

A little while ago one of the greatest advocates in Canada laid aside his gown and will appear no more in earthly tribunals. It was widely said, without a trace of disparagement, that the law was his first and his last love. And yet few men in this country have been accorded an equal measure of commendation and admiration. Year in and year out, juniors and law students flocked to the courts in which he pleaded to study his technique and revel in his lucid and vigorous examination and argument. One who was called upon publicly to appraise this simple practitioner of the law stated he "never knew a citizen more highly respected by people who did not know him." Such is the reward of one, who without excursions into other fields, practiced his profession as an art with all the devotion of a man of robust and ardent temperament.

#### REMEDY BY CURRICULAR ADDITIONS

Any statement of the desirability of liberalization inevitably elicits the obvious suggestion of adding certain liberalizing or cultural subjects to the curriculum. Unfortunately, the sack is already full and before anything else can be put in something must be taken out. So sweeping have been the recent advances in professional knowledge and so importunate have been the demands of potential employers for training in techniques and specialties that curriculum framers have had a difficult time.

Certain half-way or collateral subjects have been introduced, such, for example, as Psychology, Economics, Law and Management. But while these doubtless have some liberalizing value, they have found their way into the curricula largely by reason of a tolerance reposing on their assumed usefulness as collateral with strictly professional subjects.

It is unfortunate that the professional schools devote relatively small attention to traditional liberalizing subjects, such as English, History, Philosophy, and Art. While in the American engineering colleges, subjects of this type are frequently offered as electives and, in the case of a minority of students, serve a useful purpose, most students entering a professional school have their minds much too closely focused on those subjects that appear to them of very direct utility in the practice of their professions. Inclusions made with the obvious purpose of civilizing professional students excite a scantiness of interest that is little short of derision. The beneficiaries are disposed to exert no more effort than is required to obtain a bare standing in them.

The very limited success that has attended the introduction of so-called liberalizing subjects is not due to any lack of merit in the subjects themselves but to other circumstances. Amongst those who are admitted to the universities are some who are unsuited to professional life in its higher reaches. But that does not explain all. It may well be that the cultural subjects are placed at the wrong end of the

curriculum, and I am becoming increasingly convinced that the teaching of them is seriously at fault.

With a view to getting the general and non-professional subjects "out of the way" so that the upper years may be wholly devoted to what are deemed strictly professional matters, it has been the common practice to attempt liberalization in the lower years. Nothing could more certainly alienate the interest of the student. Young men just out of high school are eager to embark upon new and exciting studies having direct bearing upon the profession that they propose to enter. When they find that a substantial portion of the first, and perhaps the second, year is to be devoted to studies that appear no different from those that have so long engrossed their attention, they are disappointed.

President Wickenden, of the Case School of Applied Science, has presented a radical but challenging alternative. Says he:

"We have no quarrel with liberal education, nor with the doctrine that it is best for many young people to lay first a foundation of culture and then to erect upon it a superstructure of competency. But we hold that there are even more young people who will do better to lay first a foundation of competency and to build upon it a superstructure of culture and of social understanding."

Dean Emeritus Dexter S. Kimball, of the College of Engineering of Cornell University, has expressed a similar thought when confronted with the apathy with which freshmen engineers view liberalizing subjects. It is his view that

". . . if such subjects are presented to him a little later on when he is somewhat more mature and has had his technical curiosity satisfied by a few stiff courses in calculus, mechanics, etc., he will take to liberalizing subjects much more readily."

In order to meet the problem of curricular congestion arising out of additions of liberalizing subjects, it has been proposed that the professional courses be lengthened. While in medicine, dentistry, and architecture this has been found practicable, it is the experience of the engineering colleges that a professional course for a first degree will meet with only mild response if it is longer than four years. Most young men of the vigorous, adventurous, and enterprising type feel that four years is a sufficiently long period to spend in college. While as an aid to attaining the higher reaches of the profession a lengthened course would be desirable, it must be admitted that a great deal of the engineering of the world can be performed with competence and satisfaction to the employer by men who have completed a course of only four years' duration.

#### CULTURAL INHERENCES IN PROFESSIONAL SUBJECTS

Whatever broadening or liberalizing may be attempted in the professional schools will have scant efficacy unless it permeates the professional subjects themselves. Elliot D. Smith has set out the principle thus:

"A final fundamental of professional education is that its broadening elements should be integral not external, that students should be developed in human and social power, not by 'side courses,' but by ways of study that interpenetrate their technical professional development."

Approached in the proper spirit, a professional subject may be found to have a moving cultural contact. President Charles W. Eliot, himself a chemist, observed, with a wealth of experience and unsurpassed depth of appreciation that "anything useful may be cultural."

Assertion of a need for liberalization of professional courses has in most cases been based on the assumption that cultural value resides only in certain traditional subjects of study ordinarily found in the curricula of Faculties of Arts. From that view I must dissent. Dean Kimball has adequately dealt with this hypothesis. Said he:

"No study is of itself liberalizing and what is liberalizing to one man is vocational to another. Latin and Greek

may be strictly utilitarian to the archaeologist while liberalizing to the engineer. A knowledge of some industrial pursuit will be vocational to the man who is making a living thereby, while a knowledge of the same art may be very liberalizing to a divinity student. The student of the humanities and classics can lay no claim to liberal education unless he knows something about the great fields of science and industry and the human interests involved that surround and affect him for good or evil on all sides. The student of science and the man interested in industry will find many things made plainer and his horizon greatly enlarged by studying the recorded experience of those who have preceded him. No man in fact can lay claim to a liberal training if his education has narrowed his vision so that he sees only the importance of his own particular field; and the most liberal of studies may be very narrowing in its effects if it is not related to vital matters."

Students in the professional courses have often been chided for their devotion to "tool courses," upon a mastery of which their technical competency will depend. But we should not forget that devotion to the classical languages that attended the revival of learning in central Europe was prompted by the practical necessity of revealing the richness of culture preserved in the ancient manuscripts. Latin and Greek were the "tool courses" by which that treasure was recovered. As President Hotchkiss, of Rensselaer Polytechnic Institute, has pointed out, since a man could not be educated unless he knew Latin and Greek—the tools by means of which he had to obtain an education—it came to be accepted that if a man knew these languages he must therefore be cultured and if he did not know them, he was uncultured.

Any attempt to separate cultural from non-cultural subjects is attended by absurdities. President Compton, of the Massachusetts Institute of Technology, has pointed out that

"It was a cultural pursuit to delve into a study of the tools and machines of the cave men or the Egyptians, but not to try to understand the science and the machines of the civilization in which we actually live."

One may well ask at what point in a study of the development of human progress enquiry ceases to be cultural and becomes vulgar.

To go further, may I suggest that in the development of artistic appreciation some regard for the product of the professions has its place. Art attains the heights when it appeals to the imagination and stimulates thought. Judged by this criterion, many of the works of the engineer, for example, are artistic in the highest sense. In the words of President Compton

"To deny the artistic element in an engineering masterpiece and designate it as merely a material arrangement of concrete and steel is every bit as uncultural as to see in a masterpiece of painting only an arrangement of daubs of paint."

As one who has witnessed the development of many young engineers, I am impressed with the fact that there is in the study and practice of engineering much that merits a cultural recognition comparable with that accorded the more conventional fields of study. There is as fruitful a source of emotional uplift in observing and computing the hypnotic surface profile of green water pouring over the crest of a well-designed dam as in dissecting an obscure Elizabethan drama or in recording the change in shape of the amoeba. No adequate reason exists for characterizing as uncultured the man who by preference has become engrossed in the history and philosophy of the heat engine and of what that device has meant to civilization but who still remains ignorant of the music of Bach. Why should we hail as cultured one who is adept in the technique of the fingering or the plucking of strings but who is contemptuous of the applied

science that has mastered the field of vibration and has made possible the majestic pipe organ?

#### HUMANIZING THE TEACHING

Whether the stuff of culture be derived from inclusions of subjects that have come to be designated as liberalizing or from the professional courses themselves, it will remain embedded in its matrix unless extracted by sympathetic and discerning teachers. Not everyone is capable of effecting this much to be desired result, but I am sure that every one of you here will recall teaching that lent fascination to traditionally repulsive subjects.

A distressing barrier to progress has arisen from the common acceptance by the teacher of the view that students in the professional courses must of necessity abhor efforts to liberalize them and almost instinctively develop resistance to the process. An attitude of defeatism is acquired by those whose task it is to perform one of the most vital functions of teaching in the professional schools. Hope of pronounced betterment cannot be entertained until this is overcome.

A source of wide and enduring interest may be opened out by a sympathetic treatment of the historical and biographical aspects of the professions. Who, of his profession, is not moved by a portrayal of the struggles and achievements of Pasteur, of Blackstone, or of James Watt?

To those of logical mind there is allurements in breaking through departmentalized knowledge and tracing the fascinating patterns of principles that interpenetrate or interweave many sciences and arts? No surer source of delight exists for the mentally alert than to discover that principles and laws that he believed to be confined within the framework of his own science have their exact counterpart in other sciences with which he had hitherto been wholly unacquainted.

Every normal human being has a wholesome interest in the long and arduous struggle of the human race towards enlightenment and freedom. A moving spectacle it is, made the more so by a realization that one's own profession has had some influence on that progress. In the furtherance of this realization lies a worthy task for the teacher—the task of making clear, as Dr. W. P. Cohoe has put it, that

"Culture may be attained by following the commonplace to its origins and by integrating the knowledge so gained with every phase of human activity."

Of necessity, those in the professional courses must in some manner buttress themselves with a solid body of hard facts. It is the duty of teachers to assist in the process of acquisition. That assistance will not only be the more effective from the practical point of view, but will be welcomed by the student if it is touched with some little lightness and play of fancy.

Glass is a commonplace commodity in the world's commerce. There is more to it, however, than a mixture of solidified silicious materials moulded, rolled or cut to the desired form. A record of the influence of its manufacture and use on human life and pursuits when understandingly told is a drama of no mean power. George J. Overmyer has given some hint of it in his soliloquy of glass. Thus, to cite a few sentences:

"I am created of the admixture of Earth's minerals formed by the alchemy of time.

"I am born transformed in the blasting heat of fiery furnace.

"In molten mass I am tediously fashioned by the hand of cunning Artisan—or fed into the maw of intricate machine.

"I assume ten thousand hues of all the spectrum—either transparent, translucent or opaque—upon my maker's will.

"I admit the Heavenly light to hovel, palace or cathedral, and yet repel cold winter's howling breath.

"I correct my master's impaired sight and thus bestow

enjoyment of the printed word—and all of Nature's beauties roundabout.

"I magnify his minute, unseen enemies and thereby do I promote his health and happiness.

"I form the gossamer thread from which is fashioned fine raiment—yet too the insulation of his dwelling.

"I reveal to him the mysteries of his Universe—carrying his vision to the illimitable reaches of the outer stars.

"Through me he learned to chart the Firmament—to plot the orbits of the Planets and predict the courses of the Comets and Eclipses."

Few scientific subjects more appal the beginner than does Organic Chemistry with its complicated structural arrangements of molecules. The possibilities of presenting such a subject with a degree of charm that lures the student pleasantly along are seen in that delightful paper "Building Invisible Edifices" by H. I. Knowles.

#### CONCLUSION

Attainment of liberalization in the professional courses is possible only through a combination of favorable influences. Without their concurrence the results will be unimpressive.

Those who are admitted to the professional schools must give evidence of capacity for professional life and all that it entails. The raw material must be at least promising,

although one need not go so far as Gibbon, who, when speaking of the worthless Commodus, son of the Emperor Marcus Aurelius, remarked that

"The power of instruction is seldom of much efficacy, except in those happy dispositions in which it is almost superfluous."

We must by some means make sure of the constitutional receptivity of the student in the broadening programme. Surface treatment will not suffice. As John C. Parker has said:

"It is not a matter of hanging some academic trappings on the outside of a boor or of training his tongue trippingly to repeat phrases or to refer to events in history which have left him, as a man, quite unmoved."

Those subjects which are to serve as a vehicle for liberalization may be deliberate inclusions made for that purpose or, to a greater extent than has generally been realized, may be the regular professional subjects.

Upon the teacher himself more than any other factor, the process of liberalization will depend. All programmes and procedures fall to the ground unless they are permeated by the sympathetic insight and evangelistic fervor of one who is born to teach. Once again, it all depends upon our ability to find a Mark Hopkins.

## THE SIGNIFICANCE OF INDUSTRIAL RELATIONS

E. A. ALLCUTT, M.E.I.C.

*Professor of Mechanical Engineering, University of Toronto, Toronto, Ont.*

and

J. A. COOTE

*Assistant Professor of Mechanical Engineering, McGill University, Montreal, Que.*

**NOTE:—In the following article, written at the request of the Institute Committee on Industrial Relations, by two of its members, the authors define the nature of the problems usually comprised under the term "industrial relations." The Committee proposes, as part of its programme, to have other articles prepared on the subject and published from time to time in the *Journal* in order to stir up the interest of members in this important aspect of our social and economic organization.**

"Industrial Relations" comprise the whole range of human problems that arise within the structure of modern industry and, because of the size and complexity of these problems, they are now generally handled by executives specially chosen for that purpose. Engineers, by virtue of their experience, are well qualified for this work and are frequently selected for it but, if they approach the problem in the wrong way, their scientific training may prove to be a liability rather than an asset.

In the words of one of them\*: ". . . these very characteristics which distinguish engineering training and render engineers not only useful but indispensable in our modern industrial programme, tended to handicap us by inducing a certain indifference to problems that were not wholly technical in nature. I wonder if there is a single one of us who in his individual development in industry, did not become so absorbed with responsibilities of a specific technical nature that he unconsciously over-rated the importance of the exact engineering aspects of business and under-rated the significance of many factors which were not susceptible of ready analysis and measurement. How long will it take us to realize that the most important of these non-measurable elements is that human entity that we call an employee?"

\* Engineering Training and the Human Factor in Industry, by P. M. Russell. *Journal of the Society for the Advancement of Management*, May, 1937.

. . . We have recently become aware that the magnificent controls which can be applied to materials and to production processes are rendered valueless when a group of individuals decide to stop working and just sit down. The human factor in industry has with relative suddenness become a perplexing enigma for all levels of management, and many an engineer who has an excellent technical record finds himself facing a new problem in human behaviour—a problem which exhibits a great many unknown qualities, mentalities, skills and responses which are difficult enough to identify and much more difficult to analyse and appraise."

This implies that the reactions of many people to a given set of conditions are prompted rather by prejudice than by reason. With this proviso, methods of approach that have been applied successfully to the solution of other industrial problems may be used in the analysis of "industrial relations." The ground is not wholly unfamiliar.

The primary object of industry is to create wealth, or to add value to material by making it more useful or desirable to those who wish to acquire or use it. The more desirable the result and the smaller the expenditure of material and labour to obtain that result, the greater is the amount of wealth\*\* produced. On the other hand, waste of materials or labour reduces the amount of wealth produced and the result is a social loss.

This implies the existence of *human* losses as well as *material* losses, and the objective of the "Industrial Relations" section of an organization is to investigate the causes of such losses and to suggest or apply the necessary remedies. In structural engineering, graphical and mathematical analyses are employed to ascertain whether the material comprising a structure is being used to the best advantage,

\*\*The word "wealth" is used here in its broadest sense and refers to the degree of physical comfort and mental development made possible to the community as a whole.

or whether its distribution introduces redundancy or other sources of weakness. In heat engineering, balance sheets are drawn up to indicate the important losses, which are thereupon scrutinized to discover if and how they may be reduced or eliminated.

Similarly, with the human element, an idle or discontented employee is a source of weakness and a focus of infection within the organization. Friction in an industry or business is similar in its effects to friction in a mechanism—it generates heat and reduces efficiency. The task of the industrial relations department is either to remove the abrasive element or to apply the right kind and amount of lubricant.

The immediate consequence of the Industrial Revolution during the first half of the Nineteenth Century was a concentration of attention on the importance of *mechanisms* and humanity in general suffered from the deplorable social conditions that resulted from that policy. It required agitation which approached the scale of a civil war to ameliorate this condition, even to a minor extent.

The growth of industrial concerns into large corporations also divorced ownership from management and substituted the relationships of groups for those of individuals. As a consequence, it no longer was possible for managers to know individually the background and characteristics of their employees and to make allowances for their peculiarities and personal problems. Therefore, some means had to be provided whereby recorded data might take the place of personal knowledge, at least to some extent. This process was accelerated during the First World War when, as now, skilled labour was a scarce commodity and had to be employed with the utmost economy. The influx into industry of enormous numbers of unskilled workers and women, many of whom had never before seen the inside of a factory, intensified the problem and accentuated the need for its solution. During the post-war period of adjustment, the importance of the human factor continued to grow and personnel problems received more attention than ever before, so that the personnel department became a recognized part of most industrial concerns.

The first contact of the prospective employee with industry is through the employment department. This office has, or should have, a series of specifications for each kind of job and its objective is to fit the characteristics of the applicants to one or more of these specifications, so that misfits will be avoided as far as possible. The high cost of labour turnover is now generally appreciated and the old policy of more or less indiscriminate "hiring and firing" is discredited.

In many instances, vocational guidance and selective tests are used to assist in this process, though it is doubtful whether the latter are so universally valuable as their proponents assert. After their engagement, a judicious system of training and education may not only increase the value of the operators on their own particular jobs, but may also indicate those employees who are most worthy of advancement. A good promotion policy is an essential part of the scheme, as an employee who is discontented and is looking for another position is not only working inefficiently himself but probably is also a centre of unrest.

Most industrial disputes are caused by disagreements over

wages, working hours, or instability of employment. The fair apportionment of the increased value produced by industry between owners, management, labour and the community is a complex problem, and the present methods of mass bargaining, however inevitable they may be, are at best a very rough approximation to the ideal. One essential factor is that the system of wage payment used shall be as simple as possible, since the worker is immediately suspicious of any system that he cannot understand. Again, the reward should be proportional to the service rendered and, if in the form of a bonus or premium, should be paid as quickly as possible. The principal reasons for the failure of many co-operative and profit sharing schemes have been the small returns from them and the remoteness of the reward. The wages paid also should bear some relationship to the cost of living, as this fixes their real value in purchasing power. This may be done, as at present, by the use of a "cost of living index" but it seems to be difficult to devise an index that reflects the actual cost of living in each individual case.

Many potential disputes have been avoided or settled by works councils, which are set up in various industries to discuss matters of general importance, to bring to the attention of the management causes of dissatisfaction and in some instances to act as arbiters in disciplinary cases.

The high costs of accidents and lost time due to illness have directed attention to questions of health and safety, so that most firms of any considerable size now have adequate medical services, first aid and safety devices, but these are not sufficient unless the workers are educated and instructed in their proper use. This education must originate with the management, as otherwise satisfactory results will not be obtained. Closely allied with these matters are the provision of adequate meals and suitable housing, particularly in localities where new industries are being set up, and the provision of comfortable working conditions in offices and factories. The latter involves the provision of proper heating, ventilating and lighting appliances, clean workshops and suitably designed working places, as an uncomfortable worker is likely to produce work that is poor both in quality and quantity.

Most workers are exposed in a greater or lesser degree to anxiety for the future; the triple spectres of ill health, unemployment and old age are always near, and therefore unemployment insurance, health insurance, and pension schemes are now considered to be integral parts of any large industrial organization.

It is not the purpose of the writers to describe these functions in detail, but rather to indicate the ground that is covered by the term "industrial relations." It is a difficult and complex part of the system but its proper functioning is essential to the well being of any individual concern and indeed to the community as a whole. The importance of the proper maintenance of mechanisms is universally appreciated, but the greater importance of the proper maintenance of personnel is not always realized. Important as these questions are now, they will become increasingly so in the post-war period and, therefore, the Committee on Industrial Relations has been appointed to keep Canadian engineers in touch with this situation to the end that industrial peace may be obtained and maintained.

# PRONENESS TO DAMAGE OF PLANT THROUGH ENEMY ACTION

HAL GUTTERIDGE, M.I.MECH.E.,  
Consulting Engineer, London, Eng.

Paper presented at an Extra General Meeting of the Institution of Mechanical Engineers, London, Eng., on Friday, 27th February, 1942, and reproduced with the kind permission of the Institution.

**SUMMARY**—The paper endeavours to set out the probable proneness to damage, from enemy action, of various types of factory plant under risks due to war time conditions, and to put forward the probable extent of damage to individual items of plant. The kind of damage considered is that resulting from the dropping of high-explosives and incendiary bombs from aircraft. The paper excludes consideration of damage arising from other kinds of enemy activity.

The term "plant" is here intended to include all the equipment machinery and accessories installed for the operation of a factory or industrial establishment.

## PROBABILITIES OF THE EXTENT OF DAMAGE

Observations have indicated that the extent of the damage likely to occur is a function mainly of the type of bomb and the place where it falls, the type of building construction, the inflammability of materials adjacent to any fire, and the physical characteristics of the various items of plant. It is proposed, therefore, to examine each of these contributing factors in turn, to see how far each is likely to influence the result.

## KINDS OF BOMBS AND THEIR EFFECTS

The amount of damage caused by a high-explosive bomb will depend—apart from its explosive capacity and nearness to the item under examination—on the type of building construction and, in a lesser degree, on its size, and number of floors, and the position of adjacent buildings. The effect of an incendiary bomb will depend primarily on the type of roof construction. If the roof can resist the penetration of the incendiary bomb and is not itself inflammable (being thus a "protective level," as Colonel Guy Symonds<sup>1</sup> aptly termed it), fire will be prevented. If, however, the roof does not stop the passage of the incendiary bomb through it, the result will depend upon the resistance of the floors below and the proximity of inflammable material, whether the latter be constructional or materials in process of manufacture. A frequent source of danger in this respect is the existence of insufficiently protected lift shaft heads, light wells, and confined spaces between buildings through which the bomb can penetrate to the interior.

It can be expected that the fire risk per unit area of plan will be greater in multi-floor than in single-story buildings for, in addition to the possibility of bombs penetrating the "protective level," the exposed wall area is open to the entry of incendiary bombs which may descend at an angle of 16-46 deg. to the vertical, the angle depending upon the height from which they were released.

Fire is found to be usually much more destructive than blast with its accompanying flying debris. This comparison holds even when the damaged item is close to the point of impact of a high-explosive. It is easier to provide measures satisfactory to counter the effects of blast than the effects of incendiary bombs for once fire has taken a firm hold, it has potentialities in spreading ("communicated fire") which do not usually arise in high-explosive bombing attacks. The blast is of momentary duration and local in its effective range, but fire may be prolonged beyond the period of time which the exposed materials can withstand the heat without change of condition. Generally, it can be expected that the occurrence of fire will considerably increase the amount of the loss in value of the factory plant involved.

<sup>1</sup>See Jl. Roy. Soc. Arts, 1941, vol. 89, No. 4589 (13th June), "Fire Prevention Under War Conditions."

## GENERAL SURVEY OF BUILDINGS

The extent and severity of the damage to the plant will depend upon the protection given to it by the building and therefore the first observations to be made when carrying out a rapid approximate estimation of the damage will concern the building or buildings, as follows:

1. The site.
2. The construction and state of the building.
3. The walls, roofs, and floors.
4. The drainage.

### 1. THE SITE

The site of the building and its position in relation to any other nearby buildings which also are affected gives the first general impression of the extent and severity of the damage which may be expected and provides an indication of the work involved in reinstating the damaged plant. The position of the boilers and other ancillary plant will be observed, also whether they are housed in the affected building or not. If a building has collapsed completely, necessitating a replanning of the plant, the position of these services may influence the new plan.

Communicated fires from adjoining buildings can be prevented by providing an adequate artificial break between the buildings by bricking-up all openings in the side wall exposed to possible communicated fires. At the same time the wall forming the "exposed" side should be carried up to a height well above the roof level.

### 2. THE STRUCTURAL ASPECT

The type of building construction least likely to suffer from the effects of a bomb explosion is that type which is sufficiently resilient to recover its former position without strain or disintegration. Momentarily, after the explosion, the structure may have to adjust itself rapidly to very unequal air pressures on different parts, which may set up strong forces in its various members. Such stresses require proper continuity of reinforcement, or soundly jointed structures, with beams and columns acting as one unit, a feature which is only found in steel-framed buildings or in those of reinforced concrete construction.

The latter construction has shown its undoubted great superiority in resisting aerial attack in comparison with the old type of building, in which the walls bearing the loads are of brick or stone.

In the composite type of building, where the interior structure is of steel beams and columns, with external walls of brick to support the outward ends of the beams (each member being free to act independently) the resistance to aerial attack is of a much lower order than that of the steel-framed or reinforced concrete building; it is, in fact, little better than the structure composed wholly of brick. With existing buildings of the composite type, adequate strength at joints and bracing of the interior members is one of the minimum requirements for comparative safety.

In all steel frame and other types of construction the design should be such as to localize the effect of the bomb and hence to minimize progressive structural failure.<sup>2</sup>

<sup>2</sup>This aspect of design has been specially dealt with, so far as it concerns the roofs of single-story buildings, in War Time Building Bulletin, 1940, Nos. 1, 4 and 5 (H. M. Stationery Office). See also Report on Buildings Damaged by Air Raids, and Notes Relative to Reconstruction, (Inst. Structural Eng., London), 1941.

### 3. THE WALLS, ROOFS, AND FLOORS

The walls of a modern factory are not part of the structure. If they are external walls their purpose is mainly to keep out the weather, to allow light and air into the interior, and to preserve the air conditions within the factory. If internal, they form the necessary divisions of the area. They may act as protective walls or be used for other non-structural purposes. If, therefore, in a modern steel-framed building, all the walls have been blown out, the danger of collapse need not be anticipated.

Protective walls are arranged to divide the factory into a number of "cells" so that the effect of a bomb explosion will be localized. The number of cells depends upon the nature and arrangement of the plant and the operations carried on. It is usually possible in existing works, both engineering and industrial, so to arrange the walls that a high degree of protection is achieved without interference to the work of the factory.

In future factory layout, this aspect of protection will be incorporated in the design as a matter of good practice. As examples, in a glass-bottle works, the vulnerable brick-built tank furnaces would be separated by the concrete silos holding the raw material so that at least half the works would be saved in the event of an explosion; in a single-floor light engineering works the different types of machines would be separated into convenient cells by dwarf walls, so as not to interfere with production; in a Portland cement works, the rotary kilns, susceptible to dislodgement by blast, would be set lower to the ground than usual, with a protective wall or with the clinker or cement silos between them.

On the other hand, in factories with brick-built load-bearing wall construction, collapse of the walls will generally cause a complete collapse of the structure, with consequent severe damage to the plant. If the walls at ground floor level are at least 14 in. thick, there is reason to expect that plant inside those walls will be protected from blast and flying debris which may come from outside.

Roofs and floors of solid concrete strengthened with filler joists or steel reinforcement give more protection against bombing than floors in which lightness has been obtained by the use of hollow tiles or other means. With floors of the latter type, therefore, the damage to the plant can be expected to be greater. In single-story buildings of light steel frame or reinforced concrete construction, the roofs are not usually designed to be proof against incendiary bombs and in such cases the damage will be of a different character, for the bomb will fall directly upon the plant. In this type of factory the division of the floor into cells by protective walls designed to localize the effects of bombs or fire is particularly applicable.

### 4. THE DRAINAGE

If drainage is not adequate to deal with the abnormal conditions during a fire when large quantities of water may have to be conducted away, the consequent flooding is likely to damage plant which has been submerged. Particularly susceptible in this respect are electric motors and electrical equipment generally.

#### CONCLUSIONS ON GENERAL SURVEY OF BUILDINGS

(a) The extent of damage to the plant is likely to be the least where the factory building is of steel or reinforced concrete construction in which all beams and columns are properly jointed to each other to form one structural unit.

(b) The building should be so designed that conditions permitting "spreading collapse" are minimized; composite types of brick and steel beam construction require adequate bracing to render a building comparatively safe from aerial damage.

(c) Walls 14 inches thick will protect internal plant from flying debris from outside.

(d) Solid concrete floors and roofs properly strengthened with filler joists or other reinforcement are superior to lighter

floors of hollow-tile or other lightweight construction against air attack.

(e) Adequate drainage to conduct away the abnormal quantities of water present during fire-fighting will reduce the damage to plant at or below ground level.

#### SURVEY OF PLANT

The five main causes of damage to factory plant consequent upon an enemy attack from the air are:

1. Direct hit from a high-explosive bomb.
2. Blast pressure wave from bomb explosion usually accompanied by flying splinters and debris.
3. Fire caused directly by incendiary bombs, or indirectly by high-explosive bombs.
4. Damage from debris falling from above.
5. Flooding or drenching by water.

Each of the causes has a different effect on different types of plant. In other words, each type of plant has a proneness to damage, depending upon its physical characteristics, which can be indicated beforehand. All plant can be classified in this respect and limits set out within which the damage is likely to fall. Two examples will illustrate the method. The first example, a blacksmith's anvil, is unlikely to suffer any damage from any of the causes mentioned above except in an extreme set of conditions, in which it might be exposed to a direct hit or to intense heat. Such an item would have a minimum proneness to damage. The second example, at the other extreme, would be typified by some recording control equipment such as a thermostat, thermograph, or gas composition recorder. Such apparatus would be severely damaged by any of the above causes if they were near; in other words, the proneness to damage of such equipment would be high.

It is convenient to denote this variable proneness to damage by a number which will indicate the percentage of the value of the item (in its condition just before the incident) which has been lost by the damage it has suffered. This might be called the "damage proneness number," or "d.p.n."

The anvil referred to above could therefore be given a set of limits, to represent the damage likely to occur in average cases, of between 0 and 5, while the d.p.n. of the control equipment could be expected to fall between 70 and 100. These limits must, of necessity, refer to average cases; and whether the figure should be towards the higher limit or the lower limit or whether, in an exceptional case, the figure should be outside the limits, must depend on the judgement of the experienced engineer at the inspection.

As an example between these extremes, a totally enclosed air compressor can be taken. It can be expected that the totally enclosed body and bedplate will not be harmed by the causes mentioned other than a direct hit or persistent fire; but the gauges and pipe connections are subject to damage by blast or falling debris and, if they are carried away, they will fracture the flanges on the body. Such an item could therefore be given a damage proneness number ranging between 30 and 50 in average cases.

In seeking to establish these limits, the physical characteristics of the item will affect the result in every case except where extreme conditions have occurred. By this method, the limits of probable damage can be narrowed down and placed on a firmer basis, as an aid to the trained observer, in the rapid approximate estimation of the plant value lost.

Generally, factory plant can be classified in terms of damage proneness somewhat as follows. Heavy all-metal equipment for the heavy engineering industries, in the form of rolling mills, large presses, steam hammers, etc., will have a low damage proneness number; whilst in light high-speed machines used in cotton weaving and spinning, packaging machines for tea, margarine, etc., the damage proneness number will have a comparatively high value. The lighter equipment employed in engineering factories, such as lathes, shaping machines, grinding machines, etc., are, in average

cases, likely to suffer damage to parts other than the beds or bases when exposed to blast or fire and the damage proneness number may be expected to lie between 20 and 50; it may be somewhat higher if the electric motor drive has been exposed to heat or flooding. If efficient dwarf protective walls were provided, the damage proneness number would lie towards the lower limit.

Intricate machines of lighter construction will need a much greater proportion of its replacement value to be expended in repair (in relation to the proportion of actual damage) because of the high cost of assembly; on the other hand, the cost of removal and reinstallation will be considerably less than for plant of a heavier type. Again, heavy machines of an intricate nature, such as looms, will have high damage proneness numbers, despite their great weight, due to the large number of delicate parts and to the high precision required.

The high-speed automatic type of machine constructed of fabricated steel has a greater chance of survival than a machine made of cast iron, for the combination of toughness and malleability of the former is, in these conditions, a superior characteristic to the brittleness of the cast iron. Sheet metal equipment in any form, such as milk pasteurizers, fan casings, and ducts, suffer severely for they offer a large area ill-supported to resist a suddenly applied atmospheric pressure followed by an equally sudden subatmospheric pressure. Failure takes place by tearing at rivet holes, followed by general crumpling of the plate. Where exposure to blast, falling debris, or fire has occurred, a damage proneness number between 60 and 90 may be expected.

The proneness to damage is also affected by the extent of the surface of the item exposed to the blast. The blast is resisted by the weight of the item and by any anchorage that it may have to a secure foundation. Thus it is convenient to classify such plant (excluding items held down to their foundations) in terms of the ratio of the weight (in pounds) to the exposed area (in square feet). The application of this criterion assumes a structurally sound item and a rigid surface. Thus a Lancashire boiler, when full of water, would have a high ratio of weight to exposed area.

A recent experience can be cited in which two Lancashire boilers set side by side were 50 yds. from the point of detonation of a large-capacity high-explosive bomb. The side wall of the nearer boiler was at right angles to the line of the blast. The result was a movement of both boilers 1 in. away from the source of the explosion, the rupturing of the boiler settings, and the fracturing of all steam pipes on the top of the boilers.

## FACTORY SERVICES

### PIPING

The general practice of attaching service piping to the most convenient point of support has persisted despite the many advantages in accessibility, clean layout, absence of obstruction, and protection from fire or other damage which is realized by placing such piping below the ground floor level in covered channels, with vertical branches only to the points to be supplied. An added reason for such treatment is provided by the threat of air raids, for piping not so arranged is particularly vulnerable to blast, fire, or falling debris. It cannot be too strongly impressed that the supply services carried by such piping are the arteries supplying lifeblood to the machines without which they cannot operate. Factory piping should therefore receive the attention which its importance warrants, and improvements should be sought in the following directions:

1. The total length of the service lines should be as short as possible.
2. The piping should be duplicated within reasonable limits, the second line being far enough away from the first to avoid the possibility of one bomb destroying both.
3. Adequate protection should be given by placing the piping underground, or disposing it in other ways.

If piping is attached to the structural members and total collapse of the building takes place, the piping will become

a total loss with a damage proneness number approaching 100, for none of it, except the valves, is worth recovering. If, however, the piping has been placed underground, then even with a total collapse of the building, only the vertical "runs"—and these are the less important—will be lost; and the damage proneness number may be expected to lie between 40 and 80.

### ELECTRICAL POWER AND LIGHTING

The cables for the supply of electricity, as well as electric motors, switchgear, etc., are particularly vulnerable to blast, fire, falling debris, and especially to flooding. As with piping for the various services, the cables should be run in channels, watertight in this case, with vertical leads to the points of consumption. All main supply cables should be duplicated; they should be laid underground, far enough apart to prevent the possibility of one bomb affecting both of them.

Electric motors are particularly susceptible to damage from these causes but their strong body casing protects them from falling debris. They also offer a high resistance to blast by virtue of their high ratio of weight to exposed area and because of their secure fastening to their bases. Even so, it is a frequent experience to find the feet fractured and the motor dislodged. The coils and windings, although so comparatively well protected, are easily damaged by flying debris and flooding; if flooding alone has caused the damage they can sometimes be reconditioned by drying. A general damage proneness number for all electrical motor equipment, including attendant switchgear but excluding distribution mains, may range from 50 to 80 in average cases.

In generating stations, protection for the turbine-generator set can be provided by building a separate reinforced concrete structure.

### BOILERS

From the viewpoint of this survey, boilers can be classified into two general classes: the first includes Cornish, Lancashire, and fire-tube boilers of that category; and the second comprises vertical and water-tube boilers. Boilers of the first type are heavy objects when filled with water; they are set low, near the ground, and are well bedded, with sides mostly shrouded with brickwork. They offer a high ratio of weight to exposed area, and suffer little damage in themselves, although the steam connections above are likely to receive injury from flying debris. The damage proneness number for the first type of boiler is likely to be between 10 and 30 if the boiler settings have not been disturbed. A case of exceptional damage by blast to a boiler installation of this type has already been cited under the heading "Factory Services."

The second class of boiler is more susceptible to damage than the first, for such boilers are built as comparatively high structures, securely held to their foundations, with a high centre of gravity. The damage proneness number of this class may be between 40 and 70.

### INSPECTION OF DAMAGED PLANT AND RAPID ESTIMATE OF LOSS IN VALUE

For the rapid approximate estimate of the loss in value of the damaged plant, the following order of observations is suggested:

1. A general inspection of all buildings on the site and of the adjacent buildings, to obtain a comprehensive impression of the extent of the damage likely to have taken place.
2. Inquiries as to the type of bomb which caused the damage, whether the factory had received a direct hit, and if fire followed, where and for what period did the fire continue.
3. If a fire occurred, whether it burned itself out or was quenched by water.
4. A detailed inspection of the type of building construction, its condition, and whether any collapse had taken place.
5. A detailed examination, as far as possible, of the whole

of the plant, its layout, nature, and the condition of all the items damaged.

6. Ascertainment of the value of all the damaged items, the value to be that immediately before the incident.

7. Preparation of a schedule showing all items, or groups of items, of damaged plant; the damage proneness number of each in the light of the conditions to which the item was exposed; and the corresponding loss in value. By summing the individual losses, the total loss is obtained, which can be expressed as a percentage of the total former value.

An example of a schedule of a possible case is given below.

A factory of three floors covering  $\frac{1}{2}$  acre in one building of load-bearing brick construction with internal joists and columns not soundly jointed together, receives a direct hit from a high-explosive bomb of large calibre. The result, it is supposed, is the total collapse of the factory, with fire breaking out in one part of the building among inflammable materials in process of manufacture. The fire, however, did not spread. In such a case, the schedule given in Table I might reflect the state of affairs in an approximate estimation of the loss in value of the plant.

Each of the items in Table I will be made up of a number of units, of various types and values, each of which would have been given a damage proneness number, so that the

TABLE I. APPROXIMATE ESTIMATE OF DAMAGE

ITEM	Value of item, £	Damage proneness number	Value of loss £
Processing plant.....	20,000	50	10,000
Packaging equipment.....	4,000	75	3,000
Conveyers.....	1,000	100	1,000
Refrigeration plant.....	6,000	50	3,000
Electrical equipment.....	3,000	80	2,400
Service piping.....	3,000	100	3,000
Boilers.....	4,000	30	1,200
Miscellaneous.....	3,000	50	1,500
Motor vehicles.....	2,000	50	1,000
	<u>46,000</u>		<u>26,100</u>

actual items shown represent totals for groups of individual items. The total loss for the whole of the factory plant works out, therefore, at a little over 56.7 per cent of its actual value.

#### REINSTATEMENT OF DAMAGED PLANT

Whether the damage to the plant had been extensive or trivial, the same procedure is necessary for reinstatement of the plant. The approximate estimate of the loss in value will have provided the necessary information upon which to base the decision as to the future programme in regard to the re-establishment of the plant.

In the case of a totally collapsed building, if it is decided to rebuild upon the same site, the work involved falls into two parts. The first part consists of clearance from the site of all debris and plant and the dispatch of the damaged plant for repair. It is well to note here that much further damage may be done to the plant in taking it down, disentangling it from the debris, and loading it on to the removal

vehicles, so this work should only be carried out by competent men. It is usually preferable to return the damaged plant to the makers rather than to other firms.

The second part of the programme is the repair of the equipment, the planning of its subsequent layout, the construction of the building to suit the new layout, and the reinstatement of the plant leading to the re-establishment of the factory. Where only a portion of the structure and the plant has been damaged, it is usually possible to adjust the remainder of the plant so that partial production can be realized. Continuity of output is thus maintained and the staff productively employed. Ingenuity assisted by experience will dictate how much can be done in that direction and as long as some of the special-purpose plant has survived, the replacement of general-purpose equipment such as boilers, pumps, motors, etc., does not present so great a difficulty, since such items are standard commercial equipment obtainable from a number of manufacturers.

Plant sent for repair necessitated by enemy action should be overhauled for normal wear and tear at the same time. The total cost of repairs should be allocated therefore to two accounts. No. 1 account would show the cost of repair of damage due to enemy action including the cost of removal, carriage outwards, dismantling at the repair shops, reassembly, testing, and storage until the new building is ready, return carriage, re-erection, and testing as a unit. No. 2 account would show the cost of overhaul for normal wear and tear. From these accounts the actual value of the loss on repairable items will be ascertained.

In the case of a complete reconstruction, the opportunity should be taken to lay out the plant in the light of modern practice, so that, with a building to suit the layout, the factory will represent the best economical arrangement, both as regards cost of outlay and in operation.

In principle, a factory is a place in which certain changes are made in raw materials so as to increase their value. Therefore, for the enterprise to be profitable, these changes must be carried out at a cost suitably less than the increase in value of the raw materials in their changed form. In the new layout of the factory plant, the following steps are taken:

1. A "flow-line" diagram is prepared, in which every process through which the raw materials pass from their reception to their dispatch, is shown diagrammatically in sequence, together with the type of service required by each process. This diagram illustrates the qualitative aspect.

2. A "quantity-line" diagram (a development of the flow-line diagram) is prepared, to show the *number* of machines or units of equipment required and the quantity of each service supply needed for each process.

3. The disposition of machines or equipment is planned to the best productive advantage.

4. The building is constructed to suit the layout, to support each item in its proper position relative to the other items of plant, and to protect the plant from the weather, enemy attack, and other causes of damage.

5. The plant is erected, the supply services installed, and the whole plant set to work.

For the Story Bridge work, trials were made and a mean compression rate of 5 lb. per min. was found to be suitable. Schedules of operation prepared on this basis were maintained without great difficulty. The same rate was adopted for the fast stage of decompression, in incidental conformity with the American rule.

### COMPRESSED-AIR ILLNESS

Compressed-air illness is an after-effect of exposure, caused by the liberation of nitrogen bubbles from solution in the blood and tissues of the body. Its nature was determined in 1878 by Paul Bert, a French physiologist.

The atmospheric oxygen and carbon dioxide have other complex reactions which may become dangerous, with no direct bearing, however, upon the occurrence of compressed-air illness.

The nitrogen does not enter into chemical combination, but it is soluble in the blood and a state of saturation is maintained at the surface of the lungs, where intimate

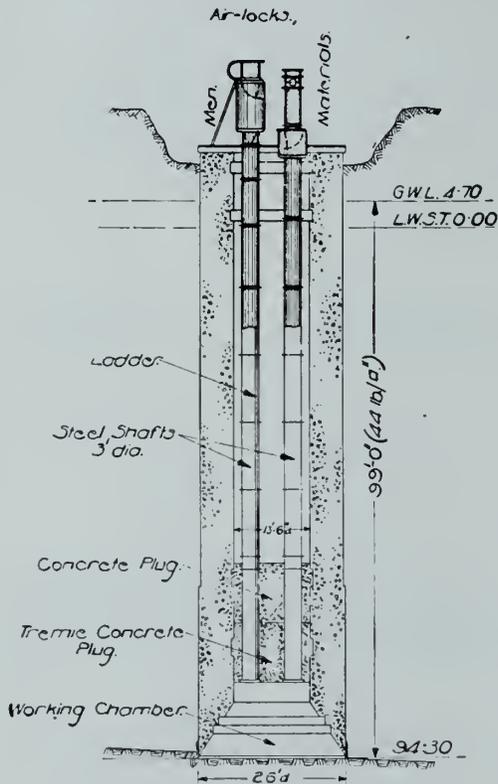

Fig. 2—Cylinder 28E.

contact is made. When compressed air is breathed, the blood leaves the lungs with an increased pressure of nitrogen in solution. In circulation it is brought into contact with the semi-liquid tissues of the body in which the solution pressure, at first normal, is lower. Nitrogen is transferred, therefore, and the content of the tissues is gradually built up. If the duration of exposure is sufficient, equilibrium is reached and the pressure of nitrogen in the tissues equals its partial pressure in the air—0.79 of the total air pressure.

The dissolved nitrogen is known to be harmless, so long as it remains in solution. When the pressure of the air is reduced below that of the nitrogen in the tissues, supersaturation is brought about, with a tendency for bubbles to be formed. The return to atmospheric conditions should be regulated so that dangerous supersaturation is avoided. When this is done the excess nitrogen is conveyed back to the lungs by the blood, and there discharged from solution without harm.

Compressed-air illness may result from faulty decompression, accidental variations or the presence of highly susceptible men. It is difficult to eliminate, but the number of cases can be kept very low if reasonable precautions are taken.

The symptoms vary widely with the location and extent of the bubbles set free. The most common forms are localized pain, dizziness, vomiting attacks, collapse, and paralysis. They rarely appear before the workmen have left the locks, and generally soon after exit.

### HALDANE'S THEORY OF DECOMPRESSION

The "uniform" decompression originally used occupied considerable time, and a more efficient course has been developed.

Modern methods are based upon the work of a British physiologist, Dr. J. S. Haldane. As a member of the Admiralty Deep Diving Committee of 1906, he was responsible for the introduction of "stage" decompression. It was found that the pressure could be lowered at once to half its absolute value, even after long exposure, without causing ill effects. By conducting the decompression rapidly to this point, and then slowly to its completion, no risk was added and much time could be saved.

Haldane wrote as follows: "Practical experience of work in compressed air shows that even with very rapid decompression, no symptoms of caisson disease occur with an absolute pressure of less than two atmospheres and that symptoms are very rare and slight until the pressure rises beyond 2.3 atmospheres, or 19 pounds per square inch. . . . Now, if it is possible to decompress rapidly and with safety from two atmospheres, or a little more, to one atmosphere, it seemed likely that it would be possible to decompress with equal safety from four atmospheres to two, or from six to three, since the volume of gas tending to be liberated would be the same in each case. Experiment showed that this was the case, and that the danger of rapid decompression depends, not on the absolute difference between the initial and final pressure, but on the proportion between the two pressures. If this proportion is only 2, or 2.3 to 1, the decompression is safe; if, on the other hand the proportion is 3 or 4 to 1, the decompression is dangerous."

In the stage method, the first rapid reduction of pressure and the slow completion of the decompression were governed by the same principle, that bubbles do not form unless a fairly definite degree of supersaturation is reached. A safe relation was maintained between the absolute pressure of the air and that of the dissolved nitrogen.

It was shown that the pressure of nitrogen is adjusted at different rates in different parts of the body, according to their relative capacity and the nature of the blood supply. Adjustment is retarded, for instance, by the presence of fat, which dissolves about six times as much nitrogen as the blood. For analytical purposes the tissues were divided into five groups, assumed to become "half-saturated or half desaturated after a given alteration of pressure," in 5, 10, 20, 40 and 75 minutes, respectively. The last rate was that determined for the slowest parts.

Haldane showed that the margin of safety should be approached throughout the decompression. Not only is the discharge of nitrogen accelerated in this way, but its continued solution in the "slow" tissues is also checked early.

### DECOMPRESSION PRACTICE

The stage method was accepted by the British Admiralty in 1906, for the decompression of divers. The extensive tables which Haldane compiled appear in the *Admiralty Diving Manual*. They have been adopted, in turn, by nearly all the navies and deep water diving authorities of the world. In their use the diver's ascent is controlled by reductions of depth called "stages," shown in Fig. 3, which have given the method its name.

In construction work, where air-locks are used, the halted stages of diving practice are not readily applied. The fast and slow reductions of pressure are more conveniently made at different uniform rates. In tunnels where approach chambers, maintained at an intermediate pressure, are traversed by the men, the periods of constant pressure shown in Fig. 4 are interposed.

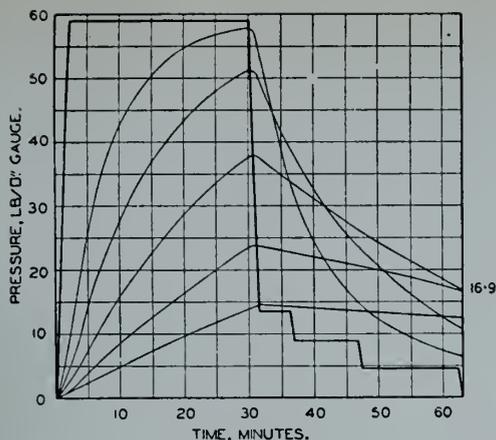

Fig. 3—Stage Decompression of Divers, according to the Diving Manual.

Table I<sup>1</sup>, the form of which is suitable for decompression in air-locks, was published by Haldane in 1907. Its practical value is small, however, on account of its limited detail. No comprehensive guide became available until the Report of The Institution of Civil Engineers<sup>2</sup> was circulated in 1936. This may account for the widespread use of inefficient procedure which continued in the intervening years.

TABLE I.

HALDANE'S TABLE—SHOWING RATE OF DEPRESSION IN CAISSON AND TUNNEL WORK

Working Pressure in lb. per sq. in.	Number of minutes for each pound of decompression after the first rapid stage		
	After first three hours exposure	After second or third three hours exposure, following an interval for a meal	After 6 hours or more of continuous exposure
18-20	2	3	5
21-24	3	5	7
25-29	5	7	8
30-34	6	7	9
35-39	7	8	9
40-45	7	8	9

Uniform decompression is still applied in some countries. It is contended that Haldane's method sets up excessive stress in the system, inducing organic reactions by which the regular process of desaturation is disturbed.<sup>3</sup> There is no evidence to support this opinion and much is known to discount it.

In America and in parts of continental Europe a compromise is used, in which the first rapid reduction extends to half the gauge working pressure only, instead of half the absolute, shown by Haldane to be safe.

For the piers of the Story Bridge, it was decided to follow the stage method completely, by carrying the first reduction of pressure down to half the absolute. The extent of the slow stage was determined from the theory, which was developed mathematically for the purpose.

MATHEMATICAL DEVELOPMENT OF THEORY

It is assumed that the blood leaves the lungs with a solution pressure of nitrogen equal to the partial pressure in the surrounding air. The pressure in the tissues is varied by an exchange of nitrogen with the circulating blood.

Referring to the diagram, Fig. 5.—

<sup>1</sup>"The Hygiene of Work in Compressed Air" by J. S. Haldane, M.D., F.R.S.—*Jour. of the Royal Society of Arts*, Vol. 56, 1907-8.

<sup>2</sup>The Institution of Civil Engineers, "Report of the Committee on Regulations for the Guidance of Engineers and Contractors for Work carried out under Compressed Air." London, 1936.

<sup>3</sup>International Labour Office, Geneva; Occupation and Health—No. 166, Compressed Air Work.

$\theta$  represents the external air pressure, in absolute units.  
 $a$  " its linear rate of change.  
 $n$  " the proportion of nitrogen in the air breathed (0.79 for atmospheric air).  
 $\phi$  " the solution pressure of nitrogen in the tissues, in absolute units.  
 $t$  " time.

$\theta_0, \phi_0, t_0$  are respective values at the outset.

From the physical laws it follows that, at any point

$$\frac{d\phi}{dt} = k\{n(\theta_0 + at) - \phi\}$$

Therefore,

$$\phi = \phi_0 + nat + \left\{n\theta_0 - \phi_0 - n\frac{a}{k}\right\} (1 - e^{-kt}) \dots \dots \dots (I)$$

The particular values of  $k$  for the different groups of tissues are as follows: For those which become "half-saturated" in—

- 5 minutes,  $k = 0.1386$  (A)
- 10 "  $k = 0.06932$  (B)
- 20 "  $k = 0.03466$  (C)
- 40 "  $k = 0.01733$  (D)
- 75 "  $k = 0.009242$  (E)

Equation (1) is general, but for ordinary conditions, in which  $n$  remains constant, a more convenient form can be secured.

Let  $P$  represent the gauge pressure of the air (above atmospheric), lb. per sq. in.

$p$  " the gauge pressure of air which would exert nitrogen pressure equal to that in the tissues, lb. per sq. in.

If the normal pressure of the atmosphere is 15 lb. per sq. in.

$$\theta = P + 15$$

$$\phi = n(p + 15).$$

By substitution in equation (1)

$$p = p_0 + at + \left\{P_0 - p_0 - \frac{a}{k}\right\} (1 - e^{-kt}) \dots \dots \dots (2)$$

Equation (2) was used in the preparation of Figs. 3 and 6. The calculations made for the values of  $k$  and for plotting Fig. 6 are given in an Appendix to the original paper.

THE PRESSURE RATIO

For safe decompression, as defined by Haldane, the ratio  $\frac{15 + p}{15 + P}$  should not exceed 2.0 to 2.3 at any time in any of the five tissue groups. In his recommended air-lock practice, when the first rapid reduction of pressure has been made, the ratio is a little less than 2.0. During the slow period which follows, it is increased slightly to not more than 2.3 at the conclusion.

Uniform decompression implies a ratio of 1.0, or less, at the outset, with a large progressive increase. In the American procedure, as shown in Table II, conditions are clearly intermediate.

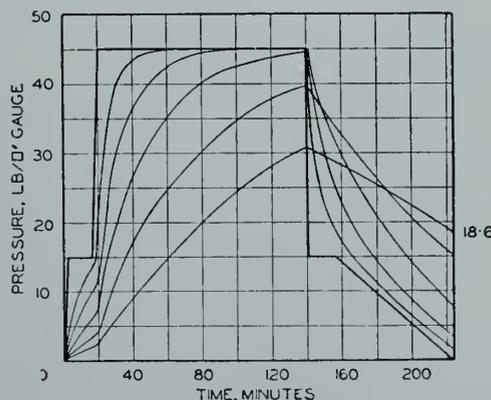

Fig. 4—Stage Decompression Adapted to Tunnelling Work.

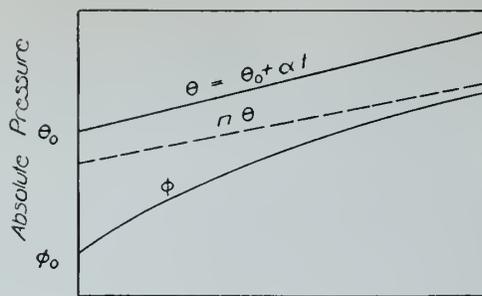

Fig. 5.

In all methods generally used the ratio reaches its highest value, and the danger of bubble formation is therefore greatest, when atmosphere pressure is restored. In practice, symptoms rarely arise beforehand.

Thus, the final ratio is the theoretical index of protection. Alternatively, the final value of  $p$  may be taken, since the two are related directly. Final ratios of 2.0 and 2.3 are represented by values of  $p$  equal to 15 and 19 lb. per sq. in., respectively.

It is inferred that positive protection should result when the value of  $p$  at exit is 15 lb. per sq. in., and that symptoms should be "rare and slight" when it is kept below 19 lb. per sq. in.

#### PRACTICAL STANDARDS OF PROTECTION

It would appear at first sight that the standard of maximum protection, corresponding to 15 lb. per sq. in. at exit, should generally be applied. Time can be saved, however, and the discomfort of long decompression reduced, if a small proportion of compressed-air illness is accepted.

It is understood that the Admiralty diving tables were compiled to provide a final solution pressure of nitrogen in the tissues corresponding to 18 lb. per sq. in. gauge pressure of air. Figure 3 is typical of a number of cases checked, in which only slight variations were found. Haldane's table for decompression in air-locks, reproduced as Table I, gives consistent values of the same order. The proportion of unsuccessful decompressions experienced in the use of both is said to be small, but no numerical records can be found.

Much higher values have been applied in American work. It is reported by Sir Henry Japp<sup>1</sup>, who introduced stage decompression in New York in 1908, during the construction of the Pennsylvania Railroad East River Tunnels, that the "nitrogen pressure in the blood" (meaning its air equivalent), was regulated to 27 lb. per sq. in. on emergence. At 40 lb. per sq. in. working pressure, the method gave 139 cases in 8,510 decompressions, or 1.63 per cent. In 1909 he recommended 25 lb. per sq. in. as a standard for general adoption.

The modified stage method used in America to-day has been developed over a number of years in the State of New York, without apparent theoretical guidance. The regulations made have been altered, from time to time, in the direction of safety. The present code and its forerunner, which is widely retained by authorities outside New York, are summarized in Table II. The results of analyses given, though irregular, indicate an approach to Haldane's standard in the amended code.

Dr. Levy's records,<sup>2</sup> taken from the Public Service Commission tunnels which were driven under the East River between 1914 and 1919, show a high degree of immunity from an adaptation of the former New York code. Only 680 cases resulted from 1,361,461 decompressions, equal to 0.05 per cent. The adjustments of procedure which were made to meet the special requirements of tunnelling work are incompletely described however, and a better knowledge of the conditions would be needed to analyse the protection given.

Australian experience in the foundations of the Grey Street Bridge is analysed in Table III. Values of  $p$  at exit, calculated from the records, are shown beside the percentages of compressed-air illness which occurred.

In the case of the Story Bridge, the six shallow foundations, which were air-locked first, were made the subject

	48	¾	5	¾	6	48	18.7	1.0	18.7
	50	½	6	½	6	50	16.5	0.5	16.5

\*Decompression to one-half the maximum gauge pressure at the rate of five pounds per minute, and the remainder at a uniform rate.

†See Fig. 8.

of experiment. By the use of graphs compiled from the theory the index was varied between 15 and 23 lb. per sq. in. In 1422 decompressions, 15 cases of compressed-air illness arose, generally following the use of higher values, when the symptoms were also more severe. The observations were consistent with Haldane's definition of the safe limit as 19 lb. per sq. in.

In Pier 28 W, a constant final value of 18.5 lb. per sq. in. was applied and 0.77 per cent. of recompressions were required. In the three remaining foundations, the index was reduced to 18.0 lb. per sq. in., and the number of cases was close to 0.5 per cent. in each case, as shown in Table IV.

Later work was carried out in Brisbane in the Pinkenba sewer, between November, 1940, and March, 1941, at a working pressure from 22 to 23 lb. per sq. in. The decompression was adjusted to secure a final value of 16.0 lb. per sq. in., and compressed-air illness was reduced to two minor cases in 771 decompressions, or 0.26 per cent.

Figure 7 has been plotted from the theory, to a constant index of 18.0 lb. per sq. in., in a form convenient for general use. Under conditions similar to those which existed in the works described, about one half per cent. of cases, with few severe symptoms, can be expected from its use.

When greater protection is desired, the time of decompression may be adjusted, but no purpose could be served by reducing the value of  $p$  at exit below 15 lb. per sq. in.

#### PRESSURE LIMITS

Figure 7 covers working pressures up to 60 lb. per sq. in. above the atmosphere.

The pressure which men can sustain with safety is limited by the toxic effect of the oxygen<sup>1</sup> in highly compressed air. Its concentration is not sufficient for this to appear within the present range of construction work.

In the Admiralty diving tables, which are known to be safe, ordinary procedure is specified to a depth of 204 ft. or 91.5 lb. per sq. in. Additions recently made provide for descents of 300 ft. by the use of special apparatus in which an oxygen respirator is employed in decompression to reduce the period.

#### THE EFFECT OF DOUBLE SHIFTS

More often than not, the workmen's day is divided into two shifts, with a period of rest between them. At the commencement of the second shift the tissues contain residual excess nitrogen which affects their subsequent condition. Thus, their nitrogen content at the conclusion is greater than it was at the end of the first shift.

Table II shows the calculated values of  $p$  at the end of

<sup>1</sup>See Chapter IX of *Caisson Sickness* by Dr. Leonard Hill, published by Edward Arnold, London, 1912.

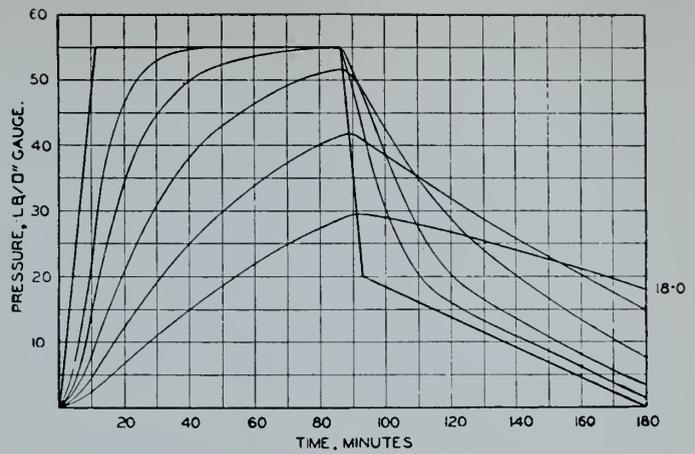

Fig. 6—True Stage Decompression used on the Story Bridge.

both periods under the American codes. An extract is extended graphically in Fig. 8. In general it can be seen that the difference is very small.

In both the Grey Street and Story Bridge foundations, two shifts were worked daily at six hours sequence. Analysis showed that the increase in the solution pressure of nitrogen at the end of the second shift, compared with the first, was negligible.

#### RATE OF CIRCULATION

In the development of Haldane's theory and the analyses made by its use, a constant rate of blood-circulation has been assumed.

It is known that the normal rate may be increased as much as ten times<sup>1</sup> by strenuous exercise. Whilst so large a variation is not to be expected in the course of ordinary work, nevertheless some difference must arise between the periods spent at work and under decompression.

The workmen are usually urged to exercise themselves in the air-locks, to increase the value of the decompression.

Apparent discrepancies in different sets of records, as well as the notably erratic proportions of compressed-air illness experienced from day to day, may be accounted for to some extent by variations of physical activity.

#### REPORT OF THE INSTITUTION OF CIVIL ENGINEERS

The Report of the Committee of The Institution of Civil Engineers, already mentioned, gives practical rules for the supervision of work in compressed air. The main feature is its table of stage decompression, of much wider application than anything published before.

<sup>1</sup>*Caisson Sickness* by Dr. Leonard Hill, published by Edward Arnold, London, 1912.

TABLE III.  
GREY STREET BRIDGE RECORDS

Working pressure, lb. per sq. in.	Time of compression, minutes	Period of work at face, hours	Time of exposure to working pressure, hours*	Time of decompression, minutes†	Calculated value of $p$ at exit, lb. per sq. in.	Cases of compressed-air illness recorded, number per cent. of decompressions
37	18.5	2	2¼	51	20.8	1.2 per cent. of 1,890
41	20.5	1½	1¾	58	20.3	0.0 per cent. of 1,458
45	22.5	1½	1¾	64	21.6	0.9 per cent. of 1,236
47	23.5	1½	1¾	67	22.4	1.1 per cent. of 1,462
48	24	1½	1¾	69	22.7‡	2.9 per cent. of 1,135
					Total	1.1 per cent. of 7,181

\*To the periods worked at the face, ¼ hour has been added for the time occupied in changing shifts.

†Decompression to one half the maximum gauge pressure at the rate of 2 lb. per min., then five pounds at the rate of 1 lb. per min., then five pounds at the rate of ½ lb. per min., then to atmospheric pressure at the rate of ½ lb. per min.

‡See Fig. 10.

Obviously the table has been compiled by the use of Haldane's theory, but the method of its compilation is not recorded.

When the Report became available in 1936, the investigations undertaken in Brisbane were already well advanced. They were completed independently, with closely parallel results. Difference arose, however, on several points.

It can be shown that the decompression table provides varied values of the final pressure index, from about 18 lb. per sq. in. for high working pressures, which is quite satisfactory, to 22 lb. per sq. in. when the working pressures are low. The protection afforded at low working pressures, in terms of the theory, therefore appears inadequate. The meagre explanatory notes included, fail to establish the safety of the departure made.

Discretionary curtailment of the decompression period is suggested in the Report, provided the number of cases requiring recompression in any one week is not allowed to exceed 2 per cent. Observations show that more than one per cent. makes excessive demands upon the medical staff and may cause anxiety amongst the men.

The fixed period of two minutes specified for the rapid stage of decompression, is more logical than the nominal rate applied in Brisbane. In view of local experience, however, it appears too fast. For average workmen the time might well be doubled.

#### CONTROL OF DECOMPRESSION

In the pressure gauges attached to the locks, accurate calibration is necessary. All gauges should be tested throughout the working range.

The air-locks used on the Story Bridge were operated by attendants stationed outside. By way of instruction to them and to assist operation, a decompression dial was provided at each air-lock, mounted near a clock beside the pressure gauges. Each dial consisted of a fixed card marked like the face of a clock, with a disc pinned in the centre

on which the course of decompression had been plotted. Its starting point is set by rotation to match the minute hand of the clock, which then indicates the gauge readings required. The inner disc must be changed with an alteration of working pressure or time of exposure, and a number should be kept on hand to cover possible variations.

#### RECOMPRESSION

It has long been known that the symptoms of compressed-air illness usually disappear on return to work. This led to the use of recompression for treatment, and it is still the only effective remedy known. The pioneer of the subject was Sir Ernest Moir, a British engineer, by whom the first medical air-lock was built.

All works of any consequence are now equipped with a medical lock. A steel cylinder is divided by a bulkhead into two compartments. Each is fitted with an air-tight door, two bunks, glass ports for observation and a "medicine-lock" for the transmission of packages from the outside. The bunks are provided with blankets to keep the patients warm. The valves and gauges for controlling the pressure are located outside the lock.

In an emergency, recompression may be carried out with confidence by anyone acquainted with its principles. Medical supervision of the patients and their treatment is generally desirable, however, because the diagnosis is sometimes uncertain and complications may arise requiring direct medical aid.

The pressure should be increased rapidly to its original working level, despite the disappearance of symptoms before it is reached. Some authorities recommended a pressure above the original, but this may not be possible when the lock is supplied with air from the same source as the works.

Recompression usually gives complete relief at once. The effect is less marked, however, when its application is delayed until the tissues have been actually damaged.

TABLE IV.  
STORY BRIDGE RECORDS

Foundation	Date of work	Working pressure range, lb. per sq. in.	Time of compression, minutes	Period of work at face, hours	Time of exposure to working pressure, hours*	Time of decompression, minutes	Value of <i>p</i> at exit, lb. per sq. in. 29 W	29/4/37 1/6/37	50 57	10 11	1	1¼	77 103	18.0	3,813	17	0.45
							Totals	11,077	65	0.59

\*To the periods worked at the face, ¼ hour has been added for the time occupied in changing shifts.

†See Fig. 11.

Relief is brought about by a reduction of the bubbles in size. For permanent results they need to be redissolved. To this end the pressure may be maintained for twenty minutes, more or less, according to the method followed. In the Admiralty practice, decompression is commenced at once, provided all symptoms have disappeared, but the rate is so slow that the result is practically the same. Tables of rates for various conditions are given in the *Diving Manual*. Even if the working pressure has been maintained for a period, a reduced rate of decompression should be applied, with particular caution as atmospheric pressure is approached.

Most patients can be cured completely, but the symptoms sometimes recur and treatment has to be repeated. In such cases the rate of decompression should be further reduced.

Late treatment is the principal cause of failure. The workmen should be warned, therefore, to report suspected symptoms at the earliest opportunity.

The breathing of oxygen from a respirator in the medical lock is a recognized means of assisting the cure, at present not widely used.

#### GENERAL PRECAUTIONS

Susceptibility to compressed-air illness varies with individuals and conditions. Unsuitable men should be eliminated by medical examination and, wherever possible, the health of the workmen should be placed under medical supervision.

The air-locks should be protected from extremes of temperature and reasonable facilities provided in and about the works to reduce discomfort and fatigue. Proper dressing sheds, with hot shower-baths are necessary. In Queensland hot coffee is supplied to each shift after decompression.

Certain standards must be satisfied in the supply of compressed air.

#### SUPPLY OF COMPRESSED AIR

Fresh air contains about 0.03 per cent of carbon dioxide. An increase to 3 per cent is hardly noticeable at atmospheric pressure, resulting only in deeper breathing than usual. Greater proportions cause distress and ultimately lead to suffocation.<sup>1</sup> Concentration has the same effect, whether brought about by an increased percentage at atmospheric pressure or by raising the pressure of the air. Thus, the safe partial pressure in the atmosphere should not be exceeded in compressed air.

The breathing of one person produce 0.014 to 0.045 cu. ft. of carbon dioxide per minute, measured at atmospheric pressure, for respective conditions of rest and work.<sup>2</sup> In the case of divers, the only source of increase is their breathing. To prevent the concentration in the helmet of a diver at work, from rising above 3 per cent. of an atmosphere, air must be supplied at the rate of  $0.045/0.03 = 1.5$  cu. ft. per min., measured at the working pressure. This is the quantity specified for Admiralty divers.

Haldane suggested that in caissons and tunnels, to make the effects of carbon dioxide "practically inappreciable," its partial pressure should not be allowed to exceed 1 per cent of an atmosphere. To provide for the breathing of the persons present, a minimum ventilation of 5 cu. ft. per man per minute, measured at the existing pressure, would suffice if the air were properly distributed.

In practice a larger supply is needed to overcome uneven distribution in the working chamber and to remove additional quantities of carbon dioxide, as well as carbon monoxide and other poisonous gases, introduced from various sources. Wastage of air through the material locks and elsewhere must also be replaced.

<sup>1</sup>See "The Hygiene of Work in Compressed Air," by J. S. Haldane, M.D., F.R.S., *Jour. of the Royal Society of Arts*, Vol. 56, 1907-8.

<sup>2</sup>See *The Diving Manual*, 1936, p. 28.

On the Story Bridge works, provision was made to supply at least 12.5 cu. ft. of compressed air per man per minute to the working chambers and 5 cu. ft. per man per minute to the man-locks. At Pier 29, where the maximum conditions occurred, 10 men were located at one time in the working chamber and 10 (to 20) men in the locks. Therefore, the requirements were  $(10 \times 12.5) + (10 \times 5) = 175$  cu. ft. per min., measured at the working pressure of 54 lb. per sq. in. In terms of "free air" i.e. air measured at atmospheric pressure, the volume was— $175 \times 69/15 = 805$  cu. ft. per min.

Air was supplied by three compressors each 13 in.  $\times$  14½ in., of displacement 570 cu. ft. per min. Their individual output was 450 to 500 cu. ft. of free air per minute. Two were kept at work under ordinary circumstances and the third, acting normally as a standby, was also brought into commission after explosives had been fired in the working chamber, to assist in clearing away the fumes. Smaller machines supplied high-pressure air for operating pneumatic tools.

The compressors were driven by electric motors. No standby source of power was installed because the risk of interruption was remote, and the quantity of air stored in the working chamber and receivers was always ample for the safe withdrawal of the men. The one failure which occurred caused no anxiety and little inconvenience.

The main supply of compressed air was delivered into each man-lock shaft, just below the man-lock, to ensure the

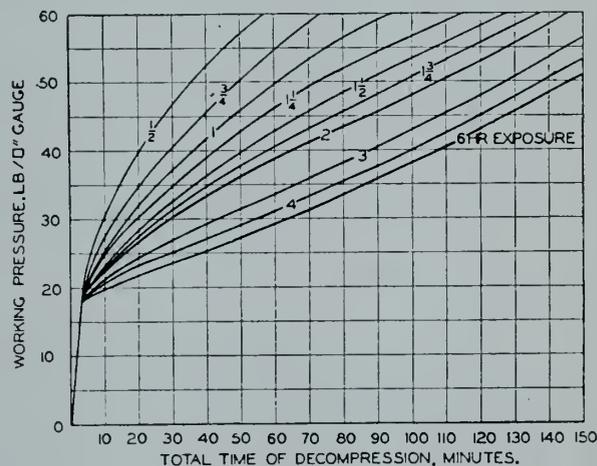

Fig. 7—Decompression Chart, for  $p = 18.0$  lb. per sq. in. at exit.

distribution of fresh air to vital points. From the inlet it had to pass down the man-lock shaft shown in Fig. 2, to the working chamber, or else through a by-pass pipe and valve to the man-lock. From the working chamber sufficient air for ventilation was generally exhausted under the cutting edges and a certain amount passed upwards through the material-locks, whenever they were operated. Below each material-lock a safety valve was fitted, to provide against blockage at the cutting edges, and an exhaust valve for blow-down purposes.

The quality of the air is important, and the intake should be arranged to secure a clean supply. Contamination in the compressors should be reduced by the use of good machines and selected lubricants. Facilities for removing oil from the compressed air should also be provided. On the Story Bridge works an "after-cooler" of tubular type was used. When the compressed air is chilled by circulating water, most of the oil it contains is carried off with the moisture condensed.

The efficiency of the workmen is affected by the temperature, humidity and movement of the air, which constitute "air-condition." The temperature can be controlled to some extent. The humidity cannot be reduced much below saturation by any practicable means, but appreciable movement can be induced by the system of

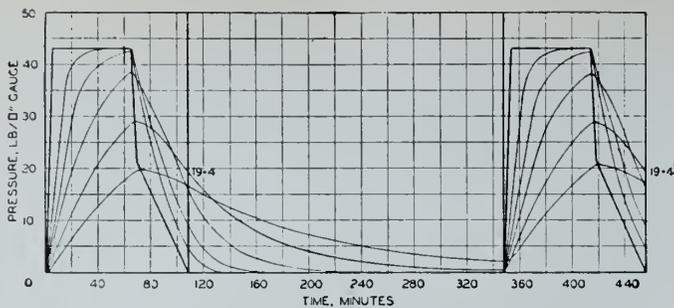

Fig. 8—Double Shifts, under the New York Code.

ventilation already described. Air condition in the working chambers of the Story Bridge foundations was checked by the medical staff from time to time. In Pier 29 E, fourteen sets of readings taken during the day and night, under different conditions of external weather, showed little variation. The wet-bulb and dry-bulb registrations were practically identical, ranging from 76° to 80° F., with an average of 78.7°. The mean velocity of the air, determined from readings of the kata thermometer, was 145 ft. per min. The conditions, though severe, are within the limits endorsed by authorities<sup>1</sup> for industrial operations.

#### CONCLUSION

The preparation of this paper was prompted by the fact that the theory of stage decompression has not previously been developed in engineering literature. Its proper use has been restricted to diving, whilst in construction work it has been regularly misapplied.

There appears no ground for departure from the principles established by Dr. Haldane.

#### APPENDIX

*Report on Workers in Compressed Air during the Construction of Piers 29 East and 29 West of the Story Bridge—between 22/2/1937 and 4/6/1937.*

Messrs. M. R. Hornibrook (Pty.) Ltd.,  
BRISBANE.

Dear Sirs,

I have pleasure in presenting this report on certain medical aspects of the work done on piers 29 east and west, under compressed air;

- |  |       |
|--|-------|
| 1. Total number of persons entering Caisson..... | 159   |
| 2. Total number of decompressions.....           | 8,216 |

<sup>1</sup>The American Society of Heating and Ventilating Engineers, Guide, 1936.

- |  |                       |
|--|-----------------------|
| 3. Cases of sickness treated in Hospital Lock<br>(Group I).....            | 40 = 0.49%            |
|  | of all decompressions |
| 4. Cases with symptoms re-entering man-locks for relief<br>(Group II)..... | 27 = 0.33%            |
|  | of all decompressions |

I do not think that the cases in Group II have previously been listed in figures published for work in compressed air, and believe that only cases of such severity as those in Group I were recorded. If this is so we may fairly compare the cases in Group I alone, with previous figures.

Doing this we find that the freedom from compressed air illness during this work compares quite favourably with that in other large works elsewhere, in spite of a mean pressure some 10 to 15 lb. per square inch higher. The mean pressure here was approximately 52 lb. per square inch.

*Age.*—The mean age of all men entering the locks differed by so little from the mean age of the men included in Group I that we may fairly say—that there is no evidence that in carefully selected workers, caisson sickness is any more common among older men. The oldest person entering the caisson was in his sixtieth year and he made a large number of descents without mishap.

Older men with previous experience of this work, appear to fare better than younger workers without experience.

*Treatment of Sickness.*—I believe that the sufferer should be compressed to the working caisson pressure as soon as possible and there maintained for thirty minutes. Decompression is on the same principle employed in the working locks but twice as long is taken in lowering from one half absolute to atmospheric pressure.

A second decompression does not seem worthwhile unless the recurrence of symptoms is severe. Other methods of making the patient more comfortable seem to be more effective. If severe symptoms do recur, recompression should certainly be employed a second and even a third time.

*Health of the Workers.*—There is no evidence that any worker was permanently injured, with the exception of one man, in whom deafness may be due to this work.

More shifts were missed as the result of other sickness as the weather became colder, and it would seem sound both from an economic and an humanitarian viewpoint, to arrange that future work of this kind is done as far as possible during the summer months.

*Working Conditions.*—These were investigated with Wet and Dry Kata thermometers.

In the working chamber, temperatures were quite satisfactory in relation to the excellent ventilation provided. The value of the after-cooler in removing oil and excess water from the air supply is undoubted. I do not think that any improvement can practicably be expected here.

Trying extremes of temperature were experienced by workers in the locks whilst entering and leaving the caisson. It should be well worth while testing the value of some method of overcoming this—by wet bagging in summer and a coil of steampipe in winter, for example.

I trust that this will be of some value to you in the future.

Thanking you for your co-operation and assistance,

I am,

Yours faithfully,

(Signed) KEITH A. MOORE,  
Medical Officer.

7/6/1937.

# REGULATIONS AFFECTING THE CONSTRUCTION INDUSTRY

At the request of the Controller of Construction, we are pleased to reproduce Order No. 12, issued last month, regulating the use of material in the construction of ALL BUILDINGS IN CANADA. Appended to this order is certain information which may be useful to engineers in the construction industry.

It should be noted that the following order does not in any way alter the licensing requirements and licenses must be obtained from the Controller of Construction as required, nor does this order relieve any person from the necessity of complying with the provisions of any other applicable order or regulations of any controller or administrator.

Warning is given that when projects are being planned which will require the use of any materials or equipment whose source of origin is the United States, the Priorities Office of the Department of Munitions and Supply in the locality or in Ottawa should be consulted as soon as possible. Unless this is done promptly, serious delays may be encountered in ascertaining whether such supplies are or can be made available.

## CONTROLLER OF CONSTRUCTION

Order No. 12

(CONSTRUCTION MATERIALS—CONSERVATION)

Dated September 22, 1942

The increasing demands of the war, and transportation difficulties arising therefrom, have seriously affected the available supply of certain materials essential to the war effort. Great Britain and the other United Nations are looking to this country for increasing supplies of raw materials and goods and in other materials Canada must look to the United States for a larger percentage of her requirements. It is imperative, therefore, that the use of all such materials be curtailed where not absolutely essential. Certain of these materials are, in normal times, used in the construction of buildings and in most cases, substitutes are available in other materials.

Therefore, pursuant to the powers vested in the Controller of Construction by Order in Council P.C. 660, dated the 30th day of January, 1942, and by any other enabling Order in Council or Statute, and with the approval of the chairman of the Wartime Industries Control Board, and the concurrence of the Steel Controller, the Metals Controller, the Oil Controller, the Timber Controller, the Controller of Supplies, and the Co-Ordinator of Metals Administration,

I HEREBY ORDER AS FOLLOWS:

1. In the construction, repair, alteration of, or any addition to, any of the following:

- Dwellings,
- Apartment buildings,
- Office buildings,
- Warehouse buildings having floors for load not exceeding 200 pounds per square foot,
- Stores, show rooms or other buildings for trade purposes,
- Theatres, halls or other buildings for amusement or recreational purposes,
- Churches or ecclesiastical buildings,
- Schools or educational buildings,
- Administrative buildings or institutions (except hospitals),
- Hotels,
- Clubs,
- Museums or galleries,
- Libraries,
- Banks or other buildings for financial purposes,
- Funeral parlours,
- Farm buildings or stables,
- Storage buildings, sheds or outbuildings,

(a) THE FOLLOWING MATERIALS MUST NOT BE USED:

1. Structural steel (including window lintels),
2. Steel stairs (including fire escapes),
3. Steel siding or roofing (including galvanized iron or steel) except for flashings,
4. Metal sash, doors, trim or furring,
5. Steel or iron railings,
6. Metal lath (except for reinforcing at joints and corners),
7. Stainless steel in any form (except fully manufactured articles),
8. Aluminum or aluminum alloys,
9. Copper or brass tubing or pipe,
10. Copper or brass alloy—sheet or plate (including flashings, downpipes, etc.),
11. Copper or copper alloy extruded shapes,
12. Copper or copper alloy screening,
13. Sheet zinc,
14. Nickel or nickel alloys in any form (except nickel plated articles),
15. Metal lockers and furniture,
16. Metal bins, partitions and shelving,
17. Rubber in any form including reclaim (except manufactured articles),
18. Cork in any form (except manufactured articles),
19. Tin or tin alloys (excluding solder),

AND

(b) The following materials must be conserved in use to the greatest possible extent:

1. Reinforcing steel,
2. Steel piping,
3. Cast iron piping,
4. Galvanized iron,
5. Copper wiring,
6. Lead or lead alloys in sheet form,
7. Linoleum,
8. Douglas fir timber,
9. Douglas fir plywood,
10. All imported hardwoods,
11. Asphalt paving, roofing, flooring.

2. For the construction, repair or alteration of, or any addition to, factories, hospitals, warehouses having floor for load exceeding two hundred pounds per square foot, manufacturing plants, munition plants, shipyards, power plants, mines, processing plants, public utilities, and all other structures not included in Section 1 of this Order:

(a) THE FOLLOWING MATERIALS MUST NOT BE USED:

1. Steel plate roofing,
2. Steel stairs,
3. Metal sash,
4. Steel plate flooring,
5. Steel and iron railings,
6. Metal doors and trim (except kalamein doors where fire hazard exists),
7. Metal partitions, bins, lockers or shelving,
8. Metal furniture or counters,
9. Aluminum or aluminum alloys,
10. Copper or copper alloy roofing, flashings or downpipes,
11. Copper or copper alloy extruded shapes,
12. Sheet zinc,
13. Tin or tin alloys in any form (excluding solder),
14. Rubber in any form including reclaim (except manufactured articles),

AND

(b) The following materials must be conserved in use to the greatest possible extent:

1. Structural steel (including window and door lintels),
2. Reinforcing steel,
3. Metal lath,
4. Copper or copper alloy sheet, pipe and wiring,
5. Copper or copper alloy screens,
6. Nickel and nickel alloys in any form (excluding nickel plated items),
7. Lead or lead alloys in sheet form,
8. Cork in any form (except manufactured articles),
9. Douglas fir plywood,
10. Structural Douglas fir timbers,
11. All imported hardwoods,
12. Asphalt for paving, roofing or flooring.

3. The design of all buildings must be economical in the use of all building materials. Wiring must be planned to use the least possible conduit, copper wire, bus bars and connections. Heating must be planned for the least possible use of piping. Location of lavatories, kitchens, etc., must be so placed that the least possible drainage connection and water connection is required.

In dwellings or apartment houses, location of bathrooms, kitchens and laundries must be planned so that only one cast iron sewage stack will be required for each self-contained dwelling place.

4. The Controller of Construction may vary the provisions of this Order, add other materials and things to the above lists or exempt any construction or use of construction materials from the prohibitions of this Order where he shall deem it advisable.

5. This Order does not in any way affect or modify any Order of the Steel Controller, the Metals Controller, the Oil Controller, the Timber Controller, the Controller of Supplies, or the Administrator of Fabricated Steel and Non-Ferrous Metals, and any Order for permission for use, or prohibition of use, given or made by any of them within his jurisdiction will supersede and govern over the requirements of this Order.

6. This Order shall come into effect on the date hereof.

C. BLAKE JACKSON (Signed)  
*Controller of Construction.*

Approved

R. C. BERKINSHAW (Signed)  
*Chairman, Wartime Industries Control Board.*

NOTE: Any correspondence with regard to this Order should be addressed to the Controller of Construction, Department of Munitions and Supply, 85 Richmond Street West, Toronto, Ontario.

#### THE CONTROLLER APPENDS THE FOLLOWING FOR THE GUIDANCE OF THE CONSTRUCTION INDUSTRY

The use of the following materials are under direct control of controllers or administrators as noted:

*Steel*—structural, reinforcing, plate and shapes—new or second hand. Regardless of other requirements permit must be obtained for use, regardless of ownership, from:

The Steel Controller,  
Department of Munitions and Supply,  
Ottawa.

*Cast Iron Pipe and Steel Pipe* not including cast iron soil pipe. Regardless of other requirements permit must be obtained from:

The Steel Controller,  
Department of Munitions and Supply,  
Ottawa.

*Public Utility Extensions* to serve new construction (such extensions must be made to existing leads, lines or mains). Permits must be obtained by public utility from:

The Metals Controller,  
Department of Munitions and Supply,  
Ottawa.

*Copper or Brass Pipe*—Cannot be used except with special permission of:

The Metals Controller,  
Department of Munitions and Supply,  
Ottawa.

*Manila Rope*—Use prohibited by:

The Controller of Supplies,  
Department of Munitions and Supply,  
Ottawa.

*Rubber*—Use of crude, reclaim and scrap rubber prohibited by:

The Controller of Supplies,  
Department of Munitions and Supply,  
Ottawa.

(Manufactured articles, if already in stock, may be used.)

*Metal Lockers, Metal Bins, Metal Shelving, Metal Counters, Metal Partitions*, under control of:

The Controller of Supplies,  
Department of Munitions and Supply,  
Ottawa.

*Refrigeration, Air-Conditioning and Comfort-Cooling Equipment*—Cannot be installed except on permit from:

The Controller of Supplies,  
Department of Munitions and Supply,  
Ottawa.

*Cork*—Ground cork for insulation purposes or cork insulation board cannot be used except by special permission of:

The Controller of Supplies,  
Department of Munitions and Supply,  
Ottawa.

*Gas Heating*—Use of gas for heating restricted in certain areas. Refer to:

The Power Controller,  
Department of Munitions and Supply,  
P.O. Box 2400, Place d'Armes,  
Montreal.

*Oil Heating Equipment*—Installation prohibited except by special permission of:

The Oil Controller,  
Department of Munitions and Supply,  
15 King Street West,  
Toronto.

*Asphalt*—The use of asphalt for construction or maintenance of any roof or road is prohibited except by permit from:

The Oil Controller,  
Department of Munitions and Supply,  
15 King Street West,  
Toronto.

*Coal Tar*—The use of coal tar for construction or repair of public or private roads is prohibited except by permit from:

The Controller of Chemicals,  
Department of Munitions and Supply,  
Ciba Building,  
1235 McGill College Ave.,  
Montreal.

*Commercial Electric Lighting*—Replacement or renewal of existing commercial or industrial lighting fixtures or lighting installations cannot be undertaken without permission of:

Mr. A. L. Brown,  
Administrator of Electrical Equipment  
and Supplies,  
Wartime Prices and Trade Board,  
Aldred Building,  
Montreal.

*Metal Sash*—Cannot be used except with permission of:

Mr. H. H. Foreman,  
Administrator of Fabricated Steel and  
Non-Ferrous Metals,  
Wartime Prices and Trade Board,  
Toronto General Trust Building,  
Toronto.

The above list is not necessarily complete and changing conditions will no doubt bring other materials under special permit. This is issued for guidance only.

*Order No. 1 of W.I.C.B.* requires compliance with the terms of U.S. Preference Rating Orders or Certificates.

*Order No. 2 of W.I.C.B.* makes conditions as to use of goods or services or surplus goods or supplies obtained under permit or order of any Controller.

#### CONSTRUCTION CONTROL LICENSES

This Order does not alter or affect the licensing requirements as required by Order in Council P.C. 660/42 and Orders of the Controller of Construction.

Applications for licenses where required must be made on required forms to:

The Controller of Construction,  
Department of Munitions and Supply,  
85 Richmond Street West,  
Toronto, Ont.

Applications for projects in Province of British Columbia *only* should be submitted to:

Mr. R. J. Lecky,  
Secretary, B.C. Construction Control  
Advisory Committee,  
342 West Pender Street,  
Vancouver.

Applications for construction of, repair of, or equipment installations to Grain Storage Warehouses in the Prairie Provinces *only* should be submitted to:

The Chairman,  
Grain Warehouse Construction Control  
Advisory Committee,  
423 Main Street,  
Winnipeg.

#### SUGGESTIONS FOR THE CONSERVATION OF MATERIALS

*Lintels*—Over doors or windows: brick or stone arch or precast concrete beam.

*Load Bearing Framing*—Timber mill construction, with laminated wood floors where necessary to suit load, or where semi fireproof construction necessary.

*Roof Framing*—Timber. When long span required use timber truss. Experts on design should be consulted.

*Roofing*—Avoid whenever possible the use of petroleum asphalt owing to the shortage of petroleum products.

*All Wood Framing*—Use the smallest sizes possible giving necessary strength. Avoid the use of B.C. fir and other western timber where possible.

*Terrazzo Floors*—Use plastic, stone or marble divider in place of metal.

*Sash*—Use wood sash. Avoid the use of steel sash.

*Chimney Stacks*—Avoid the use of metal. Radial Brick for large stacks. Owing to restrictions on electric and gas stoves, chimney facilities for kitchen should be considered.

*Flashing*—Use galvanized iron except around drainage stacks which should be sheet lead.

*Drainage Pipes*—Use glazed tile underground except where soil conditions preclude its use. Interior stacks should be the lightest weight allowed by local by-laws. Careful

planning can reduce the amount of pipe required. Cast iron and steel pipe must be conserved.

*Water Pipes*—Plumbing must be carefully planned to use the least amount of galvanized steel pipe possible. Copper or brass pipe cannot be used except with special permission of the Metals Controller.

*Heating*—Boilers: use cast iron where possible rather than steel. Radiators must be cast iron. The use of copper fin type radiators must be avoided. Piping must be planned to use the least amount of pipe by weight possible.

*Domestic Hot Water Tanks*—The smallest size that will serve requirements must be used. No copper or copper alloy tanks can be used.

*Wiring*—Wiring must be planned to use the minimum amount of copper wiring. The use of conduit and BX cable must be avoided where possible. Knob and tube work should be used wherever possible. Switching and fusing should be so planned to use the least possible number of switch boxes. Outlets not immediately necessary should be marked for installation after the war.

*Kitchen and Bathroom Fittings*—Avoid the use of Monel metal, stainless steel, copper, zinc or aluminum except for faucets and drain connection.

*Nickel and Nickel Alloys*—Avoid the use of any nickel or nickel alloys.

*Reinforcing*—Reinforced concrete for foundations or footings must not be used except when ground conditions make its use imperative. Concrete work should be increased in thickness to preclude the use of steel reinforcing. Reinforced structures must be planned so as to use more concrete and less steel reinforcing. The Portland Cement Association have made studies of such problems and their data should be consulted.

*Weather Stripping*—Use felt or wool type or storm windows. The use of copper weather stripping must be avoided.

*Plywood*—The use of B.C. fir plywood should be avoided where possible.

*Screens*—Use black iron screens or cloth screens.

*Insulation*—Use rock wool, glass fibre or fibre boards. The use of cork should be avoided.

*Public Utilities*—Construction should be planned in locations where electrical, telephone, gas, water and sewage facilities are already constructed. The extension of such facilities are under control and will be curtailed except for essential war projects.

*General*—There is at this date no serious shortage of the following materials and these should be substituted for others where possible:

Stone,  
Brick,  
Cement,  
Concrete (not reinforced),  
Tiles,  
Glazed or unglazed tile pipe and flue lining,  
Wood shingles,  
Asbestos,  
Sand and gravel,  
Plaster,  
Plaster Board,  
Stucco—but use of wire lath must be avoided,  
Fibre boards,  
Glass—except bottle glass,  
Rock wool.

The changing conditions may make the supply of the above materials difficult locally or generally at any time, and local supply should be checked with suppliers before starting construction.

# Abstracts of Current Literature

## ENGINEERS IN THE ARMY

From *The Engineer*, LONDON, ENG., AUGUST 21, 1942

In 1923 Lord Weir recommended that all the mechanical engineers in the many corps or branches of the Army should be amalgamated and incorporated in the Corps of the Royal Engineers, which, in any country less illogical than ours, would be taken to mean the engineers to the Army. His advice was not followed. Some five or six years later, Lord Milne, when Chief of the General Staff, presided over a committee to consider a similar proposition, of which he himself was in favour. The proposal was again rejected, largely no doubt because the Army Council had no senior engineer who could advise it regarding the implications of such a momentous change. Hence, when preparations were made in earnest for a mechanical war which could be averted only by a miracle, the Army found itself without a unified engineering organization, and with no mechanical engineer in a sufficiently high position to give the necessary authoritative advice direct to the Army Council. No doubt Lord Weir foresaw this difficulty in 1923, and it is safe to state that had his advice been accepted then, it would not have been necessary for Sir Ronald Charles to deplore, as he did in a recent letter to *The Times*, the great paucity of the engineering staff at his disposal when he was Master-General of Ordnance at the War Office.

From debates in Parliament it is obvious that Members of both Houses have felt uneasy that engineers and scientists are not being utilized to the best advantage by the Army, and as shown in our leading article on this subject in our issue of June 12th, it is clear that the Army has lagged far behind in granting recognition to the overwhelmingly increased importance of engineering in general and its engineers in particular. Had it been more receptive of this new idea, the lead we had in aggressive tank warfare in 1918 might well have been maintained twenty years later when the present world war began. Entirely new mechanized equipment was clearly a very expensive item in rearmament, and doubtless Hitler traded on the fact that his potential opponents throughout Europe would be chary of laying down sufficient sums of money to counter his expenditure on Panzer troops. In the very early days of warfare, the soldier was fairly well self-contained. Given his food and drink, the weapon in his hand was his main standby. As, however, time passed, more and more did he become dependent on fresh supplies sent up from some base to replenish the evergrowing weight of missiles being launched by him and to make good the wastage of his heavy equipment in the course of battle. Thus the engineering problems have increased out of all knowledge, but the recognition of the importance of the engineer has not kept pace with the desired provision, nor has he been given the requisite status to enable him to pull his full weight in the time available. Apart from the soldiers whose principal duty is to fight in the front line—cavalry, armoured corps, infantry—there are many other corps in the army—Royal Engineers, Signals, R.A.S.C., R.A.M.C., R.A.O.C., and now the recently formed R.E.M.E., a corps which it has taken twenty years of consideration and three years of war to force into existence. The heads of these corps are only Major-Generals, except in the case of the R.A.M.C. whose head is a Lieutenant-General, with many Major-Generals to support him for strictly corps duties. We may well ask why the R.A.M.C. is singled out for such an honour? Is it because the power of the British Medical Association, speaking with one voice, has ensured a just position for members of its profession, whereas there has never been one engineering voice to bring home the essential importance of that profession? We acknowledge the pressing need of medical science in war, for many an earlier campaign has been lost by disease rather than by force of arms, whereas in the wars

## Abstracts of articles appearing in the current technical periodicals

of this century our troops have been kept in wonderful health and heart, thanks to the preventive watchfulness of our medical organization. Although its senior officers do not command fighting troops in the field, we agree that the ranks of the R.A.M.C. are fully justified. It must be pointed out, however, that the labours of that corps are largely defensive in object—to prevent losses and retrieve casualties. Is there not a pressing need to assemble the engineers to force the offensive?

We do not yet know exactly what is envisaged as the final rôle of the R.E.M.E., but welcome as is this step of forming a new corps, it will hardly meet the needs of a mechanized army if it is to be concerned solely with repairs and maintenance. There are higher responsibilities which could and should be placed upon it, such as the provision and training of mechanical engineers for design, test, and investigation. We trust that even if its head is only to be a Major-General, as is the case of the other and older corps, preparations are in hand to make a post or posts external to the corps, with a higher rank to which in due course the most senior mechanical engineer can be promoted and in which he can give advice with a broad outlook, on the same level of seniority and with the same measure of authority as a member of the Army Council. Until such a step is taken we fear that mechanical engineering on which the offensive needs and spirit of our Army depend so greatly, will not come by its own, for why should the cream of our young engineers seek to join a service which is neither sufficiently consulted nor honoured?

## ELECTRIC DRIVE FOR SHIP PROPULSION

From *Trade & Engineering*, LONDON, ENG., AUGUST 1942

Opinion about the electric drive for ship propulsion has undergone many changes since the early years of the century when the first successful application was accomplished in the Russian-built shallow-draught tanker *Vandal*. The machinery comprised three 120 h.p. single-acting Atlas oil engines driving direct-current dynamos with separate propulsion motors for the three propellers. Each generator was normally connected direct to its corresponding motor with a Ward-Leonard system of variable voltage control to give speed regulation, but cross connections between any dynamo and motor could be made as necessary.

Though the advantages provided in comparison with contemporary alternative propelling arrangements were generally regarded as justifying the higher first cost, so that the outlook for this new development seemed promising, there was little further advance until Mavor's proposals for using alternating-current were put into practice in this country in the Diesel-electric vessels *Electric Arc* and *Tynemouth* during the years 1911 to 1913. The advantages of these pioneer installations and subsequent applications of the Diesel-electric drive were continually being neutralized by the advances made with direct-coupled or geared oil engine machinery and the system never gained much favour, only 70 vessels, over 100 tons gross, with this mode of propulsion being included in the classified returns of shipping. Diesel-electric alternating-current propulsion was, however, reintroduced in 1936 by the Hamburg Amerika Line in the cargo liner *Wuppertal*, in which three 1,900 kw. alternators at 2,000 volts pressure supplied power to a single-screw 6,800 s.h.p. propulsion motor, and several other vessels with generally similar equipment have since been completed. Diesel-electric drive has also been regaining favour in America for special applications, such as tugs, ferries, and dredgers, on a system developed by the General Motors

## THE AVRO "LANCASTER" HEAVY BOMBER

From *The Engineer*, LONDON, ENG., AUGUST 14, 1942

In this new bomber, designed and built by A. V. Roe and Co., Ltd., the United Nations have a vehicle of aerial destruction unparalleled in the history of the world, and to be produced in such numbers that it will rapidly take its place in the forefront of the weapons which, together, will bring victory to the Allied cause.

Already, but a few months after its completion, the "Lancaster" has helped powerfully by night to batter Cologne and Essen, with bombs of the heaviest calibre. By day it carried out the epic raid on Augsburg, and the raids on Danzig and Flensburg. Its future achievements depend upon the decisions of Bomber Command.

### DEVELOPMENT

Behind the design and construction of the "Lancaster" there lies some thirty-two years of aircraft manufacturing experience and development, for the Avro Company has been one of Britain's foremost aircraft constructors since before the last war of 1914-18. In every way this new bomber is a worthy successor of its famous ancestors, the Avro "504 K," the "Tutor," the "Anson," and the "Manchester."

From the initial flights and the report of the Ministry of Aircraft Production testing staff it was soon obvious that the Allied cause had now what has since been aptly styled by many pilots a "war winner."

The "Lancaster" heavy bomber is now in production in many factories of the Avro group, and in the factories of other large British aircraft manufacturing firms. It is also being built in one of Canada's largest aircraft factories.

The Avro Lancaster.

### GENERAL DESIGN AND CONSTRUCTION

As will be appreciated from the accompanying engraving, showing one of a series of "Lancasters" on the ground, with another circling around in the air, the new bomber has particularly graceful lines and a pleasing appearance, perhaps rarely seen in large military aircraft. In design it may be described as a mid-wing four engine all-metal cantilever monoplane, with a retractable undercarriage. In general, it is powered by four Rolls-Royce "Merlin XX" liquid-cooled engines, which have given such a good account of themselves in other bombers and fighter aircraft. Other engines, notably the Bristol "Hercules," are also being fitted to the "Lancaster." An outstanding feature is its great ease of control, and this, coupled with its high speed, is of great defensive value. Heavy defensive armament is also carried in four Parnall power-operated gun turrets working on the Fraser and Nash hydraulic system.

Corporation using a high speed V-type two stroke engine in standard units.

The landmark in the employment of the turbo-electric drive was the decision of the United States Naval Department, before the last war, to adopt it in their capital ships. An experimental installation of 7,100 s.h.p. had been carried out in the collier *Jupiter* in 1913, and the satisfactory results obtained led to the adoption of the system in the *New Mexico* and *California* classes of battleships and subsequently in the aircraft-carriers *Lexington* and *Saratoga* with their 210,000 s.h.p. installations. It might have been thought that the case for the electric drive had been fully established by these applications, but enthusiasm for the system has been spasmodic and it has been adopted to a limited extent only.

### HIGH-PRESSURE STEAM

The use of super-pressure steam conditions in the Nord-deutscher Lloyd vessels *Potsdam* and *Scharnhorst* suggested the future trend of development with the electric drive, and it was readopted in America in tanker tonnage for the Atlantic Refining Company, having machinery of 5,000 s.h.p. with steam at 625 lb. pressure and 920 deg. F. temperature. The *John D. Gill*, the seventh vessel to be fitted with this improved version of the electric drive is nearly ready. Another interesting example of the turbo-electric drive in conjunction with relatively high steam conditions is afforded by the *Kairouan*, which was put in hand for the Marseilles North Africa service just before the outbreak of war. This vessel was to have two 9,020 kw. turbo-electric sets, supplied with steam at 570 lb. pressure and 800 deg. F. temperature from La Mont forced-circulation steam generators and driving twin-screw propulsion motors of 24,000 s.h.p. aggregate output. She is understood to be approaching completion. The future position of the turbo-electric drive has been greatly influenced by the decision of the United States Maritime Commission to adopt it in the 123 tankers of the C2/S.E./A1 type, with a carrying capacity of 18,000 tons, which have been included in its expanded shipbuilding programme for delivery this year and during 1943. The first vessels of the type have been launched and are now fitting out. The power plant comprises a single alternator driving a single propulsion motor developing 6,000 s.h.p., and moderate steam conditions of 450 lb. pressure and 750 deg. F. temperature are being used in order to eliminate the use of special heat-resisting materials of construction. The large-scale experience which will be provided by these vessels is likely to have a marked influence on post-war policy by bringing out the advantages of the system.

### SPEEDING UP RADIOLOCATION

FROM ROBERT WILLIAMSON\*

By the last train to leave free Czechoslovakia there came to Britain the drawings for a new type of soldering iron which has beaten everything else for speed in Britain's aircraft, radiolocation and tank factories.

It is the invention of a Czech manufacturer who, with very little money and only two cases of personal luggage, passed the German Army of Occupation as they were crossing the frontier. When he arrived in London, he concentrated his whole attention on his new "quick" soldering iron, realizing how vital a part so simple a tool plays in war production and maintenance.

Put to its first speed test at radio control and transmitting stations, the tool is now supplied from a South Wales factory at the rate of three to four thousand a week to radiolocation centres, aerodromes, shipyards, ordnance factories, telephone exchanges and in a wide range of general factories.

Feature of the new soldering iron is that it is equally effective when used with the new soldering alloys with lower tin content introduced in Britain to save stocks of tin.

\*London Correspondent of the *Engineering Journal*.

### Principal Dimensions

Span . . . . .	102 ft.
Length . . . . .	69 ft. 4 in.
Height . . . . .	20 ft.
Gross wing area . . . . .	1,297 sq. ft.
Depth of fuselage . . . . .	8 ft. 2 in.
Width of fuselage . . . . .	5 ft. 9 in.
Main undercarriage wheel . . . . .	5 ft. 6 in. dia.
Length of bomb compartment in fuselage . . . . .	33 ft.
Weight of aircraft fully loaded . . . . .	Approx. 30 tons
Maximum speed . . . . .	Approx. 300 m.p.h.
Maximum range . . . . .	Approx. 3,000 miles
Maximum bomb load . . . . .	Approx. 8 tons
Type of engine . . . . .	Rolls-Royce "Merlin XX"
Number of engines . . . . .	Four
Maximum power with low gear supercharger . . . . .	1,260 B.H.P. at 12,250 ft.
Maximum power with high gear supercharger . . . . .	1,175 B.H.P. at 21,000 ft.
Type of airscrew . . . . .	Three-bladed, 13 ft. dia. fully feathering
Armament: Four Parnall gun turrets, one in nose, one mid- upper, one mid-under, and one in the tail	
Number of guns . . . . .	Ten Browning, 0.303 in.
Number of crew carried . . . . .	Can be seven

The keynotes of the "Lancaster" design are ease of production, easy transport, and easy maintenance and repair. The design, the makers claim, lends itself to rapid and relatively cheap production, as the entire machine is built up of numbers of components which are manufactured largely as separate and self-contained units, and are easy to transport and to assemble. Full 100 per cent interchangeability has been aimed at and achieved, and this coupled with ease of construction, has contributed largely to the ease of maintenance and repair. The fuselage is built up of transverse formers with continuous longitudinal stringers, whilst the main wing is of two-spar construction, each spar consisting of a top and a bottom extruded boom bolted on to a single thick gauge web plate. The wing ribs are made from aluminium alloy pressings, suitably flanged and swaged for stiffness. The tail-plane is built on similar lines to the wing, with twin fins and rudders at its extremities. The entire surface of the aircraft is skinned with aluminium alloy sheets secured by flush riveting, giving a smooth external surface. The undercarriage, which is of the Dowty type, is operated hydraulically and is completely retractable inside the in-board engine nacelles, the doors, which are connected to the retracting gear, being so designed that a clean nacelle is given when the undercarriage is retracted. Fuel is carried in six self-sealing fuel tanks, enclosed in petrol-tight welded aluminium sheet casings, which are carried in the wings of the machine. De-icing equipment is also fitted. At the centre section trailing edge portion of the wing a dinghy is stowed, which is automatically freed when making a crash landing, while provision for hand operation is also made.

The interior of the fuselage is equipped to meet all modern requirements. A canopy is fitted over the pilot's cockpit, which gives an excellent view in all directions, including aft. Inside the canopy immediately aft of the pilot's seat is the fighting controller's position, which again is provided with views in all directions. Slightly aft of this position is the navigator's station, with a table and provision for charts. There is an astral dome in the roof of the cabin. The wireless operator's station is at the rear end of the navigator's table, just forward of the front spar.

An armour-plated bulkhead is fixed across the centre section of the fuselage at this point, and it is so designed that it can be opened for access on either side of the centre line. The back of the pilot's seat is armour plated, and there is also an armour plate behind his head. Certain other vulnerable parts of the aircraft structure and also parts of the gun turrets are armour plated, whilst at the fighting con-

troller's position special bullet-proof glass is fitted in order to provide added protection.

Within the centre section of the fuselage the oxygen bottles are stowed in a crate, the top cover of which is upholstered and provides a comfortable rest bed with an adjustable back rest. Aft of the rear spar a mid upper turret and a mid under turret are fitted, together with the various equipment stowages for flares, emergency rations, etc. The ammunition boxes are placed in this portion of the fuselage and ammunition is transported to the tail turret by means of tracks. A robust walkway along the entire length of the fuselage is provided, and the entrance door is on the starboard side, just forward of the tailplane. The fuselage is entered by a ladder which is stowed during flight. At various suitable points throughout the fuselage there are escape hatches for all members of the crew.

The bomb aimer's station is in the nose of the fuselage below the front turret and forward of the pilot's cockpit. All the bomb-sighting equipment and bomb-release gear is fixed in this compartment, and the bomb aimer takes his sight through a clear-vision window made of laminated glass optically ground. The bomb compartment is contained within the fuselage form, and the cabin floor above, which is of robust construction and constitutes the backbone of the fuselage, is specially designed to take the housings to carry the various types of bomb employed. The two doors which open and close the bomb compartment are hydraulically operated. A further point of interest in connection with the bomb doors is that the electrical circuits are so arranged that the bombs cannot be released until the bomb doors are open. In cases of emergency or in case of a possible failure in the hydraulic system, the bomb doors and also the retractable undercarriage can be operated by means of an emergency compressed air system. There is intercommunication between all the members of the crew, and there are readily accessible stowages for parachutes provided at all the crew stations, along with easily reached oxygen points.

### THE ENGINEER IN U.S.S.R.

FROM *The New York Times*, SEPTEMBER 6, 1942

A new social class is emerging and rising to dominance in Soviet Russia, composed not of proletarians nor the old, loyal Bolsheviki, but of the young production engineers in whose hands economic control and administration has been unified, Dr. Solomon M. Schwarz declares in a report on "Heads of Russian Factories" made public recently.

In the study, which was prepared in connection with a war research project on social and economic controls in Germany and Russia under the auspices of the Graduate Faculty of Political and Social Science of the New School for Social Research, Dr. Schwarz asserts that the Communist party in Russia is no longer a workers' party, but "to an increasing extent it has become the party of the officers of the various branches of economy and administration."

According to Dr. Schwarz's findings, Russia has gone through a type of managerial revolution, with the trained executives becoming a new privileged class. "Even the most glorified Stakhanov workers were somewhat out of place" at the Communist party congress in 1939 after the great purge of 1936-38, he says, and not one of them was elected to the central committee.

As the new type of leader is promoted, the proletarian worker is subordinated, and by a 1940 decree the worker is denied the privileges of free higher education for his children. Moreover, the children of workers are obliged to take vocational training, but those of engineers, attending higher schools at which tuition fees are charged, are exempted. The promotion of workers within the industry has been abandoned, exceptional work being rewarded by bonuses and other wage premiums.

"It is characteristic of recent developments that the young engineers are being increasingly promoted, not only in industrial plants but everywhere, especially in the Communist party offices and the general administration."

Dr. Schwarz writes, "Engineers in the Soviet Union constitute to-day almost a third of the government, a phenomenon not to be observed anywhere else."

This vast social change was still in process when Germany attacked Russia and the ensuing conflict may affect the trend, but it was a process that has its roots back in the difficulties Russia has experienced with the problems of administration, he says.

In 1919, the end of the civil war, Russian factories were placed under the dual control of directors, who were Communist party members, and technical assistants inherited from the earlier regime. A conflict of authority and interests developed and in 1928 there began far-reaching changes in the personnel of factory administration, accomplished by purge, terrorization and political trials.

A plan was instituted for providing specific training for industrial management and under it young Communists, mainly of proletarian origin, were given accelerated specialist courses by the thousands. In 1932, Dr. Schwarz finds, it was openly acknowledged that the scheme had failed as a result of lowering the levels of technical training and the plan was revised to provide more thorough training. The influx of manual workers was thus limited and the emphasis of proletarian back-ground was neglected.

In the great purge of 1936-38 the old party wheel horses who had risen to directorial posts were ousted and the new type of leader was placed in charge of industrial plants.

"These new leaders were younger, often scarcely out of school, and they had a better and more systematic education than the 'Red specialists' who had preceded them," he says. "They were more interested in their professions, less interested in political problems."

The new leaders are conscious from their school days that they form a separate social stratum. Most of them leaned toward authoritative thinking and are completely devoted to Stalin as the embodiment of the economic rise and the international strengthening of the country.

"They accepted as natural the fact that this rise was dearly paid for, that the bulk of the toiling masses remained in dire want," Dr. Schwarz declares. "Their interest was not in social problems, but in the strong State that built up the national economy."

As a result, he concludes, the friction between the party apparatus and the general administration has died out.

## CHARACTERISTICS OF ENEMY AIRCRAFT

From *Army Ordnance*, WASHINGTON, D.C. SEPT.-OCT., 1942

Descriptions and available performance figures of more than fifty types of combat aircraft in use by Japan, Germany, and Italy have been made available to the people of the United Nations by the British Air Ministry and the United States Army Air Forces.

Of the thirty-one Japanese combat types listed, nine are army and navy fighter planes whose chief characteristics include comparative lightness in weight and engines of comparatively low horsepower. Protective armor for personnel is lacking in almost every case, and armament consists generally of 7.7-mm. machine guns—approximately the same as the American and British caliber .30. Some types, however, are armed with 20-mm. cannon. A more recent type is armed with four machine guns and two 20-mm. cannon. Horsepower of these single-engined Japanese fighters ranges from 650 to 850 at the most effective heights, whereas the four German pursuit planes listed are driven by engines developing 1,200 horsepower.

The German fighters are marked by the more frequent use of 20-mm. cannon, generally higher speeds, and greater protective armor for the pilots. The Heinkel 113 and the Messerschmitt 109F, for example, both single-engined fighters, weigh approximately 5,700 and 6,000 pounds respectively, as compared with an approximate average of 4,400 pounds for the Japanese pursuits. The German fighter aircraft listed also are armed with 7.9-mm. machine guns—approximately caliber .31.

Each of the five Italian fighter planes listed is armed with at least two 12.7-mm. machine guns which compare almost exactly with the American caliber .50. Italy also uses 7.7-mm. machine guns fixed in the wings and firing forward in the fuselage. The Italian planes generally provide armor plating for crew protection which makes them considerably heavier than the Japanese planes of the same comparative class, although rated horsepower for the Fiat G50 and CR42 and the Macchi C. 200 is 840 horsepower. The Macchi C. 202, which is rated as having a maximum speed of 330 miles an hour at 18,000 ft. and a cruising speed of 300 miles an hour, is powered with a 1,200-horsepower engine.

No Japanese twin-engine fighter planes are listed, although descriptions are given for the German Messerschmitt 110, powered with two 1,200-horsepower liquid-cooled engines, and the Junkers 88, driven by two motors of the same power; and the Italian Breda 88, powered with two air-cooled motors.

The German JU 88, night-fighter version of a similarly designed twin-engined ship used for long-range and dive-bombing missions, carries minimum armament of three 7.9-mm. machine guns or three 20-mm. cannon in the nose of the fuselage in addition to 7.9-mm. machine guns protecting the rear and the underside. It has an approximate maximum speed of 290 miles an hour at 18,000 ft. The ME 110, with a service ceiling of 32,000 ft., is armed with at least four 7.9-mm. machine guns and two 20-mm. cannon firing forward, in addition to machine-gun protection for the rear.

The Breda 88 has a rated maximum speed of 310 miles an hour at 13,500 ft., a service ceiling of 28,500 ft., a range of 900 miles, and is armed with three 12.7-mm. machine guns in the fuselage and two 7.7's in the wings.

The German Gotha 242 troop-carrying glider has a crew of two pilots and can accommodate twenty-one other fully equipped soldiers. It is armed with four machine guns, and carries a wheeled undercarriage which can be dropped.

The German Focke Wulf 200K is a 24-ton long-range bomber driven by four 850-horsepower motors. This ship has a range of approximately 2,400 miles and a bomb capacity of 3,300 lb. Minimum armament includes a 20-mm. cannon and five 7.9-mm. machine guns. Its duties include long-range sea reconnaissance, ship strafing, mine-laying, and work in conjunction with submarines. The Junkers 87—the dive bomber used extensively in Europe during the early stages of the war—is powered by a single liquid-cooled engine of 1,150 horsepower, has a bomb capacity of 1,100 lb. and is armed with two 7.9's in the wings and one of similar caliber to protect the rear.

The only 4-engined Japanese ship listed is the Awanishi T97 navy flying boat, reported to be based on the S42 Sikorsky flying boat. The Jap ship is a monoplane powered with four 900-horsepower air-cooled motors and has an approximate range of 1,500 miles with 3,500 lb. of bombs. This ship carries a crew of ten men and is armed with two machine-gun turrets.

Two Italian bombers—the Savoia-Marchetti 79 and the Cant Z1007—are powered with three engines; The SM79 with three Alfa-Romeo 780-horsepower air-cooled motors, and the Z1007 with three Piaggio 1,000-horsepower air-cooled engines. The latter ship is of all-wood construction, has a range of 800 miles and a bomb capacity of 2,600 lb. The SM79 is of mixed wood and metal and can carry a bomb load of 2,200 lb. 1,000 miles. Of longer range is the Italian Fiat BR20, a twin-engined bomber with a capacity of 2,200 lb. and a range of over 1,150 miles.

The Japanese Mitsubishi T97, on the other hand, powered with two 870-horsepower air-cooled motors, can carry 4,400 lb. of bombs over a range of 1,180 miles, and the Kawasaki T97 can carry either 1,100 lb. of bombs 1,250 miles or 4,400 lb. of bombs 240 miles. Japanese army types of single-engined bombing and reconnaissance planes include the Nakajima T94, the Kawasaki T97, the Mitsubishi T97 in two variations, the Mitsubishi T98 in two types, and the Showa T99.

## INDUSTRIAL RELATIONS A LEGITIMATE FIELD FOR INSTITUTE ACTIVITIES

If there be too frequent evidences of industrial discord and unrest in this country, it is not due to any lack of effort on the part of well-meaning persons to obviate them. Unfortunately, that effort has very largely been exerted after the fact. So long as the industrial machine appears to be operating smoothly, no one concerns himself about it, lest the nicely balanced mechanism be disturbed. When neglect of maintenance on the human plane brings friction or breakdown, feverish efforts are put forth to set matters right, but with no more treatment than that necessary to get it running again. There has been little fundamental overhauling or reconstruction. Whatever has been done is for the most part in the nature of makeshift, fashioned to obviate the particular kind of trouble that has then arisen.

Any lasting freedom from the human ills that beset the industrial world can come only from a searching, courageous and profound study of the relationships of employer and employee and the just position of each in the social structure. What is it that men of good will work for and how best can each, having regard to his ability and aspirations, achieve that objective?

To the solution of this problem, now become vastly complicated by intense industrialization, a sustained, calm and impartial examination and study must be directed. Occupying, as they do, a strategic position off the direct line of authority between the employer and the great mass of non-professional employees, while having relations of the greatest importance to both, engineers are peculiarly fitted to undertake such an investigation. For this reason the Council of the Institute, at its meeting in Toronto on April 25 last, established a Committee on Industrial Relations which was later charged with far-reaching duties.

Amongst the useful services already performed by the Committee is that of placing before the membership of the Institute the succinct and clarifying statement of the significance of industrial relations prepared by Professors E. A. Allcut and J. A. Coote which appears elsewhere in this issue. What they have written will commend itself. The situation there presented should be taken to heart by every educated man in this country and not least by the members of the engineering profession.

C. R. YOUNG.

## THE INSTITUTE'S PRIZES FOR STUDENTS AND JUNIORS

A good way to test one's knowledge—or lack of knowledge—of a subject is to write a paper about it. The result is often surprising to the would-be author, who may discover that he has an unexpected talent for expressing himself clearly on some technical matter, or, on the other hand, may find gaps in his store of professional information which need to be filled. In any case his effort deserves encouragement, for it helps the young engineer to acquire the art of clear and concise writing, gives him practice in discussion, and incidentally makes him better known to his fellows and to senior engineers whose acquaintance may be helpful.

These are only some of the reasons why the Institute has always included among its prizes, several for which only Students and Juniors of the Institute are eligible. The council attaches so much importance to this feature, that the Institute Committee on the Young Engineer has been asked to report specially as to the working of the present scheme of regional prizes for Students and Juniors. These prizes consist of the Martin Murphy Prize for the maritime provinces, the Ernest Marceau and the Phelps Johnson Prizes for the province of Quebec, the John Galbraith Prize

## News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

for the province of Ontario, and the H. N. Ruttan Prize for the western provinces. Their names commemorate five eminent Canadian engineers, each of whom held a leading position in the region with which his name is associated.

The prizes (of books or instruments) are given annually for the best papers presented by Students or Juniors of the Institute in each vice-presidential zone. All papers presented to his branch by a Student or Junior in good standing are eligible for consideration.

After consultation with the various branch executives, the Committee, under the chairmanship of Mr. H. F. Bennett, has reported favourably to Council as to the continuation of the present prizes, and indeed recommends an extension of the scheme if financially possible. It is also recommended that such publicity be given to these prizes as will bring them to the attention of every member of the Institute who might be a competitor. This is being arranged for.

It goes without saying that an active, vigorous body of Students and Juniors is essential for the future welfare of the Institute. From among these young engineers will come our branch executives and our Institute officers and members. Mr. Bennett's Committee, in its report, lays stress on the fact that those branches which have specialized in junior activities have obtained results which have amply repaid them. But in this matter much depends upon the attitude of our senior members, who can help by giving encouragement to the student and junior members with whom they are in frequent contact, drawing their attention to the Institute prizes as announced in the *Journal*, and urging them to take advantage of their Institute membership by participating in its activities.

## A REFERENCE BOOK ON CIVIL DEFENCE

The Institute pamphlet entitled "Structural Defence Against Bombing" is now available for distribution.

This book was carefully edited by a special sub-committee of the Institute Committee on the Engineering Features of Civil Defence. The information has been assembled under several chapters and sub-headings, resulting in a very useful reference book for all engineers interested in civil defence. It contains 79 illustrations and eight tables. The following extract from the foreword will give an idea of the subjects covered in these pages:

"This book is published in order to make available to Canadian engineers and architects a record of some of the experiences and practices of British authorities in regard to structural air raid precautions, so that in the event of emergency arising in this country the necessary action can be taken without loss of time and on the most efficient and economical lines.

Civil defence experience was gained in Britain under 'active service' conditions, with the enemy literally at the gates and boasting of his ability and intention to destroy the cities. At the same time that experience was supplemented by scientific research on a very comprehensive scale; and circumstances imposed the strictest economies in materials and labour. A great quantity of invaluable information has thus been gathered on the subject; and, while it is realized that differing conditions in Canada will not always permit of the rigid application of protective measures developed overseas, yet the main principles must be the same and will form a solid basis for civil defence in this country.

In these pages is presented an outline of methods of protection against aerial attack designed to give citizens sufficient security to carry on their work by day and to get their rest at night, and to prevent undue dislocation of industrial plants and public services. The unusual loads that have to be dealt with are discussed, together with the extensive departures from normal engineering design that are entailed in the protective expedients. It must be realized that when the problem to be faced involves the effects of a thousand pounds or more of metal and explosives falling with the speed of sound, there can be no substitute for well-founded, logical and proved solutions. A great burden of responsibility therefore lies upon the engineering profession when it is called upon to deal with such matters.

A word of warning should be added with regard to amateur and unofficial expedients such as are put forward commercially from time to time. The public should be cautioned against using proprietary types of air raid shelters and other protective devices that have not received the approval of properly qualified engineers."

In view of the very favourable comments received from those who attended the lectures given in Toronto, Council felt under obligation to make the information available in convenient form to the whole engineering profession in Canada and it is now pleased to present this handbook with the hope that it may be useful.

The book contains 56 pages and it is of 8½ x 11 in. format, with heavy paper cover. It may be secured at Institute Headquarters at \$1.00 a copy.

## CIVIL DEFENCE ACTIVITIES

At its last meeting, Council directed that the information contained in the progress reports presented from time to time by the Committee on Engineering Features of Civil Defence be published in the *Journal* in order that members may be familiar with the work that is being done by the Institute on this vital matter.

The report presented at the October meeting of Council shows that twenty of the twenty-five branches have now completed their organization and are actively engaged in the study of local conditions.

It has been suggested to all Branch Committees that they make contact with the architects and contractors in their respective areas, with a view to organizing, perhaps as the Toronto Branch Committee has already done, to deal jointly with engineering matters arising out of damage done by enemy action.

Professor R. F. Legget's subcommittee on men, plant and materials for repairs to major engineering structures and works has completed its exploratory work and is now proceeding with the main part of its assignment. In this it has seemed that the desirable first step should be arrangements for close co-operation between the Royal Architectural Institute of Canada, the Canadian Construction Association and the Engineering Institute of Canada.

Professor Legget has met with Mr. G. McL. Pitts, President, R.A.I.C., and Mr. E. V. Gage, representing Mr. J. B. Stirling, President, C.C.A., to discuss the common problems of the three organizations as they affect the work of this sub-committee. He presented for preliminary discussion a memorandum relative to organization for emergency repairs to works and buildings, a matter in which all three organizations are mutually interested. The discussion led to approval of the principle of his memorandum by those present, and the decision to lay it before the governing body of each of the three organizations for preliminary approval and, if so approved, for authority to proceed with the development of a joint presentation to proper governmental authorities.

The matter was laid before the Council of the Institute at

its meeting on September 19th. After extended discussion, Council approved the submission in principle and authorized Professor Legget to proceed with the preparation of a joint submission. Council also granted to President Young final power of approval of this submission insofar as the Engineering Institute is concerned.

It is expected that after the other organizations have had opportunity to act upon the same preliminary submission there will be a further meeting of the representatives of the three organizations.

The Toronto Branch Committee, under the chairmanship of Mr. John Grieve, has issued a circular letter to all those within its area who attended Professor Webster's Toronto lectures telling of the formation and terms of reference of the Institute Main Committee, and of the formation of the Toronto Branch Committee and what it is doing, and asking for suggestions.

The Toronto Branch Committee has initiated the formation of a Joint Committee of the Toronto Branches of The Engineering Institute of Canada, the Royal Architectural Institute of Canada and the Canadian Construction Association, to deal with matters of mutual interest in the engineering features of civil defence. This Joint Committee has found that the Toronto Builders' Exchange has already set up machinery by which the equipment, materials and men normally under the control of each of its members would in an emergency be placed at the disposal of all of them as required. The Toronto Branch of the Engineering Institute and of the Royal Architectural Institute are setting up machinery to make technical personnel similarly available.

The Toronto Joint Committee has made contact with Judge I. M. Macdonell, Chairman of Dr. Manion's Provincial ARP Committee, has offered him the co-operation, jointly or severally, of the organization it represents and has made certain suggestions to him which it is hoped will match into the framework of the plan being prepared by Professor Legget's subcommittee jointly with the Royal Architectural Institute of Canada and the Canadian Construction Association.

The Saskatchewan Branch Committee has submitted to the Institute Committee a list of nine questions dealing with high explosive bombs, fire hazards and air raid shelters. As these questions dealt with matters pertinent chiefly to the work of Mr. G. McL. Pitts' subcommittee, they were submitted to that subcommittee for preparation of a reply. That reply has been prepared on the basis of all information available to Mr. Pitts' subcommittee and has been transmitted to the Saskatchewan Branch Committee.

The organization of the Halifax-Cape Breton Branch Committee is well under way. Subcommittees are being set up to deal separately with matters having to do with shelters, incendiary bombs, strengthening of existing buildings, repairs to existing buildings in case of damage, repairs to and protection of plants and industrial buildings, and protection of public utility services. The work of some of these subcommittees is well under way. As soon as the organization is completed the committee will contact Hon. F. R. Davis, Chairman of Dr. Manion's Provincial ARP Committee and Major Osborn Cromwell, Director of Civil Defence for the City of Halifax.

The Saguenay Branch Committee is studying Professor Webster's lecture notes and has made contact with Mr. M. Gaboury, Chairman of Dr. Manion's Provincial ARP Committee.

A sub-committee of the Institute Committee on the Engineering Features of Civil Defence, under the chairmanship of Mr. H. F. Bennett has now completed the edition of the booklet on "Structural Defence Against Bombing" and this volume should be available for distribution about the same time as this *Journal* comes out.

At the request of Council and as an aid to members interested, a list is given herewith of the literature available

in the Institute's library on the subject of air raid precautions and civil defence. Not all of this material is applicable to Canadian conditions, but it is hoped that in the near future we may be able to publish a complete bibliography on this subject which would indicate the publications that might be of interest in this country.

### Literature on

## AIR RAID PRECAUTIONS AND CIVIL DEFENCE

in

### THE ENGINEERING INSTITUTE LIBRARY

#### BOOKS

##### Design and construction of air-raid shelters:

*In accordance with the civil defence act 1939, for "unspecified" areas and other purposes.* Donovan H. Lee. London, Concrete Publications Ltd. (1940). 86 pp.

##### On guard against gas:

*An account of the principles of gas warfare and of the steps to be taken by the ordinary citizen to defend his family.* H. A. Sisson. London, Hutchinson and Co. 91 pp.

##### Air raid precautions in museums, picture galleries and libraries:

*Printed by order of the Trustees of the British Museum, 1939.* 59 pp.

##### Air defence and the civil population:

*H. Montgomery Hyde and G. R. Falkiner Nuttall.* London, The Cresset Press Ltd., 1938. 215 pp.

##### A.R.P.:

*J. B. S. Haldane.* London, Victor Gollancz Ltd., 1938. 296 pp.

##### Planned A.R.P.:

*Based on the investigation of structural protection against air attack in the Metropolitan Borough of Finsbury by Tecton, Architects.* London, The Architectural Press, 1939. 138 pp.

##### Design, cost, construction and relative safety of trench, surface, bomb-proof and other air-raid shelters:

*Orc N. Arup.* London, Concrete Publications Ltd., 1939. 63 pp.

##### Civil protection:

*The application of the civil defence act and other government requirements for air raid shelters, etc.,* by F. J. Samuely and Conrad Wilson Hamann. London, The Architectural Press, 1939. 165 pp.

##### What the citizen should know about civilian defence:

*Walter D. Binger and Hilton H. Railey.* N.Y., Norton and Co. Inc., (c. 1942). 185 pp.

##### Civil defence:

*A practical manual presenting with working drawings the methods required for adequate protection against aerial attack.* 3rd. ed. C. W. Glover. London, Chapman and Hall Ltd., 1941. 804 pp.

#### STANDARDS

##### \*British Standards Institution. 28 Victoria Street, London, S.W.1. A.R.P. Series:

- No. 1—Heavy aggregates for shelters constructed in situ. Jan. 1940.
- No. 2—Bituminous paint and bituminous compound for the protection of steelwork. August, 1939.
- No. 3—Electric hand-lamp (fitted with primary battery or unspillable accumulator). August 1939, revised May, 1940.
- No. 4—Fitted cistern suitable for the decontamination of anti-gas oilskin clothing. November, 1939.
- No. 5—Chemical closets for use in shelter accommodation. September, 1939.
- No. 6—Shelter lighting (shelters for 50 persons (210 sq. ft.) or multiples thereof up to 200 persons). October 1939, revised March, 1941.
- No. 7—Electric lighting of report and control centres. September, 1939, revised March, 1941.
- No. 8—Galvanized wire netting and cloth for protection against flying glass. December, 1939.
- No. 10—Rubber gaskets for rendering doors and windows gas tight. September, 1939.
- No. 11—Adhesive tape for repairing gas-proofing material, repairing damaged material, sealing apertures and cracks, etc. September, 1939.
- No. 12—Petroleum jelly for sealing gas-tight doors, etc., September, 1939.
- No. 14—Window blind material (paper). December, 1939.
- No. 15—Light-locks at entrances to buildings. February, 1940.

- No. 16—Methods of providing low values of illumination (not exceeding 0.002 foot candle). February, 1941.
- No. 18—Fluorescent and phosphorescent paint (excluding radioactive materials) for A.R.P. purposes. July, 1940.
- No. 19—Adjustable hinge. October, 1939.
- No. 20—Methods for providing even illumination of low intensity (0.02 foot-candles). September, 1939, revised January, 1940.
- No. 21—Methods for providing even illumination of low intensity (0.2 foot-candles). October 1939, revised January, 1940.
- No. 23—Obscuration value for textile material for curtains and method of testing. November, 1939.
- No. 26—Reduced scheme for the lighting of shelters where a.c. mains are available. January, 1940, revised March, 1941.
- No. 27—Testing incombustible material resistant to incendiary bombs. February, 1940.
- No. 30—Gauges for checking low values of illumination (0.001 to 0.2 foot-candle). September, 1940.
- No. 31—Ventilation for buildings in conditions of black-out. July, 1940.
- No. 32—Illuminated and non-illuminated A.R.P. signs. May, 1940.
- No. 33—Stirrup pumps. October, 1940, Supplement, June, 1940.
- No. 35—Illuminated display cabinets. December, 1939.
- No. 36—Headlamp masks for motor vehicles. January, 1941.
- No. 37—Street lighting under war-time conditions. January, 1940, revised May, 1940.
- No. 38—Traffic paints. June, 1940.
- No. 39—Testing fire retardent timber treatment by exposure to the action of an incendiary bomb. February, 1940.
- No. 40—Bleach ointment (anti-gas ointment No. 1). April, 1940.
- No. 41—Front lamps for tram-cars. April, 1940.
- No. 43—Closet for use in air-raid shelters. April, 1940.
- No. 47—Testing incombustible material to provide a minimum standard of protection against incendiary bombs. August, 1940.
- No. 48—Fabric-bitumen emulsion treatment for roof glazing. September, 1940.
- No. 52—Simple portable standard of brightness (including notes on the measurement of low values of brightness). December, 1940.
- No. 53—Detection of incendiary bomb fires by heat-sensitive devices. February, 1941, revised March, 1941.
- No. 54—Electrical heating of shelters (shelters for 50 persons or multiples thereof.) February, 1941.

##### Great Britain. Ministry of Home Security. Research and Experiments Department. Bulletins.

- C 1—New design methods for strutting of basements, etc.: Notes on load factor. April, 1940.
- C 2—Consolidation of earth covering on Anderson shelters. June, 1940.
- C 3—The propping of reinforced concrete beams. July, 1940.
- C 4—The protection of glass in hospitals. August, 1940.
- C 5—Steps that should be taken to increase the resistance of "umbrella" type shed roofs to collapse due to air attack. July, 1940.
- C 6—Damage to cast iron pipes in works. July, 1940.
- C 7—The protection of factory glazing. July, 1940.
- C 8—Structural damage caused by recent air raids to some single storey buildings. August, 1940.
- C 9—The protection of plate glass windows. September, 1940.
- C 10—Translucent substitutes for glass. March, 1942.

## WARTIME BUREAU OF TECHNICAL PERSONNEL

### Monthly Bulletin

In order to facilitate the centralization of certain bodies operating under the Department of Labour, and to secure more space for its expanding activities, the Bureau's offices have been moved from the Confederation Building to the Motor Building at 238 Sparks Street, Ottawa.

Early in August, the Bureau opened its fifth regional office in Halifax with the arrival there of Mr. S. W. Gray, M.E.I.C., who had come from Halifax to spend a month in the Bureau to become familiar with its policy and activities, as reported in the July Bulletin. Owing to the fact that industrial activities in the Maritimes are rather widely dispersed, it would be difficult for the Halifax representative to cover all the Maritime territory without being in the field for too great a portion of his time. To cover centres away from Halifax, the Bureau was fortunate in securing the services, on a purely honorary basis, of two Halifax

engineers, Mr. A. D. Foulis, M.E.I.C., and Mr. G. F. Bennett, M.E.I.C., whose business activities require one or the other to make frequent business trips to most of the industrial centres in the Maritime region. They are available to supplement the services of the Bureau's official representative.

A native of Ottawa, Mr. Bennett is a graduate of McGill University in electrical engineering. After his graduation, he was with the Canadian Westinghouse Company Limited at Hamilton, Ontario, and later was Sales Engineer for the same Company in Halifax. In 1941, he resigned to become Managing Director of Foulis and Bennett Electric Company Ltd., a firm representing a number of well known electrical companies.

Mr. Foulis was born in Yarmouth, Nova Scotia, and is a graduate of Acadia University and Nova Scotia Technical College in mechanical engineering. Formerly associated with the Canadian Fairbanks-Morse Company, Ltd., he resigned to establish Foulis Engineering Sales Ltd. to represent many Canadian and American manufacturers in the mechanical and electrical fields. To take care of rapidly expanding business, he formed the Foulis and Bennett Electric Company with Mr. Bennett.

At the same time, arrangements were made to have honorary representation in the district immediately surrounding Quebec City, where Dr. Paul E. Gagnon, M.E.I.C., has consented to represent the Bureau in such matters as may come up from time to time. Dr. Gagnon is a member of the Bureau's Advisory Board, past President of the Canadian Chemical Association, Honorary Treasurer of the Canadian Institute of Chemistry, and President of the Graduate School of Laval University, as well as Director of the Departments of Chemistry and Chemical Engineering of the Faculty of Science.

The Director, Mr. H. W. Lea, M.E.I.C., visited Halifax shortly after that office was opened, thus completing a series of visits, initiated earlier in the year, to all regional offices. Advantage has been taken of these visits to discuss local Bureau problems, to further necessary co-operation with local National War Services Boards, and to discuss technical personnel problems with various provincial authorities with a view to ensuring the greatest possible degree of co-operation from the Governments of the provinces concerned.

In order to co-ordinate the work of all regional offices, one of the Bureau's officers is specifically charged with dealing with regional contacts, so that the established policy may be uniformly observed across the country, and so that new matters of interest may be passed on in a systematic way without delay.

Negotiations were completed for the seconding to the Bureau of Colonel G. W. Beecroft from National Defence Headquarters to deal with the large volume of work involved in contacts with the three defence services. Colonel Beecroft took up his duties with the Bureau in the middle of August, and there is already ample evidence of the wisdom of making such an arrangement. By mail, by personal interview at Ottawa, and by reference from regional offices, there is a steady flow of requests for guidance, particularly from young engineers and scientists who are in need of impartial advice as to where best their technical qualifications might be used in one of the services. Apart from these cases of individuals, it is now possible to devote further thought and discussion to broader questions, such as the possible use of certain technical groups on the establishment of one or other of the armed forces in such a way that definite need will be met on one hand, and that opportunities will be available for service on the other.

Colonel Beecroft saw service in the last war, and is a graduate in engineering from the University of Toronto. He was employed with Imperial Oil Limited and International Petroleum Company, Limited in their South American oil fields, and at Head Office in Toronto for 15 years. He went overseas in January, 1940, with No. 2 Army Field Workshop, R.C.O.C., and commanded that unit from

May, 1940, to August, 1941. On return to Canada, he served in the Directorate of Mechanical Maintenance in the M.G.O.'s Branch at National Defence Headquarters as Acting Chief Ordnance Mechanical Engineer.

The Bureau's classification sheet, which is used in conjunction with registration of technical personnel, was revised in June so as to include a number of fields of pure science which had previously not been specifically mentioned. This has facilitated the registration, of a large number of men engaged in the field of pure science, under classifications which more closely identify with their training and experience.

## WASHINGTON LETTER

One gets a better perspective of Canada's war effort from a vantage point outside the country. In the same way, the accomplishments of the United States may look better from Ottawa than they do from Washington. Nevertheless, one of the things which has struck me most forcibly, as the result of talking in Washington to people from all over the world, is the high regard in which Canada's war effort is held. An equally high regard is also held for the manner in which Canada has accomplished the transition from peace to war. Her wartime legislation—the organization of her various wartime boards—her rationing and price control schemes have all been watched with close attention and considerable approval.

The national income of the United States is sixteen times that of Canada. This is a better measure of productive capacity than population. On the basis of a ratio of sixteen to one, Canada, who had no aircraft industry shortly before the war, will this year produce on a relative basis as many aircraft as it is expected will be produced in the United States in the same period. (This is exclusive of the engines which are not made in Canada). On the same basis, the merchant shipping tonnage which is scheduled to go down Canadian ways this year will be relatively twice the American programme. Of course, Canada had a head start. The figures next year may look quite different. Nevertheless, it is recognized that Canada has achieved amazing results in a very short time. For instance, gun production has always been regarded as the special task for established and long experienced armament firms. Within three years and starting from grass roots, Canada now has in production some thirty types of guns ranging from service rifles to heavy naval and anti-aircraft guns, and experts from the United States are now going to Canada to study the new methods evolved in Canadian gun plants. I have frequently been told that the Canadian job of machine tooling for war production compares very favourably with that of any other country in the world.

Some people here are puzzled and inclined to be a little critical over Canada's failure to introduce conscription for overseas service, but they realize that the Canadian army is the relative equivalent, on a population ratio, to an American army of about six million.

In the matter of war organization, people in Washington complain of the division of U.S. control—of the multiplicity of boards and organization—and of the lack of stability regarding the bodies themselves. The War and the Navy Departments, the War Production Board, the Board of Economic Warfare and the Office of Lend-Lease Administration, and the Office of Price Administration are the major bodies controlling the United States war effort. In Canada the functions of all these bodies is centralized in the comparatively streamlined Department of Munitions and Supply which, in turn, is closely interlocked with the civilian side through the Wartime Prices and Trade Board.

In international relations between U.S. and Canada, an excellent and, in many senses, a pioneer job is being done by the Joint War Production Committee and its ten joint technical sub-committees in co-ordinating all phases of

Canadian and American War Production. It is to be hoped that the foundations of our future relations are being as carefully prepared for our political co-operation as they are for our industrial co-operation.

It would not do, however, for Canada to be complacent or self-satisfied with result of achievements to date. In this regard, the attitude presently prevailing in official circles in the United States is the more salutary one. Within a few days of each other, we recently had four pronouncements from eminent authorities to the effect that America's war effort must be drastically stepped up. In his Lend-Lease report to Congress, the President said that the United States had only achieved a little more than fifty per cent of its maximum war production. Mr. Donald Nelson appealed to people to take up the slack in our wasteful economy. He declared that, from now on, our war effort is "going to hurt." Nobody who has access to the mass of limitation orders, restrictions, and prohibitions which the War Production Board issues from day to day under his direction will doubt that he means what he says. In a very wide range of commodities, the people of the United States are living "off the shelf" and when the shelves are empty, there won't be any more! Mr. Nelson was backed up by a nationwide address by Ambassador Grew, recently "returned" from the Far East, who told the American people some home truths. On top of all this, General Lewis B. Hershey, National Selective Service director, warned that America is going to need an army of from ten to thirteen million men.

Talking about U.S. production, it will probably be of interest to engineers to note the re-entry into the active direction of the General Electric Company of Owen D. Young and Gerard Swope which was announced as I write this letter. The well-nigh fabulous collaboration of these two men in building up the General Electric Company is one of the great stories of industrial development. Charles E. Wilson and Phillip D. Reed, who took over from Swope and Young a few years ago, have both been called to Washington. Reed has been an official of the War Production Board for some time, while Wilson has only just been appointed as chairman of the Production Executive Committee of the same organization. This committee, will, if I read the signs right, become an important and powerful body. One of its members is Lt.-Gen. Brehon B. Somervell.

Over in Arlington, across the Potomac, the new Pentagon Building of the War Department is filling up. Designed under the direction of Lt.-Gen. Somervell when he was in charge of Army construction, this building is supposed to be the "largest in the world." The first occupants moved in about six months ahead of schedule. Built at a cost of about \$31,000,000, the Pentagon Building will have a floor space of over 4,000,000 square feet and will house over 30,000 people under one roof who were previously distributed in some 24 buildings about Washington. Of course, the Army is growing so fast that many of these 24 buildings will still be required for new personnel. The traffic problem created by this building, and the somewhat smaller Navy building not far away, is being taken care of by a special series of roadways and two new pontoon bridges over the Potomac.

Life in Washington, though hectic, has its compensations. In spite of temporary construction, Washington is still a beautiful city. There is much of interest for the historian or scientist or antiquarian. One may still sit under the stars, in the shadow of the Lincoln Memorial, and hear Lily Pons and André Kostelanetz; one may still attend the various affairs at Embassies and Legations, mixing with great and near great; one may still find persisting the habits and equipment of a former standard of expensive living. In spite of all this, nobody in Washington these days ever escapes very far from the major preoccupation. The war, either directly or indirectly runs like a leitmotif through all activities both social and business. The other evening we were having dinner under a romantic moon on the terrace

of the famous Shoreham Hotel overlooking the swimming pool, coloured fountains and Rock Creek park beyond. Some time previously, I had visited the War Department to discuss food problems, including dehydration plant and equipment with a certain colonel. Well, I saw the good colonel on the dance floor, in this romantic setting, in the company of a very attractive blonde. As he danced by, I overheard only one word of his conversation. It was "dehydration!"

E. R. JACOBSEN, M.E.I.C.

## VOCATIONAL GUIDANCE MANUAL

The Engineers' Council for Professional Development has recently issued a booklet designed to help engineers and committees acting in an advisory capacity to high school students who consider entering the engineering profession. It is entitled "Manual for Committees of Engineers Interested in Engineering Education and the Engineering Profession" and is published with a separately-bound appendix addressed to the student as a prospective engineer.

This guidance manual offers a general procedure recommended to individuals or groups in the profession for presenting to high school students the aims and essentials of engineering education, the aptitudes required and the types of civilian organizations and armed forces employing engineers. It presents material on the organization and selection of these committees representing local sections of national societies or local engineering clubs and societies, and points out the necessity of co-operation on the part of these committees with the vocational guidance programmes already established in the secondary schools, and with other local and professional groups who are interested in the problem of helping young people select their career.

Direct aids in counseling are given in outline form, and the advisors are urged to present their case in the form of (1) general talks to student bodies, (2) explanations of a more technical nature to small groups of boys having a definite interest in civil, electrical, or other branches of engineering, (3) essay contests limited to 500-word papers on the subject of "Why I Believe I Should be an Engineer," and (4) when practical, inspection trips and motion pictures. A list of books and pamphlets on vocational guidance, especially in relation to engineering, constitutes a final section of the booklet. The booklet purposes to make available to high school students who will qualify for and are interested in engineering, full information on the engineering field, so that engineering colleges may be supplied, for their regular or accelerated beginning classes, with competent freshmen who will persist until the training is completed.

The appendix is designed for use by the student in supplying biographical and educational background, and should be reviewed by the advisory committee or counselor prior to a conference with the candidate.

The Committee on Student Selection and Guidance of E.C.P.D. reports that advisory committees have been established in several centres of the United States and that in New York City alone, 3,000 boys have, during the year, been enlightened on the scope of the engineering profession.

In Canada, under the inspiration of the Institute Committee on the Training and Welfare of the Young Engineer, fourteen branches have organized Student Counseling Committees. As a result of the distribution by the Institute, in secondary schools, of the booklet "The Profession of Engineering in Canada, Information for Prospective Students," several requests for additional information and counsel have been received at Headquarters and have been referred to the Branch Committees in the regions where the inquiries originated. Copies of E.C.P.D.'s vocational guidance manual have been distributed to these Branch Committees and should be of great assistance to them in this work.

## CORRESPONDENCE

### Editor's Note:

At the regional meeting of Council in Halifax, pleasure was expressed at the good health and continued activity of Mr. H. C. Burchell, who has been a Member of the Institute since 1887. Greetings were sent to him from the meeting, and the following letter has been received in acknowledgment. The brief history outlined contains a life-time of activity in the professional and administrative field. It should be particularly interesting and inspirational to young members of the profession.

EASTERN LIME COMPANY LIMITED,  
WINDSOR, N.S.

September 10th, 1942.

Mr. L. Austin Wright, M.E.I.C.,  
General Secretary, The Engineering Institute of Canada,  
2050 Mansfield Street, Montreal, P.Q.

Dear Mr. Wright:

More than I can express do I appreciate the kind remembrance of the Council and its members at their Halifax meeting on August 7th. It happened to be my eighty-seventh birthday.

That was a day of reminiscence. Let me recount in brief outline some of my professional history.

Mount Allison and McGill Universities in the early seventies.

Nova Scotia, Colorado, Rocky Mountain and Chicago City Belt Line railways.

Missouri coal area investigation for C.B.Q. Copper mining.

Newfoundland, Deputy Minister of Public Works and Chief Engineer, comprising dry docks and railway building and operation. Railway Commissioner, Management of Government Telegraphs, Chairman of St. John's City Council; for a time, all concurrent.

Director of Public Works, British Honduras.

Cement manufacturing, and now lime and limestone.

Two missions to Britain and to Continental countries (France, Germany and Denmark), one for the Government of Newfoundland and one for my company.

Fifty years of married life. My wife was a daughter of F. N. Gisborne, a charter member of the Institute.

These few notes of a long record beginning in the early days of the general practitioner may interest you.

Many thanks for the warm expression of good will and good wishes from the Council and from your good self.

Yours sincerely,

(Signed) H. C. BURCHELL, M.E.I.C.

ROYAL ARSENAL, Woolwich, England,  
June, 1942.

L. Austin Wright, Esq.,  
General Secretary,  
The Engineering Institute of Canada,  
Montreal, P.Q., Canada.

Dear Mr. Wright:

May I tender my sincere personal thanks to The Engineering Institute of Canada for the kindness shewn to U.K. members in remitting annual fee.

Regularly each month since I returned from Canada I have been receiving my copy of *The Engineering Journal* and I look forward to the time when I shall be able to renew acquaintance with the many friends I made whilst in Canada.

Your personal offer of assistance at any time is much appreciated and I shall be glad if you will convey my thanks and best wishes to the Council at their next meeting.

Yours very sincerely,

(Signed) C. S. H. LEHEUP, M.E.I.C.

## BIBLIOGRAPHY PUBLISHED ON ELECTRICAL SAFETY

The third bibliography of technical literature entitled "Bibliography on Electrical Safety, 1930-1941" has just been published by the American Institute of Electrical Engineers. This publication, sponsored by the AIEE committee on safety, is designed to make available a fund of information on electrical safety which should be of special interest at a time when accident prevention is of national importance. A list of American and Canadian applicable standards, specifications, and safety codes is also included. Information on safety published before 1930 may be located through bibliographies accompanying articles listed.

The items in this bibliography are divided into sections according to subject matter as follows:

- A. Electrical Accidents and Their Causes.
- B. Accident Prevention Methods.
- C. Safety Codes and Standards.
- D. Effects of Electric Shock.
- E. Resuscitation.

The "Bibliography on Electrical Safety, 1930-1941" is a 16-page pamphlet, 8½ by 11 inches. It may be obtained from AIEE headquarters, 33 West 39th Street, New York, N.Y., at 25 cents per copy to Institute members (50 cents to non-members) with a discount of 20 per cent for quantities of 10 or more mailed at one time to one address. Remittances, payable in New York exchange, should accompany orders.

Members of the Engineering Institute may obtain copies of the bibliography at 25 cents each from their own Headquarters. This is made possible owing to the exchange arrangements between the Institute and American Societies.

## LAVAL OPENS NEW DEPARTMENT OF ELECTRICAL ENGINEERING

On September 23rd, the Université Laval in Quebec formally opened its new Department of Electrical Engineering, in the presence of a large group of important government, educational, and industrial personages. Mgr. Camille Roy, Rector of Laval University, and Mr. Adrien Pouliot, M.E.I.C., Dean of its Faculty of Science, both spoke briefly and presented Mr. René Dupuis, M.E.I.C., the Director of the new department, who gave a brief history of the foundation of the department, acknowledged the financial support of the Quebec government, and outlined the programme which it was hoped to follow.

Laval University has been giving degrees in Medicine, Law, Theology, and Arts, for over ninety years, but has only recently extended its activities to the field of pure and applied science. To-day, its Faculty of Science gives degrees in Mathematics, Physics, Chemistry, Biology, and Geology, as well as in Chemical, Mining, Metallurgical, Forestry and Electrical Engineering. The department just created will give young men in Quebec and lower St. Lawrence regions additional opportunities to enter a field in which there now exists a pressing demand for qualified engineering graduates.

The new course at Laval has been organized largely along the lines of the training given by the Department of Electrical Engineering at McGill University and thanks are due to Professor C. V. Christie and Professor G. Wallace of McGill for their advice and collaboration. During the first and second year, all engineering students follow the same basic training in mathematics, physics, chemistry, drawing, etc. In the third year, they are grouped according to the specialty that they have chosen; electrical engineering students are given basic theory in electrical circuits and machinery. In the fourth year, they may take either the

power or the communications option. In view of the importance of communications in the present war and the great effect that present-day developments in the electronic field will have on civil life after the war, considerable attention will be given at Laval to the communications field.

Main Electrical Laboratory.

The equipment of the new laboratories has been hindered by the difficulty of obtaining electrical apparatus; nevertheless, apparatus is now available to carry out normal instruction in all subjects of the curriculum. The facilities include laboratories devoted to machines, meters and relays, illumination, small apparatus, radio and telephone, and an electrical shop. A flexible distribution system provides the following currents in all laboratories; 230-115 volts D.C., 220-110 volts A.C. single-phase, 220 and 110 volts A.C., three-phase. The experimental equipment includes a 40 kw. D.C. generator driven by a 50 hp. induction motor, a 10 hp. D.C. generator set, a 10 hp. A.C. phase displacement dynamometer set, a 10 hp. D.C.-A.C. motor generator set, a 5 kw. synchronous converter, a 5 hp. squirrel-cage, induction motor, a 5 kw. six-phase mercury vapour rectifier, a 1½ kw. three-phase mercury vapour rectifier, three 2½ kva. transformers, one 30-ampere three-phase variac, three 50-ampere core type variable inductances, several resistor banks, variable condensers, and a wide assortment of measuring apparatus and meters of all ranges. A typical 2,200 volts distribution line has been set up for instruction in transmission line working. A feature of the illumination laboratory is a room with movable partitions and ceilings which will permit practical tests of reflecting surfaces, luminaires, etc. The communications laboratory already contains a cathode ray oscillograph, an electronic switch, an ohmmeter-voltmeter-milliammeter, a tube tester and numerous small components. The shop is equipped with a lathe, drill, press and wide assortment of tools.

The University has aimed at getting for its teaching staff engineers from the electrical industry who have had varied and successful experience in the electrical field. Mr. René Dupuis, M.E.I.C., who takes charge of the department as Director, studied at McGill and graduated in electrical engineering from the University of Nancy, France, comes from the staff of the Quebec Power Company where he was assistant-superintendent. The Assistant-Director, Mr. E. A. Bouchard, graduated in civil and electrical engineering from the Ecole Polytechnique, Montreal, and obtained a Master's degree in electrical engineering from the Massachusetts Institute of Technology; he was with the Shawinigan Water & Power Company for several years. Mr. G. E. Sarault, M.E.I.C., a graduate of McGill University in electrical engineering, was previously regional engineer for Quebec province with the Canadian Broadcasting Corporation and will teach communications. The department has received strong support from the provincial Government and the electrical industry in general. The Shawinigan Water & Power Company and the Quebec Power Company have contributed three scholarships of 250 dollars each and

prizes amounting to 100 dollars for the electrical students, as a token of their keen interest and their confidence in the new department. The Canadian Porcelain Company, Northern Electric Company, R.C.A. Victor, Montreal Light, Heat & Power Company, Rivière-du-Loup Power, Saguenay Power Company, the City of Quebec, the Hôpital du St-Sacrement in Quebec, have all made valuable contributions to the laboratories.

## MEETING OF COUNCIL

A meeting of the Council of the Institute was held at Headquarters on Saturday, September 19th, 1942, at ten thirty a.m.

*Present:* President C. R. Young in the chair; Vice-President K. M. Cameron; Councillors J. E. Armstrong, E. D. Gray-Donald, J. G. Hall, R. E. Heartz, W. G. Hunt, G. M. Pitts, and J. A. Vance; Secretary Emeritus R. J. Durley, General Secretary L. Austin Wright, and Assistant General Secretary Louis Trudel.

The recommendation of the Finance Committee that the two new Institute medals which had been authorized at the February meeting of Council, be known as (1) The T. C. Keefer Medal for papers on civil engineering, and (2) The R. A. Ross Medal for papers on electrical engineering, was approved unanimously. No action was taken regarding the preparation of designs or the procuring of dies for the new medals.

The general secretary reported that considerable progress was being made with regard to the Annual Meeting, which would be held at the Royal York Hotel, Toronto, on Thursday and Friday, February 11th and 12th, 1943. Mr. Ross Robertson has been appointed chairman of the Finance Committee, and Professor R. F. Leggett chairman of the Papers Committee.

The papers will be of a war nature and will feature three of the important committees recently appointed by Council—Post-War Problems, Civil Defence and Industrial Relations. One professional session will be devoted to a discussion on manpower in the United States and Canada. It is hoped to continue the custom established in recent years of having as special guests the presidents and secretaries of the American Societies. Interesting plant visits will also be arranged. The social functions will be of an informal character.

Mr. Hall, chairman of the Institute's Membership Committee, reported that his committee had studied item by item the resolution of the Toronto Branch regarding the consideration of applications for membership, which had been referred to it by Council some time ago. The committee presented a detailed report, and recommended (1) that Council send to each branch a memorandum for their guidance in considering applications for admission; and (2) that a form or chart be used by all branches in reporting their findings and recommendations to Council.

Mr. Gray-Donald thought it would be a great help if instructions or rules for the guidance of the branches in considering applications were drawn up. He felt that at the present time the classification of Institute Affiliate was being given to candidates who were not eligible for full membership, and who were not ready to take the Institute examinations. His understanding of that classification was that it should be given to persons, not necessarily engineers, whose past experience and attainments would add to the prestige of the Institute.

Mr. Hall pointed out that that classification, as well as that of Branch Affiliate, had been reported on some time ago by the Membership Committee which was still endeavoring to find an appropriate name for Branch Affiliates that would distinguish them from Institute Affiliates. His interpretation was that an Institute Affiliate might be a person of a very high calibre but not necessarily an engineer.

Mr. Pitts presented a suggestion that joint membership in the Institute and a professional association should be

recognized by some new designation such as P.M.E.I.C. He thought this might be a senior classification in the Institute which would attract persons who were not now members of an association and the Institute. The president pointed out that this was an entirely new suggestion which might properly be referred to the Institute Membership Committee for consideration and report.

Following further discussion, on the motion of Mr. Hall, seconded by Mr. Vance, it was unanimously resolved that the report of the Membership Committee be adopted, and that copies be sent to all branches and members of Council with a request for an expression of opinion on the draft form suggested for the use of branch executive committees.

On the motion of Mr. Vance, seconded by Mr. Heartz, it was unanimously resolved that Dr. J. S. Bates and Mr. Huet Massue be appointed members of the Committee on Post-War Problems.

In presenting the progress report of his Committee on the Engineering Features of Civil Defence, Mr. Armstrong stated that since the last council meeting his committee had made rapid progress. Some of the work had now advanced to a stage that required some action by Council in order that further progress might be made.

Three additional branches had appointed branch committees although seven of the branches had not yet taken this action. The president pointed out that the Cape Breton Branch would not appoint a committee as it was co-operating with the Halifax branch under the chairmanship of Councillor I. P. Macnab.

Mr. Armstrong then commented on his report item by item. His committee was still co-operating with Dr. Manion's committee on A.R.P., but there was nothing special to report at the moment in that connection. The main committee is keeping in close touch with the branch committees. The sub-committee on protection against bombing, etc., was at work under the chairmanship of Councillor G. M. Pitts, but no report had yet been received from that committee.

Professor Legget, Chairman of the Sub-Committee on Men, Plant and Materials for Repairs to Major Engineering Structures and Works, has been very active. He is proceeding carefully with the appointment of personnel for his sub-committee with a view to having its membership such as to serve as the centering points throughout Canada for currently carrying on the work of the sub-committee during an emergency. He has tentatively in mind a representative in the maritime provinces, in Quebec, in Ontario, in the prairie provinces and in British Columbia. In the meantime, the Toronto Branch Committee has offered to assist him in any way possible.

Professor Legget is now in touch with H. W. Lea, Director, Wartime Bureau of Technical Personnel, in regard to men and with H. H. Bloom, Administrator, Farm and Construction Machinery, Wartime Prices and Trade Board, in regard to plant, but has not yet made the type of contact he desires in connection with materials. An attempt is being made to develop a single contact in connection with priorities for repair materials, if, as and when required, Such a contact should save much time in an emergency as compared with the probable alternative of approaching each material Controller concerned in each individual case of damage.

President Young expressed Council's thanks and appreciation of the tremendous amount of work which Mr. Armstrong and his committee had done. The report represented one of the finest pieces of work ever undertaken by the Institute.

In response to a request from the secretary of the Canadian Chamber of Commerce, it was unanimously resolved on the motion of Mr. Vance, seconded by Mr. Gray-Donald that Vice-President deGaspé Beaubien be nominated as the Institute's representative on the board of directors of the Canadian Chamber of Commerce for the year 1942-1943.

A number of applications were considered and the following elections and transfers were effected:

## ELECTIONS AND TRANSFERS

At the meeting of Council held on September 19th, 1942, the following elections and transfers were effected:

ADMISSIONS	
Members.....	7
Juniors.....	3
Students.....	7
Affiliate.....	1
TRANSFERS	
Junior to Member.....	4
Student to Member.....	1
Affiliate to Member.....	1

It was noted that the next meeting of Council would be held at the General Brock Hotel, Niagara Falls, Ontario, on Tuesday, October 13th, 1942, convening at two o'clock p.m.

The Council rose at one forty p.m.

### "LIONS' GATE BRIDGE" PAPER AVAILABLE IN REPRINT FORM

The excellent paper by S. R. Banks, M.E.I.C., on "The Lions' Gate Bridge" published in four instalments in recent issues of the *Journal*, has been reprinted under one cover. This unabridged edition contains 60 pages and is amply illustrated.

The paper, which was awarded the Gzowski Medal of the Institute for 1941, is a faithful record of the various phases of the work on the design at Montreal, and the construction at Vancouver, of the longest suspension bridge in the Dominion. The main divisions of the paper indicate its scope: Substructure; Design and Fabrication of Superstructure; North Viaduct; Erection of Superstructure; Electrical Installation; Particulars Regarding Contracts and Personnel.

Copies of the reprint may be obtained at 30 cents each from Headquarters.

### LIST OF NOMINEES FOR OFFICERS

The report of the Nominating Committee, as accepted by Council at the meeting held on September 19th, 1942, is published herewith for the information of all corporate members as required by Sections 19 and 40 of the By-laws:

#### LIST OF NOMINEES FOR OFFICERS FOR 1943 AS PROPOSED BY THE NOMINATING COMMITTEE

PRESIDENT.....	K. M. Cameron.....	Ottawa
VICE-PRESIDENTS:		
*Zone "A" (Western Provinces).....	W. P. Brereton.....	Winnipeg
*Zone "B" (Province of Ontario).....	L. F. Grant.....	Kingston
*Zone "C" (Province of Quebec).....	C. K. McLeod.....	Montreal
COUNCILLORS:		
†Vancouver Branch.....	C. E. Webb.....	Vancouver
†Edmonton Branch.....	E. Nelson.....	Edmonton
†Saskatchewan Branch.....	A. M. Macgillivray.....	Saskatoon
†Lakehead Branch.....	H. G. O'Leary.....	Fort William
†Ottawa Branch.....	N. B. MacRostie.....	Ottawa
†Toronto Branch.....	H. E. Brandon.....	Toronto
†Border Cities Branch.....	G. E. Medlar.....	Windsor
	J. F. Bridge.....	Sandwich
†London Branch.....	J. A. Vance.....	Woodstock
†Kingston Branch.....	A. Jackson.....	Kingston
†Montreal Branch.....	E. V. Gage.....	Montreal
	J. A. Lalonde.....	Montreal
†St. Maurice Valley Branch.....	H. J. Ward.....	Shawinigan Falls
†Saguenay Branch.....	J. W. Ward.....	Arvida
†Saint John Branch.....	J. P. Mooney.....	Saint John
†Halifax Branch.....	C. Scrymgeour.....	Dartmouth

\*One vice-president to be elected for two years.

†One councillor to be elected for two years.

‡Two councillors to be elected for three years each.

#### Members

- Langevin, Louis Emilien**, B.A.Sc., C.E. (Ecole Polytechnique), constg. engr., 513 Rachel St. East, Montreal, Que.
- Magnant, Daniel Armand**, B.A.Sc., C.E. (Ecole Polytechnique), development engr., Bouchard plant, Defence Industries Limited, Ste. Therese, Que.
- Swinton, Kurt Rudolf**, B.Sc., M.Sc. (Technical Univ., Vienna), Lieut., R.C.C.S., on staff of Director of Signals Design, Army Engrg. Design Br., Dept. of Munitions & Supply, Ottawa, Ont.
- Theriault, L. Leon**, B.Sc. (Univ. of N.B.), motor vehicle dept., Dept. of Public Works, Fredericton, N.B.
- Tourigny, Charles E.**, B.A.Sc., C.E. (Ecole Polytechnique), director of customers' service bureau, Shawinigan Water & Power Company, Montreal, Que.
- Van den Broek, Jan A.**, B.Sc. (Univ. of Kansas), Ph.D. (Univ. of Mich.), professor of engineering mechanics, University of Michigan, Ann Arbor, Mich.
- Watts, Thomas Ord**, B.Sc. (Queen's Univ.), works mgr., Sutton-Horsley Co. Ltd., Toronto, Ont.

#### Juniors

- Caverly, Jefferson Austin**, B.Eng. (Geol.), (Univ. of Sask.), exploration engr., for Howe Sound Co. of New York, at Snow Lake, Man.
- Dillon, Eldridge Arthur**, B.Eng. (N.S. Tech. Coll.), student engr., Can. Gen. Elec. Co. Ltd., Peterborough, Ont.
- Laari, William**, B.A.Sc. (Univ. of Toronto), jr. field engr., Canadian Allis Chalmers Mfg. Co., Toronto, Ont.

#### Affiliate

- Swanston, Murray Maxwell**, Flying Officer, R.C.A.F. Station, Gander, Nfld.

*Transferred from the class of Junior to that of Member*

- Charlewood, Charles Benjamin**, Lieut., R.C.A., B.Sc. (Mech.), (McGill Univ.), c/o British Columbia House, 1-3 Regent St., London, S.W.1, England.
- Grant, Wilfrid John**, B.A.Sc. (Univ. of Toronto), engrg. dept., Fraser Brace Ltd., Montreal, Que.
- Jackson, William Hayes**, B.A.Sc. (Univ. of Toronto), chief dfsman., De Havilland Aircraft of Canada Ltd., Toronto, Ont.
- Petursson, Hannes Jon**, B.Sc. (Univ. of Man.), instr'man., Dept. of Highways of Ont., Longlac, Ont.

*Transferred from the class of Student to that of Member*

- Miller, Dudley Chipman Raphael**, B.A.Sc. (Univ. of Toronto), supt. of optical shops, Research Enterprises Limited, Toronto, Ont.

*Transferred from the class of Affiliate to that of Member*

- Haltrecht, Arnold**, M.E. (Tech. Univ. of Darmstadt), elec. engrg. lab., National Research Council, Ottawa, Ont.

#### Students Admitted

- Albert, Leo Maurice** (St. Francis Xavier Univ.), P.O. Box 458, Edmundston, N.B.
- Boulet, Lionel** (Laval Univ.), 172 St. Olivier St., Quebec, Que.
- Edwards, George Robert** (N.S. Tech. Coll.), Improver 1st., H.M.C. Dockyard, Halifax, N.S.
- Near, Frank Manning** (Univ. of Toronto), 39 Alexandra Blvd., Toronto, Ont.
- Provias, Peter** (McMaster Univ.), R.C.A.F. (Air Crew), No. 3 Manning Depot, Edmonton, Alta.
- Syme, Thomas Duff** (Univ. of B.C.), 8208 Hudson St., Vancouver, B.C.
- Tulk, Egbert Gordon** (N.S. Tech. Coll.), electrician's helper, H.M.C. Dockyard, Halifax, N.S.
- Vail, Bert Frank** (N.S. Tech. Coll.), 953 Barrington St., Halifax, N.S.

### COMING MEETINGS

**Canadian Institute on Sewage and Sanitation**—Ninth annual convention, Royal York Hotel, Toronto, October 29-30.

**Interprovincial Highway Conference** at Seigniory Club, Montebello, Que., October 28-29.

**Canadian Good Roads Association**—Annual general meeting in Conference Hall of Seigniory Club, Montebello, Que., at 5 p.m., October 29. Secretary-treasurer, Geo. A. McNamee, New Birks Bldg., Montreal, Que.

# RULES GOVERNING AWARD OF INSTITUTE PRIZES

## THE SIR JOHN KENNEDY MEDAL

A medal, called the "Sir John Kennedy Medal," was established in 1927, to be awarded under the following rules in commemoration of the great services rendered to the development of Canada, to engineering science and to the profession by the late Sir John Kennedy, past-president of The Engineering Institute of Canada.

- (1) The medal shall be awarded by the council of the Institute, at intervals of not less than two years, but only when the occasion warrants, as a recognition of outstanding merit in the profession or of noteworthy contribution to the science of engineering or to the benefit of the Institute.
- (2) As a guide in making the award, the council of the Institute shall take into consideration the life, activities and standing in the community and profession of the late Sir John Kennedy.
- (3) Awards shall be limited to corporate members.
- (4) At the beginning of the year of award, all members of Council shall be asked for their recommendations, supported by reasons, for the award of the medal, which must be submitted to council not later than May first. The council of the Institute shall then give consideration to the recommendations, but will not necessarily adopt any of them. If, in the opinion of the council, no corporate member of the Institute thus recommended is of sufficient merit or distinction, no award shall be made.
- (5) The award shall be decided by letter ballot of the council in a form to be prescribed by the council. The ballot shall be mailed to each member of the council and shall state the date of the council meeting at which it is proposed to canvass the ballot, which shall not be less than twenty days after the issue of the ballot. Unless at least twenty-five votes are cast there shall be no award. There shall be no award if more than two negative votes are cast.
- (6) Announcement of an award shall be made in *The Engineering Journal* and at the annual meeting, and, if possible, the presentation shall take place at that meeting.

## THE JULIAN C. SMITH MEDAL

This medal was founded in 1939 by a group of senior members to perpetuate the name of the late past-president of the Institute. It is awarded for "achievement in the development of Canada." The inaugural awards—eleven in number—were made in 1940 and 1941, but subsequent awards are limited to not more than two each year.

The general secretary shall ask each past-president and each vice-president of the Institute for nominations, which shall be submitted to a committee of three consisting of the president and two members of Council appointed by him. This committee may select not more than two names from the nominations, which name or names shall be submitted by open letter ballot to all councillors not later than October first of each year. At least twenty days shall elapse before the ballot is closed. Unless at least twenty-five votes are cast there shall be no award. There shall be no award if more than two negative votes are cast.

It is possible that some special occasion—a centenary celebration or the like—may arise when it would evidently be desirable to award more than two Julian C. Smith medals. In such a case departure from the prescribed limit may be permitted, but only if authorized by a formal resolution of Council, stating the special reasons for the action.

## DUGGAN MEDAL AND PRIZE

A prize of a medal and cash to a combined value of approximately one hundred dollars was established in 1935, to be given each year from the proceeds of a donation by Past-President G. H. Duggan, D.Sc., LL.D., M.E.I.C., for the purpose of encouraging the development of the branches of engineering in which he practised.

The prize will be awarded for the best paper presented to the Institute in accordance with the following rules:

- (1) Competition shall be open to all members of the Institute.
- (2) The papers shall be presented to the Institute either at the regular meeting of a branch or at a professional meeting of

the Institute, or directly to Headquarters. They shall not have been presented previously to any other body or meeting.

- (3) Papers to be eligible for this competition shall deal with subjects concerning the use of metals for structural or mechanical purposes. Without limiting the generality of the foregoing, it is suggested that the following topics come within this category; viz.: the economic and theoretical elements of design, fabrication, machinery, transporting, erecting, the investigation of problems or failures, methods of overcoming difficulties, new methods of design or manufacturing, the recording of tests, and other features that add to engineering knowledge.
- (4) Papers shall be the bona fide production of the author and proper credit shall be given for any assistance received from other parties, partners or reports. The relation of the author to the work shall be clearly stated. Papers shall be compiled and arranged with proper regard to literary value and shall constitute worthy contributions to the records of the engineering profession.

In judging the competition consideration will be given to the personal knowledge and appreciation of the problems and processes involved and the joint application of theoretical and practical considerations to the execution of the subject which are displayed on the part of the author.

- (5) The papers shall be judged by a committee of three corporate members, eminent in the corresponding branch of the profession, appointed for the purpose by council as required.
- (6) The award shall be made only when a paper of sufficient merit is presented. The prize year shall be from July 1st to June 30th and papers must be presented to Headquarters of the Institute by the 30th day of June.
- (7) The prize shall be awarded at the annual meeting.

## THE GZOWSKI MEDAL

A gold medal, called "The Gzowski Medal," is provided from the fund established in 1889 by Col. Sir Casimir Gzowski, A.D.C., K.C.M.G., late past-president of the Institute, and will be awarded according to the following rules for papers presented to the Institute.

- (1) Competition for the medal shall be open only to those who belong to the Institute.
- (2) The award of medals shall not be made oftener than once a year, the medal year shall be the year ended June last previous to the annual meeting at which the award is to be made.
- (3) The papers entered for competition shall be judged by a committee of five, to be called the Gzowski Medal Committee, which shall be appointed by the council as soon after the annual meeting of the Institute as practicable. Members and Honorary Members only shall be eligible to act on this committee.
- (4) Papers to be eligible for competition must be the bona fide production of those who contribute them, and must not have been previously made public, nor contributed to any other society in whole or in part.
- (5) The medal shall be awarded for the best paper of the medal year, provided such paper shall be adjudged of sufficient merit as a contribution to the literature of the profession of civil engineering, but not otherwise.
- (6) In the event of the committee not considering a paper in any one year of sufficient merit, no award shall be made; but in the following year or years, it shall be in the power of the committee to award the accumulated medals to the authors of different papers which may be deemed of sufficient merit.
- (7) The medal shall be suitably engraved by the Institute, and shall be handed to the successful authors at the annual meeting, or be given to them as soon afterwards as possible.

### THE LEONARD MEDAL

A gold medal, called "The Leonard Medal," is provided from the annual proceeds of a fund established in 1917 by the late Lieut.-Col. R. W. Leonard, and will be awarded in accordance with the following rules for *papers on mining subjects* presented either to The Canadian Institute of Mining and Metallurgy or to The Engineering Institute of Canada.

- (1) Competition for the medal shall be open to those who belong to The Canadian Institute of Mining and Metallurgy or to The Engineering Institute of Canada.
- (2) Award shall be made not oftener than once a year, and the medal year shall be the year ended June last previous to the year in which the award is made.
- (3) The medal shall be presented at annual meetings of The Engineering Institute of Canada.
- (4) A committee of five shall judge the papers entered for competition, all of whom shall be members both of The Canadian Institute of Mining and Metallurgy and The Engineering Institute of Canada, this committee to be appointed by the council of The Engineering Institute of Canada.
- (5) All papers presented shall be the work of the author or authors and must not have been made previously public, except as part of the literature of The Canadian Institute of Mining and Metallurgy or The Engineering Institute of Canada.
- (6) Should the committee not consider the papers presented in any one year of sufficient merit, no award shall be made, but in the following year, or years, the committee shall have power to award the accumulated medals or to award a second prize in the nature of a silver medal, or a third prize of books to be selected by the committee.
- (7) The medal shall be suitably engraved, containing the name of The Engineering Institute of Canada, and the words, "The Leonard Medal" together with the adopted design, and on the reverse side the name of the recipient, the date and any other inscription that may be decided upon by the committee.

### THE PLUMMER MEDAL

A gold medal, called "The Plummer Medal," is provided from the annual proceeds of a fund established in 1917 by J. H. Plummer, D.C.L., and will be awarded according to the following rules for *papers on chemical and metallurgical subjects* presented to the Institute.

- (1) Competition for the medal shall be open to those who belong to The Engineering Institute of Canada, and to non-members if their papers have been contributed to the Institute and presented at an Institute or Branch meeting.
- (2) Award shall be made not oftener than once a year, and the medal year shall be the year ended June last previous to the year in which the award is made.
- (3) The medal shall be presented at annual meetings of The Engineering Institute of Canada.
- (4) A committee of five shall judge the papers entered for competition, all of whom shall be members of The Engineering Institute of Canada, and shall be appointed by the council of the Institute.
- (5) All papers presented shall be the work of the author or authors and must not have previously been made public, except as part of the literature of The Engineering Institute of Canada.
- (6) Should the committee not consider the papers presented in any one year of sufficient merit, no award shall be made, but in the following year, or years, the committee shall have the power to award the accumulated medals or to award a second prize in the nature of a silver medal, or a third prize of books to be selected by the committee.
- (7) The medal shall be suitably engraved, containing the name of The Engineering Institute of Canada, and the words, "The Plummer Medal," together with the adopted design, and on the reverse side the name of the recipient, the date and any other inscription that may be decided upon by the committee.

### PRIZES TO STUDENTS AND JUNIORS

- (1) Five prizes may be awarded annually for the best papers presented by Students or Juniors of the Institute in the vice-presidential zones of the Institute, as follows:—

The H. N. Ruttan Prize,—  
in Zone A—The four western provinces.

The John Galbraith Prize,—  
in Zone B—The province of Ontario.

The Phelps Johnson Prize,—  
for an English Student or Junior in Zone C—The province of Quebec.

The Ernest Marceau Prize,—  
for a French Student or Junior in Zone C—The province of Quebec.

The Martin Murphy Prize,—  
in Zone D—The Maritime provinces.

- (2) Awards shall only be made if, in the opinion of the examiners for a zone, a paper of sufficient merit has been presented to a branch in that particular zone.
- (3) The winner of a prize shall be required to specify such technical books or instruments as he may desire to the total value of approximately twenty-five dollars when suitably bound and printed or engraved, as the case may be.
- (4) The award of prizes shall be for the year ending June thirtieth. On that date, each branch secretary shall forward to the examiners for his particular zone all papers presented to his branch by Students and Juniors during the prize year, regardless of whether they have been read before the branch or not.
- (5) The prizes shall be awarded only to those who are in good standing as Students or Juniors of the Institute of June thirtieth following the presentation of the paper.
- (6) The papers must be the bona fide production of those contributing them and must not have been previously made public or contributed to any other society in whole or in part. It is to be understood, however, that a paper which has won or been considered for a branch prize is nevertheless eligible for the Institute Prize. No paper shall be considered for more than one of the five prizes.
- (7) The examiners for each zone shall consist of the vice-president of that zone and two councillors resident in the zone, appointed by council. In the case of Zone C, two groups of examiners shall be appointed under the two vice-presidents, one for the English award and one for the French award. The awards shall be reported to the annual meeting of the Institute next following the prize year, and the prizes presented as soon thereafter as is reasonably possible.

### PRIZES TO UNIVERSITY STUDENTS

In 1930 Council established eleven cash prizes of twenty-five dollars each for competition among students of Canadian engineering schools, in the year prior to the graduating year. Awards are now made annually to the following institutions:

University of Alberta  
University of British Columbia  
Ecole Polytechnique, Montreal  
Laval University, Quebec  
University of Manitoba  
McGill University  
University of New Brunswick  
Nova Scotia Technical College  
Queen's University  
Royal Military College  
University of Saskatchewan  
University of Toronto.

It is the desire of council that the method of their award shall be determined by the appropriate authority in each school or university, so that a prize may be given to the student in any department of engineering who has proved himself most deserving, not only in connection with his college work, but also as judged by his activities in the student engineering organization, if any, or in the local branch of a recognized engineering society.

It is not necessary for the recipient to belong to the Institute, and in this respect the prizes are quite distinct from those offered to Students and Juniors of the Institute, or from the prizes which are offered by a number of our branches to the Students attached to them.

It is felt that the establishment of these prizes not only aids deserving students, but assists in developing their interest in engineering societies' work, and in the resulting acquirement and interchange of professional knowledge.

**Fraser S. Keith**, M.E.I.C., is the new president of the McGill Graduates Society. Graduating with honours in 1903, Mr. Keith remained on the staff for a year as senior demonstrator in the electrical department. Following a number of years devoted to technical journalism, he went to Vancouver where he was engaged in concrete construction and the manufacture and sale of concrete materials.

Returning East early in 1915, he became eastern manager of technical publications with the MacLean Publishing Company. He became managing editor of *Construction* in Toronto, from which position he was appointed to the position of first full-time secretary of the Canadian Society of Civil Engineers, which changed its name to "The Engineering Institute of Canada" a year later. Mr. Keith designed and inaugurated for the Institute the *Engineering Journal* and was its first editor and manager.

Fraser S. Keith, M.E.I.C.

In 1925 Mr. Keith resigned to accept the position which he still occupies, that of manager of the Department of Development of The Shawinigan Water and Power Company, Montreal.

**Gordon McL. Pitts**, M.E.I.C., retiring president of the McGill Graduates Society has been elected to the Board of Governors of his University. Mr. Pitts is a member of the Council of the Institute as well as president of the Royal Architectural Institute of Canada.

**James B. Woodyatt**, M.E.I.C., has been elected first vice-president of the McGill Graduates Society. Graduated from the class of 1907 he served an apprenticeship with the Canadian Westinghouse Company Limited and during the winter of 1908 and 1909 he carried out investigations of ice conditions in the Gulf and River St. Lawrence for the government. Later he was a sales engineer for Allis-Chalmers-Bullock Company Limited and in 1910 he became superintendent of the Sherbrooke Railway and Power Company, being appointed general manager in 1916, and in 1920 vice-president. In 1925 he became president of the company. Mr. Woodyatt is also vice-president and general manager of the Power Corporation of Canada, Limited.

**R. E. Stavert**, M.E.I.C., vice-president of the Consolidated Mining and Smelting Company of Canada Limited, has been elected to the Executive Committee of the McGill Graduates Society.

**G. E. Booker**, M.E.I.C., is now employed by Wartime Housing Limited and is on loan to Gore and Storrie, consulting engineers of Toronto. For the past few years Mr. Booker had been on the staff of the Bathurst Power and Paper Company, at Bathurst, N.B.

## News of the Personal Activities of members of the Institute, and visitors to Headquarters

**R. H. Rimmer**, M.E.I.C., is the newly elected chairman of the Saguenay Branch of the Institute. Born at Burlington, N.C., U.S.A., he was educated at the University of North Carolina, where he graduated as bachelor of science in chemical engineering in 1918. Upon graduation he joined the United States Navy as a chemist and inspector. From 1919 to 1922 he was with E. I. DuPont de Nemours Company at Wilmington, Del., as a chemist. In 1922 he joined the research bureau of the Aluminum Company of America at Badin, N.C., as a chemical engineer and remained in the bureau till 1928 when he was transferred to the Aluminum Company of Canada, Limited, at Arvida, Que. In 1930 he became assistant superintendent of the Aluminum plant at Arvida. At present he is in charge of the research and development work at Arvida.

**Major A. Sidney Dawes**, M.E.I.C., has recently been elected to the board of Montreal Light, Heat and Power Consolidated. Educated at Montreal High School and McGill University, where he graduated as a bachelor of science in 1910, Mr. Dawes began his engineering career as an apprentice in the Canadian Westinghouse Company's shops at Hamilton, Ont. Early in 1914, he joined the Atlas Construction Company but on the declaration of war enlisted in the Canadian Field Artillery.

Proceeding to France in 1915 he was twice wounded, received his captaincy in 1917; a year later he was promoted major and awarded the Military Cross. On demobilization he rejoined the Atlas Construction Company, of which he is presently president and managing director.

Major Dawes is president and managing director of the Belmont Construction Company, vice-president of Federal Aircraft Limited, president of the Windsor Mills Elementary Flying School—now a part of the British Commonwealth Air Training Plan—and a director of the Reliance Insurance Company.

**J. E. St. Laurent**, M.E.I.C., has been appointed vice-president of the National Harbours Board at Ottawa. He had been chief engineer of the River St. Lawrence Ship Channel, Department of Transport, Montreal, since 1937. He was previously with the Department of Public Works in Ottawa. Mr. St. Laurent graduated from the Ecole Polytechnique, Montreal, in 1909 and since then has been employed in various capacities throughout Canada with the above department. He was for a time district engineer at Port Arthur and also at Winnipeg. He has been in Ottawa since 1925.

**Captain F. S. Jones**, M.E.I.C., has been promoted to the position of chief engineer of the River St. Lawrence Ship Channel's Branch of the Department of Transport at Ottawa. Mr. Jones joined the department in 1916 upon his graduation from the University of New Brunswick and he has been assistant chief engineer since 1937. During the last war he served overseas with the Royal Canadian Engineers and received the Military Cross.

**J. M. M. Lamb**, M.E.I.C., has been appointed district engineer of the Department of Transport at St. John, N.B., succeeding Lieutenant-Colonel H. F. Morrisey, M.E.I.C., who died last summer. Mr. Lamb received his engineering education at the University of New Brunswick. He has been in the service of the Dominion Government for the last 29 years, having joined the Department of Public Works as assistant engineer in 1913.

**R. E. Farmer**, M.E.I.C., division engineer with the Canadian Pacific Railway at Woodstock, N.B., has been transferred to the same position at Sudbury, Ont.

S. G. Porter, M.E.I.C.

Augustus Griffin, M.E.I.C.

G. P. F. Boese, M.E.I.C.

**S. G. Porter, M.E.I.C.**, a past president of the Institute, has recently retired from the position of manager of the Department of Natural Resources of the Canadian Pacific Railway at Calgary, Alta. He has occupied this position since 1927. Mr. Porter joined the company in 1918 as superintendent of operation and maintenance of the southern section of the Canadian Pacific Railway irrigation system with headquarters at Lethbridge. Mr. Porter will succeed P. L. Naismith as chairman of the Advisory Committee to the Department of Natural Resources and will continue as president of the Lethbridge Collieries Limited, which position he has held since the establishment of the collieries.

**Augustus Griffin, M.E.I.C.**, for the past year assistant manager of the Department of Natural Resources of the Canadian Pacific Railway at Calgary has taken over as manager of the department succeeding S. G. Porter who has retired.

Mr. Griffin has been in the service of the Company since 1918. He was born in Visalia, California. In 1906 he graduated from the University of California with the degree of B.Sc. in civil engineering, specializing in irrigation. From 1906 to 1918 he supervised a number of irrigation projects in California, and in the latter year came to Canada as superintendent of operation and maintenance of the Canadian Pacific Railway's Eastern Section Irrigation Project at Brooks, Alta., where he remained until 1935. In 1932 he succeeded the late Mr. A. S. Dawson as chief engineer of the Department of Natural Resources. In 1935 his headquarters were moved to Strathmore, Alta., where he supervised the operation of the Company's Western Section Irrigation Project. He is a recognized authority on irrigation, both in Canada and the United States, and for two years he was chairman of the Irrigation Division of the American Society of Civil Engineers.

The Department of Natural Resources has under its jurisdiction the administration of the Company's lands, townsites, irrigation works, petroleum, gas and coal rights, and timber properties, and covers in a general way the natural resources of the Company in western Canada.

**G. P. F. Boese, M.E.I.C.**, has been appointed chief engineer of the Department of Natural Resources, Canadian Pacific Railway, following Mr. A. Griffin, who succeeded to the management of the Department on the retirement of Mr. S. G. Porter, effective September 1st.

Mr. Boese was educated in England and came to Canada in 1907. He entered the Engineering Department of the railway that year and was subsequently engaged on points, including Ottawa, Montreal, Hamilton, the Laurentians (Quebec), the north shore of Lake Superior, and the north shore of Lake Ontario where, until coming west in 1915, he was resident engineer on construction work.

During the past 25 years Mr. Boese has been connected with the Department of Natural Resources and most of that period he was engaged as assistant to the chief engineer for the Company's irrigation projects in Alberta. He has been chairman of the Calgary Branch of the Institute and also a member of Council.

**S. D. Lash, M.E.I.C.**, is now assistant professor of civil engineering at Queen's University, Kingston, Ont. He joined the teaching staff at Queen's last year as a lecturer in civil engineering.

**T. A. Carter, M.E.I.C.**, is now with the Aluminum Production Company of India in Travancore, South India. Since his graduation in electrical engineering from Queen's University in 1931 he has been employed with the Saguenay Power Company in northern Quebec.

**W. G. Jewitt, M.E.I.C.**, who was employed with Consolidated Mining and Smelting Company at Goldfields, Sask., has been transferred to the company's plant at Yellowknife, N.W.T.

**Henry Jasen, M.E.I.C.**, is now employed with the Aluminum Company of Canada at Montreal.

**John Middleton, M.E.I.C.**, has recently been admitted as an associate member of the Institute of Naval Architects, London, Eng. He is an assistant engineer in the Department of National Defence, Naval Service, Ottawa.

**C. E. Wright, M.E.I.C.**, is now employed in the Special Products Division of the Northern Electric Company, Montreal. He was previously located at Winnipeg, Man., as an inspecting engineer with the Western Canada Insurance Underwriter's Association.

**A. M. Thurston, Jr., M.E.I.C.**, was appointed, last June, plant manager of the Dominion Electric Protection Company at Montreal. He joined the company in December 1941, after having been five years with the Shawinigan Water and Power Company at Montreal. He graduated in electrical engineering from McGill in 1936.

**Gordon T. Tibbo, S.E.I.C.**, is now employed with Colas Newfoundland Limited as chemist and production engineer. He served as Sub-Lieutenant in the R.C.N.V.R. from December 1940 to November 1941, when he was discharged as medically unfit. Mr. Tibbo graduated in mechanical engineering from the Nova Scotia Technical College in 1940.

**H. F. Duffy, S.E.I.C.**, is now employed with the Saguenay Power Company at Arvida, Que. He was previously located at Fredericton, N.B., having graduated in electrical engineering from the University of New Brunswick, in 1939.

# Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

**C. E. Demers**, S.E.I.C., is now employed with H. G. Acres Company on the Shipshaw power development at Kenogami, Que. He is a graduate of Queen's University in the class of 1941.

**E. M. Cantwell**, S.E.I.C., has joined the staff of the Consolidated Mining and Smelting Company Limited at Yellowknife, N.W.T. He graduated last spring from McGill.

**Bernard Beaupré**, S.E.I.C., has been granted a fellowship by the Kellogg Foundation and has entered the University of Toronto where he will do post-graduate work in health engineering. Mr. Beaupré graduated from the Ecole Polytechnique of Montreal in 1941 and spent the past year on the staff of Dominion Bridge Company, Limited, at Montreal.

**Robert Davis**, Affiliate E.I.C., has recently returned with the Dominion Bridge Company, Limited, in Toronto, Ont., after having been on loan for a few months to the Wartime Merchant Shipping at Montreal. Mr. Davis has been with the Dominion Bridge Company since he came to Canada from Scotland in 1923.

**Anthony B. Rossetti**, S.E.I.C., is employed with Defence Industries Limited, Montreal. He graduated last spring in mechanical engineering from the Nova Scotia Technical College.

**W. D. Mackinnon**, S.E.I.C., is now employed by No. 2 Training Command, R.C.A.F., Works and Buildings Division as junior engineer at No. 5. Air Observers School Winnipeg, Man. He graduated in civil engineering from the University of Manitoba in 1941.

## VISITORS TO HEADQUARTERS

**H. G. Angell**, M.E.I.C., recently returned from Bermuda, on September 2nd.

**H. J. Hamilton**, Wartime Bureau of Technical Personnel, Ottawa, Ont., on September 2nd.

**P. E. L'Heureux, Jr.**, E.I.C., Department of Roads, Sherbrooke, Que., on September 5th.

**H. P. Moller**, M.E.I.C., Lake St. John Power and Paper Company, Dolbeau, Que., on September 8th.

**M. Fast**, S.E.I.C., Aluminum Company of Canada, Shawinigan Falls, Que., on September 12th.

**N. D. Paine**, M.E.I.C., from Kenogami, Que., on September 16th.

**John D. Johnson**, American Consul, Montreal, Que., on September 17th.

**S. D. Lash**, M.E.I.C., Queen's University, Kingston, Ont., on September 17th.

**P O J. B. Sweeney**, S.E.I.C., Eastern Air Command, Halifax, N.B., on September 18th.

**K. M. Cameron**, M.E.I.C., Chief Engineer, Department of Public Works, Ottawa, Ont., on September 19th.

**J. Gordon Kirkwood**, S.E.I.C., Canadian Bridge Company, Windsor, Ont., on September 22nd.

**Gustave St-Jacques**, M.E.I.C., Public Service Board, Quebec, Que., on September 23rd.

**M. S. Mitchell**, S.E.I.C., Foothills, Alta., on September 25th.

**W. V. Morris**, S.E.I.C., Aluminum Company of Canada, Winnipeg, Man., on September 25th.

**P O Jean Dessaulles**, S.E.I.C., Bombing and Gunnery School, R.C.A.F., Mont Joli, Que., on September 26th.

**Willie Harry Baltzell**, M.E.I.C., died at his home in Pittsburgh, Pa., on September 2, 1942. Born in Washington County, Maryland, U.S.A., on August 4th, 1868, he moved to Pittsburgh in 1891 where he entered the steel business as chief engineer for the Schoenberger Works. When the plant was merged with the American Steel and Wire Company he became district engineer of that company. Later he was chief engineer of the Donora works of the United States Steel Corporation and then he went with the Canadian Steel Corporation at Ojibway, Ont. He retired in 1938 and returned to Pittsburgh.

In 1911 to 1914 he designed and built the noted Midland Works of the Crucible Steel Company of Pittsburgh (subsidiary of the Crucible Steel of America). This plant was known to be the most modern plant in the country at that time. Carefully designed for future development, economically constructed, and operating with less manpower than any competitors, its capitalization per ton of steel made it the ranking plant in the steel world. It is still keeping pace with modern methods of to-day.

During the first World War about 1914 to 1915 he designed and built furnaces for the Aetna Chemical Company at Heidelberg, near Pittsburgh, where the famous Rittman process—producing tri-nitro-toluol (T.N.T.)—was being used. Here he developed certain valuable formulae for that work.

He was a life member of the American Society of Mechanical Engineers and the Engineers Society of Western Pennsylvania. He also held memberships in the Association of Iron and Steel Engineers, American Iron and Steel Engineers and the Association of Mining and Metallurgical Engineers.

Mr. Baltzell joined the Institute as a Member in 1920. He was instrumental in the establishment of the Border Cities Branch in which he remained very active.

**Lawson B. Porter, Jr.**, E.I.C., died in the hospital at Fredericton, N.B., on March 30, 1942. Born at Albert, N.B., on February 20, 1908, he received his engineering education at the University of New Brunswick. In the years 1929 and 1930 he was engaged in electrical inspection with Cadillac Motors, at Detroit, Mich. From 1930 to 1938 he was employed with the Saint John Harbour Commission at Saint John, N.B., in charge of field surveys. From 1938 to 1940 he was associated with Mr. Clare Mott, architect of Saint John, N.B., on the construction of several buildings. He joined the staff of the Newfoundland Railway as bridge engineer in St. John's in 1940 and up to his death he was in charge of the field construction on the programme for the rehabilitation of the main line bridges.

Mr. Porter joined the Institute as a Junior in 1938.

**Philip Reynolds**, M.E.I.C., died suddenly at his home at Dorset, England, on July 22, 1942. Born at Swindon, Wiltshire, Eng., on January 29, 1878, he received his education at Swindon Technical School. He served his apprenticeship from 1895 to 1900 with the Great Western Railway and came to Canada in 1901 as marine engineer with the Canadian Pacific Railway at Vancouver. From 1904 to 1915 he was employed in the Mechanical Department of the Canadian Pacific Railway. In 1915 to 1916 he was employed with the Imperial Munitions Board. From 1916 to 1920 he was engaged in the production of munitions as superintendent for L. M. Lymburner Limited, at Montreal. From 1921 to 1923 he was chief draftsman of the St. Lawrence Welding and Engineering Company at Montreal. In 1923, he was appointed chief engineer of the Shell Oil Company of Canada, Limited, Toronto, Ont., a position from which he retired in 1937. At that time he returned to live in Wiltshire, Eng.

Mr. Reynolds joined the Institute as a Member in 1932.

**Harry Randall Webb, M.E.I.C.**, died in a mountain accident at Mount Serrail, near Banff, Alta., on September 6th, 1942. He was born at Lucan, Ont., on January 13, 1900, and was educated at Victoria High School in Edmonton and at the University of Alberta, where he received the degree of Bachelor of Science in engineering in 1921 and of Master of Science in 1922. Upon graduation he joined the staff as a lecturer in civil engineering. In 1928 he became assistant professor and in 1932 he was appointed associate professor of civil engineering. For several years he carried on consulting work outside the university and took a leading part in important engineering projects in Canada and eastern United States.

Last year he was resident engineer in charge of construction of the Minnewanka dam, just outside of Banff. When he met his death, he was engaged in the work connected with the construction of an impounding reservoir at Lake Kananaskis. He had been investigating streams in the neighbourhood to obtain a better idea of the potential water supply.

Professor Webb joined the Institute as a Student in 1919, transferring to Junior in 1927. He became an Associate Member in 1932 and transferred to Member in 1938. He was chairman of the Edmonton Branch of the Institute in 1934. Professor Webb was instrumental in bringing about

**H. R. Webb, M.E.I.C.**

the agreement between the Institute and the Association of Professional Engineers of Alberta, and for the past three years he had been registrar of the Association. At the University he was closely connected with the Students' Engineering Society and was a former honorary president.

## News of the Branches

### HAMILTON BRANCH

A. R. HANNAFORD, M.E.I.C. - *Secretary-Treasurer*  
W. E. BROWN, J.E.I.C. - *Branch News Editor*

On the afternoon of August 7th, the completed work of the Shand Dam, near Fergus, Ont., was officially opened by Premier Mitchell Hepburn. The day was ideal and a large number of invited guests were received by the Grand River Conservation Commission together with a considerable crowd from the surrounding country. Our chairman, S. Shupe, and other officers and members of the Hamilton Branch were among the invited guests.

Before the Premier was introduced, William Philip, chairman of the Grand River Conservation Commission, reviewed the history of the work and gave great praise to W. H. Breithaupt, who was the first to envisage a plan to

### Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

control the river and expressed his pleasure that Mr. Breithaupt was able to be present to see his dream come true. Mr. Philip paid special tribute to H. G. Acres for the masterly manner in which he carried out his part of this great achievement. On being introduced by C. Gordon Cockshutt, chairman of the old Grand River Board of Trade, the Premier of Ontario was given a rousing reception as he rose to speak.

Mr. Hepburn congratulated all those who had contributed to the realization of a cherished dream—the scientific control of the waters of the Grand river. The Shand Dam and the other projects completed in connection with it would ensure an ample water supply in the dry season and would eliminate pollution from industrial wastes. It would ensure no repetition of the disastrous floods of the past, particularly the flood of 1929. He spoke at length on war matters and said that there was far too much apathy, with enslavement facing us, even in Canada. His closing remark was, "I now declare the Shand Dam officially opened."

The secretary of the Commission, Captain Roberts, had prepared refreshments in the form of sandwiches, cake and soft drinks for the guests and a great many of the spectators had the pleasure of being guests of the Commission at this stage of the occasion.

The event was a great success but space does not permit mention of all the distinguished politicians, engineers, contractors, etc., who were present.

### LONDON BRANCH

H. G. STEAD, JR., E.I.C. - *Secretary*  
A. L. FURANNA, JR., E.I.C. - *Branch News Editor*

The first meeting of the Branch after the summer recess was held on Friday night, September 25, 1942, at which the guest speaker was Dr. A. E. Berry, Director of Sanitation, Engineering Department of Health, Toronto.

The speaker was introduced by Mr. W. C. Miller. Dr. Berry is a graduate in civil engineering and public health of the University of Toronto. His chosen subject was

**The Shand Dam.**

## Some Changing Concepts in Public Health Engineering.

Dr. Berry first described public health engineering. It deals with water supply, sewage and milk, with its objective the control of disease and human welfare. The changing concepts are brought about in many ways. They are linked with chemistry, bacteriology, medicine and research; but they are also affected by advertising, shows and confusion which tend to sway public opinion.

Water supplies can be the origin of many serious epidemics as they were in England and in Europe. Although the general principles of filtration have changed little throughout the years, the technique has changed. The introduction of mechanical equipment has given better control. Recently, much work has been done in the development of taste control. These new techniques have made it possible to lower the quality of the water accepted and at the same time raise the standard of the final product.

In discussing sewage treatment, Dr. Berry stated that there are two predominant viewpoints on the use of streams for sewage dilution. Fishermen argue that no sewage should be permitted in streams unless 100 per cent treated, so as not to be detected. However, the sewage engineer maintains that the stream may be used to dispose of all sewage possible, provided that harmful bacteria has been removed. There are many new concepts in the actual treatment of sewage. Old settling tanks have been replaced by mechanical devices to remove sediment. Of course, screens can remove solids and sludge, but 100 per cent treatment can not be accomplished by screens alone. In the bacterial treatment, trickle filters, although an old process, have come back into common use, due to new development in rapid filters. This treatment is ideal for small plants. Recently, chlorine has become recognized in the treatment of bacteria and in certain cases up to 99 per cent treatment has been obtained with chlorine alone. But, due to the fact that chlorine can not completely attack solids, the remaining one per cent pollution may be dangerous and thus some other form of treatment is necessary in conjunction with chlorine.

For the collection of refuse there are also two points of view, namely, dumps and incinerators. Of course, incinerators are ideal, but their cost is often excessive. Dumps are controllable. They are very inexpensive and when properly covered with earth, the refuse harmlessly rots away. There has been no record of any case where a dump was proved to be a menace to public health, but some have been found to have damaged surrounding property.

With reference to bathing, the speaker claimed that there is a real need for chlorination.

The last topic to be discussed by Dr. Berry was the pasteurization of milk. This process too has been subject to change. While the old flash pasteurization method was in vogue for some time, it was replaced by a system in which the milk was held at a low temperature for a period of time. However, the second method was then replaced by its predecessor which is now accepted as the best method. To-day 90 per cent of the milk in Ontario is being pasteurized.

### OTTAWA BRANCH

A. A. SWINNERTON, M.E.I.C. - *Secretary-Treasurer*  
R. C. PURSER, M.E.I.C. - *Branch News Editor*

At the noon luncheon held at the Chateau Laurier on Wednesday, 16th September, the Ottawa Branch was favoured with an address by the national president, C. R. Young, of Toronto. Dean Young was introduced by Vice-President K. M. Cameron, with the local chairman, N. B. MacRostie, presiding.

The president spoke on the past year's activities and stated that it was one of the best in the Institute's history. Regarding the future he predicted that there would be more and better engineers in this country than ever before. Then the "great backlog of invention and discovery" will

be utilized by the large number who will be technically trained.

He stated that he did not agree with those who said that the Institute should curtail its activities during war time. To do so, he said would be to miss many great opportunities. "We are not going back to the old methods of engineering," he remarked, "We are going ahead."

### VANCOUVER BRANCH

P. B. STROYAN, M.E.I.C. - *Secretary-Treasurer*  
P. PEEBLES, M.E.I.C. - *Branch News Editor*

The Vancouver Branch opened its winter programme with a well attended meeting in the Medical-Dental building on Thursday, September 17. The address was entitled "**The Failure of the Tacoma Narrows Bridge**," and given by A. H. Finlay, Associate Professor of Civil Engineering at the University of British Columbia.

The collapse of the Tacoma Narrows Bridge was one of the most serious engineering failures ever to occur on this continent. This six million dollar structure had been designed by an eminent engineer having many successful major structures to his credit. It was fabricated and erected using the best materials and highly skilled labour. Why should a structure upon which no expense and skill was spared collapse after only four months of use? An official report has been submitted after very careful investigation and study but the question cannot yet be answered completely. It can only be said that failure was caused through a behaviour not previously encountered in large suspension bridges, and admittedly not understood by structural engineers. A brief description of what took place some time prior to and just before failure will serve to indicate the complexity of the problem to be solved before a complete answer is possible.

The Tacoma Narrows Bridge had a main span of 2,800 ft. and the main cables were 39 ft. centre to centre. This made it a very slender structure in terms of the ratio of floor width to centre span. It represents the climax of a tendency in suspension bridge design towards such slenderness which can be seen in several of the large bridges constructed during recent years. Perhaps too large a step had been taken in that direction in this case; yet it received the same careful study and was subject to the same methods of analysis as other structures which are rendering satisfactory service. Another departure from more conventional previous designs was the 8 ft. deep plate girder stiffener, in place of the more common stiffening truss. The floor system was fastened at about the mid-height of this girder.

As soon as the bridge was completed it began to give evidence of its slenderness by a vertical wave motion of the deck during light winds. Although this movement of the deck gave some concern to the owners and designers of the bridge, it was not thought that failure would occur. Some steps were taken to analyze this behaviour and to determine what remedies might be possible, if any. The Washington Toll Bridge Authority, owners and operators of the bridge, financed the construction of a 50 ft. model of the structure at the University of Washington, under the direction of Prof. F. B. Farquarson of that institution.

After extensive tests with the model, holding down cables were installed under the side spans of the bridge which effectively reduced the motion of those spans. Hydraulic buffers were set at the towers to take the shock and prevent damage due to movement of the floor. It was proposed but not put into effect, to install a type of fairing mounted on brackets outside of the stiffening girders to act as streamlining and break the main force of winds blowing laterally against the stiffening girders. Contracts for this work were let but nature intervened and failure took place before the work could be done. Its effectiveness can only be surmised since the idea was based upon tests made on models of short sections of the deck.

On the morning of failure a stiff wind blew up the sound,

but its velocity was only half that for which the structure had been designed. The usual vertical wave motion was taking place and traffic was using the bridge. The waves were long and undulating, presenting 5 waves with 9 nodal points and a vibration period of 36 cycles per min. On other occasions the motion had varied from one-half to 5 complete waves and the period from 8 to 36 cycles per min., depending on wind velocity. Lateral deflection of the main span was less than 2 ft., though it was designed for a maximum deflection of 20 ft. The floor was not twisting and both girders appeared to vibrate together.

About an hour before failure, the motion changed suddenly from 5 waves to one wave with a node at the mid point and at each tower. The period became 14 cycles per min. Quite as suddenly, the two sides got out of phase with each other, and the roadway began to twist as one side in the trough of a wave was opposite a point at the crown of the wave. Sighting along the span, one saw lamp posts which should have been in line, cross each other at an angle of 90 degrees, indicating that the floor was tilted at 45 degrees. Under these conditions, Prof. Farquarson, who was on the structure at the time, was just able to make his way back to the towers by following the traffic line in the centre. During this time the side spans were practically stationary. The above motion continued for nearly an hour, subjecting the suspender ropes to terrific pulls, before the first section, probably 30 ft. long, dropped out at the center of the span. Shortly afterwards a section about 600 ft. long fell into the

sound and very soon the balance of the centre span was gone. The sudden release of dead load caused the towers to swing shorewards an estimated 27 ft., and the side spans to drop 60 ft. The towers did not collapse and the side spans remained intact.

The speaker summed up this dramatic episode by stating that in one sense the bridge destroyed itself. Self-induced vibration, increased by the forces which it produced itself, built up to a point which the structure could not stand. Such vibrations are very rare, and are not studied by structural engineers. They occur in ice laden transmission lines and in a few other instances, but prior to the catastrophe described were not considered in the realm of structural engineering. It is to be hoped valuable information will be secured from studies now under way at the University of Washington in a specially constructed wind jet, which will render impossible any repetition of failure such as that of Tacoma Bridge.

The address concluded with the showing of two reels of motion pictures. The first, taken during the four months the bridge was in use, and the second showing what occurred just prior to failure as well as the actual collapse, gave an impressive visual account of what took place. Great credit is due Prof. Farquarson, who photographed the scenes.

The meeting was presided over by W. O. Scott, branch chairman, and a hearty vote of thanks was proposed by Major J. R. Grant. Fifty-five members and guests were present.

## Library Notes

### CANADIAN ENGINEERING STANDARDS ASSOCIATION

#### APPROVALS DIVISION

On and after September 1st, 1942, by mutual agreement between the National Research Council and the Canadian Engineering Standards Association, the listing of equipment and materials found, after examination and testing, to comply with the requirements of appropriate specifications respecting fire hazard, will be undertaken by the Canadian Engineering Standards Association, instead of by the National Research Council as formerly.

Such equipment and materials will be tested in laboratories named by the Canadian Engineering Standards Association, under a procedure similar to that now followed by the National Research Council. Listing will be based upon the laboratory report of the tests.

The following equipment and materials will be accepted for testing and listing by the Canadian Engineering Standards Association on and after the above-mentioned date. Acceptance of other similar items will be considered on receipt of application.

#### Domestic Oil-Burning Equipment:

- Automatic Furnace Burners (Gun Type).*
- Manual Range and Heater Burners (Shell Type and Pot Type).*
- Cooking Stoves (Shell Type and Pot Type).*
- Space Heaters (Shell Type and Pot Type).*
- Water Heaters, Storage and Side-Arm (Shell Type and Pot Type).*
- Radiant-Flame Heaters (Thermal Vaporizing Type).*

#### Domestic Gasoline-Burning Equipment:

- Cooking Stoves (Thermal Vaporizing Type).*
- Space Heaters (Thermal Vaporizing Type).*
- Radiant-Flame Heaters (Thermal Vaporizing Type).*

### Book notes, Additions to the Library of the Engineering Institute, Reviews of New Books and Publications

#### Gasoline Safety Cans:

#### Degreasing Solvents:

As from the above mentioned date, all listings granted by the National Research Council will be cancelled. Equipment and materials previously listed by the National Research Council will be granted temporary listing by the Canadian Engineering Standards Association, on application, on a basis of the former National Research Council listing.

Adjustments will be made, where necessary, respecting such National Research Council Factory Inspection and Labelling Service Agreements as are in force at the time of the above-mentioned transfer of authority.

Manufacturers desiring to have equipment or materials listed under the Canadian Engineering Standards Association fire hazard testing procedure, should apply to the Canadian Engineering Standards Association for application forms and information relative to test procedure, annual listing, fees, etc.

Address all inquiries to The Secretary, Approvals Division, Canadian Engineering Standards Association, 3010 National Research Building, Ottawa.

#### TECHNICAL BOOKS

#### Engineering Mechanics:

*2nd ed. Frank L. Brown, N.Y., John Wiley and Sons, Inc., 1942. 6 x 9 in. \$4.00.*

#### Strength and Properties of Materials:

*John Elberfeld, N.Y., Harper and Brothers, 1942. Rochester Technical Series. 6 1/4 x 9 1/4 in. \$1.75.*

#### Machine Shop Practice:

*Sherman B. Hagberg, N.Y., Harper and Brothers, 1942. Rochester Technical Series. 8 1/2 x 11 in. \$2.50.*

#### Wood and Charcoal as Fuel for Vehicles:

*2nd ed., revised and enlarged. R. Ruedy, Ottawa, National Research Council, 1942. 8 1/4 x 10 1/2 in. \$2.00 (N.R.C. Publication No. 1074).*

#### Canadian Engineering Standards Association:

*Construction and test of Electric Ranges: C. 22.2—No. 61—1942. 50c.*

#### REPORTS

#### Purdue University—Engineering Bulletin:

*Heat transfer by natural and forced convection—Research series No. 84—Proceedings of the twenty-eighth annual Road School held at the University January, 1942*  
*Management personnel responsibility for all-out war effort: proceedings of the Personnel and Industrial Relations Conference held at the University May, 1942—Extension series No. 53 and 54.*

#### Northwestern University:

*Announcement of courses in the Technological Institute for the year 1942-43.*

#### Hydro-Electric Power Commission of Ontario:

*Thirty-fourth annual report for the year ended October 1941.*

#### Electrochemical Society:

*Current leakage through cascaded cells—Preprint No. 82-6.*

#### Cornell University—Engineering Experiment Station:

*Some factors influencing the heat output of radiators—Bulletin No. 29.*

## Power Corporation of Canada:

Annual report for the year ending June, 1942.

## Asphalt Institute:

Specification for sand-asphalt base and surface courses (hot mix type), July, 1942.

## BOOK NOTES

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet the books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

### AIRCRAFT YEAR BOOK for 1942, 24th Annual Edition

Edited by H. Mingos. *Aeronautical Chamber of Commerce of America, New York, 1942. 693 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth, \$5.00.*

The 1942 issue of this annual, like its predecessors, is intended to provide a record of all important happenings during the past year in aviation. An accurate, concise account of aviation's part in the war, of our army and navy air forces, of the government's part in training and education and of government civil aviation forms a large part of the book. Air transport facilities, private flying, civilian defence, airports and airways receive due attention. Aircraft designs are shown and much statistical material is included.

### ANGLO-POLISH TRANSLATION OF WORKSHOP TERMS (Słownictwo Warsztatowe Angielsko-Polskie)

Compiled by W. Bastyr and E. Paszkowski, edited and published by the Association of Polish Engineers in Great Britain, 18 Devonshire Street, London, W.1, 1941. 43 pp., diagrs., 7 x 5 in., paper, 3s.

This pamphlet contains drawings of about five hundred Polish and English machine-shop terms, accompanied by drawings which remove all uncertainty as to meanings. The publication is sponsored by the Association of Polish Engineers in Great Britain.

### BAUGHMAN'S AVIATION DICTIONARY AND REFERENCE GUIDE, Aero-Thesaurus

By H. E. Baughman. 2 ed. Aero Publishers, 120 North Central Ave., Glendale, Calif., 1942. 906 pp., illus., diagrs. charts, tables, 9½ x 6 in., leather, \$6.50.

This work presents in one volume a useful dictionary of terms and abbreviations used in aviation, a directory and a large amount of reference information upon flying, aircraft design and aircraft production. The material included is eminently practical, and the book answers most ordinary questions very satisfactorily. The new edition has been thoroughly revised, and enlarged by the addition of many new terms.

### DIESEL ENGINES, a Complete Diesel Home Study Course

Edited by L. H. Marrison and others. Diesel Publications, New York, 1942. 824 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$8.00.

This volume provides the would-be Diesel engineer with a practical course of study, suited to self-instruction. The presentation is clear and simple, and is largely descriptive and non-mathematical.

### IRON PIONEER: Henry W. Oliver 1840-1904

By H. O. Evans. E. P. Dutton & Co., New York, 1942. 370 pp., illus., diagrs., maps, tables, 9 x 6 in., cloth, \$3.50.

This interesting book tells the story of a prominent Pittsburgh industrial leader of a generation ago. Oliver played an important part in the development of the Minnesota orefields and the Bisbee copper district, and

in railroad building in the Pittsburgh region. His biography contains much information on the steel industry.

### MACHINE SHOP PRACTICE (Rochester Technical Series)

By S. B. Hagberg in collaboration with M. S. Corrington and R. M. Biehler. Harper & Brothers, New York and London, 1942. 311 pp., illus., diagrs., charts, tables, 11 x 8½ in., cloth, \$2.50.

This textbook is one of a series developed at the Rochester Athenaeum and Mechanics Institute as a part of its programme for developing teaching materials which are practical in nature and closely related to the actual requirements of various jobs in industry. It is a shop workbook, intended to be used at the machine or bench by the student, which provides a series of projects of increasing difficulty which will enable the student to master the fundamental processes and skills involved in machine shop work.

### (The) MACHINE SHOP YEARBOOK AND PRODUCTION ENGINEERS' MANUAL

Edited by H. C. Town, foreword by Sir A. Herbert. Paul Elek Publications, Africa House, Kingsway, London, W.C.2, 1942. 558 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, 25s.

The first issue of what is planned as an annual reference book on engineering practice, this volume presents a variety of useful information. The first section consists of a number of articles on timely topics, such as machineability, diamond tools and grinding, by well-known specialists. Section two is a review of established practice in machine work, illustrated by descriptions of typical machines. The final section contains extensive abstracts of important recent papers on materials, heat treatment, testing, machinery, etc., selected from American and European journals.

### MACHINERY'S HANDBOOK for Machine Shop and Drafting-Room

By E. Oberg and F. D. Jones. 11 ed. Industrial Press, New York, 1942. 1,815 pp., diagrs., tables, 7½ x 4½ in., fabrikoid, \$6.00.

This popular reference book is too well-known to need description. It presents a great store of practical information on machine design and shop practice, of the kind constantly wanted by mechanical engineers, draftsmen and machinists. The new edition has been revised thoroughly.

### MANUAL OF MOMENT DESIGN

By J. Singleton. American Institute of Steel Construction, New York; H. M. Ives & Sons, Topeka, Kansas, 1941. 146 pp., illus., diagrs., charts, tables, 10 x 7 in., fabrikoid, \$4.00.

This book is intended to provide the designer with a ready method of calculating the bending moments in prismatic continuous beams and frames, and to eliminate much of the drudgery of computation. The user is assumed to be conversant with the theory of continuity.

### MOLECULAR FILMS, THE CYCLOTRON AND THE NEW BIOLOGY

Essays by H. S. Taylor, E. O. Lawrence and I. Langmuir. Rutgers University Press, New Brunswick, N.J., 1942. 95 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$1.25.

These essays by three distinguished scientists present historical and contemporary concepts that will help to solve some of the most difficult problems in biology. Dr. Taylor provides the historical background with a review of scientific thought during the last two centuries. Dr. Lawrence describes the cyclotron and calls attention to its promise as a means for studying biological problems. Dr. Langmuir presents the surface-film method of investigation, describes some results obtained and suggests further uses.

### National Research Council, HIGHWAY RESEARCH BOARD, PROCEEDINGS of the Twenty-First Annual Meeting, held at Johns Hopkins University, Baltimore, Md., Dec. 2-5, 1941

National Research Council, Washington, D.C., 1942. 561 pp., illus., diagrs., charts, tables, maps, 10 x 6½ in., cloth, \$3.25.

These Proceedings bring together the records of the important investigations of highway problems carried out during the past year, as reported by various committees of the Board. Questions of finance, economics, design, materials, construction, maintenance, traffic, safety and soils are discussed by engineers of wide experience.

### PLASTICS

By J. H. DuBais. American Technical Society, Chicago, 1942. 295 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, \$3.00.

This book is written for users of plastics who wish practical information concerning these materials. The history and origin of the various types and the sources of their raw materials are explained. Their physical, chemical and electrical properties are discussed, as well as their advantages and defects. Due attention is paid to their fabrication, and information on design is presented. The work will be very useful to engineers and designers.

### SHIP REPAIR AND ALTERATION

By G. V. Holiday and W. E. Swanson. Cornell Maritime Press, New York, 1942. 378 pp., diagrs., charts, tables, 7 x 5½ in., lea., \$2.75.

The handbook is a practical reference work for shipfitters, especially those engaged in altering and repairing ships. Part one describes methods of carrying out hull repairs of all kinds. Parts two and three present the mathematical and geometric knowledge needed by the shipfitter. Part four deals with the development and layout of sheet-metal work. Other features are mathematical tables and a glossary of shipbuilding terms and abbreviations.

### STRENGTH AND PROPERTIES OF MATERIALS (Rochester Technical Series)

By J. Elberfeld. Harper & Brothers, New York and London, 1942. 150 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$1.75.

This textbook aims to present, in one small volume, the essential information on materials needed by those engaged in the various industries, and is intended a preparation for courses in tool, machine and structural design. Only elementary mathematical knowledge is necessary.

### WATER HANDBOOK, Chemical Analyses and Interpretations

Published by W. H. and L. D. Betz, Frankford, Phila., Pa., 1942. 64 pp., illus., diagrs., charts, tables, 11 x 8½ in., paper, spiral binding, 50c.

This handbook is in two parts. Part one gives clear, definite directions for water analysis, covering all the tests commonly used in industrial plant control and presenting simple methods which do not require previous chemical experience. Part two discusses the interpretation of the tests and their application to plant control.

### WELDING HANDBOOK

American Welding Society, New York. 1942 ed. 1,593 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth, \$6.00 in U.S.A.; \$6.50 in foreign countries; \$5.00 to members.

The aim in preparing this work has been to give engineers an authoritative, up-to-date reference book on the technical phase of welding. The physics and metallurgy of welding, the weldability of steels, welding processes, brazing, soldering, facing, metal spraying, metal cutting, metals used, training, inspection, safety, design and testing of welds, and applications are discussed. Each topic is treated by a committee of experts.

# PRELIMINARY NOTICE

of Applications for Admission and for Transfer

FOR ADMISSION

September 28th, 1942.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.\*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the November meeting.

L. AUSTIN WRIGHT, General Secretary.

\*The professional requirements are as follows:—

**A Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupillage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

**A Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

**A Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

**An Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

**GREEN—LAWRENCE JOHN**, of Norwood Grove, Man. Born at Winnipeg, July 17th, 1899; Educ.: B. Arch., Univ. of Man., 1926; 1922-23, dftsmn., Albert Kahn, Detroit; 1923-26, dftsmn., Zachary T. Davis, Chicago; 1927-28, chief dftsmn., Oman & Lilienthal, Chicago; 1928-29, chief dftsmn., Maurice L. Bein, Chicago; 1929-31, office mgr., chief dftsmn., and chief engr., A. A. Stoughton, Winnipeg (now of New York); 1931-42, i/c of struct., elec., mech., and acoustical engr. in own office—Green, Blanksten, Russell & Ham, Architects, Reg'd Architects in Ontario, Manitoba, Sask., Alta., and B.C. Personally engineered acoustical work and sound isolation in about 40 theatres, 3 radio broadcasting studios, offices, etc. Also process steam and low pressure steam in hospitals, convents and hotels; at present, engr. (mech.), in Works & Bldgs. Branch, Naval Services of Canada, Ottawa, Ont.

# Employment Service Bureau

## SITUATIONS VACANT

**MECHANICAL ENGINEER** for British Guiana. Some experience on diesels and tractors preferred. Apply to Box 2482-V.

**ELECTRICAL ENGINEER** with at least five years practical experience for work at Mackenzie, British Guiana. Apply to Box No. 2536-V.

**JUNIOR MECHANICAL ENGINEER** wanted at Arvida, recent graduate with machine shop experience to act as assistant to shop superintendent. Apply to Box No. 2572-V.

**PERMANENT POSITION** in Toronto or Montreal areas with a large industrial fire insurance organization. Previous experience in this work is not necessary. Applicant must be a technical graduate with manufacturing or engineering experience and possess a good personality. Several months training with full pay will be given. Please send photograph with letter. Apply to Box No. 2588-V.

**JUNIOR MECHANICAL ENGINEER** wanted at Kingston, Ontario, recent graduate. Apply to Box No. 2589-V.

**GRADUATE MECHANICAL ENGINEER**, preferably a man with paper mill experience to specialize in sale and installation of material handling equipment. Apply to Box No. 2590-V.

**GRADUATE ENGINEER** or man with sufficient experience in draughting to act as squad leader of four to six men on reinforced concrete detailing, general equipment layout or mechanical drawing. This man to work along with other draughtsmen but be able to head up the job, lay out the work and check the drawings for issuing. Apply to Box No. 2577-V.

**CERAMIC ENGINEER** for work at Arvida Que. Apply to Box No. 2591-V.

**CHEMICAL OR METALLURGICAL ENGINEER** with flotation experience for work in fluoride department at Arvida, Que. Apply to Box No. 2592-V.

**MINING, METALLURGICAL OR CHEMICAL ENGINEERS** for work at Arvida, Que. Apply to Box No. 2593-V.

**CHEMICAL ENGINEERS** for work at La Tuque, Que. Apply to Box No. 2594-V.

**CIVIL ENGINEER** with some pile driving experience for work at Mackenzie, British Guiana. Apply to Box No. 2595-V.

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to **THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.**

**ELECTRICAL ENGINEER** for plant and townsite electrical maintenance work at Mackenzie, British Guiana. Apply to Box No. 2596-V.

## SITUATIONS WANTED

**INDUSTRIAL ENGINEER, M.E.I.C.** Age 40, Canadian, Married, desires position as production manager or other executive capacity. Presently employed but desires change to plant on war work. Understands layout thoroughly. Location Toronto area. Salary dependent on responsibility, minimum \$3,600. Apply to Box No. 717-W.

**MECHANICAL DRAUGHTSMAN, J.R.E.I.C.**, graduate of the University of Toronto in Electrical Engineering. Some six years of practical experience with accent on electric motor design, instruments and small tools. Has a background of two years in electric instrument laboratory. Desirous of making a change where his services will be fully utilized and better appreciated. Apply to Box No. 1486-W.

**CIVIL ENGINEER, B.A. sc.** Age 33, married. Experience covering heating, air conditioning, mining. Design, construction and maintenance of sewers, aqueducts, streets and highways, including surveying, location, estimating, inspections, drainage and soundings. Presently employed, but desires advancement. Apply to Box No. 1859-W.

**GRADUATE CIVIL ENGINEER, S.E.I.C.**, experience in surveying and in teaching same, location surveys for roads and railroads, 2 years as construction engineer in oil fields in tropics in charge of roads, earth-moving machinery, anti-malarial drainage, etc. Experience in construction of bituminous pavements. At present engaged in airport construction. Available from September first. Age 30 years. Apply to Box No. 1860-W.

**GRADUATE ELECTRICAL ENGINEER, M.E.I.C.**, with twenty-nine years experience in operation construction, repairs and maintenance of paper mill and hydro electric system. Bilingual. Available September first. Apply to Box No. 2443-W.

## TRANSITS AND LEVELS WANTED

The Department of Munitions and Supply at Ottawa is desirous of procuring:

15 transits 5" with vertical circle theodolite including tripod case and accessories.  
19 8" telescopic levels—Dumpy including tripod case and accessories.

Second-hand instruments will be acceptable providing they are in good condition and have the following:

- Transit
- Not less than 5 in. horizontal circle.
  - Vertical circle.
  - Read to minutes.
  - Carrying case tripod.
  - Plumb bob, objective shade.
  - Adjusting keys.

- Level
- Dumpy pattern preferred but not absolutely essential, must have:
- Telescope not less than 8 in.
  - Carrying case and tripod.
  - Objective shade.
  - Adjusting keys.

Please communicate direct with: L. L. Price, Director, General Purchasing Branch, Dept. of Munitions and Supply, Ottawa.

## *The Enemy Stops Short*

When an individual, either as an enemy agent or as an honest person who believes what he says, whispers that Canada's Victory Loan Bonds will not be cashed after the war, he does not go far enough. To be consistent, and fair, he should add that any future condition in this country which would cancel out the value of Victory Bonds would also make life insurance policies worthless. He should explain that savings accounts would be wiped out. He should point out that one dollar bills, five dollar bills or any other kind of currency, including silver coins, would be just something to toss into the ash can.

Victory Bonds cannot be set aside as something separate and apart from other obligations of this, our country. They are just as sacred a "promise to pay" as the one dollar bills we carry in our pockets.

These bonds are held by the people of Canada. And the only way through which they can be repudiated would be by a decision of the people of Canada not to pay themselves back.

The pessimist is out of order in Canada. The assets and resources of this country which back this loan from the people are billions and billions of dollars in excess of the loan total. Even with all the borrowing that has had to be done since the start of the war in 1939, the interest cost of Canada's total debt to this date, is only 189 million dollars a year.

Canada can and will meet indebtedness of that size. Fifty years from now our children and our children's children will likely smile at the small financial problem which we thought was so big.

# BUY VICTORY BONDS

### AIRCRAFT SANDING

An 8-page booklet, Form No. S106, just issued by Sterling Tool Products Company, Chicago, Ill., and Toronto, Ont., is entitled "Hints on Aircraft Sanding," and presents some thirty hints and directions on how to speed production by the use of the "Sterling Speed Bloc" sander. The sander is air-driven, mounted on casters, and has numerous other features which add to its efficiency and convenience of operation.

### THE CIRCUIT

The July, 1942, issue of "The Circuit," published by Canadian Line Materials Limited, Toronto, Ont., deals with "Electric Cable for Use in War Time," and the first article reviews this important subject pointing out the trend towards the use of paper, varnished cambrie, and synthetic rubber insulations and the elimination of rubber for this purpose. Testing electrical connectors in the laboratory is described in the second article, and is followed by a third entitled "Shall the Code Become the Engineer's Football."

### CONVEYING AND ELEVATING EQUIPMENT

"The Labor Saver," Volume 189, issued by Stephens-Adamson Manufacturing Company of Canada, Limited, Belleville, Ont., contains a series of brief amply illustrated articles featuring the use of this company's conveying and elevating equipment in handling products in a wide variety of plants. These include coal at the power plant of the United States Naval Academy; the elevating and storage of sulphur in a pulp plant; the conveying of ores in mining; conveying and loading cement; handling baggage at a passenger terminal; handling chemicals for water treatment at plants of thirteen cities in California; the conveying of walnuts; the elevating of anthracite; handling food products; and the conveying of shellac.

### FIREPROOF WALLBOARD

Gypsum, Lime & Alabastine Canada, Limited, Toronto, Ont., have published a 4-page folder outlining the advantages of "Gyproe" fireproof wallboard, particularly for the walls and ceilings in the remodelling of industrial plants, offices, stores and private residences.

### FLOW METERS

"Flow Meters by Cochrane" is the title of a 56-page catalogue being distributed by Cochrane Corporation, Philadelphia, Pa., covering the company's complete line of flow meters. Besides describing electric, mechanical, linometer (area), ring balance, liquid level and weir meters, it also covers the new 2-pen electric flow recorder with ratio indicating pointer, an improved low pressure (1 in. to 10 ins. water differential) electric type meter, and the ultra high pressure (6,000 psi) ring balance meter. This catalogue also includes a discussion of flow metering benefits and complete listings of specifications and ranges.

### GRITS AND GRINDS

Vol. 33, No. 5 of "Grits & Grinds," published by Norton Company of Canada, Limited, Hamilton, Ont., features an article on the reconditioning of plug gauges, worn undersize in service, not only once but several times by hard chrome plating and finishing to original size. A comparative means of grading cylindrical surface finish by means of a set of finish standards is also featured and is followed by a description of two new motion pictures, "Cutter Grinding" and "The Cylindrical Grinder." Special large refractory burner blocks for billet heating, heat treating and annealing furnaces are featured in the final article.

### FUSE CONNECTORS

A leaflet issued by Vaughan Bedell & Company, Toronto, Ont., under the title "Modernize Your Old Fuses," gives full details of the "Signalite Fuse Converter" which may be quickly and easily attached to fuses at present in use. These fuse converters provide the features of "Signalite" fuses whereby a signal light will instantly indicate which fuse has blown. They can be removed from a blown fuse and attached to a replacement or renewed fuse in a few seconds.

### HAND SAW FILING

"Saw Filing, too, is an Art!" is the title of a 4-page bulletin prepared by Nicholson File Company, Port Hope, Ont., which contains simple instructions for sharpening hand cross-cut saws and hand rip saws. These concise instructions are set in large easily read type and are accompanied by illustrations. They are given under the following headings: holding the saw; jointing; shaping teeth; setting; filing the hand cross-cut saw; and filing the hand rip saw. Each heading represents one of the four operations, the first three being similar for both the cross-cut and the rip saws while the fourth is slightly different for the two types of saws.

### HOME CONSERVATION PLAN

Alexander Murray & Company, Limited, Montreal, Que., are distributing a 16-page booklet entitled "Introducing the Donnacona Wartime Home Conservation Plan." This booklet deals with the questions arising when the building or renovating of a home is considered under present day conditions. It answers many questions starting with the first, "Can I do it?" Materials available are dealt with and a section is devoted to the conservation of each of the following: fuel, funds, space, health, values and efficiency. Various "Donnacona" and "Murray" building products are illustrated and described.

### ILLUMINATED MAGNIFIER

The Boyer-Campbell Company, Detroit, Mich., have issued a 4-page bulletin describing this company's product "Super Sight," which combines magnification and properly directed light. The bulletin outlines how "Super Sight" is adapted to close inspection, fine assembly and precision machines. It is supplied with either 4-in. or 5-in. lenses and, besides the standard models with various brackets for bench and machine, there is a model with both fluorescent and vaporproof lighting. A supplementary folder describes this same principle of properly directed light, plus magnification, as adapted to first aid and hospital use.

### JOINING AND REPAIRING PIPE

A 12-page bulletin, Form 402B, just issued by Dresser Manufacturing Company, Limited, Toronto, Ont., is entitled "How to Join and Repair Pipe." The subject matter is covered in a most comprehensive manner, accompanied by numerous illustrations and drawings. It features "Dresser" couplings and repair devices and the ease and rapidity with which the work can be done. The details covered include various styles of pipe joints and how to do the joining; how to stop leaks in pipe and pipe joints; "Dresser" repair sleeves for repairing major breaks; various types of fittings; fittings for every purpose and other "Dresser" products for special conditions.

### MAINTENANCE AND CONSTRUCTION OF BUILDINGS

The Tremco Manufacturing Company (Canada) Limited, Toronto, Ont., have published a 20-page bulletin entitled "Tremco Quick Reference Guide," which provides useful information for users of the company's products—caulking compounds, glazing compounds, paints and roofing products. The text is well illustrated and is given under the following headings; roof maintenance; floors and floor maintenance; caulking and pointing; glazing greenhouses; waterproofing and damp-proofing; bonding compounds; interior painting; exterior painting; and miscellaneous coatings.

### MANUAL ON PAINTING

A 48-page manual (revised edition) being distributed by Imperial Varnish & Color Company, Limited, Toronto, Ont., is a very comprehensive treatment of the subject of painting and is thoroughly indexed. Each paragraph is numbered so that any particular item can be easily located. The text is arranged under a number of general headings, including exterior painting, interior painting, enamel work and varnishing, floor treatment, roof protection and decoration, new wood finishes, interior decoration, etc.

### MAP OF EASTERN HEMISPHERE

A folded map, 18½ ins. by 24½ ins., in colour, showing the Eastern Hemisphere as well as part of the Western Hemisphere with distances between important points, has been issued by Canadian Line Materials Limited, Toronto, Ont. Information is also included on air raid precautions and bombs.

### OXY-ACETYLENE TIPS

"An Aid to Better Welding" is the title of the leading article in Vol. XVII, No. 5, July, 1942, "Dominion Oxy-Acetylene Tips," published by Dominion Oxygen Company, Limited, Toronto, Ont. This article thoroughly illustrates construction details of a homemade welding positioner, fabricated at a moderate cost. With it, welding jobs up to 500 lbs. in weight can be readily clamped on the table top and then quickly rotated to any position so that welds otherwise done in the vertical or overhead position can be made in the flat position. Other articles include: suggestions to get best results in bevel-cutting operations; repairing a pulp-beater drum; removing "Dutchmen" from salvaged pipe fittings; reduced cost by stack-cutting, and a page on precautions and safe practices.

### PENCILS, ERASERS, PENS, ETC.

Eberhard Faber Pencil Company of Canada, Limited, Toronto, Ont., have for distribution a 40-page catalogue, No. C-1, which contains illustrations, descriptions and specifications covering this company's extensive line of pencils, erasers, mechanical pencils, fountain pens, crayons, stamp pads, etc.

### PORTABLE ELEVATORS

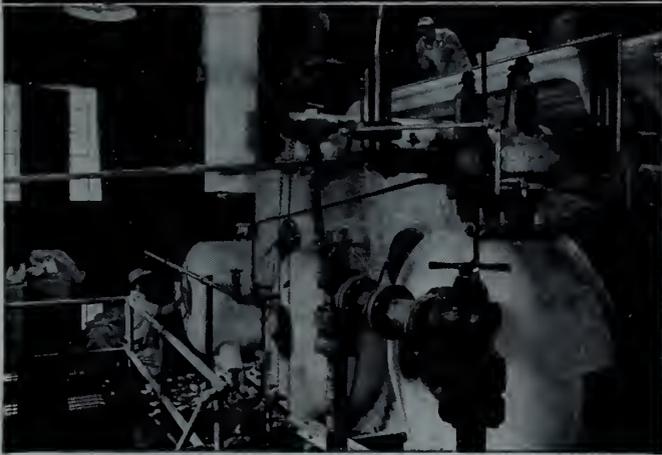

Catalogue No. 12-E, 24 pages, just issued by Mahaffy Iron Works, Toronto, Ont., features the company's "Revolver" portable elevator. Various models are illustrated with a description of each part indicated on the illustrations; dimensional drawings are included with tables of dimensions. A large number of illustrations show these elevators in operation and indicate the wide range of applications of the various models.

STEAM PIPE INSULATION

J-M 85%  
Magnesia

The Most Widely  
Used Specification  
in Power Plant  
Insulation for  
More Than 50 Years

**FOR PIPE COVERING . . .** J-M 85% Magnesia Pipe Insulation is furnished in 3-ft. sections or segments in the following thicknesses: Standard, 1½", 2", 2½", Double Standard and 3" (Double Layer). Often used as a second layer, outside of J-M Superex, where pipe temperatures are above 600° F.

**IN BLOCK FORM . . .** J-M 85% Magnesia Blocks are furnished 3"x 18", 6"x 36", 12"x 36", in thicknesses of 1" to 4". Weight, about 1.4 lb. per sq. ft., per 1" thick.

**. . . and for good reasons**

At service temperatures up to 600° F., no insulation delivers more thoroughly satisfactory performance than J-M 85% Magnesia. That's a fact that's been proved time and again in power plants of every type. Light in weight, readily cut and fitted, J-M 85% Magnesia is easy to install. On the job, it provides ample mechanical strength, long life and high insulating efficiency. Engineers agree that, wherever used, J-M 85% Magnesia assures permanently economical service.

Consult your nearest J-M District Office today about your Magnesia requirements, or write direct to Canadian Johns-Manville Co., Limited, 199 Bay St., Toronto.

## SPECIALIZED TRAINING

FOR

### THE ENGINEERING PROFESSION

International Correspondence Schools are equipped to provide the non-university man with the specialized training necessary to enable him to study for the examinations of engineering societies and associations. I.C.S. Home Study Courses are of particular interest to prospective applicants for membership in any of these organizations.

I.C.S. courses for examinations are arranged with the object of preparing the candidate for his examinations in the shortest possible time, while omitting no features of his training conducive to thoroughness and diversity of knowledge.

Each candidate will receive the individual attention of a vocational and educational specialist. The candidate's examination courses will be arranged to comply with his individual requirements and his rate of progress will be affected by no other student. He will proceed as rapidly as his ability, his study time and his application will permit. He will be allowed ample time to complete his I.C.S. course and will receive full answers to any questions he may need to ask which come within the scope of his course.

The subjects in which I.C.S. training is available include:

- High School Subjects
- Elementary Physics and Mechanics
- Strength and Elasticity of Metals
- Drawing
- Chemistry
- Chemical Engineering
- Civil Engineering
- Electrical Engineering
- Mechanical Engineering
- Mining Engineering
- Structural Engineering

**AN INVITATION**—You are invited to send for information about I.C.S. training. You incur no obligation. Just mark and mail the coupon.

International Correspondence Schools,  
Canadian Limited,  
Department H-4,  
Montreal, Canada.

Please send me complete information on I.C.S. training for engineering.

## PORTABLE FIRE EXTINGUISHERS

Pyrene Manufacturing Company of Canada, Limited, Toronto, Ont., have prepared a 6-page folder entitled "Directions for Inspecting, Recharging and Maintaining Portable Fire Extinguishers." At this time, when it is more important than ever to keep fire extinguishers in good order in shops, industries, garages and other places where fire hazard is present, this folder is of particular interest to all those responsible for fire prevention. Various types of extinguishers are described, with details regarding the care and recharging of each. A sectional drawing of the "Pyrene" fire extinguisher is used to illustrate a description entitled "The Inside Story of Pyrene."

## THE POWER SPECIALIST

The July-August, 1942, issue of *The Power Specialist*, which is issued by Canadian Johns-Manville Company, Limited, Toronto, Ont., features an article dealing with the aid being rushed from the American continent to the allied nations on the Eastern war front. This interesting article is accompanied by photographs. The second article describes the new 50,000 kw. turbo-generator unit added to the plant of the Toledo Edison Company's Acme station. Following this, the unusual features of the San Francisco radio station KPO are described and illustrated. A short illustrated item deals with cutting core-making costs and is based on ten years' experience in an Ohio foundry. A final short article is entitled "An Economic Life for Packings?" and embodies suggestions for the correct installation as a means of securing longer life for packings.

## RUBBER IN ACTIVE SERVICE

A 32-page booklet issued by Dunlop Tire & Rubber Goods Company, Limited, Toronto, Ont., tells how to keep rubber in active service. Everyone realizes that it is necessary to conserve the life of rubber products now in active service and this illustrated booklet will prove of value as it describes common causes of excess wear and failures in rubber installations in industrial plants together with methods of avoiding these and of proper maintenance of all industrial rubber products.

## TEMPERATURE AND HUMIDITY CONTROL

The Canadian Powers Regulator Company, Limited, Toronto, Ont., have for distribution a 4-page bulletin, No. 2520, which features the "Powers" thermostatic water controller for shower baths and wash sinks; No. 11 temperature regulator for industrial processes; pneumatic system of automatic temperature control for offices, factories, process rooms, etc.; and air operated controls for dryers, kilns, tanks, vats, cooking kettles, retorts, etc.

## TUBE CLEANERS

Bulletin No. Y-11, 8 pages, prepared by Elliott Company, Springfield, Ohio, features the latest "Elliott-Lagonda" development in refinery tube cleaners, designated as the "1100 series," which has a double ball-thrust motor. Illustrations show the component parts of these cleaners, typical combinations of motors and cutter heads, details of the cutter heads, cleaners for small and curved tubes, drills and flexible joints, and other specialties. Each item is fully described.

## SOLVENT DEGREASING AND ALKALI CLEANING

Under the title "Scientific Metal Cleaning—Royalene Processes," the Canadian Hanson & Van Winkle Company, Limited, Toronto, Ont., are distributing a 12-page bulletin describing solvent degreasing and vapor, immersion and spray types of "Royalene" degreasing machines. These are fully described and are followed by illustrations of recent installations in Canadian plants. The company's line of alkali compounds for cleaning and stripping metal products is included with descriptions of each and details of Magnet "A", the alkali electro-cleaning process.

## STEAM GENERATORS

Vapor Car Heating Company of Canada, Limited, Montreal, Que., have prepared a 22-page catalogue featuring the "Vapor-Clarkson" steam generators, which have been designated as "Packaged Steam" due to their efficiency, compactness and the rapidity with which these modern "recirculating" units generate steam. In addition, the catalogue includes several types of valves (reducing, motorized, shut-off and safety); traps; metallic joints; thermostatic controls; a motorized valve and damper; heat exchanger; a command alarm; stratomotor and thermo-balancer; a newly designed cooling system thermostat that sets a new standard in controlling gas and diesel engine operating temperatures. These items are especially adaptable to the marine, industrial, institutional, aviation and refinery fields. A spread of typical layouts, showing uses of the generator and necessities are also included.

## TECHNIQUE OF PLYWOOD

I. F. Laucks Ltd., Granville Island, Vancouver, B.C., have just published a book by Charles B. Norris of the Lauxite Corporation entitled "Technique of Plywood." This includes the thirty chapters of technical information on plywood which originally appeared in "Hardwood Record." These articles cover all phases of plywood manufacture and are written from a technical standpoint, primarily for engineers, designers and users of plywood. The book has been divided into five main sections under the following headings: "Strength, Deformation and Elastic Stability of Plywood"; "Elastic Theory of Wood and Plywood"; "Manufacture of Plywood"; "Warpage of Plywood"; "Bending, Moulding and Embossing of Plywood." It has an attractive red plastic binding over heavy duty covers, and is being sold for \$2.50 per single copy, postpaid, and may be obtained by writing to the company.

## WATERPROOFINGS AND CONCRETE FLOOR TREATMENTS

A 4-page bulletin just issued by Sternson Structural Specialties Limited, Brantford, Ont., contains detailed descriptions and applications of the following products; plaster bond and stain-proofing; cut stone backing paint; foundation coating and damp-proofing; colourless water-proofing; stearate paste; integral hardener and accelerator; concrete accelerators; concrete floor hardener; heavy duty metallic floor hardener; caulking and stone pointing plastics; iron waterproofing; iron bond for concrete floor toppings; protective coatings; and decorative waterproofing.

# CAUSES AND EFFECTS OF DAMAGE TO ELECTRICAL MACHINERY AND SWITCHING

C. A. LAVERTY, M.E.I.C.

*Electrical Inspector, The Boiler Insurance and Inspection Company of Canada, Montreal, Que.*

Paper delivered before the Peterborough Branch of The Engineering Institute of Canada on December 11th, 1941

## INTRODUCTION

This paper will deal briefly with some of the difficulties encountered and knowledge gained in over ten years of inspecting, testing, and repairing electrical machinery, for The Boiler Inspection and Insurance Company of Canada. The equipment involved has included all types of electrical machinery as well as steam and water turbines, and is fairly representative of that rated below 25,000 hp. in service throughout the plants of eastern and central Canada. In general, the paper will first describe the work done by the inspectors of the above company. Secondly, it will point out some weaknesses in design, installation and maintenance of electrical machinery. Finally, it will suggest closer contact between those who design and those who use electrical apparatus in order that the best interests of all concerned may be served.

## INSURANCE

The insurance of electrical machinery was started in Canada in 1923 to meet a demand for a service similar to that provided since 1875 in the boiler and pressure-vessel field. Machinery insurance provides an inspection service

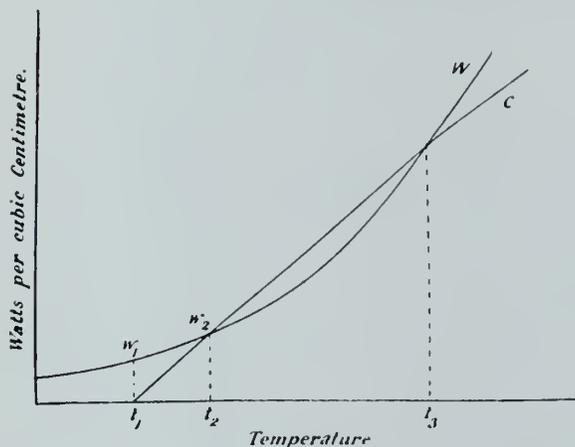

Fig. 1—Heat generated in insulating material compared with heat lost to cooling medium.

to prevent accidents, supplemented by an insurance contract which will reimburse the assured for any accidental damage to insured equipment. It is this inspection service that is of primary interest to plants insured throughout the country.

This service could not continue to be sold to more and more plants, if experience had not shown that regular inspection by an outside party improves plant operation and reduces losses due to accidental damage. A company such as that named above would not spend 30 to 40 per cent of its revenue for its inspection service, if results did not justify that expenditure.

The company's records show that when this insurance of electrical equipment was begun, the accident frequency was 105.3 accidents per year for each 1,000 insured objects. In 1935, the accident frequency was 43.4 and in 1940 it was 33.6.

To indicate what coverage an insurance policy will provide and to give some picture of the accidents for which it will pay damages, the following standard definition of an accident, contained in each insurance policy may be given.

It is:

“a sudden and accidental breaking, deforming, burning out or rupturing of the object or any part thereof, which manifests itself at the time of its occurrence by immediately preventing continued operation or by immediately impairing the functions of the object and which necessitates repair or replacement before its operation can be resumed or its functions restored.”

The only troubles not covered are normal wear and tear and such items as carbon brushes, fuses and lamps.

An insurance inspector has to be vigilant to prevent losses from becoming excessive on the equipment under his care. Naturally, it is not possible to prevent all accidents. In some cases, there are no signs of impending failure and in others, the cost of locating the trouble-provoking conditions is too great. When accidents do occur, it is also the inspector's job to decide on necessary repairs and then see that these repairs are carried out according to good practice and in the least possible time.

## CAUSES OF TROUBLE

The causes of trouble on electrical equipment will be discussed under the following headings:

1. Design
2. Service
3. Location
4. Maintenance
5. Voltage surges
6. Age

## DESIGN

The design of electrical equipment may be further divided into mechanical design and electrical design.

We find that 30 per cent of our accidents are due to premature failure of electrical insulation. Nearly all of these failures are insulation breakdowns between the turns of a coil or between the coil and the iron circuit of the machine. About four per cent are due to creepage across dirty insulation and the resultant flashover after a carbonized or conducting path is formed.

It is generally agreed that the great majority of insulation failures are due to overheating of the insulating materials. This is perhaps not strictly true for pure mica or asbestos where the insulating material does not burn but rather is disrupted or punctured by the voltage stresses applied. It must be remembered that even mica and asbestos are usually dependent on varnishes or gums to hold them in place and all binders are affected by heat.

This then is a straight electrical design problem. It involves the computation of expected voltage stresses and the choosing of type of insulation and the amount required to provide a reasonable margin for safe operation. Adequate provision for the dissipation of the heat generated due to the losses in the machine is very important. Relatively small voltages will cause the failure of the best insulation if the heat is not carried away.

All insulating materials are poor conductors of heat and in all insulating materials energy losses occur due to the applied voltage stresses. Each insulated coil that is installed has a definite ability to transfer heat from the copper to the air, iron, oil or other cooling medium. This heat transfer may be stated in watts per degree difference in temperature between the copper and the cooling medium. Failure, in most cases, is due to the weakening of the insulation owing

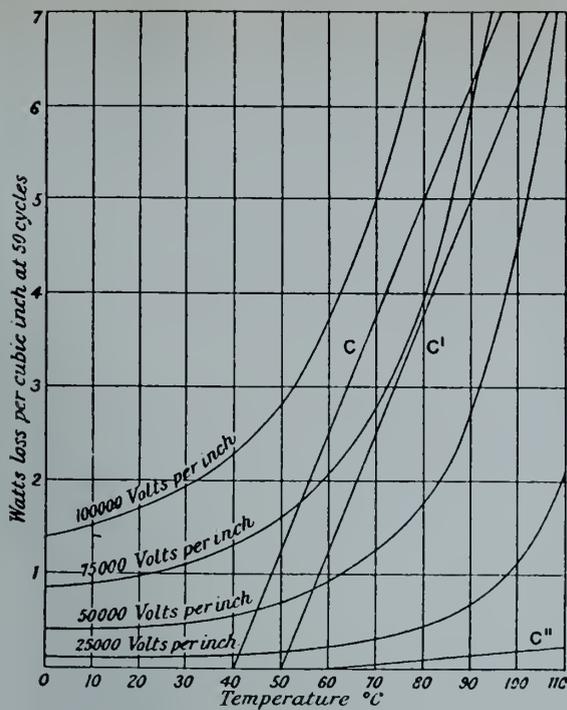

Fig. 2—Results of tests on rope-paper insulation at various voltages and cooling conditions.

to normal aging or high temperatures until it will not withstand the voltage stresses applied to it in normal service.

A book entitled "Specification and Design of Dynamo-Electric Machinery" written by Miles Walker, Professor of Electrical Engineering at the University of Manchester, England, was published in 1920. In this book, the author presents a number of curves showing the losses in insulating materials when subjected to voltage stresses at different temperatures and with varying rates of cooling.

Some curves from this book are reproduced as they are of considerable interest. Figure 1 is a typical curve to show the watts loss per cu. cm. of insulating material plotted against temperature. Let  $W$  represent the watts converted into heat in a given piece of insulating material when subjected to a certain voltage stress at various temperatures, and let  $C$  represent the rate at which this heat is carried away from the insulation. The curve  $C$  is essentially a straight line, the slope of which indicates the type of cooling; the steeper the slope, the better the cooling conditions. Under most conditions encountered the curve  $C$  will cut the curve  $W$  in two places. Let  $t_1$  equal the ambient temperature, that is the temperature of the air or cooling medium surrounding the insulation, then  $W_1$  is the watts lost at this temperature. The insulation will start to heat and as the losses increase with an increase in temperature, the losses will also increase. This process will continue until the temperature  $t_2$  is reached at which point the losses are  $W_2$  watts. The temperature under normal conditions will not increase above this point as the watts removed from the insulation due to cooling conditions represented are also  $W_2$ . If some abnormal temporary change should take place, which increases the losses or decreases the rate of cooling the temperature might rise higher than  $t_2$ , but as long as the temperature  $t_3$  is not reached, the temperature would soon return to  $t_2$  once normal conditions were re-established, since the rate of cooling in watts for any temperature between  $t_2$  and  $t_3$  is in excess of the insulation losses due to voltage stresses for the same temperature. However, if the temperature should for any reason rise above  $t_3$ , then the losses in watts due to voltage stresses are always greater than the watts dissipated in cooling and therefore, the temperature will continue to rise until the insulation fails.

The shape of the curve  $W$  will differ for different kinds of insulating material and will also depend upon the purity,

dryness, etc. of the material. The shape of the curve for any particular piece of insulation will also vary for different voltage stresses and different frequencies.

Figure 2 shows the plotted results of tests made on a  $\frac{1}{4}$  in. thickness of built up rope-paper, which was dry and had been treated with varnish. The arrangement was such that the ambient temperature could be accurately controlled. It should be pointed out that for the curve shown for 100,000 volts per inch, the test was 25,000 volts at 50 cycles on a  $\frac{1}{4}$  in. thickness test specimen. The same is true of the other curves. Again on these curves, are shown three straight lines representing cooling conditions. It will be noted that for the line  $C$ , the ambient temperature is 40 deg. C. and the rate of cooling is such that for a 32 deg. C. difference in temperature, four watts per sq. in. will be dissipated. This rate of cooling shows stable conditions with regard to temperature for all tests except those shown by the curve marked 100,000 volts per inch. It is interesting however, to note what happens if the ambient temperature rises to 50 deg. C. as shown by the cooling line  $C'$ . The rate of cooling is the same as before and the only change is in the ambient temperature, yet the result is that the curve marked 75,000 volts per inch is now unstable. A third line  $C''$  is shown representing very poor cooling condition, an ambient temperature of 60 deg. C. and only  $\frac{1}{4}$  watt per sq. in. for 50 deg. difference in temperature.

It may be of interest to state that common design practice in this country is to allow voltage stresses of from 25,000 to 30,000 volts per inch. In fact, stressing the insulation in excess of 35 volts per mil is liable to result in brush discharge effects or so called corona action unless special precautions are taken.

Finally, Fig. 3 is presented to show what will happen if the frequency is varied, other conditions remaining unchanged, with a test voltage of 4,500 volts which gave unstable results at 50 cycles. A change in frequency of three cycles gives a stable condition. Curve  $N$  is interesting as it shows a curve for changing frequencies. Unstable conditions are indicated by an increase in the upward slope of the curve of watts lost.

From these curves, it is not difficult to see how small departures from designed ratings can easily cause large changes in heating and could be responsible for an insulation failure for which the designer could not be held responsible.

In the author's opinion, the electrical design of most electrical equipment in Canada is reasonably good. It is true that instances of poor design and cases of poor workmanship in building electrical equipment are met with. However, the percentage of such cases is not large.

The factor of safety provided by present design practice is probably less than for similar apparatus built fifteen years ago. But we have to-day a better and more accurate knowledge of the characteristics and behaviour of all

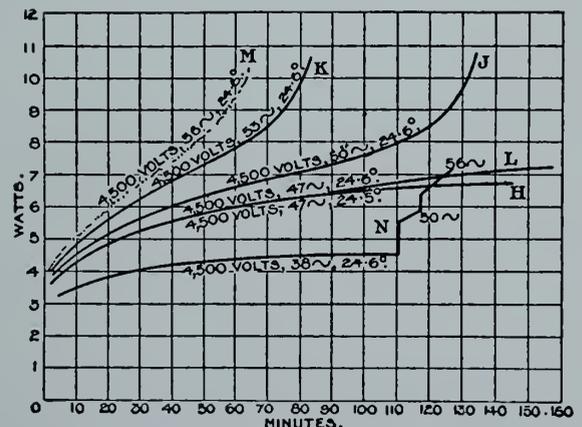

Fig. 3—Results of tests showing effect of change of frequency on stability of conditions.

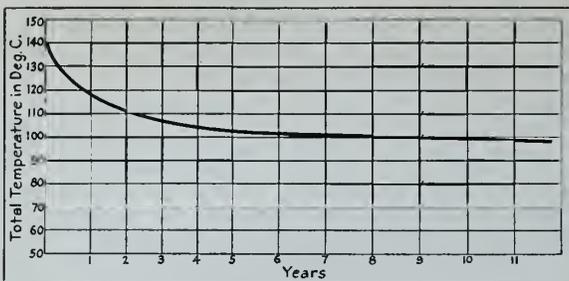

Fig. 4—Curve showing the relation of the life of fibrous insulation (motor windings) to the constant temperature to which it is subjected. Data from the work of Lamme and Steinmetz. (From *Maintenance Engineering*, OCTOBER, 1931.)

materials used in electrical apparatus. It is therefore, possible to eliminate unnecessary iron, copper or insulation.

Regarding the mechanical design of electrical machinery, there is certainly room for improvement, particularly in the design of small parts. Large parts such as frames, tanks and bedplates are usually well designed and strong enough for the required service.

The difficulty might be explained by assuming that electrical designers are usually not strong on mechanical design, which would be understandable. In some cases, however, there is evidence that they have not even considered the characteristics of detailed mechanical parts used in their designs.

This criticism will no doubt be resented by some. In that case let the designers go out into the field and discuss their mechanical design details with the engineers and maintenance staffs of plants using their equipment. If this were done, a few of the designers would return still convinced that the criticism was not justified. The majority, however, would be a whole lot wiser and better for the experience.

As previously stated, most mechanical troubles are on the smaller parts of electrical apparatus. Usually the difficulties are not serious, but are due to simple mistakes that often can be and are corrected in the field. In order to be more specific, here are some of these details that have been criticized in different plants.

They are such things as: fan blades that are mechanically weak, field poles that are not secure on the pole pieces, squirrel cage windings that prevent the removal of a field pole, connections that vibrate and break due to lack of proper support, fuse clips and switch blade contacts that do not have sufficient tension to maintain contact, side strains on insulators, banding wires that are not strong enough, small bolts where larger ones are essential, no provision for expansion and contraction, sharp metal corners pressing on soft insulation, loose iron and loose supporting fingers in magnetic circuits, oil throwing bearings, and lack of space for wiring of control apparatus.

For example, there have been  $\frac{3}{8}$  in. bolts which were provided on a control panel to take a 100 amp. terminal, reduced voltage compensators that were practically inaccessible for repair or maintenance, grounds in terminal boxes because the box was so small that the wires had to be forced into place, thereby cutting the insulation, or perhaps a long screw to hold the cover, that had gone halfway through the wires. Oil throwing bearings have caused many a motor to fail. To-day these are much better in design, chiefly due to forced changes resulting from the competition presented by ball and roller bearings.

The reason why many of these errors have not been corrected must be because designers are not informed about them.

#### SERVICE

The service given by electrical equipment depends upon the kind of load it carries. A steady load within its rated capacity is best for any piece of electrical equipment. Shock loads cause trouble. Frequent starting and stopping, or the resultant expansion and contracting of insulation

and conductors, is hard service. This abnormal service is recognized by charging higher insurance rates for hoist motors, elevator motors, crane motors, etc. In this regard, it is of interest to note that, based on a five-year period, the loss frequency on elevator, crane, conveyor and excavator motors is 80.4 compared to 62.7 for other types of service.

There is also the fact that it is difficult to provide proper economical protection for motors on intermittent duty. This is due to the fact that frequent starting and the heavy starting currents involved would cause relays set for say 125 per cent full load current, to be tripped by the starting loads.

While these comments deal specifically with motors and generators, the same experience is encountered on other apparatus of an enclosed or semi-enclosed type. For example, transformers used on indirect arc furnaces, while specially designed, take a nasty beating due to the nature of the load. It is also possible to cause voltage surges on the high tension side of furnace transformers due to the intermittent arc on the low tension side when a new charge is being heated.

#### LOCATION

The location of equipment will affect its operation. This is due in different cases to dirt interfering with normal ventilation, acid or alkali atmospheres causing the insulation to deteriorate rapidly, flying abrasive material cutting the insulation, high ambient temperatures giving the same result as overload, and many other conditions which result in abnormal operation or operation which was not contemplated when the unit was designed.

Standard motors are often installed where semi-enclosed or totally enclosed motors should be used. Equipment to be used in locations that present abnormal service conditions should be specially designed to provide the best available protection against these conditions.

#### MAINTENANCE

The maintenance procedures of different plants vary widely in their effectiveness. All sorts of practices are met

Fig. 5—Showing burning of stator iron laminations of a 450 hp. mine hoist motor. This motor failed during a lightning storm. Three teeth of the laminations were cut away before this picture was taken in order to show the extent of the iron damage at the root of the teeth.

with. The inspector finds electrical equipment that has not been overhauled for years and also equipment that is completely overhauled at least once every six months.

There are far too many plants with practically no maintenance programme, which keep no records and do not attempt to make regular inspections of their electrical apparatus. Such plants go along blissfully waiting for accidents to occur, each accident is considered a bit of bad luck. Repairs are usually rushed and poorly executed. The errors of inadequate maintenance are very evident to-day when increased production schedules have put the plant equipment to the test, and it has failed to provide dependable service.

An insurance company very properly insists on a certain minimum standard of maintenance. It is felt that money expended to keep electrical equipment in good repair will be returned with interest in the form of increased production with fewer shutdowns due to accidents.

Regular inspections by insurance company inspectors will improve plant maintenance, decrease accidents and thus, insure more efficient use of productive equipment: Each inspector is informed through a bulletin service of all important accidents that take place in insured plants; he is, therefore, able to give the plants under his care the benefit of the experience gained in all of the plants covered by the whole inspection organization.

A few illustrations will show how such service has prevented forced shutdowns due to accidents. Some ten years ago, it was decided to take insulation resistance readings on turbine generator fields at different speeds. These readings were in some cases found to vary with speed. It was suspected that this indicated a change in the position of the windings and realized that if this were true, a failure could soon be expected. This test has been used repeatedly during the last ten years and as a result more than 30 defective fields have been taken out of service. To date, there has been no case where the indications of the tests were incorrect. With regard to protective devices, it is found that many of them have not been tested and will not operate when tests are applied. Some years ago, an inspector tested 50 relays in a plant where insurance was asked. Out of the 50 relays, 37 would not operate. It is also common experience to find relays that are not applied correctly and even some that are not properly connected. Thermal relays are difficult to apply as the method of rating used by different manufacturers is very confusing. The current to trip in a definite time, would seem to be the correct rating of any overload device, but this method of rating is seldom used on overload thermal relays.

Linseed oil, transformer oil, and no oil at all, have been found in motor and generator bearings. Inspectors discover lubricating oil in small transformers and starting compensators. Fuses bridged with solid wire are a commonly encountered condition; often there is just a heavy wire and no fuse cartridge at all. Even thermal relays are bridged and often solder is used to replace the low temperature alloys used in some thermal relays and fuses.

The following experience shows what strange things can sometimes be done without causing trouble. In a certain machine shop a 50 hp. motor had to be inspected. It was mounted in an inverted position, hung from the ceiling, was running in a satisfactory manner and seemed in fairly good condition. The air gap was even. However, it was difficult to understand why it was running in this position without trouble. The man who looked after this motor and oiled the bearings stated that he did so once each day by putting oil in at the oil-level indicating cups. Actually the end bells were upside down, and the oil rings could not turn. The only change made when the motor was inverted had been to turn the oil level indicating cups around 180 degrees. Perhaps someone else can explain why these bearings had continued in service for five years without excessive wear.

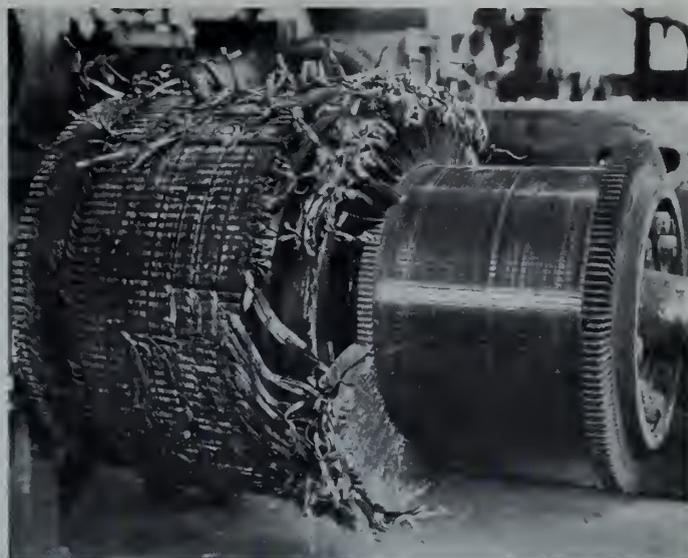

Fig. 6—Showing armature of paper machine drive generator after an accident which caused the banding wires to fail and allow the armature conductors to be thrown out of the slots.

#### VOLTAGE SURGES

Records show that about 25 per cent of the accidents for which damages are paid are due to voltage surges. Many of these could have been prevented if proper surge protective equipment had been in service with a plant grounding system of reasonably low resistance.

The effectiveness of lightning arresters has often been questioned, particularly when applied on low voltage circuits. To-day, however, much better protective equipment is available, and it appears that this newer equipment is effective in reducing the number of failures due to voltage surges.

As an illustration of this, take one case of such an installation in a very bad lightning area in the province of Quebec. This particular plant had a very bad history up until about five years ago, when the protective system was brought up to date. Failures had taken place nearly every year on at least one of the two generators in service. Finally, the practice was to shut the plant down as soon as a lightning storm started.

The generators were 2,200 volt and were connected to a fairly long exposed line. One generator was rewound, the iron restacked, and proper protective equipment installed.

This plant has been operated full time for the last five years and no further trouble has been encountered even though plants located all around it have continued to suffer from voltage surges. On some equipment, such as transformers, it is common practice to provide extra insulation on the coils nearest to the line to protect against voltage surges. This same practice is followed by some English manufacturers in building motors and generators.

#### AGE

The age of the insulation is a very definite factor in the failure of this insulation due to stresses, either electrical or mechanical, that are applied to it in normal service. Any particular form of insulation has built into its original design a definite ability to withstand applied stresses. As the years of service increase, the strength of the insulation is reduced and finally the resistance is reduced below the level of the applied stress and failure results.

Many factors may contribute to the aging of electrical insulation. Some of these are: abuse, lack of proper maintenance, corrosive atmospheres, mechanical damage, etc. However, even if we could eliminate these conditions, which are abuses of one type or another, it is definitely true that the life of any insulation is limited by the aging of the materials which make up the insulation. The expected life varies from six to eight years for street car motors to per-

haps as much as 25 years for some other classes of equipment. These figures are open to question and some organizations claim an average life of as much as forty years on some equipment.

It seems probable from the data available that an average life of forty years is decidedly optimistic and does not represent actual experience.

More failures occur as electrical equipment gets older. A recent illustration of the effects of aging has been afforded in connection with the direct current generators used to provide power for paper machine drives; most of these units

Fig. 7—Showing damage to armature and field coil winding of a paper machine drive generator. The accident was due to the banding wire supporting the armature conductors breaking or burning and allowing the armature conductors to come out of the slots.

were installed between 1928 and 1930. The last two or three years there has been an epidemic of failures in different plants which can only mean that the average life of these generators under their conditions of service is less than fifteen years. The percentage of these failures in different plants is so high and the trouble so general that no other conclusion can be reached.

In 1931, a curve was published in *Maintenance Engineering* showing the life in years for non-fibrous insulation plotted against the temperature of operation. This curve shown in Fig. 4 is from the work of Lamme & Steinmetz. It will be noted that for a temperature of 100 deg. C., the life is shown as seven to ten years. At 110 deg. C., it is only two years and at 140 deg. C., failure is to be expected in a very short time.

#### EFFECTS

The effects of damage to electrical machinery are many and varied. One certain effect is loss of use of the equipment, and loss of plant production. There is also the expense of making repairs or replacing the damaged object.

Another common effect is ensuing fire which can and often does cause more damage than the electrical failure. Sometimes, this fire is confined to the object that fails and in other cases, extensive damage outside the object results.

The possibility of ensuing fire is recognized when insulating oil is used. It is not so well known that fire often causes extensive damage to the windings of motors, generators and other rotating equipment.

A few illustrations will show what has happened in a few instances.

A small oil-filled potential transformer in a power plant failed and the tank was ruptured and the oil caught fire. Before this fire was under control, further electrical failures occurred. The result was over \$100,000 of damage and a plant out of service for some weeks.

Ten grinder motors were closed in on full voltage with the wheels loaded. The control battery was out of service, so the protective devices could not operate. In a very few minutes, the starting windings failed and the electric arc set the stator coil insulation on fire. A complete rewind of all motors was necessary. The plant was out of service for about three weeks. The repair bill was over \$100,000.

Another effect that may be encountered is an explosion of oil vapour. There was one rather odd case of this type, a few years ago. The oil vapour above the oil line in a transformer (not of the conservator type) was ignited, probably owing to a flashover of one of the high tension bushings. The tank was square and the explosion split the tank from top to bottom. Black smoke was deposited on a wall 20 ft. away. The oil did not catch fire and the coils were not damaged. In most instances, oil vapour explosions are not so accommodating and many cause serious damage.

Finally, there is another effect of electrical damage and that is the possibility of endangering human life. One fairly frequent example of this type is the failure of a common disconnecting switch when opened under load. These switches have the operating handle on the right hand side and the hinges for the switch box door on the left. An operator will naturally use his right hand to operate the switch and then if trouble develops, the door blows open and he is facing the electric arc. The result varies, but at best, it is a burned face, right arm and usually burns on the body. This type of accident seems preventable and should be provided against by the designer. First, a disconnecting switch should be able to interrupt rated current or else be provided with an ammeter to show when it is safe to operate it. Second, the door could be so hinged as to provide protection to the operator.

#### SUMMARY

Summing up the results of his experience, the author believes that there are many improvements that should be made in the design, maintenance, application and protection of electrical equipment. The common causes of failure are inadequate design, improper application, indifferent maintenance, abuse, voltage surges and old age. The results are damage to the objects themselves and sometimes to other apparatus, expensive repairs, lost production and possibly injury to operators and staff.

One method of approaching a solution to some of the problems encountered, is to gather complete information on the reason for the failures and when an analysis indicates that changes are necessary to prevent further failures, to see that these changes are made.

An equally important and very necessary procedure is to raise the standard of maintenance to an adequate level. It is in this field that insurance inspectors are playing an increasing part. Mistakes have been made in the past and others will be made in the future, but in this way only, can we develop a better and more effective inspection organization. We have already assembled a mass of information on the causes of electrical failures and, more important, are learning to recognize the presence of accident provoking conditions. As the years pass by, this knowledge will be added to, and accident frequency will be further reduced. In this way, the insurance inspector will continue to make his contribution to the economical operation of plants throughout the country.

# THE EFFECT OF WET COAL ON PULVERIZER AND BOILER PERFORMANCE

MURRAY D. STEWART, S.E.I.C.

Engineering Department, Babcock-Wilcox and Goldie-McCulloch, Limited, Galt, Ont.  
Now serving as a Lieutenant with the Royal Canadian Ordnance Corps, Overseas.

Paper presented before the Hamilton Branch of The Engineering Institute of Canada, December 16, 1940

## 1. INTRODUCTION AND STATEMENT OF THE PROBLEM

The "free" or surface moisture in coal is from two sources:

1. That which comes from the seam in the mine from which the coal is taken, and which is traceable largely to seepage from the surface, and to other underground waters;
2. That which is acquired by the coal, either in transit or in storage, from the action of the elements.

The surface moisture present in coals grading from anthracite to high-grade bituminous rarely exceeds ten per cent; in coals grading from medium-grade to low-grade bituminous, and lignites, it may amount to between 30 and 40 per cent. These are the percentages as given in the proximate analysis. It frequently happens in boiler operation that a coal, normally containing a small amount of moisture, may pick up a large amount between mine and boiler furnace. In such a case, the boiler design, and the choice of pulverizing equipment is made as if the moisture content were normally large. This is a problem of considerable importance in Canada, and in other countries where heavy precipitation in the form of rain and snow is the rule.

The presence of large amounts of such moisture causes numerous difficulties in the design and operation of pulverized coal equipment, and affects, in varying degrees, the performance of the steam generating unit.

For every type of coal, the proximate and ultimate analyses, the higher heating value, and the grindability\* can be determined. The designer bases his estimates of the coal requirements and performance of the boiler on the ultimate analysis. In many cases, however, the customer will state only the proximate analysis, the grindability, and the mine from which the coal is to be taken, in which case, an ultimate analysis must be selected which most nearly fits the information submitted. For pulverizer firing, the expected moisture in the coal "as fired" is also required.

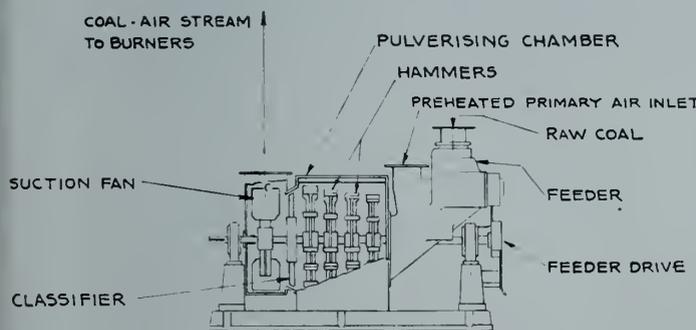

Fig. 1—Pulverizer: impact type.

By "coal as fired" is meant the condition of the coal when it enters the firing equipment, whether it is some form of stoker or a coal pulverizer. A mixture of coal and moisture (and some other foreign material) is fired, and the amount of the combustible constituents per pound, and ultimately, the calorific value of the coal, are reduced by the moisture which enters with it. All moisture, whether in the fuel, combustion air or resultant from the combustion of hydrogen causes a heat loss. Therefore, the greater the percentage of surface moisture in the coal, the greater will

\*See paragraph 4 in this paper.

be this loss, with a consequent lowering of the efficiency of the boiler.

In addition to the effect that surface moisture has on the purely thermal aspects of boiler design, it was early found to have more important effects on the performance of pulverizers and their auxiliary equipment. An investigation of the effect of this factor on the design and economical operation of pulverizers follows.

## 2. TYPES OF PULVERIZERS

A study of grinding processes is necessary for a proper understanding of the effect of moisture on pulverizer performance. Pulverizers are designed to operate on one of two basic principles of grinding, viz., impact and attrition. In most mills, however, both processes take place simultaneously, one process being secondary to the basic principle from which the mill design was evolved.

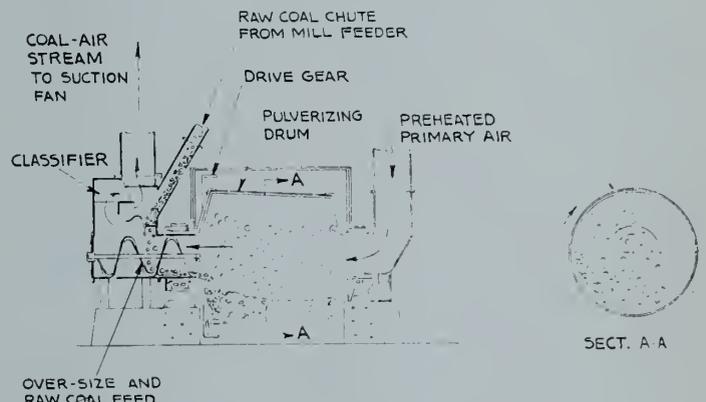

Fig. 2—Pulverizer: ball-mill type.

All pulverizers are swept by air, which is passed through by either a pressure or a suction fan, and which carries the coal to the burners. This air, called the primary, or transport air, is part of the total combustion air, and is generally heated for the double purpose of drying the coal, and improving ignition. However, if the inlet temperature is not sufficiently high to permit the primary air to cope with wet coal, various troubles arise in operation.

Most modern steam generating units burning pulverized coal are fired directly from the pulverizers, and this paper deals only with this type of installation. Therefore, no consideration is given to the bin, or storage system of firing pulverized coal, which has its own distinctive problems, as well as those encountered in direct firing.

### A. IMPACT PULVERIZERS

In pulverizers of the impact type, illustrated in Fig. 1, a series of hammers or beaters are keyed to a shaft, and revolve in a pulverizing chamber. The coal enters the mill from a feeder, and after crushing is drawn by a suction fan through some form of classifier before delivery to the burner pipes. The classifier rejects over-size particles, and returns them to the pulverizing chamber for further treatment. It can be adjusted to secure the proper coal fineness. All impact mills operate at high speeds, ranging from 1,000 to 2,000 r.p.m., and pass a practically constant volume of primary air at all loads. They have practically no reserve capacity.

### 3. MECHANICAL PROBLEMS ARISING FROM THE USE OF WET COAL

Bearing in mind the mechanics of grinding and pulverizing processes, it is now possible to consider the effects on mechanical operation resulting from an increase in moisture content. These can be seen best by considering the path that the coal takes from the coal car until it has passed through the pulverizer.

It frequently happens that the raw coal remains in the bunker for some time before use, permitting the surface moisture present to collect and drain to the bottom of the bunker. Provision must be made for tapping this water off, in order to prevent the acid, formed from the sulphur in the coal and the water, from rotting the bunker, coal pipe, scales and feeder. The possibility of the coal bridging in the bunker, starving the pulverizer and losing ignition at the burner is also serious. A severe explosion in the furnace may result if the coal suddenly starts feeding again.

The coal is carried from the bunker to scales, if installed, and then enters the raw coal pipe. This pipe must be straight-sided, and as nearly vertical and free from bends as possible to prevent plugging, and starving the feeder. Considerable trouble has been experienced in the past, and is still encountered when the feeders handle wet coal. The coal may hang up in the feeder gates, or the choking in the coal pipe and feeder proper will overload the feeder motor. This causes it either to trip out and stop the feed completely, or causes erratic feeding. Another source of erratic feeding, which occurs sometimes in feeders of the table type, is slippage between the wet coal and the table. This has been remedied by using tables faced with abrasives. The plugging of the coal chute into the mill has caused trouble, but this is obviated to a considerable extent if the mill temperature is sufficiently high, since a certain amount of drying will then take place.

The troubles arising with wet coal between the scales and the mill proper, indicate the absolute necessity for adequate areas, simplicity of design, and freedom from devious paths. It is preferable, also, to locate the feeder so that only a very short chute into the mill is required.

The handling of wet coal is a troublesome problem, and demands a special study for each case, but some measure of success in handling wet coal has been attained by maintaining the feeder and raw coal pipe at 140-150 deg. F. This can be accomplished in several ways. In pulverized coal-fired boiler installations, a flue gas air preheater is frequently installed, and some of the preheated air may be drawn off from it, and passed into the coal pipe. Steam air heaters can also be employed, but the possible temperature is limited by the available steam pressure. Flue gas is sometimes used, and unlimited heat is then available, but

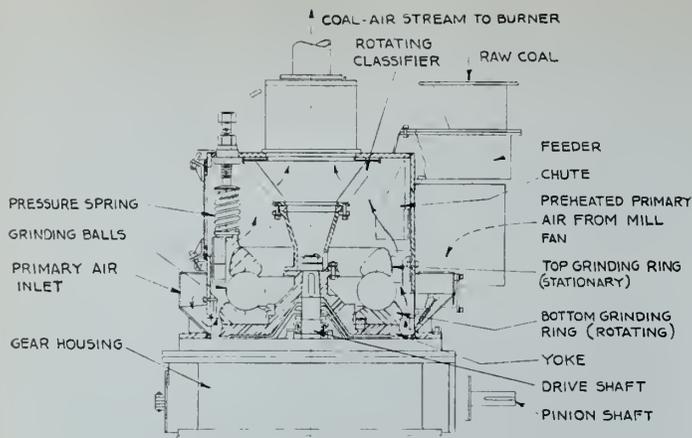

Fig. 3—Pulveriser: ball-bearing type.

#### B. ATTRITION PULVERIZERS

Pulverizers of the attrition type fall into two distinct classes, the ball-mill type, in which balls, free to move in any direction, pulverize the coal in a rotating drum, and those which operate on the ball-bearing principle, or the ring-and-roller principle.

In the ball-mill, shown in Fig. 2, the balls move with the coal bed up the inside of the drum in the direction of rotation. At this stage they tend to move towards the drum wall because of the centrifugal force exerted, and they grind by rolling over the coal, and by collision with each other. As the balls and coal move higher, some of the balls will tumble down the wall, grinding as they go. Others continue on until their weight overcomes the centrifugal force, and they also fall back into the coal bed, at which time the grinding is by impact. Thus the point at which the balls leave the wall of the drum is dependent upon its speed of rotation. It is also evident that both grinding processes take place at the same time, the impact action being scarcely secondary to the basic process of attrition.

The raw coal is fed through one of the trunnions carrying the drum, which is hollow for this purpose. The powdered coal is withdrawn by a suction fan through the inlet trunnion, and the classifier, and delivered to the burners. The primary air is varied with the boiler load. The reserve capacity is very high.

In Fig. 3 is shown a pulverizer which operates on the ball-bearing principle, and employs a vertical thrust-bearing arrangement of grinding balls and grinding rings. One or two rows of balls are used, depending upon the capacity required. The pressure on the balls, and hence the fineness of the coal, is controlled by heavy springs on the top grinding ring, an arrangement which enables wear to be taken up if required. This ring "floats", and is prevented from turning, while the lower grinding ring is driven through bevel gears. Raw coal is fed to the centre of the mill, and works through to the outside of the grinding elements by centrifugal force, where it is picked up by the air stream. From here it is carried through a classifier to the burner pipes. This type of mill can operate under pressure or suction. The primary air is varied with the boiler load.

Figure 4 illustrates a pulverizer of the roller, or bowl type. The rollers run against a horizontal bull-ring, which is driven through a worm and gear. The pressure is applied to the rollers by heavy springs, which enable wear to be taken up when necessary. The raw coal is fed to the centre of the mill, and thrown by centrifugal force between the rollers and the bullring. The powdered coal is withdrawn through the classifier by a suction fan. The primary air is varied with the boiler load as before.

Attrition pulverizers operate at low speeds, which range from 35 to 300 r.p.m., and generally have good reserve capacity.

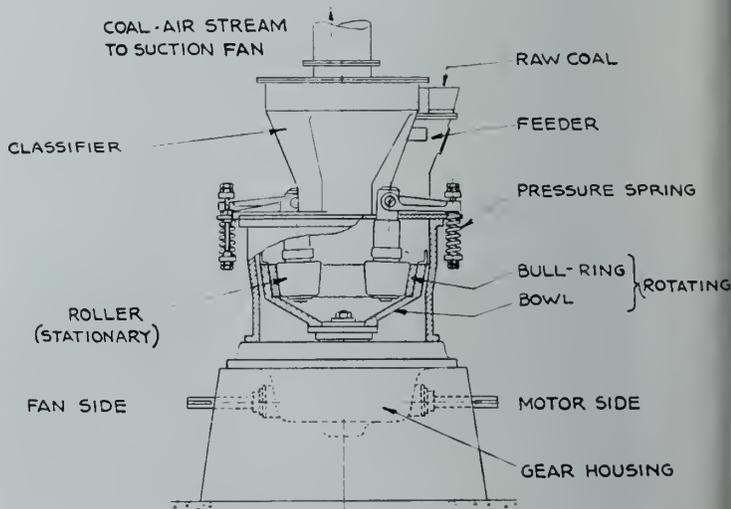

Fig. 4—Pulveriser: roller-ring type.

tempering air must generally be admitted. This reduces the safety attendant upon its use, because the oxygen in the tempering air is at high temperature, with the consequent risk of fire.

Consider the actual grinding of coal in the impact mill. When the coal is wet, the resistance to fracture is increased, that is, the coal is less friable than when dry. Thus, a blow that would shatter dry coal completely is resisted, resulting in incomplete fracture and coarse coal. The moisture present tends to ball up what fine coal there is, and these lumps and the coarse pieces of coal are rejected by the classifier and work back to the pulverizing chamber. A continuation of this condition reduces the capacity, and will ultimately plug the mill, thereby losing ignition.

The ball-mill crushes in a very deep bed and is, therefore, very susceptible to trouble with wet coal, since drying at the coal inlet is very incomplete. The wet coal tends to pack, and hence cushions the pulverizing action to a considerable extent. It will be recalled from the study of ball-mill mechanics, that the balls and coal tend to work up the side of the drum in the direction of rotation. Therefore, any intimate mixing of the heated air and coal is difficult to achieve, because the air will take the line of least resistance, and flow over the coal bed rather than through it. Under such conditions of packing and cushioning, the capacity will fall off considerably.

In pulverizers operating on either the ball-bearing or roller-ring principle, the grinding action is under the positive control of heavy springs. The enormous pressing and squeezing action which they exert is comparable to that in the mangle, or "wringer", and not only pulverizes the coal, but releases most of the surface moisture. The grinding elements are very massive, and their thermal capacity is high. They run at quite a high temperature because of their contact with the hot primary air, and because of the energy input to the mill which ultimately appears as heat. Therefore, the grinding elements contribute considerable drying action, and the mill can handle fairly wet coal even when the primary air temperature is low. Reference to Fig. 10, which shows curves of primary air temperature versus surface moisture, indicates that, up to three per cent moisture, the primary air must exert a cooling effect to maintain the proper mill outlet temperature.

#### 4. THE ECONOMIC ASPECTS OF FIRING WET COAL

##### A. PRELIMINARY DISCUSSION

With the advent of pulverized coal firing, some determination of the ease with which a coal sample could be ground was necessary for design purposes. Rittinger's law,

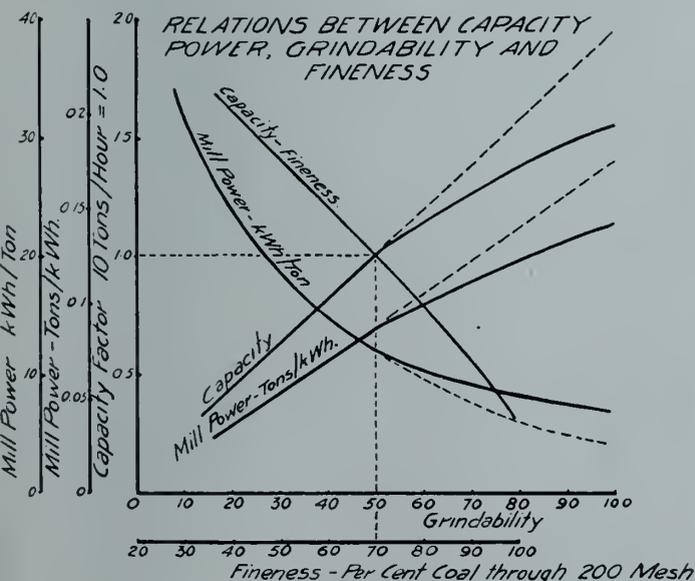

Fig. 5.

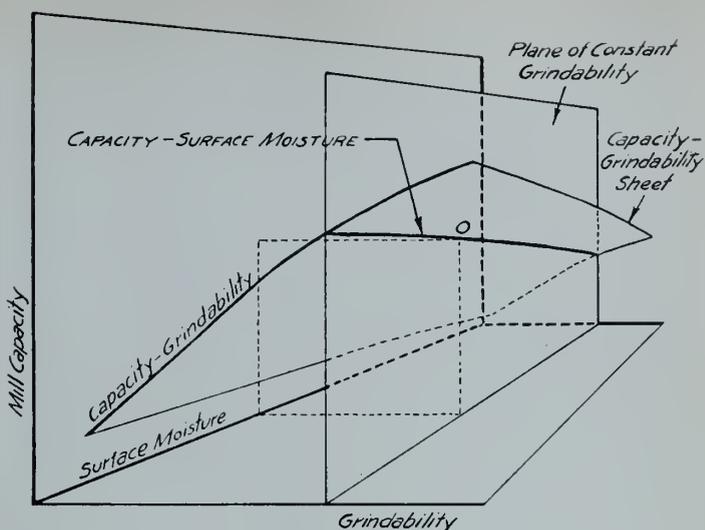

Fig. 6—Pulveriser performance sheet.

which states that the work done is proportional to the new surface produced (and hence to the reciprocal of the particle diameter), provided a starting point from which Hardgrove evolved a workable scale of grindability. In this scale, the grindability index is the ratio of new surface produced by grinding the coal sample under standard conditions, to the new surface produced in a similar way in an easily-pulverized sample of coal which has been assigned a grindability of 100\*. Hence the grindability increases with the ease of grinding; generally it is highest in the bituminous coals, and lowest in the anthracites.

Since grindability is an intrinsic property of coal, and hence comparable to the specific gravity, it is possible to determine, for any given pulverizer, the relationships existing between it and the power required for grinding, capacity and fineness. A typical set of these relations is shown in Fig. 5.

It follows from Rittinger's law that the capacity and power required will vary directly with the grindability, that is, a straight-line relationship exists between them. This is illustrated in Fig. 5 by the broken power and capacity lines. For any particular mill, this condition is almost true up to a certain point, and then the relationship departs from the straight-line law and becomes a curve. In Fig. 5 this deviation occurs at 50 grindability. At this point the mill can be considered to have unit capacity, and in this example ten tons per hour equals a capacity factor of 1.0.

To this capacity, a standard fineness, of say 70 per cent of the coal through 200 mesh, can be assigned, and all observations depending upon fineness can be corrected to this figure. There are two power curves shown; one is given in tons per kilowatt hour, and is similar to the capacity curve; the other is the familiar reciprocal curve of kilowatt hours per ton capacity.

Rittinger's law is founded on the assumption that the products of grinding are removed as formed. In coal pulverizers this is accomplished by the primary air, which sweeps the mill continuously, and delivers the powdered coal to the burners as it is produced. With coal of low grindability the capacity is low and the fineness high, because the coal stays longer in the mill and takes more power. Hence scavenging of the fines by the primary air is more thorough, and the capacity curve follows the straight-line law as shown. Above the deviation point the reverse conditions prevail, scavenging is less complete, and the grinding action is cushioned by the fines. The departure of the capacity curve from the straight line is indicative of the amount of cushioning taking place.

\*The "standard coal" is taken from the Upper Kettanning seam in Somerset County, Pennsylvania. It is a semi-bituminous coal of the following proximate analysis: Volatile matter . . . 17.45 per cent  
Fixed carbon . . . 72.88 " "  
Ash . . . 7.67 " "

The power curves show that more power is required with coals of low grindability, and less with coals of high grindability, a condition which follows necessarily from the application of Rittinger's law. Also evident is the increase in power requirements above the straight-line conditions with coals of high grindability. This is consequent upon the incomplete scavenging and resulting cushioning action which occurs with such coals.

Grindability is now determined on a standard machine which operates on the ball-bearing grinding principle—an attrition process. During the preliminary stages of development of the grindability scale, however, a machine, operating on the mortar-and-pestle principle—an impact process—gave results comparable with those obtained from the ball-bearing machine. This is evidence of the fundamental nature of grindability. The application of the grindability capacity-power relationships to pulverizer design must be made with care, however, because of the differing power requirements of different types of mills, and generally these factors must be determined experimentally.

The surface moisture present in coal is a variable quantity. Therefore, a third axis, having a scale of per cent surface moisture can be added at right angles to the axes shown in Fig. 5. The variation occurring in the capacity-grindability curve is shown in Fig. 6, and a similar treatment can be applied to the other relationships. It can be seen that, at any given percentage of moisture, a curve similar to the initial one can be drawn. By plotting curves for an infinite number of values of moisture, a capacity-grindability "sheet" is formed, giving the three-dimensional problem which occurs when a mill handles different kinds of coal. Since the customer specifies the coal which he expects to burn, the grindability is settled at once, and a plane of constant grindability cuts all the performance sheets, giving the pulverizer performance curves shown in Figs. 7, 8, 9 and 10.

#### PULVERIZER PERFORMANCE

The performance curves in Figs. 7, 9 and 10 are based on the actual calculations for a typical modern, medium-sized, pulverized coal-fired steam generating unit, which supplies steam for both power and process work. They are, therefore, typical of the conditions prevailing in modern pulverizer practice. The pulverizer happens to employ the ball-bearing grinding principle. The steam flow, steam pressure, total steam temperature and feed-water temperature remain constant throughout the investigation. It is then possible to see the effect on the performance of a given mill resulting from changes in the surface moisture in the coal.

The coal "as fired" is a mixture of coal and moisture (and foreign material) when it enters the pulverizer. Here the moisture flashes into superheated steam in the heated

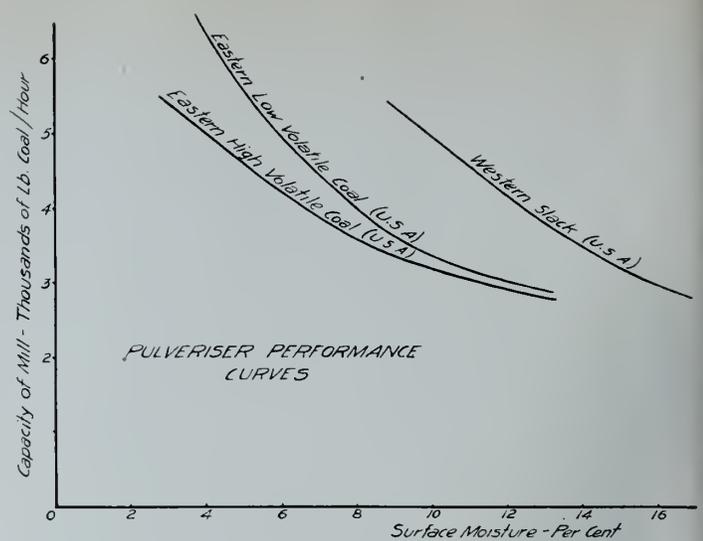

Fig. 8.

primary air, and on contact with the hot grinding elements. This action leaves only the dry coal out of the coal "as fired," and its percentage decreases in a straight line with increased moisture. Therefore, this line indicates mill capacity. It will be noted, however, in Figs. 7 and 8, that the capacity-surface moisture relations are curves indicating that other capacity-reducing action is taking place.

With an increase in moisture the friability of coal decreases, and therefore more energy is required in the pulverizing process. Consequently, in a given mill, a longer time will be taken to reduce the coal to the required size, because the numerous over-size particles produced are returned by the classifier for further treatment. This action reduces the capacity of the mill. The fines tend to cushion the grinding action, and the tendency increases with the wetness of the coal. These two factors operate on the straight-line variation of capacity with moisture, giving the curves shown.

The decrease in friability with increasing moisture gives rise to a decrease in fineness similar to the decrease in mill capacity. The pulverizing process is interfered with by packing and cushioning, resulting in the decrease in the per cent coal through 200 mesh shown in Fig. 7.

It has been noted that the mill capacity decreases with decreased friability, and it might be inferred therefrom that the power requirements for mill and fan would rise with increasing moisture in coal. Operational experience has shown this to be the case, and the general form of the resulting power curves is shown in Fig. 9.

The mill power curve depends upon two factors, the power required for grinding, and the additional power necessary to overcome packing and cushioning action. With no cushioning action or packing, the power would vary almost directly with the moisture content of the coal, because the friability is a function of the moisture content. But, since one of the results of decreased friability is increased packing and cushioning, an increasingly larger increment of power must be added. This will vary with the type of mill. The resulting curve is concave upwards.

The coal level in ball-mills, and in ball-bearing type mills varies with the boiler load, and this variation has been used to operate the control on the mill feeder. With increased moisture the capacity falls, and the resultant rise in the coal level increases the pressure drop or mill differential. The fan will then require more power to deliver the necessary primary air. Depending upon the fan characteristics, the power curve is concave upwards to a more or less degree, and may, as shown, ultimately intersect the mill power curve.

By adding together the power curves for mill and fan, a curve of total power is obtained. It is seen that the rising

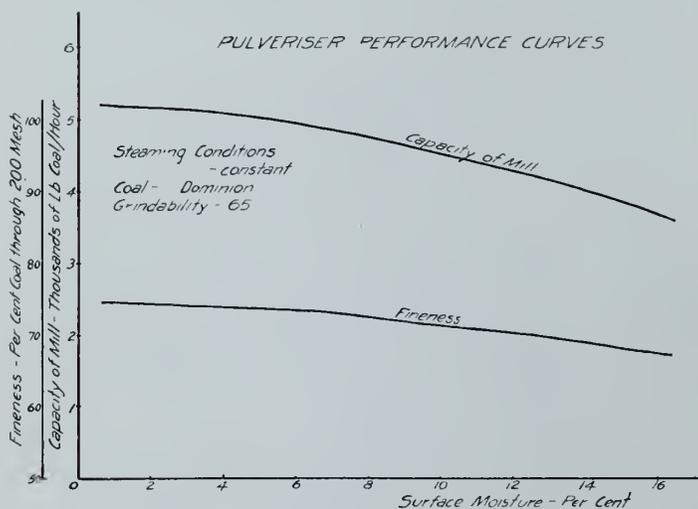

Fig. 7.

PULVERISER PERFORMANCE CURVES

Steaming Conditions - constant  
Coal - Dominion  
Grindability - 65

Fig. 9.

characteristics of both curves give a marked increase in the total power requirements with an increase in surface moisture, which is of considerable importance in a pulverized coal installation.

The necessity for drying coal for pulverizer firing presents numerous problems. In the early days, the bin, or storage system of firing was employed, and driers were necessary adjuncts. With the desire to utilize the advantages of direct firing, some form of mill drying was essential, and to-day this is almost invariably done with preheated air.

Experiment and operation have shown that a desirable outlet temperature for the primary air is about 150 deg. F. Using this figure as a basis, the minimum inlet temperature of the primary air to give complete drying can be determined for any given mill capacity, and Fig. 10 shows typical temperature-moisture relationships. Since the mill inlet temperature required depends only upon the moisture content, it increases in a straight line, and the ordinate between this and the mill outlet temperature line is a direct measure of the heat necessary to dry the coal.

The reason for finely pulverizing coal is to make it readily ignitable, and the mill operating temperature is limited by this fact. The primary air must be hot enough to dry the coal without being hot enough to coke or ignite it either in the pulverizer or burner pipe, and this consideration dictated the prevailing mill outlet temperature. This is controlled by admitting tempering air from the room to the primary air duct, thus modifying the temperature at the mill inlet.

The thermal capacity of the coal-air stream influences the ignition at the burners and the flame characteristics, and it increases with the surface moisture. The superheated steam arising from the moisture is thoroughly mixed with the coal, and before ignition can take place its temperature must be further raised. This is done at the expense of the furnace heat, with a consequent minute lowering of the furnace temperature. The effect on burner operation and flame characteristics is very small because of the accurate control available in modern practice.

5. SUMMARY

Before drawing final conclusions on the pulverizing and firing of wet coal, a brief review should be made of modern direct-fired boiler practice. Very generally speaking, it is not always economical to fire with pulverized coal if the peak steaming rate is less than about 25,000 lb. of steam per hour. Satisfactory pulverizer and burner equipment, however simple, is expensive and the increase in boiler efficiency, secured by its use over other modern alternatives, will scarcely justify the capital cost, and the subsequent costs of pulverizing and delivering the coal to the furnace.

In Fig. 11 is shown the relationship between boiler efficiency and surface moisture. When moisture is carried into the furnace with the coal as superheated steam at about 150 deg. F., it will be further superheated until it has reached the temperature of the furnace. This means a considerable absorption of heat, much of which is not then available for transfer through the boiler tubes, water-walls and superheater. Some of this heat is returned, but most of it is still in the vapour when it leaves the furnace because of the high exit gas temperature. A certain amount of this heat can be recovered in an economizer or an air preheater. There is, however, a limit set to this means of recovery, because of the corrosion, due to the presence of gases such as sulphur dioxide in the flue gas, which results if condensation takes place. This corrosive attack on the surfaces of the heat recovery equipment causes serious maintenance troubles. To prevent condensation, the latent heat of vaporization must be kept in the moisture, and hence the largest portion of the heat absorbed from the furnace is lost, and the possible boiler efficiency lowered thereby. Therefore, with increased moisture, the boiler efficiency will fall off as shown.

Actually, the decrease in efficiency is small; in the installation under consideration the drop is one per cent with an increase in moisture from two to twelve per cent. Such a loss is variable, but might be serious with expensive coal, if sustained for any considerable time. Generally, the effect of the moisture on the pulverizer performance is of more importance.

As shown in Fig. 7, the fineness of the coal in per cent through 200 mesh falls with increasing surface moisture, in this case from 74.5 per cent at two per cent moisture to 70.5 per cent at 12 per cent moisture—not a serious decrease. Although the fineness through 200 mesh is spoken of very frequently in pulverizer work, it, alone, is not a proper criterion for judging pulverizing performance. It is, of course, a very desirable coal size to have in quantity, but only if it can be secured without excessive power consumption. Far more desirable is powdered coal containing a very high percentage of sizes smaller than 100 mesh, because it is the particles of size 100 mesh or larger which cause furnace troubles. Besides, such fineness can be secured for a lower power input, and the coal burns almost as well. The fall in coal fineness with increased moisture is only important if large particles are produced in quantity resulting in the formation of slag on the tubes and furnace walls.

It has already been shown that the capacity decreases with increased moisture in the coal, and curves, indicating the decrease, are shown in Figs. 7 and 8. The difference noticeable in the shape is due, not to the coal, but to the different types of pulverizer equipment used. Since both mills have about the same capacity, it can be seen that one having a capacity curve such as in Fig. 7, would be more

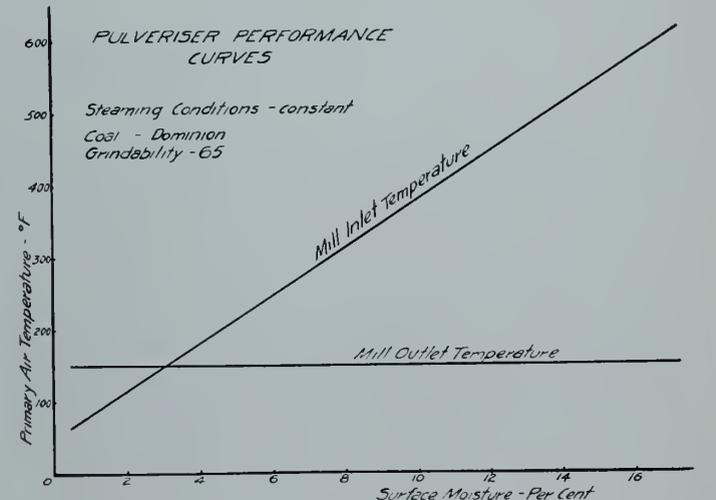

Fig. 10.

desirable than its competitor, because of its greater sustained capacity over the medium moisture range. The general fact that each type of pulverizer has its own peculiar characteristics is also clearly shown. This was indicated in the preliminary considerations of the grinding process.

In modern boiler practice, two medium-sized pulverizers, each capable of carrying over half the boiler load, are frequently installed per furnace rather than one large one. This procedure enables the medium loads to be carried more economically, because one mill will be operating at a fairly high percentage of its capacity. It also assures one mill in

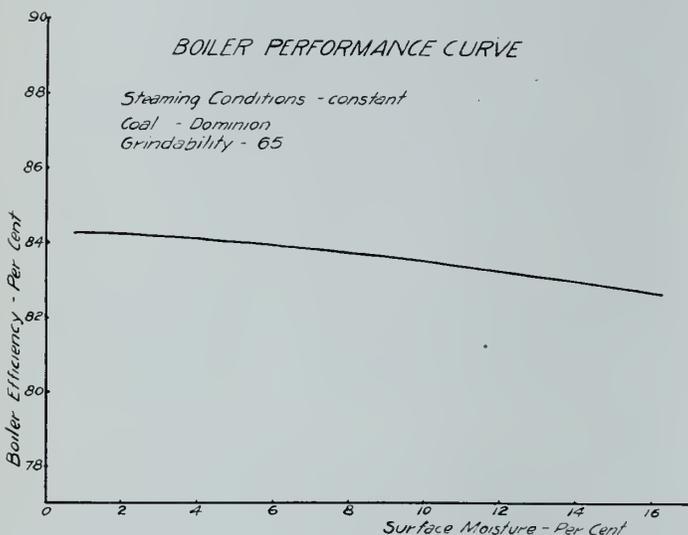

Fig. 11.

reserve in case of break-down, thus keeping the boiler on the line. But if wet coal is being fired at a medium load, the resulting reduction in pulverizer capacity may make it necessary to put on another pulverizer to keep the steam flow constant. Therefore, one mill, or both, with equalized coal output, will be operating below its best kilowatt hour per ton rating, with a resulting increase in milling costs.

The increase in mill and fan power with increased moisture necessitates the careful selection of coal with this factor in mind. It indicates also the desirability of suitable storage facilities to prevent the undue accumulation of moisture,

and the resulting troubles previously discussed. The use of lowgrade bituminous coal, and lignite, with their high percentage of surface moisture, is practically eliminated in pulverized firing unless the moisture content can be reduced to a manageable figure.

The mill inlet temperature required increases with the moisture, and here the economical size of the air preheater is a limiting factor. If the necessary temperature cannot be obtained by this means, flue gas may have to be used, and passed through a Davy screen before entering the mill. With an air preheater the necessary conditions for drying may be secured either by using a high inlet temperature, or by passing more air. Both these conditions are governed by the boiler size; the second is governed by the ability of the mill to handle the air. High temperatures may not be attainable without an expensive air preheater on medium-sized installations, and a further limit is set by the minimum allowable flue gas exit temperature necessary to prevent the condensation of water vapour.

In view of the present limitations of pulverizers when handling wet coal, reasonably complete information on boiler requirements is necessary to enable the engineer to design equipment suitable for proposed boiler plant, or for modifications to existing installations if they are desired.

#### ACKNOWLEDGEMENTS

To the engineering and sales staffs of Messrs. Babcock-Wilcox and Goldie-McCulloch Limited, and to Professor R. C. Wiren, M.E.I.C., of the University of Toronto, the author expresses his sincere thanks for their assistance in the preparation of this paper.

## EXPLOSIVES FROM WOOD

Several million dollars annually are now being saved in the manufacture of certain types of military explosives produced in Canada through the utilization of Canadian wood pulp as a source of cellulose instead of importing cotton linters.

Wood cellulose has been used in Canada for a good many years in the manufacture of "Cellophane" and rayon but it is only since the beginning of the war that research and development has been undertaken to adapt wood pulp to the manufacture of nitrocellulose, the base for certain types of high explosives required for military purposes.

The use of cellulose-bearing wood pulps, quite plentiful

in Canada, has not only eliminated the importation of cotton linters from the United States, thus effecting a considerable saving in foreign exchange but has also considerably reduced the raw material costs without in any way impairing the quality or effectiveness of the resultant product.

One Canadian wartime explosives plant has been operating on wood pulp for over a year, while two others have been using this domestic type of cellulose exclusively now for six months and two months respectively. Canada, therefore is one of the first of the United Nations to adopt large scale production of military explosives from her own domestic supplies of chemical wood pulps.

# MOVING A COAL BRIDGE AT THE ALGOMA STEEL CORPORATION, LTD.

D. C. TENNANT, M.E.I.C.

*Engineer, Ontario Division, Dominion Bridge Company Limited, Toronto, Ont.*

Paper presented at a joint meeting of the American Society of Civil Engineers and The Engineering Institute of Canada, at Niagara Falls, Ont., on October 15th, 1942

The war has greatly accentuated an ever increasing demand for steel and nowhere are the resulting problems so acute as with the steel producing mills themselves. One of the by-products of this situation at the Algoma Steel Corporation in Sault Ste. Marie, Ontario, is the necessity for practically doubling the size of the coal and coke storage area. The present coal yard, 300 ft. wide and 1,600 ft. long, is fed by railway coal cars that ride a steel trestle about 25 ft. high running longitudinally along the middle of the area, and is served by two travelling coal bridges running on longitudinal rails and spanning 300 ft. transversely. These bridges are of the usual type, supported at a clear height of 55 feet on a shear leg at one end and a pier leg at the other, the pier leg being splayed out sufficiently at the top to give stability to the structure and so resist tractive forces from the bucket trolley, while the shear leg is merely a bent supporting the other end of the bridge and capable of a certain amount of movement at the bottom to take up inequalities in track level or gauge. The general arrangement of the bridge is shown in Fig. 1.

The Algoma Steel Corporation decided to increase the coal area by providing another similar coal yard about 900 ft. to the north of the present one, leaving one of the bridges to serve the old yard and transferring the other to serve the new one and to run on new tracks with necessary concrete foundation walls to support them. The old and new tracks are, of course, level throughout their length but the new yard and its tracks are 8 ft.  $4\frac{1}{4}$  in. higher than the old. Moreover, the alignment of the new tracks, while approximately parallel to the old, actually makes a small angle of 3 deg. 15 min. with them. Two possible ways of moving such a bridge present themselves; either dismantle the bridge and re-erect it in its new position, or move the bridge along the ground to its new place without dismantling. The second alternative was chosen as being cheaper and quicker, thus getting the bridge operating in the new yard with a minimum of interruption. It was important that the move be made between the middle of July and the end of August, as there is a comparative lull in coal handling at that time of year. A contract was accordingly given to the Dominion Bridge Company, Toronto, to move the bridge to its new location beginning in July and finishing in August, 1942. The method of moving was outlined in the agreement, namely, to jack both pier and shear legs at their bottoms, high enough to allow railroad trucks to be inserted under the legs to carry the load, these trucks to travel approximately at right angles to the ordinary operating travel and to rest on standard gauge tracks laid by the Algoma Steel Corporation on slag ballast and fill at a constant up grade to bring the bridge to the level of the higher new yard and at a constant but slight curvature to take care of the 3 deg. 15 min. difference in alignment of permanent yard tracks. When the bridge reached its final site it was to be jacked again, the trucks removed, and the bridge brought to rest on the permanent rails. This method is obvious enough but no similar structure has ever before been so transferred in Canada, and we know of no very close precedent in the United States or elsewhere.

The bridge was built some time ago by Messrs. Heyl and Paterson of Pittsburgh, Pa., and their detail drawings were available for reference. The total weight of the bridge including coal carried in the bucket was stated to be 475 tons, and an independent check of the weights from the shop drawings showed this given weight to be well on the

safe side. The pier leg is actually 5 ft. longer than the shear leg. Since the bridge bottom chord is level and the pier and shear legs are the same transverse width at the top and have the same batter, it follows that the pier leg is actually wider at the bottom than the shear leg. The difference in spread is 1 ft.  $9\frac{3}{4}$  in. or  $10\frac{7}{8}$  in. on each side of the centre line of the bridge. As it was desirable that the trucks under both shear and pier legs should run on the same temporary tracks, these tracks were laid at an average distance—41 ft.  $4\frac{7}{8}$  in.—apart centre to centre so that the centre of the bottom of the batter post that rested on the trucks was only  $5\frac{7}{16}$  in. off the centre line between standard gauge rails. Theoretically this would throw more load on one rail than on the other, but this was compensated for by the stiffness of the transverse bracing in the pier leg and special knee

Fig. 1—View of coal bridge ready for moving, looking at north or shear leg end.

braces that were inserted at the base of the shear leg. Two railroad trucks, each of four wheels, were used under each pier and shear corner. At each pier corner a standard 75-ton and a 50-ton truck were used and at each shear corner two 60-ton special trucks such as are used under locomotives when they are being repaired. The standard trucks had 33-in. wheels, while the wheels on the repair trucks were much smaller but very husky. The 75 and 50-ton tandem arrangement would take care of 125 tons reaction or 250 tons for the whole pier end. The stretchers distributing to these trucks were loaded at the  $\frac{3}{5}$  points so that the heavy truck would get  $\frac{3}{5}$  of the load, the light one  $\frac{2}{5}$ . The 60-ton repair trucks were much lower in height and had to be built up with heavy timbers as shown in Fig. 2. Between them they would take 120 tons, or 240 tons total for the whole shear leg end. The different sizes of trucks were used because they were the best available and capable of carrying the loads. The rails used for the temporary track were of 85 lbs. A.S.C.E. section. The trucks were spaced 11 ft. 3 in. apart longitudinally centre to centre at the pier end, and 9 ft. apart at the shear end. The stretchers to distribute the reaction from the leg to the trucks were two 24-in. beams of 79.9 lb. per ft. These stretchers supported the legs near where the permanent wheels had supported them.

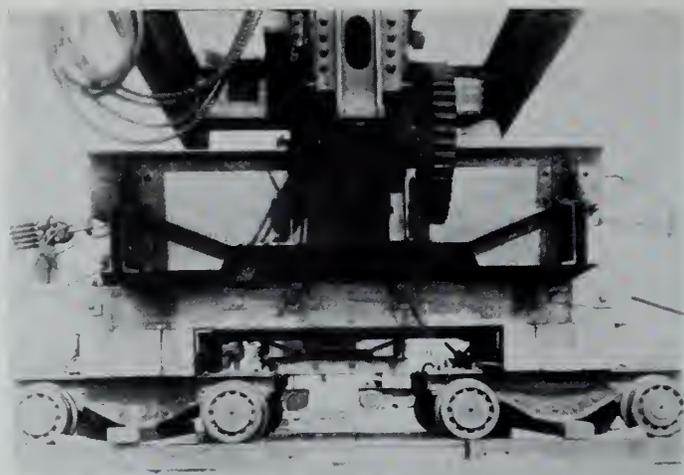

Fig. 2—Arrangement of 60-ton trucks and timbers at shear leg corner.

For jacking purposes, cribs of heavy wooden timbers were built up gradually as the bridge was raised. These cribs were just outside the temporary track width and carried four 50-ton Norton jacks at each corner. These jacks supported the four ends of two transverse 24-in. 104.5 lb. beams 20 ft. long into which were headed double 18-in. channels, at the centre of which angle ties were riveted to connect to the tops of the main gussets or box girders that formed the bases of the legs. Thus the whole load was carried through the tie angles to the cross channels, to the 24-in. beams, to the jacks, to the cribbing, to the ground. In the old yard the ground was well compacted and very little settlement under the jacks could be noted. In the new yard some ground was softer so concrete foundations were provided by the Algoma Steel Corporation at the jacking points.

The pier leg being at the south end of the bridge, this permanent track is 5 ft. lower than the one at the shear end which is to the north. This condition holds good also for the new yard, so that beginning at the most southerly point of travel the permanent rails for old and new yards are at successively higher elevations somewhat conforming to the ground surface, but not exactly so. Thus the movement of the bridge was accomplished by pulling uphill at the base of the shear leg. Needless to say the bridge as built was not intended to be pulled in any such manner and double temporary provision was made to take care of this pull and distribute it properly. The bottom of the shear leg was knee-braced to the second bottom chord joint of the bridge by means of two members about 75 ft. long as seen in Fig. 1. These temporary members were actually derrick booms from Dominion Bridge Company's stock,

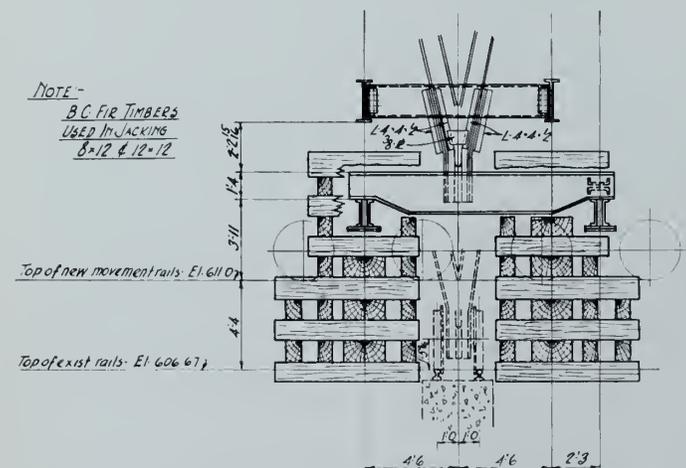

Fig. 3—Special framing for jacking at bottom of pier legs.

with their ends adapted to connect to the leg at the bottom, and to the bottom chord joint at their upper ends, and to take either tension or compression. As an added means of distributing the traction pull, 1½-in. threaded rods were inserted as horizontal ties between the bottoms of the shear and pier legs. These were in 30-ft. lengths connected together with home-made turnbuckles and suspended at several points by wire rope hangers from the truss above to prevent sag. One of these tie rods with its turnbuckle, and a towing tackle can be discerned in Fig. 2. During pauses in the movement several lengths of these tie rods could be readily removed if necessary to allow track or road traffic to pass under the bridge but in such cases the trucks were first wedged in position so that they could not move on the temporary tracks. It was assumed that there might possibly be as much as 15 tons pull required at each corner at the shear leg end in order to move the bridge along the tracks. No one was surprised, however, when a much smaller pull proved adequate. Ten parts of 5/8-in. plow steel rope were used at each corner to take the pull from the hoisting engine.

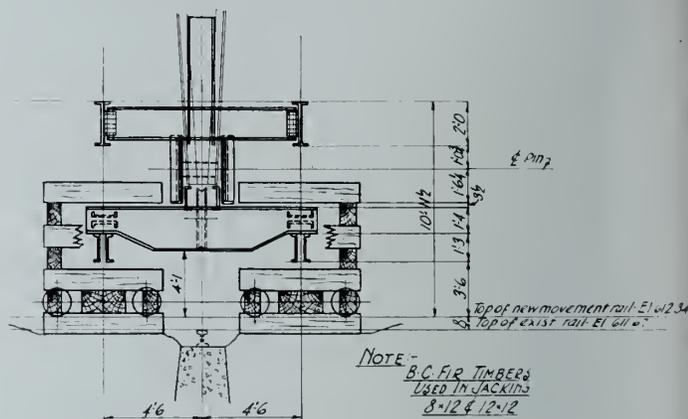

Fig. 4—Special framing for jacking at bottom of shear legs.

Figures 3 and 4 illustrate the special framing used at the bottoms of the pier and shear legs to take the load from the jacks into the legs and to deliver the load from the legs to the trucks and temporary rails after the jacks were removed.

Figure 5 shows the jacking crib at the shear leg end with the bridge jacked up high enough to allow the two specially timbered 60-ton repair trucks to be set in place under the leg. (See also Fig. 4).

The sequence of operations at the site was as follows:—

1. A suitable place was chosen near the east end of the yards where the bridge could be transferred from one runway to the other with a minimum of inconvenience to ordinary yard operations and shunting. At this place the actual distance that the bridge would have to be moved was about 860 ft.

2. The two standard gauge temporary railroad tracks were built by the Algoma Steel Corporation with slag ballast and gravel fill. These tracks were set on a uniform curve to include four points, viz., the centre lines of pier leg and shear leg in the existing yard and also at their new location in the new yard. A constant upgrade delivered the bridge to about its final elevation. Gaps were left in the concrete foundations under the permanent rails in the new yard to give clearance for the trucks and jacking down operations.

3. The path of the bridge crossed many existing tracks and a main road. On two of these tracks and on the road the traffic could be interrupted for only three or four hours, so it was necessary to arrange for the temporary tracks to be supported at these points on special timber framing that could be quickly placed and removed.

4. The bridge itself was prepared for its travel by connecting the 75-ft. knee braces at the shear end, inserting

the tie rods near ground level, removing certain platforms and machinery parts at the bottoms of the legs that interfered with jacking operations, and connecting the jacking girders with angle ties to the base gusset plates of the legs, and temporary braces at the bottom of the shear leg for lateral stability.

5. Using eight jacks, four at each corner of the pier leg, this end was raised about a foot and blocked in position using timbers. The jacks were then removed and taken to the shear leg end which was raised about two feet. This alternate process continued until the bridge was up some eight feet, that is, high enough for the trucks to be inserted at both ends and the bridge lowered to rest on them.

6. One hoisting engine was used to pull the bridge up-grade on the tracks at a speed of 8 ft. per minute. It had to be moved successively to new locations with the snatch block also connecting to new deadmen. The bridge was blocked and guyed when not in motion and it was not moved during high winds. During the rests in the moving, the busy tracks and the road were cleared of obstructions such as temporary track, rope haul, or horizontal tie rods.

7. When the pulling was completed the bridge was jacked to the proper level at each end, was set on rails that rested on temporary timbers in the gaps that had been left in the foundation walls, and was moved on these tracks until it rested over the permanent new foundation walls.

8. The tie rods and knee braces were then removed and the machinery parts and platforms that had been removed were replaced at the bottoms of the legs.

9. The temporary timbers were removed from the gaps in the foundation walls and these gaps were filled with concrete construction corresponding to the rest of the walls, and permanent rails were completed.

10. The temporary railroad tracks on which the bridge had been moved were taken away.

Actually some preparations for connecting jacking beams were begun on July 24th and jacking began about August

Fig. 5—Jacking crib at shear leg end showing 60-ton trucks being placed under leg.

first. The pulling of the bridge on its temporary tracks took place during the third week in August and the bridge was on its final permanent rails before the end of the month.

No hitch of any sort occurred in the moving operation. The structure was insured from the time the jacking commenced until set in its final position in the new yard. Much of the credit for the smoothness of the arrangements belongs to the Algoma Steel Corporation, and particularly to its chief engineer, Mr. Carl Stenbol, M.E.I.C. Good co-operation was also received from the Sault Structural Steel Company of which Mr. E. A. Kelly, M.E.I.C., is manager. The planning and execution was the responsibility of the Ontario Division of the Dominion Bridge Company, with Mr. A. Ross Robertson, M.E.I.C., as general manager, Mr. W. H. Butler, erection superintendent and Mr. Jack Erickson as erection foreman at Sault Ste. Marie.

## MUSIC AS AN AID TO WAR PRODUCTION

In an address delivered recently before the Metropolitan Section of The American Society of Mechanical Engineers, Professor Harold Burriss-Meyer, Director of Research in Sound at Stevens Institute of Technology revealed the results of what is claimed to be the first scientific, statistical investigation conducted in the United States for the purpose of evaluating the effects of music on employee morale and factory production.

Professor Burriss-Meyer and Mr. Richmond L. Cardiwell, also of Stevens, invaded a number of factories and war plants in the east to measure the most obvious thing—does music in the factory influence the production rate. The data showed that in 75 per cent of the investigations production was considerably higher where music was used than where it was not used. Increases in production rates, resulting from the introduction of music, ranged from 1.3 per cent to 11.1 per cent. Further studies indicated that the effect was not a transient one. The production increases are even more surprising when it is considered that many of the groups measured consisted of employees on piece work who already were producing at top speed. In addition to increasing the production rate, Monday morning absenteeism and early end-of-day departures were reduced phenomenally.

Having answered definitely the question of what music does to the production rate, the investigators next turned their attention to an appraisal of programmes. The curves indicate that a carefully selected and planned programme boosted production 6.8 per cent in a typical plant already employing music.

Said Professor Burriss-Meyer, "This would seem to bear

out a theory to which I have long subscribed, which is that, while music is better than no music, programming will not be satisfactory until it is undertaken on the basis of a careful analysis of the results it gets. We have to date only the showmanship and experience of the programmers. More statistical analysis of factory performance should teach us much. We believe that programming must ultimately be undertaken for the factory, if not for the specific operation. Fatigue curves vary in shape and amplitude and it is difficult to find one remedy for dips occurring at different times in different operations. We have, at least, established the fact that the remedy exists and the technique for employing it is in hand."

In closing, the speaker observed, "Little of the music used in the factory is germane to the endeavour it accompanies. The work song took not only its rhythm but its mood and lyric from the work operation. The transcription carried something composed for the concert hall, the stage or the night club. The leisure music is not in the idiom of the modern industrial plant and yet the industrial audience will at the present rate soon be the largest audience for the musician. No artist undertakes a composition or performance without the consciousness of his audience, and insofar as his art is valid he undertakes to exercise emotional control over that audience. When the composer starts to think of his work as being first and oftenest performed in a factory, before people who are working while they listen, we may well have a musical idiom which is something new on the face of the earth, and what industry can do for music may be as important when the record of this civilization is written, as anything music can do for industry."

# THE SUPERCHARGING OF TWO-STROKE DIESEL ENGINES

F. OEDERLIN

*Managing Director in charge of Engineering, Sulzer Brothers Limited, Winterthur, Switzerland*

Extracts from a paper describing development work in connection with the supercharging of two-stroke Diesel engines

**SUMMARY**—Starting with the Sulzer two-stroke Diesel engine with normal scavenging-air pressure, supercharged types of engines with exhaust-gas turbines are described, in which mean effective pressures of 12 to 18 kg. per CM<sup>2</sup> (170-255 lb. per sq. in.) have been reached not only on the testbed but also in industrial service. In addition, engines of special design are mentioned, whose working cylinders may also be used as power gas generators.

The supercharging of two-stroke Diesel engines has always been an important aim in the development of the Diesel engine, more particularly since the four-stroke engine has been supercharged successfully. In 1912 the Sulzer two-stroke engine was built with "extra-charging." The air charge in the cylinder at the beginning of the compression stroke was at a higher pressure than had hitherto been generally used. This extra-charging pressure was limited, in accordance with the scavenging-air pressure, to about 1.2 to 1.4 atm. (17-20 lb. per sq. in.) abs., this giving, as compared with engines without extra-charging, an increased output of 10 to 30 per cent. This extra-charging pressure has remained practically unchanged up to the present day and has been increased only in some special cases. The reason for this is that any further increase in the extra-charging pressure means an increase in the work absorbed by the scavenging pumps, and consequently the fuel consumption is increased unless the energy of the exhaust gases, which increases with the extra-charging pressure, can be utilized.

The adoption of higher supercharging pressures therefore requires, particularly with respect to fuel consumption, utilization of the exhaust energy, that is to say its conversion into useful mechanical energy. At present the best means for this is the exhaust-gas turbine.

The most evident solution would be to use the exhaust-gas turbine to drive a rotary compressor supplying scavenging and charging air, and in this way to eliminate the scavenging pump. Unfortunately it is not possible to realize this method of supercharging in practice, since only at high loads and high exhaust temperatures is the output of the exhaust-gas turbine sufficient for compressing the necessary amount of scavenging and charging air; at low loads the supply of air would be insufficient. The crux of the matter, however, is that the two-stroke engine supercharged in such a manner could not be started at all, since the exhaust-gas turbine driving the compressor comes too slowly up to speed after being started. Consequently, to supercharge the two-stroke engine, the energy which is lacking, particularly for the compressor when starting and at low load, must be supplied from outside.

It is possible for instance, according to the Sulzer-process here called "high supercharging," to adopt for this purpose a reciprocating scavenging-air pump, suitably strengthened and of such dimensions as to give the appropriate degree of supercharging, this pump being driven from the crankshaft and supplying the total quantity of air required. In order to be utilized, the turbine energy is transmitted to the crankshaft by gearing. The reciprocating scavenging-air pump may also be replaced by a rotary compressor which is driven direct or indirect from the exhaust-gas turbine coupled to the crankshaft through gearing. In both cases the compressor is already driven by the Diesel engine when starting and can therefore supply the necessary quantity of scavenging air. The supercharging pressure can, at least theoretically, be chosen as desired. The most efficacious supercharging pressure will vary, however, from time to time.

Investigations have shown that the indicated output of

the exhaust-gas turbine is greater than the indicated power absorbed by the compressor. A positive area of indicated work is therefore available for the charging set. However, because of the unavoidable losses in the exhaust-gas turbine and compressor, the output of the turbine is sufficient to cover the power required by the compressor only in the case of large installations and when the load on the plant is high. The surplus power of the supercharging set is then transmitted to the crankshaft through the gearing already mentioned. But even with engines of medium and small output the power required by the compressor will be supplied mostly by the exhaust-gas turbine. Under average conditions it can be presumed that the power required for the compressor and the output developed by the turbine will balance each other to a large extent.

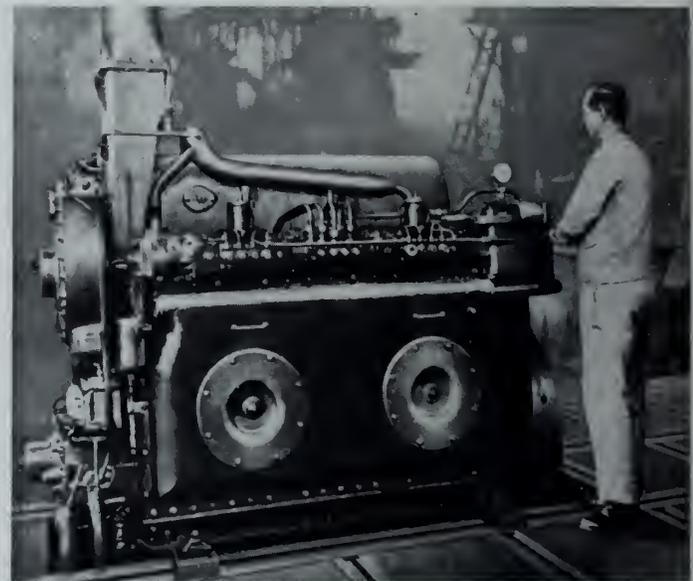

Fig. 1—First supercharged opposed-piston two-stroke Diesel engine with coupled exhaust turbines.

Based on these considerations, Sulzer Brothers several years ago took up the problem of two-stroke high supercharging. First of all a special experimental engine was built and submitted to thorough tests. These tests were at first confined to the Diesel engine alone. The effect of the exhaust-gas turbine was imitated by a throttle orifice. The air for scavenging and charging was taken from the compressed-air system in the works and heated up to the temperature corresponding to the polytropic compression of a normal compressor.

With this experimental engine supercharged to 2 atm. abs., a mean effective pressure of 12 kg. per cm<sup>2</sup> (170 lb. per sq. in.) was obtained with absolutely clear exhaust. This mean effective pressure could be maintained without any difficulty for a considerable length of time. During a later test on another engine with the same supercharging pressure, a mean effective pressure of as much as 13 kg. per cm<sup>2</sup> exponent (185 lb. per sq. in.) was maintained for 48 hours. In comparison with the non-supercharged two-stroke engine, the increase in mean effective pressure or in output was 100 per cent.

The same experimental engine was then worked with a supercharging pressure of 3 atm. abs., which allowed a mean effective pressure of 15 kg. per cm<sup>2</sup> (210 lb. per sq. in.) to

be reached, and this could also be maintained as long as desired with the exhaust perfectly clear.

After the clearance space had been suitably enlarged, the same experimental engine was run, the supercharging pressure being gradually increased to 6 atm.abs., and it was found that a mean effective pressure of 18 kg. per cm<sup>2</sup> (255 lb. per sq. in.) could be obtained. Under such conditions combustion takes place with a relatively large proportion of excess air and gives at all loads an absolutely smokeless exhaust gas, the purity of which shows it to be an excellent medium for working an exhaust-gas turbine.

Based on the excellent results obtained with the experimental engine mentioned, an engine supercharged to 2 atm.abs. was built. In order to obtain an engine with as high an output as possible, the opposed-piston type was adopted. The exhaust-gas turbine is connected overhung to the end of the exhaust manifold. Its output is transmitted to the crankshaft through toothed gearing. The scavenging and charging air is supplied by reciprocating compressors coupled to the crankshaft. This engine is shown in Figs. 1 and 2. Its principal data are:—

Number of cylinders.....	4
Bore.....	190 mm.
Stroke.....	2x300 mm.
Speed.....	750 r.p.m.
Piston speed.....	7.5 m/sec.
.....	1475 ft./min.
1-hour rating.....	1370 B.H.P.
Mean effective pressure at 1-hour rating, including turbine and compressor.	12 kg./cm <sup>2</sup> . 170 lb/sq.in.
Fuel consumption.....	158 grams/B.H.P.-hour. 0.35 lb/

During industrial service in the Sulzer works for more than 3,000 hours, it was found that the newly designed constructional elements comply in all respects with the stipulated conditions. The mechanical transmission of energy between exhaust turbine and crankshaft never gave rise to any trouble. Even during periods of severe cold the engine always started easily and quickly. This Sulzer engine represents the first practically usable realization of a supercharged two-stroke engine with built-on exhaust-gas turbine, with which such high mean effective pressures were attained.

In large installations the mechanical coupling between the turbine and the crankshaft can be replaced by an electro-magnetic or an hydraulic coupling. The transmission of energy may also be effected electrically, the supercharging set being driven by an electric motor receiving energy from the mains or from a separate generator.

In order to determine the suitability of high supercharging at higher speeds, an experimental engine was built having cylinders of 120 mm. bore and 2 by 150 mm. stroke,

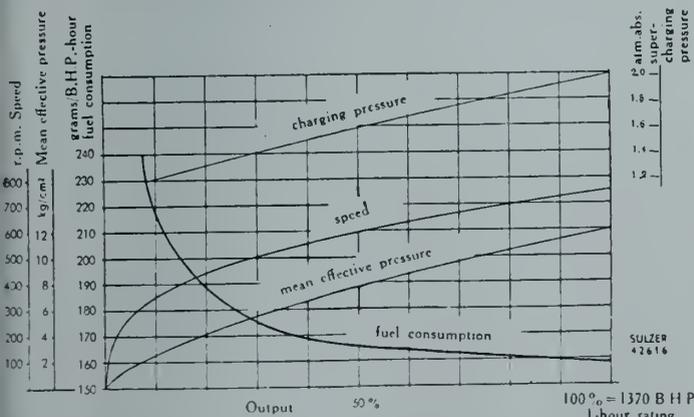

Fig. 2—Fuel consumption, speed, charging pressure and mean effective pressure of the supercharged opposed-piston two-stroke Diesel engine illustrated in Fig. 1, as a function of the load when working according to the propeller law.

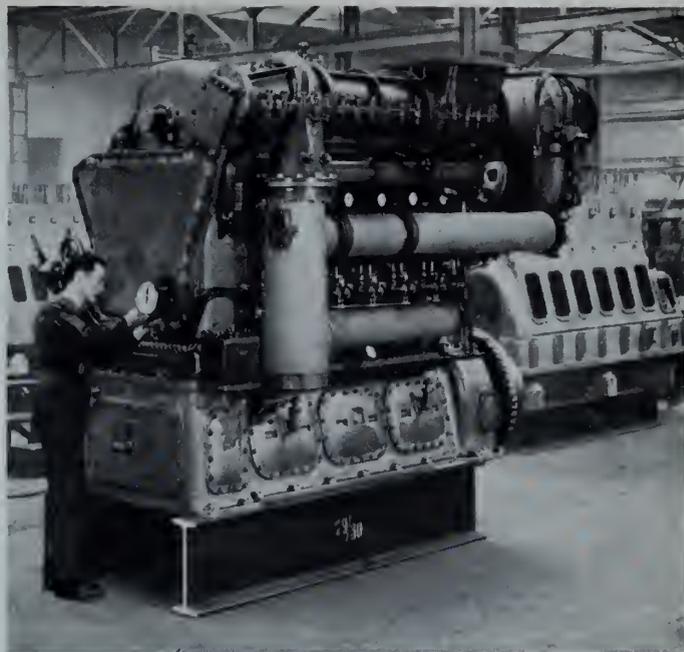

Fig. 3—Two-stroke two-shaft opposed-piston Diesel engine, supercharged to 2 atm. abs. and developing 1,560 B.H.P. at 850 r.p.m.

and intended at first to run at 1500 r.p.m. Also this new design easily reached the mean effective pressures of the former experimental engines, amounting to 12, 15 and 18 kg per cm<sup>2</sup> with supercharging to 2, 3 and 6 atm.abs., respectively. At 1500 r.p.m. the fuel consumption was 180-190 grams per B.H.P. per hour, if the output of the turbine and the power absorbed by the compressor are not considered, which, as mentioned, practically balance each other. Meanwhile the speed has been raised to 2400 r.p.m., corresponding to a piston speed of 12 m. per sec.

In addition, tests were made on a single-piston engine of 420 mm. bore, where the supercharging was at first limited to 2 atm.abs. Also these tests showed that the output increases up to this limit practically in direct proportion to the height of supercharging, thus confirming the results that had been obtained with engines of smaller bore in this field.

Based on these results, Sulzer Brothers have started gradually to adapt their single-piston engines of medium-sized and large bore to the requirements of two-stroke supercharging. Simultaneously they have developed a new type of engine (Fig. 3), allowing a far-reaching utilization of the possibilities offered by high supercharging. This engine, of the two-shaft opposed-piston type, has the following data:—

Number of cylinders.....	6
Bore.....	180 mm.
Stroke.....	2x225 mm.
Speed.....	850 r.p.m.
Piston speed.....	6.375 m/sec. 1250 ft./min.
Supercharging pressure.....	2 atm.abs. 28 lb/sq.in.
Output, 1-hour rating.....	1560 B.H.P.

This engine is built in such a way that it can also be supercharged experimentally at 6 atm.abs. thus raising its output to 2340 B.H.P. and further reducing its specific weight.

Supercharging to 5 or 6 atm. (70-85 lb. per sq. in.) abs. is peculiar, in that, within this range of supercharging, the power delivered by the Diesel engine and the power absorbed by the supercharging compressor become equal. The effective output of the whole plant thus corresponds essentially to the output of the exhaust-gas turbine. The turbine may therefore be uncoupled from the Diesel engine and from the compressor without disturbing the energy balance of the

whole set. The set, comprising Diesel engine and compressor, here designated "power gas generator," fulfils the same purpose as, for instance, a boiler in a steam power station. The whole effective output is given out by the power gas turbine which corresponds to the steam turbine of the steam power station. Accordingly several power gas generators can be arranged to work on one common power gas turbine.

This power generating process can also be performed by free-piston power gas generators. With power gas generators of this kind (shown diagrammatically in Fig. 4), each of the opposed pistons of the Diesel part works direct on a compressor piston which compresses the scavenging and charging air. No crankshaft is provided. The two pistons

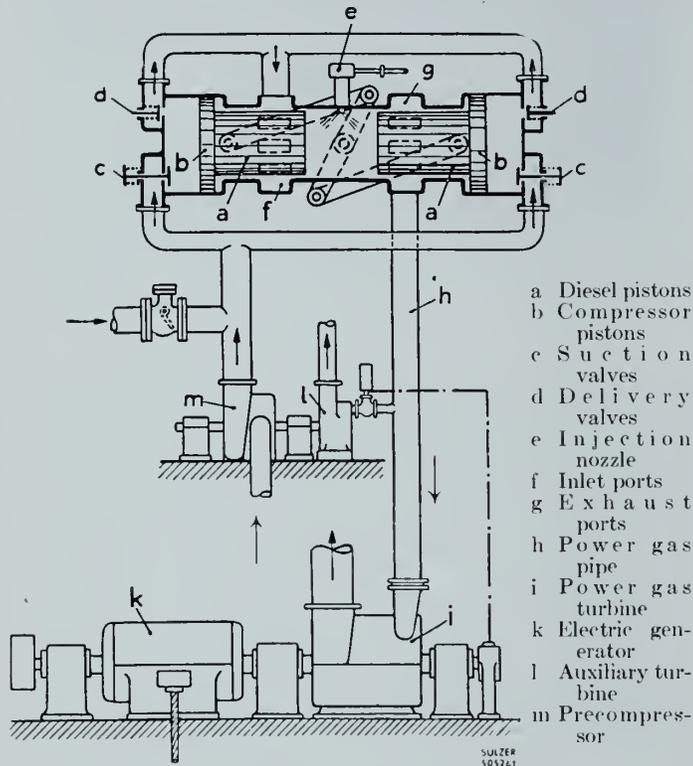

Fig. 4—Power gas process with free-piston power gas generator. The two Diesel pistons *a* with the built-on compressor pistons *b* are connected to each other by a synchronising device. The two Diesel pistons are pushed inwards by the expansion of the air remaining in the compressor cylinders, thereby compressing the air contained in the Diesel cylinder. The fuel injected through the nozzle *e* is burnt in the highly compressed air, after which the two Diesel pistons are forced outwards. Then the air drawn in by the compressor pistons during the previous stroke is compressed. The compressed air delivered by the arrangement serves for scavenging and charging the Diesel cylinder. The exhaust gases, here called power gases, drive the exhaust gas turbine *i* coupled to an electric generator *k*. The auxiliary turbine *l*, which is also connected to the power gas pipe *h*, drives the precompressor *m* which precompresses the air entering the compressors and thereby supercharges them.

are merely coupled to each other by a linkage which ensures their running symmetrically. The volume of the clearance space adjusts itself automatically to suit the supercharging pressure used at the moment.

The power gas process constitutes a practical realization of the "gas turbine." A remarkable feature is the high thermal efficiency of 35 to 40 per cent, without employing any recuperators or similar apparatus and at service temperatures of only 450 to 500 deg. C. (840-935 deg. F.). The power gas turbines are small and simple. The reliability in service of the whole plant is increased by the independence of the individual power gas generators. Critical speeds are not to be feared, since the separate power gas generators are coupled to each other only by a very flexible gas column. With the power gas process, outputs may be obtained

which lay hitherto beyond the range covered by the Diesel engine, and with specific weights corresponding to those of the lightest steam installations.

The supercharging pressure may be increased beyond 6 atm.abs. With the power gas process, however, the exhaust-gas turbine output must be drawn upon in this case for the compression work, since the power required by the compressor exceeds the power developed by the Diesel engine.

The supercharging set of the supercharged two-stroke engine may be regarded as a constant-pressure gas turbine, i.e., a gas turbine with continuous combustion whose combustion chamber is replaced by a supercharged Diesel engine. The supercharging set has, as in the case of the gas turbine, an indicated output of positive value. Whilst in the case of the gas turbine only the difference between the output of the turbine and the power absorbed by the compressor appears as effective output, this is increased, with high supercharging, by the output obtained from the Diesel engine. Its effect appears clearly in the thermal efficiency, which is of the order of about 40 per cent with high supercharging, whilst it amounts to about 18 per cent with the simple gas turbine.

Replacing the combustion chamber of the gas turbine by a Diesel engine is also justified with respect to the heat load, since it is in any case necessary to cool the hot gases from their initial temperature of 1500-2000 deg. C. to about 500-600 deg. C. before admitting them to the exhaust-gas turbine. Instead of effecting this cooling by admixture of excess air, as is the case in the gas turbine, this cooling takes place in the supercharged Diesel engine, mostly through adiabatic expansion of the gases in the Diesel cylinders, where they at the same time perform useful work.

When the supercharging pressure of the Diesel engine is further increased, the swept volume becomes smaller and smaller, the clearance remaining the same. In the limiting case the swept volume becomes zero, and the Diesel engine is then reduced to nothing but clearance space. This is then identical with the combustion chamber of the hypothetical high-pressure gas turbine, which because of its high working temperatures can at present not yet be realized. On the other hand, this working process can, as has been shown, be carried out with good efficiency in the supercharged Diesel engine or in the power gas plant.

From the constructional point of view it is logical to have the combustion process and the higher compression and expansion pressures in the Diesel cylinder, this being the most suitable structural element therefor. Since, however, the expensive swept volume of the Diesel engine is only poorly utilized in the lower part of the indicator diagram, it is again logical, as far as it is possible to do so, to confide this part of the compression and expansion work to radial or axial compressors and to turbines, which as is well known, are cheaper, lighter and smaller, and have proved especially well suited for handling large quantities of gases at low and medium pressures.

From these considerations and the results obtained, it can be concluded that there are important reasons in favour of this combination of the Diesel engine and the gas turbine. It offers an increase in thermal efficiency of more than 100% as compared with the gas turbine, and an increase in mean effective pressure of 100 to 200% as compared with the non-supercharged Diesel engine.

Nevertheless the gas turbine should acquire importance as well as the power gas process, especially in fields where units of great power are needed, provided that its efficiency, at full load and particularly at part load, can be considerably improved. However, the gas turbine will not be able to replace the Diesel engine, whether supercharged or not, since the Diesel engine can still today claim to have the highest thermal efficiency of any form of thermal prime mover, and it will maintain this superiority also in face of the gas turbine.

# WARTIME NATIONAL EFFICIENCY

G. A. GAHERTY, M.E.I.C.

President of the Montreal Engineering Company, Ltd.

Substance of an address given September 9, 1942, at a dinner meeting of the American Institute of Electrical Engineers' Pacific Coast convention, Vancouver, B.C.

**SUMMARY**—Recognizing that war causes a dislocation in a nation's economy which in turn tends to lower its efficiency, the author cites the necessity for expediting war production in Canada and suggests a national-efficiency programme applicable to any nation at war. He declares that to achieve victory there must be a judicious allocation of men and materials for the maximum output of the implements of war and for the curtailed output of essential civilian goods; that there must be a rigorous practice of conservation on the part of individuals, business, and government; and that there must be a forfeiture of personal convenience where the national welfare is concerned.

Canada now has been at war for three years and in that time has advanced far along the road to total war. It is timely to consider the war experiences of Canada, and the conclusions that can be drawn from them, since the war programme of the United States, as it unfolds, is likely to follow much the same pattern.

At the very outset Canada became a major and rapidly increasing source of supply for Britain of aluminum, copper, zinc, foodstuffs, and automotive equipment. The financing of these purchases, a billion dollars of which were assumed by the Canadian Government, was a heavy strain on Canadian economy, but thanks to the foresight of the Canadian Department of Finance, stringent control of foreign exchange was imposed and enforced from the outbreak of war. While this brought the war home to Canadians who wanted American funds, it enabled Canada to finance the British requirements and also to meet her own financial obligations to the United States.

With the co-operation of industry, prices on war goods in Canada were for a time held down to prewar levels, but the industrial activity resulted in so much more money in the hands of wage earners that prices soon began to rise at an alarming rate. Sensing the danger, the Canadian Government with commendable promptness stabilized wages more than a year ago on a cost-of-living basis and established maximum prices for goods and services. These "ceilings" have since been maintained with considerable success, notwithstanding the efforts of certain labour and agricultural pressure groups.

## ALLOCATE MEN AS WELL AS MATERIALS

Income and other taxes have been raised until those whose income is dependent upon the profits of corporations are taxed even more heavily than in Britain. The excess profits tax has been increased to 100 per cent, of which 20 per cent represents compulsory savings refundable after the war. Compulsory saving has been instituted for those on salaries and wages, and installment buying has been curbed. Gasoline, sugar, coffee, and tea have been rationed throughout Canada. The civilian use of rubber, copper, aluminum, and steel has been cut almost to nothing and even their military use is drastically restricted. The manufacture of many articles has been prohibited. Notwithstanding these measures, the shortage of labour has become so acute that vital war industries such as shipbuilding are now working at reduced capacity because of inability to get men. Selective service, which the Government has just introduced, is designed to make more men available for war work, but there is a definite limit to the Canadian manpower supply and the war effort can be further stepped up only through the more effective utilization of resources in man-power and materials, in other words, by wartime national efficiency.

With all due respect for the splendid progress to date, this is no time for complacency. We are facing a crafty

and unscrupulous enemy. He has cut us off from our main sources of three vital war materials: tin, tungsten, and rubber. He is taking a heavy toll of shipping and has played havoc with lines of communication, notably his severing of the Mediterranean route to Suez. Resources are being dissipated by the resulting necessity for convoying, for shipping via roundabout routes, for building ships to replace those he is sinking, and for constructing synthetic-rubber plants. His resources, at the same time, are increasing as he puts to work the enslaved peoples of Europe.

Make no mistake of it, victory can be achieved only by the complete mobilization of *all* our resources and their skillful employment in offensive operations; in other words, total war. *We must seek out and destroy the enemy.* It is not the total number of men in the army that counts, but the fire-power and the mobility of the armed force with which to strike across the English Channel and in the China Sea. The Canadian Navy, Army, Air Force and munitions industry must all be developed in proper balance so that an attack can be made with maximum effect.

## MILITARY VERSUS POLITICAL STRATEGY

The great weakness of democracies is that their resources too often are frittered away through the deciding of war policies on grounds of political expediency rather than of military strategy. In Canada, for example, in calling up men for military service, whether they are married or single is the criterion, and single men who are too old are taken in preference to married men better fitted for fighting. In matters of this kind motives of self-interest still dominate, unfortunately. Our problem is to better, by democratic means, what the National Socialists of Germany achieve by enslavement, espionage, and lying propaganda. The stepping-up of Canadian national efficiency for war involves not only the problem of allocating each individual to his proper sphere, but also the problem of recognizing and counteracting the various subversive forces and of building a morale conducive to the *maximum output per individual.*

A major war causes an upheaval in national economy that in itself tends to lower national efficiency. In peacetime we live largely by taking in each other's washing. We exchange goods and services, money serving as a convenient medium whereby transactions can be effected that are fundamentally barter. The real wages for our services are not the money we receive, but what that money will purchase in goods and services. Such goods and services can be made available in wartime only at the expense of war production, and herein lies the main difficulty of a wartime economy. For the *total war* in which we are involved, the very *minimum standard of living* for everyone is indispensable, as is also the *maximum war output per individual.* The problem is how to get everyone working to his utmost with the very minimum of immediate reward.

## LIVING STANDARDS VERSUS WAR PRODUCTION

A major war produces a tremendous dislocation of income, and consequently of purchasing power. On the one hand, many businesses such as the automobile business become war casualties; salaried people must work longer hours but for an income that is much reduced by taxation; those who have invested their savings in common stocks, the very foundation of our industrial progress, have their income taxed first in the hands of the corporation, and then again when it reaches the individual. On the other hand, wage earners in most cases are much better off. They are

fully employed and they work longer hours often at high overtime rates. Some of them, who ordinarily would be considered unemployable command good wages under the present acute labour shortage. It is not surprising to find them breaking out in a spending rash and buying those things which heretofore they have been unable to buy. Thus we find an increased demand for the very goods the production of which must be curtailed or cut off to wage a successful war. It is this increased demand with a diminished supply of such goods and services that starts the inflationary spiral.

How best to curb the purchasing power of the individual while the war lasts is the question facing us to-day. Taxation, rationing, and curtailment of production of non-essentials all have their place, but if carried too far promote discontent, and for maximum output it is indispensable that our workers be happy. We must do our utmost to induce the workers to postpone the enjoyment of the fruits of their labour until after the war; in other words, to save. It is of no great importance whether the savings are in war loans, or in bank deposits, or in paying off a mortgage, so long as the money is not spent on services or goods the production of which involves the use of man-power or of critical materials. It should be recognized, however, that a modicum of non-essentials, and even of luxuries is indispensable if the worker is to be kept happy, and we should concentrate on those that involve the least use of man-power and critical materials.

#### WHAT IS "ESSENTIAL" ?

The individual view as to what is "essential" depends largely on "whose ox is gored." There is the example of a labour deputation, in a Canadian province that prides itself on its patriotism, arguing that a local newsprint mill should not be shut down, but that instead "non-essential" industries should be discontinued. Needless to say, the deputation did not elaborate on what industries it considered "nonessential" and why. We in the light-and-power business, until recently at least, have considered electricity to be indispensable. True, it is essential for the mass production of munitions, but for the household it is only a convenience. Further, the use of electric power for the display advertising of goods, the sale of which should be restricted, is a positive detriment to the war effort.

Essentiality is also a question of degree. A four-page newspaper might be deemed essential, but not so a forty-page one. Wheat and flour are just as essential for our war effort as shells, but we do not need all the 400,000,000 bushels that the Canadian prairie produces. When production facilities exceed essential needs, efficiency generally can be achieved best by maintaining capacity operation in enough plants to produce only the required amount of goods, allowing these plants an adequate supply of labour and materials, and by closing down plants which produce goods in excess of exact needs. This already has been done in several Canadian industries, such as sugar refining.

Essentiality is a word that cannot be qualified. Either a thing is essential or it is not; but one cannot say that one thing is more essential than another, that tanks are more essential than guns. Both are needed in definite proportions, although one may be needed in advance of the other. Already the Englishman has been forced to recognize this and has done away with priorities almost entirely. To obtain the requisite materials, however, a "certificate of essentiality" is required, and by this means non-essentials are cut off and war work is limited to what existing facilities and resources can produce efficiently.

We must always remember that there is a definite limit to what we can produce, and if we attempt to push our production too far we end by actually producing less. The law of supply and demand works as far as labour is concerned, and if the demand exceeds the supply the loafer comes into his own and efficiency drops. It is therefore imperative that we cut our suit according to our cloth and

concentrate our attention on the more effective use of our existing resources—men as well as materials.

The curbing of nonessential spending by companies and by governments insofar as it involves the use of man-power and of critical materials is just as important as in the case of the individual. Expenditures for extensions and replacements should be avoided wherever possible, and old equipment made to last. Accounting, sales, and other departments should be streamlined to eliminate all unnecessary posts, current maintenance should be deferred to the very limit. For example, a Canadian power company is adopting a bi-monthly accounting period. It should be recognized, however, that company policy regarding replacements and maintenance is something that from its very nature is beyond the control of the government and that to secure the full co-operation of the companies, it is indispensable that labour and materials for maintenance and replacements be made available as necessary on a high priority. Otherwise the far-sighted plant manager is likely to stock up with spare parts and keep his plant in a high state of repair for fear of getting caught with a prolonged shutdown because of material or labour shortage.

#### GOVERNMENTS CAN ECONOMIZE TOO

For years civil government has been absorbing a greater and greater proportion of workers, but we have now reached a point where we must revert to the simpler life of earlier days. Our various government agencies now provide innumerable services ostensibly for the benefit of the public that could be dispensed with until after the war. Every civil servant that can be diverted to war work is just so much clear gain even if his full former salary is continued. Public-utility commissioners, judges, and so forth, have the experience needed to administer the various war controls, and already in Canada the services of such men are being utilized in war jobs.

Throughout the country the construction of public works such as roads is rapidly being tapered off and before long we expect to see it cease altogether, as more and more of our political leaders are realizing that such work is carried out only at the expense of our war effort. A much more difficult problem arises in connection with works having a wartime justification such as housing projects. Here it is a case of relative importance. We must always remember that every house we build is at the expense of our production of guns and tanks, and we must decide which we need more. Obviously it is better to be somewhat overcrowded than to have our country overrun by the enemy. Too much overcrowding however results in discontent among workmen and a lowering of the war output per man. The danger is that local pressure groups will force the building of housing projects, when in the national interest the man-power and the materials are more urgently required for other purposes. Such pressure groups usually are led by well-meaning citizens who think they are doing a public service, but their activities should be recognized in their true light as one of the most effective forms of sabotage.

In such questions the short-term view must be taken. It is the current expenditure of material and man-power that counts. Whether it be a barracks, a munitions factory, or a housing project, the use of temporary instead of permanent construction is fully justified wherever any saving can be made in man-power or critical materials, as this will mean that many more ships and guns can be turned out currently, and they are needed *now*.

Our armed forces constitute the chief drain on our total man-power and therefore it is the efficiency with which they are employed that is the main factor in our war effort. The total *number* of men in the army means nothing. It is the number that can *strike* in a theatre of war and their fire-power that counts. It is not the number of tanks and airplanes, but their fighting qualities that count. Too often in democratic countries sectional pressure leads to forces being immobilized to guard against possible hit-and-run

raids and other military diversions. Also, shore establishment in dockyards may be built up, although repair work might be done with less use of man-power by shipbuilding contractors. More men may be used to guard munition plants than would be required to restore any damage likely to arise from sabotage if the plants were left unprotected. These are questions that should be dealt with by the General Staff, but it is the duty of every citizen to see that the General Staff in making these decisions is unhampered by the sinister activities of pressure groups.

#### IF WE ARE TO STOP LOSING THIS WAR—

If we are to stop losing the war, further industries and businesses will have to be shut down. In some instances these necessary changes involve disturbing implications. South Africa, for example, is almost entirely dependent upon the gold-mining industry, but that industry is not essential to the war effort of the United Nations. It is only by the drastic curtailment of nonessential industries that sufficient labour can be made available to relieve the acute shortage in war industries. The 40-hour week and the various conditions of labour which require the employment of three men where two would do, jurisdictional limitations which prevent a man from handling

more than one job—these, too, are contrary to the national interest in wartime when all must produce the utmost.

We in the power business have had to slip into reverse. It is no easy matter to overcome the training of years and start saving electricity so that it will be available in sufficient quantity for essential war industries. That is to say, we must forego sales that are our bread and butter to take on business that is financially unattractive. At least one power company in Canada is already replacing copper conductors with iron wire on lightly loaded primary circuits so as to make more of this scarce metal available for war purposes.

Beware of the individual who looks upon the war as a golden opportunity to introduce his pet social theory, such as prohibition which was foisted on the country in the last war. Thumbs down on those who by spreading racial, sectional, religious, or class prejudice, would divide and rule.

Promote, particularly among those in the lower income brackets, a better understanding of the reasons for war hardships. Provide the necessary incentive so all will work to the utmost. Save both as individuals and in one's official capacity so that man-power and material can be conserved for war work. This is the way to step up our wartime national efficiency.

## SALVAGE AND SUBSTITUTES

On October 17th, fifteen hundred production men attended a conference of munitions manufacturers. It was held in Toronto, and was called by the Production Coordinator of the Department of Munitions, H. J. Carmichael. The topic was how to produce to capacity. Waste must go. Materials, machinery and man-power must be made to go farther, by substitutions, redesigning, and new methods. The Minister, C. D. Howe, sent a special message to the gathering. The staff of his department had arranged an impressive show of examples where savings have already been made. The changes they illustrated have already led to savings amounting to over one hundred and fifty million dollars annually, and to the release of valuable machine tools, rubber, copper, tin, and labour. Canadian industry is required to continue and intensify this effort. What has already been accomplished, said Mr. Carmichael, only scratches the surface.

The exhibits showed the astonishing effect of changes in details or small parts. For example, redesign of the rear catch of the Bren machine gun magazine, formerly welded but now stamped, saves 198,000 pounds of copper coated welding rod, \$39,000 worth of oxygen and acetylene, saves 515,592 man-hours and releases ten milling machines and 24 welding positions at the cost of six new machines, resulting in an estimated annual saving of \$339,112. Hundreds of other instances could be named. The substitution of Canadian-made wood pulp for the imported cotton linters formerly used in nitrocellulose manufacture for explosives, increases our nitrocellulose manufacturing capacity and shows a net annual saving, including exchange, of two million dollars.

The exhibition was in fact, an extraordinary pooling of trade secrets and methods. Production men were not only asked to save critical materials, machines and man-hours, they were shown how it was being done and how it could be done. They were assured by officials of Army, Navy and Air Force Inspection Boards that although there would still be insistence on high quality the programme would have the full co-operation of their inspection authorities.

Not only were the production men asked to turn their own engineering staffs on to the problems of conservation by redesign, simplification and substitution, they were asked to seek out and welcome suggestions from all their workers.

"Suggestion box" systems which have been successful in some of the larger plants were described and recommended as sources of new ideas.

Canadian production of munitions and supplies will reach its peak early in 1943, at an estimated total of \$3,700,000,000 a year. In face of a programme that is taxing our raw material supplies, plant capacity and man-power to the

A corner of the exhibit at the munitions manufacturers conference in Toronto on October 17th.

utmost, the time has now come for intensive development of every possible resource, not only in material and machines, but in human ingenuity as well. The Carmichael conference was not twenty-four hours old before immediate results were becoming manifest. A change in production method, inspired by the conference, was announced by a large munitions plant. The change will permit reallocation of 300 workers to other tasks. Investigation of material replacement possibilities was under way in many plants. A major munitions project announced its intention to adopt the government-endorsed "suggestion box" scheme immediately. A company which had applied for a building project cancelled the request. Canadian wartime industry is buckling down to the stern job of making the most of what we've got.

# MAN-POWER CONTROL IN CANADA

At the recent joint meeting of The Engineering Institute of Canada and the American Society of Civil Engineers at Niagara Falls, Ont., an address on this subject was given by the general secretary of the Institute; his remarks form the basis of the following article. As our members know, Mr. Wright's services are lent to the government, and he is now assistant director of National Selective Service at Ottawa. The director of the Wartime Bureau of Technical Personnel, H. W. Lea, M.E.I.C., was present at the meeting and added to the information presented by Mr. Wright.

Few Canadians yet realize the wide scope and real importance of the operations of the National Selective Service organization, or the active part which the Institute and kindred societies took in the early stages of its development. Obviously there must be proper control and utilization of all our man-power if our war effort is to be a total one. Thus the means by which this vital need is being supplied must be of primary interest to every Canadian and especially to engineers, because the first steps taken dealt with the availability of technically trained men.

Late in 1938—before war began—the Department of National Defence asked the three national technical institutes (the Canadian Institute of Chemistry, the Canadian Institute of Mining and Metallurgy, and The Engineering Institute of Canada), to circularize their membership in order to establish a roster of technical personnel giving the information necessary for the utilization of such persons in time of war. This is believed to have been Canada's first effort to survey any part of the man-power field for war purposes. The request was encouraging for it accepted the principle that members of a specialized group are the people best qualified to deal with that group.

A committee made up of the secretaries of the three institutes was established to carry out the work. Recognizing the national importance of such a registration, the committee recommended that registration should go beyond the membership of the three institutes, and include the provincial associations of professional engineers, and certain other organizations whose membership could be classified as technical.

A questionnaire devised and supplied by the Department of National Defence was circulated to a consolidated mailing list. From the completed forms the information was transferred to cards upon which the skills and competencies of each person were noted in the form of a coded index.

About this time Ottawa was being flooded by offers of citizens to serve in almost every or any capacity. To handle this there was set up by the Government an office known as the Voluntary Service Registration Bureau. Eventually all the records of the original questionnaire were transferred to that office thus installing the technical section of the Bureau. The valiant efforts of its small staff, however, could not cope with such a huge task, and as time went on the usefulness of the records became increasingly limited.

Late in 1940 the three institutes were approached again, this time by the Department of Labour. By now the war had progressed sufficiently that the shortage of technical personnel was apparent, and it became more than ever urgent that something be done about it.

The Department of Labour proposed that the three institutes should combine to take over the whole problem and work out their own solutions. The acceptance of this proposal in February 1941 resulted in the establishment by order-in-council of the Wartime Bureau of Technical Personnel. The three institutes recommended to the Minister the appointment of Elliott M. Little to the post of director of the Bureau, and late in February the Bureau opened its office in Ottawa.

The direction of the enterprise was left entirely in the hands of the voluntary bodies, while the costs were met by the Federal Government. It is pleasant to know that the

Government's confidence in this technical group has not been misplaced. The results of the work of the bureau are indeed gratifying.

In view of the desire to have the bureau act for the entire professional group, an advisory board was established, upon which representation was given to the three institutes, the universities, the professional associations and employers as represented by the Canadian Manufacturers' Association. Thanks are due for the assistance given in preliminary investigations by American friends, particularly the National Roster of Scientific and Technical Personnel in Washington and the employment office of the Founder Societies in New York.

The Bureau's record system has been kept very simple. The complete story of each person is kept on a large questionnaire filed alphabetically with smaller cards filed under classification code numbers to indicate competencies. In this way any person can be found by name and any type of person can be found under the classification code number.

After approximately one year of operation a very helpful order-in-council was passed. The principle features of Order-in-Council 638 are:

(a) That no technical person as described in the order can take a new position without having a permit from the Bureau.

(b) No employer can take into his employ any technical person without a permit.

(c) Every employer will have to maintain the seniority of any employee who leaves his services for more essential work at the request of the Bureau and reinstate him at the conclusion of that work.

The total number of registered persons is about 25,000 which is probably 80 per cent of all the technical personnel in Canada. The Bureau is now issuing about 400 permits a month.

The Bureau is also concerned with the availability of students following technical courses at the universities, and has been influential in the establishment of a control system which provides for the postponement of their call-up for compulsory military service during their college courses, provided that they enroll in the C.O.T.C. or some other unit. Students who fail to pass university examinations, however, may be called up immediately. Post graduate study is only permitted if it is considered to be in the national interest or in aid of the prosecution of the war. Permission is refused for a student to change his course. These and other requirements are covered by Order-in-Council 8343.

During the first two years of the war it became increasingly evident that peace time methods of obtaining workers and supervisory personnel were quite inadequate to fill the needs of our rapidly expanding wartime industries. Difficulties, interferences, and confusion developed in existing industries. The establishment of new plants and the growth of old ones led to shortage of men and excessive labour turn over. It became evident that a very extensive general scheme of man-power control must be put in force. The work of the Wartime Bureau of Technical Personnel was in fact an essential part, but only a part, of the task of man-power control, and it was no doubt a recognition of this fact which led to the selection of Elliott Little, the director of the Bureau, to direct the new and larger organization now found to be necessary.

Accordingly, legislation was passed putting in force, some six months ago, a comprehensive system of man-power control under the name of National Selective Service. Its original form was modified by certain changes made as recently as September 1st, when its scope and the powers of the board were extended, so as to make a reasonable amount of control eventually possible. It is realized that many

difficulties are ahead, however, and that it will take time to surmount them.

The following notes will help to indicate the principles on which National Selective Service is now working:

As part of the Selective Service authority, the Minister of Labour has power to call for the compulsory registration of any groups of people in Canada. This is being done and from these special registrations there is being built up a man-power inventory of everyone in the Dominion.

The field organization is using the existing local offices of the Unemployment Insurance Commission, some two hundred in number, and additional offices will be opened where needed.

The outstanding features of the Selective Service legislation are briefly as follows:

A schedule of priorities of industries has been established to be used as a guide by the employment offices in placing men.

With a few exceptions no person may leave his employment without giving at least seven days notice, and no employer may lay off or dismiss a worker without giving him seven days notice. The purpose of these important provisions is to stabilize the movement of labour. With a scarcity in every industry it was not reasonable to permit workers to wander from place to place as they saw fit without regard to the amount of time lost nor was it reasonable to permit employers to dismiss men without giving them some notice whereby they might arrange for their next employment.

As Selective Service is now responsible for the placement of all workers it is absolutely necessary that some advance notice be given of the requirements of employers and of all dismissals so that some planning can be done in advance. The notice also provides a cooling-off time for both employer and the employee in which a decision not to be separated might be made.

No employer may take into employment or discuss employment with any worker who does not carry with him a permit issued by a Selective Service officer whereby he is permitted to be interviewed and to be employed. These permits are obtained when the seven days notice of separation is brought to the Selective Service officer.

The permit is usually limited to the area in which the office functions, that is, a worker may not move back and forward across the country unless he has a permit authorizing him to do so. A great deal of the travelling done by

labour was induced by employers themselves who were constantly making their needs known in other parts of the country.

The permit may also limit the work to a single establishment or to a single industry or to a single occupation. In this way, absolute control is given over the direction of all unemployed labour.

A disturbing factor in the labour market has been a multiplicity of "help wanted" advertisements appearing in the daily papers. The new legislation now prohibits advertising unless the advertisement is approved by a Selective Service officer.

Any person who has been out of work for seven days may be placed in employment by an officer and he may not leave this employment without the permission of the same officer.

Any person who has been only partially employed for a period of fourteen days may be moved to other work of a high essentiality where he may work full time.

Provision has been made for certain supplementary allowances to compensate workers when they are transferred by a Selective Service officer. These allowances include travelling compensation and compensation when the earnings on the new position are less than those of the position from which he was transferred. Advances can also be made at the commencement of new employment to help a worker until his first pay is received.

Severe penalties are provided for infraction, fines up to \$500 may be assessed and imprisonment up to twelve months with hard labour or both fine and imprisonment.

This, in essence, covers the labour controls now in force in Canada. Some weaknesses have been found in the legislation but they are not serious and, on the whole, it is believed excellent results can be obtained from the present regulations.

It is evident that during a brief transition period there will be some confusion and even misunderstanding, but eventually the controls will work smoothly as their necessity becomes understood. Many employers have already reported greatly improved conditions, although there has not yet been time for the system to function to its full extent.

With the support of the public the job can be done. Engineers form an influential section of that public, and their assistance will be specially helpful.

---

## BROTHERS OF THE BRIDGE

A. L. CARRUTHERS, M.E.I.C.

*Bridge Engineer, Provincial Department of Public Works, Victoria, B.C.*

**From an address presented to the Victoria Branch of the Engineering Institute of Canada,  
on January 19, 1940**

*Abstracted by R. C. PURSER, M.E.I.C.*

When the Dark Ages descended upon Europe after the fall of the Roman Empire, progress in the arts and sciences received a shock that made its impress felt for a thousand years. Law and order were disrupted, trade and commerce almost ceased, and fear and suspicion prevailed everywhere. Barbarism terrorized the population for many years.

Included in the general disintegration was the art and science of transportation, developed by the Romans to a high point in their many conquests. Roads and bridges, so necessary to them in the subjugation of outlying countries, became a danger to those countries now that the imperial power had become dissipated. Such facilities were an invitation to the invader to loot, rob, pillage and destroy. For this reason they were largely neglected and sometimes even done away with, a course of action that was concurred in by the Church, which maintained that rivers, gorges and mountains were made by Providence to keep peoples apart.

The consequences to trade and to the whole political, social and commercial structure of Europe were tremendous.

After the first period of utter chaos was over, a system of society distinctive to the age was slowly evolved. Human beings, like every other animate creature, must eat to live. So back to mother earth they were forced. In time as they gradually attained a measure of abundance they felt the necessity of defending themselves and their possessions and of building up some semblance of law and order. Out of this necessity, through long centuries of darkness, they groped their way toward and into the feudal system, an economic, political and social system based simply and only upon fixed property—land and buildings.

It would take too much space here to trace the complete development of this system in western Europe throughout the mediaeval period, to describe its amazing virility and the reasons why some vestiges of it still persist in such a

democratic, highly industrialized country as England is to-day. Although it was a good system for the times, in that by fixing society to the soil it brought barbarism to a halt, it had many limitations, not the least of which was the fact that it steadily resisted the free movement of trade. For this reason feudalism saw no necessity for the extensive development of transportation facilities, and was disinclined toward any outstanding contribution that would tend to break down the generally held notion that geographic barriers were meant to keep people apart. But it could not stifle such development entirely.

An important feature of the times was the place of monasticism in social life. All monasteries were not started initially as religious institutions—they existed long before the Christian era—but those organized and supported by the Church naturally emphasized the religious side of life. To a large extent they were established and maintained by men who craved to be emancipated from the ennui that was eating their hearts out, those who found themselves unemployed, frustrated, disillusioned and generally “fed up.” There are records to show that they were, at times, started simply as unemployment camps to which flocked thousands of people from every class of society, simply to find an escape or asylum for themselves. Their ranks included the lazy, the active, intelligent, illiterate and educated, the saint, the sinner, the serf, freeman and knight, and even feudal lords.

The monasteries were feudal. The abbots of the monastery were feudal lords. Their overlord and source of property rights might be a baron, a prince or king, a bishop, or as evolved in later years the Pope at Rome. Fees or dues were paid in produce or later on in money, or both. To maintain their own health and sanity in these institutions the monks toiled and also impressed upon their members the duty and dignity of worthwhile work. They turned to practical pursuits, to studies, art, science, literature, farming and what is of interest to the modern engineer, in the course of time some of them turned to bridge building.

Among the privileges bestowed upon the monks by their feudal lords was that of collecting tolls on roads, bridges and ferries. These tolls they turned into the monastic treasury and from them the monks received their subsistence. This was in recognition of their commendable service in establishing hostels for the care and protection of transients and travellers. But it was a poor subsistence as trade and travel in those days was not extensive.

In time the monks established for themselves an enviable reputation. Their humble services were greatly appreciated all over Europe, and even barbarous tribes while making their raids seldom disturbed them. This esteem became fixed in codes of behaviour and law, and turned out to be a very important factor in their success.

As travel became more general the monks were requested to take on the maintenance of highways and collect dues therefor. More and more responsibility was assumed. Their overlords thought enough of their efforts to help in the good work. In the meantime more settled conditions obtained and their thoughts turned to replacing bridges that had been destroyed and to substituting bridges for ferries.

As a guide they had the remains of old Roman bridges, and there is evidence to show that they were quite familiar with the bridge work in Italy. They started to study and to draw plans. As most of their buildings were of brick and stone, good masons were available; and as some monastic estates were hewn out of the dense forests they had men trained in timber work.

At first their attempts were rather feeble and were much opposed by the religious prejudices against bridging gulfs of separation established by Providence. Other forces rendered their efforts difficult if not futile. Ultimately in 1154 so as more effectually to carry on, the bridge builders among the Benedictines, an important order in southern France to which they belonged, separated therefrom and organized at Maupas as *Fratres Pontifices*—a bridge-building brotherhood. Their leader was Bénézet, a monk of great courage,

marvellous personality and with a constructive mind that refused to be trammelled by the deadening absolutism of philosophic thought of the day.

Apparently the Brothers of the Bridge were loosely organized for the reason that they held little land and were dependent for funds upon the barons, bishops and overlords who were sufficiently concerned with improved facilities. They were students, workers and organizers, and inspired confidence and respect. The old tradition of “hands off” stood them in good stead. From place to place and country to country they sent their missionaries, establishing branches of the order wherever they found intelligent, enterprising and progressive groups who were willing to plan and work. Thriving municipalities sent for them to assist in designing and supervising their bridges.

In their organization, built up somewhat the same as other feudal orders, the abbot was Pontifex Maximus. One of these attained the position and dignity of Pope and ever since then one of the highest titles conferred upon His Holiness is that of Pontifex Maximus. Legend connects this with the Pope's power to bridge the gulf between earth and heaven, a natural deduction as priests in quite early times supervised bridge building and were always required to officiate at dedications.

One of their finest structures was that over the Rhône at St-Esprit, completed in 1309 A.D., and consisting of 26 stone arches, 86-foot to 114-foot spans, roadway 18 feet wide and a total length of 2,700 feet. For years it was the longest masonry bridge in existence. At Lyons, La Rochelle, Villeneuve and Saintes there were similar structures. But a complete list would be too lengthy here. We shall mention only two of them in detail.

One of the earlier bridges, constructed under the direction of Bénézet himself shortly after the formation of this order, was that over the Rhône at Avignon. It was a magnificent structure for the times consisting of 22 stone masonry arches on stone piers, a roadway 13 feet wide and at a level 46 feet above high water. A chapel to St-Nicholas, the guardian saint of river travellers, was built on the main central pier.

Legend has it that Bénézet came to the Rhône at Avignon in 1177 in response to divine command, spent his last farthing to be ferried across the river and then, according to an account in “*Mediaeval Towns*”:

“Bénézet entered the city and sought the bishop who was preaching to the people in the abbey and said, ‘Stay, an angel hath sent me to build a bridge over the Rhône.’ The bishop holding him a mocker threatened to lead him to the provost to be chastised and his feet and hands cut off as a vile knave. ‘But, I have been sent by a divine message to build the bridge,’ stated Bénézet. ‘Thou base varlet that hast naught’, returned the bishop, ‘and yet pratest of building a bridge, when neither St-Peter, nor St-Paul, nor great Charles the Emperor hath been able to build it. But I will give thee a stone at my palace and if thou canst carry it away, I will believe thee.’

“So Bénézet, the bishop and a great crowd went to the palace. And Bénézet carried a stone that thirty men could not move as easily as if it were a pebble and laid it down for the foundation of the bridge. Then thanks were given and they all cast down all the pieces of silver they had for the bridge; and so the great bridge was begun.”

Thus the legend goes that is associated with the commencement of this bridge. Historical records, however, state that Bénézet was already prior of the Brothers of the Bridge at Maupas, where the order was first established, and they had been planning for years for such a project.

On completion of this bridge Bénézet was made a saint and the Friars Pontiff had privileges lavished upon them. Barons, bishops, kings and popes granted indulgences to those who contributed funds or labour to build and maintain bridges under their supervision. Bénézet established branches of the order at Avignon as well as at other important centres in France.

In those days quite a number of bridges were built by religious orders in England, but whether any of these orders were connected with the Brothers of the Bridge is not clear. The first bridge over the Thames was a timber trestle built in the tenth century by a religious order founded by the ferryman's daughter for the purpose. It was later destroyed by fire, rebuilt, and burned down again.

The celebrated Old London Bridge was started in 1176 by Peter of Colechurch, a Friar Pontiff. He laboured at it faithfully for years but died in 1205 before its completion and was buried in a crypt in the chapel. King John had been so impressed by the work of the Brothers in France that he sent for Isambert, a celebrated builder of the time. Isambert completed the bridge in 1209. Afterwards buildings were erected on top of the piers, along and over the roadway and sidewalks, some of them extending away out over the structure.

There were 20 arches in all, a single draw span and two defence towers. The piers were founded on piles with timber grillage. The total length was 940 feet.

Soon everything pertaining to the life of Old London centred around London Bridge. Meetings, riots, celebrations, executions, duels, courting, begging, suicides, murders, robbing, stargazing and shopping were accommodated by the old structure to such an extent that it is amazing how room was left for traffic.

From the time it was finished until it was removed six hundred years later it continued to fall down in parts. "London Bridge is Falling Down," the celebrated song and game sung and played all over the English-speaking world, had its origin in this circumstance. Every line of it has a historical significance.

Serious foundation defects developed in 1770. A Frenchman, Labele, the inventor of the modern caisson, was called in. He could have done something about foundations for a new pier, but for one already built, not at all. Smeaton, of lighthouse fame, was called in and deposited large blocks of stone riprap all around and saved it.

On several occasions houses split in two and toppled over into the river. Boats fouled the piers and sank. Five more or less disastrous fires occurred. During one of these, 3,000 people were burned to death or drowned. Finally the buildings and therefore the fire hazard were removed and it looked then as if the old veteran would last forever. It stood until 1830 when it was replaced by the present really fine stone arch structure built by the Rennies.

So with the few records available and a knowledge of the times in which they lived and worked, the remains of structures still existing, and a little imagination, we can arrive at a fair estimate of the work of these faithful Brothers. They started out in southern France by rendering a small but commendable service to harried travellers. They established themselves in the confidence and good will of all peoples. They recognized the dire need, they studied, planned, ventured, worked and accomplished great things in themselves, but what is quite as important, they revived and perpetuated and to some extent improved an art that would otherwise have languished.

Others, especially the Italians, did carry on notable bridge construction throughout the mediaeval period; but undoubtedly, the work of the Friars Pontiff and their lay brothers in France where their finest bridges were built had much to do with the rapid advance in bridge construction during and after the Renaissance.

## Abstracts of Current Literature

### TIMBER BRIDGE FLOATED DOWN TO DISMANTLING POINT

*From National Lumber Manufacturers Association, Washington, D.C.*

Floating a full-sized timber bridge down a river it once had spanned was a unique feat of engineering performed on the Kettle River in Washington when the waters began to pour into the 150-mile-wide reservoir of the new Grand Coulee Dam.

Back from the dam, 112 miles, the Great Northern Rail-

### Abstracts of articles appearing in the current technical periodicals

wasteful not to recover them in the process of removal.

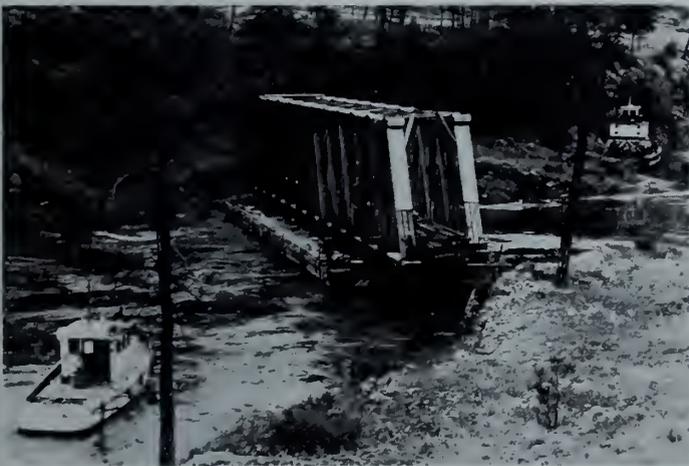

Rather than transport derrick and piling 150 miles overland to this remote spot, engineers decided, instead of dismantling the bridge at the site, to try an innovation. They would drop the two spans of the bridge down onto huge barges and float them down the river, then down the Columbia to the dam where they could be dismantled more economically and their timbers salvaged for further service.

But a difficulty was involved in this neat plan: the furious little river was not wide enough. However, as the reservoir waters would rise, they would back into the Kettle channel and widen it.

A delicate problem of timing then came into play. The water level in the Kettle gorge had to rise but not *too* high. A new bridge to carry the relocated tracks had been made ready a quarter-of-a-mile downstream and there was none too much clearance beneath it to allow for passage of the barge-borne timber spans. The operation, therefore, had to be calculated closely against the rate-of-rise of the water—and, once begun, completed in a hurry.

It took two days to bring the barges and the necessary tugboats from the dam, up the two rivers to the site of the bridge. The Kettle by now was widened and quieted by the waters which were steadily backing into it. In one day, a crew of 14 men freed the bridge from its moorings and swung it down on the waiting barges. In another two days, it was at the dam and; in four days more, it was dismantled. Its still-serviceable timbers were valued at \$15 per 1,000 board feet.

As a matter of engineering interest, the bridge consisted of two Howe-truss all-timber spans, one 68 ft. long, weighing 90 tons, and the other, 151 ft. long, weighing 210 tons. Its deck elevation was 1,288 ft. and it contained 100,000 board feet of lumber.

road had a 26-mile branch-line between Spokane and Republic. Where the tracks crossed the narrow and turbulent Kettle as it raced toward the Columbia, there was a timber bridge that had been doing duty since 1902.

Since the rising waters of the vast reservoir would inundate both tracks and bridge to a depth of two feet, the branch-line had to be moved. The bridge timbers were still sound, had good salvage value, and it would be

From *The Engineer* (LONDON), SEPT. 4, 1942

Reference has already been made in our columns to the formation of a new corps called the Royal Electrical and Mechanical Engineers. It is now announced that this new corps was formally inaugurated on October 1st. During the past week the War Office arranged a press visit to the new R.E.M.E. headquarters, with its workshops and training centres, to show the results of the reorganization which has been going on during the past few months. In the main the R.E.M.E. includes all the engineering side of the R.A.O.C. and the maintenance staff of the R.A.S.C., along with a portion of the mechanical maintenance staff of the Royal Engineers. Major-General E. B. Roweroft, a former officer of the R.A.S.C., has been appointed Director of Mechanical Maintenance. At the headquarters, officers and artificers are rapidly being trained in specialised courses, the former according to their engineering qualifications and the latter according to their different trades. The courses so far arranged include the repair and recovery of armoured fighting vehicles, mechanical transport repair and recovery, and armament inspection, along with a course for R.E.M.E. staff appointments in the field. Other important courses include, those in electrical work, in armour plate welding and general welding, along with a special course in compression-ignition engines. At separate establishments other courses are given in field artillery equipment, anti-aircraft artillery equipment, radio and wireless equipment, and fire control instruments. In all these courses intensive training is given under conditions which correspond as closely as possible to actual field work. This work, which includes rigorous infantry training, covers a very wide range. It includes that of light detachments for the front line of battle, mobile brigade workshops, and work at the base depôts and home bases, right up to the factories themselves. The repair and maintenance work of the R.E.M.E. embraces tanks, guns, motor-cycles, searchlights, binoculars, typewriters, and wrist watches. All tradesmen in the ranks will be given the new title of "craftsman." The new badge of the Royal Electrical and Mechanical Engineers is officially described as "a laurel wreath surmounted by a crown, four shields on the wreath bearing the letters R.E.M.E., and within the wreath a pair of calipers," these having been chosen as an indication of the accuracy which is demanded by the work of the new corps. We understand that the new motto for the R.E.M.E. will be chosen when the corps has started on its career.

### GROWTH OF MODERN TYPES OF SOVIET LOCOMOTIVES

From *Trade & Engineering* (LONDON), SEPTEMBER, 1942

Thirty-five years ago well over 50 per cent of all the steam locomotives in Russia were fired by oil, but the proportion now probably does not exceed ten per cent, for while the oil production of the U.S.S.R. has increased since the pre-1914 era the requirements of industry, aviation, agriculture, and the army have gone up to such an extent that railway needs have come to be regarded as of secondary importance in view of the new coalfields exploited. For the same reason the large-scale construction of Diesel locomotives inaugurated ten to twelve years ago has been stopped.

This change in fuel probably forms the greatest fundamental difference between Tsarist and Soviet locomotives. It is true that the number, power, and size have increased enormously, but that is merely the normal progress to be expected in any country. Another feature is the use of condensing tenders in arid districts. According to some reports over 1,000 of such equipments are in service, but possibly this figure should be regarded with reserve.

Some years after the last war, efforts were made to standardize a freight locomotive of the 0-10-0 type, and a few thousands were built in Germany, Sweden, and the U.S.S.R. They were designed specifically to suit as many lines as possible, and therefore the axle-load was severely restricted. They were the most powerful engines for freight traffic until 1931-32, when several heavy American-built locomotives of great capacity, with the 2-10-2 and 2-10-4 wheel arrangements, were set to work on routes—particularly in the Donbass—where track and bridges had been strengthened appreciably. A little later, a 4-8-2+2-8-4 Beyer-Garratt, the largest locomotive ever exported from England, was obtained, and about 1934 two 4-14-4 locomotives, weighing 300 tons with tender, were completed at Lugansk ostensibly for working 3,000-ton mineral trains over the then new Moscow-Donbass direct line. At the same time designs were prepared for standard freight and standard passenger engines for heavy work, to take advantage of the bridge strengthening and track relaying which were being carried out as part of the second Five-year Plan. The freight engine—a 2-10-2—was modelled largely on the United States engines of the same type delivered in 1931, and the passenger engine—a 2-8-4—had boilers and cylinders similar to those of the freight class.

The now very numerous 2-10-2 engines of the standard FD (Felix Dzerjinsky) class have two 26½ in. by 30¼ in. cylinders and 59 in. coupled wheels; their boiler pressure is 213 lb. per sq. in. and the evaporative heating surface 3,177 sq. ft. They have slab frames, wide fire-boxes with Belpaire tops, multi-element E-type superheaters, feed-water heaters, mechanical stokers, and boosters. It is believed that engines of this type work most of the mineral traffic on the Donbass, Donbass-Moscow, Kussbass-Ural, and other main lines, hauling trains up to 3,000 tons in weight and composed of 40-50-ton bogie cars.

Comprehensive tests with locomotives of this class, equipped with a plain circular blast nozzle, showed that at an hourly firing rate of about 120 lb. per sq. ft. of grate area the evaporation was equivalent to 13.5 lb. of steam per sq. ft. of evaporating heating surface, and that a tractive effort of 43,800 lb. could be maintained up to 17-18 m.p.h.: at 35-37 m.p.h. the tractive effort at the wheel rims was 25,000-24,000 lb. The minimum steam consumption was equivalent to 17.4 lb. per rail h.p. hour.

### STANDARD PASSENGER CLASS

To supersede old 4-6-2 and unsuccessful three-cylinder 4-8-0 engines the U.S.S.R. Commissariat of Transport in 1933 began to develop the JS (Josef Stalin) class of two-cylinder 2-8-4 express and heavy passenger locomotives, and these, with various detail modifications made in the last seven or eight years, work the principal passenger trains on the Moscow-Leningrad route and the other main lines radiating from Moscow. Streamlining has been applied to one or two of the class.

In these locomotives the 26½ in. by 30¼ in. cylinders drive 73 in. wheels, but the boiler proportions, rather limited maximum cut-off, and equipment are the same as those of the FD class; the differences are in the chassis—frame, wheels, trucks, boxes, and suspension. Theoretically, the boiler should have the same evaporative capacity, but in some of the long line tests conducted the plain circular blast nozzle used in the FD type was superseded by a special nozzle with separate exhausts from right and left hand cylinders, and having four circular openings with an aggregate area 32 per cent greater than that of the FD nozzle. This was largely responsible for increasing the evaporation by 16-17 per cent to about 15¾ lb. of steam per sq. ft. of evaporative heating surface. Other results of the improved draught arrangements are the reduced back pressure and consequent increased horse-power, and the reduction in steam consumption to a minimum of 15½ lb. per rail h.p. hour.

## DEVELOPMENT OF IMPACT-RESISTANT WINDSHIELDS

From *S.A.E. Journal* (NEW YORK), July 1942

At this time when the nation's air transportation system is important to the war effort, the maintenance of safe and reliable operation assumes added significance. Accordingly, the conduct of technical development looking to the minimization of causes of accidents not only is necessary as a safety measure but has become a defence urgency.

One of the most serious potential hazards to air-carrier operation involves the existing lack of means for adequately protecting windshields against collision with birds during flight. Such collisions usually result in the immediate and total decease of the birds. Unfortunately, however, they also can result in the destruction of the airplanes involved and in the death of their occupants.

Impact forces in such collisions are enormous. Even small birds such as ducks not only have penetrated the windshield, but one in particular continued through the bulkhead, travelled the length of the cabin, penetrated the rear cabin wall, and lodged finally in the baggage compartment. Fortunately in this case neither the passengers nor the crew were struck.

The possible destruction and loss of life resulting from such a collision with a duck is unpleasant to contemplate. However, the force of such an impact is multiplied several times when an airplane disputes the right of way with a swan. This has occurred. In fact the collision in question involved five swans. The pilot of that airplane reported as follows:

"Time 12.17 a.m.—Climbing at 8,000 feet—Air speed 150 m.p.h.—Hit flock of swans—One swan penetrated leading edge, left wing—Second swan almost tore off left vertical stabilizer—Rudders jammed—Third swan struck and dented engine cowl—Later, two swans went through propeller—Portion of swan taken from wing after landing, weighed 11½ lb."

NOTE: Wild swans weigh as much as 20 lb.

Accidents involving bird collision have become alarmingly numerous. A partial record, obtained by M. Gould Beard of American Airlines, includes 61 such collisions since 1939, two-thirds of which occurred at night and more than one-third of which resulted in the penetration and shattering of the windshield.

The development of means to protect aircraft windshields from such collisions appears to the Technical development Division of the Civil Aeronautics Administration to be a "must" project. This urgency further has been emphasized by numerous requests from the industry and from other bodies within the Administration that such development be undertaken. This now is in process.

The prospect of stopping a 20 lb. swan at a relative approaching velocity of 270 m.p.h. at first was somewhat disheartening, particularly since de-icing means and protection against visual and acoustical shock due to lightning necessarily are involved in any windshield development problem. Continued studies and investigations, however, have indicated that there is considerable promise of providing a large degree of protection, and that such protection need not involve excessive weight or complication.

Thus among other possibilities, the use of a retractable metal screen or similar arrangement was considered, although the mechanical difficulties involved made its practical realization somewhat doubtful. Recently, however, developments of transparent glass-plastic combinations have resulted in windshield panels of reasonable thickness that have proved highly resistant to impact, as indicated by numerous pressure and impact tests and by computations based upon those tests.

Those pressure and impact tests were carried out by the manufacturer of the glass-plastic panels, by Dr. F. W. Adams of the Mellon Institute of Industrial Research, by Dr. G. M. Klein of the National Bureau of Standards, and

by personnel of the Civil Aeronautics Administration. Pressure tests of the glass-plastic windshield panels indicate that static pressures of at least 35 lb. per sq. in. can be withstood by a 14 x 28 in. panel ⅝ in. thick, and that the panel will undergo large deflections of several inches magnitude before the plastic layer will rupture. Dr. Klein's tests on the recently developed glass-plastic windshield panels further indicate that at normal temperature those panels are far more resistant to penetration by a falling dart than is the conventional type of windshield.

The tests carried out by Dr. Adams to determine qualitatively the effect of variations in the consistency of a projectile striking a glass panel revealed secondary effects caused by the velocity of the projectile, and the effect of variations in angle of incidence during collision. It was indicated that a semi-liquid projectile, such as a bird carcass, has considerably less penetrating power than a tough rubber-like projectile, that at high velocities this effect becomes even more pronounced, and that the resistance of a windshield at 45 deg. incidence to the path of a projectile is much greater compared to resistance at normal impact than would be expected from geometric theory.

### RESULTS OF EARLY TESTS

A further series of tests was made by the Civil Aeronautics Administration in which a compressed-air gun with a 3½ in. diameter barrel and operated at 200 lb. per sq. in. pressure was utilized to project freshly killed chickens against a backstop. It was learned from such tests that the chicken carcass would be completely flattened and shredded by a 200 ft. per sec. impact, although still hanging together in one mass, and would cover an area of approximately 100 sq. in. on the backstop. It further was indicated by those tests that it is practical to utilize a freshly killed bird carcass for test purposes.

The degree of protection provided either by a retracting shield arrangement or by improved windshield materials appears doubtful until tests which simulate actual flight conditions can be conducted. The Technical Development Division, therefore, has considered that as a prerequisite to obtaining adequate windshield protection, it is essential that a satisfactory testing method be developed: for obtaining fundamental design data; for evaluating the degree of protection afforded by presently existing windshield materials; to provide a basis for indicating when adequate protection finally is obtained; and for determining the resistance of other portions of aircraft structures against such impacts. It has appeared evident in such connection that the testing method should utilize a catapult to project a simulated or actual bird carcass against the test structure at a velocity equal to the velocity at which the bird and airplane approach each other under flight conditions. It furthermore has been indicated through considerable investigation that the most practical type of test catapult is a compressed-air gun.

In order to obtain preliminary data for the design of such a gun and further to determine the practicability of its use as described before, a series of tests was made with a small gun available at the National Bureau of Standards from which freshly killed chickens were shot. As previously mentioned, it was concluded from those tests that a bird carcass can be propelled from such a gun without appreciable damage to its body and that the complete flattening and spreading which occurs upon impact would be difficult or impossible to simulate with anything but an actual bird carcass.

### LARGER GUN BEING DEVELOPED

As a result of those experiments it is considered desirable to attempt the development of a larger air gun which would be capable of projecting 16 lb. of de-winged swan carcass at a velocity of 270 m.p.h. Accordingly, arrangements are being made by the Civil Aeronautics Administration to negotiate a contract with the Westinghouse Electric and Mfg. Co., to provide a complete test setup at its East

Pittsburgh plant. This set-up will include a compressed-air gun using either of two 20 ft. barrels of 5 in. and 10 in. diameters, means for mounting the forward cabin or other portion of airplanes in front of the gun, and means for measuring the velocity of the bird carcasses as they are projected. In addition, it is planned to obtain high-speed motion pictures during the tests and to install strain gages and accelerometer pick-ups at various points on the structure in order to obtain impact forces, stresses, and other data on the windshields and supporting structures.

In addition to its use by the Civil Aeronautics Administration, it is planned to make the test set-up available to other designated organizations so that windshields, windshield protecting devices, or other portions of airplanes may be tested from time to time as may prove desirable. However, since a number of recently developed windshield panels now are available, it is felt that the first series of tests should involve the forward cabin portion of an air-carrier type airplane with various panels installed.

Attempts now are being made to obtain such a structure. The Pittsburgh Plate Glass Co., and the Libby-Owens Ford Glass Co., have indicated their desire to submit test panels. F. C. Lincoln of the Division of Wild Life Research of the Department of the Interior has been most helpful in supplying information concerning the weights and proportions of migrating birds and is aiding in our efforts to obtain bird carcasses for testing purposes. It is hoped that members of the industry and interested Government agencies will participate in this programme in every way possible.

*Excerpts from the paper of the same title by A. L. Morse, Civil Aeronautics Administration, presented at the National Aeronautic Meeting of the Society, New York, N.Y., March 12, 1942.*

## THERMIT AS USED IN INCENDIARY BOMBS

From *Chemical & Metallurgical Engineering* (NEW YORK), July 1942

It was a German, Goldschmidt, who, while he was attempting to reduce chromium and manganese, discovered how to ignite thermit safely. His countrymen later applied this knowledge of aluminothermics to the design of a magnesium-thermit incendiary bomb during the closing months of the first World War. Ludendorff, in his memoirs, reports that a number of incendiaries of this type were ready for use in 1918, but that the German High Command, knowing the conflict was nearing its end, did not order their use, fearing that thereby more severe peace terms might be imposed upon the German nation.

The modern magnesium-thermit incendiary used by Axis bombers on British and European cities has been described many times. The most common size weighs one kilogram or 2.2 pounds. It consists of a tube of magnesium alloy filled with a firmly packed thermit mixture, and fitted with tail-fins and a firing mechanism. Since it was manufactured by the Griesheim-Elektron company, it sometimes is known as the Elektron bomb.

The bomb ignites on impact, a pin being driven into a firing cap that sets fire to a starting charge which in turn ignites the thermit. The temperature of the thermit reaction is more than sufficient to ignite the magnesium alloy tube which constitutes the body of the bomb. The high temperature generated by the thermit reaction within the tube builds up considerable pressure so that bits of molten metal, flame, and smoke are forced out of the vent holes. But this reaction continues only for about three minutes, and thereafter the magnesium burns with less vigor at a temperature of about 2,300 deg. F. for fifteen minutes or more if undisturbed. A certain number of the bombs, called "discouragers," contain a light explosive charge that will go off during the thermit reaction.

Burning magnesium's ability to extract oxygen even from water is turned to advantage in disposing of bombs of this type. A spray of water directed on the bomb speeds up the rate of combustion so that the bomb will be consumed

in about two minutes. If a solid stream of water is applied to the bomb, however, it will cause such an ebullient action as to spread the fire.

Thermit is used also in the petroleum type of incendiary to provide ignition. Inexpensive grades of oil with high flash points can thus be used. To prevent the petroleum from being scattered on impact, it is mixed with soap to form a wax-like solid. Metallic sodium or potassium may be mixed with the petroleum when attacks are made on water-front objectives, because the vigorous reaction of these solids with water will ignite the oil. Petroleum bombs are generally of large size. Some of those dropped on London produced pillars of fire rising 30 feet in the air and 12 feet in diameter.

Thermit alone, in a steel bomb case fitted with tail fins and a firing mechanism, is reported to be a type of incendiary used by Japan. These are said to weigh 15 and 50 kilograms, and would have considerable penetration power. This type of bomb also ignites on impact and may contain an explosive charge. The thermit reaction, which transforms the metallic oxide and all the steel parts of the bomb into molten metal, is completed in about 30 seconds, and it is the great heat of this metal that carries the threat of fire.

The Chemical Warfare Service recommends, if there is a chance to minimize the incendiary effect of the molten metal, that a spray of water be directed onto it to cool it as quickly as possible below the ignition temperature of the combustible material with which it comes into contact.

There is a demonstration of the thermit reaction often made of late in training classes for civilian defence workers. A small quantity of a thermit mixture is placed in a paper cup and suspended above a container of water. A few inches below the level of the water a metal plate is suspended and at the bottom of the container is a layer of sand. The thermit is ignited with a starting mixture, and of course, it falls into the water and burns through the metal plate, dropping to the sand at the bottom of the container, where it glows briefly and causes the water to boil and bubble. This demonstration shows that thermit "even burns under water." The thermit reaction is practically completed when the residue of molten iron and slag burns through the metal plate, and what the spectator sees at the bottom of the container is the cooling metal.

The effect of thermit on ordinary carbonaceous material is not as positive as on steel. When burning on wood, for example, a layer of carbon forms under the molten iron, which serves to insulate the area below the hot iron against further burning. Thus, if a crucible is made on a 2-in. plank, and filled with thermit, the chances are that the thermit will not burn through the plank. But under the same circumstances, it would burn cleanly through a 1-in. steel plate.

## THE PRODUCTION OF HELIUM

From *Engineering* (LONDON), AUGUST 28, 1942

The properties and uses of helium are well known; it is a colourless, odourless, non-inflammable and exceedingly light gas, having a specific gravity of only 0.139 (air = 1.0). On account of its non-inflammability, it has been used for many years for filling airships and balloons, since it is only twice as heavy as hydrogen and possesses 92.6 per cent of the lifting power of that gas. Helium, however, has other applications; mixed with oxygen it is employed to prevent deep-sea divers from suffering from "bends" (a form of paralysis resulting from a rapid change of pressure) and to mitigate caisson disease. Helium-oxygen mixtures are also employed in medicine for the treatment of asthma and other respiratory affections. Helium occurs as a constituent of natural gas and is extracted in large quantities at an installation owned and worked by the United States Bureau of Mines, at Amarillo, Texas. The process employed, we understand, simply involves the separation, or isolation by low-

temperature fractionation, of the helium from the other gaseous constituents.

Since the establishment of the Amarillo plant in 1929, the Bureau has been responsible for the production of upwards of 100 million cu. ft. of the gas. The installation, however, had not been operated at its maximum capacity until last year when the course of world events brought increasing demands for helium. In order to supply these demands the plant at Amarillo has recently been considerably extended, and it is anticipated that the production this year will be several times larger than that for 1941. In addition, a new helium-producing plant, the exact location of which is not stated has been decided upon. This will draw its supplies of helium-bearing gas from an existing pipe line which conveys natural gas to a distant site where it is consumed as fuel. Arrangements have also been made for conducting systematic surveys of other fields which may become a source of helium in commercial quantities, and engineers and geologists on the staff of the Bureau of Mines are conducting this work. To meet the cost of all these developments the United States Congress recently voted a sum of four million dollars. It is satisfactory to find that the Bureau of Mines has made every endeavour to maintain the price of helium low and that this has steadily fallen during the three years 1938 to 1940. In this last year the cost per 1,000 cu. ft., exclusive of service charges, was \$11.17 to medical users, \$11.73 to scientific users, and \$13.14 to commercial firms.

### WORKS RELATIONS SCHEMES

From *The Engineer* (LONDON), Sept. 18, 1942

Some weeks ago we stressed the importance of suitable propaganda in the factory, and the opportunity was taken to suggest that the wholesale use of slogans had inherent defects. We notice with satisfaction that similar sentiments are finding their way into the American technical papers, one of which, bravely borrowing a weapon from the enemy, exclaims, "Don't slug 'em with slogans." We are not surprised to be informed that "any intelligent worker will and should resent" such sentiments plastered over the workshop walls as "Work Wins War," "Count Me in this War," "Shake a Leg, Mister," while "Do Your Duty" conveys the implication that the boss is doing his, but that you are not doing yours. Slogans may be an easy way of making an appeal, but it is a way far from the best. It is our desire to suggest the better way, which lies in a far greater development of what may be termed "Works Relations Schemes."

The Royal Ordnance Factories, with their Joint Productive Consultative and Advisory Committees, have taken the somewhat revolutionary line of enlisting the help of the worker in the efficient management of the workshop but the subject of works relations is a far broader one, in which the main idea is to make every single operator keen on his job, and able to take an intelligent interest in the production of even the simplest part. The Ministry of Supply con-

siders this question as of sufficient importance to warrant the setting up of a special Public Relations Branch, which maintains contact through the various production departments with a large number of factories working for the Ministry. The staff in this special branch is composed of men who have both factory and newspaper experience, and who are able to spread good ideas and readily sense special needs in relation to observed *morale*. The idea of compulsion is repugnant to the scheme, for co-operation and understanding make its keynote. Many methods have been suggested and explored. Perhaps the most important step is that of ensuring that the worker knows the purpose for which the article he or she is producing day in and day out is intended; it all seems so remote from the war effort as to be meaningless. If a picture is displayed clearly showing how the particular component fits into some article, and how that article in turn is assembled into something bigger, something that perchance figures in the daily press, then interest is awakened. That small piece becomes more vital when it is shown, let us say, set in the fuse, which fuse is then depicted in the shell destined to bring to destruction an enemy aircraft. It is still better when the bomber pilot, fresh back from some notable feat, calls at the filling factory and talks to the employees who are engaged on filling his bombs, when one of our paratroops has a talk with the people who make his equipment, or when the A.A. gunner tells the men in the gun factory something of his life and the behaviour of his weapon. These talks usually take place in the mid-day interval at the works canteen and the speaker is generally entertained to luncheon with the workers.

In the first six months of organizing these talks the Ministry of Supply has provided over five hundred speakers from the Services for different factories, and the results have been strikingly successful. The visits arranged to the proof butts for workers to see their products actually tested, for girls from filling factories to visit Bomber Command stations and talk to crews returning from action, for inter-factory visits so that persons working on sub-contracts may see how a job that is remote from the finished product will take its place in the final stages of production—all these have added a spur to production.

The general principle underlying efficient works relations schemes must always be information rather than exhortation, and to this end no tool will be despised, be it the educational film, be it the factory radio, with its great potentialities, or be it the use of the public press, in fact, anything that will encourage a better appreciation of the industrial front. To sum up the position, every effort is made to give workpeople a clearer perspective, enabling them to appreciate what happens as a result of their personal efforts. It has been abundantly proved that men and women in our factories are extraordinarily receptive of information, and welcome demonstrations, while mere exhortations leave them cold or even sullen. The more manufacturers realize the value of works relations schemes, the greater will be the effect on output. Much has been done, but much more still remains to be done.

## STRUCTURAL DEFENCE AGAINST BOMBING

A reference book on the engineering features of civil defence, published by The Engineering Institute of Canada in order to make available to Canadian engineers and architects a record of some of the experiences and practices of British authorities in regard to structural air raid precautions, so that in the event of emergency arising in this country the necessary action can be taken without loss of time and on the most efficient and economical lines.

It is a 56-page booklet, 8½ by 11 in., with heavy paper cover. It contains 79 illustrations and eight tables. Copies may be secured at \$1.00 each from

THE ENGINEERING INSTITUTE OF CANADA, 2050 MANSFIELD STREET,  
MONTREAL, QUE.

## THE WORK OF LOCAL RECONSTRUCTION COMMITTEES

At the October meeting of Council, the chairman of the Institute Committee on Post War Problems presented an interim report, pointing out that under the Department of Pensions and National Health, citizens' committees are being established in various localities throughout Canada to deal with problems of post-war reconstruction. Mr. Miller suggested that these local groups could make good use of the branches of the Institute. He believed that our branches would be pleased to nominate engineers to work on these citizens' committees if desired, and proposed to communicate with the various local committee chairmen accordingly. This course met with Council's approval.

The formation of these local citizens' committees is a very necessary step, for reasons which have been explained in a recent memorandum prepared by the Cabinet Committee on Reconstruction, usually referred to as the James Committee.<sup>1</sup> The memorandum indicates the various kinds of problems which will have to be considered by such committees and by local authorities; in connection with many of these it is plain that engineers nominated by our local branch could render valuable assistance.

The memorandum points out that there are many post-war problems which cannot be solved unless they are solved locally, because geographic and economic conditions vary so widely throughout Canada. It therefore mentions a number of topics of this kind, as starting points on the road to detailed study and planning.

These questions are grouped under five heads, as follows:

1. Town planning.—This would cover the provision of parks and other amenities, the construction of roads and public buildings, and housing developments.<sup>2</sup> For all these, master-plans must be available in each community, so that detailed specifications for each project can be ready when the war comes to an end. This is a task that must be done locally, though the interested agencies of the Dominion Government will be able to give useful assistance.

2. Employment opportunities and social security.—There is now in operation a Dominion-wide system of employment offices. Workers and business enterprises in each community should become familiar with the operation of the local office so as to make recommendations to render its working more efficient. This applies also to questions of public health, the assistance of workers who may be in distress, and retirement allowances for those who can no longer earn their living. These and other like matters should be studied now, and locally.

3. Education.—In Canada education is administered by provincial governments, under which local educational authorities operate. In many places war conditions have made it evident that serious weaknesses exist in our present system, and changes may be needed. Local committees may well study their local needs, notably in regard to the possible lack of facilities for technical training, not only for university or professional students but also for the multitudes who will become workers on farms, in factories or offices.

4. Conservation of natural resources.—A sub-committee of the James Committee is already studying the conservation and effective utilization of the Dominion's natural resources. But in many places there are local problems of forest development, flood control, irrigation or land utilization which can best be considered by those familiar with local conditions, in consultation with duly constituted local authorities.

5. Projects for the integration of industry and agriculture.—In some rural areas or small urban communities a proper

<sup>1</sup>Its chairman is Dr. F. Cyril James, Principal of McGill University.

<sup>2</sup>A subcommittee of the James Committee is studying construction projects. Its chairman is K. M. Cameron, M.E.I.C.

## News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

integration of industry and agriculture would provide increased employment opportunities and a more stable standard of living for those concerned. There are already many instances of successful schemes of this kind. In fruit growing areas, canning factories; in forest areas, woodworking industries giving employment when logging is dull; in seasonal agricultural regions, small factories for the production of consumer goods during the off seasons; all these have been found workable. Local committees may well make plans for such activities where suitable conditions exist.

In all these matters the initiative has to be taken locally, and there must be co-operation between local, provincial and federal authorities. It will be seen that the local citizens' committees, to whom the memorandum is primarily addressed, will have before them many questions on which the advice and opinion of trained engineers would be helpful if not essential. The Institute Council therefore hopes that the citizens' committees as well as our branches will see their way to act in accordance with Mr. Miller's suggestion.

### 1943 ANNUAL MEETING

All plans for the Annual Meeting of the Institute were suspended upon the announcement made a short time ago in the press by the Honourable C. D. Howe, HON. M. E. I. C., that the Government was requesting organizations to cancel their conventions in order to economize on transportation facilities.

At the meeting of Council held in Niagara Falls in October it was agreed that Vice-President K. M. Cameron and the General Secretary should consult Mr. Howe in Ottawa to see whether or not his request included such business and professional meetings as that held by the Institute.

At the first opportunity, Mr. Cameron and Mr. Wright called on Mr. Howe and received assurance that such meetings were not included. He thought organizations whose meetings could make a contribution to the war, should be continued, particularly where the amount of railroad travelling was not unreasonable.

As the 1943 meeting is to be held in Toronto, by far the largest percentage of those in attendance will come from the Toronto area, therefore, the meeting is not likely to result in any noticeable amount of railroad travel.

Pending this decision, some time has been lost in planning, but the machinery was all set in motion again as soon as Mr. Howe's decision was obtained, and it is expected that everything will be in full readiness in good time for the meeting.

## ACTIVITIES OF THE CIVIL DEFENCE COMMITTEE

The following notes have been extracted from the latest progress report of the committee on the Engineering Features of Civil Defence for the information of the general membership.

No report has as yet been received indicating that any of Dr. Manion's Provincial A.R.P. Committees had sought contact with or requested assistance from any of our Branch Committees. Some of the latter have not yet felt themselves to be in position to offer such assistance, but six of the 19 Branch Committees report that they have made contact with the appropriate Provincial A.R.P. Committee and have offered their assistance as desired. These six Branch Committees are: Border Cities, Montreal, Saguenay, Saskatchewan, Toronto, Winnipeg. It is expected that additional Branch Committees will report such contacts in the near future.

The Branch Committees have found it difficult to know just how to carry on effectively, because of lack of specific assignments from the main Committee. It is expected that this situation will be somewhat relieved now that "Structural Defence Against Bombing" has been issued and these Committees placed in a position to proceed along the lines intended. The situation should be still further relieved as other work of the main Committee progresses and it becomes possible to issue further information to the branch Committees with suggestions as to its use.

Mr. H. F. Bennett's sub-committee on the abridged Webster notes has completed its assignment in a manner well worthy of the appreciation of the Institute.

The secretary having assembled information in regard to the number of copies of this sub-committee's report to be struck off and the price per copy at which it should be sold, there being no meeting of Council in immediate prospect, and there being an urgent desire to have the report available before the middle of October, the Finance Committee decided on October 5th that,

- (1) For the first printing 1,000 copies would be struck off and the type would remain set for three months so that within that time additional copies could be struck off as required.
- (2) The report would be sold at \$1.00 per copy, with no discount on quantity orders and no copies distributed free.

The report was printed and issued on this basis as an E.I.C. publication, under the title "Structural Defence Against Bombing." It became available on October 14th and up to date of this progress report over 250 copies have been sold, without benefit of advertising or of public announcement other than those at the Niagara Falls closed session and at the Montreal Branch meeting on October 22nd.

"Structural Defence Against Bombing" has been called directly to the attention of the chairmen of all Branch Committees and certain others, with the suggestion that they call this publication to the attention of the members of their Branches and, through them or otherwise, to the attention of those companies or other organizations in their territories to whom it will prove of value and assistance. A wide distribution is desired in order to disseminate as rapidly as possible information, not now generally available, to that portion of the public which this publication is intended to serve.

Professor Legget's preliminary draft memorandum relative to organization for emergency repairs to works and buildings has been approved in principle by the governing bodies of The Engineering Institute of Canada, the Royal Architectural Institute of Canada and the Canadian Construction Association, and work is actively in hand by representatives of these three bodies in the preparation of a joint submission.

Through contacts made by Professor Legget, he received copy of a press release by the Office of Civilian Defence,

Washington, D.C., reporting the request by Director Landis of the O.C.D. for the formation of regional, state and local committees representing the technical and scientific professions and assigning to these committees three "urgent missions," as follows:

- (1) Organization and training in each city of a suitable number of technical intelligence units.
- (2) Check as to the adequacy and suitability of air raid shelters as now selected and designated.
- (3) Check as to the adequacy of provision for break-down service in the most essential public utilities, especially water supply, electric power and communications.

This press release states that the various U.S. national technical and professional societies have offered the services of their offices and members in developing technical committees for civilian defence throughout the United States.

Copies of this press release have been sent to the chairmen of Branch Committees and others as information, with the request that, until the assignment Professor Legget's Sub-committee has in hand has been completed, no corresponding action should be taken by them, but that in due course they may be asked to assist in work of a similar nature.

During the joint meeting of the American Society of Civil Engineers and the Institute in Niagara Falls, a symposium on Civilian Protection in Wartime was held on Wednesday afternoon, October 14th, as a closed session under the joint auspices of the E.I.C. Committee on Engineering Features of Civil Defence and the A.S.C.E. National Committee on Civilian Protection in Wartime. The Canadian speakers were:

- President C. R. Young—Introductory remarks on behalf of the Institute.
- Mr. H. F. Bennett —Structural aspects of civil defence work.
- Mr. G. McL. Pitts —Co-operation in Canada between architects and engineers.
- Prof. R. L. Legget —Review of the work of the Institute Committee on Engineering Features of Civil Defence.

About 200 were in attendance and the closed session was both interesting and instructive. The Institute publication "Structural Defence Against Bombing," was available for sale after the meeting.

Branch Committee reports indicate progress in perfecting their organization so as to be ready to handle any assignments that may be transmitted to them.

On the evening of October 22nd, Mr. D. C. Tennant, Engineer, Ontario Division, Dominion Bridge Company, Toronto, spoke at a meeting of the Montreal Branch, his subject being "Engineering Aspects of Air Bombing and Structural Defence."

## TO MEMBERS WITH RELATIVES IN THE SERVICES

In the September issue of the *Journal*, attention was called to a resolution, passed at the regional Council meeting held at Halifax in August, and suggesting that members might render valuable service by providing some measure of hospitality at their homes, for sons and daughters of members of the Institute from other parts of the country, stationed in their locality.

The introductions for such hospitality can best be arranged through the branch secretaries. Members who wish to establish contacts for a relative in a distant centre should refer to the third page of the *Journal*, where they can find every month the names and addresses of all branch secretaries. A word sent to any of them should bring quick action.

Headquarters has already received indications that the Institute Branch, at "An Eastern Canadian port," is anxious to take the initiative in this new endeavour.

## NIAGARA FALLS JOINT MEETING

(Left) The two presidents, Dean C. R. Young of the Institute and E. B. Black of the Society.

(Right) The incoming presidents, K. M. Cameron of the Institute and Ezra B. Whitman of the Society.

(Above) Officers of the Institute and the Society; Front row: T. H. Hogg, past-president of the Institute, C. R. Young, president of the Institute, C. M. Spofford, vice-president of the Society, E. B. Black, president of the Society, K. M. Cameron, president-elect of the Institute. Back row: L. Austin Wright, general secretary of the Institute, A. J. Grant, past-president of the Institute, C. H. Stevens, vice-president of the Society; C. J. Mackenzie, past-president of the Institute, C. B. Burdick, vice-president of the Society, and F. H. Fowler, past-president of the Society.

(Right) Local section delegates, officers and guests gather at the hotel entrance.

Prof. C. M. Spofford, M.Am.Soc.C.E., one of the Society's vice-presidents and Ezra B. Whitman, official nominee for president of the Society.

Major J. P. Carrière, R.C.E., of the Directorate of Military Training, Ottawa, discusses engineer training with Col. L. E. Robbe of the U.S. Engineer Corps.

(Above) E.P. Goodrich, director of the American Society and chairman of National Committee on Civilian Protection in War Time.

(Lower left) G. MacL. Pitts, M.E.I.C., president of the Royal Architectural Institute of Canada, advocates close co-operation between architects and engineers.

(Upper right) H. W. Lea, director of the Wartime Bureau of Technical Personnel, Ottawa

(Above) L. Austin Wright, general secretary of the Institute and assistant director of National Selective Service, discusses man-power while G. T. Seabury, secretary of the American Society, listens.

(Lower right) Prof. H. E. Wessman, M.Am.Soc.C.E. of New York University.

### THE JOINT MEETING AT NIAGARA FALLS

Eight years ago the American Society of Civil Engineers came to Vancouver to hold a regional meeting jointly with The Engineering Institute of Canada and the affair was a great success. Many of our members still have pleasant memories of that event, and have hoped that our friends would come to Canada again. This year they have done so crossing the border at Niagara Falls, Ontario, to hold joint sessions there with the Institute. The choice of locality proved to be wise. Some four hundred members of the Society and the Institute attended, and from October 13th to the 15th took part in a well-planned programme of technical sessions, business meetings and social events. The weather was favourable most of the time. The falls continued their regular hydraulic performance throughout the meetings and the General Brock Hotel did well as regards creature comforts and accommodation.

Activities really began on Monday, October 12th, when the Society's Board of Direction held sessions throughout the day. On Tuesday, the Institute Council had a well attended regional meeting, dealing largely with the work of the Institute committees on Post-War Problems and the Engineering Features of Civil Defence. Luncheon on this day and an informal dinner in the evening gave excellent opportunities for meeting old friends and making new ones.

The more formal proceedings began on Wednesday morning with an exchange of official greetings between officers of the two societies. This pleasant ceremony was followed by a discussion of man-power control as it is being developed in Canada and in the United States—a matter of pressing importance to both countries at the present time. L. Austin Wright, assistant director of National Selective Service, explained the regulations now effective in Canada and the general information that he gave was supplemented by H. W. Lea, director of the Wartime Bureau of Technical Personnel.

At luncheon President C. R. Young spoke on "The Place of the Engineer"; his address was welcomed as one of the outstanding features of the whole meeting<sup>1</sup>.

The afternoon session on Wednesday took the form of a symposium on civil defence in Canada and the United States.

<sup>1</sup>The President's address will appear in our next issue.

Much of the information presented was of a confidential nature, based on data obtained in England and in other places where war damage has been extensive. Recognizing the need for proper secrecy, admission to this closed session was by signed tickets only. Members willingly co-operated in this necessary precaution. Those present felt that real help had been given them by this discussion and exchange of views.

A formal dinner was held in the evening at which two hundred and fifty sat down. After toasts to the King and the President of the United States, Dr. H. J. Cody, president of the University of Toronto gave an inspiring address on the development of our present civilization, sounding an urgent call for the international co-operation which is necessary for its defence.

Thursday was fully taken up with meetings of the Technical Divisions of the A.S.C.E. in which many members of the Institute took part. At luncheon an interesting account of army engineer training in the United States was given by Brigadier-General E. H. Marks of the United States Army.

For the ladies there were trips, bridge parties and teas; they also had the pleasure of hearing Dr. Alice Vibert Douglas, dean of women in Queen's University, Kingston, who spoke on "Astronomy's Debt to the Engineer."

All the arrangements worked smoothly. Our American visitors appreciated the courtesy and help of the Immigration and Customs Officers who made transfer across the border at the Rainbow Bridge a simple affair.

The benefits of such a meeting are manifold. Not the least of them is the development of a feeling of mutual confidence and comradeship between the engineers of the two neighbouring countries.

### COMING MEETINGS

**Canadian Construction Association.**—Annual Convention, Log Chateau, Seignior Club, Que. January 20-22, 1943. General Manager, J. Clark Reilly, Ottawa Building, Ottawa, Ont.

**The Engineering Institute of Canada.**—57th Annual General Professional Meeting, Royal York Hotel, Toronto, Ont., February 11-12, 1943. General Secretary, L. Austin Wright, 2050 Mansfield St., Montreal, Que.

Councillor J. A. Vance discusses Institute activities with Miss M. McLaren from Headquarters while J. C. Hoyt of Washington proposes a toast to Miss E. Gibson also from Institute Headquarters.

When one views the wastage and devastation of modern war it would seem that the human race will be impoverished for years to come. But a more careful view indicates that the appalling expenditure of materials is being mitigated by the research and development which has been made necessary by the demands of modern warfare and by the increasing scarcity of raw materials. This is not immediately apparent as many of the most spectacular achievements of engineers, chemists and scientists are now being used for war purposes. Most of these developments are still military secrets. In many instances, their civilian potentialities have not yet been explored.

One example which comes to mind is the advancement in the field of radio communication. I heard an authority say recently that the principles involved in the radio locator, once they could be divulged and divorced from military necessity, would revolutionize communication. Less spectacular perhaps, but more tangible, are the possibilities inherent in micro-photography combined with world-wide aviation. Following the war, no one need be more than a few days separated from anyone anywhere in the world.

At present, the light metals are being monopolized for war purposes. The vast expansion in both the capacities and the techniques of the production of aluminum and magnesium may well revolutionize much of our way of living when these light metals are made available for civilian requirements.

The great synthetic rubber industry now being brought into production will produce a wide variety of rubbers capable of meeting all the normal requirements and many new requirements which hitherto could not be met by natural rubber at all.

As an offshoot of synthetic rubber, research techniques in polymerization and hydrogenization and the use of catalysts are finding interesting ramifications. It is now possible to produce high-test gasoline from a wide variety of agricultural products with comparatively simple plant and equipment. Hitherto inaccessible regions may eventually be equipped to produce their own gasoline. This may have an important bearing on both air transportation and mechanized agriculture.

There are some who will predicate a whole post-war programme of industrial expansion on the civilian application of plastics which are now being largely used for war purposes. Polyethylene and polythene, because of their amazing electrical properties, are being exclusively used in radar work and are hardly known to the public at all. New plastic tubes and pipes are now being made which can be welded like metals. Lucite and a host of other plastics will, after the war, take their place in civilian life.

The paint industry has engaged in research into the special requirements of camouflage, into infra-red resistant pigments and into special lacquers to take the place of tin and other metal coatings. This research will probably result in paints for civilian use far in advance of anything known before.

Food research is now perfecting dehydration techniques. New methods of packaging and preserving—methods of crystallizing foods with preservation of all their essential qualities—new methods of planting and rotation—will all have their effect.

We are also learning to use our critical materials more sparingly. Recent developments of electrolytic tinning have already cut requirements for tin in half. Close scrutiny regarding the use and specifications of nickel have reduced our requirements by 25 per cent. New steel specifications are having similar effects.

The necessity for maintaining large numbers of men in virgin territories is resulting in new methods of sanitary control and the development of highly mobile sanitary equipment. Such techniques may open up parts of the world hitherto considered to be inaccessible.

Allied to all the above, of course, is the fact that everywhere the search for new raw materials and new methods and new processes is being accelerated. At long last, the countries of the world are beginning to adopt a closer standardization of scientific measurements. The industrialization of the world is being disseminated more evenly throughout the various regions of the earth. Mass production methods and pools of skilled labour can now be found all over the world. Through recently negotiated patent agreements, scientific techniques and processes are now being made available to all the peoples of the United Nations.

Thus are engineers and scientists laying the foundations of an ampler world, in part atonement, at least, for making possible many of the horrors of modern war.

As the fate of Manchuria and Poland and Pearl Harbor forced upon the democratic countries of the world a progressive realization that war was inevitable, we began by imposing a war production programme on top of our normal civilian production. As we increased our war preparations, it became necessary to invent a way of curtailing civilian production. A priority system was set up whereby war requirements were given a prior claim over civilian needs on scarce materials. Very soon, priorities had to be extended to civilian requirements in order to distinguish between "essential" and "non-essential" civilian requirements. Finally, the point was reached when the sum of "essential civilian" and "total war" requirements exceeded total production capacity. At this point the priority system naturally broke down. This happened in England towards the end of the first year of the war. It is happening now in the United States. The alternative is a system of allocations in which an attempt is made to balance total production with total need. To the engineer this seems like as easy and obvious next step, but it involves profound and far reaching consequences. In economic parlance the transition from priorities to allocation might almost be regarded as a change from *laissez-faire* to a planned economy. Since we are fighting a global war and since the normal sources of so many raw materials are now in enemy hands and since the production of certain articles of war and certain synthetics must be centralized in one area or another, our allocation system must also be planned to operate on a global scale. The job of setting up bodies and of organizing the programmes for the production and consumption of the United Nations and of establishing the necessary authorities to carry them out on a world-wide scale is an herculean task. Short of production itself, it is the most important undertaking in the world at the moment. It is an undertaking so complicated and so vast and requiring such close detail that nothing short of a major crisis in the affairs of all mankind could have forced us to face it and carry it through. Those of us who are immersed in the immediate tasks of carrying into effect this programming scheme tend to see only the difficulties and the possibilities of strain and misunderstanding and international friction. Underlying it all is a great new step forward in world affairs. One of the most immediate effects is the fact that the division between civilian and war requirements is disappearing. All requirements are now becoming either direct or indirect war requirements. Anything which does not aid the war effort has no place. Thus it is being brought home to all that this is a people's war and that the peace must be a people's peace. It is a demonstration of the necessity of international solidarity and of the possibility of international co-operation. It is a "first" in history and there will be no going back. Humanity is being organized in a phalanx. Churchill, Roosevelt, Stalin, Chiang-Kai-shek; behind them the general staffs; behind them the joint international boards; behind them the various boards and organizations; and behind them the combined efforts of fifteen hundred million people, now for the first time treading the same road in a communal effort and setting their faces towards a common goal.

E. R. JACOBSEN, M.E.I.C.

## THE COMMITTEE ON THE YOUNG ENGINEER

At the Council meeting held at Niagara Falls last month, H. F. Bennett presented the following report concerning the recent activities of his committee:

I am reporting on the activities of the Engineering Institute of Canada Committee on the Training and Welfare of the Young Engineer since the Annual Meeting in February, 1942.

(1) About 13,000 copies of the brochure—"The Profession of Engineering in Canada"—have been published and about 9,000 copies have been distributed without charge to the engineering colleges and to the high schools throughout Canada.

(2) Student Guidance Committees have been set up in sixteen of the branches of the Institute to implement the guidance phase covered by the brochure. I have received frequent reports from several of these branches, indicating a considerable activity. It is to be hoped that the remaining branches will follow with the naming of their committees.

(3) The French language edition of the brochure is now in the hands of the printers. These will be distributed to the French speaking schools in the province of Quebec and in the French districts of the other provinces.

(4) The president and other members of the Institute have spoken on the subject of student guidance at a majority of the branches of the Institute.

(5) The several Branch Committees are now co-operating with local guidance committees, student counsellors, university alumni and high school principals.

(6) Single copies of the E.C.P.D. Manual for Student Counsellors have been distributed to the Branch Committee chairmen, and they are asking that a supply be obtained for their use. This request will be in my recommendation portion of this report.

(7) Since we reported to you on the need for greater publicity on the subject of Student and Junior prizes, we have had enquiries from the branches indicating a renewed interest in these competitions.

### RECOMMENDATIONS

(1) We would recommend to the councillors of each Branch that they encourage the activities of the Junior member committees and the Student guidance committees, and if these have not yet been formed in their individual branches, that they be urged to carry out this request so that there will be no loophole in our organization.

(2) We would recommend that 200 copies of the E.C.P.D. Manual for Committees of Engineers, and 200 copies of Appendix "A" of that Manual, be obtained from the E.C.P.D. at an estimated cost of \$15.00.

Respectfully submitted on behalf of the Committee.

(Signed) HARRY F. BENNETT, M.E.I.C.,  
Committee Chairman.

## ENGINEERS COUNCIL FOR PROFESSIONAL DEVELOPMENT

The 10th Annual Meeting of the Engineers Council for Professional Development was held in New York on Saturday and Sunday, October 17th and 18th under the general guidance of R. E. Doherty, Chairman of the Council, and President of the Carnegie Institute of Technology. The meetings were held in the board room of the American Society of Civil Engineers and the Engineer's Club.

The Institute was well represented by President C. R. Young, and past presidents J. B. Challies and Arthur Surveyer, and James Vance, the Institute's representative on the Committee of Professional Recognition, and the General Secretary.

Saturday's session was devoted to a meeting of the executive of the council and Sunday was a general meeting, concluding with a dinner at the Engineer's Club in the evening, at which Dr. Doherty was chairman and Colonel C. E. Davies was toastmaster.

From left to right, Harold V. Coes, president-elect of the American Society of Mechanical Engineers; Past-President Arthur Surveyer of The Engineering Institute of Canada; Dr. R. E. Doherty, president of Carnegie Institute of Technology and chairman of E.C.P.D.; Toastmaster Colonel C. E. Davies, secretary of A.S.M.E.; L. Anstin Wright, general secretary of E.I.C.; Dean R. L. Sackett of Pennsylvania State College, chairman of the Committee on Student Selection and Guidance; C. H. Stevens; Dr. A. R. Cullimore, president of Newark College of Engineering. Past-President J. B. Challies of the E.I.C. was sitting on the left just out of the camera range.

The evening was given over to discussion of the work already accomplished by the E.C.P.D. in the first ten years of its existence, and to its position in the future in relationship to the various war activities.

At the Sunday meeting, the reports from all committees were presented and approved. All or part of these reports will be printed in the *Engineering Journal* very shortly. They point out the value of the work being done in a field in which the Council is giving very definite leadership. No single agency is doing so much for the advancement of the professional interest of the engineers, as is the Engineers Council for Professional Development.

## PROFESSOR WEBSTER PURSUES HIS GOOD WORK

Those who had the privilege of attending Professor Webster's lectures or of meeting him personally will be interested in the following letter from the Chief Engineer of the British Ministry of Home Security, Sir A. M. Rouse.

Ministry of Home Security,  
Home Office Building, Whitehall.

7th September, 1942.

Assistant General Secretary,  
The Engineering Institute of Canada,  
Montreal, Que.

Dear Mr. Trudel,

Your letter of the 29th July, 1942, to Prof. F. Webster, enclosing Copy No. 1 of "Structural Defence against Bombing" has been received, and in his absence I have opened it.

Prof. Webster is absent in the East giving advice on the defence of an important installation, and I delayed acknowledging your letter in case he should return in time to do so himself.

I feel, however, that your letter must be answered lest you should feel that Prof. Webster is guilty of a discourtesy.

It is very gratifying to us, his colleagues, to know that his work in Canada was appreciated so widely.

Yours sincerely,

(Signed) A. M. ROUSE,  
Chief Engineer.

We wish Mr. Webster all success in his work which does so much to lessen the possible damage and loss of life from aerial bombing.

## CANADIAN ENGINEERS IN ENGLAND

About this time last year, a representative of the British Ministry of Aircraft Production, member of the Institute, came from England to enlist the services of a number of Canadian engineers on several important construction projects of the Ministry.

Before his arrival, Mr. W. O. Maclaren had communicated with the Institute, requesting that a number of possible candidates for the positions be assembled ready for his interviewing. The Institute Employment Service, in co-operation with the Wartime Bureau of Technical Personnel, did the necessary canvassing and, upon his arrival in Canada, Mr. Maclaren was able to interview several qualified persons in the principal centres. As a result, several engineers were engaged, by the Ministry, in a civilian capacity, and went over to England early this year.

The following letter received recently from Mr. Maclaren may be of interest to the relatives and friends of these engineers:

MINISTRY OF AIRCRAFT PRODUCTION,  
Thames House, Millbank, S.W.1.  
15th October, 1942.

The Secretary,  
The Engineering Institute of Canada,  
Montreal, P.Q.

Dear Sir,

I regret that owing to my activities in this country, I am not able to write nearly as often as I would like.

I do feel, however, that you will be interested to learn something of the activities of some of the Canadian engineers whom I brought over to this country to take up positions with the Ministry of Aircraft Production.

Mr. S. S. W. Cole has proved himself to be extremely useful in his capacity of resident engineer in charge of a very secret type of factory, the cost of which project is running into some three and a half million dollars. Mr. Cole is making extremely good efforts in this country and is handling his work with customary Canadian efficiency.

Mr. W. H. Ellis is my deputy (superintending engineer) on a contract for the Ministry, in value of over six million dollars, and is carrying out his duties conscientiously and with outstanding ability. He is extremely interested in his work and perfectly happy in his surroundings.

Mr. J. H. Brown is resident engineer and is distinguishing himself on a three million dollar project for the Ministry, and by his high degree of energy, activity and outstanding ability in administering this contract in a most able and satisfactory manner.

Mr. Kingston is engaged as civil engineer on one of the biggest undertakings in this country, running approximately ten million dollars and he has proved himself to be extremely satisfactory in every way.

Mr. J. A. Fisher is engaged as civil engineer on another very large contract in the north of England, and his tactful understanding, energy and conscientious application to his duties are assisting in no small measure in the early completion of a major contract being undertaken by this Ministry. Mr. Fisher is taking a particularly keen interest in local conditions in this country, and any spare moments he has (which are few) he is studying every building of any historical interest and appears to be getting a real kick out of it.

Mr. J. C. Loiselle, s.e.i.c., is mostly engaged on design work at the Ministry's headquarters, and his cheerfulness and willing application to his duties both ensure that his work is being undertaken in a most efficient manner and enable him to get along agreeably with people with whom he comes into contact. Mr. Loiselle should be acquiring by this time a very intimate knowledge of London and its environs.

Mr. C. M. Hare, m.e.i.c., is carrying out some very useful work for the Ministry, but as I have not come in contact with him for some months now, I have less detailed informa-

tion about him than of the other members of the party.

I must thank the Institute for its most gracious and helpful co-operation at the time of my recent visit to Canada, during which time these engineers were chosen, and since when they have arrived in this country. My visit would have been well worth while if I had only obtained one engineer out of the group noted above. As I am fortunate enough to obtain several extremely able engineers through the good offices of the Institute and the Wartime Bureau of Technical Personnel, the position is even more favourable.

In conclusion, I would like to convey my most sincere regards to Mr. L. Austin Wright, Miss McLaren, his secretary, and to Mr. H. W. Lea, now the director of the Wartime Bureau of Technical Personnel, for making my visit both profitable and interesting.

I will let you have such further information as may come into my possession at as frequent intervals as conditions permit.

Yours faithfully,

(Signed) W. O. MACLAREN, m.e.i.c.,  
Superintending Engineer—M.A.P.,  
Assistant Director of Aircraft Production Factories.

## CORRESPONDENCE

THE KING VS. PARADIS AND FARLEY INC.

Montreal, October 20th, 1942.

The Editor,  
The Engineering Journal, Montreal, Que.

Dear Sir,

I would like to submit to the attention of your readers the following thoughts in connection with the case recently decided by the Supreme Court of Canada and summarized in the September issue of the *Journal*, *The King vs. Paradis & Farley, Inc.*

The learned judges say that the contractor was obligated to drive piles in a specified location, not in a specified material. Suppose the test borings, which were probably not closer than 100 ft., by chance did not in any way represent the material, and it developed that piles could not be driven at all instead of at some additional cost. The design of necessity would then have been changed, and either the contract cancelled, or the contractor compensated at agreed prices for the changed conditions. The owner and the owner's engineers generally have ample time and facilities for securing information. Accurate information as to the foundation material is a prerequisite for the design. By publishing information, I contend that the owner tacitly admits influencing the contractor, who generally has neither the time nor means to verify the information, and regardless of the fact that the owner states he is not to be held responsible for such information, he undoubtedly should be responsible if he issues information at all. Partial change from the conditions anticipated by the published information, warrants adjustment of compensation to the contractor, just as a complete change in design warrants adjustment.

Why should a clause be allowed in a contract, or a whole contract be written permitting an owner to benefit at the expense of a contractor, because of the deficiencies or professional irresponsibility of the owner's engineers, or to put it more gently, because of the owner's lack of confidence in his engineer, or again because the owner desires to take unfair advantage of the cupidity of many contractors.

Bidding, of course, is voluntary, and a contractor does not have to put his head in a noose. Lotteries are not allowed in this country however. Government departments and others should not be allowed to call for tenders on work under such conditions.

Regardless of what may be done, the old principle of *Caveat emptor* will prevail. As I see it, the contractor "buys" every job for which he signs a contract. However, His Majesty, and those acting for him, are supposedly beyond

reproach. That His Majesty or any owner should retain or employ engineers, and then by outrageously one-sided contractual obligations attempt to safeguard the owners from all possible errors, omissions or misjudgements of the engineers, appears to me grossly unjust to the contractor, apart from being a very terrible reflection on the integrity and capabilities of the engineers.

In my opinion, all information available pertinent to proper pricing by the contractor, should be given always. When there is doubt as to the reliability of the information, or when the owner arbitrarily will not assume responsibility for it, then a fee type of contract should be mandatory.

If unit prices or a stipulated sum are required, the information should without any doubt be guaranteed.

If the actual conditions result in additional cost over the guaranteed conditions, the contractor will be entitled to compensation and the owner will be required to pay. The owner would have to pay in any case if the true conditions were known when the tender was made. If the conditions are uncertain and are not guaranteed—but turn out much better than anticipated, then the owner under a fee contract pays the actual cost only.

I have been misled by improper information. The most glaring occurrence was in 1932 arising out of my contract for the construction of the Paris high level bridge for the Ontario Department of Highways. The Department exhibited borings on the drawings, and at the same time disclaimed all responsibility for them. There were a number of river piers and a large east abutment. The footing for this abutment was about 45 ft. below the existing ground at the bottom of the east bank of the Grand River valley. The roadway was about 45 ft. above, i.e., a total height of about 90 ft.

The borings showed shale to rock at 45 ft. below the existing ground. The shale in the vicinity was such that it could be dug with a clam mostly without shooting. The overbreak would not be excessive and sheeting and bracing would not be required. So the job was bid and "bought."

There was clay but no shale for the whole 45 ft. The overbreak was very great, and disaster due to the hill sliding was just avoided, serious cracks having developed in the old road 60 ft. above the existing ground one hundred feet above the bottom of the hole. I had inspected the cores previous to bidding. These must have been allowed to dry out before being recorded.

Some adjustment was made after over a year's delay, but the Department disclaimed all responsibility.

E. P. MUNTZ, M.E.I.C.,

*Past President, National Construction Council.*

## MEETING OF COUNCIL

A regional meeting of the Council of the Institute was held at the General Brock Hotel, Niagara Falls, Ontario, on Tuesday, October 13th, 1942, at two o'clock p.m.

Present: President C. R. Young (Toronto) in the chair; Past-Presidents T. H. Hogg (Toronto) and C. J. Mackenzie (Ottawa); Vice-President K. M. Cameron (Ottawa); Councillors A. E. Berry (Toronto), J. G. Hall (Montreal), R. E. Hertz (Montreal), A. W. F. McQueen (Niagara Peninsula), G. M. Pitts (Montreal), W. J. W. Reid (Hamilton), H. R. Sills (Peterborough), and J. A. Vance (London); Treasurer E. G. M. Cape (Montreal); General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel. There were also present by invitation—Past-President A. J. Grant (St. Catharines); Past-Vice-President E. P. Muntz (Montreal); Past-Councillors M. B. Atkinson, W. R. Manock and W. Jackson of the Niagara Peninsula Branch; D. J. Emery, chairman, Peterborough Branch; C. G. Cline, chairman, C. G. Moon, past-chairman, J. H. Ings, secretary-treasurer, W. D. Bracken and J. W. Brooks, members of executive, Niagara Peninsula Branch; W. C. Miller, Presi-

dent, Association of Professional Engineers of Ontario and chairman of the Institute's Committee on Post-war Problems; H. F. Bennett, chairman of the Committee on the Training and Welfare of the Young Engineer; Major M. B. Watson, Registrar of the Association of Professional Engineers of Ontario and Secretary of the Dominion Council of Professional Engineers.

In welcoming the councillors and guests President Young expressed his pleasure at seeing so many past officers. Their advice and participation in the discussions would be of great assistance to Council. Following the usual custom, he asked each person present to stand and give his name, place of residence, and Institute affiliation.

The question had been raised as to whether or not the Institute would be justified, under present conditions, in proceeding with the preparation of dies for the two new medals recently established by Council. Enquiries had been made and although no reply had as yet been received from Mr. H. E. Ewart, the Master of the Royal Canadian Mint, Henry Birks and Sons advised that they could accept an order for the dies, but the medals could only be made in gold or silver. It was decided to await a reply from Mr. Ewart before reaching any decision.

Attention was drawn to a recent announcement in the press whereby in order to conserve transportation, the Honourable C. D. Howe made an appeal for the curtailment of all unnecessary travel, including the postponing of conventions and similar gatherings.

The general secretary read a letter which the President had addressed to Mr. Howe, asking whether his appeal would go so far as to make it desirable for the Institute to abandon the idea of its annual professional meeting in February, 1943. In Mr. Howe's absence in England a reply had been received from Mr. W. J. Bennett, executive assistant to Mr. Howe, which indicated that, in his opinion, Mr. Howe would likely suggest that the meeting be postponed as the appeal to be effective should apply without favour to any particular group.

President Young pointed out that at the regional meeting of Council held in Halifax in August, before any appeal had been made for the conservation of transportation facilities, it had been unanimously decided to hold the annual meeting in its usual form.

Dean Mackenzie who had attended the Halifax meeting, felt that the meeting in Toronto would not be a very great strain on the transportation systems as a large proportion of the members attending would come from Toronto and nearby territory. In view of the important part which engineers are taking in the war effort, he would not like to see the meeting postponed.

Colonel Cape felt that the Institute meeting would be a purely professional gathering, mostly taken up with matters of vital interest to the war effort, and would not be in the same class as other conventions which Mr. Howe had in mind.

Following discussion it was unanimously decided to ask Vice-President Cameron and the general secretary to wait upon Mr. Howe as soon as possible after his return from England, and discuss the matter with him.

Dr. Berry reported that the Toronto Branch Annual Meeting Committee was making good progress. Arrangements had been completed with the hotel, and the Papers Committee was at work. However, plans would be held in abeyance until a decision had been reached as to whether or not the meeting would be held. It was very desirable that the Papers Committee should be informed of the decision as soon as possible.

A letter was read from Mr. Wills MacLachlan, chairman of the Committee on Industrial Relations, who had expected to be present, although he had no special report to make at this time. The next meeting of his committee would be held on October 16th, following which a further report would be available.

Mr. W. C. Miller, chairman of the Committee on Post War Problems, read a letter describing the work accomplished by his committee and referring to the possible co-operation with the various citizens' committees now being established under the guidance of the Department of Pensions and National Health and dealing with the problems to be met in the rehabilitation of returned soldiers.

President Young felt that in contacting the various citizen committees now being established under the guidance of the Department of Pensions and National Health, Mr. Miller's committee had undertaken a very useful activity.

Mr. Cameron stated that his sub-committee on post-war construction was looking forward with much interest to receiving the report from Mr. Miller's committee on the draft questionnaire entitled "Considerations for the Evaluation of Post-War Construction Projects." Mr. Cameron was interested to note that his suggestion regarding the possibility of members of the Institute supporting the various citizens committees, had been acted upon. He felt that this offered a splendid opportunity for engineers to obtain some recognition, and also to show that they are really public spirited citizens. Engineers are taking a leading part in the war effort, and while post-war reconstruction problems must necessarily take second place to the actual prosecution of the war, Mr. Cameron felt that engineers, both individually and as a body, would be able to render a real service in post-war planning.

In Mr. Pitts' opinion, too many committees on post-war construction were being formed. A greater co-ordination of effort would be more likely to produce results.

Following further discussion, Mr. Miller's letter was accepted as a progress report.

In the absence of Chairman J. E. Armstrong, the assistant general secretary read progress report No. 3 of the Committee on the Engineering Features of Civil Defence, dated September 5th, 1942. This report is published in the October number of the *Journal* for the information of all members.

As chairman of the sub-committee on the abridged edition of the Webster lectures, Mr. Bennett reported that his committee had completed its task which had been rather difficult owing to the fact that the committee members were somewhat scattered. Special thanks were due to Mr. S. R. Banks for the way in which he had centralized the work of the committee. It was announced that the books would be available for distribution at this meeting.

Mr. Pitts reported that his sub-committee on Protection Against Bombing, etc., was making progress. The committee was gathering information but had nothing definite to report at the present time.

Regarding Mr. Legget's sub-committee on the Repairing of Damaged Structures, Mr. Pitts had received authority from the Royal Architectural Institute of Canada to co-operate with the Institute and the Canadian Construction Association in completing the report which is being prepared for submission to the federal government by the three bodies.

Following presentation by Mr. Bennett of his report on the Committee for the Welfare and Training of the Young Engineer printed elsewhere in this issue, Mr. Pitts drew attention to the financial aid which is now being given by the federal and provincial governments to enable students to complete their engineering and science courses. He wondered if it would be possible for such financial aid to be continued as part of the reconstruction programme after the war. He believed that if the Institute—possibly through Mr. Bennett's committee—would associate itself with such a proposition, the government would be very willing to co-operate. Mr. Bennett's sub-committees on student guidance would be in a good position to advise the government on prospective candidates for this financial aid.

Mr. Bennett stated that he had been rather surprised that his committee had not been consulted in connection with this question. He believed that this aid to students would be continued after the war, and his student guidance committees would be in an excellent position to render

valuable assistance in the matter of selection of prospective candidates. Individual members of his committee had already been consulted, although the committee as a whole had not been approached. Mr. McQueen, a member of Mr. Bennett's committee who had been approached unofficially, thought it would be of great assistance both to students thinking of entering the university and to the student guidance committees if the contact with the government could be made more or less official. In President Young's opinion this would be a very useful service for the Institute's committee to undertake.

Dean Mackenzie pointed out that as education is a provincial matter, the whole subject would require careful consideration. He felt that post-war scholarships should not be confused with those now being given by the government on a war basis. He doubted whether it would be wise for the Institute to make any recommendations along this line at the present time, although he was in favour of studying the matter.

Following further discussion, it was unanimously resolved that Mr. Bennett's committee be asked to give this whole matter some preliminary consideration and make recommendations to Council regarding any action that might be taken by the Institute.

Mr. Muntz, chairman of the Nominating Committee, reported that the unanimous selection of his committee for the presidential nominee for 1943 was Vice-President K. M. Cameron.

President Young expressed his own particular pleasure in having Vice-President Cameron nominated as his successor. He testified most heartily to Mr. Cameron's devotion to the cause of the Institute. He had been a tower of strength to him during his term of office. The Institute would be most fortunate in having him as president.

Mr. Cameron expressed his appreciation of the great honour conferred upon him. His two years as vice-president had given him a great deal of pleasure and satisfaction. He had enjoyed particularly the privilege of accompanying Dean Young and Dean Mackenzie on their presidential visits to the branches. If elected president, he would do all he could for the engineers of Canada.

A letter was presented from Past-President McKiel reporting that when in Newfoundland recently he had discussed with members of the Institute the possibility of establishing a branch in St. John's. As a great many of the members now in Newfoundland are there temporarily as a result of the war, it was the general feeling that it would not be wise to attempt the formation of such a branch at the present time. This report was noted.

The death of Past Councillor H. S. Johnston, of Halifax, who had attended the regional meeting of Council held in Halifax in August last, was noted with sincere regret. It was also noted that Professor H. R. Webb, of Edmonton, a past councillor of the Institute and registrar of the Association of Professional Engineers of Alberta, had been killed in a mountain-climbing accident while surveying for the Calgary Power Company. The general secretary was directed to convey to the families of these two former members of Council, the sincere sympathy of the President and Council of the Institute.

A number of applications were considered and the the following elections and transfers were affected:

ADMISSIONS	
Members.....	11
Students.....	9
TRANSFERS	
Junior to Member.....	13
Student to Member.....	2
Student to Junior.....	7

Several applications for admission as Affiliate were presented, together with a memorandum regarding this classification from Councillor H. N. Macpherson, and a letter

from the Montreal Branch asking for Council's opinion on two particular cases in order that the branch might have a clear interpretation of Council's policy regarding the admission of Affiliates.

A prolonged discussion took place as to the type of person to be admitted under the provisions of Section II of the By-laws. It was noted that recently Affiliate Membership has been offered to candidates who have had a great deal of engineering experience but who have not the required educational qualifications for the class of Member, and who may not at the present time be in a position to sit for the Institute's examination. This did not seem to be the correct classification for such persons. It was felt that this classification was intended more properly for persons with high educational qualifications but who are not necessarily engineers.

There appears to be a great difference of opinion as to the type of person who should be admitted to this classification. The interpretation of the by-law itself by members of Council was far from unanimous. Dean Mackenzie did not agree with the suggestion that any person who complied with the requirements of Section II should be admitted as an Affiliate. In his opinion, it might even be necessary to amend that section of the by-laws. Mr. Hall pointed out that the Institute Membership Committee had had this classification under consideration for some time, and the matter had been thoroughly discussed at several Council meetings. The present discussion had brought out more clearly than ever the fact that there is no unanimity of opinion as to what is meant in the by-law. His recommendation would be that for the time being, the present by-law should be clarified so that everyone would have the same interpretation. After investigation it might be found desirable to revise Section II of the by-laws.

Mr. Bennett suggested that a good idea of the type of man that this classification was intended to cover might be obtained if the records of Affiliates of twenty years ago were examined.

Following further discussion, it was decided to defer action on all applications for admission as Affiliate, and to ask the Institute's Membership Committee to investigate the situation thoroughly, to look up the records of early Affiliates, and endeavour to establish a normal interpretation of Section II of the By-laws. Such an interpretation, if approved by Council, could be circulated to all branches for their guidance, and would obviate the necessity of changing the by-law at the present time.

Dr. Hogg expressed appreciation of the presence at this meeting of an esteemed past-president, Mr. A. J. Grant, of St. Catharines, Ontario.

It was decided that the next meeting of Council would be held in Montreal on Saturday, November 21st, 1942.

There being no further business, the Council rose at four-thirty p.m.

## ELECTIONS AND TRANSFERS

At the meeting of Council held on October 13th, 1942, the following elections and transfers were effected.

### Members

- Dell**, Charles Adin Orin, elec. designing dftsman., H. G. Acres & Co., Niagara Falls, Ont.
- Easton**, Wallace Moffat, B.Sc. (Mech.), Hon.M.E., (Clarkson Coll. of Technology), asst. divn. engr., Consolidated Paper Corp'n. Ltd., Shawinigan Falls, Ont.
- Fortin**, René, B.A.Sc., C.E. (Ecole Polytechnique), designing engr., B. R. Perry, M.E.I.C., constg. engr., Montreal, Que.
- Lapeyre**, Jean, ingénieur diplômé de l'Ecole Polytechnique et de l'Ecole Supérieure d'Electricité de Paris, tool engr., Engineering Products of Canada, Ltd., Montreal, Que.
- Miard**, Henry Thomas, B.A.Sc. (Civil), (Univ. of B.C.), senior asst. engr., Civil Aviation Division, Dept. of Transport, Lethbridge, Alta.
- Mills**, Cecil Gordon, B.Sc. (Elec.), (McGill Univ.), elec. engr., West Kootenay Power & Light Co., Trail, B.C.
- McIntyre**, Jacob Spence, B.A.Sc. (Univ. of Toronto) chief mech. engr., Armstrong, Wood & Co., Toronto, Ont.

**Patterson**, Wilfred Ernest, B.Sc. (Chem. & Met.), (Queen's Univ.), technical director, Merck & Co. Ltd., Montreal, Que.

**Pouliot**, Adrien, B.A.Sc., C.E. (Ecole Polytechnique), L.Sc. (Maths.), (Sorbonne, Paris), M.Sc. (Laval Univ.), Dean, The Faculty of Science, Laval University, Quebec, Que.

**Ransom**, Rosmore Howard, B.Eng. (McGill Univ.), Officers' Training Course, R.C.A.F., Montreal, Que.

**Sarault**, Gilles Edouard, B.Eng. (Elec.), (McGill Univ.), lecturer, Dept. of Electrical Engineering, Laval University, Quebec, Que.

### Transferred from the class of Junior to that of Member

**Baxter**, Gordon Bruce, B.Sc. (Elec.), (McGill Univ.), asst. elect. supt., Canadian International Paper Co., Three Rivers, Que.

**Benoit**, Jacques Emmanuel, B.A.Sc., C.E. (Ecole Polytechnique), dist. sales mgr., Wallace & Tiernan, Ltd., Montreal, Que.

**Colpitts**, Cecil Ashton, B.Sc. (Civil), (Univ. of Manitoba), divn. engr., C.P.R., Saskatoon, Sask.

**Denton**, Allan Leslie, B.Sc. (Elec.), (Univ. of N.B.), Navigation Instructor, (Pilot Officer), R.C.A.F., Chatham, N.B.

**Dickson**, William Leslie, B.Sc. (Elec.), (N.S.Tech. Coll.), B.Eng. (Mech.), (McGill Univ.), asst. chief engr., Deloro Smelting & Refining Co. Ltd., Deloro, Ont.

**Doddridge**, Paul William, B.Sc. (Elec.), (Univ. of N.B.), asst. switch-gear engr., apparatus sales dept., Can. Gen. Elec. Co. Ltd., Toronto, Ont.

**Eagles**, Norman Borden, B.Sc. (Elec.), (Univ. of N.B.), Engineering Instructor, No. 21 E.F.T.S., Chatham, N.B.

**Fisher**, Sidney Thomson, B.A.Sc. (Univ. of Toronto), development engr. & sales engr., Special Products Division, Northern Elec. Co., Montreal, Que.

**Laird**, David William, B.Sc. (Civil), (Univ. of Man.), designing engr., C. D. Howe Co. Ltd., Port Arthur, Ont.

**Powell**, John Giles, B.A.Sc. (Civil), (Univ. of Toronto), asst. engr., Gore & Storrie, constg. engrs., Toronto, Ont.

**Stewart**, Leslie Baxter, B.Sc. (Elec.), (McGill Univ.), powerhouse supt., Shawinigan Water & Power Co., Rapide Blane, Que.

**Sudden**, Edwin Alexander, B.A.Sc. (Univ. of Toronto), design engr., hydraulic dept., H.E.P.C. of Ontario, Toronto, Ont.

**Young**, William Hugh, B.Sc. (Mech.), (Queen's Univ.), mill engr., Brompton Pulp & Paper Co. Ltd., East Angus, Que.

### Transferred from the class of Student to that of Member

**Filion**, Paul, B.Eng. (Chem.), (McGill Univ.), engr., fire prevention dept., [Reed, Shaw & McNaught, Ltd., Montreal, Que.

**Smith**, Arthur James Edwin, B.A.Sc. (Civil), (Univ. of Toronto), Capt., R.C.E., Works Officer, M.D. No. 10, Fort Osborne Barracks, Winnipeg, Man.

### Transferred from the class of Student to that of Junior

**Auclair**, Charles A., B.A.Sc., C.E. (Ecole Polytechnique), gen'l. engr., Arthur Surveyer & Co., Montreal, Que.

**Campbell**, Gerald Arthur, B.Sc. (Civil), (Univ. of N.B.), c/o Mrs. Helen S. Hubbard, Beaverbrook Residence, Fredericton, N.B.

**Conklin**, Maurice, B.Eng. (Mech.), (Univ. of Sask.), tool designer, Canadian Propellers, Ltd., Montreal, Que.

**Hilbard**, Ashley Gardner, B.Eng. (Civil), (McGill Univ.), dftsman., bridge engr. dept., C.P.R., Montreal, Que.

**McBride**, James Wallace, B.Sc. (Elec.), (Univ. of Man.), S.M. (Aero), (M.I.T.), research associate, divn. of industrial co-operation, Mass. Institute of Technology, Cambridge, Mass.

**Stanley**, James Paul, B.Eng. (Mech.), (McGill Univ.), Flying Officer, engrg. divn., R.C.A.F. Headquarters, Montreal, Que.

### Students Admitted

**Bailey**, John Calvin, B.Sc. (E.E.), (Purdue Univ.), student engr., Can. Gen. Elec. Co. Ltd., Peterborough, Ont.

**Belyea**, James Louis, (Univ. of N.B.), Beaverbrook Residence, Fredericton, N.B.

**Goodfellow**, J. Bruce G., (McGill Univ.), 134 Cornwall Ave., Town of Mount Royal, Que.

**James**, Lourimer, (Mount Allison Univ.), 108 Pacific Ave., Moncton, N.B.

**Nachfolger**, Nathan, (McGill Univ.), 4359 Esplanade Ave., Montreal, Que.

**Macnab**, Edward Nelson, (Univ. of N.B.), Beaverbrook Residence, Fredericton, N.B.

**Roche**, Maurie John, (McGill Univ.), 3426 McTavish St., Montreal, Que.

**Smith**, Robert Rudolph, (Univ. of N.B.), 10 Paddock St., Saint John, N.B.

**Stone**, Daniel, (Univ. of Toronto), 46 Burnside Drive, Toronto, Ont.

## News of the Personal Activities of members of the Institute, and visitors to Headquarters

**R. deB. Corriveau**, M.E.I.C., assistant chief engineer of the Department of Public Works of Canada, was honoured recently at a presentation made to him upon his retirement effective September 1st, 1942, after 42 years of continuous service in the department. The presentation of a sterling silver tray was made by the Honourable J. E. Michaud, Minister of Public Works, before the assembled staff of the chief engineer's office. In addition to the address of the minister, Mr. Corriveau was also complimented by K. M. Cameron, M.E.I.C., chief engineer of the Department of Public Works and W. P. Harrell, acting deputy minister.

R. deB. Corriveau, M.E.I.C.

**E. P. Murphy**, M.E.I.C., has been appointed Deputy Minister of Public Works of Canada succeeding the late James B. Hunter. Mr. Murphy graduated from Queen's University and joined the Department of Railways and Canals in 1907 as engineer on the Trent Canal. From 1914 to 1918 he was engineer on the St. Peter's Canal, Cape Breton. Later he worked on the Cornwall Canal and on the Severn division

E. P. Murphy, M.E.I.C.

Born at West Hoboken, N.J., Mr. Corriveau was educated at McGill University, Montreal, where he received the degree of Bachelor of Science in 1900. During the summers of his university course he was engaged on railway location and harbour surveys. Following graduation, he entered the federal service in the Public Works Department and was first associated with the late chief engineer of the department, Arthur St. Laurent, past president of the Institute, on the construction of the Laurier Avenue bridge over the Rideau Canal at Ottawa. From that time until the death of J. H. Fraser, M. Can. Soc. of C.E., he was principal assistant to Mr. Fraser whom he succeeded as district engineer of the department, with headquarters at Ottawa. In 1923, when Mr. St. Laurent died, Mr. K. M. Cameron succeeded him as chief engineer of the department and Mr. Corriveau was appointed assistant chief engineer succeeding Mr. Cameron.

In his capacity as assistant chief engineer Mr. Corriveau has been associated for the past forty-two years with all the important projects carried out by the department on river and harbour work. In addition he did special development work on the St. Hubert airport from 1928 to 1930 and pursued intensive hydraulic studies in connection with the regulation of international waters.

The many friends of Mr. Corriveau in the engineering profession throughout Canada wish him every happiness and a long period of well-earned retirement.

**P. E. Doncaster**, M.E.I.C., district engineer for the Department of Public Works of Canada at Fort William, Ont., is at present with the engineering services of Polymer Corporation Limited, Sarnia, Ont.

**D. J. Emery**, M.E.I.C., chairman of the Peterborough Branch of the Institute, spent two weeks in Montreal last month attending a special course on chemical warfare given at McGill University under the auspices of the Directorate of Civil Air Raid Precautions. Mr. Emery was delegated by the Peterborough A.R.P. organization.

of the Trent Canal. From 1921 to 1930 he was division engineer on the construction of the Welland Ship Canal at Thorold, Welland and Port Colborne. From 1930 to 1934 he was superintendent of operations on the southern division of the Welland Canal and from 1934 to 1937 he was construction engineer. In 1937 he became engineer in the Department of Transport and at the outbreak of war in 1939 he was appointed construction engineer of the War Supply Board. Before his recent appointment Mr. Murphy was director of the Defence Projects Construction Branch in the Department of Munitions and Supplies at Ottawa.

**J. A. Lalonde**, M.E.I.C., chairman of the Montreal Branch of the Institute, has recently accepted a position as production manager with Marine Industries Limited at Sorel, Que.

**J. M. M. Lamb**, M.E.I.C., was reported in the last number of the *Journal* as having been appointed district engineer of the Department of Transport at Saint John, N.B. Mr. Lamb has been district engineer since 1940 and last July he was promoted to the position of agent of the Department of Transport, succeeding Colonel H. F. Morrissey, M.E.I.C., who died last summer.

**A. M. Reid**, M.E.I.C., of the Bell Telephone Company of Canada has been transferred recently from Toronto to Montreal as general employment supervisor. Mr. Reid is the secretary of the Institute Committee on Industrial Relations.

**Major J. P. Carrière**, M.E.I.C., has been appointed recently to the staff of the Directorate of Military Training at National Defence Headquarters and is in charge of engineer training and chemical warfare training. Major Carrière returned from overseas last spring to attend the Staff College at Kingston, Ont.

**C. O. P. Klotz**, M.E.I.C., is now employed as resident engineer with the Aluminum Company of Canada Limited at Kingston, Ont. He was previously located at Arvida, Que., with the same company.

**Dr. Paul E. Gagnon**, M.E.I.C., director of the Department of Chemistry at Laval University, Quebec, has been awarded the first prize of the scientific section in the 1942 Quebec provincial government's contests, commonly known as the David competitions. Dr. Gagnon was educated at Laval

**Dr. Paul E. Gagnon, M.E.I.C.**

University. He did post-graduate work in Paris during three years and spent 18 months at the University of London, England, as well as six months at the Massachusetts Institute of Technology, Cambridge, Mass. He joined the staff of the university as a lecturer in 1931 and became an assistant professor in 1932. He was appointed professor in the Faculty of Science in 1935 and he received his present appointment of director of the Department of Chemistry in 1938. Dr. Gagnon is also president of the Graduate School at Laval University.

**J. Frank Roberts**, M.E.I.C., has accepted a position as manager of the hydraulic department of Allis-Chalmers Manufacturing Company at Milwaukee, Wis. For the past six years he was connected with the Tennessee Valley Authority as senior mechanical engineer at Knoxville, Tenn., U.S.A. Mr. Roberts graduated from the University of Wisconsin in 1918 with the degree of Bachelor of Science and from 1919 until 1922 was testing engineer with the Allis-Chalmers Manufacturing Company. In 1922 he became sales engineer with the hydraulic department of the same company, and in 1924-1926 he was sales engineer in charge of the company's Canadian work for the hydraulic department. In 1927 he came to Canada as hydraulic engineer with the Power Corporation of Canada, Limited, at Montreal.

**H. J. McLean**, M.E.I.C., was offered a complimentary dinner last month by the Calgary Branch of the Institute jointly with the Rocky Mountain Branch of the Canadian Institute of Mining and Metallurgy and the Calgary district of the Association of Professional Engineers of Alberta, on the occasion of his transfer to Montreal as superintendent of construction with Montreal Engineering Company. Mr. McLean has been connected with the Calgary Power Company Limited since 1926. He was responsible for the construction of the Ghost Power Development of the company, and, as hydraulic engineer, he developed means of improving the hydraulic efficiency of the various stations of the company. He carried out investigations in connection with several storage projects. For the past two years he was actively engaged in the construction of the Cascade plant of the company.

Mr. McLean took a special interest in the activities of the engineering societies in Calgary and he was councillor of the Institute and chairman of the Calgary Branch. In 1940 he was president of the Association of Professional Engineers of Alberta and he was instrumental in bringing about the agreement between the Institute and the Association.

**Aimé Cousineau**, M.E.I.C., sanitary engineer of the Department of Health of the city of Montreal, has been appointed

**Aimé Cousineau, M.E.I.C.**

assistant director of the department in addition to his normal duties.

**R. J. Askin**, M.E.I.C., has been transferred recently from the position of mill manager of the Thunder Bay Paper Company Limited, at Toronto, to the position of assistant manager of mills with Abitibi Power and Paper Company Limited, at Toronto, Ont. Since his graduation from Queen's University in 1923 he has been connected with the Fort William Paper Company and later with the Abitibi Power and Paper Company.

**A. C. Abbott**, M.E.I.C., of The Shawinigan Water and Power Company has been transferred recently from Trois-Rivières to Montreal. Mr. Abbott has been with the company ever since his graduation from McGill University in 1926.

**Pilot Officer E. S. Braddell**, M.E.I.C., has been appointed technical adjutant of the maintenance squadron at No. 2 Flying Instructor's School, R.C.A.F., Vulcan, Alta. Previous to his enlistment in the Air Force, Mr. Braddell was with the Northern Electric Company Limited at Winnipeg, Man.

**Jean Bouchard**, M.E.I.C., is now located at Mackenzie, British Guiana, with Demerara Bauxite Company. For the past few years he had been employed with A. Janin and Company at Gaspé, Que.

**F. S. Small**, M.E.I.C., left the employ of the Hudson Bay Company, Flin Flon, Man., a few months ago, and is now with Fraser Brace Limited at La Tuque, Que.

**J. E. Neilson**, M.E.I.C., of Foster Wheeler Limited, has been transferred recently from Montreal to St. Catharines, Ont. He has been in the employ of the company since 1934. Upon his graduation from Queen's University in 1928 he went with the Riley Engineering and Supply Company Limited in Toronto, Ont., and remained in their employ until he joined Foster Wheeler.

**R. H. Riva**, M.E.I.C., is now superintendent with McGraw Construction Company, Inc., at Middletown, Ohio, U.S.A. Lately he had been with the Gary Armor Plate Plant, Gary, Indiana.

**W. C. Tatham**, M.E.I.C., was appointed works engineer of the nylon division of Canadian Industries Limited last

March and has been located in Kingston, Ont., since then. Previous to joining Canadian Industries Limited Mr. Tatham was assistant chief engineer with Courtaulds (Canada) Limited at Cornwall, Ont.

**Lieut. J. P. Leroux**, M.E.I.C., graduated last month from the Officer's Training Centre at Brockville, Ont. Before joining up he was resident engineer with the Mont-Joli Airport, Mont-Joli, Que. He graduated from the Ecole Polytechnique in 1939.

**Colonel M. P. Jolley**, Jr.E.I.C., who was with the Department of National Defence Headquarters at Ottawa is now president and general manager of Small Arms Limited, Long Branch, Ont.

After his graduation with honours in mechanical engineering from McGill University in 1933, he studied at the Military College of Science, Woolwich, Eng., and qualified as an ordnance mechanical engineer. During the years 1935 and 1936 he made a survey of small arms production in England. He returned to Canada in 1936 and became assistant to the director of artillery and mechanization at National Defence Headquarters, Ottawa.

**Lieut. René Leduc**, Jr.E.I.C., graduated last month from the Officer's Training Centre at Brockville, Ont. Before he enlisted, Lieut. Leduc was employed with Consolidated Paper Corporation Limited at Montreal.

**H. E. Hewitt**, M.E.I.C., is now employed at the International Coal and Coke Company Limited at Coleman, Alta., as assistant engineer.

**Major A. P. Boutilier**, R.C.E., Jr.E.I.C., is chief works officer with the Department of National Defence, engineer services at Sydney, N.S. Previous to his enlistment he was with the Dominion Steel and Coal Corporation at Sydney.

**F. Allan Davis**, Jr.E.I.C., of British American Oil Company Limited has been transferred recently to the head office of the company in Toronto, Ont. He was previously refinery engineer at Montreal East.

**2nd Lieut. Raymond LeBel**, Jr.E.I.C., graduated this month from the Officer's Training Centre, Brockville, Ont., and is now stationed at Petawawa, Ont. Mr. LeBel left the employ of J. M. E. Guay, Incorporated, consulting engineers, Montreal, last August to join the Royal Canadian Engineers.

**René Dupuy**, Jr.E.I.C., of the British Air Commission has been posted at Canadian Car and Foundry Company Limited, Fort William, Ont. He was previously inspector in charge at Canadian Vickers Limited, Montreal.

**F. C. Read**, Jr.E.I.C., of Dominion Tar and Chemical Company, Limited, has been transferred from Montreal to the Toronto plant of the company.

**Harold T. Kummen**, S.E.I.C., has joined the Navy and is now stationed as a Probationary Sub-Lieutenant at Halifax, N.S. Since his graduation from the University of Manitoba in 1941 he had been with the Aluminum Company of Canada Limited at Arvida, Que.

**Richard Scott**, S.E.I.C., has joined the staff of the Department of Electrical Engineering of the University of Toronto. He was previously with Canadian General Electric Company Limited at Peterborough, Ont.

**J. E. Poole**, S.E.I.C., is now working in the engineering department of Defence Industries Limited, Montreal, having been transferred from the nylon division of Canadian Industries Limited, Kingston, Ont.

**V. G. Kosnar**, S.E.I.C., who was previously located in Trinidad, B.W.I., with Trinidad Leaseholds Limited, is now employed in the Naval Service of the Department of National Defence at Ottawa.

**W. R. Staples**, S.E.I.C., is now instructor in mechanical engineering with the University of Saskatchewan at Saskatoon, Sask. Mr. Staples graduated from the university in 1942 and lately had been located in Montreal, with Dominion Engineering Works.

**Irving I. Zweig**, S.E.I.C., has recently received an appointment as senior research assistant in the division of physics and electrical engineering, National Research Council, Ottawa.

**P. G. Wolstenholme**, Affil. E.I.C., has been transferred from the Montreal office of the Aluminum Company of Canada Limited to the company's plant at La Tuque, Que.

## VISITORS TO HEADQUARTERS

**Jean Morency**, Jr.E.I.C., Bureau of Mines, Quebec, on September 3rd.

**Gilbert Padley**, Jr.E.I.C., from Trinidad, B.W.I., on October 8th.

**Viggo Jepsen**, M.E.I.C., chief draftsman, Consolidated Paper Corporation Limited, Grand'Mère, Que., on October 10th.

**J. Phileas Villemure**, Jr.E.I.C., superintendent of city works, Grand'Mère, Que., on October 10th.

**Rosaire Saintonge**, S.E.I.C., Consolidated Paper Corporation Limited, Port Alfred, Que., on October 10th.

**John E. Cade**, M.E.I.C., assistant chief engineer, Fraser Companies Limited, Edmundston, N.B., on October 15th.

**D. J. Emery**, M.E.I.C., designing engineer, Canadian General Electric Company Limited, and chairman of the Peterborough Branch of the Institute, Peterborough, Ont., on October 20th.

**D. C. Tennant**, M.E.I.C., engineer, Ontario Division, Dominion Bridge Company Limited, Toronto, Ont., on October 22nd.

**S. D. Levine**, S.E.I.C., Crucible Steel Company, Newark, N.J., on October 22nd.

**H. T. Kummen**, S.E.I.C., from Arvida, Que., on October 22nd.

## Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

**Harold Stanley Johnston**, M.E.I.C., chief engineer of the Nova Scotia Power Commission died at his home in Halifax on Tuesday, October 6th, 1942. He had been in ill health for the past year and confined to his home for a month. Born at Gananoque, Ont., on February 21, 1885, he graduated from McGill University in civil engineering in 1911 with honours in railway engineering after working some years with the Canadian Pacific Railway on construction jobs.

He was for some time assistant hydro-electric engineer with Smith, Kerry and Chase, engineers, in Nipissing, Ont., and later engineer in charge of construction with the Calgary Power Company at Horseshoe Falls, Alta. After 18 months in the armed forces he served in the engineering branch of the Department of Soldiers Civil Reestablishment at Calgary.

Mr. Johnston came to Nova Scotia in 1920 to join the staff of the Nova Scotia Power Commission and in a few years was promoted to chief engineer, the post he held until the time of his death. Keenly interested in the affairs of the community, he was an active member of All Saints Cathedral, former member of the executive of the Halifax Y.M.C.A. and until a year ago chairman of the Y.M.C.A. Service Men's Hostel, a member of the Halifax Club and the Commercial Club.

Harold Stanley Johnston, M.E.I.C.

Mr. Johnston joined the Institute as a Student in 1907. He was transferred to Associate Member in 1911 and he became a Member in 1922. He was a member of the Association of Professional Engineers of Nova Scotia since 1920, had served on its Council and was very active and instrumental in the drafting of the agreement now existing between the Institute and the Association of Professional Engineers of Nova Scotia.

**Lyall Radcliffe McCurdy, M.E.I.C.**, died in the hospital in Montreal on October 9th, 1942, after a brief illness.

He was born at New Glasgow, N.S., on July 16th, 1897. He was educated at Dalhousie University, Halifax, and at McGill University in Montreal where he received the degree of Bachelor of Science in mechanical engineering, in 1921. He was granted the Master of Science degree in machine design from McGill in 1927, after writing a thesis on research work he had carried out concurrently with teaching. From

1922 to 1927 he was sessional lecturer and demonstrator in the Department of Mechanical Engineering at McGill and in 1927 was appointed lecturer in the same department. In 1936 he became assistant professor of mechanical engineering, a position which he occupied until the time of his death. Professor McCurdy had made a special study of journal bearing friction and he had conducted a special investigation on the efficiency and operating costs of towing equipment on the upper Ottawa River.

Mr. McCurdy joined the Institute as a Student in 1919, transferred to Junior in 1926, and became an Associate Member in 1929. In 1940 he became a Member.

**Lt.-Colonel Charles Rowlett Townsend, M.E.I.C.**, died on board ship and was buried at sea on October 11th, 1942. He had suddenly taken ill in Scotland and was returning to Canada.

Born at Victoria, B.C., on February 9th, 1891, he received his engineering education at the University of New Brunswick where he graduated with the degree of Bachelor of Science in 1920. Two years later he received his degree of Master of Science from the same university. He served in the Canadian Field Artillery in the last war and won the Military Medal.

Upon his graduation in 1920 he joined the air service division of the Laurentide Company Limited at Grand-Mère, Que., and was engaged during the next three years in aerial photography. In 1923 he was transferred to the logging division. In 1930 he became chief forester of the Canada Power and Paper Corporation and a few months later he was appointed manager of the Anticosti Island for the Consolidated Paper Corporation. In 1936 he came to Montreal as consulting forest engineer. Two years ago he went overseas with the Transport Section of the Canadian Forestry Corps.

Colonel Townsend joined the Institute as an Affiliate in 1927, transferring to Associate Member in 1934 and becoming a Member in 1940.

## News of the Branches

### BORDER CITIES BRANCH

J. B. DOWLER, M.E.I.C. - Secretary Treasurer  
W. R. STICKNEY, M.E.I.C. - Branch News Editor

On Friday, October 16, the president, Dean C. R. Young visited the Border Cities Branch, accompanied by Assistant General Secretary Louis Trudel. Along with several members of the Branch executive, they were taken on an inspection tour of the Ford Motor Company of Canada, then had luncheon in Detroit at the new Rackham Memorial Building with executive members of the American Society of Mechanical Engineers.

At the evening dinner meeting in the Prince Edward Hotel, by special arrangement in honour of the president's visit, the Border Cities Branch was host to the members of the Detroit Section of the American Society of Mechanical Engineers and several distinguished American engineers. H. L. Johnston, branch chairman, acted as chairman and toastmaster and after introducing the members and distinguished guests at the head table, called on Mr. C. M. Goodrich, consulting engineer of the Canadian Bridge Company, who proposed a toast to the American Society of Mechanical Engineers. In responding to the toast, Dr. J. W. Parker, president of the American Society of Mechanical Engineers, paid tribute to the co-operative work being done by engineers in Canada and the United States in our war effort. He also spoke of attending the annual meeting of The Engineering Institute of Canada in Montreal, and how much he was moved by the tremendous affection demonstrated at that time for their scientist and military leader, Lieutenant-General A. G. L. McNaughton.

### Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

From left to right: J. W. Armour, Dr. James W. Parker, Dean C. R. Young and Chairman H. L. Johnston.

Mr. Armour, chairman of the Detroit Section of the American Society of Mechanical Engineers, introduced Dean C. R. Young who spoke on **The Engineer and the Technologist**. He described a technician as a person skilled in mechanical art or trade but with no knowledge of the science underlying that art or trade; a technologist as a person who possesses unusual knowledge of one branch of a science or scientific process but without the ability to

## HALIFAX BRANCH

S. W. GRAY, M.E.I.C. - *Secretary-Treasurer*  
G. V. ROSS, M.E.I.C. - *Branch News Editor*

The first fall meeting of the Halifax Branch was held at the Halifax Hotel on October 22, with Mr. J. R. Sutherland as the guest speaker.

Mr. Sutherland is the editor of the *New Glasgow Evening News* and has just returned from a six weeks visit to the British Isles as a guest of the Canadian Government. He spoke of many interesting phases of life in Britain, and particularly of the work he saw being done by engineers in the Canadian Army.

Mr. Sutherland stated that General McNaughton "is extremely well thought of in England, particularly by the Americans, who told me if they had their choice, General McNaughton would be put in charge of all the Allied Nations technicians."

The scroll of the Engineering Institute prize was presented to William Henry Bowes, student at the Nova Scotia Technical College, by J. R. Kaye.

About 70 persons were present including several senior students of the Technical College. For some years, the Branch has endeavoured to have all the senior engineering students attend one of the dinner meetings as guest of the Branch.

P. A. Lovett was chairman of the meeting.

## HAMILTON BRANCH

A. R. HANNAFORD, M.E.I.C. - *Secretary-Treasurer*  
W. E. BROWN, Jr., E.I.C. - *Branch News Editor*

In the Westinghouse auditorium on October 6th, John A. M. Galilee and L. A. Shaver, both members of the Canadian Westinghouse Company, spoke on the subject entitled **P.C.C. Street Railway Cars.**

The occasion was a joint meeting of the Hamilton Group of the American Institute of Electrical Engineers and the Hamilton Branch of the Institute. J. T. Thwaite, chairman of the former group, occupied the chair assisted by Stanley Shupe, chairman of the Hamilton branch of the Institute.

Mr. Galilee introduced the subject of the P.C.C. cars which are now in use by the Toronto Transportation Commission and also in other cities on this continent. In view of the serious situation regarding automobiles, the public transit industry has assumed great importance at this time. Only a few years ago it was generally considered that street cars were going out and yet today Toronto has 140 new P.C.C. cars in operation and has more on order.

In the 1920's the street car business flourished but in the 1930's the automobile caused a decline of revenue. The following figures are very interesting and are indicative of the trends. The population of Toronto is 875,000 and the number of passengers carried per year is: 1922—187,000,000; 1923—189,000,000; 1929—206,000,000; then comes the lowest year, 1930—148,000,000; 1940—168,000,000; 1942—238,000,000 (forecast). The declining revenue in the 1930's worried the public transit ownership and the association of the various transit companies on the continent realized that a better street car was imperative. As the representatives of these companies were principally presidents, the 1932 gathering was called the Presidents Conference Committee, hence the name P.C.C. cars. The committee invited the co-operation of the transit companies and the manufacturers of every part that goes into a car, and funds were raised to build a car that would compete with the automobile. The first P.C.C. car was built in 1935, its object was to regain public favour and its improvements were many: smooth rapid acceleration of 4.7 m.p.h. per sec. with retardation at the same rate and with a maximum rate of speed of 45 m.p.h. on level track; good lighting for reading; streamline appearance; windows comparable to an automobile; clean hand rails; modern heating and ventilation; rubber springs and also magnetic hand brake. Lantern slides illustrated the historical background of the street car from the time of

co-ordinate many phases of scientific study. The engineer is the utilizor of many arts and sciences, not necessarily proficient in any one of them, but with judgment and discernment he can employ and direct the labours of other men and act as general co-ordinator.

In these days it is appropriate to develop technologists, since we cannot afford time to get men wholly trained for work which must be done. Such men are much in demand now, but difficulties will arise in placing these wartime specialists in the post-war world where their efforts will be most profitable.

There is a distinct attraction in the study of technology, and young men often make the mistake of ignoring the broad view of engineering. The point of view of the engineer is of far greater importance than the limited viewpoint of the pure technologist. During depression years, many charges were laid against engineers for supposed failure to recognize human values and needs. That danger does exist but it must be overcome. Engineers should know and appreciate what constitutes a profession, and should get away from the idea that engineering is a technological study. They must not spend all their time in the fascinating study of a particular science, but realize they have a duty to society and a trusteeship imposed on them as professional men similar to other professional men. Properly regarded, engineering is a very learned profession involving the solution of many problems having both scientific and human backgrounds.

Mr. J. Clark Keith, past vice-president of the Institute, moved a vote of thanks to Dr. J. W. Parker, and Mr. A. M. Selvey, past chairman of the Detroit section of the American Society of Mechanical Engineers, moved a vote of thanks to Dean Young. Motion for adjournment was made by Councillor E. M. Krebsler.

## CALGARY BRANCH

K. W. MITCHELL, M.E.I.C. - *Secretary-Treasurer*  
J. N. FORD, Jr., E.I.C. - *Branch News Editor*

Mr. C. A. Price of Hamilton, chief engineer of the Canadian Westinghouse Co., was the guest speaker at a special meeting held by the Calgary Branch on September 25th in the Palliser Hotel.

The subject of the speaker's address was **Recent Electrical Developments.** Mr. Price pointed out that due to present day shortages in certain materials such as cork, rubber, tin solder and babbitt, much effort has been directed to the discovery of substitutes for these materials which are so vital in the manufacture of electrical apparatus. Great strides have been made in this direction with compounds of lead, copper and silver playing their part in the making of these substitutes. Friction and ball bearings have also given way to sleeve bearings which are more easily repaired.

One of the most recent developments in the electrical field is the use of the mercury arc rectifier as a frequency changer. The efficiency of this rectifier is six per cent higher than any type of frequency changer in present day use. The speaker also stated that carrier current relaying has been developed to a point where it will perform any relay operation needed.

"Present day requirements call for closer design and higher speeds in electrical apparatus with the result that the use of synchronous condensers and the flywheel effect has been increased considerably," stated Mr. Price.

At the conclusion of the speaker's address Mr. McEwen expressed the appreciation of the meeting, for an interesting account of present day developments.

The second part of the evening's programme was sponsored by the Canadian General Electric Co. with some very interesting moving pictures in technicolour on "Welding." These pictures showed remarkable photography and stressed the four important points in welding, namely, speed of travel, length of arc, angle of electrode and current setting.

the horse drawn cars. A movie of the P.C.C. car in motion was shown.

Mr. Shaver, control engineer, showed that the design had two objects, better riding comfort for the passengers and a saving of weight. The P.C.C. car is driven by four 55 hp. motors, each weighing 4,000 lb. as compared to the previous latest car having four 40 hp. motors each weighing 7,000 lb. The speaker explained that the operation is entirely automatic and he gave a very lucid description of the control which allows such rapid acceleration and retardation with a maximum of safety for the public.

W. Hollingworth, moved a vote of thanks to the speakers for this very able and instructive lecture and he also expressed the thanks of the Hamilton Branch to the Canadian Westinghouse Company for the use of the auditorium. The attendance was 150.

### MONTREAL BRANCH

L. A. DUCHASTEL, M.E.I.C. - *Secretary-Treasurer*  
WILLIS P. MALONE, M.E.I.C. - *Branch News Editor*

The first meeting of the 1942-43 season opened on October 8th with a lecture on **Aquifers and Water Wells** by J. W. Simard.

Water has always been one of the prime needs of man and his migrations have always taken him where there were adequate supplies of surface water. More recently he has been turning to ground water as a source of supply.

The source of all water supply is rainfall. When rain falls on impervious ground it finds its way to small streams, rivers, lakes, and finally the oceans. Falling on pervious ground, it seeps through to form a reservoir deep in the subsoil, ready to be tapped and used. Deep wells are sunk down to the reservoir and the water pumped up. These wells should not be confused with artesian wells where the water issues under pressure from a fissure in rock.

A typical deep well is the gravel wall well. It consists of an outer casing, an inner casing, and a screen which is attached to the inner casing. The pump is located in the inner casing near the bottom and is operated through a shaft by motive power above the ground. The outer casing is first put in position, followed by the inner casing with the screen on the end. The annular space between the casings is filled with gravel. Water is pumped up through the inner casing, and with the water come fine particles of sand and clay. As the fine particles are removed the screen and inner casing are gradually lowered until the end of the inner casing is on a level with the end of the outer casing, the screen being below this level. The gravel in the annular ring moves down around the screen to form a filter bed. This gravel keeps fine particles out of the water being pumped and minimizes wear in the pump.

A typical installation with a 12 in. diameter inner casing will deliver 1,000 gallons per minute with a pump efficiency of 80 per cent. A well supplying 2,000,000 gallons per day is considered a large well.

In the United States today 50,000,000 people use ground water. Of these 20,000,000 are supplied through public works. This gives some idea of the extent to which this system of water supply has been developed.

Following the lecture refreshments were served in the reading room.

\* \* \*

On October 15th Mr. Z. Krzywoblocki gave a lecture on **Air Power Theories and Aviation Progress in Reality**, outlining the various theories that have been expounded on the use of air power in warfare, and the development of the airplane since the last war.

The use of air power in the last war was based on the theory of collaboration with the ground forces.

About 1921-23 Italy was responsible for the theory that with command of the air the enemy could eventually be made to capitulate.

Then followed about 1933-35 the French theory that air power should be flexible—that flyers should be trained to

operate in either small units or large units, or even singly, as occasion demands. Hence they introduced the all-purpose plane.

The Douhet theory, as exemplified by the German Luftwaffe had its first trial in Spain. Since that time it has had many trials with varying successes and failures. The successes include Poland, where in three days the Germans gained control with their 8,000 planes against Poland's 1,000; Finland, where Russia used 400 bombers at Helsinki; Norway, where air power was victorious over sea power; France, where the old type French planes were no match for those of the Luftwaffe. It has failed in Great Britain; and Crete cannot be counted a success, as the loss of planes was so great and first honours went to the air-borne infantry.

The success of the Douhet theory depends on a huge quantity of bombers. These are costly and short-lived, and mass production of them demands standardization of all industry, with specialists and skilled workmen in the plants. Ten trained men are required on the ground for every man in the air. Fuel is required in enormous quantities.

Great progress has been made in the development of the airplane since the last war. The experience of the last war pointed the way for this progress in the matters of design and armaments. The monoplane became the basic type and metal the basic material, although wood has come into fairly wide use in the past ten years. With increase in speeds, instruments have become more important and great improvements have been made.

This war has seen no structural changes, no material changes, no startling developments in bombs, no new records in speed or altitude. Progress has been made in the speeds of normal planes—these tend to approach record speeds—in navigation and radio, in high altitude and ocean flying, in armaments. The major effort has been expended in increasing production rather than in development of quality.

\* \* \*

**Air Bombing and Structural Defence** was the subject of the lecture given on October 22nd by D. C. Tennant. Mr. Tennant described various types of bombs, their effects, and the defence means that have been developed.

The main types of bombs in use are fragmentation bombs, demolition bombs, and incendiary bombs. The fragmentation bombs are designed to explode on contact, expelling the fragments at a velocity of about 7,000 ft. per second. They have more effect on people in the vicinity than on buildings. Demolition bombs have delayed action fuzes and penetrate the ground or buildings before exploding. Bombs vary in weight from 20 pounds to 2 tons.

The explosion of a bomb radiates a pressure wave which is followed almost instantaneously by a suction wave. The latter causes the walls of buildings to fall outwards, and in the case of wall-bearing structure, the building or part of it collapses. Reinforced concrete structures withstand bomb explosions best. One reason that so much damage has been done to buildings in Great Britain is that most of the buildings are wall-bearing, and reinforced concrete construction is rare.

Important buildings are camouflaged to look like fields or orchards, while in a field perhaps half a mile distant, a dummy skeleton of the factory is built.

Shelters of various types and sizes have been built in Britain. The most popular is the Anderson shelter designed for family use. It is made of corrugated steel and partly sunk in the ground. This shelter will suffer considerable distortion but cases of total collapse are rare. Communal shelters are made of reinforced concrete, and to withstand a direct hit the roof is made ten feet thick. Tunnels make effective shelters and are used where they are available. In Chunking 400,000 people are accommodated in tunnels.

In this country the need of air shelters, in the event of air raids, would not be nearly so great as in Great Britain because our multi-storied buildings of reinforced concrete would offer a high degree of protection.

## OTTAWA BRANCH

A. A. SWINNERTON, M.E.I.C. - *Secretary Treasurer*  
R. C. PURSER, M.E.I.C. - *Branch News Editor*

A joint evening meeting with the Ottawa branch of the Canadian Institute of Mining and Metallurgy was held at the National Research Council auditorium on October 22. O. W. Titus, B.A.Sc., chief engineer of the Canada Wire and Cable Company Limited, Toronto, spoke on **Copper Mining in Arizona**, his address being accompanied by a motion picture relating to the subject.

Copper, as one of the earliest metals known to man, was used for making weapons of war and played an important part in the rise and fall of early empires. The speaker paid tribute to the sagacity of the earliest copper miners. "Modern prospectors," he said, "could teach the early Roman prospectors nothing."

Methods used in extracting copper in Arizona were shown in the film, as well as the course for the open pits and deep shafts to the smelters. Modern machinery as used in copper production and means of maintaining a high standard of safety were also depicted.

N. B. MacRostie, chairman of the Ottawa Branch of the Institute, introduced the speaker. He was thanked by Ralph Bartlett, vice-chairman of the local branch of the Canadian Institute of Mining and Metallurgy.

A joint evening meeting with the Ottawa section of the Society of Chemical Industry was held at the National Research Council auditorium on September 25. Dr. I. M. Rabinowitch, M.D., M.Sc., of McGill University addressed the meeting on the subject of **Chemical Warfare**, with particular reference to the use of poisonous substances in air attacks and methods of decontamination of persons and property. He had spent considerable time in England studying this subject under "blitz" conditions.

Dr. Rabinowitch said that of all the thousands of chemical substances with poisonous qualities, only a dozen or so have practical military application, the two general classes being: non-persistent, such as tear gas, and persistent blister gases of the "mustard" class, which included arsenicals. "The worst part of the blister gases," he said, "is their insidious approach. A person might be beyond medical aid before he realized he had been contaminated." Such gases seeped through clothing and boots and caused total blindness if even one drop got in the eye, and serious blisters if on the skin. They could last weeks or months, could get into shelters ordinarily safe against bullets or bombs, and were much more economical than explosives.

"If the Germans should attack Canada," he said, "they would probably use the mustard gases with high explosives." The presence of the gas greatly complicated first aid, repairs and cleaning up after raids. The speaker advised his listeners never to look up in the air during a gas raid "since you would likely get enough gas to cause blindness."

## SASKATCHEWAN BRANCH

STEWART YOUNG, M.E.I.C. - *Secretary Treasurer*

The Saskatchewan Branch met jointly with the Association of Professional Engineers in the Kitchener Hotel, Regina, on Wednesday evening, October 21, 1941. After dinner, at which the attendance was 45, adjournment was made to the Crime Detection Laboratory, R.C.M.P. Barracks where Surgeon (Dr.) Maurice Powers, Director of Criminal Investigation for Canada, explained the organization of the laboratory, afterwards showing a film depicting the "Hit and Run Driver." Following this, those in attendance were shown by Sgt. J. I. Mallow, B.Sc. (Eng.) and Corp. J. Robinson through the laboratory and given explanations of the various microscopes, photographic and chemical equipment, spectroscope and the museum of criminal investigation display. The latter included samples of forged documents, counterfeit notes and coins, fingerprints, masks and weapons of various description.

## ST. MAURICE VALLEY BRANCH

VIGGO JEPSEN, M.E.I.C., *Chairman*

The St. Maurice Valley Branch held a meeting in Shawinigan Falls on Thursday, October 22, 1942, at the Cascade Inn. The attendance was approximately one hundred.

The speaker was Mr. A. W. Whitaker, Jr., general manager of the Aluminum Company of Canada, Limited.

In his address Mr. Whitaker dealt with the history of his company at Shawinigan Falls and the progress it has made since its inception. He also referred to the early history of Shawinigan itself and how the Aluminum Company of Canada had come into the picture through the development of power by the Shawinigan Water and Power Co., in 1899.

Mr. Whitaker explained how the development of hydro-electric power had been the means of establishing the aluminum industry in Canada, and at Shawinigan Falls, the first plant to be erected, contemporaneous with the installation of the first power units thirty years ago, was that of the Northern Aluminum Company, which commenced operations in 1901. He told of the utility and value of the plant at Shawinigan and how it had contributed to the industrial progress of the Dominion.

In referring to the history of the plant at Shawinigan, Mr. Whitaker mentioned that since 1901, the output has increased enormously, especially since the beginning of the present war. The first power contract, he said, was signed in 1899.

The Shawinigan plant has had its difficulties, but today, the plant is working at full capacity on the production of war materials. Mr. Whitaker also related the story of the company's activities at Arvida and of the giant new plant that was built there, as well as the new power development at Shipshaw. He spoke of the various developments of the company since then and every increasing expansion of the industry. He told of how it had progressed from comparatively small beginnings to a great enterprise. The story of the Aluminum Company of Canada is an interesting one, a story which tells of the rapid progress and enormous expansion that has taken place. The company has been expanding in a number of places and its production has increased enormously. The terrific rate of expansion which it has had to deal with has presented problems of great importance. Additional equipment and man-power were necessary. More and more aluminum had to be made for war purposes. The company has had to build new plants and borrow money in order to make aluminum more quickly. Its record of achievement has been remarkable and Mr. Whitaker made the story very interesting to an appreciative audience.

The speech was illustrated with many lantern slides.

The speaker was introduced by Mr. P. Radley and thanked by Mr. H. G. Timmis. The Branch chairman, Viggo Jepsen, presided over the meeting.

## VANCOUVER BRANCH

P. B. STROYAN, M.E.I.C. - *Secretary-Treasurer*  
A. PEEBLES, M.E.I.C. - *Branch News Editor*

**The Design and Construction of the Scanlon Dam**, was the subject of a paper given before the Vancouver Branch on October 22nd in the Medical-Dental Building. The speaker was William Jamieson, field engineer for the Powell River Co. Ltd., Powell River, B.C.

The pulp and paper plant of the Powell River Co. Ltd. is situated on the B.C. coast, about 70 miles north of Vancouver. Additions to this plant completed in 1926 included development of the hydro-electric system to its full economic capacity. When further expansion was undertaken in 1929, a new source of power had to be found, and a site was chosen near Stillwater, 17 miles south of Powell River. Here, the Lois river forms the outlet from Gordon Pasha lakes, and several smaller lakes in the same drainage basin of some 480 square miles.

Temporary development was carried out at this site to provide for immediate requirements, but plans included additional work when future increase in capacity should be required. The power house was completed but only one 18,000 Kva. generator was installed. Extensive borings were made and a geological survey carried out to determine the best site for a future permanent dam. Above this point a temporary log crib structure was built, providing storage and a 350 ft. head above the power house.

From this dam a 12 ft. diam. wood penstock carried the water to a point below the permanent dam site, where it joined a section of reinforced concrete pipe. A tunnel was bored, approximately a mile long and 12 ft. in diam. from which a steel penstock continued down to the power house at tide-water. A feature of this penstock is its surge tank which is a well known landmark for travellers along the coast. All this work, with the exception of the log dam, head-works, and wood penstock, was part of the ultimate development.

It was believed that after four or five years, the permanent dam would be required, but business conditions did not warrant further capital outlays and the work was delayed. However, nature intervened and after nine years, serious deterioration had taken place in the log crib dam and its head-works, and expensive repairs were indicated. An expert survey indicated that rot and termites had found favourable conditions in the structure and had attacked it rapidly. The logs were not peeled or treated, a fact which hastened their decay.

It was decided to proceed with the permanent dam, rather than spend money on repairs. The structure recently built is of the variable radius arch type, 980 ft. long at the base and 780 ft. long on the crest, 8 ft. thick at the top and 37 ft. at the bottom. The height is 205 ft. though the dam has not been carried to its final height except at the intake structure. The spillway, at one end, is still a rock excavation only. At some future time it will be concreted, and provided with four taintor gates 20 ft. wide, and one 10 ft. wide.

Focal points were established for the radii at each construction joint and carefully referenced. As all the foundation excavation was in rock, the area was contoured very carefully, and the grid maintained by painting lines of various colours on the rock as drilling and removal proceeded. Bedrock was 50 ft. below the river bed, and timber shafts were employed during excavation. The temporary wood stave penstock crossing the site had to be kept in service; so it was supported by timber trusses resting on un-excavated ground at the limits of the foundation area. Settlement started at one end of these, and a square pier of reinforced concrete had to be built from the bottom of a shaft sunk to bedrock, to carry one end of the trusses. This was later incorporated into the dam. The area was kept dry by several pumps and a series of wellpoints. A 6 ft. diam. concrete culvert was used to pass the river flow during construction, being later sealed with concrete. Water stops of steel, 16 in. wide, with copper seals, were placed in each construction joint. Concrete was placed in blocks and no artificial cooling was provided for.

Maximum design stress in the concrete was 780 lb. per sq. in. The mix contained 376 lb. of cement per cu. yd. and included three sizes of gravel and sand. Maximum aggregate size was 4 in. All concrete was vibrated after being deposited from swinging derricks or buggies. Before placing the first concrete, holes from 24 to 27 ft. in depth were drilled in the foundation and grouted to fill up any seams in the rock and minimize seepage.

The contract was for a lump sum, and quantities included 50,000 cu. yd. of rock excavation and 61,000 cu. yd. of concrete. Mr. B. C. Condit was consulting engineer and contractors were Stuart Cameron and Co. Ltd. The total sum involved was \$1,100,000.

Following his address, Mr. Jamieson displayed many interesting photographs and plans of the work. The chairman of the branch, W. O. Scott, presided, and 30 members were present.

## Library Notes

### ADDITIONS TO THE LIBRARY

#### U.S. Bureau of Mines—Miners' Circular:

No. 43—Some haulage safety devices for use on grades, slopes and inclined shafts.

#### U.S. Geological Survey—Water Supply Papers:

No. 887—Methods for determining permeability of water-bearing materials. 897—Surface water supply of the U.S.A. 1940: pt. 7, Lower Mississippi River basin. 899—Surface water supply of the U.S.A. 1940: pt. 9, Colorado River basin. 906—Water levels and artesian pressure in observation wells in the U.S.A. in 1940: pt. 1, Northwestern States. 907—Water levels and artesian pressure in observation wells in the U.S.A. in 1940: pt. 2, Southeastern States. 909—Water levels and artesian pressure in observation wells in the U.S.A. in 1940: pt. 4, South Central States.

#### U.S. Geological Survey—Professional Papers:

No. 197A—Alkalic rocks of Iron Hill, Gunnison County, Colorado. 197B—Oligocene foraminifera near Miltry, Alabama.

### AIR RAID PRECAUTIONS

#### Canadian Engineering Standards Association—ARP Specifications:

No. 501—Strengthening of cellars in houses. June, 1942.  
No. 502—Blackout illumination. June, 1942.

### Book notes, Additions to the Library of the Engineering Institute, Reviews of New Books and Publications

No. 503—Specification for street lighting during blackouts. July, 1942.

No. 504—Specification for blackout of buildings. July, 1942.

#### TECHNICAL BOOKS

##### Principles of Heat Engineering:

Neil P. Bailey. N.Y., John Wiley and Sons, Inc., 1942. 6 x 9 1/4 in. \$2.75.

##### Oil Property Valuation:

Paul Paine. N.Y., John Wiley and Sons, Inc., 1942. 6 x 9 1/4 in. \$2.75.

##### Fundamentals of Electric Waves:

Hugh Hildreth Skilling. N.Y., John Wiley and Sons, Inc., 1942. 6 x 9 in. \$2.75.

##### Natural Trigonometric Functions:

To seven decimal places for every ten seconds of arc together with miscellaneous tables. 2nd ed. Howard Chapin Ives. 7 x 10 in. \$9.00.

#### PROCEEDINGS, TRANSACTIONS

##### Society for the Promotion of Engineering Education:

Proceedings of the forty-ninth annual meeting held at the University of Michigan, June 23-27, 1941. Pittsburgh, Office of the Secretary, 1942.

#### Smithsonian Institution:

Annual report of the Board of Regents for the year ended June 30, 1941.

#### Canadian Electrical Association:

Proceedings of the fifty-second annual convention, 1942.

#### REPORTS

##### The Asphalt Institute

Specification for the sand-asphalt road mix course on natural sand subgrade. No. RM-3—July 31, 1942.

##### Edison Electric Institute:

Specifications for single tube seamless copper splicing sleeves. TD-9, 1942.

##### American Institute of Electrical Engineers Standards:

No. 3—Proposed standard for guiding principles for the selection of reference values for electrical standards. June, 1942. No. 21—Standards for apparatus bushings and test code for apparatus bushings. June, 1942. No. 22—Standard for air switches and bus supports. June, 1942. No. 27—Standards for switchgear assemblies. August, 1942. No. 32—Neutral grounding devices. June, 1942.

## U.S. Bureau of Standards—Building Materials and Structures Reports:

Dimensional changes of floor coverings with changes in relative humidity and temperature, BMS85—Structural, heat-transfer and water-permeability properties of "Speedbrik" wall construction sponsored by the General Shale Products Corporation, BMS86—A method for developing specifications for building construction, BMS87—Structural properties of "Precision-Built, Jr." prefabricated wood-frame wall construction sponsored by the Homasote Co., BMS89—Structural properties of "PHC" prefabricated wood-frame constructions for walls, floors and roofs sponsored by the PHC Housing Corporation, BMS90.

Inspection and control of weights and measures in the U.S.A. Publication No. 7.

## Canada—National Research Council:

The theory of some A-C commutator motors with series characteristics. Reprinted from The Canadian Journal of Research, vol. 20, May, 1942.

## American Institute of Steel Construction, Inc.:

Annual report for the year ending September, 1942.

## Quebec—Streams Commission:

Twenty-sixth report for the year 1937.

## American Telegraph and Telephone Company and the Edison Electric Company:

Wave shape of multi-phase rectifiers. Engineering report No. 49, April, 1942.

## The Electrochemical Society—Preprints:

No. 81-33—The electrolytic decomposition of aqueous ammonium chloride solutions. 82-7—The electric resistance and anisotropy of artificial graphite between 290° K and 12° K. 82-8—The specific heat equations for carbon dioxide, carbon monoxide, steam, hydrogen and oxygen and the free energy equation for the water-gas reaction. 82-9—An electrolytic study of linear diffusion of silver salts. 82-10—Absorption potentials at gas-solid interfaces. 82-11—Cathode films in tungstate-containing plating baths. 82-12—The effect of temperature on the rate of self discharge of lead acid storage batteries. 82-13—Reaction rates in ionic solutions. 82-14—The corrosion resistance afforded by bright dipped cadmium coatings. 82-15—Diffusion theory of the codeposition of gold and copper. 82-16—Ion-solvent interaction and individual properties of electrolytes. 82-18—Anodic treatment of plain carbon steels. 82-19—Some observations on the formation and stability of oxide films. 82-20 The adherence of thick silver plate on steel. 82-21—The structure of brush-plated silver.

82-22—An interpretation of the mechanism of bright electroplating. 82-23—The electrolysis of grignard reagents: short-lived free radicals in ethyl ether. 82-24—Tin plating from potassium stannate bath. 82-25—Studies on over-voltage xiii decay of cathodes potential in still and stirred solutions with hydrogen or with nitrogen.

## Bell Telephone System—Technical Publications:

The rate of oxidation of copper—The crystallinity of cellulose esters—Greensalt wood preservative—Electron diffraction studies on thin films—A secondary frequency standard—Inspection in a manufacturing plant—The future of transoceanic telephony—Monographs No. 1340-1346.

## U.S. Geological Survey—Bulletins:

No. 917D—Tertiary deposits of the eagle-circle district Alaska. 926B—Geology of the Gerstle river district, Alaska. 931C—Tin deposit at Majuba Hill, Pershing County, Nevada. 931E—Tungsten deposits in the Sierra Nevada near Bishop, California. 931F—Nickel deposits of Bohemia Basin and vicinity Yakohi Island, Alaska. 931G—Chromite deposits of Kenai Peninsula, Alaska. 931I—Nickel deposit near Riddle Douglas County, Oregon. 931J—Quick silver deposits in the Steens and Pueblo Mountains, Southern Oregon. 931L—Tin deposits of northern Lander County, Nevada. 931M—Manganese deposits in the Nevada district, White Pine County, Nevada. 931N—Quicksilver deposits of the opalite district Malheur County, Oregon, and Humboldt County, Nevada. 931O—Nickel deposit near Gold Hill Boulder County, Colorado. 931P—Mica-bearing pegmatites of New Hampshire. 931Q—Quicksilver and antimony deposits of the Stayton district, California. 932B—Geophysical abstracts 105, April, June, 1941. 932C—Geophysical abstracts 106, July, September, 1941. 933A—Mineral industry of Alaska in 1940.

## U.S. Bureau of Mines—Bulletins:

No. 425—Magnetic separation of ores. 445—Plastic and swelling properties of bituminous coking coals. 446—Typical analyses of coals of the U.S.A. 447—Quarry accidents in the U.S.A. during 1940. 448—Coal accidents in the U.S.A., 1940.

## U.S. Bureau of Mines—Technical Papers:

No. 626—Analyses of West Virginia coals. 634—Carbonizing properties and petrographic composition of lower lignite-bed coal from the Atlas mine, Middlesboro, Bell County, Ky., and the effect of blending this coal with Pocahontas No. 3 and No. 4 bed coals. 638—Photomicroscopy of salt in petroleum. 639—Bibliography of Bureau of Mines investigations of coal and its products 1935 to 1940. 643—Theoretical calculations for explosives.

## BOOK NOTES

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet the books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

## AIRCRAFT ENGINE MAINTENANCE

By J. H. Suddeth. John Wiley & Sons, New York: Chapman & Hall, London, 1942. 374 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$2.75.

In addition to covering thoroughly proper methods of inspection, servicing and repair, this work goes extensively into construction and operating principles, as a background for practical work. Engine components, fuels, fuel systems, carburation, lubrication, ignition, instruments, accessories and propellers are described in detail.

## AIRPLANE STRUCTURAL ANALYSIS AND DESIGN (Galcit Aeronautical Series)

By E. E. Sechler and L. G. Dunn. John Wiley & Sons, New York: Chapman & Hall, London, 1942. 412 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth, \$4.00.

The material in this book is divided into three major parts: preliminary considerations in design; methods of structural analysis; and applied stress analysis. The treatment of the standard structural problems has been held to a minimum. Emphasis is placed on the presentation of most of the recognized design criteria, with experimental evidence, when available, as to their exactness. Literature references accompany each chapter.

## AMERICAN HIGHWAY PRACTICE, Vol. 2

By L. I. Hewes. John Wiley & Sons, New York: Chapman & Hall, London, 1942. 492 pp., illus., diagrs., charts, tables 9½ x 6 in., cloth, \$6.00.

The second volume of this treatise is devoted to pavements of asphalt, concrete and brick. Penetration macadam, sheet asphalt, asphaltic concrete, cement concrete and brick roads are treated comprehensively, with some attention to their origins and historical development, and full information on current American practice. The design of cement-concrete pavement mixtures and concrete road slabs is given special attention, and a chapter is devoted to small bridges, culverts, guard rails, etc., Each chapter has a bibliography.

## AMERICA'S FUTURE PATTERN

By E. S. Cornell, Jr., author and publisher, Larchmont, New York, 1942. 214 pp., diagrs., charts, tables, 8 x 5 in., cardboard, \$1.50

The author presents a picture of our present economic situation, explains what brought it about and indicates the correctives which he feels are necessary. Chapters upon politics, religion, education and law are included as belonging to the complete picture.

## AMERICAN ELECTRICIANS' HANDBOOK

By T. Croft, revised by C. C. Carr. 5th ed. McGraw-Hill Book Co., New York and London, 1942. 1,634 pp., illus., diagrs., charts, tables, 8 x 5 in., lea., \$5.00.

The new edition of this well-known reference book has been thoroughly revised and considerably expanded, new sections on the properties and splicing of conductors and on general electrical equipment and batteries have been added, and others have been rearranged. The book aims to meet the needs of those having little technical training by providing accurate information, based on correct engineering principles, in simple language.

## BLUEPRINT READING FOR THE METAL TRADES

By W. A. De Vette and D. E. Kellogg. Bruce Publishing Co., Milwaukee, Wis., 1942. 132 pp., blueprints, diagrs., charts, tables, 11 x 8½ in., cloth, \$2.50.

Practical instructions are given for the interpretation of blueprints of machine parts. The text is illustrated by numerous actual blueprints for explanation or for practice work. The material is presented in such a way as to be of assistance to the mechanic who must make sketches himself, and a large group of miscellaneous problems and check sheets is included.

**CODE OF MINIMUM REQUIREMENTS FOR INSTRUCTION OF WELDING OPERATORS Part A—Arc Welding of Steel 3/16 to 3/4 in. thick (tentative).** American Welding Society, 19 West 39th St., New York, 1942. 68 pp., illus., diagrs., charts, tables, 9 x 6 in., paper, 50c.

This publication is a revision of the "proposed" code issued by the American Welding Society in 1941, which was adopted by the

War Production Board for use in defining an "accredited school." The revision has expanded the code considerably, especially the suggestions to persons organizing courses in metal arc welding. Requirements regarding school equipment, qualifications and duties of instructors, instruction in welding practice and theory and final testing are given.

#### CONTROLLED ATMOSPHERES

*Symposium presented before the Twenty-Third Annual Convention of the American Society for Metals held in Philadelphia, Pa., October 20 to 24, 1941. American Society for Metals, Cleveland, Ohio, 1942. 232 pp., illus., charts, tables, 9½ x 6 in., cloth, \$4.00.*

This volume contains the papers presented at a symposium held in 1941 by the American Society for Metals. The ten papers presented discuss various aspects of the control of furnace atmospheres in the heat treatment of steel, copper, aluminum and magnesium, including the question of cost.

#### ECONOMICS OF AMERICAN INDUSTRY

*By E. B. Alderfer and H. E. Michl. McGraw-Hill Book Co., New York and London, 1942. 566 pp., illus., diagrs., charts, maps, tables, 9½ x 6 in., cloth, \$4.00.*

This is an introductory survey of the principal manufacturing industries of the United States, intended as a textbook for students of industrial management and industrial relations, and of economics. The predominant economic characteristics of the industries are set forth, and the basic character of each industry and its significant developments are interpreted.

#### ENGINEERING MECHANICS

*By F. L. Brown. 2 ed. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 503 pp., diagrs., 9½ x 6 in., cloth, \$4.00.*

A textbook in mechanics for students of engineering which is characterized by emphasis on methods of solution in which reference is made to relationships set forth verbally, as principles, rather than symbolically, as formulas. The new edition has many more problems than the first one, has new cuts and has been completely reset.

#### ENGINEERING QUESTIONS AND ANSWERS, Vol. 3

*Emmott & Co., Ltd., London and Manchester, England, 1942. 176 pp., illus., diagrs., charts, tables, 10 x 7½ in., cardboard, 6s.*

These questions have been selected from those submitted by readers of the "Mechanical World and Engineering Record," and are here re-published with the answers prepared by the editors. A wide variety of practical shop problems is covered.

#### Great Britain. Dept. of Scientific and Industrial Research

#### FUEL RESEARCH, Physical and Chemical Survey of the National Coal Resources No. 54

#### THE LEICESTERSHIRE AND SOUTH DERBYSHIRE AND SOUTH DERBYSHIRE COALFIELD. SOUTH DERBYSHIRE AREA, THE EUREKA SEAM

*His Majesty's Stationery Office, London, 1942. 42 pp., illus., diagrs., tables, 9½ x 6 in., paper, (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, 90c.).*

This report, one of a series forming a survey of the coal seams of Great Britain, gives a comprehensive and detailed account of the physical and chemical properties of the coal of the Eureka seam in South Derbyshire.

#### Great Britain. Department of Scientific and Industrial Research

#### BUILDING RESEARCH, WARTIME BUILDING BULLETIN No. 21. Notes on the Repair of Bomb-Damaged Houses

*His Majesty's Stationery Office, London, 1942. 21 pp., illus., diagrs., tables, 11 x 8½ in., paper, 1 s. (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, 30c.).*

This bulletin is designed to assist the expert to decide what to do to a damaged building. It gives data on the strength of damaged walls and general suggestions on various repair problems, including the treatment of dry rot and the interior finishing of repaired structures.

#### Great Britain. Ministry of Labour and National Service

#### HOW FACTORY ACCIDENTS HAPPEN. Descriptions of Certain INDUSTRIAL ACCIDENTS, Notified to H.M. Inspectors of Factories, Vol. 25, 1st November, 1941

*His Majesty's Stationery Office, London, 1941. 33 pp., diagrs., 9½ x 6 in., paper, (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, 15c.).*

The accidents described are classified in various groups: power and transmission, process machinery, lifting machinery, electrical plant, explosions and fires, gassing and poisoning, buildings and structural work, miscellaneous, and the worker. The types of accidents that are most common in war time are given special attention.

#### HOW TO REMODEL A HOUSE

*By J. R. Dalzell and G. Townsend. American Technical Society, Chicago, 1942. 528 pp., illus., diagrs., charts, tables, 9 x 5½ in., cloth, \$4.75.*

The steps involved in remodeling a dwelling or modernizing individual rooms are explained in full detail in this volume, which should prove useful to home owners and others interested. An illustrative example is carried through step by step. Numerous illustrations add to the value of the text.

#### INDUSTRIAL CHEMISTRY

*By E. R. Riegel. 4 ed. Reinhold Publishing Corp., New York, 1942. 861 pp., illus., diagrs., charts, tabl s., 9½ x 6 in., lea., \$5.50.*

After five years, this popular text has been again revised and somewhat enlarged. New chapters on Paper and pulp and on Synthetic textile fibers have been added. Statistics have been brought closer to date. Throughout, changes have been made to cover new developments. A vast amount of information on the chemical industries is brought together in a single volume.

#### INTRODUCTION TO HIGHWAY ENGINEERING

*By J. H. Bateman. 4th ed. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 459 pp., illus., diagrs., charts, tabl s., 9½ x 6 in., cloth, \$4.00.*

A textbook for students of civil engineering in which emphasis is on fundamental principles and processes. In addition, current practice is described in some detail. This edition has been revised and rearranged. The chapters on roadside improvement, properties of bituminous materials, subgrade stabilization and the structural design of pavements have been expanded.

#### ISOMERIZATION OF PURE HYDROCARBONS (American Chemical Society Monograph Series No. 88)

*By G. Egloff, G. Hulla and V. I. Komarevsky. Reinhold Publishing Corp., New York, 1942. 499 pp., diagrs., charts, tables, 9½ x 6 in., cloth, \$9.00.*

This useful monograph reviews the literature upon isomerization of hydrocarbons of the aliphatic, alicyclic and aromatic series, a process responsible for many important com-

mercial products, such as high-grade gasoline, viscous oils, synthetic rubber, etc. Isomerization is discussed for individual members of the various groups of hydrocarbons and typical reactions are analyzed. The data contained in over seven hundred reports have been calculated to a uniform basis and tabulated. There is a digest of patents and an extensive bibliography.

#### LEARNING THE RADIOTELEGRAPH CODE

*By J. Huntoon. American Radio Relay League, West Hartford, Conn., 1942. 34 pp., illus., diagrs., charts, tables, 9½ x 6½ in., paper, 25c.*

This pamphlet is issued in view of the present widespread interest in learning the international Morse code, and is intended to supply a method suitable for either class use or individual study.

#### MANUAL OF AIRCRAFT HYDRAULICS, Theory, Maintenance, Design

*By J. E. Thompson and R. B. Campbell. Aviation Press, San Francisco, Calif., 1942. 202 pp., illus., diagrs., charts, tables, 10 x 7½ in., paper, \$4.00.*

The design, operation and maintenance of hydraulic systems and equipment as used in aircraft are presented in this text. Many typical units of hydraulic systems used by American manufacturers are described. The illustrations add to the text.

#### MARINE ENGINEERING, Vol. 1, By H. L. Seward

*Society of Naval Architects and Marine Engineers, New York, 1942. 353 pp., illus., diagrs., charts, tables, 11 x 8½ in., cloth, \$6.00.*

This volume is the first of two which have been sponsored by the Society of Naval Architects and Marine Engineers as a companion to the "Principles of Naval Architecture" issued by it recently. Prepared by various authorities it is intended to provide a comprehensive treatise on up-to-date practice in merchant ships. Volume I deals with propelling machinery, power and revolutions, general design procedure, boilers, steam and Diesel engines, reduction gears, propellers and shafting, and materials and metallurgy.

#### MATERIALS TESTING AND HEAT TREATING (Rochester Technical Series)

*By W. A. Clark and B. Plehn. Harper and Brothers, New York and London, 1942. 132 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$1.75.*

This manual offers a series of laboratory exercises that suggest many commercial acceptance tests, but which have been adapted to ordinary school or college laboratory equipment. The tests have been chosen for their educational value in illustrating fundamental principles as well as for their relation to commercial tests.

#### MATHEMATICS OF MODERN ENGINEERING, Vol. 2 (Mathematical Engineering)

*By E. G. Keller. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 309 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$4.00.*

The three-volume work of which this is the second volume aims to present those aspects of mathematics which the experience of a large manufacturing organization, in dealing with mechanical and electrical investigations, has found to be of most value to engineers. This volume contains an explanation and elaboration of the fundamental method of mathematical engineering which includes the reduction of physical phenomena to a mathematical system and the solution of that system.

# PRELIMINARY NOTICE

## of Applications for Admission and for Transfer

October 31st, 1942.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.\*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

**Communications relating to applicants are considered by the Council as strictly confidential.**

The Council will consider the applications herein described at the December meeting.

L. AUSTIN WRIGHT, General Secretary.

\*The professional requirements are as follows:—

**A Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupillage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

**A Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

**A Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

**An Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

## FOR ADMISSION

**BEAUDOIN**—JOSEPH ARTHUR ALFRED, of 37-a Price Street, Kenogami, Que. Born at St. Hilaire, Que., July 17th, 1893; Educ.: I.C.S. Elec. Engrg. course; 1914-18, mtce. work, elec. dept., Brompton Pulp & Paper Co. Ltd., East Angus, Que.; 1919 to date, asst. to elec. supt., Price Bros. & Co. Ltd., Kenogami.

References: C. A. Hellstrom, J. W. Gathercole, J. Vinet.

**BRUNSKILL**—HARRY TALMADGE, of 911 Ouellette Ave., Windsor, Ont. Born at Saskatoon, Sask., Jan. 28th, 1916; Educ.: B.Sc. (Mech.), Univ. of Sask., 1940; 1940-41, dftsman., McKinnon Industries Ltd., St. Catharines, Ont.; 1941-42, engr., English Electric Co. of Canada, St. Catharines; at present, engr., plant engr. dept., Ford Motor Co. of Canada, Windsor, Ont.

References: V. W. MacIsaac, W. W. Brumby, I. M. Fraser.

**CRANSWICK**—JACK EDWIN BOYD, of Edmonton, Alta. Born at Moore Park, Man., Oct. 28th, 1905; Educ.: B.Sc. (E.E.), Univ. of Man., 1929; 1927-29 (summers), chairman, Manitoba Power Comm., Ivellev, C.N.R., trans. line inspr. Hudson's Bay Mining & Smelting Co.; With Canadian Westinghouse Co. Ltd. as follows: 1929-31, ap'tice course, 1931-35, sales office, Edmonton, 1935-41, salesman, Edmonton territory, 1941-42, sales engr., Calgary territory, and at present, sales engr. i/c Edmonton Branch.

References: H. J. McEwen, D. A. Hansen, W. I. McFarland, R. M. Hardy, C. W. Carry.

**de GUISE**—PAUL ERNEST, of 4598 Decarie Blvd., Montreal, Que. Born at Montreal, Dec. 7th, 1897; Educ.: B.A.Sc., C.E., Ecole Polytechnique, 1923; R.P.E. of Que.; 1923-29, asst. chem. engr., J. J. Joubert Ltée., Montreal; 1929-30, chem. engr. (in charge), Mount Royal Dairies Ltd., Montreal; 1930-33, asst. engr., tech. dept., City of Montreal; 1933-36, heating & ventilation engr., Paul de Guise; 1936-42, heating, ventilation & elec. engr., de Guise & Duquette, and at present, conslgt. engr., heating, ventilation & elec. engr., de Guise & Desaulniers, Montreal.

References: E. Gohier, J. A. Lalonde, L. Trudel, A. C. Fleischmann, H. Massue.

**GRAYDON**—EDGAR ROSS, of 82 Hillcrest Drive, Toronto, Ont. Born at Toronto, May 16th, 1914; Educ.: B.A.Sc., Univ. of Toronto, 1935; 1935-37 designing, detailing, etc., Toronto Iron Works Ltd.; 1937 to date, with the Dominion Bridge Co. Ltd., Toronto, as follows: 1938-39, field engr., 1939-42, checking struct. steel diagrams, drawings, and at present, struct. engr., designing struct. steel.

References: H. S. Irwin, M. W. Huggins, W. H. M. Laughlin, A. R. Robertson, G. J. Price.

**HEYLAND**—KENNETH VAUGHAN, of 4849 Wilson Ave., Montreal, Que. Born at Toronto, May 9th, 1902; Educ.: B.A.Sc., Univ. of Toronto, 1924; 1920-23 (summers), instr. man., O.L.S. and Toronto-Hamilton Highway Comm.; 1924-25, junior engr., Abitibi Power & Paper Co., Iroquois Falls, Ont.; 1927-41, sales representative, Kent-McClain Ltd., Toronto; 1941 to date, asst. mgr., Construction Equipment Company, Montreal, Que.

References: L. A. Wright, A. R. Chadwick, H. C. Seeley, F. G. Rutley, W. Griesbach.

**HOWARD**—ERNEST E., of Kansas City, Miss. Born at Toronto, Ont., Feb. 23rd, 1890; Educ.: C.E. and B.S., Univ. of Texas, 1900; D.Eng., Univ. of Nebraska, 1937; R.P.E. of N.Y., Miss., Iowa, Neb., Kansas, etc.; Member, A.S.C.E., 1900-01, instructor in engrg., Univ. of Texas; 1901-07, dftsman., designer, inspr., res. engr. on constrn., 1907-14, junior partner, Waddell & Harrington; 1914-28, partner, Harrington, Howard & Ash; 1928 to date, partner, Ash, Howard, Needles & Tammer, and at present, senior partner, Howard, Needles, Tammer & Berquedoff, New York, N.Y. All of above firms have devoted their attention to design & supervision of constrn. of bridges & similar structures.

References: M. B. Atkinson, F. E. Sterns, L. A. Wright, L. Trudel.

**JONES**—LORNE ALLAN, of 760 Gladstone Ave., Ottawa, Ont. Born at South Burgess, Ont., March 2nd, 1911; Educ.: Junior Matric.; 1933-35, timekeeper, roadman, transitman, road and bridge location work, with Lanark County Engineer; 1936-38, exploration branch, McIntyre Mines Ltd., Schumacher, Ont., as asst. to engr. on various properties and in exploration office; July, 1941, to date, junior engr., Directorate of Works & Bldgs., Rockcliffe Airport, Dept. of National Defence for Air.

References: V. R. Currie, P. W. Wallace, N. A. Thompson.

**LINDSAY**—DONALD LORNE, of Westmount, Que. Born at Quebec, Que., March 23rd, 1918; Educ.: B.Eng. (Mech.), McGill Univ., 1941; 1938 (summer), Anglin Norcross Ltd.; 1940 (summer), radio dept., Northern Electric Co. Ltd.; Since graduation—Sub-Lieut. (E) R.C.N.V.R., c/o Fleet Mail Office, Halifax, N.S.

**LOVELL**—JOHN, of 45 Third Ave. West, The Mountain, Hamilton, Ont. Born at Leeds, Yorks., England, July 25th, 1875; Educ.: Plymouth Technical College and private study; 1890-96, ap'tice to mech. engrg.; 1896-1901, various engr. shops; 1901-10, H.M. Dockyard, Devonport, on erection and install. of ship machy., steam trials, indicating powers, etc.; 1910-21, chief dftsman. and technical adviser, Messrs. Willoughby Ltd., shipbldrs. and marine engrg., iron and brass foundry, struct. and elec. engrg.; 1921-24, general manager for same company; 1924-30, private practice as conslgt. engr. Also part-time lecturer at Plymouth Technical College on "The Economics of Engrg. and the Principles of Works Management"; at present, engr. Hamilton Bridge Co. Ltd., Hamilton, Ont.

References: A. Love, L. S. MacDonald, G. A. Colhoun, A. R. Hannaford, W. S. Macnamara.

**LUNDY**—HOMER SHANNON, of Niagara Falls, Ont. Born at Niagara Falls, Oct. 29th, 1908; Educ.: Tech. Schools and private study. R.P.E. of Ont.; With H. G. Acres & Company as follows: 1929, junior dftsman., 1929-30, asst. to res. engr., 1930-33, dftng. and minor design on various jobs, 1934-38, design and detail on various projects, 1938, survey, design and supervision in the field of repairs to Parry Sound power house, 1938-39, engr. for contractors on Quinze River Dam, 1939, supervision of concrete work, 1939-41, design on various projects, 1941 to date, design and supervision of design and structural concrete for power house and head-block for Shipshaw power development, Aluminum Laboratories Ltd., Arvida, Que.

References: H. G. Acres, A. W. F. McQueen, H. E. Barnett, J. H. Ings, R. L. Hearn.

**ROUNTHWAITE**—CYRIL FREDERIC THOMAS, of 69 Howland Ave., Toronto, Ont. Born at Sault Ste. Marie, Ont., May 16th, 1917; Educ.: Bach. of Arch., Univ. of Toronto, 1942; Lieut., R.C.E. (Candn. Army Res.); 1929-33 (summers), misc. surveys, field work, etc.; 1939-40 (summers), mech. supt's. clerk, asst. field engr., Algoma Steel Corp.; 1941, struct. designer, Nelson Barracks, Halifax, office and lab., British American Oil Company, Sarnia; 1941, struct. designer, phthalic anhydride plant, Dominion Tar & Chemical Co.; 1941, designer, Candn. Officers' Training Corps Hdqrs. extension; 1942, struct. designer, C. F. Morrison, M.E.I.C., conslgt. engr., Toronto (awaiting appointment in R.C.E.).

References: C. F. Morrison, A. D. LePan, J. L. Lang, C. Stenbol, W. H. M. Laughlin, A. M. Wilson.

**SCRIVENER**—ROBERT MASSEY, of 35 Whitehall Road, Toronto, Ont. Born at Ryde, New South Wales, Australia, May, 1886; Educ.: B.Sc., McGill Univ., 1911; R.P.E. of Ont.; 1911-13, engrg. dept., 1913-15, asst. field engr., and 1915-22, field engr., Eastern Canada Power & Mining Machy. Corp., Milwaukee; 1922-26, mining machy. engr., China and Japan Trading Co., Shanghai; 1926-28, field engr., Wagner Elec. Corp., St. Louis, Export Dept., London; 1928-42, conslgt. engr. for various companies—consultant on design of plants and bldgs., design of constrn. equipment, etc.; at present, general manager, Toronto Shipbuilding Co. Ltd., Toronto, Ont.

References: W. E. Bonn, C. Johnston, A. O. Wolff, E. L. Cousins, S. R. Frost, A. R. Robertson, J. B. Stirling, C. C. Cariss.

TURNER—GEORGE WEBBER, of 42 Chapel St., Thorold, Ont. Born at Thorold, June 3rd, 1908; 1927-31, rodman, 1932-35, engr. office and dftng. room, Welland Ship Canal; 1937 to date, dftng., detailing, and layout work for H. G. Acres & Company, Niagara Falls, Ont., incl. 2½ years chief instr'man and asst. to res. engr. on Grand River Conservation Dam, Fergus, Ont.

References: H. G. Acres, A. W. F. McQueen, J. H. Ings, C. W. West, H. E. Barnett.

WEAVER—HOWARD LEWIS, of 103 Dorothy St., Welland, Ont. Born at Port Colborne, Ont., July 25th, 1896; Educ.: completed course in Structl. Steel Design, Wilson Eng. Corp., Cambridge, Mass., 1928; 1913-15, apticeship, mech. dftng., M. Beatty & Sons, Welland; 1915-19, dftsmen. on plant layout and design. Electro-Metallurgical Co. of Canada, Welland; 1920, dftsmen., Buffalo Structural Steel Co.; 1920-21, dftsmen., Canadian Mead-Morrison Co., Welland; 1922-29, structl. steel dftsmen., checker and acting chief dftsmen., Standard Steel Constrn. Co., Welland; 1929-32, checker, Hamilton Bridge Company, Hamilton; 1932-33, designing buildings and layout equipment, Canadian Cannery Ltd., Hamilton; 1933-38, checking drawings, Hamilton Bridge Company; 1938 to date, chief dftsmen., Standard Steel Constrn. Co., Welland, Ont.

References: D. S. Scrymgeour, R. W. Willis, M. H. Jones, J. H. Ings, A. M. Fennis.

WEIGHTMAN—LEONARD, of 3811 Prudhomme Ave., Montreal, Que. Born at Nottingham, England, July 9th, 1904; Educ.: Comm. and Tech. High Schools; I.C.S.; prior to 1934, dftsmen. with Northern Electric Co. Ltd., B. J. Coghlin Co., Williams & Wilson, also engr. specialties salesman with the latter company; 1934-41, asst. plant supt. and mtce. engr., and asst. to designing engr. and chief dftsmen.; 1941 to date, engrg. dept., mech. and elec. engrg., Steel Company of Canada, Montreal, Que.

## STRUCTURAL DEFENCE AGAINST BOMBING

A reference book on the engineering features of civil defence, published by The Engineering Institute of Canada in order to make available to Canadian engineers and architects a record of some of the experiences and practices of British authorities in regard to structural air raid precautions, so that in the event of emergency arising in this country the necessary action can be taken without loss of time and on the most efficient and economical lines.

It is a 56-page booklet, 8½ by 11 in., with heavy paper cover. It contains 79 illustrations and eight tables. Copies may be secured at \$1.00 each from

THE ENGINEERING INSTITUTE OF CANADA, 2050 MANSFIELD STREET, MONTREAL, QUE.

# Employment Service Bureau

## SITUATIONS VACANT

PERMANENT POSITION in Toronto or Montreal areas with a large industrial fire insurance organization. Previous experience in this work is not necessary. Applicant must be a technical graduate with manufacturing or engineering experience and possess a good personality. Several months training with full pay will be given. Please send photograph with letter. Apply to Box No. 2588-V.

GRADUATE MECHANICAL ENGINEER, preferably a man with paper mill experience to specialize in sale and installation of material handling equipment. Apply to Box No. 2590-V.

CHEMICAL OR METALLURGICAL ENGINEER with flotation experience for work in fluoride department at Arvida, Que. Apply to Box No. 2592-V.

CHEMICAL ENGINEERS for work at La Tuque, Que. Apply to Box No. 2594-V.

CIVIL ENGINEER with some pile driving experience for work at Mackenzie, British Guiana. Apply to Box No. 2595-V.

ELECTRICAL ENGINEER for plant and townsite electrical maintenance work at Mackenzie, British Guiana. Apply to Box No. 2596-V.

CONCRETE DETAILER for Arvida, Quebec. Apply to Box 2597-V.

DEVELOPMENT SUPERVISOR, technical graduate to take charge of small groups of younger engineers doing experimental and development work at Arvida, Quebec. Apply to Box 2598-V.

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.

MINING METALLURGICAL OR CHEMICAL ENGINEER for aluminum plant at Arvida. Industrial smelting or mining experience for experimental and technical work and supervision in remelt and shipping departments. Apply to Box 2599-V.

MECHANICAL DRAUGHTSMAN, general engineering department, Arvida, Que. Industrial plant piping, layouts and detailing experience. Apply to Box No. 2600-V.

CHEMICAL OR METALLURGICAL ENGINEER with flotation experience for work in cryolite plant at Arvida, Que. Apply to Box No. 2601-V.

CHEMIST, general technical department, Arvida, Que. Trained in experimenting in technical work with good prospects for work on investigational problems if satisfactory. Apply to Box No. 2602-V.

METALLURGICAL ENGINEER with physical metallurgy experience. Kingston Works, Aluminum Company of Canada, Ltd. Apply to Box No. 2603-V.

DESIGNING ENGINEER WANTED for a permanent position as chief engineer with a machinery manufacturing concern in Eastern Canada. State age, salary expected and give details of past experience. Apply to Box No. 2604-V.

## SITUATIONS WANTED

ENGINEER available, graduate, twenty years experience including apprenticeship, university and field, covering design, construction and maintenance. For full particulars, apply to Box No. 704-W.

INDUSTRIAL ENGINEER, M.E.I.C., Age 40, Canadian, Married, desires position as production manager or other executive capacity. Presently employed but desires change to plant on war work. Understands layout thoroughly. Location Toronto area. Salary dependent on responsibility, minimum \$3,600. Apply to Box No. 717-W.

## LIBRARY NOTES

(Continued from page 652)

### MODERN ELECTROPLATING (Special Volume)

*Electrochemical Society, Columbia University, New York, 1942. 399 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$5.50.*

This volume is an important addition to the treatise on electroplating, for it provides a comprehensive survey of modern practice, prepared by various experts and provided with copious references to the literature. The opening paper describes general principles and methods. Succeeding chapters deal severally with the various metals.

### MODERN SHIPFITTER'S HANDBOOK

*By W. E. Swanson. 2 ed. rev. and enl. Cornell Maritime Press, New York, 1941. 309 pp., illus., diags., charts, tables, 7½ x 5 in., cloth, \$2.50.*

This handbook supplies, in plain language, an account of the fundamental principles and working problems encountered in building a ship. Blueprint reading, mold loft and structural shop work, anglesmithing, assembly of sections, erection and launching are explained. Special attention is given to welded construction.

### MODERN WIRE ROPE DIGEST

*American Chain & Cable Co., Wilkes Barre, Pa., 1941. 253 pp., illus., diags., charts, tables, 7½ x 4½ in., cardboard, \$2.50.*

*Wire Rope Recommendations, Supplement to the Modern Wire Rope Digest, 1942 ed. American Chain & Cable Co., Bridgeport, Conn., 83 pp., illus., diags., 6½ x 4 in., paper, no extra price.*

This little handbook contains much practical information on the manufacture of wire rope, the types in use, the selection of rope for various purposes and its maintenance. It is intended as a guide to users.

### NATIONAL BUILDING CODE

*Prepared under the joint sponsorship of the National Housing Administration, Department of Finance, and the Codes and Specifications Section, National Research Council of Canada, Ottawa, Canada, 1941. 422 pp., diags., charts, tables, 9 x 6 in., linen, \$1.00.*

This code has been prepared under the sponsorship of the National Housing Administration and the National Research Council of

Canada by representatives of many professional and trade associations. Structural requirements, protection from fire, and health and sanitary requirements are covered. The code is recommended to municipalities as a model.

### NATURAL AND SYNTHETIC HIGH POLYMERS, a Textbook and Reference Book for Chemists and Biologists. (High Polymers, Vol. 4)

*By K. H. Meyer, translated by L. E. R. Picken. Interscience Publishers, New York, 1942. 690 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$11.00.*

This treatise is a translation of volume two of the second edition of Meyer and Mark's "Der Aufbau der hochpolymeren organischen Naturstoffe." It aims to provide a thorough description of the different high polymeric substances from the point of view of their preparation, purification, structure and properties. Natural and synthetic polymers, both organic and inorganic, are considered. The book is a substantial contribution, of great importance to chemists, technologists and biologists, as it provides a systematic account of our knowledge in this field.

### NEW TECHNICAL AND COMMERCIAL DICTIONARY

Part I—Spanish—English  
Part II—English—Spanish  
Part III—Conversion Tables of Weights, Measures and Monetary Units

*Compiled by A. P. Guerreto. Editorial Técnica Unida and Chemical Publishing Co., Brooklyn, N.Y., 1942. 600 pp., tables, 9½ x 6 in., fabrikoid, \$10.00.*

This dictionary contains more than 50,000 words used in electrical, mechanical, chemical and marine engineering, radio, mining, textile and other industries. It includes modern words referring to mechanized and motorized warfare, aviation, meteorology, etc., There is also a separate section giving conversion tables of weights, measures and monetary units.

### POISSON'S EXPONENTIAL BINOMIAL LIMIT

Table I—Individual Terms  
Table II—Cumulated Terms  
*By E. C. Molina. D. Van Nostrand Co., New York, 1942. 47 pp., tables, 11 x 8 in., paper, \$2.75.*

These tables give the numerical limiting values of the individual and cumulative terms for value of the parameter from .001 to 100.

Originally prepared by the Bell Telephone System for use in solving switching and traffic problems, they are also very useful in handling inspection data and for solving problems of sampling.

### PRINCIPLES OF IGNITION

*By J. D. Morgan, Sir Isaac Pitman & Sons, London, (Pitman Publishing Corp., New York, will not have this book in stock), 1942. 133 pp., diags., charts, tables, 9 x 5½ in., cloth, 12s. 6d.*

The purpose of this book is to describe simply and briefly the principal facts relating to the ignition of inflammable gas mixtures by sparks, flames, incandescent solid particles and other localized sources. Certain theories which have been put forward to co-ordinate or explain the action of these sources are also described. The book is intended primarily for engineers concerned with internal-combustion engines and with the prevention of explosions in mines and factories.

### PROCEDURE HANDBOOK OF ARC WELDING DESIGN AND PRACTICE 7th ed.

*Lincoln Electric Company, Cleveland, Ohio, 1942. 1,267 pp., illus., diags., charts, tables, 9 x 6 in., fabrikoid (\$1.50 in U.S.A.; \$2.00 foreign).*

This well-known reference book offers a comprehensive, authoritative description of the arc welding process. Methods and equipment, welding technique, procedures, speeds, costs, test methods, design of welded machines and structures, and typical applications of welding are considered. The new edition has been revised and enlarged.

### TABLES OF PROBABILITY FUNCTIONS Vol. 2

*Prepared by the Federal Works Agency, Work Projects Administration for the City of New York, conducted under the sponsorship of and for sale by the National Bureau of Standards, Washington, D.C., 1942. 344 pp., tables, 11 x 8 in., cloth, \$2.00.*

The two functions tabulated here are frequently called the ordinate and area respectively of the normal frequency curve, and are of fundamental importance in statistics, especially in testing the significance of a deviation in a normally distributed variate and in fitting normal distribution to observations. The tables extend to fifteen decimal places, at intervals of 0.0001 for x ranging from 0 to 1, and at intervals of 0.001 for x ranging from 1 to 7.8.

### BUILDING CODE

A National Building Code has just been published by the National Research Council, Ottawa, Ont., containing 422 pages and is priced at \$1.00 per copy. The code represents the work of some sixty active committee members chosen for their individual knowledge in specialized fields, together with an advisory committee comprising representatives of about sixty professional and trade associations and government agencies throughout Canada. It is, therefore, an authoritative document representing the considered views of a large group of competent advisers. Wide distribution of the National Building Code throughout Canada will, it is hoped, prove very useful as a means of improving regulations governing construction in Canadian municipalities.

### CAULKING COMPOUND

A 4-page bulletin is being distributed by The Conant Company, Limited, Montreal, Que., featuring the saving of fuel by the effective use of "Conant" caulking compound for glazing, pointing, caulking and embedding. This bulletin contains illustrations of various types of application, accompanied by full descriptions of the product, its application and action, and directions for its use. The compound is available in fifteen colours.

### CLEANING SPONGES

Evans & Company, Limited, Montreal, Que., have for distribution a 2-page folder describing the "Handy Maid" genuine natural sponges available for general cleaning purposes. These sponges are made of pieces of natural sponge, shredded for uniform texture and encased in self-absorbent cloth or white knitted cord covers. They are available in various sizes from 5 ins. by 6½ ins. to 7½ ins. by 10 inches.

### ELECTRICAL CONNECTORS

A 48-page pocket catalogue issued by Canadian Line Materials Limited, Toronto, Ont., contains descriptions, illustrations, dimensional drawings and specification tables covering a portion of the extensive line of "Burndy" electrical connectors. The complete line includes connectors for every wire, cable and bus application.

### ELECTRIC HEATING UNITS

The "Chromalox" line of heating units and equipment is comprehensively covered in a 64-page catalogue just published by Canadian Chromalox Company, Limited, Toronto, Ont. The catalogue contains illustrations and descriptions of each item, and in addition, tables of dimensions, capacities, etc., are included. The "Chromalox" line embraces a wide range of units for every purpose and this is illustrated on the first and last pages where typical standard units and special units are included. Ten pages of technical data are included.

### ELEVATOR-CONVEYOR

Link-Belt Limited, Toronto, Ont., have just issued a catalogue and data book, No. 2075, containing 32 pages. Two new sizes of Link-Belt "Bulk-Flo" elevator-conveyors are included, as compared with the catalogue that the company issued when it first announced this new bulk conveying system last year. Power formulae and other engineering data have also been added. The book contains diagrams showing paths of operation, gives a long list of materials that can be handled, and contains illustrated case studies, with tables of sizes, capacities, dimensions, etc. "Bulk-Flo" was announced as "a distinctly new and different power-operated conveyor system for the positive and continuous conveying of flowable granular, crushed, ground or pulverized materials of a non-corrosive nature."

## NOVA SCOTIA

### THE MINERAL PROVINCE OF EASTERN CANADA

Fully alive to the mining industry's vital importance to the war effort, the Nova Scotia Department of Mines in close co-operation with the Dominion Government has been very active in investigating the occurrences of the strategic minerals of manganese, tungsten and oil. By the end of this season at least \$150,000 will have been spent in the search for and the production of these minerals.

### THE DEPARTMENT OF MINES

HALIFAX

L. D. CURRIE  
Minister

A. E. CAMERON  
Deputy Minister

### MR. JOHN E. HESS, DECEASED

Mr. John E. Hess of the English Electric Company of Canada Limited, St. Catharines, Ont., died on October 4th at the age of forty-seven.

For the past eight years Mr. Hess has been Transformer Engineer of the English Electric Company of Canada Limited. He was a graduate in electrical engineering of the University of Toronto, and prior to coming to St. Catharines had been a member of the engineering department of the Canadian General Electric Company Limited of Toronto.

Mr. Hess was a member of the American Institute of Electrical Engineering, and of the Society of Professional Engineers of the Province of Ontario. He was widely known as one of the ablest engineers in his field, having an exceptional grasp of the practical as well as the technical aspects of electrical design, and was highly respected by his associates and members of the profession throughout Canada. During his career he designed many large, high-voltage power transformers operating in Canada at the present time.

Mr. John E. Hess.

### FLEXIBLE SHAFT MACHINES

Canadian Fairbanks-Morse Company, Limited, Montreal, Que., have prepared a 4-page bulletin, No. 401, describing the "Stow" line of flexible shafting and flexible shaft machines for grinding, sanding, wire-brushing, drilling, buffing, polishing and filing. In addition to illustrations and descriptive details of various models, a table is included giving specifications for both the direct connected machines and the multi-speed machines.

### FLOOR REPAIRING AND RESURFACING

A 4-page bulletin issued by Flexrock Company, Toronto, Ont., deals with factory flooring and tells how to cover rough concrete or wood floors, platforms, aislesways, ramps, and steps, to produce tough, durable, smooth surfaces. It describes and illustrates each operation in the making of feather-edge patches without chipping out old concrete or ripping up splintery wood, featuring the fact that any handy man can make permanent repairs with the least possible effort.

### GRINDING AND GRINDING WHEELS

"Grits & Grinds," No. 33, No. 8, published by Norton Company of Canada Limited, Hamilton, Ont., contains a story "The ABC of O.D. Grinding," based on the Company's booklet of the same name, which provides useful information and directions for the grinding of cylindrical shaped pieces and parts. This is combined with a section on the selection of grinding wheels for both cylindrical and centerless grinding.

### GUNITE CONSTRUCTION

A 66-page book just issued by Gunitite & Waterproofing Limited, Montreal, Que., contains technical data and general information regarding "Gunitite" and its use in construction. Following a tabulation of facts about "Gunitite," a series of seven chapters present the following information about "Gunitite": Its composition, properties and characteristics; in building construction; in engineering construction; in hydraulic structures; in the construction and restoration of tunnels and sewers; in mines; and in the protection and fireproofing of steel structures. A great number of photographs are used in each chapter to illustrate the application of "Gunitite" to the particular work described.

### HARD-FACING WELDING ELECTRODES

"Hard-Facing, Industry's Weapon Against Wear" is the title of a booklet being distributed by G. D. Peters & Company of Canada Limited, Montreal, Que. This booklet includes a brief description of the various "Stoody" electrodes and a condensed summary of the benefits of hard-facing. Considerable space is devoted to illustrated applications of hard-facing electrodes in various industries such as, mining, coke and gas, agriculture, dredging, lumber and paper, petroleum, contracting, etc. Finally, 140 odd parts which are subject to wear, impact and abrasion are listed in conjunction with the recommended electrode and method of application for their repair.

### HEAT ENGINEERING

In Volume XVII, No. 6, of "Heat Engineering" published by Foster Wheeler Limited, St. Catharines, Ont., the combination primary and secondary air preheater which features the new steam generator of the Bryce E. Morrow Station of the Consumers Power Company, near Kalamazoo, Mich., is described and illustrated. Other articles are entitled "Improved Coal Pulverizer Performance", "Liberty Ships" and "Chemical-Petroleum Equipment", each accompanied by illustrations.

### LIFT TRUCKS

Towmotor Company, Cleveland, Ohio, have published a 40-page manual, Form No. 37, entitled "The Inside Story of Towmotor," which explains what a lift truck really is, tells what performance can be expected of it, and sets up logical yardsticks of comparison enabling purchasers to determine whether the equipment they are considering is most suitable for their particular handling problem. Written simply, and well illustrated with diagrams and photographs, the manual translates basic engineering principles of functional lift-truck construction into terms readily grasped by even those now completely unfamiliar with this type of materials handling equipment. It is divided into six complete chapters, covering design, frame construction, lifting and stacking mechanism, power plant and travel mechanism, operating and control mechanism and servicing and maintenance features.

### LIGHTNING ARRESTER INSPECTION

A 16-page booklet, entitled "About the ET (Eye Test) Inspection of Lightning Arresters," has been issued by Canadian Line Materials Limited, Toronto, Ont. This booklet deals with the C-L-M arresters and the fully transparent glass body of these arresters which provides a means for reliable, easy, quick and conclusive field inspection, eliminates the necessity of expensive testing equipment, and assures constant, positive protection against lightning hazards.

### LUBRICATION EQUIPMENT

Stewart-Warner-Alemite Corporation of Canada Limited, Belleville, Ont., have issued a 34-page catalogue, Form No. C-22-23, which presents the "Alemite" line of power lubrication equipment designed to meet the needs of any branch of industry. Complete data, illustrations and specifications are given for each unit. In addition to the wide variety of power lubrication devices shown, the company has a separate catalogue covering "Alemite" hand guns and fittings.

### MANAGEMENT-EMPLOYEE CO-OPERATIONS

Under the title "More Production—Better Morale," The Chas. E. Bedaux Company of Canada, Limited, Toronto, Ont., has presented in a 16-page booklet some of its ideas on the prerequisites of efficient production based on the principle that skill, knowledge and experience of workers, supervisors and engineers must be pooled for the common objective to achieve maximum production.

### THE PRIME MINISTER VISITS JOHN INGLIS PLANT

Prime Minister W. L. M. King, accompanied by Mr. A. L. Ainsworth, Vice-President of John Inglis Company, Limited, visited the Inglis plant in Toronto where he inspected the work being done and chatted with many of the workers.

Starting at the front office on Strachan Avenue, the official party went completely through the plant to wind up at the Hanna Avenue gate. They saw everything that was to be seen and did not miss any of the departments.

Picture shows the Premier chatting with Miss Gladys Morton, who told the Prime Minister that "we are only doing our share" when he stopped to thank her and her many thousands of fellow workers employed at the Inglis plant, for the work they are doing.

Major James E. Hahn, D.S.O., M.C.

### APPOINTED DIRECTOR-GENERAL OF ARMY TECHNICAL DEVELOPMENT BOARD

Major James E. Hahn, D.S.O., M.C., of Toronto, has been appointed Director-General of the Army Technical Development Board, which was set up for the development of improvements and of new designs in weapons. Major Hahn has an impressive war record. Serving with the Canadian Expeditionary Force from 1914 to 1918 he was awarded the Distinguished Service Order and the Military Cross for gallantry in the Field. He was mentioned in dispatches three times, and was wounded twice.

Born in New York in 1892, Major Hahn came to Canada when he was six years of age. He was first commissioned in 1908 and later transferred to the 27th Battalion. He went overseas with the 1st Canadian Infantry

Battalion and was later appointed Staff Captain with the Eighth Infantry Brigade. During convalescence, after being severely wounded in France in 1916, he was attached to the staff of the Director of Organization, Canadian Military Headquarters, London, England.

He again returned to France and served on the General Staff of the Third and Fourth Canadian Division. Major Hahn's twin sons are now in the Queen's Own Rifles, Reserve Army.

### ANTI-RUST COMPOUND PROTECTS WAR SUPPLIES

A new anti-rust compound, designed especially to resist the effects of widely varying temperatures and salt spray encountered on long sea voyages, has saved thousands of automotive parts from the junk pile after arrival in war theatres.

Speaking on new packing and rust-proofing methods at the meeting of the S.A.E., in Toronto, on October 21st, Jack E. Harper of the Ford Motor Company of Canada, and Ralph Shelley of the Chrysler Corporation, explained that due to the greatly increased shipping time under war conditions, the packing of equipment for shipment during peacetime is not suitable at this time and extra precautions are necessary.

Previously, they said, many automobile parts sent from Canada had been arriving in such theatres as the Middle East in useless condition. Movies were used to show the waste caused by inefficient packing methods.

Working together, the meeting was told, Ford and Chrysler have perfected a new salt-resistant material which can withstand salt spray for 500 hours. New methods are being evolved every day, including the use of wax and cellophane.

Chairman of the meeting for the evening was J. H. Hickey, general manager of the service division, Chrysler Corporation.

### WATERPROOF PLASTIC RESIN GLUE

Le Page's Inc., Montreal, Que., are distributing a pocket-size folder describing their new waterproof plastic resin glue, which is available in powder form and is prepared for use by adding one pound of cold water to two pounds powder. Immediately after mixing, the glue is ready for use. It takes the form of an easy spreading, smooth, liquid glue which is waterproof after setting. It is packed in 50- and 140-lb. containers as well as in domestic sizes from 1½ ozs. to 16 ozs.

### WELDING

"The Stabilizer," Vol. No. 3, issued by The Lincoln Electric Company of Canada Limited, Leaside, Ont., features short contributed stories of actual problems and how they were solved by men engaged in welding work in the United States and Canada. A very wide variety of experiences and types of welding work is covered by these illustrated and signed contributions which occupy three columns of some fifteen pages.

The Prime Minister visits Inglis Plant.

"To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

---

## AS THE YEAR ENDS

IT IS WELL, and never more so than now, that periodic relaxations should punctuate the long-continued and intense activities of men. Even for the furtherance of the immediate objective, interruption is not only salutary but necessary.

Of the virtue of intermittency as a principle it is scarcely necessary to speak. Every soldier knows what it means to march discipline. The student toiling for the impending examination cannot ignore it. A great Chief of State has publicly declared that from time to time he must seek days of quiet reflection. Out of them, more than out of executive tumult, come decisions and pronouncements of far-reaching import.

Nor does the association of pause with the quality of performance rest merely upon the need for relieving fatigue. Thought itself is intermittent. It comes in jets of intuition, not as a steady, uniform, long-sustained flow. Indeed, as Dimnet has pointed out, the most significant advances in a field of thought are often made when one has deliberately turned to another, and perhaps momentarily a more attractive, subject.

And so it is that reflection and reinvigoration are essential to human progress. They may be foregone only at the risk of personal impoverishment of effort and ultimate loss to the community. The injunction to keep the Sabbath rests not only upon religious authority, but also upon sound physiological and psychological principles.

In Christian countries the festival of Christmas has come to be the great moment in all the year when men and women re-examine their position and re-dedicate themselves to high endeavour. Sham and selfishness have no place here. It is a time when generous impulses well to the surface unbidden and unrestrained. With them come perspective, calmness, judgment. With them, there breaks in upon us the realization of the futility of a life devoted only to personal advancement divorced from thought of wider responsibilities. The giving of some added momentum to the slow but sure onward movement of the human race becomes a source of deep satisfaction.

For engineers, the turning of the year has profound significance. In this cataclysm of war they have laboured long and hard and to great purpose. Their prestige stands higher than ever before in the history of the world. But what of the future? There can be no doubt that re-oriented and refreshed by the reflections and wholesome atmosphere of the Christmas season they will go forward on both the combat and the industrial fronts with renewed energy, clearness of purpose, and devotion to the grim task of carrying the war to a successful conclusion.

But there is need for doing more. In the inevitable setting of preoccupation and strain that will continue for we know not how long there should be a periodic bringing forward of the inspirations and outreachings of the generous season now upon us. Innumerable new tasks face the engineering profession when peace has come, tasks that will demand qualities of high citizenship as well as technical competency. Let us do our share to see that it meets the test with resolution and devotion.

President.

# THE CONSERVATION OF NATURAL RESOURCES WITH SOME REFERENCE TO POST-WAR PLANNING

A summary of the proceedings at a special open meeting of the Toronto Branch of The Engineering Institute of Canada, held on Thursday, 4th December, 1941.

## INTRODUCTION

By ROBERT F. LEGGET, M.E.I.C.

*Assistant Professor of Civil Engineering, The University of Toronto.*

The conservation of natural resources is a matter in which there has recently been a renewal of public interest in Canada. In the public press, frequent references to conservation may now be found. Organizations whose functions have any relation to natural resources—such as those of naturalists, hunters and anglers—have intensified their studies of special aspects of conservation, often in co-operative efforts. As a direct outcome of such work there was inaugurated in 1940 the Canadian Conservation Association, designed to correlate previously separated activities. And the conservational work of Ducks (Canada) Unlimited in the west of Canada, under the able direction of T. C. Main, M.E.I.C., has attracted international attention.

Mention of such bodies as hunters' and anglers' associations may seem to support the popular misconception that conservation is a matter to be studied only by those interested in wild life. That this view is a misconception is well known to all who have even started to investigate the present state of Canada's natural resources, or who have even glanced over any of the better informed literature on the subject. Any such introduction to the real meaning of conservation will show that no approach to the proper husbanding of resources can be made without some consideration of water. Depletion of forests interferes with run-off conditions; soil erosion is usually the effect of uncontrolled water flow. A natural consequence of both is the alteration of normal river flow—spring floods are increased, dry weather flow is reduced, reservoirs are filled by silt. With all such matters, the engineer is vitally concerned; he is inevitably one of the group of interested people by the concerted efforts of whom alone can the problems of conservation be faced and be solved.

Consider, as only one example, the work of the Grand River Conservation Commission. Little over one hundred years ago, the Grand River flowed through the well-wooded virgin brush country that was then south-western Ontario. In the course of a century, its valley has been largely denuded of trees, its banks plowed up with furrows often

running straight downhill to the river, and the great marsh provided by Nature as the source of its summer flow has been partially drained. And the result? Spring floods that have done incalculable damage to the cities and towns along its banks, and summer flows so low as to be a menace to public health. Of necessity the Conservation Commission was set up; the Shand Dam has been built to increase low summer flows, and correspondingly to reduce spring flooding; it is planned to fill up again the Luther Marsh! Thus has a start been made at the engineering features of conservation in one of eastern Canada's most fertile valleys, typical of what must be done elsewhere, in addition to agricultural and forestry conservation measures, if this land is to remain the pleasant and fertile country that so many imagine it still to be.

Conservation measures can only be undertaken on an appropriate scale if motivated by an awakened and informed public opinion. Since conservation measures appear to be particularly well suited for consideration in planning for the immediate post-war world, requiring in general much labour but relatively little capital expenditure, the mobilization of public opinion regarding conservation is today of even greater importance than usual. In an attempt to make some contribution to the desirable awakening of the public's appreciation of what conservation really means, the Toronto Branch of The Engineering Institute of Canada organized a special open meeting on 4th December, 1941. It was held in the theatre of the Royal Ontario Museum and was attended by about 400 people, including members of several interested societies and associations, present as guests.

Three short papers were presented, suitably linked together by appropriate introductory remarks. The Branch was signally honoured in that the (then) newly-appointed Deputy Minister of Lands and Forests of Ontario agreed to present a brief review of Ontario's forests. Against this background, Professor A. F. Coventry—a noted student of conservation who has made special studies of the water situation in southern Ontario—presented a vivid picture of soil erosion and water depletion. Finally, Dr. A. E. Berry, a member of the Branch and councillor of the Institute, discussed the relation of conservation and public health. Short summaries of these three papers follow.

## FOREST AND DRAINAGE AREAS OF ONTARIO

F. A. MACDOUGALL, B.Sc.F.

*Deputy Minister of Lands and Forests of the Province of Ontario.*

The forests of Ontario are extensive and varied. They vary from the southern hardwoods to the Arctic muskeg types. The formation is closely related to the geology of the area. A comparison of this geology with the forest regions shows this relationship.

The greater part of Ontario lies on the worn down mountain range known as the Laurentian Shield. Around Hudson's Bay it merges into the Coastal Plain. True agricultural regions are found south of this shield and in the glacial lake bottom known as the Clay Belt. Apart from small pockets of fertile soil, the Laurentian Shield is an area of forest covered sand and rock.

The forests in this area vary from the southern hardwoods in the agricultural lands to temperate hardwood and pine, north to the Arctic drainage; spruce forests north to the Coastal Plain and, finally, the sparse muskeg type and shoreline forest north to the Arctic.

One would be very unwise, confronted by existing evidence, to generalize as to the relationship of forest to water

in all the province. In the southern section water shortages may, through excessive drainage, become acute; in the extreme north there is water stagnation in the muskeg areas. The water problem and its forest relationship must be more clearly defined and related to definite areas.

Consider the forest on the Laurentian Shield. Clouds passing over this area precipitate their moisture over the dense forest. Under shelter, it lies as a deep mantle of snow protected from evaporation. The dense forest acts as a sponge to hold the moisture, but even a sponge becomes saturated and so it passes into the little streams, into the large rivers and on to the ocean.

The function of this forest is one of preventing evaporation by sheltering the area, encouraging precipitation and acting as a filter to let the water seep out gradually. The forest delays the time of run off in this region. Whether this delay is an advantage or disadvantage on the Laurentian Shield is tied up with watershed runoff and storage studies, and is a problem for waterpower engineers.

Fig. 1—Mouth of the Michipicoten river, Lake Superior. Typical Laurentian forests and lake view.

The rivers of this region passing through and over rock and gravel do not present the problems of erosion so common to agricultural land.

On the Laurentian Shield the problems of water use and study are therefore six in number:

1. The water serves to maintain the natural forest, and the forest reacts on water;
2. The great forest area affects the climate of all the region by holding back snow melting in the spring and keeping the air above it cool in the hot summer.
3. The water stored is used for power purposes and for logging;
4. The waters of the streams, their associated springs protected by forest growth, make a cool habitat for fish life;
5. The waters and this forest are necessary to maintain and shelter animal life;
6. The combination of this well forested and well watered country makes it a great resort for health.

The planning and management of all these water uses are briefly:

1. The protection of this natural forest as it stands, from fire, insects and disease.

## THE WATER SITUATION IN SOUTHERN ONTARIO

PROFESSOR A. F. COVENTRY, B.A.  
*Department of Zoology, University of Toronto.*

During recent years, indications have been accumulating that all is not well with the water supply of southern, agricultural Ontario. Many folks living in the country have endured failure of wells, drying up of ponds, diminution and often complete cessation of flow in streams, and all these have raised doubts. Several recent critical investigations have confirmed the doubts and given point to fears for the stability of the water supply of southern Ontario.

The first of these researches was conducted by K. M. Mayall in 1937 in King Township, under the auspices of Mr. Aubrey Davis of Newmarket. Mayall's findings on the water situation can be summarized briefly. The township, about 130 square miles in extent, has some 200 miles of watercourses leading north and south from a central ridge. A hundred years ago all these watercourses carried permanent streams; now, only some 25 or 30 miles continue in flow throughout a normal summer, the rest—80 to 85 per cent of them—becoming waterless. At the same time wells are failing and springs and ponds are drying up. Originally 80 per cent of the township was covered with mixed forest, but at the present time not more than 11

2. This natural forest must be brought under control. To control it requires permanency in management and cropping.

To attain this permanency there will be much work for the engineer in post-war days. Permanent forest roads in a logging area make possible the systematic cropping of a large area. Permanent waterpower structures to replace thousands of temporary lumber dams will make possible planned use of water.

To summarize the relation of Ontario's forests to water conservation there are three phases to the problem:

Fig. 2—Brulé Rock, Lake Superior. Sparse Laurentian forest cover.

(a) The water in the Laurentian Shield whereon erosion is absent;

(b) Agricultural Ontario where excessive drainage may make water scarcity.

(c) The northern Coastal Plain where excessive water is a problem.

In considering the relationship of post-war man-power problems with the control of water and its conservation in the forests of Ontario, The Engineering Institute is moving wisely and surely.

per cent of the land is wooded, and half of that 11 per cent is grazed and is thus inefficient.

The discovery of so disturbing a condition naturally and properly raised the question whether King Township is, as it was intended to be, a fair sample of conditions in southern Ontario; various pieces of evidence lead to the conclusion that it is representative.

N. Douglas, of Owen Sound, has reported that all the 15 townships of Grey County suffer from seasonal shortage of water, acute in all but two, and that 75 per cent of the streams have ceased to flow from ground springs and are therefore very uncertain.

R. S. Carman, of the Ontario Forestry Branch, has reported that the headwaters of Wilmot Creek, north of Orono, in Durham County, have shortened considerably within the memory of living men, that the springs from which they flow are now further down the hillsides, that the total flow in Wilmot Creek is now much less than formerly, and that wells have needed deepening in recent years. The reasonable inference seems to be that the underground water reservoir stands now at a lower level than in earlier days.

A survey by A. F. Coventry of the streams of the Peel Plain region, west of Toronto, reveals conditions closely comparable with those of King Township, and over a much larger area of land more completely devoted to agriculture, about 1,300 square miles in all. Figure 3 is a map of the watercourses of this area, totalling some 1,500 miles; those shown by solid lines are permanent, the rest, in broken lines, cease to flow for some part of a normal summer. The sinuous, stippled line indicates approximately the position

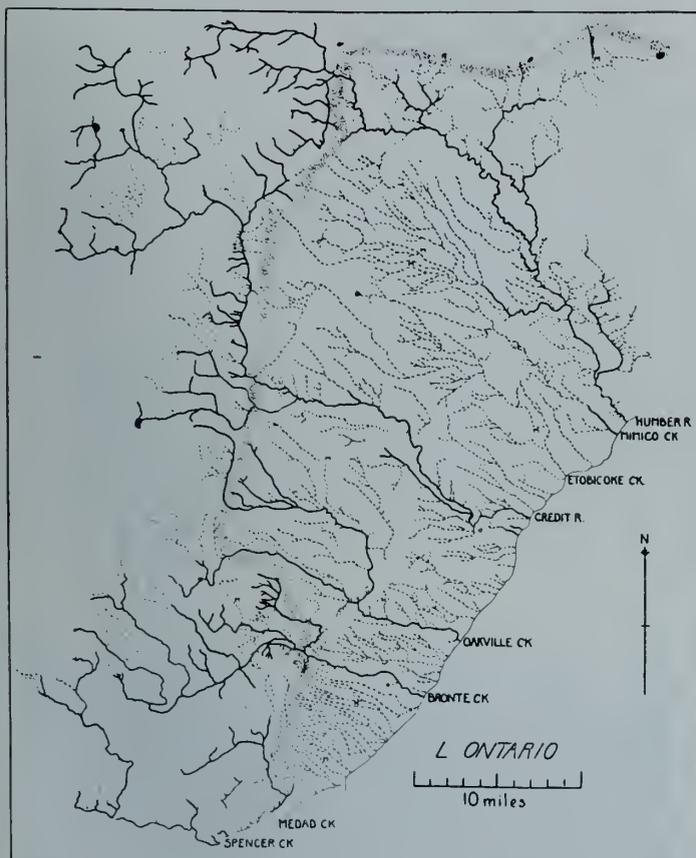

Fig. 3—Plan of the watercourses of Peel Plain and adjacent areas.

of the limestone escarpment on the west and the interlobate moraine on the north; it separates the highly developed agricultural plain to the southeast from the rougher, less fully cleared highlands on the north and west. About 500 miles of watercourse are on the rougher highland, the remaining 1,000 miles on the lowland.

In the area considered as a whole, 67 per cent of the streams are temporary; that is bad enough, but the situation becomes worse on further analysis. In the upland rougher region with more marshes and more cover, 31 per cent of the streams fail; in the lowland, 82 per cent. This is not the full tale; with one very small exception all the permanently flowing streams of the lowland owe their permanence to waters they receive from the highlands; the agricultural plain is now for practical purposes unable to maintain a permanent stream, where a hundred years ago, or less, were streams that drove mills. The average forest cover on the plain is some  $3\frac{1}{2}$  per cent.

These figures, striking in themselves, can perhaps be emphasized by a few pictures; they are chosen out of a considerable collection, for it is, in summer, easier to find dry stream beds than flowing streams. Figures 4 and 5 show the Etobicoke Creek near Summerville, on Dundas Street, at different seasons. The first is in summer. The stream bed is devoid of flowing water, the few puddles being the product of twenty hours' rain just before the photograph was made. The second picture, Figure 5, shows the same place during spring flood, though not at its greatest height. The flow is of the order of 200 cu. ft. per sec. and

it is rapidly removing from some 90 square miles of drainage basin the meltwater from the winter's accumulation of snow. In other words, a large part of the summer's water supply is going fast and uselessly to the lake a few miles away, instead of soaking into the ground as a reserve. About sixty years ago there was a mill at this point.

Figure 6 shows a stream bed in Halton County; it is now usually dry in May, although twenty-five or thirty years ago it was a trout stream. In its neighbourhood springs have failed for the first time during the last few years.

In many places streams that go dry for some part of the summer have cut their beds through the glacial till to bed-rock; not even this low level ensures a water supply, and what this implies in terms of underground reservoir is only too alarmingly easy to imagine.

The dominant features of the existing water situation in southern Ontario are floods in the time of spring thaw; dry stream beds in summer; failing wells in fall and winter.

All these are assignable to the same cause—removal of too much of the original cover, mainly forests, in the shelter of which the stream system developed through some 30,000 years. This slowly established water balance has been wrecked in about 100 years. In the absence of cover, snow is more exposed to evaporation by wind and sun, so that the amount that accumulates during winter is less than it used to be; what does remain lying on the open ground melts fast in the first warm days of spring and runs rapidly off as floods, often destructive and always wasteful, instead of melting slowly and soaking into the ground to swell the vast underground reservoir which is a vital part of the natural economy of water. In comparable fashion the water thrown down by summer storms lacks in some degree

Fig. 4—Etobicoke Creek near Summerville, Peel County, in summer.

Fig. 5—Etobicoke Creek near Summerville, Peel County, during spring run-off.

Fig. 6—Limestone Creek, Rattlesnake Point, Halton County, in fall.

the natural control which would allow the fullest use to be made of it.

These floods and the droughts correlated with them, bad as they are, are not the only evil of the unbalanced water system. Coupled with them is soil erosion—the removal of the fertile surface material on which the productivity of the land depends. This aspect of the loss of natural resources is well known in the United States and in our own West; perhaps there is less full realization that it has reached serious proportions in southern Ontario.

Erosion and water cannot be discussed apart to any profit, for they are aspects of the same problem. Wherever water runs over exposed soil it carries with it some of that soil, and the amount thus transported becomes tremendously greater with every small increase of the speed of the flow. This leads to several kinds of erosion, not sharply demarcated from each other.

Under natural conditions erosion occurs seldom, at any rate under conditions like those of southern Ontario before the coming of the white man. When, however, its natural cover is removed from the soil, this single process upsets the water balance and makes water, according to the season, either too abundant or too scarce, and at the same time lays the soil bare to the action of moving water or wind.

Sheet erosion is the most widespread form, and it is probably the most dangerous, since it is less obvious than other types. It is the general removal of surface soil over large areas and it has affected nearly all parts of agricultural Ontario. The damage is of course greater on sloping lands, but even on practically level lands the surface may, in time, be removed to a destructive extent. This may not be easily observable from the ground, but it is a very conspicuous feature of a large proportion of air photographs of southern Ontario, and it is an important indication of loss of fertility.

It has been said that if the streams of a country are dirty after rain, the agricultural doom of that country is sealed; most of the streams of southern Ontario are dirty after rain.

When suitable conditions exist, sheet erosion can easily pass into much more dramatic forms: rills may enlarge into small gullies, and these may combine and extend on the grand scale. Figure 7 shows a small part of one such resulting area on red clay in Wentworth County. The gully shown is about 45 ft. deep.

Gullying may also be very destructive in light sandy and gravelly soil, as can be abundantly seen on the interlobate moraine and along the shore of Lake Erie.

Wind erosion is most damaging on sandy soils, of which there are many thousand acres in agricultural Ontario. Removal of the original forest cover deprived them of their protection; desiccation altered their physical condition; and the combined effect was to leave them open to destruction by wind. The surface is gradually blown away, sometimes

to a depth of three or four feet, and the transported material may easily impair the utility of adjacent lands. Figure 8 shows an area which has suffered this fate about 25 miles from Toronto.

Land in this condition is of course entirely useless for production; it is, in addition, an active menace through its tendency constantly to spread; and its value as a water-collecting area is reduced. This last is often a matter of special importance, since much of the land of this nature is along highlands which control the streams of neighbouring lowland, more purely agricultural regions.

Summing up, there has been no significant diminution in the annual fall of rain and snow on southern Ontario, and the amount that falls was, in the past, sufficient to develop a rich forest cover, abundant streams, and a soil eminently capable of supporting agricultural procedures. Now the streams are disappearing, largely in one annual, spectacular splurge at the time of spring floods, and the soil is losing its fertility, sometimes obviously, more often insidiously but none the less surely. The two processes are closely interlocked and cannot be separated in consideration or treatment. The conditions of the present will not cure themselves; they will almost certainly get worse as more and more cover is removed from the land, and more and more land is left open to the attacks of wind and water.

Ontario is faced with a grave problem, which, left unsolved, threatens her future, both social and economic. The solution will need comprehensive organization. First, careful and complete surveys are needed of existing conditions, about which far too little is known in sufficient detail for

Fig. 7—Gully in red clay near Waterdown, Wentworth County.

Fig. 8—Wind erosion near Aurora, York County.

the preparation of large-scale remedial measures; then, these surveys will be the basis for working out plans for reconstruction. In both phases the skilled knowledge of a wide range of technical experts will be demanded.

The execution of the plans, actual reconstruction, will require the toil of many men and so will be a proper subject for post-war re-establishment; but in order that this work may be available in the period of transition to a peace footing, the plans must be fully prepared beforehand during the war.

## PUBLIC HEALTH AND CONSERVATION

A. E. BERRY, M.E.I.C.

*Director, Sanitary Engineering Division, Ontario Department of Health.*

Conservation includes not just a storing up of resources and physical assets but rather intelligent utilization of these facilities. Minimum impairment of capital assets by conservation is in contrast to waste and abuse. Consideration of future needs is important in any programme of conservation.

The objective in conservation is prosperity and welfare of the citizens of the country. Resources are of use only when the people are able to make use of them.

Conservation of man-power is essential for the welfare of a country, alike in peace and in war emergencies. Maximum use of man-power can result only when human welfare reaches the highest in health, morale, comfort and happiness. Thus a close association must exist between health and conservation programmes. Health protection is conservation of the most important kind. If a nation cannot be assured of health, the natural resources will be of little avail.

National wealth is measurable. In all Canada the average is about \$2,500 per capita—mostly made up of urban property and agriculture. In contrast to this who can measure the potentialities of the human population, when health and welfare are conserved.

### PROBLEMS OF PUBLIC HEALTH

Efforts in conservation of health have been going on for years. Great improvements have been made, but much yet remains to be done. The Honourable Ian McKenzie, Minister of Pensions and National Health, has stated that "sickness costs Canadians more than \$250,000,000 a year." This is more than the cost of the air training plan, in addition to loss in wages and productive capacity. It is also estimated that 50,000 wage earners are idle every day through sickness. This loss to industry is ten times as great as that from industrial accidents. Sickness may account for 10 days loss per worker per year or a loss to industry of \$100 per year per wage earner.

### ACTIVITIES OF HEALTH BODIES

Health agencies have been organized on a large scale with the objective of protecting humans against the ravages of disease, as well as making the environment more conducive to human welfare. These activities are carried on by the Dominion, the provinces, the municipalities and by voluntary agencies. Each has its task to perform.

There is in this programme a division of responsibility between the state and the individual. The state can do much to control the environment and prevent the spread of infection. The individual must also assume an important share in this work. He cannot depend entirely on the state for health protection.

### PRESENT STATUS IN DISEASE CONTROL

What is the situation to-day in the control of communicable diseases in this country? These have been reduced greatly. Lifetime has been extended, but certain diseases are still not under control. Heart diseases are at the top

Further, it must not be supposed that reconstruction once effected can be left to look after itself; on the contrary, maintaining the countryside in its most efficient state, from every aspect, will be a continuing job, employing permanently a far greater number of trained men than has so far been at all contemplated.

Reconstruction on the lines just suggested is one of the basic problems confronting Ontario, and the treatment given it will play a large part in determining the future of the province.

in the list of causes of death. Cancer also is high. Both of these maladies depend much on the action of the individual.

In the case of tuberculosis there has been an energetic action taken by the state to control this. A steady decline has resulted. The death rate now in Ontario is 26.7 per 100,000 population. The province spends about 2½ million dollars annually on treatment and prevention; 61,000 examinations were made last year in chest clinics. Early diagnosis and prevention does much to conserve the nation's man-power.

The infant death rate in the province has dropped in the last 10 years from 73.7 to 43.2 per cent, and the percentage of deaths in this period caused by diseases of the digestive tract has dropped from 19 to 6.

Diphtheria has been declining steadily, and now very few if any cases are found in large cities.

In the diseases associated with environmental sanitation much improvement has been made. Typhoid fever is the lowest on record, and has been declining steadily. Undulant fever, paratyphoid fever and others in this group have reacted similarly. To do this it is essential to control the environment. Continual vigilance is needed. These diseases, where the state can exercise supervision, have shown promising results. The same does not apply to all those diseases which depend more on the individual's action.

### WHAT IS THE CAUSE OF UNCONTROLLED DISEASES ?

Some diseases are more easily prevented than others. In some the state can adopt effective measures. It is necessary to enforce prevention and to adopt compulsory measures such as in the treatment of water, the pasteurization of milk, quarantine, etc. Prevention is seldom popular or dramatic except in cases of actual emergency. Public support is necessary in disease control. Education is desirable, but is seldom as rapid as compulsion.

### THE ENVIRONMENT AND DISEASE

To what extent does environment affect the health of the citizen, and how is conservation of resources linked with this? Some diseases are linked closely to the environment, and in general a prosperous country tends to good health. Soil erosion has a devastating effect on nutrition and general welfare.

### WATER SUPPLIES

Environmental problems include water supplies, stream pollution, sewage and waste disposal, flood control and droughts, recreational facilities, etc. All are specific problems for the conservationists in any country.

Municipalities must be assured of water supplies adequate in quantity and satisfactory in quality. It is required for domestic use, for fish life and for recreational purposes.

Ontario is fortunate, in general, in having an adequate supply of water for domestic purposes, except in small streams and shallow wells. Underground, deep wells have not been affected to any noticeable extent here, but elsewhere the levels have receded as much as 200 ft. Efforts

are made to replenish this supply by diverting used water into the underground again.

In surface waters, particularly in streams, floods and droughts are the opposite extremes of a single condition. Floods are not so serious to health, but they do constitute a real menace to property and to life. In 1941 the United States Government had an appropriation of \$69,000,000 for four major river control projects. Losses in Canada are periodically serious.

Droughts offer a very real health menace. Objectionable tastes are created, higher pollution occurs and illness is contracted. To avoid this, reforestation has been carried out at a number of places. The results are satisfactory.

#### POLLUTION OF STREAMS

The pollution of streams is a major problem in built up communities. This pollution is both domestic and industrial. Many examples of this are found in Ontario. They give rise to odour complaints, destruction of fish, problems in water treatment, algae decomposition, etc. Streams and surface waters should be utilized, but undue pollution should be avoided.

#### TREATMENT OF WATER AND SEWAGE

Modern methods are effective, but within limitations. High expenditures are involved for correction of pollution. Only a small part of the sewage from urban centres is adequately treated. The problem is not how to do this, but rather how to secure public support for the expenditures that are involved.

#### FOOD SUPPLIES

Food supplies and adequate nutrition are important in the health and welfare of a nation. Soil conservation plays a major role. Erosion may result in loss of essential minerals.

These foods must be carefully protected in the course from production to consumer. Milk supply is an example of this. Pasteurization, made compulsory in Ontario has achieved effective results in disease control.

The present situation in conservation leaves much to be desired. It is essential that interest be stimulated in these activities, and that funds will be forthcoming to meet the costs involved.

#### CONCLUDING NOTE

Following the presentation of the foregoing papers, there was exhibited—by special permission of the U.S. Department of Agriculture—one of the most remarkable of all documentary sound films, "The River". The film deals with the Mississippi River, what it has done and what man has done to it. It depicts vividly the vital part that this river has played in the development of the United States and shows how man, by abusing natural conditions has, in many cases, turned the river from a natural blessing into an uncontrollable menace. It goes one step further and points out how through agricultural practices and engineering projects, which in themselves are beneficial to the country as a whole, control of the river can be regained. It is a conscious attempt to present a fundamental problem so factually and so dramatically that those who see the picture will be moved to action. (Copies of this film are now available for loan in Canada; enquiry should be made of the National Film Board, Ottawa).

The film has great emotional appeal and formed a fitting climax to the preceding speeches. But, of set purpose, the meeting was continued so that the message of the film could be correlated with Canadian conditions. This was done by Professor Coventry in a brief but moving appeal, based on the situation in southern Ontario which he had previously described—a situation which demanded attention, he said, and that promptly. With this challenge, the meeting ended.

# DEVELOPMENT OF GROUND WATER SUPPLY

J. W. SIMARD, M.E.I.C.

*International Water Supply Limited, Montreal, Que.*

Paper presented before the Montreal Branch of The Engineering Institute of Canada, on October 8th, 1942

So long as primitive peoples were satisfied to live on the shores of streams, their water problems were easy to solve. Our early ancestors and their herds quenched their thirst from brooks and rivers.

Old Bible texts very often mention facts showing the scarcity of surface water, and the necessity of resorting to underground strata. They tell us about Abraham and his son, Isaac, sinking wells after their arrival in Palestine. They also describe the seven years of drought in Egypt, under the Pharaohs, as well as the journey across the desert by Moses and his people, when he had to strike the rock in order to save them from death by thirst. All these facts prove clearly that, even in the old days, surface water was sometimes scarce.

But when surface water was lacking, underground water had to be found, and this is how the art of well digging started.

Ancient wells generally gave little water, just enough for the domestic requirements of the people, and their live stock. Occasionally large flowing underground strata were encountered by chance, and their water used for irrigation purposes, but with these exceptions it can be said that before the industrial era, underground water was not exploited extensively.

With the growth of industry and the increase of population in various regions, many surface waters have become contaminated. In some areas, the flow of streams is not large enough to supply the requirements of constantly increasing cities and towns. Similarly, industrial developments also require water, sometimes in large quantity, and it must be always available, during drought as well as during rainy seasons. And so, we have been brought to the scientific search for ground water, and to the technique of well development.

The following notes give a résumé of some of the methods of locating water-bearing underground strata, and utilising their supplies.

## ORIGIN OF UNDERGROUND WATER

Unless its origin is magmatic or volcanic, water can only reach the subsoil by infiltration from the surface through pervious formations, or through rock fissures. If the ground is impervious, and if the rock formation is solid, and not porous, no underground water is to be found, whatever the depth.

The great source of ground water is rain. Rain water, after it has reached the surface of the earth, will run off on impervious soil like clay or solid rock, and will flow down to brooks, streams, rivers and lakes, finally reaching the sea. During its course, and depending on atmospheric conditions, it will lose part of its volume by evaporation, and vegetation will also absorb the quantity necessary for its life.

But rain falling on pervious ground percolates through it. This water seepage feeds the ground water-bearing strata, often called "aquifers".

However, there are exceptions to this rule, and water can penetrate underground through fissures in impervious rock. In this case water, following the laws of gravity, may be carried to great depth by these natural channels. Sometimes hot water springs and geysers originate in this manner. The water coming down from the surface is gradually heated at the approximate rate of one degree Fahrenheit per sixty feet of depth; in its course, it dissolves some of the mineral matters in contact with it, and at its outlet, it is frequently used for therapeutic purposes.

Experience has shown that the chances of reaching underground water by boring through fissured rock are sometimes remote, unless some effective geophysical methods are used to detect with such precision as is possible, the depth of the fissures.

In some pervious rocks like porous sandstone or limestone, the chances of securing water are much better, and in certain cases large quantities of water can be obtained when these rocks are in contact with a pervious stratum. Such geological conditions exist in northern France, around the industrial region of Flanders, where much fissured limestone lies at a shallow depth. This limestone, lying directly under sandy formations, is entirely submerged, and many wells have been bored in it to supply large plants with industrial water. It has been stated that the Maginot line was not extended to the Channel, on account of the practical impossibility of handling the ground water which would have been met with during construction.

Under normal conditions, water is in the subsoil, provided a pervious stratum permits its percolation. For this reason, it is not advisable to drill a well without a preliminary examination to find out if such a stratum exists.

## PRELIMINARY STUDY

There are many ways to secure this information: first, the study of geological maps will show what the ground outcrops are in the surrounding country; this will give a general idea of the formations; then an investigation trip on the ground will confirm the findings, and give the opportunity to check the drainage area. It will also be useful to see the wells of the region, if there are any; also to visit any trenches, quarries, or excavations which may exist. A careful study of the data so secured will indicate the existence or absence of an underground stratum, and if the conclusion is favourable, a rough estimate of its capacity may be made.

There exist many large ground water developments. In the United States, in the states of New York, Minnesota, Texas, Utah and California, and in Florida and Georgia, also in France and England, as well as in North Africa, in Algeria and Tunisia, there are many sources of this kind, tapped by hundreds of wells, supplying ground water in large quantities to public services, and to industry.

Thus it is often necessary to obtain very large supplies of water from underground sources; in such cases it is important to estimate the capacity of the water-bearing formations.

The capacity of a water-bearing stratum is limited to the amount of surface water percolating to it, and to the velocity of the underground flow. It is therefore necessary to estimate the catchment area, and to secure rainfall data on the surrounding country in order to calculate approximately the volume of water that may be drawn under favourable conditions.

## QUALITY OF GROUND WATER

All ground waters cannot be used. Some are not potable; some contain too much salt and magnesium, others contain carbonates and sulphates, and must be softened before distribution; the iron contents of others are too high for domestic purposes, or for their use by some industries. Therefore, it is important, before going to the expense of a permanent well, and of its equipment, to secure water samples for analysis. In order to get these, a small diameter test hole is drilled into the aquifer, and this is pumped until the water becomes clear. First samples will only be

taken after some hours of pumping, so that the water is not saturated with the soluble matters in the formation; the samples thus secured would represent the water to be obtained under future pumping conditions.

Ground water has many advantages, when compared to surface water. Its quality never varies; its mineral content is the same at all seasons; it is free from bacteria; its clearness and temperature are constant, and the cost of its treatment, when necessary, is low. Moreover, underground strata constitute an ideal reserve of water, economically stored, available whenever required.

The initial test hole will have given some information on the conditions underground, and as to the lengths and diameters of casings needed for the permanent well.

### VELOCITY OF UNDERGROUND FLOW

It remains to find what will be the probable flow from the proposed well. This is a more complicated question, for the following reasons: the underground water exists in pervious ground; these strata are generally formed by alluvial deposits, or consist of sedimentary formations. Alluvial deposits are found in the valleys of old and modern streams. Often, as it is the case in the Laurentian country, they have been washed down by glacier streams, or deposited during the moraine period, by the displacement of glaciers, which have eroded the secondary and tertiary formations of our region, under their tremendous weight. These deposits, sometimes called drift or overburden, are not evenly distributed; they contain clay, sand and gravel in variable quantities. Ground water will flow more freely if the sands are coarse, and if they contain little clay; on the other hand, the water circulation will be slower in fine sands, especially if they are mixed with clay.

The loss of velocity due to friction through coarse sand will therefore be less than the one through fine sand with clay. And this explains why the conditions of underground flow can vary in the same stratum, within a few hundred feet, and why the capacity of a proposed well can only be estimated by a test, to find out the conditions of the subsoil, on the site of the work itself.

Such tests are made in the following manner: a small diameter test well is drilled into the aquifer, and a temporary screen is set in the water-bearing stratum. The static level of the water in the well is then measured, and the well is pumped until the water is clear, and the pumping level stabilized. Note is taken of the volume of water pumped, and of the drawdown of the water in the well during pumping, the drawdown being the difference of depth of the water in the well, between static and pumping levels. After pumping, the time of recovery to the original level is also noted. Taking into account the time of pumping, the yield of the well per foot drawdown can now be established, and this is called the specific capacity of the well. Knowing the thickness of the stratum by boring, the specific capacity, and the possible drawdown, the volume of water that may be expected from the permanent well can now be estimated.

However, this figuring must be done with some care, because it is clear that by applying strictly the formula in thick layers of fine clayish sands, impossible yields would be figured. This is where experience counts. Even in a stratum composed of coarse elements, one must not forget that the maximum capacity of a well is limited to the velocity of water at the outside of the metallic screen set in the aquifer, and to the velocity of the water flow in the stratum itself. The well will only deliver the smaller quantity of water produced by either of those two factors. After the geological study and the two tests, necessary information to plan a well producing a known minimum quantity of water will be available.

There are many methods of measuring ground water flow. Dyes like fluorescin and eosin, highly coloured matters, are frequently used. Powdered fluorescin can be seen in a solution of one part in 40 million, and it can also be

detected by experiment in a solution of one to ten billion. The powder is deposited at a certain spot in the stratum, and then note is taken of the time when colour appears at a point downstream.

Many specialists in hydrology have given formulae on underground flow. Unfortunately, Mother Nature does not always take laboratory data into account, and the proportions of sand, gravel and clay may vary in different parts of the same stratum. For these reasons, it is wise to decide only after actual testing has been done.

In certain countries, sedimentary formations of the Lower Tertiary, and of the Cretaceous have been deposited

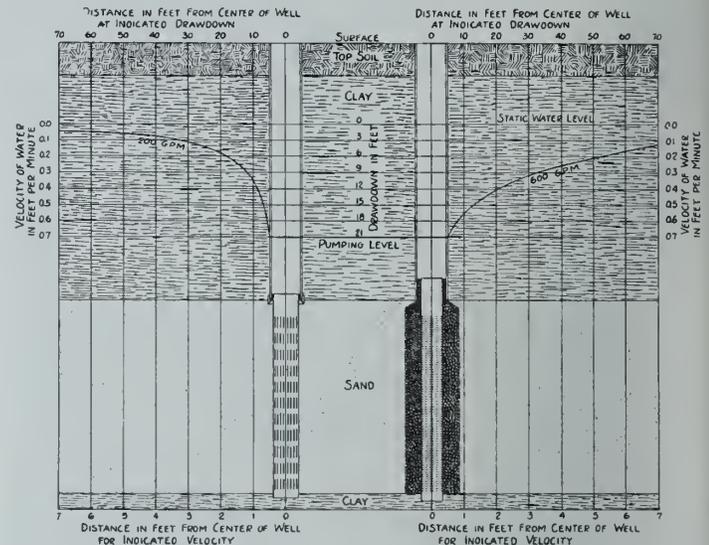

Fig. 1—Comparative yields of an ordinary tubular well (left), with a gravel wall well (right).

by the old seas. Important pervious deposits have thus been formed; they are spread on large areas, and are evenly distributed; their outcrops are also well located. Where many wells have been long in operation in such places, they have given valuable information on the water-bearing deposits, and it is therefore possible to estimate without testing, the minimum yield of a well, or of a series of wells.

The author has had some years' experience with deposits of this kind in Europe and Africa; more specially in France, near Paris, within the limits of the great depression of the Parisian basin. Many wells were sunk down to the Sparnacian formation of the Lower Eocene, as well as to the Albian and Aptian formations, of the Cretaceous; these wells were drilled without preliminary testing, on a water guarantee basis averaging 800 gallons per minute. It was possible to bore these wells without previous experimenting, because the strata tapped were well known, and a mass of data on the formations was available. But discretion must be used in this kind of estimation, and the safety factor must be applied, if one wishes to avoid numerous disappointments.

It may be added that in practice, the two tests to determine the quality and quantity of ground water, are made in the same test boring.

### CONSTRUCTION AND DEVELOPMENT OF A WELL

A modern well constructed in unconsolidated material generally consists of three main parts: the outer casing, the inner casing, and the screen.

The outer casing is a tube which extends from the ground level down to within a few feet of the top of the water-bearing formation. The lower end of the outer casing lies therefore a few feet above the top of the screen. Due to local conditions, it is sometimes necessary to set more than one outer casing.

Inside the outer casing, and concentric with it, is the inner casing, of a smaller diameter. It is set down to the water-bearing layer, and is directly connected to the screen.

The screen, usually of the same diameter as the inner casing, and connected to it, is set in the stratum at the most favourable level to secure the best underground flow. Various metals are used to resist corrosion, Armco iron, silicon or manganese bronze, copper, wrought iron or even stainless steel. The best types of screens are perforated with horizontal or vertical openings called shutters. It is through these openings that the water percolates into the well. The size of the openings of the screen depends upon the kind of formation. In short, the screen is a cylindrical metallic filter at the base of the well.

Two methods of drilling are most frequently used for water wells—the rotary and the cable-tool methods.

The rotary method, with its clay seal, has a great advantage in deep wells where many water-bearing formations exist, each containing different types of water of more or less good quality. By using this clay seal, good water formations can be developed, without being contaminated by undesirable water from others. An interesting case in the author's experience is one of a well passing through four water-bearing layers, the first and third being discarded, and the second and fourth being developed.

On the other hand, the cable-tool method is quicker for shallow wells, especially where hard formations are encountered. This method also gives better information on the ground structure, unless expensive coring is done with the rotary system.

But let us suppose that by using either system the hole has been completed, and that casings and screen of proper diameters have been set, the screen resting well in the stratum, so that water can seep into the well under the best conditions.

For most drillers the work is then completed, and it is now up to the customer to buy a pump, if the well is not flowing. Often, after this pump is set, it will be noticed that the yield has decreased, and that the quantity of water pumped is not up to expectation. If an investigation is made, it will tend to show that generally, the decrease of flow is due to the finer particles of the water-bearing layer which have been sucked into the lower part of the screen, and are partially blocking the shutters. If pumping is continued under these conditions, pump parts such as shafts, impellers and wear rings may soon be badly worn and the yield of the well will keep on decreasing until it will practically become useless. Sometimes the production of water will suddenly cease without warning. What is the probable cause of the trouble in such an emergency?

It is most likely that fine particles of sand and clay have been deposited in the bottom of the well, partially blocking the screen, and reducing its percolating area. Some of this sand may have gone through the pump, and caused the untimely wear. Or the displacement of these fine sands may have left cavities around the well, and after a while the formation has caved in along the walls of the casing and screen, and this latter may be entirely blocked. In this case, most frequently, the well is a total loss.

It is therefore important that the well when in operation should not yield water which is cloudy or contains sand or clay. If it does, the rate of pumping should be reduced until the water is clear again.

Experience has shown that the sinking of a well, and the setting of screen and casings, is only part of the enterprise, and often the easiest. What remains to be done is even more important: the development of the well to bring it up to a minimum water production, and its permanent stabilization to that production. This is the purpose of the so-called "gravel wall well." (See Fig. 1).

The object of this development is to increase the filtering area through which the water penetrates into the well. This is accomplished by setting around the screen clean gravel of such a size that it will not pass through its shut-

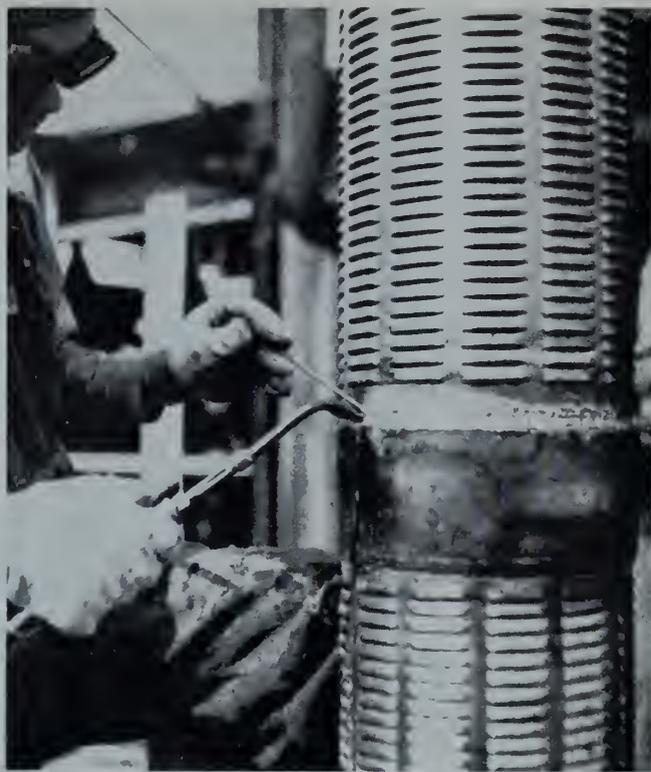

Fig. 2—Field welding joints of 12-in. bronze shutter screen as it is being installed in well.

ters, but will build up outside its metallic walls. The gravel is first put into the annular space between the outer and the inner casing, and then forced down by agitating and pumping. In the course of these operations, the finer constituents of the aquifer in the immediate vicinity of the well are purposely forced inside the screen, and simultaneously replaced by calibrated gravel. After many operations of this kind, a mass of gravel is formed around the screen, and the bottom of the well has become a regular gravel filter with a metallic core. The filtering area of the well was originally only that of the metallic screen itself, but it has been increased, and is now measured by the outside surface of the gravel filter. If more gravel is forced down, the size of the filter will increase, and so will the area through which the water can penetrate into the well. It follows that for the same flow of water, the larger this area, the slower is the velocity of the incoming water. If for a given capacity, the water velocity can be decreased to such a point that no fine matters are washed into the screen, then the water will be clear, and the well stabilized. After these operations, all fine matters having been forcibly removed around the screen, the well has been cleared of everything that could destroy its equilibrium in the course of future pumping.

It is important, during the developing process, to provide that gravel spreads as evenly as possible around the screen. Voids, caused by gravel bridging, would produce points of high velocity, through which more fine material would soon wash in to block the screen, and the whole undertaking would have to be started all over again.

During such development, it will be noted that the yield of the well increases at the same pumping level, and that water clears up more rapidly at the increased rate of pumping. This is because the well is stabilizing properly, and in some cases yields of from ten to twenty times the original output are finally secured.

After the required flow is obtained it is necessary to continue operation, so as to make sure that the water remains clear, and that the pumping level stabilizes. When these conditions have prevailed for many consecutive hours, it shows that the well has been developed to its permanent

yield, and that there is no more danger of future sanding up or cave in.

The quantity of gravel absorbed by a well in the course of its development varies a great deal. It is the flow of the

Fig. 3—Setting a 16-in. shutter screen in the 42-in. outer casing of a Layne gravel wall well.

water required, and the kind of material in the stratum around the well, that will govern the size of the gravel filter. However, in order to give some approximate figures, it may be said that frequently a gravel wall well will absorb from 10 to 15 tons of gravel. The author knows of a well in which 120 tons were required to stabilize a formation composed of fine material, where a rather high yield was wanted. Thus it is not surprising to learn that it often takes more time to develop a well than to sink it.

However, there is a limit to development, and the filter must not exceed certain dimensions. If its size would become such that the loss of head through it should be greater than the loss of head through the stratum itself, it is clear that further development would only be negative.

#### PUMPING UNITS

The well is now completed. If it is not flowing, some pumping unit must be installed. The choice of this machinery must be made with care. In recent years, manufacturers of vertical turbine pumps have greatly improved their device. Today we can obtain a pump, to be set in a twelve-inch casing, that will deliver more than 1,000 gallons per minute with 80 per cent efficiency.

In order to get the best and quickest results, it is desirable that the same specialist should supply the complete installation, both well and pumping equipment. At first sight the drilling of a well and the supply and installation of a pump do not seem to have anything in common, but experience has shown that these operations are closely related for the following reasons.

After much work, a competent specialist has finally succeeded in completing a high yield well. But unless the well is a flowing one, the customer as yet has no water, and he will not have any until a proper pumping outfit is installed. If the furnishing and installation of this unit is given to somebody who is not interested in the well, it may, and often does happen, that during the setting of the pump some tool or part of machinery is dropped into the well; this may partially block the screen, and therefore decrease the yield of the well. Even if the pump is installed without mishap, it will be necessary to make tests and this may result in a lot of trouble if done by some one not familiar with the technique of gravel wall well construction. For example, if starting and stopping of the pump is too frequent, and not

watched closely, or if the capacity of the pump is such that the volume of water coming out of the well is larger than the capacity to which it has been developed, the agitation caused by too frequent starts and stops, or by over-pumping, may destroy the equilibrium of the formation, and the fine sands and silt will then move in again with the consequences which have already been mentioned.

The customer will not be satisfied, because he will have no water, and he will have to deal with two contractors, each of whom may in good faith blame the other for the failure of the enterprise.

How natural it would be for the builder of the well to claim in his favour the results of his preliminary pumping, duly demonstrated by tests. On the other hand, the manufacturer might say that his pump is according to specifications, and offer to prove its features by laboratory tests. He would therefore claim that if the well does not give more water it is because it has been badly constructed. In the meantime, the customer will be without water, and this might cause considerable damage to his industry, or to the public service he is directing.

In order to avoid useless trouble and discussions, and to obtain quick practical results, it is therefore advisable to give to the same party the whole water production undertaking. If this party knows his business, after having made the necessary tests he should be in a position to give a water guarantee, as to quantity, quality and pressure. Thus the customer will get satisfactory results, and if he is not satisfied, he will know whom to blame.

#### WATER GUARANTEE

Such a water guarantee should cover the water production of the well, and also the material and equipment. It should extend for a period of one year from the time of the final installation of the pumping unit. This will give enough time to find out if the water stratum can stand the pumping during the four seasons of the year, including the dry ones, and to observe if pump and motor are working up to specifications.

If something were to go wrong in the water-bearing stratum, either on account of overpumping, or of improper construction or development, an abnormal drawdown of the pumping level in the well would immediately occur, or the volume of water pumped would decrease materially, or both these events would happen at the same time; the water would become cloudy, or even full of dirt, and sand deposits would be observed. If, however, during the few weeks following the beginning of operation everything remains normal, it is because the well has been properly developed and because the source of water can stand the pumping without failing.

For the reasons already mentioned, it will be understood that a water guarantee cannot be given in a rock well. It is very difficult to locate a water-bearing fissure; moreover, no well can be expanded against rock walls; it is necessary therefore to be satisfied with the initial quantity of water contained in the fissure itself.

#### BATTERIES OF WELLS

As already mentioned, many important water-bearing strata have been tapped to feed large cities, which thus depend entirely on wells for their water supply. Mr. O. E. Meinzer, geologist in charge, Division of Ground Water, United States Geological Survey, estimated some years ago that in the United States alone more than fifty million people were supplied by wells, and that of these, twenty million were getting their supply through public services. In the United States about half of the cities with populations from 5,000 to 25,000 people are using surface water, the others are getting ground water; more than 8,000 small cities and villages of less than 5,000 population are also depending on ground water.

Amongst the large centres using well water, are those of the western section of Long Island, being part of Greater

New York; the cities of Houston, Memphis, Salt Lake City, etc. If ground water should fail them, very grave conditions would result.

When it is realized that for Long Island alone more than 200 million gallons of water are daily extracted from the ground and distributed, one can understand how necessary it is to study carefully the possible variations of the underground water strata.

It will be of interest to consider what has to be done when a large centre is to be supplied with ground water, and consequently many wells must be sunk in the same formation.

After having figured the capacity of the water-bearing stratum, by studying the geological formations, the physical contours, and the local precipitation data, tests are made to determine the quality of the ground water, and then steps are taken to estimate the possible capacity of the aquifer.

If the project is large, a number of wells may have to be constructed and, in that case, the distance between the wells must be determined so as to give the best performance.

Let us examine what happens in a non-flowing well, when idle, and when in operation. Although the same natural laws prevail for underground as for surface waters, they are subject to a different regime. This is due to the difficulty of circulation of water through the formation.

When a well is not pumped, the water comes up to the natural level of the water table, at what is called its static level. If this static level is higher than the ground, a flowing well will result.

As soon as pumping begins, the suction of water in the well will reduce the pressure, and this will gradually bring water down to the pumping level. After a certain time, if the well has been properly made and developed, and if the supply is not overpumped, we know that the pumping level will stabilize itself for the same volume of water. If then gauge holes are sunk from place to place around the well, and observations made of the water level in them, they will make it possible to study the effects of pumping on the ground water table near the well which is being pumped. If a cross section curve is drawn, it will show that the water table has taken the form of an inverted cone, the apex of which is in the well at the pumping level, the irregular edges being more or less distant according to the perviousness of the formation.

The ratio of the depth of the cone to the average diameter of its base is in direct proportion to the loss of head through the water-bearing stratum; the finer the sands, the steeper will be the sides of the cone, and the smaller its base. Inversely, for the same yield, in a deposit of coarse sands and gravel, there will be a lesser depression of the water table, extending within a greater radius from the well. The zone of this depression represents the area of interference around the well. In certain cases this interference extends to some distance, and it is quite important to find the limits of this zone, when a battery of wells have to be made and pumped simultaneously in the same area.

For if wells are too close they will interfere with one another, and their pumping levels will show an abnormal drawdown; in an extreme case the total capacity of two wells sunk too close together, might not be more than the capacity of one of the wells. It is therefore necessary to locate the wells so that there is the least interference.

But on the other hand, for certain reasons of economy, one may be forced to locate the wells within their zone of interference, and still gain by doing so; but in such a case it is necessary to make sure that an increased flow is ob-

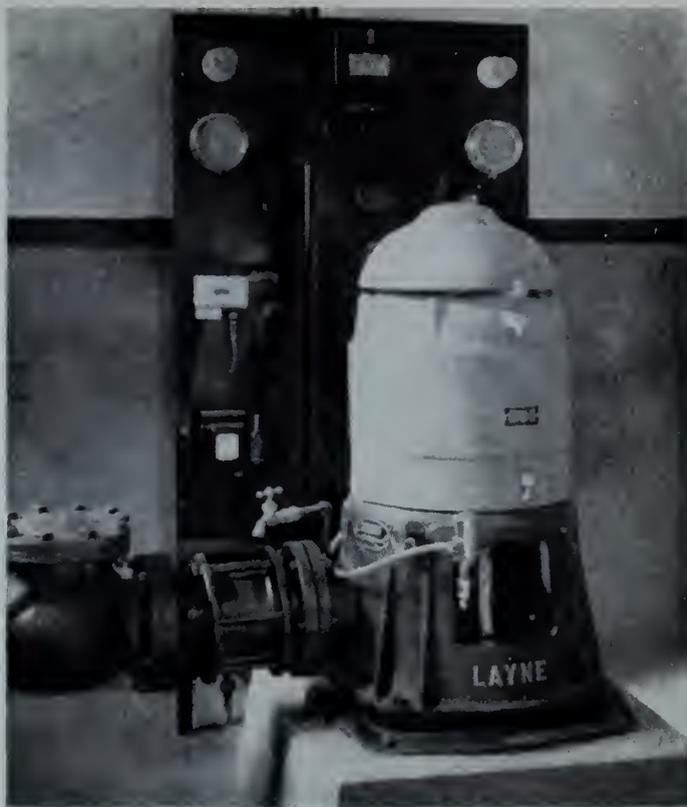

Fig. 4—Layne gravel wall well and vertical turbine pump installation for the municipality of Chesley, Ont.

tained, and that the pumping levels are definitely stabilized. Therefore, it is advisable to watch closely the interference of the wells amongst themselves. One method is to stop the pumping of one or of a series of wells, and to observe the effects of stopping and starting on observation wells.

Sometimes the problem is the construction of new wells sunk to a stratum already supplying large quantities of water. It is then advisable to watch closely the effects of the new pumping, and if it produces too great a depression on the water table, immediate precautions should be taken not to deplete the water-bearing stratum. In other words, when a battery of wells have to be sunk in a stratum, it is necessary to make sure that the total amount of water to be extracted is not greater than the recharge possibility of the stratum itself.

By taking adequate measures which cannot be detailed here, it has been possible to restore important water strata that had previously been overpumped and, by so doing, avoid disastrous conditions for populations that depended exclusively on wells for their water supply.

The object of these notes has been to show that water supplies from aquifers have rendered, and can still render, great services to the community. It is, however, important that those in charge of the work should be familiar with modern technique, and should understand that the time is gone for wells made in haphazard fashion.

The construction of a large-yield well, or of a system of wells, must be preceded by a serious study, and must be carried out by scientific and technical methods. In this way the development of ground water strata will aid more effectively the industrial and economical development of our country.

# ENGINEERING ASPECTS OF AIR BOMBING AND STRUCTURAL DEFENCE

D. C. TENNANT, M.E.I.C.

Engineer, Ontario Division, Dominion Bridge Company Limited, Toronto, Ont.

Paper presented before the Montreal Branch of The Engineering Institute of Canada, October 22nd, 1942, and before the Hamilton Branch, on November 18th, 1942.

Shortly after the outbreak of this war, we in Canada and the United States began to learn—though not at first hand—of the devastating effects of air raids, and possible defences against them. For a while definite information was hard to get, but as months and even years have gone by much has been spoken, written, and published regarding experiences in Britain, Europe, Africa, China and the Far East, so that now it is not easy to choose from the available information, concise and salient data, adequate for a clear picture, but lacking details that might be of use to the enemy.

Broadly speaking the title of this paper might be taken to include both military and civil activities, for air bombing is directed at naval, military and civilian targets, but it is assumed that The Engineering Institute is more particularly interested in the civilian side of the subject and the author does not feel qualified to suggest anything in connection with the military aspect.

Table I outlines a typical organization for civilian defence that applies to the Dominion itself and also to provinces and municipalities. It will be noted that the five main subdivisions of this organization deal with police, fire, health, structures and transport. The sub-headings shown under these five departments indicate that practically all the engineering considerations group themselves under structures and transport. Transport is important and local preparations have in some cases been made for it. It is, however, a specialized engineering activity and one that is difficult to discuss until actual needs emerge. This paper will, therefore, limit itself to a consideration of the engineering items listed in Table I under structures.

## (A) AIR BOMBS

### 1. INCENDIARY BOMBS

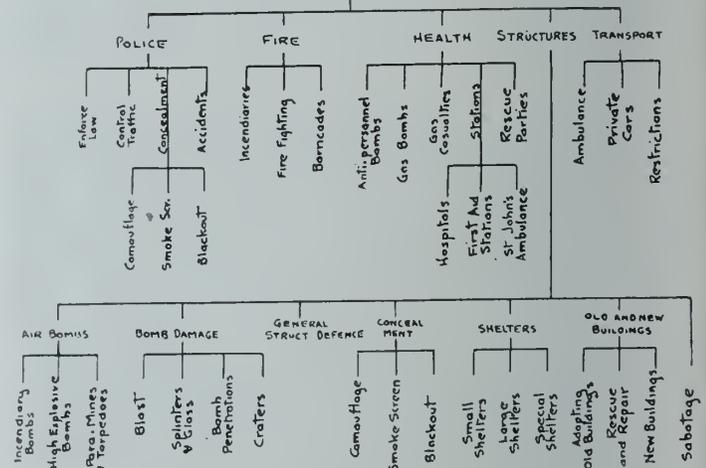

Fire has historically been one of the most powerful and most feared agencies of destruction in war. Incendiary bombs are especially intended to cause fires, but it may be fairly stated that over fifty per cent of the damage done to buildings from all sorts of air bombs is due to the fires that are kindled. German incendiary bombs used in the first world war were of a somewhat squat shape approaching the spherical and contained phosphorus, thermite, tarred cotton waste, and were wound round with tarred rope. Those used in this war are mostly of metallic magnesium, long and cylindrical and fitted with a fuse near the nose and with metal vanes at the rear. They weigh one kilogramme or slightly more than two pounds. The magnesium itself burns and is very difficult to extinguish with water as this tends to spread the fire. The bomb may be smothered with sand. A two pound incendiary bomb will perforate most roof materials except concrete, as it usually has a striking velocity of about four hundred feet per second. When air raids are expected it is, therefore, necessary to keep guards posted on roofs and upper storeys for the prompt removal of incendiary bombs. A typical present day German incendiary bomb is shown in Fig. 1. A great deal more might be said about incendiary bombs as fire is really an engineering subject, but fire protection has become the special care of our fire departments and this paper will treat more particularly of other forms of bombing.

### 2. HIGH EXPLOSIVE BOMBS

As a background it is well to remember that although modern bombing is new, yet history includes experience in

the hurling of missiles against fortifications in time of war considerable study of earthquake resistant buildings, and fires and fire fighting. This knowledge helps in a consideration of the impact, shake, and fires caused by high explosive bombs. An aircraft bomb consists of a "case" holding high explosive or incendiary mixture or gas, with means of exploding, igniting or discharging the contents as the case may be. The bombs are in a carrier on the bottom of the aircraft so that when released their speed and direction are the same as those of the airplane itself. Bombs were formerly spherical but now they are cylindrical or barrel

TABLE I  
ORGANIZATION CHART  
CIVILIAN DEFENCE COMMITTEE

shaped so that the guide vanes at the rear help them to retain their direction and the smaller cross sectional area offers less air resistance, resulting in greater speeds. A bomb released from a plane travelling horizontally will have a trajectory in the form of a parabola with a vertical axis and an ever increasing steepness as it approaches the earth. The air resistance modifies the parabolic path and considerably slows the velocity. Actually the high explosive bombs that have been dropped in Great Britain seldom have a striking velocity of more than 1,000 ft. per sec. even if dropped from great heights such as 15,000 feet. This is due to air resistance. The angle that the trajectory makes with the vertical at the point of impact is known as the "angle of impact."

Table II shows the height of release, angle of impact and striking velocity for bombs released from a plane travelling horizontally at 200 miles per hour.

A low explosive such as gunpowder burns with a rapid combustion. A high explosive such as gun cotton or trinitrotoluene—T.N.T.—explodes so much faster that the action is referred to as detonation. Table III shows the speed of detonation of several high explosives and their explosive factor which indicates their power as compared with black gunpowder.

The speed is the outstanding difference. A pound of a low explosive such as gunpowder, scientifically packed alongside a railroad rail and exploded, will shift the whole track perhaps thirty feet or more. But a pound of the high explosive gun cotton properly packed will create so much

heat and impact so rapidly that it will shatter a portion of the rail by fusing it. Gunpowder or cordite will expel a bullet from a rifle, but gun cotton would shatter the rifle chamber or breech before the bullet had time to be expelled from the barrel.

TABLE II

Height of release Feet	Angle of impact Degrees	Striking velocity Feet per Sec.
1,000	46	390
3,000	33	520
5,000	26	610
7,500	22	710
10,000	19	800
12,500	17.5	880
15,000	16	950

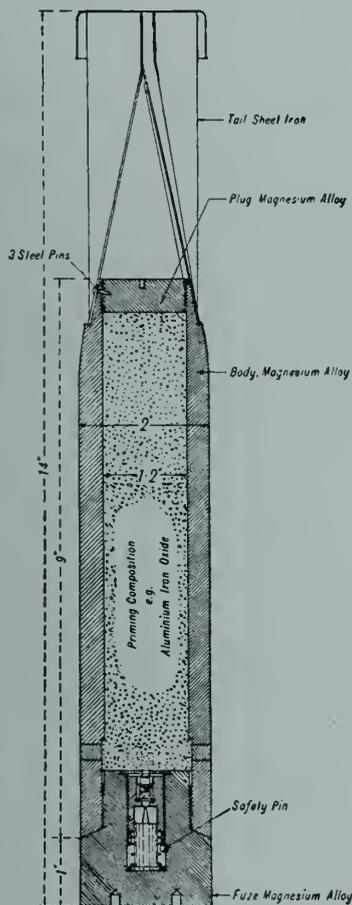

Fig. 1—Typical German incendiary bomb.

TABLE III

Explosive	Vel. of detona- tion Metres per sec.	Explosive Factor
Gun-cotton (dry).....	7300	2.8
Trinitrotoluene (T.N.T.) .....	6950 to 6483	3
Dynamite No. 1.....	6800	2.8
Amatol 80/20.....	5080	2.4

High explosive bombs differ, of course, in size from say— an anti-personnel bomb of 2 lb. or less to a large bomb weighing two tons as used at the beginning of the war, or four tons as recorded recently in our Canadian newspapers. They differ also in two other important respects, namely the relative weight of the case itself and the kind of fuse. So we have armour piercing, heavy case, medium case and light case bombs. The heavier the case, the greater the

penetrating power of the bomb. Obviously in two bombs of equal size and weight the one with the heavier case will contain a lesser weight percentage of explosive. Fuses are of two main kinds, the instantaneous fuse designed to cause explosion at the moment of impact and usually attached to the nose of the bomb, and the delay or time fuse having mechanical, electrical or chemical means to explode the bomb some time after impact; this period may be a fraction of a second or even several hours, as desired. Time fuses are ordinarily attached to the rear of the bomb where the impact when the bomb strikes the target is not so likely to smash the fuse mechanism and put it out of business. Tables IV and V show types and sample dimensions of H.E. bombs. It is not possible to give complete data on air bombs because in this war new and heavier varieties are appearing so frequently.

TABLE IV

Type of bomb	Charge/weight Per cent	Gross weight
Anti-personnel.....	15 to 20	20 lb.
Light-case.....	50 to 60	50 to 4000 lb.
Medium-case.....	25 to 40	
Heavy-case.....	small	

TABLE V

TYPICAL DIMENSIONS OF AIRCRAFT BOMBS

Bomb	Length	Diam.	Sectional Density
2,000 lb. light-case.....	14 (9) ft.	24 ins.	4.4 lb./in. <sup>2</sup>
1,100 lb. heavy-case.....	6 (4) ft.	12 ins.	9.7 "
550 lb. medium-case....	5 (4) ft.	15 ins.	3.1 "
220 lb. medium-case....	4½ (2) ft.	10 ins.	2.8 "
100 lb. medium-case....	4 (2) ft.	9 ins.	1.6 "
20 lb. Anti-personnel...	2 (1) ft.	5 ins.	1.0 "

Figures in brackets in Col. 2 give length of bomb-carcase not including tail.

$$\text{Sectional density equals } \frac{\text{Mass}}{\text{Max. Cross Sectional Area}}$$

Armour-piercing bombs are generally used against military or naval rather than civilian targets. They have very heavy cases and great penetrating power. The advantage of a heavy case and a time fuse is that the bomb enters and lodges in the target before the explosion takes place, and an explosion in a confined space does more damage to the target than does a surface explosion. On the other hand a light case bomb with instantaneous fuse will explode on the surface of a street and its greater percentage of explosive will cause greater air impact and a greater number of splinters, doing more damage to persons and shattering more glass at great distances from the explosion centre.

### 3. PARACHUTE MINES AND AERIAL TORPEDOES

These two varieties of explosive missiles dropped by aeroplanes have no resemblance to each other but may be mentioned because we have recently heard of their use. The parachute mine contains a very high percentage of explosive. Its protective casing is light and has little resistance to impact, so that the speed of descent has to be moderated by attaching it to a parachute. When it reaches the ground it is most dangerous from an incendiary and explosive point of view. Much of the more recent damage by the Germans in congested areas has been due to parachute mines.

The aerial torpedo is used by aeroplanes operating with the navy. It resembles an ordinary naval self propelling torpedo and is used against enemy ships, but is released from a low-flying plane and attacks the target in the same

way as any other torpedo. Because it is carried by an aeroplane it is likely to be smaller than most other torpedos.

## (B) BOMB DAMAGE

### 1. BLAST

Let us assume that a high-explosive bomb contains one cubic foot of solid or liquid explosive. Detonation converts this into a gas which would have a volume of say 1,000 cu. ft. at ordinary temperature and pressure. But at the very high temperature of detonation this volume may be 10,000 or 12,000 cu. ft. at the instant of explosion. The case expands, mostly at its centre, to about one and a half times its usual size and then bursts, releasing explosive gas and shooting out fragments or splinters in all directions at about twice the speed of a rifle bullet, which is 2,500 to 3,000 ft. per sec. All this happens in about one five thousandth of a second. The results are a sudden enormous air pressure, fragmentation, disruption, penetration, craters and other damage. These may best be studied separately.

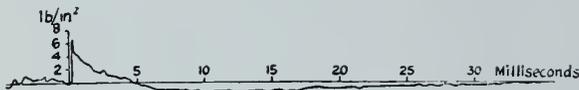

Fig. 2—Oscillograph record of typical blast wave.

Experiments show that in the immediate vicinity of the blast the air pressure increases greatly and suddenly and then subsides to a subnormal pressure or suction that lasts much longer than the initial high pressure and often causes more damage to structures. Figure 2 shows an actual experimental curve of pressure taken at 50 feet from the explosion of a 500 lb. bomb.

Table VI gives pressures and suctions at different distances from the explosion centre. This successive pressure and suction radiates in air waves, the duration of each wave as shown in Fig. 2 being about 30 milli-seconds, which is about one thirty-third of a second.

TABLE VI  
INITIAL PHASES—500 LB. MEDIUM-CASE BOMB

Distance from Bomb Feet	Maximum Positive Pressure Lb. per sq. in.	Maximum Suction Lb. per sq. in.
30	24	—
50	6	1.4
100	2.3	0.8
200	0.4	0.2

Some rather strange examples can be cited to prove that this suction actually exists as a destructive part of the shock wave in the air. Fig. 2 might give the casual impression that the maximum positive pressure in the air wave is not excessive, but it will be noted that it represents pressures at 50 feet from the centre of explosion, and according to Table VI the pressures are vastly greater closer to the explosion, so much so that life cannot withstand the air shock at close quarters, to say nothing of fragments and splinters travelling at high speeds in all directions.

### 2. SPLINTERS AND GLASS

Splinters or bomb fragments travel outwards from the explosion centre as already stated at initial speeds up to 7,000 feet per sec. These penetrate or perforate any targets presented, depending on the character of the target and the speed and weight of the splinters. Table VII shows penetration into Douglas fir.

Table VIII indicates the number of perforations in steel plates of varying thicknesses and at different distances from the explosion.

Flying glass is very dangerous, particularly to persons. In the first world war the Halifax explosion smashed the glass in a front door and carried the splinters the full 50-ft.

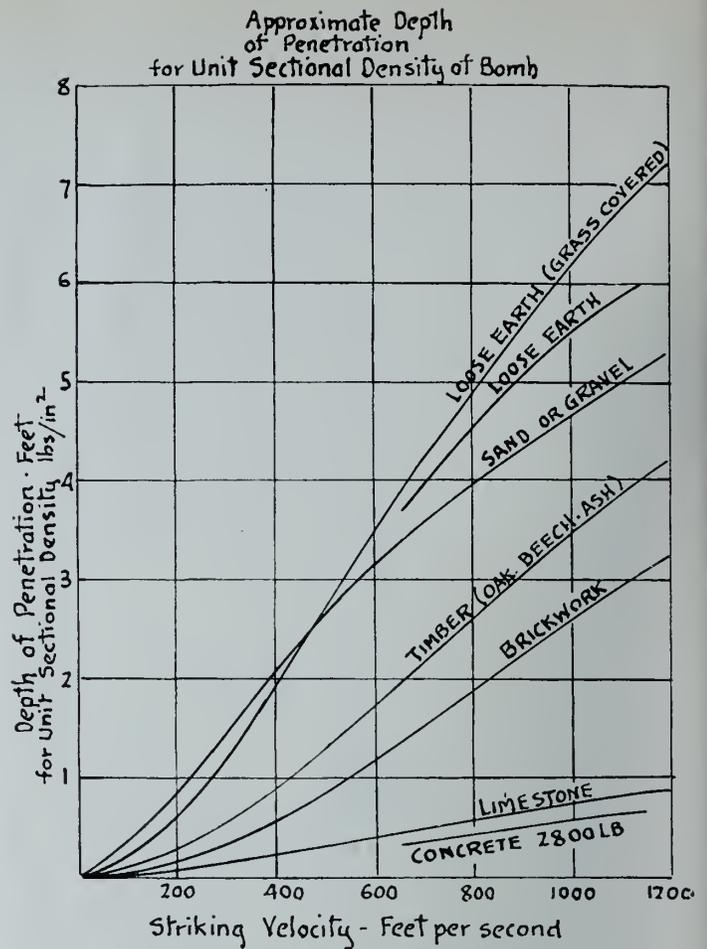

Fig. 3—Diagram showing depth of penetration of different materials by typical bombs.

length of a corridor, embedding them in a wooden door at the far end, and the splinters did not fall perceptibly in transit.

The fragments from anti-aircraft shells dropping to earth after the explosion, cause damage similar to that of the splinters from a bomb blast. Their speed is the result of the force of gravity.

### 3. BOMB PENETRATIONS

Perforation means that the bomb or fragment passes through the target. Penetration includes any entering of

TABLE VII  
PENETRATION BY FRAGMENTS INTO DOUGLAS FIR

Fragment Wt. Ounces	Striking Velocity Feet per Sec.	Mean Penetration Inches
1/2	2,000	5.05
	1,000	2.5
1/4	1,000	1.4
	4,000	3.55
1/25	2,000	2.1
	2,000	1.2
1/50	2,000	1.2
	4,000	1.6
1/200	3,000	1.3
	2,000	0.8

the target short of perforation. In the case of bombs, penetration is not an end in itself as is the case with rifle bullets, shrapnel or splinters, but it is rather a means to an end, the end being destruction by explosion or fire, or the distribution of war gas. Table IX shows penetrations of different targets by typical bombs of varying case thickness, size and speed.

TABLE VIII

PERFORATIONS PER 100 SQ. FT. IN STEEL PLATE FROM HEAVY BOMB

Plate thickness	30 ft. dist.	50 ft.	100 ft. dist.
1/2 in.	—	72	—
1 in.	42	24	4.5
1 1/2 in.	26	15	3
2 in. (2-1")	11	5	—

Figure 3 gives similar information regarding various targets. It may be noted that if we have two bombs of similar shape, one of which has just twice the linear dimensions of the other, then the larger will have eight times the volume or mass of the smaller, but only four times the cross sectional area. The gravity pull on the larger will be eight times that on the smaller bomb, whereas the air resistance—which depends on the sectional area—will be only four times as great. Thus with similar shape and density and a similar height of release the larger bomb will reach the earth surface at a higher speed than the smaller one. Sectional density is the weight of the bomb per square inch of cross sectional area. The greater the sectional density, the greater the speed of the bomb, other factors being equal.

TABLE IX  
BOMB PENETRATIONS

Bomb lb.	50	110	220	550	1100	2200	4000

Referring to Shell Case—M.H. denotes Medium Heavy.

4. CRATERS

If a heavy-case bomb with time fuse hits the concrete roof of a multi-storey building with concrete floors, it is quite likely to perforate the roof and several floors before coming to rest and exploding. Figure 4 illustrates the action on a concrete slab, showing how the impact causes a compression in the upper portion of the slab, which in turn creates a tension in the lower portion, dislodging an irregular plug-shaped portion and allowing the bomb to come through. This is known as the scabbing of concrete and it occurs successively on the upper floor slabs, with lessened force each time until the bomb is brought to rest.

If the bomb does not perforate the target but merely penetrates it to some depth as indicated in Table IX, the resulting depression in the surface is known as a crater. Most bombs are dropped from great heights coming to the ground with great velocity but seldom more than 1,000 ft. per sec. Even in a city like London, only about 15 per cent of the ground surface is covered by buildings, therefore, the chances are about six to one that the bomb will not hit a building but will land in a park, street, lane or backyard. More accurate aim can, of course, be attained with low flying planes or dive bombers. The crater left in the earth surface after the explosion of a heavy-case bomb deserves

study. Figure 5 is a diagrammatic representation of a crater in ordinary earth. The circle O shows where the bomb bursts and it will be noted that the depth of this burst below the normal earth surface is about equal to the radius AB of the final crater. The ratio AB over AO is known as the index of the mine, which in this particular case is equal to one. With this index the crater is known as a common mine. If, due to less penetration, or greater explosive power, the index—usually referred to as *n*—is greater than unity, then we have an overcharged mine. If the index is less than unity it means that the penetration is deeper or the explosive force relatively less and the radius of the crater is less than the depth of burst, resulting in an undercharged mine. It is also possible for the burst to be at such a depth that the explosion does not affect the ground surface. This is known in military language as a camouflet. The opposite extreme is the surface explosion—perhaps from a light-case instantaneous bomb—bursting on the fairly hard paved

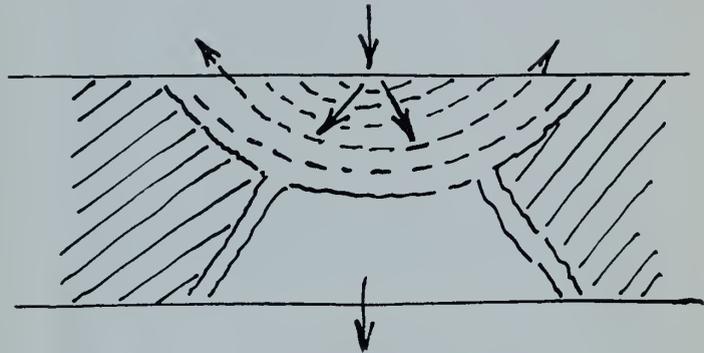

Fig. 4—Diagram showing "scabbing" of concrete.

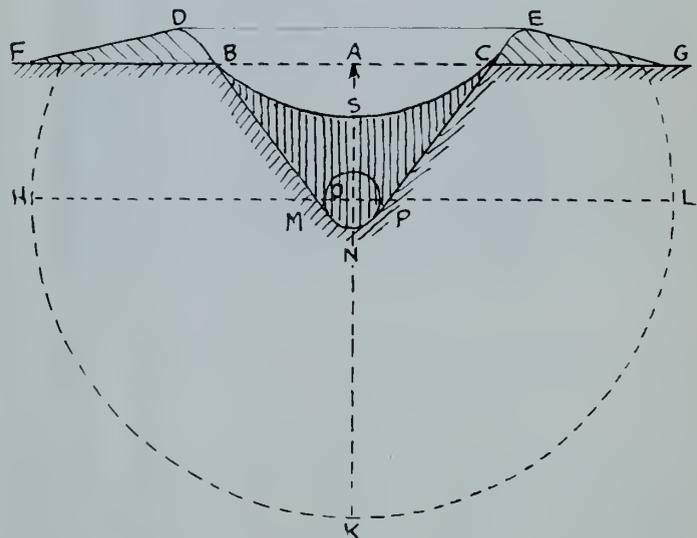

Fig. 5—Diagrammatic representation of a crater in ordinary earth.

street or on frozen ground and making only a very shallow crater or none at all. Figure 6 shows the relation between depth of burst and diameter and depth of crater for various bombs and different values of *n*.

Near London a test was made on a plot of ground forty feet square. A brick sewer was laid 8 ft. 6 in. below the surface. Water and gas mains, power, light and telephone cables were laid below the surface in loamy soil and in two layers at right angles to each other. Four-inch wood block pavement was laid on the surface resting on 11-inch reinforced concrete on ash and hard ballast. A large medium-case bomb was inserted 2 ft. 6 in. deep at the centre of the plot. When exploded it formed a hole in the pavement 8 ft. in diameter and a cavern below the pavement 20 ft. in diameter and 4 ft. 3 in. deep. Fragments of concrete were thrown 100 yards. Both layers of service mains were made almost useless but the sewer while damaged was still

capable of functioning. The photograph in Fig. 7 shows a bomb crater in one of London's streets and it will be observed that service conduits, water mains and sewer have been badly disrupted.

Variation of Diam. and Depth of Crater with Depth of Burst in Earth ( $S=1.4$ ). Light Case Bombs.  $C$ =Weight of Charge.

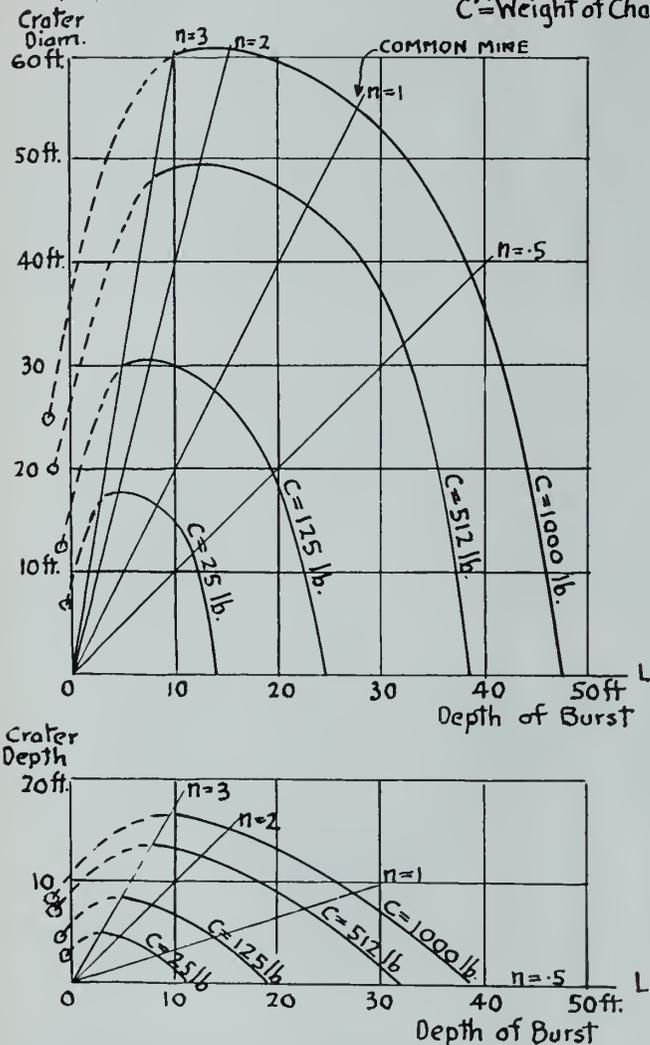

Fig. 6—Diagram showing relation between depth of burst and diameter and depth of crater for various bombs, for different values of  $n$ .

(C) STRUCTURAL DEFENCE

In connection with the foregoing, it should be understood that the sizes of bombs, craters, etc., are merely typical. Even if it were possible to make an exhaustive list for the kinds of bombs used to date, it must be remembered that greater and more powerful bombs are continually being designed and the end is not yet.

Thus in designing structures a combination of common sense and foresight will produce varying degrees of bomb resistance, but an absolutely bomb proof structure can exist only in the imagination of an optimist. One must know the unknowable future before deciding that anything is bomb proof.

Structural defence enhances the safety of persons, and also that of buildings and plant. If these latter are demolished the country's industrial and war effort will be paralysed. To help in consideration of this subject it will be well to take it under three main headings, viz. concealment, shelters and buildings, old and new.

(D) CONCEALMENT

1. CAMOUFLAGE

Camouflage is a broad subject—almost anything may be camouflaged to blend with the colour of its surroundings

Fig. 7—Photograph of bomb crater in one of London's streets.

and so be less noticeable. So far as air attack is concerned, camouflage should be designed to deceive the attacking pilots and their observers at the place and at the height where bombs might be released. Such camouflage should be backed up by the use of fighting planes and anti-aircraft artillery, because if the attacking planes reach low altitudes for any length of time the camouflage is likely to be solved by the enemy. It is quite possible with wire mesh and various sorts and colours of canvas, along with light temporary framing, to so change the contour and even the colour of a limited portion of the landscape as to make it appear that some vulnerable target, such as a building or a bridge is, say, half or three quarters of a mile away from its real site. Some light dummy construction is used to simulate the structure itself. Almost the best possible camouflage is natural protection by trees. To simulate trees by camouflage requires elaborate and expensive work. But if in building new roads or factories the trees can be left in place to some appreciable extent, instead of being entirely destroyed as is usually the case, then camouflage will be greatly simplified and at the same time we shall earn the lasting goodwill of our friends, the landscape architects.

Inflated balloons with suspended nets are sometimes used to prevent the too near approach of enemy planes, even where camouflage is not in use. Camouflage and balloons are usually arranged for by military authorities.

2. SMOKE SCREENS

A smoke screen is readily created in industrial areas by merely interrupting the observance of the usual laws enforcing smoke suppression. The effectiveness of the screen depends on the number and size and strategic position of the local chimneys and on the character of the fuel used; and the duration of the effectiveness depends on air, weather and winds. Usually these smoke screens cannot be depended on to last as long as they are wanted and where they are wanted.

3. BLACKOUT

Lights are of great advantage to the attacking bomber at night, particularly in or near large cities. So it is generally

conceded that a blackout is the best night defence. They have been very effective in Great Britain and in Europe. Many parts of Canada and the United States, especially the coastal cities and towns, are well organized and have had blackout rehearsals. In private houses and most buildings where work is not being done at night the blackout arrangements are simple and all lights are dimmed or put out. Special cases include schools conducting night classes, war factories on night shifts, hospitals, railway stations and railroad trains. It is desirable that all such institutions carry on with a minimum of interruption. Even with the best of care there must be many more alarms than actual raids. Use is made of a fabric known as hessian bitumen for blacking window panes. Heavy black curtains that can be drawn across the inside of windows are also used, and opaque wooden shutters are used outside the windows. At railroad stations and hospital entrances and on emergency automobiles dim lights may be permitted. Nurses are often allowed dim flash lights. In war factories arrangements are made for the workers to have safety refuges near their benches or machines, thus reducing the interruption by the air raid to a few minutes. Nearly all municipalities in Canada and the United States have air wardens organized for handling blackout problems and accidents. These organizations are modelled after those that have been successful in Great Britain.

Recently, night defence by excessive glare of lights, enough to dazzle the attacking planes, has been advocated in the United States and actually tried as a defence by the Germans against a recent air raid by the R.A.F. The casualties among the attackers were decidedly greater than usual, but it is possible that the damage by bombing on more obvious targets may have been much more severe also.

#### (E) AIR RAID SHELTERS

##### 1. SMALL SHELTERS

Many small shelters were built in the back yards of houses in Great Britain almost as soon as war broke out. None of them will withstand a direct hit by a bomb, but all are resistant to flying bomb splinters, incendiary two-pound bombs, and falling fragments from anti-aircraft shells. Three sorts may be mentioned.

##### Trench Shelters

These are buried or half buried in the ground and generally accommodate from four to twelve persons. They are covered or arched over with wood or other framing and the roof is covered with about 18 inches of turf or sandbags. At one end there is a door opening and sometimes a special door covering. The opening should if possible be not more than six feet away from and facing a good permanent wall so that splinters cannot very well enter unless they deflect from the wall, which is unlikely. The shelter should be floored and lined and properly drained and seats or bunks should be provided.

##### Surface Shelters

These are like the trench shelters, except that they are entirely above ground and there is no drainage problem. The walls are of brick or stone or reinforced concrete about 13 inches thick. This thickness of wall or the 18 inches of turf on the roof will keep most splinters out.

##### Anderson Shelters

The Anderson shelter resembles the trench shelter and is often half buried in the ground. The sides and roof are lined with corrugated iron vertical side pieces—curved to arch shape at the roof and overlapping at the crown—and the roof and sides are covered with at least 18 inches of turf. These have been derided in North America as tin cans but photographs show them still holding together even when distorted by blast, when everything else around was demolished. They have actually saved more lives than any

other class of shelter and have been very widely used. Figure 8 shows a typical Anderson shelter.

Fig. 8—Photographs showing method of erection of Anderson shelter and final appearance.

##### 2. LARGE SHELTERS

After many serious results from high explosive bombs exploding at or near small private shelters, the municipalities in Britain themselves began to assume responsibility for larger, safer shelters, and they called on the Institution of Civil Engineers for recommendations. The Institution set up a special committee for the purpose and they enunciated the important principle that shelter design is dependent on more or less definite assumption as to what is to be resisted whether blast and splinters only, hits by smaller bombs up to 500 lb., or direct hits by larger bombs. Table X shows the three types of protection as suggested by the Institution's Committee and also the thickness of earth, sand, ballast, brick or concrete that should resist a bomb explosion either through the roof, floor, or sides of the shelter above or below ground. It is possible for a bomb to penetrate the ground alongside the shelter with a resulting explosion adjacent to the side walls or even under the floor. Figures 9 and 10 show circular and rectangular, partially underground, shelters in accordance with the Institution's suggestions. The maximum concrete roof thickness of 7 ft. 6 in. suggested in Table X has since been increased to 10 ft. to take care of more severe bomb bursts. Other dimensions have been similarly increased.

The following suggestions apply to shelters in general and especially public underground shelters:

(a) Limiting capacities are usually assumed at 400 persons for shelter against lighter bombs and 1,200 persons where heavier bombs are likely.

(b) There should be two entrances, so that if one is blocked by debris the other will be available. Entrances in public shelters should be capable of admitting stretcher cases and wide enough to permit quick access or emptying.

(c) Division walls help to support and strengthen the roof and it is advisable to divide the shelter into compartments each for about 50 persons. This localizes damage by bombs and prevents to some extent the spread of panic.

TABLE X

Type of Protection	Overhead Protection	Lateral above Ground	Lateral below Ground	Base Protection
FIRST Blast and Splinters, 50 feet away	1' 6" Earth, Sand, or Ballast, or 6" Concrete or 5" Reinf. Concrete.	2' 6" Sand or Earth, or 13 1/2" Good Brick or Stone Wall.		
SECOND Hit by 500 lb. Medium Case Bomb	Special Quality Reinf. Concrete 5' thick.	Special Quality Reinf. Concrete 3' 3" thick.	Special Reinf. Concrete 6' 6" thick.	Reinf. Concrete 5" thick.
THIRD Hit by Heavy-Case Bomb.	Special Quality Reinforced Concrete 7' 6" thick.	Same as above	Same as above	Same as above

N.B.—Thickness of walls below ground may be reduced to 5' 6" for Round Shelters not more than 30 ft. inside dia., or on straight walls with Buttresses not more than 10 ft. apart.

Below 25 ft. in Sand or Gravel or 40 ft. in Clay, wall and base thicknesses may be reduced 4 in. for every additional foot of depth to a minimum thickness of 2' 6".

(d) If shelters are open to outside air, gas masks must be available. If shelters are sealed in some effective way, gas

masks are unnecessary. Sealed shelters may be air conditioned.

(e) Preventive low earth dams can be built around the entrances to underground shelters to prevent surface water entering the shelter.

(f) Chemical closets will provide the necessary sanitary facilities.

(g) Emergency supply of drinking water in bottles is useful if the regular water pipes are damaged.

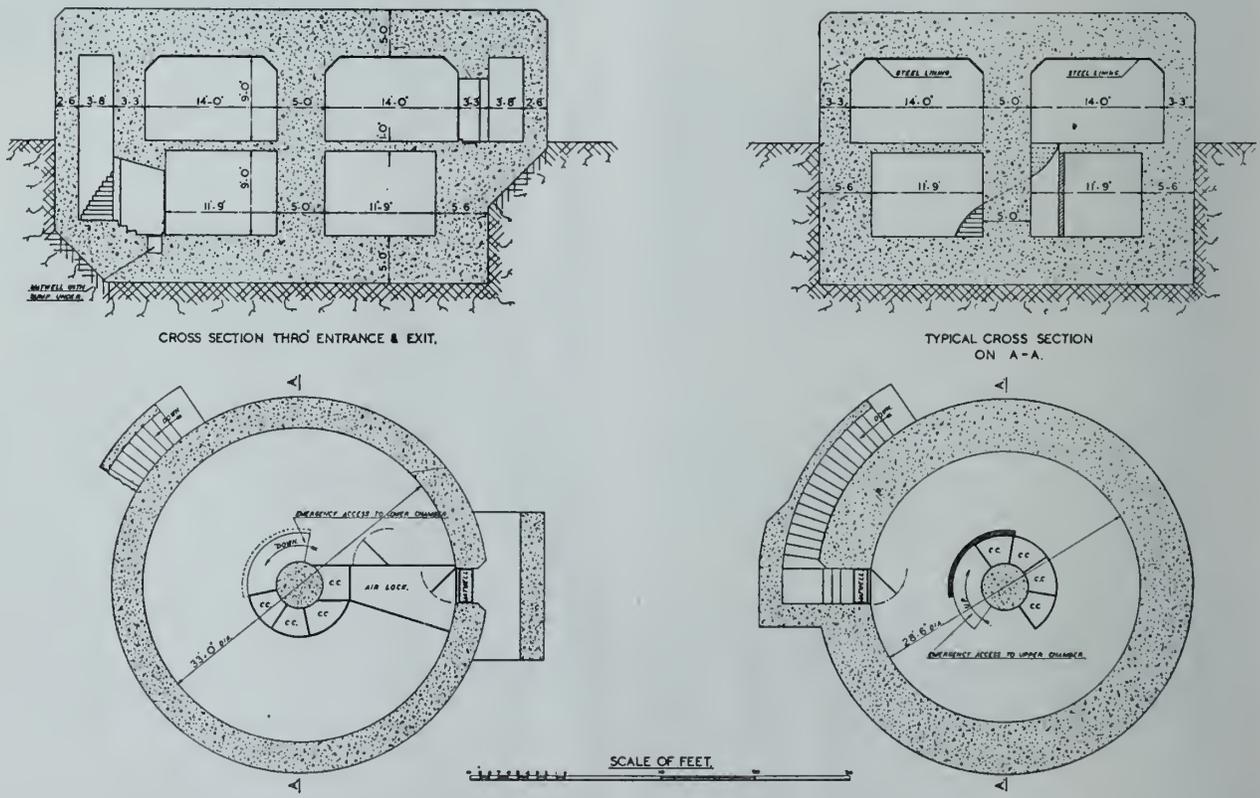

(h) Similarly, candles are advisable in case the regular lighting system is out of order.

(i) Spades and picks in the shelter will come in handy if it is necessary that occupants dig themselves out.

While most of the larger shelters are built by municipalities, some of the best have also been erected by telephone and power companies and by schools.

Some general observations on shelters may be made here. A shelter has really done its job if it prevents serious damage or death of the occupants, even if it comes out of the bombing in a bent and battered condition. There will often be an opportunity to repair and strengthen it before the second onslaught occurs or it may survive several bombings with only increased distortion while still offering a good deal of protection. Therefore it is wrong to use ordinary working stresses as stipulated by peace time codes in designing shelters. Allowable stresses should be considerably increased, to at least the elastic limit of the material and full advantage should be taken of redundancy. In fact redundancy is of very great advantage in case part of the shelter or some members are removed or displaced by the explosion.

Elaborate and fairly comfortable shelters tend to induce some persons to resort to them more than is necessary and to stay there unduly perhaps in a spot that they may come to look on as reserved for themselves. These persons are certainly not making a maximum war effort when they are in the shelters unnecessarily. On the other hand, there are many people who can scarcely be induced to go to the shelters when they really should.

CIRCULAR SHELTER FOR 200 PERSONS  
Fig. 9—Circular shelter for 200 persons.

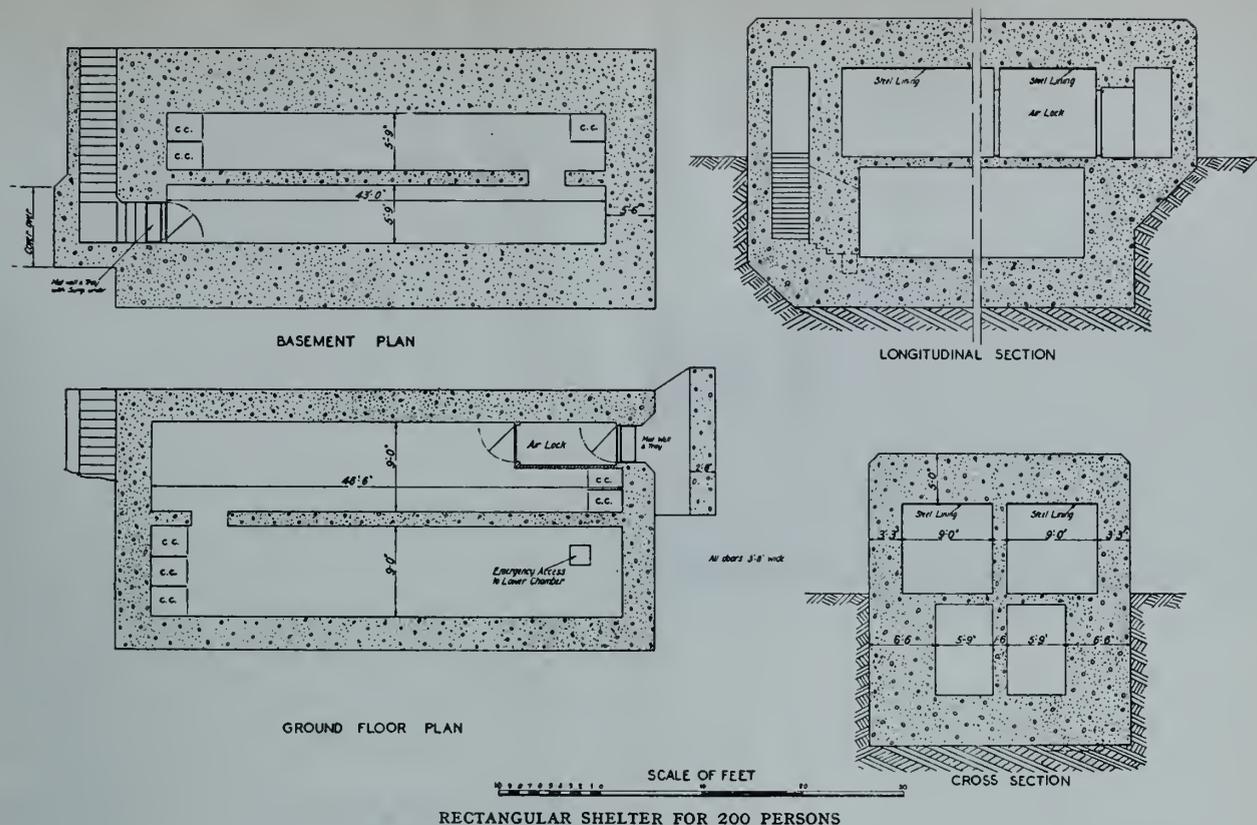

Fig. 10—Rectangular shelter for 200 persons.

Justification for expensive shelters is a matter of judgment. In Great Britain heavy bombing has been at times very frequent and important cities, such as London and the industrial centres require shelters of great capacity if their life and work is to continue and be productive. Permanently built refuges such as underground shelters of great capacity and portions of transportation tunnels have been provided. Schools have in many cases built shelters large in capacity but not so sturdily constructed. North America has not yet suffered from air bombing, but precautions such as blackouts, captive balloons and air raid precaution training have been organized and rehearsed and put into effect in coastal areas and some other strategic points farther inland. The taking of such measures is an insurance against disaster. The amount spent in this manner should depend on two things, the likelihood of attack and the importance of the buildings or plant in the war economy.

### 3. SPECIAL SHELTERS

Among the more specialized shelters may be noted the sheet steel cone-shaped shelter of sufficient size to hold only one or two persons. It has a tight fitting stiffened side door, curved to conform to the shape of the cone. Figure 11 shows such a shelter. It is intended to give some protection to the very limited number of key men—such as air wardens—who must stay at times in dangerous places.

There is also the corridor-like pre-cast reinforced concrete shelter consisting of portable concrete frames a foot or two long clamped together by long tie rods passing through holes in the frames like the sections of an ordinary heating radiator. These can be made as long as advisable and can be taken apart and easily moved. They are used just outside of war factories and their nearness to the factory minimizes the time that the worker loses during an air raid alarm.

In Ramsgate, and also in Chungking, China, and in many other places, underground tunnels of enormous capacity have been dug in somewhat chalky soil. Finsbury—one of the London boroughs—has projected underground spiral garages of large size to serve as municipal shelters during

the war and as regular garages afterwards. Figure 12 shows such tunnels and the spiral garage.

## (F) OLD AND NEW BUILDINGS

### 1. ADAPTING OLD BUILDINGS

When a bomb explodes above ground, air shock is of importance as it will shatter glass and light partitions and curtain walls even at some distance. When the explosion is below ground, earth shock assumes primary importance, the vertical and horizontal components of this shock causing the collapse of walls and floors, especially when these are not well bonded together.

Fig. 11—Cone-shaped shelter.

Fabrics such as the hessian bitumen mentioned under blackout tend to prevent shattering and flying of glass. Wired glass is much better than plain glass, and wire mesh can be secured just inside the panes with a good effect.

Wire "trussing" of panes and the pasting of brown paper on the glass are not very effective. Large windows may be strongly boarded outside or partially or entirely walled up by temporary brick walls. If these walls do not reach the top of the window it will be well during an air raid to open

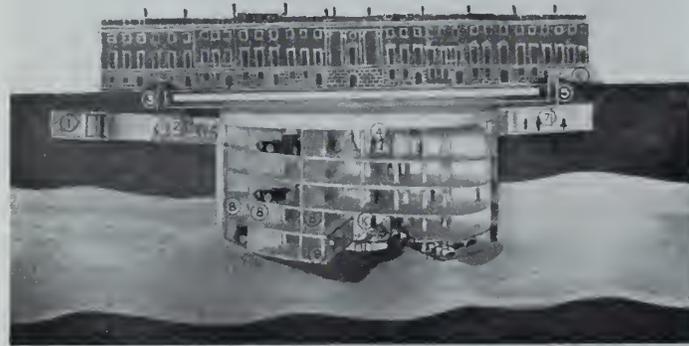

Fig. 12—Underground spiral garages to serve as municipal shelter, during war, projected for the borough of Finsbury.

that portion of the window that is not walled, thus preventing glass breakage.

The collapsing of walls, roofs, and floors in the upper part of a building is almost sure to throw a heavy debris load on some of the lower floors. It is well therefore to choose a suitable lower floor and insert extra props of wood or other material to help that floor to withstand this debris load. Such props and other reinforcing can be designed with a much smaller factor of safety than used in ordinary construction because deflections and distortions do not make much difference as long as actual collapse is prevented.

If part of an existing building is to be used as a shelter it is well to choose a portion where bombs would have to perforate several floors or walls before reaching the shelter.

In buildings of only a few storeys this location will usually be the basement or some of the lower floors and somewhere near the centre of the site. The walls and ceiling of the chosen room can have extra reinforcing and shoring. If above ground, the shelter room is better a storey or two up, because splinters from bombs in the streets do most damage on the ground and first floors.

In certain special buildings such as power and transformer stations it may be advisable to enclose important equipment and the machines by heavy reinforced concrete or brick construction of a strength comparable to that used in large public shelters.

In some dwelling houses, sleeping mattresses are placed under heavy tables and these tables are made strong enough to carry a heavy debris load of collapsed floors, plaster, etc. The space from floor to table is screened with heavy wire mesh to exclude large fragments. The so-called Morrison shelter is of this type. It is built with either a steel or wood frame and top cover, well braced together.

In all buildings there are certain measures that may be taken to minimize damage from air raids.

(a) Heavy objects should be moved from upper to lower levels.

(b) Needless high brick parapets or chimneys can be made lower so as to lessen the danger if they should fall.

(c) Flammable objects should be taken out of buildings and should not be allowed outdoors within 10 feet of the building. This applies generally to automobiles also.

(d) Ready access should be provided to the roof so that it can be patrolled for the removal or extinguishing of incendiary bombs.

(e) Important plumbing may be encased in concrete walls giving sufficient room for emergency access.

## 2. RESCUE AND REPAIR PARTIES

Parties are organized in London for rescue and repair after bombings thus illustrating the necessity of co-operation between different branches of the Defence Committee's work. Table XI shows the equipment provided for heavy rescue parties and for light rescue parties. The first two-thirds of the list includes equipment that an ordinary householder would be unlikely to have available. The latter third of the list contains more common tools. The first duty of rescue parties is to save life and minimize injuries to persons pinned beneath wreckage. The second is the making of temporary repairs and the prompt reporting of unsafe conditions in walls, chimneys, etc. The rescue and repair parties are followed by demolition squads and more permanent repair and reconstruction gangs.

## 3. NEW BUILDINGS

The design of new buildings should take cognizance of the lessons learned from air raids.

Fire is on the whole the most destructive force in such raids. Fireproof construction is therefore indicated. If wood must be used it can be impregnated with chemical salts forced into the wood itself, or covered with certain protective paints, which are not nearly so effective as the salts.

Experience shows that buildings with a complete steel or reinforced concrete frame supporting the various floors, walls and roof are more resistant to shocks from either earthquakes or bombs than any other type of multi-storey building.

Buildings with load-carrying walls should have frequent cross walls or ties to prevent the main walls spreading and allowing the floors to collapse.

Steel or concrete frames for buildings of either one or more storeys can be designed with stiff or continuous joints so that even if one important member is removed or ruined the building may still stand and the damage can be repaired without any great delay or interruption in the use of the building. Some buildings still stand in place after one column or column foundation has been destroyed by blast.

A bomb blast may loosen light weight partitions or doors from their fastenings and hurl them as missiles causing much damage. These can be arranged so that they are not

TABLE XI

For Heavy Party	TOOLS FOR RESCUE PARTIES	For Light Party

Fire baskets for warmth in winter.

Miscell. Tools, spikes, blocks.

Use small trucks for transport.

easily moved in the direction of the probable blast, or, they may be omitted altogether.

Roofs of war factories—which are usually of one storey—may be of wood, corrugated iron or concrete slab. The slab gives protection against the entrance of incendiary bombs, bomb splinters, or fragments of anti-aircraft shells, but with a direct hit on the concrete roof much greater damage will occur inside the building than with the lighter roofs, because a collapsed concrete slab is more destructive to equipment beneath it than are lighter roof coverings. Saw tooth roofs or any other sort of roof windows should be avoided or protected by louvres that can be closed in emergency, because the flying glass resulting from a blast is most dangerous and nullifies for sometime any heating or ventilation control in the building. Figure 13 shows buildings completely framed to carry all dead and live loads including the walls. It will be noted that even after a severe bombing the main frame still stands and the repairs will therefore be accomplished without much trouble and in a comparatively short time.

The war has emphasized the essential place in our economy occupied by various materials, especially steel. It seems likely therefore that the increased allowable unit stresses now advocated for the duration of the war only, will to some extent survive the coming of peace. At any rate it is frequently worth while, in designing steelwork, to take into account continuity of beam action and stiffness of joints, thus reducing cross sectional area while benefitting from the resultant rigidity and indeterminacy.

Fig. 13—Photograph of completely framed buildings still standing after severe bombing.

#### (G) SABOTAGE

Perhaps what has been said about air bombs, bomb damage, structural defence, and shelters seems somewhat

remote from our comparatively peaceful existence in the central portion of America. Not so as to sabotage. During the last war it is certain that enemy agents spent many millions of dollars in deliberately trying to destroy war factories and dislocate industries. It is known definitely that similar agencies are at work here to-day but obviously the publication of details would be unwise.

Sabotage differs from air bombing in that explosives or incendiary packages can be carefully concealed at the most vulnerable locations. Often it is difficult for the saboteur to carry on his work and he therefore cannot handle the enormous quantities of explosives, etc., that would be used in an air raid. But he makes up for this by skill and cunning in the placing of his mines.

Last July, in Minneapolis, the American Society of Civil Engineers held a symposium on sabotage. This symposium indicated that the attacks were likely to centre around water supply, power, and war industries. One of the most common destructive agencies is fire, and water and power are essential in fighting fires. Transportation systems such as railroads, and communication agencies such as telephones may also be attacked but these services are well equipped to fight storms and other services may be temporarily substituted. It is difficult to entirely disorganize sewer systems and a small damage does not usually cause an immediate crisis. It is well, however, to provide as far as possible, duplicate systems for water, power, light and sewerage. Generally speaking measures taken to combat sabotage are also useful in cases of an air raid.

#### ACKNOWLEDGMENT

In compiling these notes the writer owes much to Handbooks 5 and 5-A, published by the British Government on air bombs and structural defence; to publications of the American Society of Civil Engineers; to several good friends who have given him pictures and hints; and also to several engineers both from Canada and from Great Britain who have been eye witnesses of some of those calamities against whose perpetrators our war is being waged.

**Editor's Note**—A reference book on "Structural Defence Against Bombing" has recently been published by The Engineering Institute of Canada in order to make available to Canadian engineers and architects a record of some of the experiences and practices of British authorities in regard to structural air raid precautions, so that in the event of emergency arising in this country the necessary action can be taken without loss of time and on the most efficient and economical lines.

This book was carefully edited by a sub-committee of the Institute Committee on Engineering Features of Civil Defence. It contains 56 pages, 79 illustrations, 8 tables and an extensive bibliography. It may be secured at Institute Headquarters at \$1.00 per copy.

# THE PLACE OF THE ENGINEER

C. R. YOUNG, M.E.I.C.

*Dean of the Faculty of Applied Science and Engineering, University of Toronto and President of The Engineering Institute of Canada.*

From a luncheon address presented at the joint meeting of The Engineering Institute of Canada and the American Society of Civil Engineers, Niagara Falls, Ont., October 14th, 1942.

In the scant two centuries that have elapsed since the engineer first had applied to him the designation that he now bears, he has risen high in the professional scale. At no time has he stood higher than now. Not only does he head up the technological phases of both wartime industry and the maintenance of the public services, but at the same time he has entered the armed forces to a far greater extent than would be called for by a mere consideration of occupational statistics.

There are reasons for the rise of the engineer and there are reasons, too, for his progress being less rapid than the circumstances of his scientific and technical attainments would appear to warrant.

## EARLY BARRIERS TO ADVANCEMENT

Professional engineering grew out of the practical achievements of clear-headed, resourceful artisans and skilled manual workers. James Brindley, the creator of the canal system of Britain was a millwright, ill-educated, ingenious, and human. After many disappointments in attempting to improve the Newcomen engine, he frankly records in that revealing account book of his the entry "To running about a drinking, 1 6." Things were cheaper in those days. John Rennie, the founder of a noted family of engineers, was another millwright. Thomas Telford, who remade the highway system of Scotland, began as a stone mason. George Stephenson, who made the locomotive a practicable mechanism for transport, was a pumping engine fireman and could neither read nor write till he was nineteen years of age.

The attitude of the literary and classical groups was hostile to these workers in a new and practical sphere. Seneca, after recording that there had been inventions such as transparent windows and tubes for diffusing warmth equally through all parts of a building, observed that

"The inventing of such things is drudgery for the lowest slaves. Philosophy lies deeper. It is not her office to teach men how to use their hands. The object of her lessons is to form the soul."

Dr. Samuel Johnson, in his famous dictionary, defined mechanical as "mean or servile."

Dean Swift spoke in scorn of "that fellow Newton (Sir Isaac) over the way—a glass grinder and a maker of spectacles."

John Smeaton, to whom the designation of "civil engineer" was first applied, and one of the most profound philosophers of the profession, was taken to task by his fellow members of the Royal Society for having undertaken the "navvy" work of building a road across the valley of the Trent.

In fact, the educated classes of the eighteenth century regarded mechanical subjects with contempt and pursuits involving them as neither honourable nor remunerative.

The situation improved but slowly. Training for the practice of engineering was still largely a matter of pupillage or apprenticeship in the offices of practising engineers or manufacturers. So much stress was laid on the practical that John Rennie held that a young man was, after three or four years at Oxford or Cambridge, in a sense, unfitted for the practical work of engineering.

While Rensselaer Polytechnic Institute, at Troy, N.Y., was founded in 1824, the influence of the universities and engineering colleges was slow in making itself felt. As late as 1840, when a professorship of civil engineering and mechanics was founded in Glasgow University, a vigorous

campaign was carried on by the traditionalists to have it suppressed.

And so the calling of the engineer was held much too close to specific technological tasks, without any notable concern for the long-range interests of the client or the country. In his presidential address to the Western Society of Engineers, in 1891, L. E. Cooley asserted that

"The early engineer of this country was a species of scientific or skilled tramp with a precarious tenure of position measured by the work in progress. He furnished his employer with the skill of his trade without questioning public policy or the best solution."

It is not strange, therefore, that public recognition has lagged behind the warrant for it. Around the turn of the century, a member of the Canadian Society of Civil Engineers reported that his parents had left him a sum of money to study a profession, and when he chose engineering, certain interested persons tried to bar his claim on the ground that engineering was not a profession at all. When he succeeded, after great expense, in establishing the validity of his choice in the courts, the decision was the occasion of widespread surprise.

## THE TURN OF THE TIDE

As the universities and engineering colleges more and more took over the educational aspects of the training of the engineer, the attitude of the public to the profession of engineering became more cordial. Some of the breadth of outlook that derives from the mingling of young men of widely different interests on the campuses of the world soon made its effect apparent. Educationally, engineers were henceforth to be classed with the members of other learned professions.

For half a century there has persisted on this continent a reaching out for improved professional status for engineers. To many, the most direct route to the objective appeared to be legislation and restriction. It was all very simple. Secure a licence to practise and you are set up for life.

It is not remarkable that this simple mechanism failed to solve the problem of status. Except for a few who were excluded by reason of unsatisfactory qualifications, the relative position of engineers remained the same. One does not need to seek for the reason: licensure carries with it nothing more than an assurance of good character and minimum technical competency. Of itself, it does not reveal those who excel, either in their technical equipment or in the intangible qualities of a leader of the profession. As Colonel Willard Chevalier has said:

"There is something bigger, more vital and more fundamental in the professional relationship than anything you can write into a statute."

The truth of this is becoming increasingly apparent. Perhaps the most significant of the objectives of the Engineers Council for Professional Development, and one on which emphasis ought to be placed, is the early seating of the young, newly-graduated engineer comfortably in the professional saddle. True, technical competency must remain the solid foundation on which the lower lifts of the young man's professional life have to be built, but he will not go far nor fare well if he contents himself with it alone. He must develop an interest in the long-range welfare of his employer and a sympathetic understanding of the currents of national and community life. He must be able to take his place comfortably amongst the leaders of other professions

and be able to represent with credit any institution or any just cause.

### THE PROFESSIONAL GOAL

It is taken for granted, of course, that the place that the engineer seeks is within the professional orbit. Whether he receives his compensation in the form of fees or in the form of salary makes no essential difference. The demands of the professional life are the same.

It is axiomatic that valid membership in a profession connotes a sound and broad education. There are no unlearned professions. As Abraham Flexner has pointed out, a profession has its roots deep in cultural and idealistic soil. It represents the application of free, unhampered, resourceful intelligence to the comprehension and solution of problems.

Of course, whoever would maintain his place in a profession must possess technical competency. It is the solid and prerequisite foundation on which service to the client, the employer, and the public must be built.

The most significant element in the professional relationship, however, without which all apparent service is vain, is the principle of trusteeship. The engineer cannot afford to avail himself of the doctrine of *caveat emptor*. In common with the conscientious physician or lawyer, he seeks to procure for the employer that which is ultimately best for the employer himself and not that which will most benefit the adviser or give him the least personal trouble.

When Sir John Fowler was retained by a corporation he gave to it the maximum of his energy and attention, so that he came to be spoken of as the shareholders' engineer.

It would have been much easier for Alfred Noble to sign the majority report of the International Commission of Engineers and to throw his great weight on the side of those who urged an attempt at the construction of a sea-level canal at Panama. Conscious of a duty to safeguard the United States against what he thought to be a hazardous enterprise, he wrote the minority report, which was finally adopted. In that act he conformed to the doctrine of trusteeship.

Not all of the effort of which a professional man is capable is properly applicable to the advancement of his personal fortunes. The profession of itself has some claims on him. John Smeaton deliberately limited his undertakings as an engineer in order to broaden his horizon and carry on scientific investigation. He held that "the abilities of the individual are a debt due to the common stock of public well-being." Over three hundred years ago, Francis Bacon had laid this obligation squarely upon shoulders meant for it:

"I hold every man a debtor to his profession; from which as men of course do seek to receive countenance and profit, so ought they of duty to endeavour themselves by way of amends to be a help and ornament thereto."

### THE ENGINEER IN THE FUTURE

Despite the inevitable dislocations that will occur when war gives way to peace, there is no ground for fearing long or widespread technological employment. An immense backlog of unsatisfied demand for the goods of peace is being built up, and the standards and patterns of 1939 will not satisfy a world that has seen invention break into new

territory on innumerable fronts. Dr. Charles M. A. Stine has said that the inconceivables of two years ago are today's realities. Under the stress of war, chemists have discovered new continents of matter and the world of 1940 is already an antiquity. In such a setting the technically competent will find ample scope for their abilities and energies.

It would be comforting if we could be equally sure that the engineer of the post-war years could be depended upon to do his full share in bringing about that lessening of the impact of technological advance on society of which President Roosevelt spoke so earnestly in 1936. It is no imaginary menace. So thoughtful and realistic an observer as President R. E. Doherty, of the Carnegie Institute of Technology, has this to say of it:

"The engineering profession—has added fuel to the technological flame that has illuminated and warmed the whole social community with physical comfort and convenience, but apparently it has not occurred to the profession that the flame, though beautiful and interesting, may yet consume us."

The place that the engineer is to occupy in the future will very largely depend on how well he adjusts himself and his technology to the whole inexorable forward movement of humanity. From that place which he hopes to attain, it is expected that he will look out with sympathy and understanding on the long upward struggle of mankind in which he must, through his technical attainments, play a vital part.

The engineer should realize fully that not all of the problems of the world can be solved by a technological approach. Much consideration must be given to those sentimental and often perverse intangibles that determine the attitude of human beings to the great issues of life. It is idle to expect laymen to subscribe to the pious wish that everyone should try to look at things in the way that engineers look at them.

The plain truth is that the solution of many of our problems does not lie in the direction that engineers think it does. Professor Lorenzo G. Straub has effectively pointed out the futility of the one-track approach:

"I cannot agree that our much glorified 'engineering approach to a problem' is the panacea which the world has been awaiting. In fact, the technical procedures of the engineer, where not tempered by perspective gained in studies in the humanities, definitely handicap him in his efforts to unravel social problems. He fails to recognize that the structure of our social-economic order is dynamic and constantly changing—fundamentally different from technology. The ever-changing problems of human affairs do not lend themselves to fixed formulas as technology does, encompassed as it is by the rigid laws of the physical sciences."

And so the place of the engineer in the future is largely conditional upon the breadth of his outlook, his interests, and his activities. For one who buttresses his technical competency with a wholesome regard for the interests of his fellows and with constructive labours on their behalf, it is secure. That security is not augmented by any straining after status. More than upon anything else it rests upon the individual stature of the engineer himself.

# WE ARE IN IT TOGETHER IN THE DEFENCE OF CIVILIZATION

H. J. CODY

*President, University of Toronto, Toronto, Ont.*

Substance of an address delivered at a joint meeting of the American Society of Civil Engineers and The Engineering Institute of Canada at Niagara Falls, Ont., on October 11th, 1942.

I thank you very much for your very hearty welcome.

It is a pleasure to have here this evening, as the president of The Engineering Institute of Canada, one who has already addressed you on the place of the engineer in society and in the whole constructive problem of the race. We are very proud of Dean C. R. Young, proud of the Institute and the faculty of engineering over which he so ably presides.

He has come from the performance of a very difficult task. Our Government, like the Government in the United States, has called for more engineers. The Navy, the Army, the Air Force and industry are all calling for engineers. Our engineering schools cannot meet the demand immediately but that demand has led to a great influx of students into the faculties of engineering on this continent.

Dean Young presides over a group of students now numbering 1,428. The first year students actually numbered 606. You will naturally understand how a dean and his faculty are perplexed in solving the problem. But one thing I am very sure of, and that is that they will not lower the standards of instruction. They will give of their best, so that after the war there will be no half-baked or half-trained engineers going forth with their degrees from the University of Toronto.

What is true of that university will be true of all the universities in this continent, I believe.

We have all been trying to accelerate programmes of instruction. I am inclined to think, if I may venture so to say, that on the other side of the international boundary there has been a tendency to accelerate too much and in too many faculties. It is especially difficult to accelerate in engineering, because the course is a blend of theory and of the application of theory, and if you try to accelerate too much you add period to period of theory without giving adequate opportunity for the practice of its application.

And so, we have decided in the University of Toronto to make our contribution to the supply of additional engineers by putting on extra courses at night or in some cases in the daytime, to fit groups of students for special purposes. We have just begun in our university a new course for 160 young men, aged about nineteen. They have come from all parts of the Dominion, and they are taking a one-year intensive combined course in mathematics, physics, and selected engineering subjects. These men will be fitted at any rate to be well-trained technical men in industry, if not in the armed forces.

Dean Young, fully appreciating the high calling of an engineer, is determined that there shall be no lowering of standard, and he is also determined—may I emphasize his determination—to inject into the strict engineering course as much of the humanities as possible. I think one of the defects of our professional education in these days is the neglect of the humanities.

As far as I can foresee, for some years to come there will be a great tendency in all our educational work toward what are called the practical subjects. The study of these subjects alone will not, I am sure, make a man as well educated all around as will the professional course or the practical course, if those courses are inspired somewhat by the divine afflatus that comes from study of the humanities. Let us not put the practical subjects and the humanities in stark antagonism. They ought to go together. And what I am sure in the Divine Purpose is meant to be joined together let us not permanently put asunder.

While it is true that I am not a technical engineer, I do know by observation and intercourse a little about the curriculum of engineering and certainly about the characteristics of many of the instructors and something of the strength and educational foibles of the engineering student.

I shall not attempt to discuss the wide field of engineering, but it is a wonderful art, the art of organizing and training and directing the energies and the brains of men and the control of the forces and materials of nature for the benefit of mankind. Can there be a nobler calling?

When you engineers realize the length and breadth and height of those ideals, you may well be proud of being the material builders of every nation on the face of the earth.

But there is, of course, over and above those material aims certain great moral or spiritual ideals which you are building into materials you control and combine. On your American defence stamps, you remember, there is a hand holding a torch, the Torch of Liberty, doubtless. But a torch burns out while it gives its light, and liberty is only the sure possession of those who are willing to make sacrifices to maintain it and to diffuse it.

Above the Torch of Liberty there are four great words: "Security, Education, Conservation, Health," four great ideals that every living and progressive and sound nation is seeking to realize.

The first of those is that which confronts us at the moment, the great ideal of security. We cannot carry on our educational programme or a programme of conservation or well establish a great programme of national health unless we are reasonably secure in our action and in our planning. Security is the problem that challenges us on every side. The war is the background, in other words, and the foreground of all our thought and planning and action. In war time nothing can be as usual. Business cannot be as usual. Social life cannot be as usual. Our educational programmes cannot be as usual. Even our religious worship cannot be as usual, while we are confronted with this great struggle for security, aye, and for more than security, for the victory that will make peace, righteous peace, secure through the generations that are to come.

Now we are engaged today in a war that on the one hand is dominated by science, pure and applied, as no other war has been, and at the same time is being waged for the most ideal of objects. Never did the scientist and the engineer play a greater part in any human struggle than they are playing today in this great conflict.

From the research work that lies behind our military progress and our military activities, there will come great advances in almost every realm of science. I know something of those that are coming in the field of medicine. Have you ever thought that the fact that air power plays so great a part at the present time in the struggle calls into being a whole series of medical problems in connection with aviators, and there is growing up a great department of aviation medicine upon which very little has been written up to date.

I know in our own laboratories in the medical department of research in the University of Toronto, Sir Frederick Banting, the discoverer of insulin, inaugurated a programme of investigation into problems of aviation medicine. You can easily guess what these are.

How can you guard against the aviator's blackout which comes as you drop from 45,000 feet elevation to 5,000—You are blind! Can you avoid it? How can you fight against

the physical effect upon the aviator of these different altitudes? There will be research in medicine on the sea. How are you going to deal with a man as he passes from a lighted cabin to the blackness of the outer night? He is blind. Can you overcome that difficulty?

In the realm of chemistry the story of what is being discovered in the way of new materials, new processes, the substitution of one thing for another, is as marvellous as any fairy tale. We shall come out of this war having made tremendous advances in pure and applied science.

The man who could tell you infinitely more about that than I can is seated here at this table in the person of Dean Mackenzie who directs our National Research Council at Ottawa. But not even the most interesting of these stories can be told as yet.

The reason is that these things must now be kept secret; some day they will be the common possession of the scientists of the world.

This is a great war of ideas and ideals. Many of you when you were boys and girls read that famous old allegory, John Bunyan's "Pilgrim's Progress." I often think that the picture there of the Pilgrim, Christian, going down into the Valley of Humiliation and being confronted by the destroyer, the Devil, the old serpent, Apollyon, was a picture of what really lies behind this whole struggle.

Here is Christian, aware of his weaknesses, repenting of all his faults and failures in the past, stumbling often, and yet heading in the right direction, and here is Apollyon, the destroyer, come to cast down that which is morally exalted, come to block the way of all that is noblest in progress and achievement. Here are the twain in stark antagonism.

And that is the situation today. Every fundamental that we hold most dear, that we hold as indispensable to the building of a worthy life of the individual and of the nation, is at stake and is challenged.

In the university from which many of us come, there stands in the very centre of our campus a beautiful memorial tower in which is a carillon of bells. That is flanked by a screen bearing the names of 600 men or more who gave all that men can give, life itself, for the cause of human freedom, decency, justice, and mercy in the last great war.

Above the names there is engraved in the stone a glorious sentence from an old Greek writer, Thucydides. It is a sentence from the speech of the great Athenian statesman, Pericles, over the dead of Athens who had laid down their lives to prevent the tyranny of Persia from passing over the narrow seas and becoming dominant in Athens, the glory that was Greece.

Ah, ladies and gentlemen, the glory that was Greece in those heroic ages has been repeated in our own generation. Today dying and agonized Greeks, men, women, and children, are repeating in another form the glory of devotion to the noblest of causes, the glory of self-sacrifice. May God help and spare and bless those heroic people!

Here is the sentence which every one in our university who passes that tower may read:

"Take these men as your ensamples and like them remember that prosperity is only for the free and that freedom is the sure possession of those alone who have the courage to defend it." That is a golden sentence; it is an inspiration; today every man with power and nobility wants to give all he has himself to the great cause of freedom.

The topic upon which I desire especially to speak is, that we are in this together for no other purpose than for the defence and the preservation and the enrichment and the transmission of civilization at its best and highest.

What does civilization mean? It does not necessarily involve an increase of speed. A foolish person may climb into an aeroplane and be whizzed from one spot to another at the rate of 300 miles or more an hour, but if there has taken place in him no change of character he will laud at the other end still a foolish person. So, speed alone does not constitute civilization.

Comfort does not constitute civilization. Ladies and gentlemen, we have been besotted and I believe degraded for some years past by making comfort the god to be supremely revered. Many have been teaching us in college and in the press and in magazines and books that the worst thing that could happen to any man or woman, boy or girl, was to have to do something difficult, was to have to face hardship, was to have to endure suffering. Discomfort was the hell to be avoided.

That doctrine has meant deterioration of character. But thank God it has not gone far enough to do its deadly work on this young generation that is offering itself for the great fight. Some thought this generation of youth had become soft and perhaps even cowardly, but thank God when the day of testing came, they were worthy.

The other day one of our most brilliant young medical graduates, whose father was a professor in our medical faculty, was lost at sea. His father and his elder brother had contracted some infection and died while in pursuit of some scientific investigation. Then the younger brother determined to carry on the family tradition in medicine. So he studied medicine. He graduated, and went on the *Ottawa* as surgeon. The ship was torpedoed.

Four days they kept up the fight and the young Dr. Henry worked all that time, practically without sleep, tending the sick, performing major operations. Then when the ship was sinking he and the captain reached a raft but they were too exhausted to cling to it on the heavy sea. A few of the men were stronger, and were able to get on the raft again, but the captain and Dr. Henry went down.

The younger generation has been all right. It has proved its merit.

In worshipping comfort, we thought of it as an essential part of civilization; but we know now that it isn't an essential quality.

What is civilization? I think it is something like this: The organization of men and women in such a fashion that in their relations one to another they may enlarge and enrich their personalities, they may enlarge and enrich life. Civilization is really the enlargement and the enrichment of human life.

If that is civilization how does it come about? What are the elements that make it up? Well, civilization is made of manifold elements and they are all combined. May I briefly summarize them?

First of all, we have received from ancient Greece the contribution of the search for truth, the love of beauty, the passion for freedom. That is the Greek contribution.

Then when the Romans came, they made their own contribution, law, reverence for law, for order, for organization, for justice between man and man, and nation and nation. That was the Roman contribution in the great days of old, before the little dictators had been thought of.

And the third contribution came from our Jewish-Christian teaching, the teaching that the individual man is of infinite value in the sight of God, that human personality is a sacred thing and therefore there is an obligation to kindness and helpfulness and to care for the needs of others.

Come down through the years and you find those ages of chivalry that contributed the element of help of the underprivileged, tolerance, generosity. Come down a little further to the era of the Reformation or the Renaissance when once more the right and glory of the individual were emphasized.

Come down further to the contribution that France made—not so very long ago—in laying stress upon logic and good taste, and intellectual integrity. Then come to the element that old Britain contributed, that element of beauty, that element of doing the decent thing.

A modern writer has well said that you can summarize the British contribution whether in the Old Islands across the sea or in the broad republic or in the Dominion on this side, under two heads, doing your duty, and being a gentleman.

There are some things we ought to do and there are some things that no decent man would dream of doing. Decency and duty are the great British contributions to this idea of civilization.

Now take all those and blend them together, the Greek and the Roman, and above all, the Christian contribution and the historical contribution through the ages. My point is this, that we are engaged in a vastly more than political struggle. We are fighting for survival. Perhaps more than half of us do not yet realize that fact, but we are in cold earnest, the American Republic, the United Kingdom, all the overseas Dominions, Russia, and China—we are all fighting for survival, and the utmost at the moment perhaps that we can say is this: We have not been beaten. We have not won yet. We believe we shall. But let us be humble and devoted, remembering that we have escaped being beaten and we have our chance to win.

It is no ignoble motive to say that a nation is fighting for its life. Ladies and gentlemen, this is a life and death struggle; make no mistake about it. Aye, and it is a struggle between life and death, between all the factors that go to make up worthy living, individual or national, and all those forces that tend to the degradation and the death of that which is truly and nobly human. It is a life and death struggle.

But we are struggling for the defence of all those precious elements that enter into our civilization to-day. Every one of them has been repudiated, scorned, trodden underfoot, not simply in regard to individuals but in regard to nations, by the Nazi group and those whom they are leading to-day.

Truth, the sacredness of contract, kindness—and one might go on through the whole enumeration—every one of those is scouted by the enemy. I think we sometimes are amazed at that. Language as we use it does not seem to mean the same thing to the enemy as it means to us. Things that to us are simply impossible of conception or of action seem to be taken for granted as the right thing by the enemy forces.

I am sure you have all been reading—you can't help it—every day in the newspapers, some of the results of this "New Order," as it is called, in Europe. It is a curious thing, but if you look on the back of an American dollar bill you find perhaps the first use of that phrase, the *Nova Ordo*, the new order of freedom that was ushered in on this continent.

But the Nazi new order is not really new, for it is as old as the tyrannies and repressions of the past. Under it, law has passed out of existence in Europe; there, law is only the will of the Führer. Plenty is changed to famine for the multitudes that are conquered, while those who have conquered are fattening upon their very means of living.

May I repeat that every one of these great fundamentals that make up a worthy life for an individual or a nation is being called in question in this great struggle to-day. That is why we are standing in defence to-day of all that is best and noblest in what we call civilization. It is a struggle of ideals. If the enemy won, where should we be individually? Where should we be as families? Where would our educational system be? There is not a university in Europe where the cloven feet of the Führer and his myrmidons have not trodden. No universities can exist save in free countries. Sometimes when people propose to close down universities in wartime I would protest that that is a purely Hitlerian

proposition and that loss of freedom would follow such suppression.

There can be universities, with their freedom of thought, only where there is political freedom.

Now, is the struggle then worth while? Is it worth while to maintain the fundamental basis of democracy, namely, that every individual is of value in the sight of Almighty God, the great moral principle that human personality is the most precious thing in the world, the great political principle of freedom of the individual, of the individual conscience, and the great domestic principle of the sacredness of the family, which is the expanded individual?

Is it worth while to maintain these fundamentals, for they are all at stake and every one of them would be suppressed or so transformed and degraded as to be really non-existent, if the enemy won?

It seems to me that the enemy has given up hope that he can win a decisive victory. I think the best he hopes for and what he is struggling for to-day is a drawn war, and a peace that would grow out of such a draw. He has to admit that things have not gone as well as he would like.

And yet, do not underestimate the tremendous power the man still has. He practically has all Europe at his disposal, with all its natural resources. He is still desperately cunning and desperately strong.

So let us remember we must do our utmost; we have to go on or we shall go under. Never was the chance better, the challenge greater than it is at this present moment. Therefore, let us be of strong will and stout heart, and high hope.

We cannot help looking forward to what will be after the war, keeping in mind that the kind of peace we have after the war will grow out of our conduct in the war. No great barrier will shut off the days to come from the days that now are. As we conduct ourselves now and as we organize ourselves now, so shall we be laying the foundation for the future. Will that future be good, bad, or indifferent? It depends on us. But as we believe that truth is stronger than lies, and that ultimately justice is stronger than injustice, and that freedom is stronger than slavery, because each one of those is a reflection of the character of the Almighty Himself, so we believe that if we do our part, surely God will defend the right and the day of victory will come.

In the last war the editor of that famous English journal, *Punch*, Sir Owen Seaman, wrote lines that might with equal applicability be written and used to-day to cheer. May I read them to you?

"Ye that have faith to look with fearless eyes  
Beyond the tragedy of a world at strife,  
And trust that out of night and death shall rise  
The dawn of ampler life;

"Rejoice, whatever anguish tears your heart,  
That God has given you the priceless dower  
To live in these great times and have your part  
In freedom's crowning hour;

"That ye may tell your sons who see the light  
High in the heavens, their heritage to take,  
'I saw the powers of darkness put to flight,  
I saw the morning break!'"

God hasten that day!

# TENTH ANNUAL MEETING OF E.C.P.D.

The *Journal* is indebted to George A. Stetson, editor of *Mechanical Engineering*, for the following account of the meeting.

At the annual meeting of the Engineers' Council for Professional Development, R. E. Doherty, president, Carnegie Institute of Technology, was re-elected chairman. The meeting was held on Sunday, October 18, at the Engineering Societies Building in New York, and was followed by a dinner, at the Engineers' Club, to which members of the governing boards of the constituent societies had been invited to listen to résumés of the annual reports of the Councils' committees. A feature of the dinner was a tribute to R. L. Sackett who retired following ten years of service as chairman of the E.C.P.D. Committee on Student Selection and Guidance.

Other officers elected at the meeting are: S. D. Kirkpatrick (A.I.Ch.E.), vice-chairman; A. B. Parsons (A.I.M.E.), secretary; and S. L. Tyler (A.I.Ch.E.), assistant secretary.

Members of the Council appointed to serve for the term 1942-1945 were: George W. Burpee, R. L. Sackett, O. W. Eschbach, Arthur Surveyer, Chas. F. Scott, and C. M. A. Stine (all reappointments); and A. F. Greaves-Walker (A.I.M.E.) and D. B. Prentice (S.P.E.E.) new appointments.

Chairmen of the committees of the Council were announced as follows: A. R. Cullimore, Committee on Student Selection and Guidance; D. B. Prentice, Committee on Engineering Schools; Everett S. Lee, Committee on Professional Training; Chas. F. Scott, Committee on Professional Recognition; and E. H. Robie, Committee on Information.

Members of committees appointed to serve for the term 1942-1945 are:

Student Selection and Guidance, A. R. Cullimore and G. B. Thomas (reappointments), and W. B. Plank.

Engineering Schools, J. W. Barker, E. L. Morland and B. M. Woods (reappointments).

Professional Training, G. B. Holderer (new appointment) and John C. Arnell (reappointment).

Professional Recognition, N. W. Dougherty, Webster N. Jones, and George A. Stetson.

Information, F. A. Lewis, to succeed G. Ross Henninger.

The Engineering Institute of Canada was represented at the meeting by the following officers: President C. R. Young, Past-Presidents Arthur Surveyer and J. B. Challies, Councillor J. H. Vance and General Secretary L. Austin Wright.

## R. E. DOHERTY REPORTS TO COUNCIL

In his report to the Council, R. E. Doherty, chairman, said that E.C.P.D. had not escaped the pressures of war and the prospects were that it would feel them still more. It was his opinion that the Council should take an aggressive position and "pursue at an accelerated rate every activity, within its charter, that gives promise of supporting the war effort or that would lay foundations of professional development that may now appear to be essential for the most effective service to the country by engineers and the engineering profession in peace-time reconstruction."

Mr. Doherty reviewed two general avenues of approach to the accomplishment of its objectives of professional development. One was to cultivate among constituent bodies an attitude of co-operation and an improved practical facility in taking joint action. The other was an educational campaign "to inform the individuals among the boards of direction and the memberships of the several constituent bodies—indeed, all engineers—with respect to the purposes and activities of E.C.P.D. and to encourage them to have an active interest."

Although the problem of reaching individual engineers was more complicated than that of reaching the constituent bodies themselves, he said, nevertheless the main elements of necessary machinery were in existence. "The channels of

flow from the Council to such individuals are the national organizations of the constituent bodies. In all major cities and industrial centres there are local branches or sections of the national organizations; and on the campuses of most engineering schools there are student branches . . . It remains to organize at such centres, where the organizations do not already exist, joint groups in which activities relating to professional development can be centred, and which, through local branches or sections, can be in communication with E.C.P.D. through the national organizations." Such a plan, he continued, was essential and he and J. F. Fairman had undertaken to formulate the details of it.

Mr. Doherty then outlined the work of the standing committees, and his comments follow.

## STUDENT SELECTION AND GUIDANCE

(E.I.C. REPRESENTATIVE: H. F. BENNETT)

The selection of students who are intellectually qualified and the guidance of such students into the engineering profession now represent one of our most critical problems. Normally, it is a problem of basic importance that the aptitudes of students yet in high school be determined. But this problem becomes critical in the war effort which demands more full-fledged engineers and that everybody, including students, be placed where they can render the most service. Then these students could be properly selected and guided. The expensive and insufficient facilities for engineering education must not be wasted upon so many students who can not make the grade. And the only hope now apparent of solving this problem is the further active development of the distinguished work Dean Sackett's Committee on Selection and Guidance has already accomplished. He has laid a sound foundation of procedure in connection with the knotty problem of selection—of determining aptitude. After the exploration of earlier years, studies that have been made during the last two with the very substantial support of President Cullimore have apparently begun to open the way to the solution of this problem. And in guidance, from the experiments sponsored and studied by Dean Sackett's committee in a number of urban centers, notably New York, have emerged procedures that constitute the beginning of a solution of this difficult problem. I would urge upon you my belief that the work of this committee probably represents our most important immediate opportunity.

And I cannot leave this matter without expressing to Dean Sackett, on behalf of the Council, a deep and enduring gratitude for the foundation he has laid under this important work during a whole decade of patient, unremitting, unsung toil, and until the last year or two with practically no funds at his disposal. And I hope that as he now retires from the committee he will find satisfaction in both a job well done and the gratitude of his colleagues in E.C.P.D.

## ENGINEERING SCHOOLS

(NO E.I.C. REPRESENTATIVE)

The problems of the Committee on Engineering Schools are increasing in both difficulty and scope. War pressures raise questions not alone as to modification of the accrediting programme; it now appears that the whole structure of higher education, including engineering, may be torn apart for the duration. What the engineering profession, as represented by E.C.P.D., can do to hold to a minimum this impending devastation and to lay such foundations as fall within the Council's scope for post-war reconstruction of engineering curricula, is a problem with which the Committee on Engineering Schools, presumably, must deal. As Chairman Prentice of the committee has indicated,

there may be also an opportunity of assisting in some way in connection with war plans in the engineering colleges. Hence it seems very clear that although the accrediting programme itself will be suspended, the efforts of this committee should not be relaxed, rather should they be re-directed to the war problems.

In this general connection I would report that the Executive Committee undertook to explore the problems created by confused authority and policy in connection with professional engineering man-power in the war effort, and with this purpose in mind organized a meeting held in New York on September 20. The group included Dr. E. C. Elliott, chief, professional and Technical Division, War Man-power Commission, Dr. Leonard Carmichael, director of the National Roster of Scientific and Professional Personnel, L. Austin Wright, assistant director, Canadian Selective Service, and a few representatives of war industries, in addition to the Executive Committee and others associated with E.C.P.D., including the national secretaries. After a period of general discussion, Dr. Elliott appointed the entire group as a special committee of his division of the War Man-power Commission, and as such it passed a resolution to be reported at the meeting to-day.

#### PROFESSIONAL RECOGNITION

(E.I.C. REPRESENTATIVE: J. A. VANCE)

The Committee on Professional Recognition has had from the beginning a thorny and uncertain path. As Professor Scott, its present chairman, has reported, the decision was reached a few years ago that the profession was not yet ready, not sufficiently like-minded, to settle upon formal criteria of recognition, and that therefore the committee's work should be redirected toward an educational programme regarding the profession, reaching college students and junior engineers. Thus would a more unified understanding of the profession be cultivated and the foundation laid for future action regarding the problem of professional recognition. Professor Scott's pursuit of this wise change in committee policy is to be commended, for I venture to say there are few students and junior engineers and probably no engineering teachers who have not felt the touch of his campaign, about which he has given full report.

#### PROFESSIONAL TRAINING

(E.I.C. REPRESENTATIVE: C. R. YOUNG)

The Committee on Professional Training has taken a new lease on life. Under its energetic chairman it has cleared its mind as to purpose, settling upon the preparation of a "Manual for Junior Engineers" as its primary undertaking, at the same time carrying forward as far as may be practicable under war pressures other important, but secondary, projects; and this I believe to be a wise plan. The new manual will be as important to junior engineers as the pamphlet "Engineering as a Career" is to high-school and college students, and we must now make financial plans for its publication so that no time will be lost when the manuscript is ready. It is now approaching the end of the planning stage. Recalling the long hunt for outside funds for publishing "Engineering as a Career," I wish to prepare now for the manual and am recommending herein appropriate action.

#### ETHICS

(E.I.C. REPRESENTATIVE: C. R. YOUNG)

The Committee on Ethics, which had been organized under the late American Engineering Council, came to E.C.P.D.'s sponsorship about two years ago. Under the leadership of Prof. D. C. Jackson the committee has succeeded in the difficult task of formulating a code and a "Statement of Faith" that at least have the unanimous approval of the committee. The importance of such documents to the profession, if generally accepted, needs no argument here. Moreover, I need not remind you of the extended and careful thought that these documents have

had. Hence it is my hope that the Council may see fit to approve them.

#### INFORMATION

(E.I.C. REPRESENTATIVE: L. AUSTIN WRIGHT)

The Committee on Information under the chairmanship of G. Ross Henninger, has followed the customary policy of a number of years with respect to publicity of merely reporting the facts regarding actual work of E.C.P.D. and results accomplished. In addition it has carried out the special assignment during the last year of re-editing and printing the pamphlet "Engineering as a Career," which has been warmly received by the schools and colleges.

#### WAYS AND MEANS

Our situation is sound. Against the proposal to support the work of the Committee on Selection and Guidance that has significance in war as in peace, to finance the publication of the "Manual for Junior Engineers," and to protect the Council's responsibility for restoring the list of accredited curricula after the war, the Council has a substantial balance, as indicated on the financial statement. I have recommended that appropriate amounts be set aside now as special reserves for these purposes. Then against the regular expense budget for the year 1942-1943 submitted to-day for your approval, is an adequate income from The Engineering Foundation and constituent bodies. I am gratified to report that the Foundation has already appropriated for 1942-1943 a sum of \$5,000, an increase of \$500 over last year. I have expressed the Council's appreciation both to the Foundation for its continuing interest in E.C.P.D.'s work, and to Dean Potter for his good offices in supporting the Council's request. And there is every indication that the several appropriations from the constituent bodies for the year just closed will be renewed in full for the coming year, and for this, of course, we are most grateful.

Last year when it was decided to abolish the fees collected from colleges for reinspection of accredited curricula, it was necessary to obtain new funds. The chairman was authorized to seek the funds from the constituent bodies. The A.S.M.E., A.I.E.E., A.S.C.E., and A.I.Ch.E., responded by doubling their respective appropriations, and the problem was thus solved.

#### CONSTITUENT BODIES REPORT

A customary feature of E.C.P.D.'s annual meetings is a report from each of the constituent bodies on what has been accomplished during the year with suggestions as to how the Council could better approach its objectives. Abstracts of these reports for 1942 follow.

#### AMERICAN SOCIETY OF CIVIL ENGINEERS

On behalf of the American Society of Civil Engineers, E. E. Howard read from a report by R. E. Bakenhus. The report said that the A.S.C.E. had endeavored continuously to uphold the policies of the E.C.P.D., particularly in its accrediting programme. This was done in part through student-chapter organizations. The A.S.C.E. representatives on the Council were proud to report the continued activity of the New York Engineers' Committee on Student Selection and Guidance, which for the past five years had been under the chairmanship of an A.S.C.E. member, Arthur G. Hayden. This committee was made up of members of the five engineering societies participating in E.C.P.D., the civil engineering subcommittee consisting of 20 members. Mr. Hayden's report for 1941-1942 had stated that 28 group meetings and three general assemblies had been held in the high schools of New York City, at which more than 7,000 students had been in attendance.

Representatives of A.S.C.E. had attended the conference with the War Man-power Commission held under the auspices of E.C.P.D. on September 20. Although A.S.C.E. had expressed no formal opinion, it might be stated that

"the Society thoroughly endorses the stand: first, that every effort should be made to supply the armed services with engineers of the type that are required and in the tasks that require engineers; second, that every effort be made to supply necessary and vital industrial establishments with engineering talent for use in the tasks where it is necessary; and third, that the supply of trained engineers be kept up as the war needs indicate."

As to what E.C.P.D. might do, the report called attention to the expressed desire of the A.S.C.E. Board of Direction "that E.C.P.D. might well limit its work of accrediting curricula to the five major fields of engineering." The report also stated that "any steps in the direction of greater solidarity of the profession and greater effectiveness in dealing with technical, social, and economic problems, particularly in these times when the country is under great stress due to the war and social changes, would be desirable."

#### NATIONAL COUNCIL OF STATE BOARDS OF ENGINEERING EXAMINERS

Reporting for the National Council of State Boards of Engineering Examiners, N. W. Dougherty expressed pleasure that the distribution by E.C.P.D. of Wickenden's "The Second Mile" (published in *The Engineering Journal*, March, 1941, pages 111-114) was well under way, that a guide for senior students and junior engineers was being prepared, and that a "code of ethics" has been written, as these projects all concerned N.C.S.B.E.E.

E.C.P.D., said Mr. Dougherty, had been organized to enhance professional status. Four phases of a continuing programme of procedure for promoting E.C.P.D. objectives were: (1) Better practitioners, about which N.C.S.B.E.E. had done much; (2) Co-operation of the different engineering agencies, about which they had done little, except as something had been done through overlapping of memberships; (3) recognition on the part of engineers that they are members of a profession; and (4) public recognition that engineers deserve a place of esteem about which much was yet to be done.

#### THE ENGINEERING INSTITUTE OF CANADA

The report on behalf of The Engineering Institute of Canada was presented by Dean C. R. Young, president of the Institute. Under the direction of the Institute's Committee on the Training and Welfare of the Young Engineer, a pamphlet entitled "The Profession of Engineering in Canada" had been printed and 9,000 copies distributed without charge to the engineering colleges and to each of the secondary schools of Canada where the instruction is given in English. A French language edition of the brochure was now in the hands of the printers.

Student guidance committees had been set up in 16 of the 25 branches of E.I.C. in Canada, and the remaining nine branches were preparing to name similar committees. Favourable comment on the work of student guidance had been voiced and the Institute had been commended for its action. Arrangements were being made to distribute the E.C.P.D. manual for committees who aid young men interested in engineering education and the engineering profession to all counseling committees of the Institute.

It was planned, he said, that the E.I.C. Committee on the Training and Welfare of the Young Engineer would expand its activities in the direction of the training of the young engineer following graduation. Steps to foster competition of student and junior members for prizes offered by the Institute had been taken.

The Institute had also created a sentiment for the greater solidarity of engineers in all that is essential to their professional life.

#### THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS

Dean R. L. Sackett presented the report of representatives of The American Society of Mechanical Engineers, who are

A. R. Stevenson, Jr., and H. T. Woolson, in addition to Dean Sackett. The report follows:

This Society has two committees which co-operate with E.C.P.D. in furthering its programmes.

The Committee on Relations with Colleges is charged with the supervision of the 120 student branches of the Society. Copies of the address by President Wickenden entitled "The Second Mile" were sent to each student branch chairman and honorary chairman with a letter suggesting the use of the address as the basis for student and faculty programmes.

The Committee on Local Sections sent to each section chairman a reminder of the need for local guidance in the high schools for those boys who were interested in an engineering education. Only five sections out of 22 answering the enquiry had organized guidance committees.

If the experience of other societies is similar, it indicates a low interest in civic affairs and in the future status of the engineering profession.

It is desirable that Society committees in charge of local sections and student chapters or branches should promote the efforts of E.C.P.D. which are designed to encourage, inform, and help members and prospective members. Society publications provide reviews of E.C.P.D. meetings and the programmes of committees but local section and student meetings give scant attention to subjects of immediate concern to the progressive individual.

The Committee on Education and Training for the Industries held two sessions at the Cleveland Meeting, June 8-10, 1942, on "Education and Training for Industry Before and After the War," "Co-operative Education," and "Looking Ahead in Adult Education."

At the Rochester meeting, October 12-14, "Training Women for Engineering Jobs" was discussed by Mrs. Lillian M. Gilbreth, A.S.M.E., and others, and a panel discussion on "Education for Industry" was held.

The A.S.M.E. has increased its appropriation for the support of E.C.P.D. to \$1,700 for the year.

It is understood that leadership is woefully lacking in candidates at Officers Training Camps; the same qualities or similar abilities are needed in industry, which finds them difficult to discover. E.C.P.D. has discussed the subject since in its objectives it is authorized to co-ordinate and promote efforts and aspirations directed toward "greater effectiveness in dealing with technical, social, and economic problems."

One way for E.C.P.D. to help in accomplishing this purpose would be to ask the education committee of each constituent society to put on programmes designed to inform the engineering profession concerning social problems and its responsibility in solving those particularly to which it has contributed. Leadership depends on the engineer's sensing the part he has played in creating social and economic problems, and applying his intelligence, jointly with other forces, to the improvement of labour relations and human understanding of the conditions involved.

#### THE SOCIETY FOR THE PROMOTION OF ENGINEERING EDUCATION

Reporting for the Society for the Promotion of Engineering Education, C. C. Williams said that "the activities of S.P.E.E. for the year have been directed toward rendering the colleges of engineering maximally useful in the war effort. "The effectiveness," he said, "has been hampered by two circumstances: (1) A lack of up-to-date comprehension at Washington of the distribution and potentialities of the technologic and research activities in the universities, and (2) a lack of knowledge on the part of engineering educators of the technical needs of the war effort."

"In the present disturbed state of engineering education," he concluded, "it seems likely that E.C.P.D. may well devote its attention to the relations of the engineering profession to the war effort and allow engineering education to find its own way. The exigencies that will arise in the

colleges of engineering will have to be handled by the individual institutions in view of their own conditions and by organizations in S.P.E.E. and other associations most immediately concerned with educational administration. When engineering education begins to enter the period of post-war adjustment, E.C.P.D. may well give thought to the part that undergraduate and graduate education have in the comprehensive project of professional development."

#### AMERICAN INSTITUTE OF MINING AND METALLURGICAL ENGINEERS

In presenting a report on behalf of the American Institute of Mining and Metallurgical Engineers, W. B. Plank told of a special committee of the Institute which "has made a preliminary report outlining a plan whereby, mainly through local sections, special attention will be given to new engineering graduates, to make them acquainted with other young engineers and to make it possible for them to participate both technically and socially in local-section activities."

He mentioned also a committee which has made a study of the Selective Service as it affects young mining and metallurgical engineers. Through advice to deans of schools and correspondence with Selective Service officials, and later with the War Man-power Commission, the committee had been instrumental in clearing up many questions.

A second edition of a booklet by T. T. Read, "Careers in the Mineral Industries," had been issued during the year. Also during the year the A.I.M.E. had sponsored publication of a notable book by T. T. Read, "The Development of Mineral Education in the United States."

#### AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS

After reporting that he fully expected favourable action on the part of the Board of Directors of the American Institute of Electrical Engineers on the request for continuance of an increased appropriation for the work of E.C.P.D., J. F. Fairman, speaking for A.I.E.E. representatives, told about the presentation of an address, "What the Sections Can Do to Assist E.C.P.D.," delivered at the 1942 Summer Convention of the Institute.

"During the year," Mr. Fairman continued, "we have reviewed the situation as to the existence of student branches of the Institute at institutions whose curricula in electrical engineering were not accredited by E.C.P.D. In 1940 there were eleven cases. In 1941 there were seven. If Council approves the recommendations of its Committee on Engineering Schools, after this meeting there will remain only five. This seems to indicate progress and a definite effort on the part of the schools to get themselves on the accredited list."

As to suggestions for the work of E.C.P.D., Mr. Fairman said, "Our own opinion . . . is that E.C.P.D. would do well to concentrate on its immediate objective and to avoid the temptation to adventure in broader fields."

#### AMERICAN INSTITUTE OF CHEMICAL ENGINEERS

B. F. Dodge, speaking on behalf of the representatives of the American Institute of Chemical Engineers, applauded the E.C.P.D. for its resolution of September 20 on the subject of man-power. He said that the demand for chemical engineers greatly exceeded the supply. Inasmuch as chemical engineering was a young man's occupation, there was no pool of older men upon which to draw. It was his opinion that the place of the chemical engineer was in the production army. He was thankful that there were no outstanding differences between the A.I.Ch.E. and E.C.P.D. The A.I.Ch.E., he said, had 5,000 student members.

#### E.C.P.D. ANNUAL DINNER

Col. C. E. Davies, secretary, A.S.M.E., acted as toastmaster at the annual dinner of E.C.P.D. which was held at the Engineers' Club, New York, N.Y., on Sunday evening, October 18, following the annual meeting of the Council. In addition to members of the Council and its

committees there were also present at the dinner representatives of the governing boards of several of the constituent bodies.

Colonel Davies recalled how the E.C.P.D. had been formed following a "Conference on Certification" held ten years ago. A profession, he said, was nothing without ideals, ideas, and leaders. We had to be realistic about the engineering profession and to realize that we had hardly started to build a profession of engineering. A wide range of viewpoints existed which had to be considered. E.C.P.D. had started in 1932 as "a conference of engineering bodies," and its purpose was to suggest to operating groups what should be done. In order to have leadership, he continued, acquaintanceship was essential, and such gatherings as the one he was addressing were a means to such an end. The ten years of E.C.P.D.'s activities had, in his opinion, been worth while, and he proposed to call upon representatives of E.C.P.D. committees to tell briefly what E.C.P.D. was thinking about.

Col. Davies then called upon Chas. F. Scott, Committee on Professional Recognition; D. C. Jackson, Committee on Ethics; S. D. Kirkpatrick, Committee on Engineer Training; D. B. Prentice, Committee on Engineering Schools; and R. L. Sackett, Committee on Student Selection and Guidance; who spoke briefly of the work of their committees. As the reports of these committees have been summarized elsewhere in this account of the E.C.P.D. annual meeting, no attempt to repeat these reports will be made here.

#### TRIBUTE TO DEAN SACKETT

Following Dean Sackett's brief address, the toastmaster called upon George A. Stetson to report for a special committee which had been appointed to prepare a tribute to Dean Sackett who retires from the Chairmanship of the Committee on Student Selection and Guidance after a service of ten years. After reviewing the importance and significance of the work of this committee under Dean Sackett's leadership, the tribute read:

"We have listened to-day to the report of one of your committee chairman who has lived through this period of evolution. Long years of service in the field of engineering education have matured his wisdom and judgment. Experience with several generations of youth, with practising engineers, and with the men and women of this nation has been his in rich measure. Some inner quality of alertness to men and events has kept his mind youthful and his vision clear. Although justified by years and the value of his accomplishments in enjoying the leisure that the vigour of his health would make a pleasure rather than a burden, he has preferred to pioneer in the field of selection and guidance of young engineers, and has devoted his time and energy to a new and important aspect of engineering education upon which the quality of future generations of engineers will indubitably depend. To the professional social scientist and the pedagogical psychologist he is a layman; but those who have known him and worked with him recognize that new ideas in any field coalesce into the substance of practicability when exposed to the influence of his maturity and experience.

"Dean Sackett, it is my privilege to extend to you on behalf of this group of your friends and fellow workers their congratulations and their tribute to you for your service in the field of engineering education and particularly for your ten years of leadership in developing the techniques of selection and guidance of engineering students. As your studies bear fruit in application in education and engineering, more and better leaders will be developed and a larger and more intelligent group of young men will rally to wise leadership. You cannot pass on to them your maturity and experience; but, when peace returns, following your example and aided by the influences you have set in motion, they will be able to distinguish between true leadership and false, bring education to serve the liberties and well being of mankind, and build a nobler profession that will be the

master and not the victim of applied science through a wise use of maturity and experience."

In his response Dean Sackett, to whom the tribute had come as a complete surprise, said that his service on the committee had been a pleasant experience in spite of the resistance he had encountered. In such a part a certain amount of mulishness was necessary. Many times, he confessed, he had not known whether he had been kicked downstairs or up. He had not been indifferent but ignorant of having been rebuffed.

Following the tribute to Dean Sackett, F. L. Bishop, secretary, S.P.E.E., called attention to the fact that normally the work of E.C.P.D. and the engineering colleges had to do with students who had the financial backing necessary for getting an engineering education. When the Army and Navy takes over, he said, twice as many young men would be able to enter engineering colleges as had been the case under normal conditions.

#### CANADIAN ENGINEERS COMPLIMENT E.C.P.D.

Calling attention to the fact that The Engineering Institute of Canada was the only constituent body which had sent its full delegation of representatives to the E.C.P.D. annual meeting, Col. Davies asked Arthur Surveyer to speak for the E.I.C. representatives.

Mr. Surveyer said that he was attending his first E.C.P.D. annual meeting. He had, he said, a feeling of pride that The Engineering Institute of Canada had been asked to become one of the constituent bodies of E.C.P.D. E.C.P.D., he recalled, had worked relentlessly to improve the status and education of engineers and to guide high-school students.

Appraisal of aptitudes for a profession was important, he said. No other profession, in his opinion, had given so much thought to the question of selection or had gone so far in saving young men from the disappointment of making a wrong choice. Lawyers and doctors, he pointed out, remained practitioners throughout their lives, while engineers usually advanced to administrative positions. In this advancement the engineer generally had to discard the practice that had helped him to rise. It was his habit to look for fine qualities in men and to help their development.

It was difficult for laymen, he said, to understand how a group of men having such differences of background and function as engineers exhibit could constitute a profession. However, professionalism for engineers was an attitude of mind, an ability to analyze and to sift essentials from non-essentials.

It was now necessary for engineers to assist in winning the war and the peace which was to follow. No men, Mr. Surveyer concluded, were better trained than the engineers of the United Nations. With the discipline of their education they should participate in the bringing of peace.

J. B. Challies, also of the E.I.C., followed Mr. Surveyer and spoke briefly. He had had something to do with the suggestion that E.I.C. be associated with E.C.P.D. Engineers in Canada were not separate, and they appreciated being members of the "supreme Court of Organized Engineering in North America," the E.C.P.D.

In introducing L. Austin Wright, secretary of The Engineering Institute of Canada, Colonel Davies said that he had been impressed with man-power controls in Canada. Mr. Wright was deputy director of National Selective Service in Canada, under Elliot M. Little, former director, also an engineer, to whom the job had been given because of the success which had attended his handling the Wartime Bureau of Technical Personnel organized by three Canadian engineering societies.

Mr. Wright described briefly but clearly the operation of the National Selective Service system in Canada and the controls of man-power that are exercised there. He also told about the control of engineering students and their allocation, upon graduation, to the armed forces and to industry. Students in Canadian universities were permitted to finish their courses, he said, and in the case of engineering students, summer work in industry was required, inasmuch as the courses were not "accelerated" as they have been in the United States. No more postgraduate courses are offered and one failure would be sufficient to remove a student from school. Changes of courses were not permitted students, unless the changes were in the national interest. All students were to be called up for active service upon graduation and those physically unfit for military service would be required to take positions in industry. Allocation of graduates to the armed forces and industry was under the control of the National Selective Service and was caused out in accordance with national need. It was planned, he said, to carry the control back to the high schools in order to provide an adequate supply of college-trained men for the armed forces, the government, and industry.

#### OFFICE OF TECHNICAL DEVELOPMENT

Webster W. Jones, dean of the College of Engineering, Carnegie Institute of Technology, reviewed informally the survey made for the War Production Board which resulted in the recommendation that a group of engineers and scientists be set up as an Office of Technical Development. The Office, he said, would be advisory to Donald M. Nelson, W.P.B. director.

#### PRESIDENT-ELECT H. V. COES, OF A.S.M.E., SPEAKS

Asked by Colonel Davies to speak to the Council, H. V. Coes, president-elect of The American Society of Mechanical Engineers, said that he had followed the work of the E.C.P.D. with interest for several years. It had set a pattern for co-operative efforts of engineering groups which too often conducted their affairs in such "airtight compartments" that they lost track of their objectives.

In bringing the dinner to a close, President Doherty said that it was heartening to the officers of E.C.P.D. to see the interest taken in its affairs and discussions. He appreciated the spirit of the discussions he had just listened to and the help of our Canadian colleagues. We could, he said, face the coming year with encouragement and determination to aid in the war effort.

## ACCIDENT PRONENESS

From *Engineering* (LONDON), SEPT. 11, 1942

Factory accidents are not purely fortuitous occurrences, the incidence of which can neither be foreseen nor controlled. If they were, their distribution would follow definite arithmetical rules such as are exhibited in cases of pure chance. A simple example is given by the tossing of a coin. If a large number of people, say a million, toss for heads or tails, then obviously, on the first occasion, there will be 500,000 winners and 500,000 losers. If the process is repeated, there is an even chance that each winner will toss head or tail with the result that 250,000 people will win twice. Equally, 250,000 will lose twice. With large numbers this process may be repeated over many stages so that after, say, six tossings there will be 18,000 people who have won six times and a similar number who have lost. There will be a tendency for the winners to suppose that they have some peculiar personal qualification making them persistently lucky and for the losers to describe themselves as always unlucky. Actually any of them have an equal chance of winning or losing next time and the fact that some have a run of luck or misfortune has nothing to do with them personally. It is an arithmetical necessity. The possibility of sustaining an accident in a factory is not a simple yes-or-no chance like tossing a coin, but it is amenable to the same kind of statistical treatment, and it can be shown that some people will necessarily have more than their share of accidents. Examination of many records, however, indicates that this is not a sufficient explanation of the distribution of industrial accidents. Some extraneous factor interferes with the laws of probability.

An example illustrating this was given by an investigation, carried out before the war, in a factory in which women were engaged on machine operations in the manufacture of shells. Although, from a statistical point of view, the number of workpeople concerned was not large, it was great enough to indicate that other factors than chance helped to determine the results. The data obtained concerned the activities of 648 women over some months. It was found that the number suffering no accident was 448, while 132 had one accident; 42, two accidents; and 26, three, four or five accidents. Further observation showed that groups of women free from accidents tended to maintain that status, while other groups which had previously suffered one or more accidents continued in the same type of liability. A probability calculation in this case showed that, had the distribution been determined by chance, instead of 26 women sustaining three to five accidents, the number would have been eight.

The chance of an accident occurring to an individual is naturally largely determined by the degree of risk to which he or she is exposed. Many investigations of the type mentioned above, however, have shown that some people are more likely to sustain an accident than others. This likelihood has been termed "accident proneness" and is the factor which nullifies probability calculations. In its broad aspects, the existence of accident proneness has probably been realised throughout human history, although it has had to wait for a scientific era to acquire a name. That people who are thoughtless, careless, clumsy or "all thumbs" are more likely to injure themselves in mechanical operations than those of greater care and finesse must have been realised since tools were invented. It is only in recent years, however, that investigation has shown that this broad and elementary concept is not in itself sufficient to distinguish accident-prone people from those who are naturally accident-free. Mental and physical qualities of a less obvious kind have significant bearing in the matter.

This subject, which has always been of importance in connection with factory work, has become of increasing

## Abstracts of articles appearing in the current technical periodicals

moment with the large increase in the number of people engaged in workshop operations. That the enormous increase in the factory population should be accompanied by an increase in factory accidents was only to be expected; the increase, however, is relative as well as actual. This also was, perhaps, to be expected, in view of the fact that very many of the additional workers are new to factory life, but this does not make it satisfactory. Apart from the question of suffering for individuals, and attendant expense, all accidents delay production in some measure. The question of accident proneness is but one item in the board question of accident prevention, or rather, minimization, in factories, but present conditions have given it a new urgency. The new factory populations are necessarily engaged, in the first place, with but little individual selection, and it is more than probable that the proportion of accident-prone people engaged exceeds the normal average encountered in peace-time industrial experience.

In order to assist works executives in dealing with this matter as profitably as possible, the Industrial Health Research Board has published a pamphlet entitled "The Personal Factor in Accidents."<sup>1</sup> It forms the third of the Board's Emergency Reports. The pamphlet does not contain new material. It is in essence a summary of the conclusions which have been arrived at as a result of the Board's work in this field in recent years. Particulars of the various investigations have been published in the past, but this digest of a large amount of material will be of value to many who, at the present time, are certainly not in a position to study any extensive series of reports.

The question of importance at the moment is whether it is possible in any way to recognize accident proneness so that individuals affected may be employed on operations in which risk of injury is small. Various tests have been developed by means of which the sensori-motor co-ordination of individuals may be measured, or at least indicated. The tests which are termed "aesthetokinetic" give a measure of the rapidity and accuracy of the co-ordination between hand and eye, which is to some extent a measure of accident proneness. It cannot be said that these tests have been developed to a stage at which they form an infallible guide in selection, but they give a useful indication. They have proved most reliable in connection with skilled operations. The whole question of selection by means of individual tests has been much studied in recent years and a good deal has been done in connection with Army recruits. It would be difficult, however, particularly from the point of view of the supply of suitable observers, to apply the method on any comprehensive scale to the thousands of new entrants now being brought into industrial life.

The second method of dealing with the matter which is mentioned in the pamphlet appears to be more generally applicable. This is based on the use of accident records. Like an accident itself, the severity of an accident is largely a matter of chance, and although anyone who is accident-prone may suffer more than the average number of mishaps, he may be so fortunate that they are all minor. This, however, is no guarantee for the future; the next in the series may be serious. It is in virtue of this that the pamphlet recommends the keeping of records which shall contain information about all accidents, no matter how trivial. It is proposed that the records should be kept on cards, one for each employee. Such a collection of cards, divided into packs corresponding to the departments of a works, would show at once which accidents were the most dangerous,

<sup>1</sup>H. M. Stationery Office (Price 4 d net).

and which department offered the most fruitful field for a more detailed investigation. Further, each pack would distinguish the individuals in the particular department concerned who were most liable to accident, and those in the most dangerous departments could be transferred to work of a safer type before they had done themselves serious harm. Probably all factories already keep some type of accident record, but frequently only accidents involving absence from work are considered worthy of attention. Those who are operating factories at the present time are keeping records of many kinds and probably do not wish this particular type of activity to be added to. If, however, an elaboration of a system already in operation would assist in reducing the accident rate, which is undesirably high, it might prove profitable not only in eliminating some suffering, but in increasing output.

## GRATICULES

From *Monthly Science News* (LONDON, ENG.), August, 1942

In many types of measuring instruments mechanical methods in which vernier and micrometer scales were employed are now being replaced by optical methods in which the standards of measurement are provided by graticules. These are the cross-lines seen in surveying telescopes and other instruments. This replacement has largely been made possible by the development of special photographic methods in the laboratories of the British Scientific Instrument Research Association for the reproduction of graticules, and accurately divided circles bearing circular measuring scales.

Prior to the development of these methods it was necessary to rule each circle or graticule individually. This ruling was carried out by means of a diamond on the uncoated glass surface, or by a steel tool which cut through a layer of resistant material spread over the surface thus exposing the underlying glass which could then be etched where the rulings had been made. Both these methods are subject to severe limitations. In the first place, by the ruling processes it is difficult to obtain lines with abrupt ends or to stop lines short at a point of intersection with another line. Under the high magnification to which graticules are subjected any gap or overrun becomes plainly visible. In the second place, a complicated graticule is exceedingly difficult to produce by any method of ruling and etching.

In the photographic method of graticule production a master of the graticule is drawn which may be a hundred times the required size. Sharp edges can be given to the lines of the master and all spacings can be accurately proportioned. From this master, reproductions can be easily and rapidly made with the elimination of all capricious and uncontrollable operations. One important feature of these graticules is that, although prepared by a photographic process, the transparent portions of the finished graticule are devoid of any film, thus eliminating the optical defects which arise in using ordinary photographic emulsions of silver halides in gelatine or collodion.

The use of the photographic process enables complicated graticules to be reproduced with ease, results in economy of production, and, as the processes involved are controllable, permits of a production time-table. When circles or scales so made are used for purposes of measurement, the brilliancy of the image seen, the opacity of the graduation marks against a bright background, and the large magnification employed, make it possible for readings to be taken with great ease and precision.

## JOINT PLAN FOR BASE METALS

From *Trade and Engineering*, (LONDON), SEPT., 1942

The Governments of the United States and Canada have worked out arrangements to procure still greater quantities of industrial minerals from the Dominion. Washington's announcement that the Reconstruction Finance Corpora-

tion will finance development of marginal and sub-marginal deposits of copper, lead, zinc, and graphite in Canada for the Metals Reserve Corporation, a wartime organization owned by the United States Government, is only part of the story; it is believed that, in addition, advances will be made where required, to enable companies already producing to expand their output, and that financial assistance may be provided also for prospecting for new properties.

The Ottawa administration and the Provincial Governments are helping. Moderate exemptions from income-tax have been allowed to prospecting syndicates and mining and exploration companies. Base-metal producers of less than three years standing have been exempted entirely from the excess profits tax, so that they will pay only 18 per cent on their net profits, after provision for depletion and depreciation, whereas the minimum tax payable by other corporations is 40 per cent and earnings of other industries now are subject to the 100 per cent excess profits levy. In addition the base-metal enterprises will have priorities for labour and materials.

Canada's War Metals Advisory Committee, which was organized by the Metals Controller, is making a careful survey of the possibilities of obtaining increased output of strategic minerals, and it is expected that any special assistance, whether from the Dominion Government or from the Reconstruction Finance Corporation of the United States, will be made in accordance with the recommendations of this committee. Such arrangement will provide a measure of advice and direction for development by the ablest and most experienced mining brains in the Dominion, and promises to be highly important in the future exploration and exploitation of this country's mineral resources. In addition to the more common base metals, occurrences of molybdenite are being given considerable attention.

## TUBE SHELTERS

From *The Engineer*, (LONDON), SEPT. 18, 1942

Eight new tube shelters in the London area are now so nearly completed that in emergency they could be brought into use without delay. Actually it is not intended to throw them open for the use of tube shelterers unless and until there is a need for the extra accommodation they will provide. These shelters, the design of all of which is practically the same, have been constructed in such positions that they can become parts of new tube railways that may be driven below London when the war is over. Each shelter consists of two tunnels side by side, each 16½ ft. dia. These tunnels were driven by methods similar to those unusually employed for boring such tunnels in the London area. But it is interesting to note that the place of the more usual cast iron lining has been taken to a considerable extent by pre-cast concrete blocks. The use of this alternative material was referred to by Mr. Halcrow, in his Thomas Hawksley Lecture before the Institution of Mechanical Engineers last November. For their special use as shelters, the tunnels are divided by a concrete slab forming upper and lower "floors." Each shelter is about 1,200 ft. long and capable of holding 2,000 people. Cross-passages provide space for medical aid posts, control rooms and the like. The tunnels lie at levels between 75 ft. and 110 ft. below ground level and to each there are several alternative entrances. Four of the shelters are north and four south of the Thames. The Exchequer is paying for the cost of the construction of these shelters and for their maintenance.

## MOTOR SHIPBUILDING

From *Trade and Engineering* (LONDON), SEPT. 1942.

It is reported from Copenhagen that during the course of this month the first gas-engined ship built by Messrs. Burmeister and Wain will go on trials. Much interest was aroused last year when it was announced that Messrs. Burmeister and Wain, who may be regarded as pioneers in motor-ship construction, had taken up the manufacture of a

marine gas engine and would instal the first unit in a 3,000 ton cargo ship. It was also announced that although the first engine had an output of only 900 b.h.p., plans had been laid for the manufacture of much larger units.

The first vessel, now completed, is to the order of the Danish company, A. S. Navitas, which is apparently a new shipping company established probably with the idea of trying out this new development. The engine is a seven-cylinder four-stroke trunk-piston type, to which gas is supplied from two generators. Apparatus is provided for crushing the coal, and gas coolers are provided. The general design of the engine is similar to that of a Diesel engine but without normal fuel valves and fuel pumps. A special design of gas inlet valve is employed. The producer plant is installed forward of the engine-room, and sufficient bunkers for operation at full speed for twenty days can be carried. Ordinary coal is utilized, and the consumption is 0.7 lb. per i.h.p. hour when using fuel having a calorific value of 7,000 B.Th.U. per lb. In port, current is obtained from a gas-engine dynamo, a small independent coal-fired gas producer being fitted. Arrangements can be made for converting the propelling engine to operate on Diesel fuel as a Diesel motor, and it is stated that this conversion can be carried out in about three days.

#### VARIABLE-PITCH PROPELLERS

The Swedish Johnson Line has ordered a 7,800 ton cargo passenger ship in which the normal fixed propellers will be replaced by variable-pitch propellers. There are to be two single-acting 3,500 b.h.p. engines, and the propellers are of the Kamewa type, which have now been adopted in about forty Scandinavian ships. As the largest of these has machinery of under 1,000 h.p. the new ship represents an important advance.

The design of the propeller is based upon that of the impeller of the well-known Kaplan water turbines, which are built in sizes up to 60,000 h.p. The movement of the blades to provide variation in pitch is effected by an oil-operated servo-motor enclosed within the hub of the propeller. Among the advantages hoped for is a higher overall propeller efficiency under all conditions of speed and load, since the blades can be fixed to give the most desirable pitch for any circumstances of operation. Complete control can be effected from the bridge, and the engines may be of the non-reversible type. Further, they will run at constant speed during all manoeuvres, starting and stopping during the manoeuvring period thus being avoided. It remains to be seen whether these advantages will outweigh the additional cost which apparently will necessarily be involved.

#### FRENCH PASSENGER LINERS

It is a curious fact of the war situation that while no large passenger liners are being built in any of the belligerent countries, work should continue on a vessel of this class in France. A 24 knot turbine-driven liner, Kairouan, built for the Marseilles-Tunis route, was launched a short time ago, and the propelling machinery of a much larger vessel, the Maréchal Pétain, has lately been completed. It is now stated that the Maréchal Pétain will be launched at the end of the year. She will be the highest-powered oil-engined passenger liner constructed in France, having a gross tonnage of 18,000, with a length of 594 ft. and a beam of 75 ft. 9 in. The three Sulzer propelling engines have been built in France at St. Denis, near Paris, and are each

designed to develop 8,300 b.h.p. at 131 r.p.m. They will normally give a speed of 20 knots, but the total output may be increased to 31,000 s.h.p. when required, this enabling a speed of 22 knots to be maintained for some hours. A remarkable feature of this ship is that all auxiliaries, including winches and other deck machinery, are to be driven by electric motors of the alternating current type.

#### HIGH-POWERED TUGS

Tugs of various types have been ordered in this country and America, and some of these vessels are now coming into commission. They are interesting from the point of view of the methods of propulsion employed. Several of the largest built in America employ Kort propellers, two 1,200 b.h.p. engines driving separate propellers through reduction gearing. The engines in this case are of the four-stroke pressure-charged type and are connected to the pinions of the reduction gear through electric couplings. In other still larger tugs there are four 950 b.h.p. high-speed engines driving dynamos which supply current to a single electric propelling motor. In yet another type utilizing electric propulsion two-stroke General Motors Diesel machinery is installed. These tugs have the further interest that the propelling motor is of the high-speed type and drives the propeller through reduction gearing.

### TRACTOR PLOUGHING BY NIGHT

From *The Engineer* (LONDON), SEPT. 4, 1942

In order to meet any future shortage of new tractors, likely to be brought about by the cutting down of the American and Canadian farm machinery manufacturing programmes, the Ministry of Agriculture, which is anxious to get the bulk of the increased acreage of wheat sown in this country by the end of November, recommends the use of night ploughing, wherever this can be arranged. The training of night-shift tractor drivers is to be begun, and the Ministry of Agriculture has collaborated with the Ministry of Home Security in drawing up regulations for the lighting of tractors by means of motor-car headlamps. The use of lighted tractors must in every case conform with the security limits. Experimental tests have shown that straightforward ploughing can be successfully carried out using one masked motor-car headlamp fixed near the bottom of the radiator, and another at the back of the driver's seat. In addition, the use of a masked torch will be permitted, in order to be sure that all is going well with the plough. Even with the amount of lighting permitted it is pointed out that in a general way turning at headlands and the marking out of fields and the making of finishing runs may be difficult. It is therefore recommended that fields to be ploughed by night should be marked out in daylight and the finishing runs left till the following morning. Some few tractors are already equipped with lighting sets, but in the case of most of the tractors it will be necessary to add headlamps and fixing brackets and a lighting dynamo or battery; 36-watt bulbs have been found satisfactory. Much of this equipment, it is stated, may be found on old motor scrap dumps. Although the number of tractors coming to this country will be reduced, and the manufacturing of lower-powered crawler tractors has been stopped in order to provide higher-powered tractors for military and civil engineering purposes, arrangements have been made to assure a sufficient quantity of spare parts to keep tractors already in service in good repair.

FIFTY-SEVENTH  
ANNUAL GENERAL MEETING  
AND  
GENERAL PROFESSIONAL MEETING  
THE ENGINEERING INSTITUTE OF CANADA

**Toronto** - *Thursday and Friday...  
February 11th and 12th, 1943*

**THE ENGINEER AND THE WAR**

*The Toronto Branch  
has set up a special  
committee*

under the chairmanship of  
W. S. Wilson, M.E.I.C., to handle  
all arrangements

*All sessions will be  
held at the  
Royal York Hotel,  
Front Street*

**PRELIMINARY PROGRAMME**

*Thursday, February 11th*

- 10.00 a.m.—Annual Business Meeting.
- 11.00 a.m.—Discussion of the work of the Committee on Engineering Features of Civil Defence.
- 12.30 p.m.—Luncheon—Address on: "The Alaska Highway," by Brig.-Gen. C. L. Sturdevant, Assistant Chief of Engineers, U.S. Army.
- 2.30 p.m.—Discussion on the work of the Committee on Industrial Relations.
- 7.30 p.m.—Banquet and Dance.

*Friday, February 12th*

- 10.00 a.m.—Discussion on The Application of Statistical Control to the Quality of Materials and Manufactured Products.
- 12.30 p.m.—Luncheon—Address on: "Canada's Wartime Achievements in Shipbuilding," by Desmond A. Clarke, Director-General of Shipbuilding, Department of Munitions and Supply.
- 2.30 p.m.—Discussion on Post-War Planning and Reconstruction.
- Evening— Joint Smoker with Association of Professional Engineers of Ontario.

*See the January Journal for full details*

### YOUNG ENGINEERS ON E.C.P.D. COMMITTEE

Some time ago a suggestion was made that the contribution of The Engineering Institute of Canada to the work of the Committee on Professional Training of the Engineers' Council for Professional Development might be increased if one or two members of the Institute were appointed to the junior division of the Committee.

J. W. Brooks, Jr. E.I.C.

On discussing this matter with Mr. Everett S. Lee, chairman of the Committee on Professional Training, and with Dr. R. E. Doherty, chairman of E.C.P.D., President Young of the Institute found them most sympathetic. The matter was then brought to the attention of E.C.P.D. Executive Committee, on October 17th, by Mr. Lee and, as a result, Dean Young was asked to submit the names of two of the younger members of the In-

stitute to serve on the junior committee.

At its meeting held at Headquarters on November 21st, Council approved of the recommendation submitted by Dean Young that the following members of the Institute be appointed to the junior division of the Committee on Professional Training of the Engineers' Council for Professional Development: J. W. Brooks, Jr. E.I.C., structural designer with H. G. Acres and Company, Niagara Falls, Ont.; and W. E. Brown, Jr. E.I.C., wire rope engineer, B. Greening Wire Company, Limited, Hamilton, Ont.

Mr. Brooks is an honour graduate in civil engineering of Queen's University of the class of 1939. He was president of the Civils Club and is a member of the class '39 permanent executive. For two years after graduation he was demonstrator and lecturer in civil engineering at Queen's University. For one summer he was employed on surveying and structural design by the Beauharnois Light, Heat and Power Company. He is a member of the executive of the Niagara Peninsula Branch of the Institute.

Mr. Brown is an honour graduate in civil engineering of the University of Toronto of the class of 1932. For the first year after graduation he was engaged in highway construction. The following year he joined the staff of the B. Greening Wire Company, Limited, spending some time in the plant and later being transferred to the engineering department. For the past five years he has been the wire rope engineer for the company. He is the nominee for the post of secretary-treasurer of the Hamilton Branch of the Institute for 1943.

W. E. Brown, Jr. E.I.C.

It is expected that these two young men will be most creditable representatives of the Institute on the committee and that their contribution, in presenting the point of view of the young engineer, will be most valuable.

### WASHINGTON LETTER

The War Production Board is again being reorganized. Mr. Donald Nelson has announced what almost amounts to a reconstitution of the board. Personnel and departments will be regrouped under the control of the office of the programme vice-chairman. The programme vice-chairman is Mr. F. Eberstadt, one time chairman of the Army and Navy Munitions Assignment Board. Governing all operations of the War Production Board is the Requirements Committee of which Mr. Eberstadt is also chairman. Directly under him in his capacity as programme vice-chairman are four major bureaus: Programme Bureau, including in its scope studies of supply, man-power, adjustment of programme and requirements, priority ratings and materials distribution systems; Facilities Bureau, which is responsible for construction programme, plant facilities, utilization of existing equipment and so on; Distribution Bureau, which is charged with the job of ensuring the continuity of flow of material; Resources Bureau, which will direct stockpiling, conservation, simplification, standardization, etc. The industrial branches of W. P. B. have been raised to the status of divisions. There are thirty-six of them and they have been placed directly under the control of the programme vice-chairman. Also under him, and exercising local authority, are twelve regional offices covering the United States. Aircraft, radio, shipbuilding and rubber divisions remain outside Mr. Eberstadt's scope.

Tied in with the reorganization of W. P. B. is the announcement of the new "Controlled Materials Plan." This is a newly evolved plan to control the distribution of certain critical materials and, through them, the whole production cycle. "Bills of Material" are to be prepared, showing the amounts of critical material in all the major commodities including both war requirements and civilian supply. The three critical materials chosen to inaugurate the plan are steel, copper and aluminum. All requirements both military and civilian will be produced for one of seven agencies: War Department, Maritime Commission, Aircraft Scheduling Unit, Office of Lend-Lease, Board of Economic Warfare and Office of Civilian Supply. These seven agencies have been termed "Claimant Agencies". Each agency will present its requirements to the Requirements Committee of the War Production Board. On the basis of the "Bills of Material", it will be possible to check the amount of critical material required to fill these programmes. The Requirements Committee, on the other hand, will be fully informed as to the available supply and the whole purpose of the plan is to "assure a balance between supply and demand of controlled materials, to the end that such materials shall be available in the quantity and form and at the time required to meet authorized programmes and schedules". If necessary, the programmes of the various Claimant Agencies are revised to suit supply. At the time of writing I have just spent a whole afternoon in conference with several others trying to understand and digest the 58-page W.P.B. pamphlet which explains the plan and sets forth the procedure. As may well be imagined, the mechanics of such a plan are very involved and it is not expected that it will be possible to put the plan

## INDUSTRIAL RELATIONS COMMITTEE

It was reported, at the last Council meeting, by the chairman of the Committee on Industrial Relations, that his committee had been requested to take charge of one of the sessions at the Annual Meeting of the Institute. It is planned to have two speakers—one dealing with the general Canadian situation, and one with the scientific approach to the problems of employee relations. Arrangements are not yet completed for the Canadian presentation, but Professor M. S. Viteles, associate professor of psychology, University of Pennsylvania, and director of personnel research and training of the Philadelphia Electric Company, will present a paper entitled "A Scientific Approach to the Problems of Employee Relations."

It would appear, as a result of a survey made by the committee, that none of the Canadian universities "offer courses to engineering students ample enough to serve the needs of modern industry with respect to industrial relations," and that often, such courses as are offered are not fully taken advantage of by the students. Realizing the importance of such a subject in time of war, as well as afterwards if industrial peace is to be maintained, the committee asked authorization from Council to communicate with the universities, urging them to organize courses in industrial relations. While it was realized that the engineering curricula were already heavily loaded, it was thought that perhaps it might be possible, at some universities, to arrange for extra-mural courses on this subject, perhaps in the evening, so that graduate engineers might attend. The attendance at courses in personnel management instituted in some of the universities this year would indicate that there is a large demand for such activities.

Accordingly, Council authorized its committee to communicate with the universities, drawing attention to the great desirability of giving adequate consideration to matters of industrial relations in courses for undergraduate or graduate engineers. The Canadian universities have been circularized and have been informed of the committee's desire to be of assistance to them in such matters.

At a meeting of the committee held at Headquarters on November 25th, it was agreed that the following statement, written by the Archbishop of Canterbury, and published recently in an American magazine, should be reproduced in the *Journal* for the benefit of all members.

### THE FULL DEVELOPMENT OF INDIVIDUAL PERSONALITY

The structure of life as we knew it before the war has already been profoundly modified. How far do we want to restore it if we can?

The task of the Church in face of social problems is to make good Christian men and women. That is by far its most important contribution.

But it is also part of the duty of a Christian to judge how far particular evils are symptoms of a disease deeper than the evils themselves.

Thus, in the economic field, goods are produced so that men can satisfy their needs by consuming them. If a system comes into being in which production is regulated more by profit than by the needs of the consumer, that system is symptomatic of something wrong.

There is nothing wrong about profits as such. It has always been recognized that both the producer and the trader are entitled to a profit which they have earned by their service to the community. But it is possible, nonetheless, for these two to get in the wrong order. Then the consumer is treated only as a *means* to success . . . whereas he ought to be considered the *wholes end* of the process.

If that is true, it is the duty of Christians to become aware of it and to demand a remedy. I offer these suggestions as a goal to aim at immediately:

1. Every child should find itself a member of a family

housed with decency and dignity, so that it may grow up as a member of that basic community in a happy fellowship unspoiled by underfeeding—or over-crowding, by dirty and drab surroundings—or by mechanical monotony of environment.

2. Every child should have the opportunity of an education till years of maturity, so planned as to allow for his peculiar aptitudes and make possible their full development. This education should be inspired by faith in God and find its focus in worship.
3. Every citizen should be secure in possession of such income as will enable him to maintain a home and bring up children in such conditions as are described in paragraph 1 above.
4. Every citizen should have a voice in the conduct of the business of industry which is carried on by means of his labour, and the satisfaction of knowing that his labour is directed to the well-being of the community.
5. After the war, every citizen should have sufficient daily leisure, with two days of rest in seven, and, if an employee, an annual holiday with pay, to enable him to enjoy a full personal life with such interests and activities as his tasks and talents may direct.
6. Every citizen should have assured liberty in the forms of freedom of worship, of speech, of assembly, and of association for special purposes.

Utopian? Only in the sense that we cannot have it all to-morrow. But we can set ourselves steadily to advance towards that six-fold objective. It can all be summed up in a phrase: *The aim of a Christian Social order is the fullest possible development of individual personality in the widest and deepest possible fellowship.*

I should give a false impression of my own convictions if I did not here add that there is no hope of establishing a more Christian social order except through the labour and sacrifice of those in whom the Spirit of Christ is active.

(Signed) WILLIAM CANTUAR,

(Archbishop of Canterbury.)

## ACTIVITIES OF THE CIVIL DEFENCE COMMITTEE

At the November meeting of Council, the chairman of the Committee on the Engineering Features of Civil Defence presented a progress report from which the following notes have been extracted for the information of all members.

Through the Edmonton Branch Committee, Professor I. F. Morrison, of the University of Alberta, has offered to let anyone make suitable use of a lecture and slides which he has prepared in connection with the Webster Toronto lectures. This lecture has already been presented before several branches and is reported to be very interesting.

At the request of Mr. E. P. Goodrich, chairman, American Society of Civil Engineers National Committee on Civilian Protection in Wartime, the A.S.C.E. has been sending to the Institute Committee a substantial volume of very interesting literature, including U.S. Office of Civilian Defence specifications and bulletins and much other material. Branch Committees have been advised of the existence of this information, which is on file and can be secured for perusal from Headquarters.

Headquarters has issued a small number of copies of "Structural Defence Against Bombing" to Branch Committee chairmen on consignment. The demand for this publication, 510 copies of which have been purchased by Dr. Manion, has been such that the first printing of 1,000 copies has been exhausted. A second printing had to be ordered and is now available.

A joint committee representing the Royal Architectural Institute of Canada, the Canadian Construction Association and the Institute, has prepared a memorandum on the engineering features of civil defence in Canada, accompanied by an organization chart, all of which is intended to cover that portion of the civil defence field lying between the field covered by Dr. Manion's A.R.P. organization and that covered by the armed forces. It has also prepared a letter of transmissal to the Rt. Hon. W. L. Mackenzie King, Prime Minister of Canada. Both documents were signed by Mr. J. B. Stirling, president, C.C.A., Mr. Gordon McL. Pitts, president, R.A.I.C., and Dean C. R. Young, president, E.I.C., and transmitted to the Prime Minister under date of November 3rd, 1942. Acknowledgment has been received from Mr. H. L. R. Henry, Private Secretary to the Prime Minister, stating that the submission will receive early consideration by the War Committee of the Cabinet.

#### BRANCH COMMITTEE REPORTS

The committee, under the chairmanship of Mr. I. P. Macnab, which is serving as the Branch Committee for both the Halifax and Cape Breton Branches, has set up sub-committees to deal separately with six divisions of its work, as follows:

1. Shelters.
2. Incendiary bombs and emergency fire protection.
3. Strengthening existing buildings, repairs to existing buildings in case of damage, and design of new industrial buildings.
4. Protection of industrial plants and buildings.
5. Public utility services.
6. Railways, highways and transportation generally.

The London Branch Committee, under the chairmanship of Mr. H. F. Bennett, reports that a meeting of its representatives from London, Woodstock, St. Thomas and Stratford was held on November 5th. In London, members of the Institute form the greater part of the local A.R.P. Committee and are specially responsible for the organizations covering gas, shelters, utilities and demolition. Six members are speaking weekly to A.R.P. posts on these matters. On the evening of November 5th, a semi-public meeting of the Branch, attended by A.R.P. officials from London and St. Thomas, was addressed by Mr. H. F. Bennett on the structural aspects of civil defence. Mr. Bennett is to address the St. Thomas Kiwanis Club early in December on this subject. The committee believes it is making progress in London and that similar progress will follow at Woodstock, St. Thomas and Stratford in due course.

On page 580 of the October *Journal*, a list of the British Standards, A.R.P. Series, was published. The chairman of the Institute Committee on the Engineering Features of Civil Defence has secured, through the secretary of the Canadian Engineering Standards Association, information on the applicability of these specifications in Canada. This appears under Library Notes in this issue.

The following additions have been made to the library of the Institute since publication, on page 580 of the October *Journal*, of the list of literature available on Air Raid Precautions and Civil Defence:

**Great Britain. Ministry of Home Security—Research and Experiments Department—Bulletin:**

*No. C11—Kilo magnesium bombs and resultant fires—Use of chemical fire extinguishers. 2nd ed. Aug. 19, 1942.*

**Great Britain. Dept. of Scientific and Industrial Research—Building Research—Wartime Building Bulletin:**

*No. 14—Centreless arch designs.*

**American Gas Association:**

*War protection of the gas industry.*

The following material consists of pamphlets and leaflets on the subject of air raid precaution and civilian defence. For convenience it is arranged by subject.

**Protection against gas:**

*U.S. Office of Civilian Defence, Dec., 1941. 74p.*

**E. P. Goodrich:**

*A.S.C.E. National Committee on Civilian Protection in Wartime Bulletin for May 13, 1942, re gas masks and gas.*

**Mechanism of action of ordinary war gases:**

*C. D. Leake and D. F. Marsh. Excerpt from "Science" for August 28, 1942.*

**Pliofilm:**

*Dr. A. B. Ray.*

**How to protect yourself against gas:**

*U.S. Office of Civilian Defence, operations letter No. 46, June 9, 1942.*

#### BLACKOUTS

**A new blackout bulb:**

*Excerpt from "Science" supplement, April 3, 1942.*

**Traffic control signals during blackouts:**

*Institute of Traffic Engineers.*

#### CAMOUFLAGE

**Camouflage:**

*Paper delivered by Greville Hickard. U.S. Office of Civilian Defence, May, 1942.*

**Industrial camouflage:**

*Excerpt from Engineering News Record, July 30, 1942.*

#### TRANSPORTATION

**Local passenger transport:**

*U.S. Chamber of Commerce, Transportation and Communication Dept., April, 1942. 13p.*

**Conservation of vital war transportation:**

#### BIBLIOGRAPHIES

*References that have been found useful to the National Chairman of the A.S.C.E. National Committee on Civilian Protection.*

At its last meeting the Institute Council approved a memorandum submitted by the Committee on Professional Interests, setting forth certain amendments which are thought desirable to facilitate the operation of the agreement now existing between the Institute and the Association of Professional Engineers of Saskatchewan.

It is gratifying to both parties to note that the agreement has been found to work so satisfactorily as regards all its main provisions. But those responsible for drafting a document of this kind could not be expected to foresee all the possible contingencies or changes of conditions which might arise, or to provide for remedial action in every conceivable eventuality.

Experience gained in the practical working of the several agreements now in force has naturally brought to light minor omissions which have been taken care of in drafting the later agreements. It will be remembered that the Saskatchewan Association was the first to enter into a co-operative agreement with the Institute; its formal signature having taken place in Regina in October, 1938.

In fact a few unforeseen minor difficulties have been found in connection with the operation of the Saskatchewan agreement. They have been considered by the Institute Committee and by the Association, and amendments to cover them have now been approved by the Councils of the two bodies concerned.

These amendments deal with three points:—

*First*, the agreement already provides for the payment to the Association of a single annual joint membership fee, covering membership in both bodies. The original intention was that this arrangement would apply only to persons permanently residing in the province, but the wording of the agreement did not make this clear. An amendment to clause six now does so, by adding the words "and shall apply only to permanent residents of the province of Saskatchewan."

*Second*, under the agreement, members of the Institute may join the Association without paying its admission fee, if application is made within twelve months of taking up residence in the province. In effect this means that if he applies after the twelve-month period, an Institute member must pay the regular Association admission fee. An amendment now provides that in such a case, the Institute member may enter the Association on payment of the difference between the regular Association entrance fee and the amount he has already paid to enter the Institute, an arrangement which is a reasonable one.

*Third*, there has been some question as to the legality in Saskatchewan of any disciplinary action which might be taken by the Institute against a joint member in the province. The original clause seven of the agreement will be repealed and a new clause substituted, making it clear that nothing in the agreement shall prevent either party from exercising the rights conferred by its charter and by-laws as regards the disciplining, suspension or expulsion of any of its members.

In case of a joint member, however, neither party is to take final action until it has furnished the other party with sufficient information to decide whether the circumstances warrant its taking action also. In other words, separate disciplinary action by the Institute and the Association is provided for.

The Institute Council, having approved the proposed memorandum of amendment to agreement, has authorized the president and general secretary to sign the document on behalf of the Institute.

Verdun S.A.A. Plant,  
425 River Street.  
Verdun, Que.  
October 27th, 1942.

Secretary,  
The Engineering Institute of Canada,  
Montreal, Que.

Dear Sir:

With reference to Mr. D. C. Tennant's paper on bombing and structural defence given in Montreal on the 22nd instant (published in this issue), during the discussion period one of the members submitted a question relating to an apparent anomaly appearing in the tabulation of depth penetration of bomb fragments, resulting from both light case and heavy case bombs in soft timber and gravel, which question Mr. Tennant did not have time to answer.

Probably the following information may clear up this matter:

Primarily, it must be understood that many of the tabulated figures given by Mr. Tennant were derived from experimental and laboratory type-tests taken under assimilated conditions and not from actual bombing, from which latter it is almost hopeless to expect to secure accurate and conclusive data. Further, in taking laboratory type-tests on explosive missiles, such as bombs and shells, the results obtained from two similar types of bombs are often very dissimilar; no two explosions producing the same result.

Only the mean of many tests and experiments can be taken as a basis for tabulation. Further, a number of factors are introduced which may or may not occur under actual bombing conditions. All such data should, therefore, be accepted as purely empirical and with such it is practically impossible to differentiate to any degree of exactness, the two effects of fragments striking different materials.

The three most important factors likely to affect depth of penetration are: First, the brizant qualities of the bomb casing irrespective of whether it is a light or heavy case; second, the superficial area of the face of the fragment on impact; and third, the quality of explosive and its degree of tamping in the bomb at the time of detonation.

The number of fragments of all sizes of bomb, range between 2,000 and 6,000 of all shapes and sizes. The maximum velocities obtained (under experimental conditions) lie within the limits of 4,000 and 7,000 feet per second, and are reached within less than ten feet from the bomb.

The depth which a given fragment will penetrate may be taken to vary (only as very approximately) inversely as the specific gravity of the material hit.

As far as penetration in wood is concerned, a purely empirical formula has been derived and is used only for statistical purposes. In its use, large differences must be allowed for, due to numerous influences affecting the penetration especially if it is desirous to make comparisons, as our friend was attempting to do.

This formula may be of interest to Mr. Tennant and other members, and is given as follows:

Assuming:  $D$ , depth of penetration in inches,  
 $M$ , mass of fragment in ounces,  
 $V$ , velocity of fragment in ft. per sec.,  
 $A$ , area of the face of fragment presented to the target;

$$\text{then: } D = \frac{K \times M \times V}{A}$$

$K$ , being a constant for the material relative to the functions of density and resiliency, for normal soft woods such as fir, is equal to  $1.4 \times 10^{-3}$ .

By taking the specific gravity of fir at .53 and gravel at 2.0, the constant  $K$  would approximate for gravel.  $37 \times 10^{-3}$ , and neglecting the other multitude of variables likely to affect penetration, it will be seen that if a fragment of the same type, size and face area could be made, through explosive action, to strike the two different materials at exactly the same angle, it would be reasonable to expect that penetration in the timber would approximate a depth of four times that of the depth in gravel, but taking all factors into consideration and noting the fact that it is a well established ballistic axiom that loose material has a greater stopping effect on bullets and fragments than monolithic or solid material, the result as a whole is a problematic uncertainty.

Yours very truly,

(Signed) CAPT. A. C. RAYMENT, M.S.M., M.E.I.C.

THE KING vs PARADIS AND FARLEY

University of Toronto,  
Toronto, Ont.,  
November 26, 1942.

The Editor,  
*The Engineering Journal*,  
Montreal, Que.

Dear Sir:

In the November issue of the *Journal*, Mr. E. P. Muntz presents some interesting comments upon the Supreme Court judgment in the case of *The King vs Paradis and Farley*, previously published in the September issue.

As would be obvious to all who read the Supreme Court judgment, this case is one of great importance to engineers. In view of this, and of familiarity with the case, I had promised to write a brief summary for the *Journal* when time permitted. Unfortunately, the pressure of other work has so far prevented the preparation of this summary, but I venture to mention the matter in this way, with a promise of its submission as soon as possible, in view of certain statements of Mr. Muntz.

In his letter, Mr. Muntz says that he may "have been misled by improper information." As the Supreme Court judgment did not go into technical details, it is rather the lack of information that has led Mr. Muntz to say "That His Majesty or any owner should retain or employ engineers, and then by outrageously one-sided contractual obligations attempt to safeguard the owners from all possible errors, omissions or misjudgments of the engineers, appears to me grossly unjust to the contractor, apart from being a very terrible reflection on the integrity and capabilities of the engineers."

Although probably not so intended, this statement as published appears to relate to the Paradis and Farley case, and so to the Department of Public Works of Canada. As the facts of the case were exactly the reverse of Mr. Muntz's suggestion, I would ask you to publish this letter, as a correction to possible misunderstandings, pending the publication of full details of the case in question.

Yours truly,

(Signed) ROBERT F. LEGGET, M.E.I.C.

1538 Sherbrooke Street W.,  
Montreal, Que.  
November 28, 1942.

The Editor,  
*The Engineering Journal*,  
Montreal, Que.

Dear Sir:

I have received from Mr. R. F. Legget a copy of his letter dated November 26, addressed to you.

Reading my letter in the November issue of the *Journal*, in the light of Mr. Legget's letter, it appears that I must emphasize the bases of my argument, though I am convinced they are self-evident. They are the full written judg-

ment, as well as the summary appearing in the September issue of the *Journal*, and the first two sentences of the second paragraph of my letter, "The learned judges say that the contractor was obligated to drive piles in a specified location, not in a specified material. Suppose the test borings, which were probably not closer than 100 ft., by chance did not in any way represent the material, and it developed that piles could not be driven at all instead of at some additional cost."

My argument then developed from the hypothesis, it seems to me abundantly clear that I had reference to the iniquitous practice of giving information, and at the same time disclaiming responsibility for such information.

There is no reflection on any individual in my letter, except insofar as the individual may be party, tacitly or otherwise, to the custom too often practised by our various Departments of Public Works and others. This practice, I am firmly convinced is wrong, unjust to the profession and unfair to the contractor.

I appreciate Mr. Legget's letter, since it helps to give more emphasis to my argument. He, however, is guilty of misquoting, both directly and by inference. My letter stated clearly, that "I have been misled by improper information," not that I may have been misled. Mr. Legget joins this reference in his second paragraph with context with which it was not associated in my letter, and infers that this context was predicated upon *The King vs Paradis and Farley Incorporated*, whereas the context is general. "As I see it, the contractor buys every job for which he signs a contract" immediately precedes in my letter the second quotation given by Mr. Legget.

Technical details preceding the judgment have nothing to do with my contention that it is wrong to publish information on plans or in specifications which cannot be readily verified by a contractor, and then to disclaim responsibility for such information.

The information given in the case of the work reviewed in *The King vs Paradis and Farley Incorporated* may have been of the highest order, and responsibility may have been assumed for it.

The fact still remains that it is wrong to give such information unless responsibility is assumed for it.

Yours very truly,

(Signed) E. P. MUNTZ, M.E.I.C.,  
Past President, National Construction Council.

Here are some additional letters received at Headquarters thanking council for its action in remitting again this year the fees of members in combatant areas, as an appreciation of the privations and disturbances to normal living that they are enduring. Some of these letters contain invitations to members on active service overseas.

26 Irwin Road, Bedford.  
(rec'd Sept. 16th, 1942)

Dear Mr. Wright,

I greatly appreciated your kind letter of June 1st, and the decision of Council to continue the remission of fees of members of the Institute resident in England. I need hardly say that it was owing to severe indisposition that I did not acknowledge your letter at the time. It is cheering to feel that fellow members are animated by goodwill to us here. You may have read that the enemy claimed to have bombed us here in Bedford. Well, I must admit that my garden fence was damaged, but it is not beyond repair!

I have been receiving copies of the *Journal* regularly, and am interested to hear of progress of the Institute, and the doings of members.

With all good wishes and thanks,

Yours sincerely,

(Signed) C. O. THOMAS, M.E.I.C.

"Goyt Bungalow,"  
Church Hill, Helston,  
Cornwall, July 25th, 1942.

c/o Canada House,  
Trafalgar Square,  
London, S.W.1., July 19th, 1942.

Dear Mr. Wright,

I have to thank you for your letter of June 1st and wish to express my sincere appreciation of the Institute's generous consideration for those of us resident in this country. I feel that my inclusion amongst those accorded this generous treatment is somewhat like obtaining money under false pretences as I must consider myself a permanent resident in this country and therefore not strictly entitled to special consideration.

Although an Englishman by birth I was only a child when I went to Canada where I received all my education so that I have a sort of mental resentment as not being able to call myself a Canadian but I can, at least, appreciate the wonderful effort Canada has made much more than those to whom Canada is either but a name or a place where they have some relatives living there "somewhere." It is—or should I say "was"—a great pity that those of either side of the water knew so little about those on the other side and it is to be hoped that one of the good results of this war will be to bring to both Canadians and English a better appreciation of each others qualities.

Your kind offers of assistance are very greatly appreciated but it would please me far more to be of some help to some of our Members who are over here on War Service. Unfortunately, I am not now residing at my own home as I took over a wartime job here in Helston and have no spare accommodation. My wife and I do what we can in a small way to extend hospitality to the few Canadian personnel (mostly airmen) who happen to be on duty in this area and I would like to suggest that Members of the Institute proceeding overseas to England be given a list of the names and addresses of those of us ordinarily resident in this country; I am quite sure I speak for us all when I say we should be delighted to meet any colleagues who find themselves in our neighborhood and would welcome the opportunity of entertaining them to the best of our ability under existing conditions.

For the "duration" I am filling a post as Assistant Divisional Surveyor to the Cornwall County Council on highway maintenance. After the war I have great hopes of being able to visit Canada and am considering moving my family over there for good.

You will be interested to hear I have received every copy of the *Journal* in due course and look forward to its arrival.

Please accept my very sincere good wishes for the welfare of the Institute and its Members.

Very sincerely yours,  
(Signed) BERNARD H. HUGHES, M.E.I.C.

Kitwe, N. Rhodesia,  
August 15th, 1942.

The General Secretary,  
The Engineering Institute of Canada,  
Montreal, Que.

Dear Mr. Wright,

It is indeed gratifying to learn of your decision to continue remitting the annual fees of members resident in the combatant areas, although we at Kitwe are not nearly so affected by hostilities as are members at home, except, of course, that we are very intimately concerned with the fabrication of the wherewithal to oust the Hun.

"Thanks to the Navy," *The Engineering Journal* continues to reach me regularly and affords me much enjoyment. It keeps me in touch with activities at home.

Your good wishes and kind thoughts are appreciated and reciprocated and I shall certainly avail myself of your very kind offer of assistance should the occasion arise.

With best regards,  
Yours sincerely,  
(Signed) A. M. MORTON, M.E.I.C.

Dear Mr. Wright,

This is to acknowledge with much thanks your letter dated June 1st on behalf of the Institute. I am sure that the provision made to us over here is universally and heartily appreciated though a good many of us would no doubt be glad to get back.

More than once you have asked me for illuminating letters on what I am doing, but of late, particularly, a rather strict censorship prohibits that, and all I can do is more or less generalize.

For the past year, I have been on operational duty in Iceland, and only just left quite recently. The job on land not being too all-absorbing, a few of us managed to see something more of it than others, and one, being an experienced geologist was able to show us a good many interesting features. The basic structure of the whole island is volcanic, and we can see that everything in the way of life and habitation hinges around that fact and is limited as a result. Some of us were fortunate to get a glimpse of Greenland, too, though our American friends, being established there, could be much more informative as to that.

Having finished my first operational tour, I have been brought back to the Home Forces, and am in the process of becoming a staff pilot, instructing at an operational training unit. The Air Ministry calls it a "rest," but it will mean anything but an easy time, it is merely a rest from operational duty. However, it all means assimilating more knowledge, and even passing it on where it can be of use. Hope that at a not-too-distant date that I will be able to pass on some of it to be of use to some one or to some section of the Institute.

Again let me express my appreciation to you, and the Council, for your thought. I trust I can put that appreciation into more concrete form when I am able to take a more active part in the programme and doings of the Institute.

Until then, I remain,

Yours sincerely,  
E. B. A. LEMAITRE, S.E.I.C.

56 Cathedral Road,  
Cardiff, 1st July, 1942.

Dear Mr. Wright,

I thank you very much for your letter of June 1st, and assure you that we fellows in England who are members of the Institute greatly appreciate the support and goodwill of our Canadian colleagues.

I think that in remitting our annual subscription the Institute shows a most patriotic spirit, not only to its members but to the great Commonwealth to which we all belong.

*The Engineering Journal* has been arriving month by month and I enjoy it tremendously, not only from the technical aspect but often in its pages I run up against old friends, particularly when dealing with matters out in the West.

You will remember that I lost my home in one of the air-raids and therefore had to change my address. The *Journal* and correspondence are still going to the old address—would you therefore, please note that I now live in 67 Ninian Road, Roath Park, Cardiff; and for the purpose of your records I am now engaged in the Civil Service as Deputy Area Officer (Wales) of the Machine Tool Control.

With regard to the end of your letter, I myself am looking forward to the day when I shall be able to meet some of my old colleagues in Canada and some of the numerous friends I have who live south of the border.

Yours sincerely,  
(Signed) C. H. OAKES, M.E.I.C.

Dear Mr. Wright,  
14 Cotham Lawn Road,  
Bristol, England, 1st July, 1942.

Many thanks for your letter of 1st ult. I appreciate very much the Institute's kindly gesture in the matter of membership fees, but really things are not quite so bad in the Old Country as one might imagine, and we are carrying on quite comfortably.

I am glad to say I am receiving the *Journal* regularly, and look forward to it very eagerly as practically the only link, at present, with Canada. I am still trying to get back into the service, with the R.E. or the R.C.E., with both of which I have served, but I am told I am too old. Although I am still physically fit and able-bodied and have had nearly 25 years military engineering experience, in addition to my civil work.

For your information my present engagement is resident engineer on construction of new reinforced concrete oil berths somewhere in England.

I should like to get in touch with any members who are now in England, if you can let me know where to find them. With regard to the last paragraph of your very welcome letter, you may be sure that I shall not hesitate to apply to you for any information or advice I may need in the future.

I am,

Sincerely yours,

(Signed) A. G. ASHFORD, M.E.I.C.

Southern Railway,  
Chief Electrical Engineer's Office,  
Deepdene Hotel, Dorking, Surrey,

Dear Mr. Secretary,  
2nd July, 1942.

I am in receipt of your letter of the 1st instant and wish to assure you that the gesture of the Council in remitting the annual fees of members resident in the United Kingdom is very much appreciated indeed.

When your first notification to this effect reached me a year ago, I was so impressed by the gesture that I showed your letter to a number of engineering colleagues who were equally impressed.

*The Engineering Journal* arrives regularly and I find that it contains much of interest.

With best wishes to the Institute and to you, personally,

Yours truly,

(Signed) H. C. BECK, M.E.I.C.

11 Glencairn Dr.,  
Glasgow, S.1. (rec'd July 27th, 1942.)

Dear Mr. Wright,

I have to thank you for your very kind letter of the 1st June in which you give notice that the Council have graciously resolved to continue the practice of remitting the annual fees of members residing in the United Kingdom.

I can assure you that this gesture of goodwill and your kind reference to the difficult conditions under which we are living is greatly appreciated.

*The Engineering Journal* which reaches me regularly is, I find, most interesting as it keeps me in touch with the current engineering undertakings and its has brought home to me the heartening evidence that the Engineers of Britain who are putting forth their maximum effort to win the war are being whole-heartedly supported by the enormous contribution to the war effort by the engineers of Canada.

When the wastage of war and the din of battle is past and we can again settle down to more noble undertakings, I am sure, if we maintain the same spirit of co-operation and understanding, the engineers of the Empire will be able to take their places in the rebuilding of a better and happier world.

Most kind regards.

Yours sincerely,

(Signed) JOHN SHANNON, M.E.I.C.

e/o Royal Bank of Canada,  
6 Lothbury, London, E.C.

May 7th, 1942.

The General Secretary,  
The Engineering Institute of Canada,  
Montreal, Que.

Dear Sir,

Your letter to my husband came a few days ago and, as I am looking after things generally for him while he is abroad, I opened it. I am sending on your letter to him, but as it will take so many months to reach him, I felt I should acknowledge it. I am sure that my husband, as all other members of the Institute here, will greatly appreciate your most generous action.

Last year he was recalled to the R.E. and is now in India with railway troops. In case you are interested his address is:

Major C. B. R. Macdonald, R.E. (M.E.I.C.),  
No. 2 Trans Training Centre,  
Jullunder Cantonment,  
Punjab, India.

Yours sincerely,

(Signed) MRS. C. B. R. MACDONALD.

I.C.I. (Alkali) Limited,  
Middlewich, Cheshire,  
England, July 7th, 1942.

Dear Mr. Wright,

Thank you very much for your cordial letter dated June 1st, in which you notify me of the remission of fees to the Institute for the duration of the war.

I was greatly interested to read the inspiring address given by General McNaughton at the annual meeting.

I heartily reciprocate your good wishes, and remain,

Yours sincerely,

(Signed) G. H. BRUNNER, M.E.I.C.

#### MEETING OF COUNCIL

A meeting of the Council of the Institute was held at Headquarters on Saturday, November 21st, 1942, at ten thirty a.m.

*Present:* President C. R. Young in the chair; Vice-Presidents de Gaspé Beaubien and K. M. Cameron; Councillors J. E. Armstrong, E. D. Gray-Donald, J. G. Hall, R. E. Heartz, W. G. Hunt, C. K. McLeod and G. M. Pitts; Treasurer E. G. M. Cape; Secretary Emeritus R. J. Durley, General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel.

Mr. Hall and Mr. Gray-Donald were appointed scrutineers to canvass the ballots for the award of the Julian C. Smith Medals. They presented their report and accordingly, Julian C. Smith Medals for the year 1942 will be awarded to—

H. G. ACRES, M.E.I.C.,  
Consulting Engineer,  
Niagara Falls, Ont.

R. M. SMITH, M.E.I.C.,  
Deputy Minister,  
Department of Highways, Ontario,  
Toronto, Ont.

Mr. Wright reported that he had investigated the possibilities of getting dies made for the new medals. He had found out that it might be possible to get the dies cut providing there was no great hurry about it. It was proposed that the actual designs might be proceeded with but that the matter be given more consideration before it was decided to go ahead with the making of the dies. It was also agreed that further consideration of the entire matter be left in the hands of Mr. Durley and the general secretary, and that they report at a subsequent meeting of Council.

To comply with the by-laws, it was unanimously resolved that the Annual General Meeting be convened at Headquarters on Friday, January 15th, 1943, at eight o'clock p.m., the meeting to be adjourned and re-convened at the Royal York Hotel, Toronto, Ontario, at ten o'clock a.m., on Thursday, February 11th, 1943. It was noted that the president would preside at this meeting and would afterwards be the principal speaker at the meeting of the Montreal Branch.

President Young reported briefly on the progress being made by the Annual Meeting Committee. Past-President Gaby had accepted the chairmanship of the Finance Committee, replacing Mr. Ross Robertson who had passed away recently. For one of the technical sessions an effort was being made to secure one of the United States Army Officers who had been associated with the work on the Alaska Highway.

The general secretary read a report from the Committee on Post-War Problems, transmitting the various suggestions and recommendations received from the Institute branches on the form entitled "Considerations for Evaluating Projects," which had been prepared by Mr. K. M. Cameron's sub-committee on Construction of Dr. James' committee on Re-Construction.

From the report it appeared that the majority of the branches, after considering the matter, had found the proposed form generally acceptable, although several branches had made certain suggestions and recommendations. The committee had not made any pronouncement as to whether or not, in its opinion, such changes were desirable.

After discussion, on the motion of Mr. Pitts, seconded by Mr. Hartz, it was unanimously resolved that the report be accepted and that Council transmit to Mr. Cameron's sub-committee the assurance that The Engineering Institute of Canada generally approves of the document, but submits certain suggestions and recommendations for consideration.

A further report was presented from Mr. Miller, advising that his committee, in accordance with the authority given at the last meeting of Council, had written to all Institute branches, suggesting that they encourage their members to interest themselves in the work of the local committees set up under the auspices of the Department of Pensions and National Health to study problems concerned with the rehabilitation of returning soldiers. The report was noted and the secretary was directed to thank Mr. Miller and his committee for their interest in this activity.

In presenting two progress reports, Mr. Armstrong, Chairman of the Committee on the Engineering Features of Civil Defence, asked if Council had any suggestions to offer as to the dates on which these monthly progress reports should be presented. There had been some difficulty in selecting a date which fitted in with the date of the Council meeting, and the dead line for publication in the *Journal*. President Young assured Mr. Armstrong that the reports would be very acceptable at any time convenient to the committee.

Mr. Armstrong then presented two reports, dated October 24th and November 19th respectively, commenting upon the more important items in each.

It was noted that the memorandum on the Engineering Features of Civil Defence in Canada, accompanied by an organization chart prepared by a joint committee representing the Royal Architectural Institute of Canada, the Canadian Construction Association and the Engineering Institute of Canada, had been signed by the Presidents of the three organizations and transmitted to the Prime Minister under date of November 3rd. Acknowledgment had been received from the Prime Minister's private secretary, stating that the submission would receive early consideration by the War Committee of the Cabinet.

As this was a very lengthy document, it was decided that it should not be read to the meeting. Mr. Armstrong pointed

out that if any member of Council was particularly interested, a copy was available, although at the present stage, it was not available for publication. He expected that at a later date it would be possible to send a copy to the branches and to all members of Council.

It was noted that the financial statement to October 31st, 1942, had been examined and found satisfactory. Six thousand dollars had been invested in the Third Victory Loan Bonds.

It was noted that a suggestion from the Joint Finance Committee in Alberta that the Institute make a total rebate of \$20.00 for the year 1942 to the Lethbridge Branch in order to bring their total rebates from the Institute and the Association up to the minimum of \$100.00, had been approved by the Institute's Finance Committee.

A letter had been received from P O E. S. Braddell, M.E.I.C., suggesting that further consideration be given to remitting the fees of members in the active forces while serving in Canada. On the recommendation of the Finance Committee it was decided that no change should be made in Council's present policy of remitting the fees of members only when service requires them to leave Canada for overseas.

The general secretary read a telegram from the Toronto Branch executive urging that the \$1.00 charge for *The Engineering Journal* to members overseas be cancelled and that copies of the *Journal* be sent free to all such members.

In Colonel Cape's opinion very few of the members serving overseas would have the time or convenience to read the *Journal*, and those who had the time would be quite willing to pay the small charge of \$1.00. Following some discussion, it was decided that no change should be made in Council's present policy in this respect.

The general secretary read a letter from Dr. Challies, chairman of the Institute's committee on Professional Interests, submitting a proposed "Memorandum of Amendment to Agreement" between the Institute and the Saskatchewan Association, and recommending that this Memorandum be approved.

These proposed amendments have already been approved in principle by Council, and on the motion of Mr. Beaubien, seconded by Mr. Pitts, it was unanimously resolved that the proposed Memorandum of Amendment to Agreement be approved, and that the President and General Secretary be authorized to sign the document on behalf of the Institute.

Mr. Wright presented a letter from Mr. A. B. Parsons, Secretary of the Engineers' Council for Professional Development, with which he enclosed a copy of a proposed "Canons of Ethics for Engineers." This had been prepared by the Committee on Principles of Engineering Ethics under the chairmanship of Dr. Dugald C. Jackson, and was being referred to the constituent bodies of E.C.P.D. with a request for comments and suggestions.

Mr. Wright read a letter from Dr. Challies, one of the Institute's representatives on the committee of E.C.P.D., giving his views on the proposed "Canons of Ethics for Engineers," and suggesting that Council might take one or other of the following courses:

- (a) Reference to a special committee of Council and others to be named by the President.
- (b) Reference to the Branch Executive Committees.
- (c) Consultation with those provincial associations with which the Institute has agreements.
- (d) Discussion at the next Annual General Meeting.

A letter was also presented from Dr. Surveyer, another of the Institute's representatives on the executive committee of E.C.P.D., suggesting that the Institute should approve in principle the Canons as drafted by Dr. Dugald C. Jackson, and his committee, on which the Institute was represented by President C. R. Young.

Discussion followed as to the best way of securing the opinion of the Institute membership on the proposed Canons of Ethics. In President Young's opinion, it would be very desirable to have a statement of ethics subscribed

to by all the constituent bodies of E.C.P.D., but he realized the difficulty of obtaining an absolutely unanimous opinion on the matter. The present draft was the fourth or fifth which had been prepared, and it had been carefully reviewed and rewritten before presentation at the annual meeting. The main criticism now was that it was too long.

One member of the committee had thought that a code of ethics should consist of about ten short items, but the majority opinion was that as a code would be of more direct importance to the younger engineers, it should embody a certain amount of instruction and guidance which could not be incorporated in a shorter code. Another suggestion had been that an abstract of the thirty-one canons of ethics might be prepared for the use of anyone desiring a shorter code.

Following further discussion, on the motion of Mr. Hertz, seconded by Mr. Gray-Donald, it was unanimously resolved that a copy of the proposed "Canons of Ethics for Engineers" be sent to all members of Council with a request for written comments, so that the matter might be further discussed at the January meeting of Council.

A letter was presented from E.C.P.D. asking the Institute to nominate a representative to a new committee on Unionism as Related to Engineers and Technologists. It was suggested that the Committee on Industrial Relations might make a recommendation and, after some discussion, it was decided to leave it to the president and the general secretary to make the nomination after consultation with the chairman of the Committee on Industrial Relations.

The general secretary read a letter from Dr. Challies, commenting on a communication which he had received from Mr. J. F. Fairman, the American Institute of Electrical Engineers representative on the E.C.P.D. executive committee, with reference to the policy of the A.I.E.E. towards student branches in those institutions in the United States whose curriculum in electrical engineering has not been accredited by E.C.P.D.

In the papers accompanying Mr. Fairman's communication it was pointed out that the Board of Direction of the American Society of Civil Engineers has recently decided that eleven student chapters at institutions in the United States where the civil engineering curriculum has not been accredited by E.C.P.D., will have their charters withdrawn on January 1st, 1944, unless in the meantime the civil engineering curriculum is duly accredited. Dr. Challies doubted whether the communication had any special significance to the Institute except perhaps to raise the question of the inadvisability of any of the founder societies establishing student chapters at any of the engineering schools in Canada.

President Young pointed out that the question of the founder societies establishing sections or branches in Canada was constantly before the Institute. The general secretary had it in mind in all his conversations with the societies and he, himself, had been keeping in close touch with the situation. Following some discussion, it was decided that the general secretary should communicate with Mr. Fairman.

The general secretary read a letter from the president advising that the National Construction Council contemplates setting up regional committees in twenty of the more important cities in Canada. It was proposed that certain organizations, including The Engineering Institute of Canada, should be asked to appoint a representative in each of the cities named to serve on the regional committee. The Council would like to know beforehand if the Institute would be willing to appoint representatives if the proposal is proceeded with. These committees would deal with matters of concern to the National Construction Council and to the construction industry in general. On the motion of Colonel Cape, seconded by Mr. Pitts, it was unanimously agreed that the Institute would be prepared to name representatives to these regional committees should they be established.

A number of applications were considered and the following elections and transfers were effected:

ADMISSIONS	
Members.....	14
Junior.....	1
Students.....	30

TRANSFERS	
Junior to Member.....	8
Student to Member.....	12
Student to Junior.....	32
Student to Affiliate.....	1

It was decided that the next meeting of Council would be held in Montreal on Saturday, December 19th, 1942. Following a suggestion of Councillor E. D. Gray-Donald, it was unanimously agreed that Saturday morning meetings in Montreal would in future convene at ten o'clock a.m. instead of ten thirty.

The Council rose at one forty-five p.m.

## ELECTIONS AND TRANSFERS

At the meeting of Council held on November 21st, 1942, the following elections and transfers were effected:

### Members

- Jomini**, Harry, B.Sc. (C.E.), (Univ. of Man.), B.Sc. (Mining), (McGill Univ.), railroad supt., Demerara Bauxite Co. Ltd., Mackenzie, Demerara, British Guiana, S.A.
- Lauriault**, Wilfrid Eldege, B.A.Sc., C.E., CHEM. ENGR. (Ecole Polytechnique), consultg. engr. and Quebec land surveyer, Montreal, Que.
- Riddell**, John Morrison, Major, R.C.E., B.A.Sc., (Univ. of Toronto), O.C. 28th Field Coy., R.C.E. (A), Ottawa, Ont.
- Wideman**, Norman Edward, B.A.Sc. (Elec.), (Univ. of Toronto), district relay engr., H.E.P.C. of Ontario, Port Arthur, Ont.

### Juniors

- Carter**, Harry Akers, B.Sc. (Queen's Univ.), S.M. (Mass. Inst. Tech.), research assistant, Aero. Engrg. Dept., Massachusetts Institute of Technology, Cambridge, Mass.
- Cole**, Donald Lorne, B.A.Sc. (Elec.), (Univ. of Toronto), junior engr., Can. Gen. Elec. Co. Ltd., Peterborough, Ont.
- Transferred from the class of Junior to that of Member*
- Davis**, William Roe, Jr., B.Sc. (Elec.), (Univ. of Alta.), asst. elec. engr., Montreal Engineering Co. Ltd., Montreal, Que.
- Forbes**, Donald Alexander, B.Sc. (Civil), (Univ. of Sask.), asst. to chief engr., Price Bros. & Co. Ltd., Kenogami, Que.
- Ford**, John Norman, B.Sc. (Univ. of Alta.), constrn. and mtce. engr., Calgary Power Co. Ltd., Calgary, Alta.
- Fullerton**, Roland McNutt, B.Sc. (Elec.), (N.S. Tech. Coll.), shift engr., Aluminum Co. of Canada Ltd., Arvida, Que.
- Guenette**, Joseph Antoine Paul, B.A.Sc., C.E. (Ecole Polytechnique), head of planning dept., Regent Knitting Mills Co. Ltd., St. Jerome, Que.
- Neilson**, Charles Shibley, B.Sc. (Civil), (Queen's Univ.), squad boss, Canadian Bridge Co., Walkerville, Ont.
- Wellwood**, Frank Elvin, B.A.Sc., (Univ. of Toronto), engr., Dept. of Buildings, City of Toronto, Ont.

### *Transferred from the class of Student to that of Member*

- Boutillier**, Tremaine Thompson, B.Eng. (Elec.), (N.S. Tech. College), mfg. engr., Northern Electric Co. Ltd., Montreal, Que.
- Bowering**, Reginald, B.Sc., (Univ. of Man.), M.A.Sc., (Univ. of Toronto), public health engr. and chief sanitary inspr., Provincial Board of Health of British Columbia, Vancouver, B.C.
- Buteau**, Lucien, B.A.Sc., C.E., (Ecole Polytechnique), field engr., Bell Telephone Co. of Canada, Quebec, Que.
- Crepeau**, Marcel, B.A.Sc., C.E., (Ecole Polytechnique), mtce. of bridges, Dept. of Public Works, Quebec, Que.
- Cuthbertson**, Charles Cassells, B.Sc., (Chem. Eng.), B.Sc., (Chemistry), (Queen's Univ.), process supervisor, Canadian Industries, Ltd., Alkali Divn., Shawinigan Falls, Que.
- DeGuise**, Yvon, B.A.Sc., C.E., (Ecole Polytechnique), civil engr., hydraulic service, Dept. of Lands and Forests, Quebec, Que.
- Demie**, Thomas, B.A.Sc., M.A.Sc., (Univ. of Toronto), estimating and design dept., McGregor-McIntyre Divn., Dominion Bridge Co., Toronto.
- London**, Woodrow P., B.Sc., (Elec.), (Univ. of N.B.), designing dftsnn., H. G. Acres & Co., Niagara Falls, Ont.
- Love**, Edwin Reginald, Capt., B.Sc., (Elec.), (Univ. of Man.), second in command of School of Instruction, C.S.T.C., R.C. Signals, C.A., Kingston, Ont.

- Mahoux**, Raymond Jean, B.Eng. (Mech.), (McGill Univ.), chief planner, Delorimier Plant, Federal Aircraft Ltd., Montreal, Que.
- Saintonage**, Jean-Jacques Rosaire, B.C.Sc., C.E., (Ecole Polytechnique), asst. plant engr., Consolidated Paper Corp. Ltd., Port Alfred, Que.
- Stafford**, James Walter, B.Sc., (Elec.), (Univ. of Alta.), genl. electl. supt., plant Nos. 1 and 2, Aluminum Co. of Canada, Ltd., Shawinigan Falls, Que.
- Transferred from the class of Student to that of Junior*
- Aird**, Joseph Andre Philippe, F/O., B.A.Sc., C.E., (Ecole Polytechnique), officer i/c Depot Inspn. secn., No. 9 Repair Depot, R.C.A.F., St. Johns, Que.
- Archambault**, Georges Louis, B.Eng. (Mech.), (McGill Univ.), mtec. engr., Aluminum Co. of Canada, Arvida, Que.
- Asselin**, Hector, B.A.Sc., C.E., (Ecole Polytechnique), engr., Arthur Surveyer & Co., Montreal, Que.
- Boisclair**, Robert, B.A.Sc., C.E., (Ecole Polytechnique), engr., Aluminum Co. of Canada, Passe Dangereuse, Que.
- Deslauriers**, Charles-Edouard, B.A.Sc., C.E., (Ecole Polytechnique), hydraulic service, Dept. of Lands and Forests, Quebec, Que.
- Duckett**, William Anderson, B.Eng. (Elec.), (McGill Univ.), asst. engr., Bell Telephone Co. of Canada, Montreal, Que.
- Flahault**, John E., B.A.Sc., C.E., (Ecole Polytechnique), B.Sc., (Met.), (Carnegie Inst. of Tech., Pittsburgh), supervisor in potrooms, Aluminum Co. of Canada, Ltd., Arvida, Que.
- Frigon**, Raymond A., B.A.Sc., C.E., (Ecole Polytechnique), M.Sc. (Mass. Inst. of Tech.), asst. Materials Testing and Research Lab., Ecole Polytechnique, Montreal.
- Goddard**, Albert Reginald, B.Sc., (Civil), (Univ. of Man.), jr. asst. engr., Dept. of National Defence, R.C.A.F., Winnipeg, Man.
- Gohier**, Roch Edouard, B.Eng., (Met.), (McGill Univ.), metallurgist, Sorel Industries, Ltd., Sorel, Que.
- Hopkins**, Albert Parker Eugene, B.A.Sc., (Univ. of Toronto), asst. mining engr. and surveyor, Hallnor Mines Ltd., Pamour, Ont.
- Hopkins**, Alfred, B.Eng., (Elec.), (N.S. Tech. Coll.), engr. service dept., Canadian Westinghouse Co. Ltd., Hamilton, Ont.
- Huggard**, John Harold, B.Sc., (Elec.), (Univ. of N.B.), engr. at Shipshaw Power Development for H. G. Acres & Co., Kenogami, Que.
- Kennedy**, Dorwin Elmore, B.A.Sc., (Univ. of Toronto), junior engr., Hydraulic Dept., Hydro Electric Power Commn., Toronto, Ont.
- Kennedy**, Harold Edward, B.Sc., (Mech.), (Queen's Univ.), structl. designer and dftsmn., Hydro Electric Power Commn., Toronto, Ont.
- Kent**, A. Douglas, B.Sc., (Queen's Univ.), foundry supt., Aluminum Co. of Canada, Arvida, Que.
- Kerfoot**, John Grenville, B.Sc., (Queen's Univ.), tool engr., Defence Industries, Ltd., Verdun, Que.
- Lefort**, Jean, B.Eng., (McGill Univ.), junior engr., Stevenson & Kellogg Ltd., Montreal, Que.
- Leroux**, George Gustave, F/Lt., B.Eng., (McGill Univ.), asst. chief instructor, No. 8 Air Observer School, Ancienne Lorette, Que.
- Lvinc**, Samuel Dave, B.A.Sc., (Chem.), (Univ. of Toronto), examiner, Inspection Board of the United Kingdom and Canada, Newark, N.J.
- Menard**, Raymond, B.A.Sc., C.E., (Ecole Polytechnique), res. engr., Roads Dept., Province of Quebec, Montreal, Que.
- Mullins**, Harrison Alexander, B.Sc., (Elec.), (Univ. of Man.), asst. project engr., Defence Industries Ltd., Montreal, Que.
- McMath**, John Proctor Clark, B.Sc., (Elec.), (Univ. of Alta.), design engr., wires and cables, Northern Electric Co., Montreal, Que.
- Nadeau**, Yvon, B.A.Sc., C.E., (Ecole Polytechnique), instrumentman and asst. engr. at Aluminum Plant, LaTuque, Que., for Frasca Brace Ltd.
- Ostigny**, Joseph Ephrem Maurice, B.A.Sc., C.E., (Ecole Polytechnique) asst. divnl. engr., Roads Dept., Province of Quebec, Waterloo, Que.
- Rioux**, Joseph Henri Rene, B.A.Sc., C.E., (Ecole Polytechnique), asst. divnl. engr., Dept. of Roads, Province of Quebec, Que.
- Rowan**, Russell Gillespie, B.Sc., (Queen's Univ.), engrg. asst., Bell Telephone Co. of Canada, Montreal. Now posted as Pilot Officer in the Special Reserve, Navigation Branch, R.C.A.F.
- Shearer**, John Alexander, B.Sc., (Civil), (Univ. of N.B.), transitman, Canadian Pacific Rly., Sudbury, Ont.
- Sinclair**, George, B.Sc., M.Sc., (Univ. of Alta.), research asst., Ohio State Research Foundation, Columbus, Ohio.
- Torrington**, Frank Delbridge, F/O., B.Sc., (Mech.), (Univ. of Sask.), res. technical officer, R.C.A.F., Longueuil, Que.
- Wallis**, William Herbert Cyril, P/O, B.Sc., (Civil), (Univ. of N.B.), flying instructor on service aircraft, R.C.A.F., Montreal, Que.
- Woods**, George Maitland, B.Sc., (Mech.), (Univ. of Sask.), senior foreman, Defence Industries Ltd., Verdun, Que.
- Archibald**, Huestis Everett, (Univ. of Toronto), 11 Poplar Plains Crescent, Toronto, Ontario.
- Berbrayer**, Abram M., (Univ. of Manitoba), 114 Granville St., Winnipeg, Man.
- Bernstein**, Saul, (McGill Univ.), 369 Laurier Ave. West, Montreal.
- Bolton**, Gerald Henry, (Univ. of Manitoba), 1206 Wolseley Ave., Winnipeg, Man.
- Brasloff**, Reuben Isaac, (McGill Univ.), 5617 Jeanne Mance St., Montreal, Que.
- Carignan**, Louis-Georges, (Ecole Polytechnique), 353 St. Joseph St., Lachine, Que.
- Cloutier**, Jean Paul, tool supervisor, Sorel Industries Ltd., Sorel, Que.
- Decarie**, Maurice, (McGill Univ.), 3533 Oxford Ave., Montreal, Que.
- Dutton**, Vernon LeRoy, (Univ. of Man.), 37 Kennedy St., Winnipeg.
- Fitzgerald**, Joseph John Gerry, (McGill Univ.), 1963 Kent Ave., Montreal, Que.
- Freeman**, John Edward, (McGill Univ.), Douglas Hall, McGill University, Montreal, Que.
- Gagnon**, Paul, (McGill Univ.), 386 Wiseman Ave., Montreal, Que.
- Gauthier**, Edouard Antoine, (McGill Univ.), 645 Querbes Ave., Outremont, Que.
- Glen**, Andre, (Ecole Polytechnique), 7860 St. Denis St., Montreal, Que.
- Gordon**, Lynn Marshal, (Univ. of Toronto), 203 St. Paul St. West, Kamloops, B.C.
- Grondines**, J. Leon, (Ecole Polytechnique), 1431 Joliette St., Montreal, Que.
- Hink**, Anthony Albert, (Univ. of Man.), 426 Stradbroke Ave., Winnipeg, Man.
- Howe**, Lloyd G., (McGill Univ.), 3580 Durocher St., Montreal, Que.
- Killam**, Robert Bradbury, (McGill Univ.), Douglas Hall, McGill University, Montreal, Que.
- Klein**, Max, (McGill Univ.), 362 Fairmount Ave. West, Montreal.
- Lackman**, Gerald Leonard, (McGill Univ.), 639 de l'Epee Ave., Outremont, Que.
- MacLean**, Donald Gordon, (Univ. of Toronto), 40 Spring St., Guelph, Ont.
- Matthews**, C. Robert, (McGill Univ.), 3580 Durocher St., Montreal.
- Oldreive**, Donald Drake, (Univ. of Toronto), 321 Bloor St. West, Toronto, Ont.
- Polley**, Edward Victor, B.A.Sc., (Civil), (Univ. of Toronto), Lieutenant, R.C.E. (Section officer), Officers' Mess, C.E.T.C. (AS), Petawawa, Ont.
- Ray**, Louis William, (Univ. of Toronto), 273 Danforth Ave., Toronto.
- Roy**, Henry George, (Ecole Polytechnique), 4669 Pontiac St., Montreal, Que.
- St. Pierre**, Robert, (Ecole Polytechnique), 6665 De Normanville St., Montreal, Que.
- Wallace**, W. Robert J., foreman electrician, Canada Strip Mill, Montreal, Que.
- Yespelkis**, Charles Robert, (Ecole Polytechnique), 2055 Montgomery St., Montreal, Que.

By virtue of the co-operative agreement between the Institute and the Association of Professional Engineers of Nova Scotia, the following elections and transfers have become effective:

#### Members

- Buckley**, Frederick William, (N.S. Tech. Coll.), asst. engr., N.S. Power Commission, Halifax, N.S.
- Harrington**, Arthur Russell, B.Eng., (Elec.), (N.S. Tech. Coll.), engr., N.S. Light & Power Co. Ltd., Halifax, N.S.
- Hunt**, William Murray, B.Sc., (Elec.), (N.S. Tech. Coll.), gen. traffic supervisor, Maritime Telephone and Telegraph Company, Halifax, N.S.
- Nunn**, Thomas Andrew, field engr., N.S. Light & Power Co. Ltd., Halifax, N.S.
- Parsons**, Alfred Medley, Lieut., M.C., overseers' office, Naval Service, H.M.C. Dockyard, Halifax, N.S.
- Pippy**, George Alexander, B.Sc., (N.S. Tech. Coll.), supervisor, fuel oil and burner dept., Imperial Oil Limited, Halifax, N.S.
- Roger**, William Hugh Gregory, Lieut. Commander (S.B.), R.C.N.V.R. mgr. of elec. engrg., H.M.C. Dockyard, Halifax, N.S.
- Rosier**, Claude Harry, B.Eng., (Mech.), (N.S. Tech. Coll.), Sub. Lieut., R.C.N.V.R., asst. inspr. of naval ordnance, H.M.C. Dockyards, Halifax, N.S.
- Smith**, James Joseph, Lieut., R.C.N.V.R., i/c naval elec. repair section, H.M.C. Dockyard, Halifax, N.S.
- Wells**, Alexander Victor, Lieut.-Commander, R.C.N.V.R., Engineer Officer in Charge, H.M.C. Dockyard, Sydney, N.S.

*Transferred from the class of Junior to that of Member*

- Dobson**, Richard Nesbitt, B.Eng., (Mech.), (N.S. Tech. Coll.), asst. works mgr., i/c production and engrg., Canadian Car & Foundry Co. Ltd., Amherst, N.S.

# Personals

## News of the Personal Activities of members of the Institute, and visitors to Headquarters

**H. Forbes-Roberts**, M.E.I.C., has recently been appointed manager of the Newfoundland Light and Power Company Limited. He was previously with the Calgary Power Company, at Calgary, Alta. Coming to Canada from England in 1913, he was engaged as construction engineer with Northwestern Electric Company Limited, at Regina, Sask. In 1919 he became manager and proprietor of Akola Light and Power Company, at Arcola, Sask. In 1927 he joined the staff of the Montreal Engineering Company Limited, at Regina, Sask.

**Noel N. Wright**, M.E.I.C., has joined the R.C.N.V.R. as a lieutenant and has taken up his new duties at Ottawa. Since his graduation from the University of Illinois in 1928, he has been with Ferranti Electric Limited and has been attached to the eastern district as sales and service engineer, at Montreal.

**Gordon D. Hulme**, M.E.I.C., has been promoted to assistant manager of the department of development of The Shawinigan Water and Power Company, Montreal.

Graduating with honours from McGill University with a degree of Bachelor of Science in electrical engineering, Mr. Hulme joined the Shawinigan Company in 1931. After being located successively at Valleyfield, Trois-Rivières, Victoriaville, Quebec, Montreal and Shawinigan Falls, he returned to Montreal and was attached to the transmission line and communication department, where he became assistant to the superintendent. In 1937 he joined the department of development, where he now becomes assistant manager.

Mr. Hulme is on the executive of the Montreal Branch

Noel N. Wright, M.E.I.C.

Flying Officer M. S. Layton, Jr.E.I.C.

Gordon D. Hulme, M.E.I.C.

**Flying Officer M. S. Layton, Jr.E.I.C.**, is reported as having acted as navigator on the bomber which took Prime Minister Churchill to Moscow a few months ago. Before his enlistment in October, 1940, he was assistant chemical engineer with the Steel Company of Canada at Montreal.

Mr. Layton was awarded the Duggan Medal and Prize of the Institute in 1940, for his paper "Coated Electrodes for Electric Arc Welding," which was published in the July 1940, issue of the *Journal*.

**Leon A. Duchastel**, M.E.I.C., has been appointed manager of the Power Sales Division, Commercial and Distribution Department of the Shawinigan Water & Power Co., Ltd. Mr. Duchastel is the secretary of the Montreal Branch of the Institute.

**T. R. Durley**, M.E.I.C., has been granted leave of absence by the Manufacturers Mutual Fire Insurance Company and has been appointed superintendent of shell filling, at the plant of Stormont Chemicals Limited, Cornwall, Ont.

**George W. Howse**, M.E.I.C., district inspector of the Hydro Electric Power Commission of Ontario, at Hamilton, has been elected first vice-president of the International Association of Electrical Inspectors at their convention, in Detroit, Mich., held on October 5th, 6th and 7th, 1942.

of the Institute and is a councillor of the Montreal Junior Board of Trade.

**Flying Officer W. E. Seely**, M.E.I.C., who for the past year had been stationed at No. 8 Service Flying Training School, at Moncton, N.B., has recently been transferred to Montreal.

**S. N. Tremblay**, M.E.I.C., has obtained leave of absence from the Quebec Streams Commission, Montreal, to join the Veterans' Guard of Canada as a lieutenant and is at present posted at Toronto, Ont. Lieutenant Tremblay served overseas in the last war and was a major when he was demobilized. Before joining the staff of the Quebec Streams Commission in 1930 he had been employed since 1926 as a field engineer with the Gatineau Power Company, Ottawa, Ont.

**N. A. Bradley**, M.E.I.C., who was on the staff of the Department of Public Works of Alberta, at Edmonton, has joined the Doncaster Construction Company of Edmonton.

**J. B. Snape**, M.E.I.C., has transferred his services from the Department of Mines and Resources at Jasper, Alta., to the Works and Buildings Branch of the Naval Service, at Esquimalt, B.C., where he is employed as a reconnaissance engineer.

**A. D. Turnbull**, M.E.I.C., assistant chief engineer for Dominion Sound Equipments Limited, Montreal, is on loan to the National Research Council at Ottawa, where he performs certain technical administrative duties, under the direction of the Deputy Director of Scientific Research in connection with the work that the Council is doing for the Royal Canadian Navy.

Mr. Turnbull graduated in mechanical engineering from Nova Scotia Technical College in 1928 and spent a year with the Dominion Steel Company Limited, at Sydney, N.S. He joined the staff of Northern Electric Company Limited as a service engineer in 1929. In 1935 he was appointed assistant chief engineer of Dominion Sound Equipments Limited. Mr. Turnbull was, since 1933, on the staff of the evening faculty of science of Sir George Williams College, Montreal, lecturing in radio-physics and electricity.

**Maurice Bélanger**, Jr.E.I.C., formerly concrete designer with Baulne and Leonard, civil engineers, Montreal, has joined the staff of Sorel Industries Limited, at Sorel, Que. He graduated from the Ecole Polytechnique, of Montreal, in 1939.

**G. A. Campbell**, Jr.E.I.C., is employed with E. G. M. Cape and Company at Dartmouth, N.S. He returned a few months ago from Trinidad, B.W.I., where he had been employed for the last few years with United British Oilfields.

**J. A. Caverly**, Jr.E.I.C., has returned to his former position as assistant geologist with the Britannia Mining and Smelting Company Limited, at Britannia Beach, B.C. For the past year he had been employed as an exploration engineer in northern Manitoba with the Howe Sound Company of New York. He graduated from the University of Saskatchewan in 1941.

**Major Alexandre Dugas**, Jr.E.I.C., is now back overseas after having spent this last year in Canada where he was stationed for some months as an instructor at the Officer's Training Centre at Brockville, Ont., and later at the Staff College at Kingston, Ont. Major Dugas enlisted at the outbreak of war and first went overseas with the Régiment de Maisonneuve in 1940.

**J. W. Kerr**, Jr.E.I.C., has joined the Royal Canadian Air Force as an aeronautical engineering officer. Since his graduation from the University of Toronto in 1937 he has been on the staff of Canadian Westinghouse Company Limited, at Hamilton, Ont.

**James R. Rettie**, Jr.E.I.C., is on loan from the Manitoba Department of Mines and Resources, The Pas, Man., to Fraser-Brace Company Limited, at La Tuque, Que.

**R. B. Warren**, Jr.E.I.C., has joined the staff of the Aluminum Company of Canada Limited at Montreal, Que. He was previously employed with the Prairie Farm Rehabilitation Administration, at Regina, Sask.

**Sub-Lieutenant (E) C. S. Baburek**, S.E.I.C., R.C.N.V.R., is at present on loan to the Royal Navy. He graduated in mechanical engineering from McGill University in 1941.

**E. H. Bartlett**, S.E.I.C., has been transferred from Seebe, Alta., to the head-office of the Calgary Power Company, at Calgary, Alta., and he is now employed in the transmission and distribution lines department.

**A. M. Forster**, S.E.I.C., has recently left his position with the Aluminum Company of Canada Limited, Montreal, to join the R.C.N.V.R. as a Sub-Lieutenant.

**James J. Hurley**, S.E.I.C., has returned to the University of Toronto to resume his course after having worked last summer at Gander, Nfld.

**Maurice Laquerre**, S.E.I.C., has joined the staff of the Aluminum Company of Canada Limited at Arvida, Que.

He graduated from the Ecole Polytechnique, Montreal, last spring.

**D. O. D. Ramsdale**, S.E.I.C., has left his position with the English Electric Company of Canada Limited, in Toronto, to join the R.C.N.V.R. as a Sub-Lieutenant.

**D. L. Rigsby**, S.E.I.C., has recently joined the staff of the Aluminum Company of Canada Limited, at Kingston, Ont.

**C. C. Simpson**, S.E.I.C., has been transferred from Edmonton, Alta., to the general sales department, power apparatus division, of the Northern Electric Company Limited, at Montreal. He joined the company upon graduation in electrical engineering from the University of Alberta, in 1937.

**T. C. York**, S.E.I.C., has joined the staff of Murray, Jones and Company, at Toronto, Ont., as a tool designer. He was employed previously by Noorduyn Aviation Limited, Montreal.

**Pilot Officer H. B. Young**, S.E.I.C., has left the employ of Demerara Bauxite Company, Mackenzie, British Guiana, to join the Royal Canadian Air Force and is now stationed at Winnipeg, Man. He graduated in civil engineering from the University of Manitoba in 1941.

**H. S. Olafson**, S.E.I.C., who graduated as a B.Sc. in electrical engineering from the University of Manitoba in 1941, is now a Lieutenant in the Royal Canadian Signal Corps and is at present stationed at Kingston, Ont.

**S. M. Schofield**, S.E.I.C., is a Lieutenant with the Royal Canadian Engineers and is at present training at Chilliwack, B.C. He graduated in civil engineering from the University of Manitoba in 1941.

#### VISITORS TO HEADQUARTERS

**René Dupuis**, M.E.I.C., director, Department of Electrical Engineering, Faculty of Applied Science, Laval University, Quebec, Que., on October 28th.

**Jacques Vinet**, M.E.I.C., cost engineer, The Foundation Company of Canada Limited, Shipshaw, Que., on November 5th.

**Edgar H. Davis**, Jr.E.I.C., St. John Dry Dock and Shipbuilding Company Limited, Saint John, N.B., on November 9th.

**Lieutenant-Colonel Theo. Miville Dechene**, M.E.I.C., bridge engineer, Department of Public Works, Quebec, Que., on November 11th.

**Georges Demers**, Jr.E.I.C., consulting engineer, Quebec, Que., on November 11th.

**Herbert E. Ziel**, Albert Kahn, Associated Architects and Engineers Incorporated, Detroit, Mich., on November 12th.

**G. E. Booker**, M.E.I.C., Wartime Housing Limited, Toronto, Ont., on November 25th.

**D. Hutchison**, M.E.I.C., Mgr., Mackenzie River Transport, Hudson Bay Co., Edmonton, Alta., on November 23rd.

**Lieutenant C. L. Stevenson**, M.E.I.C., Dept. of Munitions & Supply, Army Engineering Design Branch, R.C.O.C., Ottawa, Ont., November 27th.

**T. M. Moran**, M.E.I.C., Vice-President, Stevenson & Kellogg Ltd., Toronto, Ont., on December 10th.

**W. B. Redman**, M.E.I.C., assistant engineer, Canadian National Railways, Toronto, on December 10th.

**Paul E. Cadrin**, Jr.E.I.C., Sorel Industries Ltd., Sorel, Que., on December 11th.

# Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

**Claus Marius Bang**, M.E.I.C., was among the missing passengers of the ill-fated S.S. "Caribou" which was sunk by the enemy on the Atlantic Coast on October 14th, 1942. He was born at Copenhagen, Denmark, on July 21st, 1882, and graduated in 1906, as a Bachelor of Science in mechanical engineering from the Polytechnical Academy of Copenhagen. After a few years spent on the teaching staff of the Academy he came to Canada in 1911, where he joined the staff of the Northern Electric Company, in Montreal. The following year he went with the Cedars Rapids Power and Manufacturing Company, as an electrical draftsman. During the last war he was engaged as a draftsman and tool designer with several of the munitions plants in Montreal. In 1918 he joined the staff of the Wayagamack Pulp and Paper Company, at Three Rivers, Que., as an electrical designer. In 1924 Mr. Bang went to Corner Brook, Newfoundland, as an electrical engineer on the staff of John Stadler, M.E.I.C., during the construction of the paper mill. Upon completion of construction in 1926, he left Corner Brook to take up an appointment as electrical engineer on the construction of a new paper mill at Dolbeau, Que.

In 1928 Mr. Bang married Miss Jean Fisher, daughter of Mr. Joseph Fisher, of Corner Brook; they made their first home at Dolbeau, Que., remaining there until 1930 when Mr. Bang accepted the appointment of electrical superintendent at the Canadian International Paper Company's mill in Three Rivers, Que.

In November 1936, he was transferred, by the same company, to Newfoundland as manager of Hydro-Electric Power Development with International Power and Paper Company of Newfoundland Limited and took up residence at Deer Lake in May 1937. He retained this office until the time of the disaster.

Mr. Bang joined the Institute as an Associate Member in 1922 and he became a Member in 1940.

**Earle Munro Dennis**, M.E.I.C., died in the hospital at Ottawa, Ont., on November 1st, 1942. He was born at Holbrook, Ont., on January 26th, 1883, and was educated at Queen's University, Kingston, Ont., where he graduated as a Bachelor of Science in 1904. He obtained his commission as Dominion Land Surveyor in 1908. Upon graduation he joined the Civil Service in the office of the Surveyor General at Ottawa. Between the years 1905 and 1907 he was engaged in survey work in Saskatchewan and Alberta.

In 1912 he was appointed assistant chief of a division in the Topographical Surveys Branch of the Department of the Interior. In 1924 he was made chief of administration in the Topographical and Air Survey Bureau of this department and held this position until 1937 when he became chief of administration of the Hydrographic and Map Service of the Department of Mines and Resources. In 1939 he became general executive assistant in the Lands, Parks and Forests Branch of the Department of Mines and Resources which position he held till the time of his death. In religion a Baptist, he attended Fourth Avenue Baptist Church where he was secretary and clerk of the roll. He is survived by his widow, three sons and one daughter.

Mr. Dennis joined the Institute as an Associate Member in 1921 and became a Member in 1940.

**D. A. Jackson**, M.E.I.C., died at Chatham, N.B., on June 3rd, 1942. He was born at Montreal, Que., on January 27th, 1888, and was educated at McGill University where he received the degree of Bachelor of Science in electrical engineering in 1910. From 1914 to 1916 he was engaged as an electrical engineer at the wireless plant at Newcastle, N.B., of the Universal Radio Syndicate Limited of London, England, and from 1916 to 1920 he was engineer in charge of the station. In 1920 he became town superintendent

and engineer at Chatham, N.B. At the time of his death he was employed in the Highway Division of the Department of Public Works of New Brunswick, at Chatham.

Mr. Jackson joined the Institute as a Member early this year.

**William Matheson Macphail**, M.E.I.C., died in Winnipeg, Man., on June 9th, 1942. He was a member of a notable and distinguished Prince Edward Island family which for several generations had a tradition of learning and scholarship. His father, the late William Macphail, was in the earlier years of his life superintendent of schools in Queen's County, P.E.I., and latterly supervisor of the Prince Edward Island Hospital for Mental Diseases. His mother, Catherine Smith, was well known in the community for her strength of character and high ideals.

Mr. Macphail was born at Orwell, Prince Edward Island, on March 18th, 1872. He was educated at Uigg Grammar School and Prince of Wales College, Charlottetown, where he obtained university matriculation. After teaching for a few years he proceeded to McGill University, Montreal, Que., and graduated as Bachelor of Applied Science in 1898. During university summer vacations he worked on import-

**William Matheson Macphail, M.E.I.C.**

ant engineering projects, combining classroom and laboratory instructions with practical experience.

Following graduation he engaged in turn in municipal, railroad and hydraulic engineering, being one of the pioneers in water power development at Niagara Falls. Later he was assistant city engineer of Toronto.

In 1906 he went to Winnipeg where he organized Bitulithic and Contracting Limited, in association with Warren Brothers, Boston, Mass., and for the next ten years had large paving contracts throughout the West. In 1917 he became manager of Warren Brothers operations in the Pacific Coast States and in Montana. In 1928 he went to Warsaw, representing Warren Brothers, and carried on operations in Poland and Hungary, also in Spain.

After returning to Canada in 1933, he associated himself with the Carter-Halls-Aldinger Company and for the past three years had supervision of airport contracts in the Prairie Provinces and in British Columbia.

In 1910 he married Ethel Penrose of Winnipeg. He is survived by her and two daughters, Marion, wife of Lieutenant Lawrence Delbridge, and Catherine, wife of Lieutenant Vincent Jackson, of Winnipeg. Other survivors include three sisters, Mrs. A. N. Jenkins, Vancouver, B.C., Miss Janetta Macphail, Saint John, N.B., and Mrs. S. M. Martin, Middleton, P.E.I., also two brothers, Colonel Alexander Macphail, C.M.G., M.E.I.C., Kingston, Ont., and J. G. Macphail, M.E.I.C., Ottawa, Ont.

Mr. Macphail joined the Institute as a Student in 1897, becoming an Associate Member in 1901. He was transferred to Member in 1916. He was also member of the American Society of Civil Engineers.

**A. Ross Robertson**, M.E.I.C., manager of the Ontario division of the Dominion Bridge Company Limited, at Toronto, Ont., died in the hospital on November 4th, 1942. He was born at Glencoe, Ont., on May 22nd, 1888. He was educated in Glencoe public and high schools and graduated from the University of Toronto School of Practical Science in 1909 as a Bachelor of Science. He began his engineering practice with his father at Glencoe, and shortly afterwards joined the City of Toronto roadways department. A few months later he entered the drawing offices of Canada Foundry Limited. In 1912 he joined the firm of McGregor and McIntyre Limited, then he became vice-president on the formation of McGregor-McIntyre Structural Steel Limited, in 1928. When the company was purchased by Dominion Bridge Limited, he became manager of the Ontario division.

At the outbreak of the first Great War, Mr. Robertson held the rank of captain with the 169th Battalion. In order to go overseas, he reverted to lieutenant and went overseas in 1916. He was then transferred to the Royal Canadian Engineers and promoted to captain. He was wounded, and demobilized in 1919.

**A. Ross Robertson, M.E.I.C.**

Mr. Robertson joined the Institute as an Associate Member in 1920 and became a Member in 1940. He was a past chairman of the Toronto Branch of the Institute.

He was a past president and honorary treasurer of the Industrial Accident Prevention Association of Ontario, a director of the Canadian National Exhibition, a director of the Toronto Industrial Commission, a past chairman of the Ontario Division, Canadian Manufacturers' Association and a past president of the University of Toronto Engineering Alumni Association.

He was a member of the Deer Park United Church in Toronto. He is survived by his widow, the former Grace Irene Gammage, of Chatham; two daughters, Mrs. W. R. Carruthers and Miss Dorothy Robertson; his father, James Robertson; a brother, J. Murray Robertson, and a sister, Miss Helen Robertson, all of Toronto.

"He was the most reasonable of men," said W. R. Plewman, a close friend. "Unassuming and simple in his mode of life, he stood for everything that is worth while in our national life. Nobody sought more diligently and with greater success to ameliorate the differences between workmen and employers."

**Squadron Leader Joseph J. White**, M.E.I.C., died in Winnipeg, Man., on October 23rd, 1942. He was born at Oldham, England, in 1896 and came to Canada as a youngster. From

**Squadron Leader Joseph J. White, M.E.I.C.**

1912 to 1915 he was engaged in general building construction with Frid Lewis Company. Veteran of the first Great War, Squadron Leader White served in France with the Canadian Expeditionary Forces, later transferring to the Royal Air Force.

Returning to Regina from overseas in 1919, he worked in the city for a while and, in the fall of that year, entered the University of Saskatchewan where he graduated as a Bachelor of Engineering in 1925. During his undergraduate days, he became associated with C. M. Miner's Construction Company with whom he stayed until 1939, when he was appointed building inspector for the city of Regina. During his period of office at the Regina city hall, he prepared for the architectural profession and passed his final examinations in 1937.

In August, 1940, Squadron Leader White joined the R.C.A.F. and had been attached as an engineer officer to the Works and Buildings Branch at No. 2 Training Command, Winnipeg, Man.

Squadron Leader White joined the Institute as a Student in 1924, becoming an Associate Member in 1928. He was transferred to Member in 1936. Squadron Leader White has always been active in engineering circles and for four years he served as secretary-treasurer of the Saskatchewan Branch of the Institute and registrar of the Association of Professional Engineers of Saskatchewan. He was responsible in no small part for the successful conduct of the negotiations which brought about the signing of the agreement between the Institute and the Association in 1938, and almost entirely for the subsequent arrangement of operating details.

He is survived by his wife, the former Bertha Dymott, of Regina.

#### COMING MEETINGS

**Canadian Construction Association.**—Annual Convention, Log Chateau, Seignior Club, Que., January 20-22, 1943. General Manager, J. Clark Reilly, Ottawa Building, Ottawa, Ont.

**Canadian Pulp & Paper Association.**—30th Annual Meeting, January 27th, 28th, 29th, Mount Royal Hotel, Montreal. Secretary, A. E. Cadman, 3420 University St., Montreal, Que.

**The Engineering Institute of Canada.**—57th Annual General Professional Meeting, Royal York Hotel, Toronto, Ont., February 11-12, 1943. General Secretary, L. Austin Wright, 2050 Mansfield St., Montreal, Que.

# News of the Branches

## CALGARY BRANCH

K. W. MITCHELL, M.E.I.C. - *Secretary-Treasurer*  
J. N. FORD, JR., E.I.C. - *Branch News Editor*

Mr. S. N. Green, formerly aero-engineer with United Transport Company, and at present instructor of aeronautical engineering at the Provincial Institute of Technology, addressed a meeting of the Calgary Branch at 8 o'clock Wednesday evening, October 28, 1942, in the west small dining room of the Palliser Hotel. The subject of his address was **History of Aircraft Construction over the Past Thirty Years**.

Mr. Green introduced his subject by a group of slides depicting how man had dreams of flying thousands of years ago. Leonardo da Vinci studied flying as far back as the 15th century. Up to the 19th century all flying attempts were made by man by means of wings attached to his body. It was soon realized that man's muscular development was not sufficient and so our inventors turned to the use of engines. Later Horatio Phillips developed the wind tunnel in the early nineties. By this means he was able to study the effect of varying weather conditions on model planes. This method is still used for modern design. In the late nineties Octave Chanute developed the glider and made very valuable discoveries in his many glider flights until he finally crashed and was killed. His discoveries were used extensively by Orville and Wilbur Wright who made their first successful flight in December, 1903.

The United States of America adopted the aeroplane immediately and a great deal of development was made. By 1914 all planes were still underpowered and unreliable. However, they were used extensively in the war by the year 1915. After the war huge sums of money were spent in their further development and in 1920 the first commercial transport plane was used to carry mail.

Aircraft may be classified as follows:

1. Landplane which can be converted to a ski-plane or seaplane by means of skis or floats.
2. A flying-boat in which the fuselage is in the shape of a hull for use on water only.
3. An Amphibian which may be used for landing on land or water at will. This latter type would be ideal for flying in Northern Canada. However, it is more expensive to build and so has not been used.

In designing aircraft a designer must consider two points: firstly, the performance of the aircraft, i.e., it must be able to carry a paying load; secondly, it must be structurally strong and efficient. One of the finest things done for flying was the formation of the Aircraft Inspection Department under the Department of Transport. The inspectors are qualified engineers and flyers and they insist on good design and material being used.

Mr. Green then showed slides of different types of wing construction. He mentioned the internally braced monoplane such as is used in the Ferry Battle as the ideal type. The externally braced wing has not the aerodynamic efficiency of the internally braced wing but it is cheaper to build. The aerodynamic efficiency of the biplane is lower than the monoplane but the biplane is stronger for its weight and is excellent for training purposes.

Mr. Green cited the Composite Flying Boat as another step in flying progress. In this case a large flying boat is used to take a smaller craft into the air and then release it to continue on its way. The smaller aircraft is then able to carry heavier loads as a plane does not need as much power in the air as it does on take-off.

Material used for plane design may be all metal or wood and metal. The woods used are citrus spruce, mahogany and birch. Metals used are aluminum, magnesium, copper, steel and their alloys. Where fabric is used for the skin on a plane it is protected by a liquid called dope. This liquid shrinks the fabric and makes it air and waterproof.

## Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

Mr. Green finished his address with a group of slides showing detailed wing and fusilage construction.

Mr. McEwen, Chairman of the Branch, expressed the appreciation of the meeting for a very interesting and instructive paper.

## EDMONTON BRANCH

F. R. BURFIELD, M.E.I.C. - *Secretary-Treasurer*  
L. A. THORSEN, M.E.I.C. - *Branch News Editor*

The Edmonton Branch of the Institute opened its winter activities by inviting the engineers from the United States to attend a reception in the Macdonald Hotel on Friday, November 6th. Some thirty-five American engineers, now living in Edmonton while working for the United States Government on defence projects, attended the reception thus affording an opportunity for the American and Canadian engineers to become acquainted. The evening was thoroughly enjoyed by all who attended.

The first regular dinner meeting of the branch was held in the Macdonald Hotel on November 13th, at which many Americans again made their appearance. In the absence of Mr. Hansen, R. M. Hardy was in the chair. Mr. G. M. Hutt, assistant development commissioner, Canadian Pacific Railway, Winnipeg, Man., spoke on **The Development of Natural Resources in Relationship to the Railways**. He pointed out how the railways had opened up a great deal of Canada by building lines into hitherto unused areas thus permitting their development. He illustrated this statement by references to a number of the agricultural, mining and lumbering areas that had been developed through the foresight of the railways. The work of the railway along experimental lines, such as various C.P.R. experimental farms, was noted by the speaker. Incidental to the main theme of his talk, Mr. Hutt, also pointed out some of the factors governing express and freight rates as charged by the railways. The paper was followed by a quite lively discussion demonstrating the interest taken in Mr. Hutt's remarks.

The main business of the meeting was the election of a new chairman. Our chairman for the coming year, Mr. D. A. Hansen, resigned his position on being transferred to the Calgary office of the Calgary Power Company. Mr. D. Hutchison, present vice-chairman was elected to fill the vacancy, while Mr. C. W. Cary becomes our new vice-chairman.

During the meeting, Mr. J. Garrett presented to Mr. H. T. Stevinson, a student at the University of Alberta, the Institute's prize for his accomplishments during the 1941-42 session at the university.

## HALIFAX BRANCH

S. W. GRAY, M.E.I.C. - *Secretary-Treasurer*  
G. V. ROSS, M.E.I.C. - *Branch News Editor*

**Aircraft—Overhaul and repair for the R.C.A.F.** was the subject of a talk given at a dinner meeting of the Halifax Branch at the Halifax Hotel on November 19th. The speaker was D. B. Lindsay, manager of the Clark Ruse Aircraft Limited, of Eastern Passage, N.S.

An aircraft that has figured in a crash is classed in one of three ways. "A" is a washout, or one which is damaged beyond repair and has only salvage value; "B" is one which has suffered sufficient damage to require overhaul in a civilian repair shop; "C" is a crash which puts a plane out of action but repairs can be made by the R.C.A.F. The decision on the type of crash is made by technical officers of the R.C.A.F. and in the case of "B" crashes, notice is sent

out to the civilian repair plant that a plane of certain type will be in for repairs.

On receipt of the plane, crew chiefs proceed to dismantle it, all parts are inspected and the planning engineer obtains new parts or supervises repairs to damaged parts. All the undamaged parts, repaired parts and replacements flow into a room for one aircraft only and rebuilding is carried out under the same crew chiefs who supervised the tearing down process. When completed the plane is turned over to the test pilot and flight engineer.

Sometimes thirteen or fourteen different types of planes may be in the shop at one time, for some of which the company may not have any blueprints. It is necessary that the engineering department be able to design new parts and that the shops be able to construct them. The men engaged on the work are specialists and each group handles only its own speciality.

Mr. Lindsay has had a varied career in aeronautical work. In 1937 he was a member of a party on an experimental flight from England to Australia. Just five days before the outbreak of the war he made a forced landing at an Italian air force field and while waiting repairs was able to inspect Italian planes which he found to be badly built and of very inferior quality. At the start of the war he was attached to the R.A.F. in France. The greatest handicap under which the R.A.F. worked was a lack of repair depots near the front. The French fliers he found to be excellent but their planes were obsolete, comparatively unarmed and overhaul and repair services inadequate.

For some time Mr. Lindsay was engaged in production work on Sterling bombers and Sunderland flying boats and he has recently inspected the new Avro Lancaster bombers. He classed these as "magnificent machines" and the equal or better than any planes produced anywhere in the world.

Eighty-four members and guests, including a number of technical officers of the Eastern Air Command, were present.

#### HAMILTON BRANCH

A. R. HANNAFORD, M.E.I.C. - *Secretary-Treasurer*  
W. E. BROWN, Jr.E.I.C. - *Branch News Editor*

In accordance with wishes of Headquarters this branch has formed a committee on "Engineering Features of Civil Defence", and its personnel is interesting because all are not members of the Institute, but all except one were present at the Webster lectures.

W. L. McFaul, M.E.I.C., City Engineer, Chairman;  
Mr. D. P. Brown, Canadian Westinghouse Co.  
Mr. C. J. Porter, Steel Company of Canada;  
Mr. I. J. MacPherson, Otis-Fensom Elevator Co.;  
C. H. Hutton, M.E.I.C., Hamilton Hydro Electric System;  
C. C. Parker, M.E.I.C., Hamilton Bridge Co.;  
G. W. Howse, M.E.I.C., Hydro Electric Power Commission;  
A. R. Hannaford, M.E.I.C., City Engineers Department.

The first meeting of the committee was taken up with considerations as to how best the general public could be served in the hour of danger. It was decided to ask the papers to insert a prominent notice stating that the Hamilton Branch of the Institute was prepared to accept inquiries as to the best method of using present buildings or strengthening same in case of air raids.

There have been some requests and in each case a sub-committee of three makes a careful examination of all conditions and after reporting back to the committee and discussing all points a written reply is given to the party concerned. The committee hopes to branch out into more general useful application, as well as continue with the original idea.

A group has been formed by Professor C. H. Stearn, McMaster University, and Miss Freda Waldron, Librarian of the Hamilton Public Libraries, which has now been styled "Hamilton Council of Adult Education Agencies". The first

meeting was a dinner gathering at McMaster University at which this branch was invited to attend. Thirty-seven societies and bodies were represented there and later in the day an exhibition was held in the main Public Library building. Each body had been asked to present a poster for this exhibition, outlining their respective objects. The Hamilton Branch poster carried the exact colours of the cover of *The Engineering Journal*.

The first meeting was held early in September and at the second meeting some definite line of action was arrived at. During the evening Dr. A. H. Wingfield, a member of our executive, was appointed to one of the sub-committees. For the purpose of grouping the various bodies they were divided into groups as follows: hobbies, cultural or lecture, and professional; the Institute coming under the latter heading.

#### LAKEHEAD BRANCH

W. C. BYERS, Jr.E.I.C. - *Secretary-Treasurer*  
A. L. PIERCE, M.E.I.C. - *Branch News Editor*

On Wednesday evening, November 11th, Mr. Jules J. Cross, M.E., well known engineer of Port Arthur, addressed the members of the Institute resident in Fort William and Port Arthur.

Mr. Cross, who was the discoverer of the great hematite ore body at Steep Rock Lake near Atikokan, Ontario, spoke on the **Iron Ore Occurrences in the Lake Superior District** with special reference to the Steep Rock Lake project.

The speaker was introduced by Mr. S. E. Flook, city engineer of Port Arthur.

Mr. Cross spoke with a wide knowledge of the potential iron resources of the Lake Superior area and warned the meeting that "if we are to take full advantage of our iron ore position it will not be by shipping ore but by the establishment of industries that will produce finished steel in Canada."

Miss E. M. G. McGill, chairman of the Branch, presided, and some 35 members and guests were in attendance.

Messrs. W. L. Bird and E. J. Davies moved a vote of thanks to the speaker.

#### MONTREAL BRANCH

L. A. DUCHASTEL, M.E.I.C. - *Secretary-Treasurer*  
W. W. INGRAM, S.E.I.C. - *Branch News Editor*

On Thursday, November 19th, the branch held its annual student night. The chairman for the evening was J. D. Anderson, a student of McGill University. The judges for the papers were Messrs. R. E. Heartz, Aimé Cousineau and E. V. Gage.

The first paper was presented by R. A. Ritchie, from McGill, on the **Assembly of Marine Engines**. The engines are built vertically and lengthwise for weight distribution in the ship and are four-cylinder engines. The bedplate is machined for the columns, which support the cylinders, and the crankshaft bearings. The crankshaft is built up of the webs and pins which are shrunk together and the shaft which is bolted on. The cylinders are set on the columns which have been leveled up. The piston rod is put in from the bottom and the piston bolted to it. The cylinders are checked by means of piano wire strung across the top and a telescoping micrometer. The connecting rod, way shaft or reversing mechanism and other smaller parts are then added. The pistons are lined up with the valves by means of wooden battens, one on the piston and one on the valve. The completed engine has the underside painted aluminum to increase the light for inspection.

The second paper was presented by P. E. Salvat, from the Ecole Polytechnique, on **Launching of Ships**. The launching of a ship is the transfer of the ship from the ways to the water and is really the birth of the ship. Usually it is necessary to reinforce the ground with piling to carry the heavy weight of the ship during construction. The keel is

usually laid on heavy wooden blocking about five feet above ground level on a slope of one-half in. per ft. For launching, the declivity is usually  $11/16$  to  $3/4$  in. per ft. Small and medium-sized ships are sometimes launched sideways. The advantages are that the ship is vertical and on an even keel. The disadvantage is the large space required, the necessity of removing the construction equipment on the river side and the danger of capsizing the ship. For the heavier ships, stern launching is the usual method. The ship is held in puppets fore and aft on brackets welded to the ship. The ship is held by doghouses and triggers while she is being prepared for launching. The bearing pressure is about two and a half tons per ft. As the ship is sliding down the way, the balance is very important. Tipping and pivoting are liable to occur if the balance is not proper. Once the ship is waterborne she is usually stopped by the drag of chains in the water.

The third paper was presented by J. H. Maclure, of McGill, on **Wooden Shipbuilding**. The building of wooden ships is an art which had its beginning in the ark built by Noah. The art has been revised by the use of wooden ships as minesweepers in the present war. The usual shipyard which the author has visited consists of two or three buildings; the staff is made up of the owner and builder, a bookkeeper, several carpenters and a blacksmith. Labour consists of farmers and fishermen who are very unreliable at some seasons. The use of mold loft practice, the transfer of the ship's dimensions to the floor of the mold loft of the longitudinal vertical, and the longitudinal horizontal plans plotted from a table of ordinates and the transverse vertical made from a combination of the above plans. By the use of diagonals the final fairing, which removes any flat spots, is made. The rabbeting and bearding takes care of the intersection of the planks in the prow and heel of the ship. For the trial run of the ship usually everyone who had something to do on the ship is on board.

The fourth paper was presented by G. Bisailon, from the Ecole Polytechnique, on **Long Range Cruising Control**. Twenty years ago an aviator crossing the Atlantic was a hero. Today it is quite common for aeroplanes to fly to all parts of the world in the ferry service. The main factors to long range flight are the altitude of the plane and engine performance at altitude. The forces acting on the plane are the weight counteracted by the lift and the drag caused by the air resistance. The effect of altitude is such that a plane can fly faster at altitude than at ground with the same fuel consumption. The engines are most efficient at altitude with full throttle and low engine r.p.m. For commercial flight the most economical altitude is from eight to ten thousand feet as no heat or oxygen is necessary.

While the judges were arriving at their decision, Mr. J. A. Lalonde, branch chairman, presented the Institute prizes to engineering students to Sam Gerstein, of McGill University, and to Henri Audette, of the Ecole Polytechnique.

The judges awarded the first prize, \$15.00, for the evening, to P. E. Salvas and two second prizes of \$10.00 each, to J. H. Maclure and G. Bisailon.

The meeting then adjourned for refreshments.

### OTTAWA BRANCH

A. A. SWINNERTON, M.E.I.C. - *Secretary-Treasurer*  
R. C. PURSER, M.E.I.C. - - - *Branch News Editor*

At a luncheon meeting of the Ottawa Branch on November 5, R. M. Gooderham, B.A.Sc., M.E., of the Shipbuilding Branch of the Department of Munitions and Supply, gave a talk on **Increasing Welded Production**. Mr. Gooderham's duties relate to the improvement of welding methods in Canadian shipyards. N. B. MacRostie, local chairman, presided and the luncheon meeting drew an exceptionally large attendance.

In the last war, stated Mr. Gooderham, welding was primarily used for salvage and repair operations whereas

in this war it is used as a production tool as well. In United States, for instance, taking into account all the different kinds of welding, it is reckoned as the eighth largest industry with a total annual volume of sales of well over \$200,000,000. Of this arc welding is in the greatest proportion with about 150,000 arc welders employed. In spite of this fact, welding is still considered to be in its infancy.

The speaker went on to say that "in the near future" it is predicted that 90 per cent of all rivetting will be replaced by welding, although one thing that will have to be taken into account is the large amount of rivetting equipment that will still have to be used up. Advantages of welding over rivetting include the use of rolled steel over cast iron. The former is from four to five times as strong in tension and from two to two-and-a-half times stiffer. With rigidity one of the prime factors in any engineering design the latter point becomes most important.

In arc welding, which essentially embodies the principle of the melting of metal the rate of welding accomplished is almost directly proportional to the amount of current used. Thus as a first principle if the amount of welded production is to be increased the amount of current must be increased. Another thing to take into account is that welding can only be carried on while the arc is going. The number of minutes out of the hour in which welding actually takes place—the operating efficiency—must be increased if the amount of welding is to be stepped up. In some plants some operators, for instance, do not actually weld more than six minutes out of the hour whereas many times this efficiency should be aimed at. The rest of the time is taken up in assembling his materials and putting them in proper position for doing his welding work.

In stepping up efficiency the operator should be given every facility toward keeping his arc going, as well as a monetary incentive. The latter could be effected by payment of a piece work on bonus system basis. The speaker did not agree with those who prophesied that under such circumstances the quality of the work would suffer. He dwelt at some length on this and outlined various systems of procedure whereby such a possibility would be obviated.

One feature of the question of increased production to which a great deal of attention has not yet been given, according to Mr. Gooderham, is that of the operator's comfort. Greater attention should be paid to the reduction of eye fatigue, the use of more comfortable clothing, the dissipation of heat, and other comfort-producing items. Such things have generally been neglected in the past.

With the main job now to increase our efficiency in the matter of production, engineers as a class should more surely acquire that sense of urgency in getting things done and more closely study every means possible toward that end.

The luncheon talk was followed by a motion picture film in full colour and sound illustrating the right and wrong ways to go about the job of welding.

At an evening meeting on November 19, at the auditorium of the National Research Laboratories, members of the branch and their friends were treated to a most interesting address and demonstration on "**Your Voice as Others Hear It.**" This was given by George L. Long who for the past six years has been in charge of the Telephone Museum and Historical Collection of the Bell Telephone Company of Canada in Montreal. He has had many years experience in telephone engineering, including the training and instructing of telephone workers.

Mr. Long demonstrated the operation of a microphone and of a magnetic tape recording device which enabled members of the audience to hear how their voices were heard by others. Through its use, it was possible for one to appraise his own *voice appeal* and to take steps to improve his own speech.

The meeting, which was open to the public, was particularly well attended and there were many ladies in the audience.

## SAGUENAY BRANCH

A. T. CAIRNCROSS, M.E.I.C. - - *Secretary-Treasurer*  
GEORGE ARCHAMBAULT, Jr., E.I.C. - *Branch News Editor*

On October 8th the Branch was entertained at the showing of the film **Inside Arc Welding**, produced by the United States Government and sponsored by the General Electric Company. Mr. C. Miller, M.E.I.C., acted as chairman.

Mr. John Ward moved a vote of thanks to Messrs. R. N. Fournier and R. H. McBrien, who showed the film.

OCTOBER 15TH—

The speaker of the evening of October 15th was Mr. A. W. Whitaker, Jr., general manager of the Aluminum Company of Canada, Limited, who spoke on **The Aluminum Industry and the War Effort**. Mr. R. H. Rimmer, M.E.I.C., acted as chairman.

Mr. Whitaker briefly outlined the story of aluminum from its *discovery* in the metallic form by a Danish chemist, H. C. Oersted, in the year 1825. In 1886 the electrolytic method of producing aluminum—the present commercial process—was discovered at about the same time by Charles Martin Hall, an American, and Paul L. T. Héroult, a Frenchman. Hall and Héroult worked along the same lines, unknown to each other, and both had patents granted them by their respective governments. When aluminum was produced on a commercial scale for the first time, the producers could find no ready market for the new light metal and it was not until the pot and pan industry was entered that aluminum came into its own. Since then, and particularly during the last decade, the uses for aluminum have increased so that to-day it is a vital necessity in the war effort and a potential wonder for post-war prosperity.

Mr. Whitaker took the audience on a tour of some of the Company holdings, by means of beautifully coloured pictures taken by himself during various trips to the distant points. The pictures showed life and work at such places as Northern Quebec, Newfoundland, British Guiana, and Greenland. Through the pictures and his knowledge of the subject the speaker was able to bring clearly to the minds of the audience the part being played by many individuals spread over a great portion of the Western Hemisphere in the production of the vitally essential aluminum.

Mr. S. J. Fisher, M.E.I.C., thanked the speaker on behalf of the Saguenay Branch.

OCTOBER 30TH—

On October 30th Mr. F. T. Agthe, engineer with the Allis-Chalmers Company of Milwaukee, addressed a meeting of the branch on the subject **Processing Equipment—Mills and Kilns**. Mr. C. Miller, M.E.I.C., acted as chairman.

Mr. Agthe divided his lecture into two parts, dealing separately with mills and kilns and showing slides depicting each.

MILLS

The speaker said that grinding has played an important part in the life of man, dating back hundreds of years to the time when all grain was ground between rotating stones. The first known departure from stone grinding was about 1868 when a ball mill was introduced to South Africa, and since then grinding methods have continued to advance yearly.

Grinding is divided into two distinct classes: wet and dry. The wet process has been used in most metallurgical grinding operations, and the dry method has been used most extensively in the cement and ceramic industries. The speaker also explained the meaning of ball mills, tube mills, ball-peg and ring mills.

Cement dry mills, Mr. Agthe said, were successfully operated for the first time in America during 1895, and from then until 1930 production was the moving power behind cement producers. The great dam building projects, introduced about 1930, necessitated the introduction of special cements and this caused the producers to investigate the mining fields where the wet process was used. To-day two-stage, dry-wet grinding of material is common practice,

with the result that cements may be produced for particular uses in varied climates and utilizing different pouring methods.

KILNS

Mr. Agthe said that the first known experiments with kilns were done in England. In America the first commercial kiln was operated at Coplay, Penn., about 1896. It was fired with oil at the beginning, but in 1898 the fuel was changed to pulverized coal. The kiln was 6 ft. by 60 ft. and had a capacity of 25,000 barrels per day. As knowledge grew with the use of this and other kilns, the sizes of the kilns grew to modern lengths of over 500 ft. with diameters in excess of 12 ft.

As the capacity of the kilns increased, more and more control over the processing became necessary. Continuous filters and coolers were introduced to take care of the incoming mixture and the outgoing product. Incoming primary and secondary air, fuel, and outgoing gases all have to be carefully watched in order to secure a uniformly graded product. Automatic control has now been introduced and the human eye and mind have been replaced by such instruments as the pyrometer and the potentiometer, which never fail if correctly operated.

Mr. M. G. Saunders, M.E.I.C., thanked the speaker on behalf of the Saguenay Branch.

## SASKATCHEWAN BRANCH

STEWART YOUNG, M.E.I.C. - *Secretary-Treasurer*

The Saskatchewan Branch met jointly with the Association of Professional Engineers in the Kitchener Hotel, Regina, on November 19 to hear an address by Dr. John Mitchell, Head of the Soils Department, University of Saskatchewan, on **"The Soils of Saskatchewan."** The attendance was 50 and the address preceded by a dinner at 6.30 p.m.

The various soil formations in Saskatchewan lie parallel with the south westerly limit of the Pre-Cambrian structure in the northerly half of the province and at right angles to the various ice advances and recessions in the respective glacial periods; in the southwest, there is the short grass area, followed in a north easterly direction by the clay belt (best suited to wheat), then the park area (mixed farming) and lastly the gray soils area which merges into the forest area of the Pre-Cambrian structure.

In developing his subject Dr. Mitchell stressed the damage through improper farming from chemical (principally phosphorus) exhaustion, soil drift and erosion, mentioning briefly the methods to be employed to counteract deterioration. He pointed out that for the past 15 years the acreage of land in Saskatchewan under cultivation had remained static and that, while new land had been brought under cultivation, it had been offset by the withdrawal of submarginal land for community pasture purposes. This fact, he intimated was a fair indication that Saskatchewan had now reached the maximum of farm land settlement. The address proved both interesting and instructive and was followed by numerous questions from those in attendance.

Following Dr. Mitchell's address, Major H. L. Roblin gave a brief outline of the objective in organizing the 14th Reserve Field Coy., R.C.E.; afterwards Mr. Geo. E. Kent, assistant superintendent, Imperial Oil Company Plant, showed several reels of coloured film taken in Bolivia and Peru and depicting in particular the rugged nature of the country.

Mr. A. M. Macgillivray concluded the meeting by expressing thanks to the several speakers.

## SAULT STE. MARIE BRANCH

O. A. EVANS, Jr., E.I.C. - *Secretary-Treasurer*  
N. C. COWIE, Jr., E.I.C. - *Branch News Editor*

The fifth general meeting for the year 1942 was held in the Grill Room of the Windsor Hotel on October 30th, 1942, when sixteen members and guests sat down to dinner at 6.45 p.m. At 8:00 p.m. Chairman L. R. Brown rose and asked the members to drink a toast to the King.

The chairman explained that the meeting had been called to have a round table discussion on **Post-War Reconstruction and Rehabilitation** and invited the views of the members. P. P. Martin started the discussion by saying that the boys returning would have absorbed a certain amount of culture from the foreign countries that they have been in and would hold divergent views from ours on their return. He maintained that after the war we should not look on the purely monetary side of affairs, but on actual values as the wealth of a nation is not its gold hoard but its productiveness. C. Stenbol said that we must make the rural districts of the country more attractive to live in. He believed that the real basis of national wealth was originally derived from the rural districts. He maintained that one way to make the rural districts more congenial to live in was to have the electric current in all rural homes, which could be done by a long term amortization plan. J. O. Fitzgibbons maintained that the city needed an adequate system of sewage disposal and that in reforestation the primary object was the correct disposal of slash which he felt was not being done in Ontario. The chairman said that a great number of roads needed to be built and surfaced which would absorb man-power. G. W. MacLeod felt that none of the schemes elaborated would take care of the great host of skilled and technical people released after the war. The secretary felt that there was a great need for socialized medicine and hospitalization after the war.

A committee to study the Post-War Problems was then set up under the pro-tem chairmanship of J. L. Lang. The committee nominated consisted of J. L. Lang, P. P. Martin, G. W. MacLeod, K. G. Ross and E. M. MacQuarrie.

At this moment J. O. Fitzgibbons arose and went on record that he would like this committee to consult him as he was very interested in this subject.

The executive and branch would welcome suggestions from non-resident members on solutions to the Post-War Problems.

#### TORONTO BRANCH

S. H. DEJONG, M.E.I.C. - *Secretary-Treasurer*  
D. FORGAN, M.E.I.C. - *Branch News Editor*

In opening the initial meeting of the Toronto Branch for the current season, the chairman, Col. W. S. Wilson, fittingly referred to the great loss which the profession as a whole and The Engineering Institute in particular, has sustained by the recent death of Ross Robertson (which is referred to elsewhere in the *Journal*). On the motion of Prof. Morrison the branch formally recorded its deep sense of loss and its sympathy with his family.

The meeting was held in the Debates Room, Hart House, on November 5th, about 70 attending. Amongst those whom the branch welcomed as visitors and guests were Messrs. Callander and Foote of the Canadian Westinghouse Company, Hamilton, the latter being president of the Ontario Section of the A.I.E.E., and also Squadron Leader Spence of No. 1 Air Training Command. The presence of several other members of the A.I.E.E. was noted with pleasure.

The speaker of the evening was Mr. Thomasson of the Canadian Westinghouse Company, who described present day practice in the **Welding of Large Electrical Equipment**. Added interest was given to Mr. Thomasson's paper by the fact that he was one of the successful contestants in a recent competition sponsored by the Lincoln Electric Company of the U.S.A. His paper won high place out of more than 2,000 entries received from 17 different countries, and brought Mr. Thomasson a prize of several thousand dollars.

His most interesting talk, which occasioned considerable discussion at its finish, dealt with the assembly, fabrication, and construction of large electrical equipment such as generators, transformers, oil breakers, etc., by the use of welding equipment. The economies in time, labour and material which recent developments in this art have made effective were illustrated both orally and graphically by the speaker, with the aid of lantern slides, the presentation

of which took the audience through the shops where these operations are conducted.

After a vote of thanks happily expressed by Mr. C. Sisson of the Canadian General Electric Company the meeting was adjourned for refreshments.

#### VANCOUVER BRANCH

P. B. STROYAN, M.E.I.C. - *Secretary-Treasurer*  
A. PEEBLES, M.E.I.C. - *Branch News Editor*

On Monday, November 9th, members of the branch were guests at a meeting of the Vancouver section of the American Institute of Electrical Engineers. Their speaker was Dr. H. S. Osborne, plant engineer of the American Telephone and Telegraph Company, and national president of the American Institute of Electrical Engineers. He gave an address on "**The Conservation of Critical Materials**," treating his subject under the following headings:

- A. Making the greatest possible use of what we have.
  1. Increasing the extent of use and capacity of plant.
  2. Prolonging plant life.
  3. Re-use of material recovered in alterations.
- B. Limiting additions and changes to those necessary for essential service.
- C. Making minimum use of critical materials in necessary plant extensions.
  1. Substitutions of less critical materials.
  2. Re-design to use less material.
  3. Addition of plant for immediate needs only.
  4. Standardization.
- D. Placing back into circulation materials which can be spared.
  1. Clean up and dispose of junk.
  2. Reduction of inventories.
  3. Taking materials out of working plant.

Dr. Osborne gave examples of the application of each of the above procedures, mainly appertaining to the electrical industry, but to be found in all branches of industry and engineering.

Loads on transformers may be increased by better cooling arrangements. Capacitors may be used to take reactance. Worn parts may be built up by using sprayed metal. Tools should be given better care and supervision. Better care of material in dismantling operations will increase the amount of salvage. Economic requirements may be secondary to the use of materials in the emergency. An exchange of inventory can often be made between companies.

Silver has been substituted for copper on some government work for bus bars, windings, and in switch gear. Steel wire and copper clad steel tubing are being substituted for solid copper in carrier systems by using higher frequency transmission. Lead may be substituted for zinc in rust-proofing exposed metal such as pole line hardware. A more careful study of wiring diagrams will often save considerable material. Shorter life designs are justified, even as low as one to three years. Standard parts usually use less material than those of special design. Saving material against a scarcity is not justified at the present time.

The electrical industry in 1941 used 50 per cent of the available supply of copper. In 1942 it will consume only 20 per cent of 1941 requirements, and this will represent but one per cent of the total supply. The problem of conservation is made more difficult by reason of the greater demand for service. A compromise is nearly always possible. The address was followed by considerable discussion, some of which pointed to the possible saving of material which could be effected in contracts for the government and the armed services, by a revision of their specifications. The chair was occupied by T. Ingledow, chief engineer of the British Columbia Electric Railway Company and chairman of the local section of the American Institute of Electrical Engineers. Eighty persons were present.

# News of Other Societies

## UNIVERSITY OF TORONTO ENGINEERING ALUMNI REUNION

On Saturday, November 14th, another in the long series of triennial reunions took place at Toronto. In spite of the handicap of being only one day in duration instead of two, it equalled in enthusiasm and attainment all its predecessors.

The morning was given over to sessions of Council and special committees. At noon, class luncheons were held, some of them being so successful that adjournments were obtained only about in time for the banquet.

The afternoon was taken up with the annual business meeting. It was a great tribute to the officers of the society that this was the best attended business meeting within the memory of anyone present.

At night the dinner was held. This was the feature of the whole reunion. Between four and five hundred assembled to see alumni medals presented to W. P. Dobson, M.E.I.C., '10, Chief Research and Inspection Department, Hydro-Electric Power Company of Ontario, and Colonel W. E. Phillips, '14, President of Research Enterprises Limited, and to hear Major J. E. Hahn, Director General, Army Technical Division Board, the speaker of the evening. W. E. Wingfield, President of the alumni, was in the chair.

Alumni officers were elected for the next three years.

## Items of interest regarding activities of other engineering societies or associations

*Above:* M. B. Hastings, incoming president of the Engineering Alumni and president of the Alumni Federation of the University of Toronto, addresses the meeting. On his right, Maj. Hahn.

*Below:* Dr. J. L. Morris, M.E.I.C., the oldest living graduate of the School, and Balmer Neilly, of McIntyre Poreupine Mines Ltd.

*Above:* Major J. E. Hahn, the speaker of the evening, and H. E. Wingfield, M.E.I.C., chairman and president of the Alumni. At the microphone: N. F. Parkinson.

*Below:* H. J. A. Chambers, M.E.I.C., chief engineer of the Hamilton Bridge, and Wm. C. Foulds, manager, Engineers' Club of Toronto.

W. P. Dobson, M.E.I.C., one of the recipients of the Alumni Medal.

## ASSOCIATION OF PROFESSIONAL ENGINEERS OF ALBERTA

The Calgary District Meeting of the Association of Professional Engineers was held at 10.15 p.m., Saturday, October 17th, 1942, at the Renfrew Club.

The District Meeting, at this time, should have been held in Lethbridge, but owing to the fact that there was to be a joint dinner in honour of Mr. H. J. McLean, who is leaving Calgary to reside in Montreal, Council decided to hold the Calgary District Meeting at this time and the Lethbridge District Meeting early in the new year.

Since members of the engineering profession are so busy at the present time, Council decided to hold the district meetings this year after the evening programme.

The president, Mr. S. G. Coultis, called the meeting to order and spoke for fifteen or twenty minutes on the activities of the Association, since the Annual Meeting last March.

Mr. Coultis announced that six new members had been admitted at the Board of Examiners meeting in April. Twenty-three new engineers-in-training were also admitted. During the summer, five new licenses were granted. The membership now stands at 306, members, made up as follows:

16 life members; 290 members (23 of whom are on active service). There are now 97 engineers-in-training registered with the Association.

Under discipline and enforcement, the president stated that there were no particular cases at the present time. He discussed the use of the word "engineer" and informed the meeting that the Council had decided that the Association should take all practicable steps to publicize its proprietary rights to the use of the term "professional engineer" as set forth in the Engineering Profession Act of 1930. He informed the meeting that the membership card for 1943 would be altered so as to bring before the public, the term "professional engineer."

Mr. Coultis next outlined the schedule of rates and categories into which licensees are classified.

The president notified the members that Council had set the fees for 1943 the same as they were at the present time. He also mentioned that for members on active service, the Association and The Engineering Institute of Canada remit all fees when they leave for overseas.

This year the Association lost three members who passed away since the Annual Meeting. These were: Life Members, Messrs. W. D. L. Hardie and O. E. S. Whiteside, and the registrar, Mr. Harry R. Webb.

After this outline of activities of the Association since the Annual Meeting, the president asked if any members present had any questions or business to bring before the meeting.

The president next called on the newly appointed registrar, Mr. W. E. Cornish; the vice-president, Mr. Vernon Pearson; and the Lethbridge councillor, Mr. Donaldson, to say a few words.

Mr. deHart gave a brief report on the Dominion Council Meeting held at Saint John, N.B. on May 22nd, 23rd and 24th, 1942. He discussed the informal meeting held in Montreal at 10.30 a.m. on Thursday, May 21st, consisting of delegates to the Saint John meeting of the Dominion Council and others. This meeting discussed a previous resolution of Dominion Council which looked to the co-ordination of the voluntary engineering societies in Canada, and the forma-

tion by them of a board or council which would be available to take joint action in cases where common effort was desirable.

Dominion Council discussed the possibility of setting up a central Examining Board, which might conduct examinations of no lower standard than those currently being conducted by the associations. The results of such examinations could be accepted by all associations as equivalent to their own. To do this, certain associations would have to make drastic changes in their Acts.

The president finally called on Mr. H. J. McLean to say a few words.

The meeting adjourned at 11.00 p.m. There were 37 members present at the meeting.

## SAFETY ENGINEERING ORGANIZATION HEADED BY CANADIAN

Wills Maclachlan, M.E.I.C., has been elected general chairman of the Engineering Section of the National Safety Council for 1943.

Wills Maclachlan, M.E.I.C.

This organization, with headquarters in Chicago, has been engaged for the past thirty years in the prevention of accidents in industry, in homes, on streets and highways and in other public places, and the prevention of occupational diseases. Its voluntary committees now include more than a thousand men and women in various fields, who are contributing their time and effort to promoting the work of the Council.

The Engineering Section was organized in 1921. In 1924 it absorbed the American Society of Safety Engineers and today, the organization is still known as the A.S.S.E.—Engineering Section of the National Safety Council. Its object is the promotion of the arts and sciences connected with engineering in its relation to accident prevention and the conservation of life and property, and the development of safety engineering as a profession.

Mr. Maclachlan is the first Canadian to be elected as general chairman of the Engineering Section. He is an engineering graduate of the University of Toronto from the class of 1907. After serving an apprenticeship with Westinghouse Electric and Manufacturing Company, he was engaged for several years in the engineering division of the power industry. In 1915, he became connected with the Electrical Employers Association of Ontario, of which he is still secretary-treasurer and engineer. Since 1917 he has also been in charge of the Employees Relations Department of the Hydro-Electric Power Commission of Ontario.

Mr. Maclachlan is also a consultant in industrial relations and he is at present chairman of the Committee on Industrial Relations of The Engineering Institute of Canada.

### BS/ARP STANDARDS

#### COMMENTS

#### RELATIVE TO APPLICATION IN CANADA

The following comments, supplied by the Canadian Engineering Standards Association, have been submitted by representative and authoritative Canadian interests in response to direct inquiries as to the applicability in Canada of the specifications issued by the British Standards Institution with regard to Air Raid Precautions.

#### BS/ARP No. 3—Electric Hand-lamps:

*Clause 1, General, Note—Change "torch" to "flashlight." Re Battery—Consult manufacturers before deciding specified capacities, etc.*

#### BS/ARP No. 6—Shelter Lighting:

*Editorial rearrangement and rewording of clauses. Desirable to consult manufacturers of batteries, low-voltage lighting sets, etc., before deciding capacities, etc.*

#### BS/ARP No. 7—Electric Lighting of Report and Control Centres:

*Editorial rearrangement and rewording of clauses. Desirable to consult manufacturers of batteries, low-voltage lighting sets, etc., before deciding specified capacities, etc.*

#### BS/ARP No. 8—Galvanized Wire Netting and Cloth for Protection Against Flying Particles:

*Part I— $\frac{1}{2}$ -in. netting not manufactured in Canada. Suggested that 1-in. be used, as this is available. Part II— $\frac{1}{2}$  in. by  $\frac{1}{2}$  in. is available in Canada—applicable.*

#### BS/ARP No. 10—Rubber Gaskets for Rendering Doors and Windows Gas Tight:

*Applicable, but if a new specification is to be prepared some slight changes would be suggested.*

#### BS/ARP No. 11—Adhesive Tape for Repairing Damaged Material, Sealing Apertures and Cracks.

*Applicable to conditions in Canada.*

#### BS/ARP No. 12—Petroleum Jelly for Sealing Gas-tight Doors, etc.:

*Drop Point—Suggested that ASTM D 127-30 be specified. Penetration—Suggested that ASTM 217-38T for method of test be specified. Revise lower limit of penetration from 200 to 170. Would revise specification to include both ASTM specifications.*

#### BS/ARP No. 14—Window Blind Material (Paper):

*In general, the important point is not colour but opacity. A point to be considered also is the reflectance of glass windows even when they are blacked out.*

#### BS/ARP No. 16—Methods of Providing Even Illumination of Low Intensity (0.002 foot-candle):

*For adoption in this country a few changes will be necessary in order to have equipment conform to Canadian standards.*

#### BS/ARP No. 18—Fluorescent and Phosphorescent Paint:

*Specification acceptable but suggests going further. Eastman Kodak Company sent copy of report of their laboratory covering review of this specification.*

*The specification is cumbersome and requires specially built testing equipment; it appears to be of little use in Canada. It might be accepted if the ultra-violet source were more carefully specified, if the amount of paint spread on the surface was specified, and if the specification was broadened to include radium-excited luminous paints.*

*American Standards Association sent copies of "Summary of American Opinion," prepared by the Eastman Kodak Company. Specification seems satisfactory—have no criticisms to offer.*

#### BS/ARP No. 20—Methods of Providing Even Illumination of Low Intensity (0.02 foot-candle):

*For adoption in this country a few changes would be necessary to have equipment, etc., conform to Canadian standards.*

#### BS/ARP No. 21—Methods of Providing Even Illumination of Low Intensity (0.2 foot-candle):

*For adoption in this country a few changes will be necessary to have equipment, etc., conform to Canadian standards; suggests necessary changes.*

#### BS/ARP No. 23—Obscuration Value for Textile Materials for Curtains:

*Satisfactory for Canadian use in present form.*

#### BS/ARP No. 26—Reduced Scheme for Lighting of Shelters where A.C. Mains are Available:

*Editorial rearrangement and rewording of clauses suggested. It would be desirable to consult manufacturers of batteries, low-voltage lighting sets, etc., before deciding specified capacities, etc.*

#### BS/ARP No. 27—Testing Incombustible Material Resistant to Incendiary Bombs:

*Specification applicable to Canadian conditions with suggestions on the following minor points: (1) Arrangements for a supply of the one kilo magnesium thermite bombs should be made. (2) Tests on more than one specimen would probably be advisable, particularly with material apt to crack.*

*Specification applicable. It was pointed out, however, that the chief differences involved would be the impact resistance of the ordinary roof structures in Canada as compared with the tile and other types of resistant roof structures used in Europe.*

#### BS/ARP No. 30—Gauges for Checking Low Values of Illumination (0.001 to 0.2 foot-candle):

*Suggested that Clause 3 be revised as follows: "The angle subtended by the field of view at the observer's eye shall be nowhere less than 7 deg. under normal conditions of use. If a concentric type of field is used, the diameter of the central area shall not be less than 5 deg.*

#### BS/ARP No. 32—Illuminated and Non-illuminated ARP Signs:

*Suitable for use under Canadian conditions with slight changes in nomenclature which would be unfamiliar to Canadians. Map symbols in use in Ontario were submitted. Slight changes in nomenclature were suggested also by the Province of Quebec.*

#### BS/ARP No. 33 and Supplement—Stirrup Pumps:

*No comments. Survey of manufacturing possibilities were made in Canada.*

#### BS/ARP No. 35—Illuminated Display Cabinets:

*For adoption in this country a few changes would be necessary to have equipment, etc., conform to Canadian standards.*

#### BS/ARP No. 36—Headlamp Masks for Motor Vehicles:

*For adoption in this country a few changes would be necessary to have equipment, etc., conform to Canadian standards.*

#### BS/ARP No. 37—Street Lighting Under Wartime Conditions:

*Specification seems satisfactory, with slight modifications. Similar specification has been given preliminary consideration by the Canadian Region of the Illuminating Engineering Society. Conditions differ somewhat in Canada from those in England.*

#### BS/ARP No. 38—Traffic Paints:

*No Comments.*

#### BS/ARP No. 39—Testing Fire-retardant Timber Treatment by Exposure to Action of Incendiary Bomb:

*Specification satisfactory for the purpose intended. (See Forest Products Laboratories' Report on Fire Retardant Paints). "There is some question as to whether or not the exposure of an electron bomb in the British test is more severe than the Bunsen burner used in our test."*

#### BS/ARP No. 40—Bleach Ointment (Anti-gas Ointment No. 1):

*Specification satisfactory as long as materials are available in Canada.*

#### BS/ARP No. 41—Front Lamps for Tram Cars:

*Specification might be revised to agree with U.S. standards, which would be more applicable to Canadian conditions.*

#### BS/ARP No. 43—A Closet for Use in Air Raid Shelters:

*No comments.*

#### BS/ARP No. 47—Testing Incombustible Material to Provide a Minimum Standard of Protection Against Incendiary Bombs:

*Specification applicable. It was pointed out, however, that the chief differences involved would be the impact resistance of the ordinary roof structures in Canada as compared with the tile and other types of roof structures used in Europe.*

#### BS/ARP No. 48—Fabric-bitumen Emulsion Treatment for Roof Glazing:

*Specification applicable, with exception possibly, of the following minor points—the ring test under Appendix D is essentially the ASTM test except that the brass ring shown has double the ASTM wall thickness and has no bevel. It is unlikely that this will influence the test results but a few comparative tests of commercial bitumens might be in order.*

**BS ARP No. 52—A Simple Portable Standard of Brightness:**

Appears to be suitable for use in Canada and is actually in use in the optics laboratory of the National Research Council.

**BS/ARP No. 53—Detection of Incendiary Bomb Fires by Heat-sensitive Devices:**

Appears to be suitable with the minor exception that the words "accumulator" and "Leclanche cell" are not commonly used in Canada.

**BS/ARP No. 53 (Cont'd)—Fire-Detection Devices with Special Reference to the Detection of Incendiary Bombs—A Memorandum by the I.E.E. Advisory Committee to Ministry of Home Security:**

This is a general circular containing information that might be useful to scientific workers.

**BS/ARP No. 54—Electrical Heating of Shelters:**

For adoption in this country a few changes will be necessary to have equipment, etc., conform to Canadian standards.

**ADDITIONS TO THE LIBRARY****TECHNICAL BOOKS****The Steam Locomotive:**

Its theory, operation and economics. Ralph P. Johnson. N.Y., Simmons-Boardman Publishing Company, (c. 1942). 6 x 9½ in. \$3.50.

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet the books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

**A.S.T.M. STANDARDS ON COAL AND COKE**

Prepared by Committee D-5 on Coal and Coke. Sampling Methods, Chemical Analysis, Methods of Testing, Specifications and Classifications, Definitions of Terms. Sept. 1942, American Society for Testing Materials, Phila., Pa. 122 pp., illus., diags., charts, tables, 9 x 6 in., paper, \$1.35.

The methods of coal and coke approved by the Society and the official definitions and specifications for classifying coals by rank and grade are collected in convenient form in this pamphlet.

**AIR RAID PRECAUTIONS HANDBOOK**

No. 4A (2nd edition). DECONTAMINATION OF CLOTHING, INCLUDING ANTI-GAS CLOTHING AND EQUIPMENT, FROM PERSISTENT GASES

His Majesty's Stationery Office, London, 1942. 31 pp., tables, 7 x 5 in., paper, (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, 10c.)

Precise directions are given for decontamination of clothing and personal belongings of all kinds.

**AIR RAID PRECAUTIONS HANDBOOK No. 13 (1st edition). FIRE PROTECTION for the Guidance of Occupiers of Factories and Other Business Premises**

His Majesty's Stationery Office, London, 1942. 91 pp., diags., charts, tables, 9½ x 6 in., paper, (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, 30c.)

This pamphlet brings together much practical information on the measures to be taken for dealing with fires following air raids, and is based on English experience in recent years.

**AIR RAID PRECAUTIONS TRAINING MANUAL No. 3 (1st edition). RESCUE SERVICE MANUAL**

His Majesty's Stationery Office, London, 1942. 149 pp., illus., diags., tables, 10 x 6 in., paper, (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, 45c.)

The organization of a rescue service, the equipment needed, the methods to be used and the training of rescue teams are set forth in considerable detail in this practical manual. The book is based on British air-raid experience.

**AIRCRAFT DRAFTING ROOM MANUAL (Cadet Series)**

By J. C. Thompson. Aviation Press, San Francisco, Calif., 1939, pages in eight sections, illus., diags., charts, tables, 11½ x 9½ in., paper, \$3.50.

The purpose of this book is to supply information on the general requirements for airplane drawings and adequate reference information for preparing them, and to explain the operation of the drafting-room system used in most aircraft factories. Part one describes drafting practices, based upon the requirements of the Army Air Corps. Part two discusses the organization of an engineering office and the establishment of a system for handling drawings. Part three contains data upon the materials used in aircraft.

**THE AMERICAN STUDENT FLYER**

By M. C. Hamburg and G. H. Twency. Pitman Publishing Corp., New York and Chicago, 1942. 692 pp., illus., diags., charts, tables, 9 x 5½ in., cloth, \$1.50.

This text is designed for use in high schools where preliminary training is offered to boys who intend to apply for appointments to Army and Navy flying corps. The aim has been to provide all the material needed for these pre-flight courses in a single volume.

**ARC WELDING JOB TRAINING UNITS (Dunwoody Series Welding Training Jobs) 103 pp.****GAS WELDING JOB TRAINING UNITS (Dunwoody Series Welding Training Jobs) 92 pp.**

*American Technical Society, Chicago, Ill., 1942, illus., diagrs., 11 x 8½ in., paper, \$1.25 each.*

These manuals present a course in welding with the electric arc and with gas, adapted to the needs of industrial schools and apprentice training. Each course consists of forty jobs, an information sheet being furnished for each. Question sheets are also provided for most jobs. The courses have been thoroughly tested in schools and industries.

#### **BASIC RADIO, the Essentials of Electron Tubes and Their Circuits**

*By J. B. Hoag. D. Van Nostrand Co., New York, 1942. 379 pp., illus., diagrs., charts, tables, maps, 9 x 5½ in., lea., \$3.25.*

The aim in this text is to select the radio tubes and circuits which experience has proved useful, present a simple explanation of how they work and where they are applied, and to provide sufficient numerical constants and other details to make them readily understandable. The text is intended for students with only a limited knowledge of physics and mathematics.

#### **BOILER FEED AND BOILER WATER SOFTENING, a Boiler Operators' Manual**

*By H. K. Blanning and A. D. Rieh, 3 ed. Niekerson & Collins Co., Chicago, 1942. 164 pp., charts, tables, 11 x 8½ in., cloth, \$3.50.*

Methods of testing water, the interpretation of tests and the various treatments available for softening and purifying feed water are discussed in detail in this book. The subject is discussed from the point of view of the operators of power plants, especially small ones of low and medium pressure, where expert chemical assistance is not readily available.

#### **THE CHEMICAL TECHNOLOGY OF PETROLEUM (published formerly as Petroleum and Its Products)**

*By W. A. Gruse and D. R. Stevens, 2 ed. McGraw-Hill Book Co., New York and London, 1942. 733 pp., diagrs., charts, tables, 9½ x 6 in., cloth, \$7.50.*

Based upon Gruse's "Petroleum and Its Products", the present volume is twice the size of the original book and has been completely rewritten. It presents a chemical discussion of the petroleum industry as a whole. The chemical composition of petroleum, their chemical and physical properties, the group reactions of petroleum oils, the chemistry of production and the origin of petroleum are treated. Chapters are given on distillation, refining by chemical and physical methods, and on cracking and the chemical thermodynamics of petroleum hydrocarbons. Other chapters discuss motor fuels, kerosene, petroleum lubricants, paraffin, petroleum asphalts and other products.

#### **ELECTRICAL ENGINEERING, Vol. 2**

*By W. T. Maceall. University Tutorial Press, Ltd., London, 1942. 463 pp., illus., diagrs., charts, tables, 9 x 5½ in., cloth, 15s.*

This book is based on the author's former "Alternating Current Electrical Engineering". With volume one of the present work it is intended to cover all the fundamentals of all branches of electrical engineering dealt with in the usual three-year courses given in British schools. This volume discusses symbolic notation, harmonic analysis, alternating-current generators and motors, converters, mercury-arc rectifiers, transmission, protection and symmetrical components.

#### **Great Britain. Dept. of Scientific and Industrial Research. BUILDING RESEARCH, WARTIME BUILDING BULLETIN No. 20, SAND-LIME BRICKS**

*His Majesty's Stationery Office, London, 1942. 6 pp., 11 x 8½ in., paper, (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, 10e.).*

A brief exposition of the properties, uses and availability in England of these bricks, with comment on some points of direct wartime interest.

#### **Great Britain. Ministry of Works and Buildings. SECOND REPORT OF THE COMMITTEE ON THE BRICK INDUSTRY**

*His Majesty's Stationery Office, London, 1942. 28 pp., tables, 9½ x 6 in., paper, (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, 15e.).*

This report discusses the condition of the British brick industry and makes wartime recommendations concerning the reduction of output, a quota plan of allocation, the fixing of minimum and maximum prices, and compensation for loss of sales.

#### **GUN MANUFACTURE, compiled by the editors of "American Machinist"**

*McGraw-Hill Publishing Co., New York and London, 1942. 138 pp., illus., diagrs., charts, tables, 11 x 8½ in., paper, \$1.00.*

The articles upon gun manufacture which have appeared in the "American Machinist" during the last two years have been collected in this convenient volume. Methods of tooling up for a variety of guns, as practised in various American factories, are described in detail.

#### **HANDBOOK OF APPLIED HYDRAULICS**

*By C. V. Davis. McGraw-Hill Book Co., New York and London, 1942. 1,084 pp., illus., diagrs., charts, maps, tables, 9 x 6 in., lea., \$7.50.*

A general reference work on hydraulics, composed of brief, yet complete texts on its various branches with practical information on the planning and design of hydraulic works. Hydrology, river regulation, dams, spillways, canals, hydroelectric plants, hydraulic machinery, water supplies, sewerage, irrigation, drainage, etc., are discussed by eighteen prominent engineers with experience in various fields.

#### **HANDBOOK OF WAR PRODUCTION**

*By E. A. Boyan, with a foreword by E. H. Schell. McGraw-Hill Book Co., New York and London, 1942. 368 pp., diagrs., charts, tables, 9½ x 6 in., cloth, \$3.00.*

This handbook discusses the problems of management that are involved in the conversion of plants to the production of war materials, and in increasing the quality and speed of output. It is based upon the experience of pioneer war manufacturers. Among the subjects discussed are the procurement of contracts, materials and supplies, production planning and control, quality control, labor and expansion, conservation of strategic material, industrial accounting in wartime, estimating for war contracts, and subcontracting.

#### **HARDNESS AND HARDNESS MEASUREMENTS**

*By S. R. Williams. American Society for Metals, Cleveland, Ohio, 1942. 558 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$7.50.*

In writing this book, the author has aimed to revive interest in an active study of the subject, to promote a more general outlook on the problem, and to bring together the literature on the subject in convenient form. The theories of hardness, the conditions underlying hardness measurements, and the various methods and instruments available are discussed. There is a bibliography of over 2,000 references.

#### **INTERNATIONAL ASSOCIATION FOR BRIDGE AND STRUCTURAL ENGINEERING**

#### **MEMOIRES, ABHANDLUNGEN, PUBLICATIONS, Vol. 6, 1940-41**

*Published by the General Secretariat in Zurich, copies for sale at A. G. Gebr. Leemann & Co., Stoekerstrasse 64, Zurich, Switzerland, 1942. 306 pp., illus., diagrs., charts, tables, 9½ x 6½ in., paper, Swiss Frs. 25; RM. 15.*

The present volume of the Proceedings contains four papers in English, two in French and ten in German, which have collected at the headquarters of the Association since 1939. The papers discuss various matters related to the theory and practice of bridge and structural engineering.

#### **INTRODUCTION TO NAVAL ARCHITECTURE**

*By J. P. Comstock. Simmons-Boardman Publishing Corp., New York, 1942. 209 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$4.00.*

This textbook is based upon the course in theoretical naval architecture given to hull-drawing apprentices at the Newport News Shipbuilding and Dry Dock Company. It is intended for students with only high-school education and does not call for higher mathematics. The fundamentals of the subject and their interrelations are explained, and their application is shown by practical examples in design.

#### **MECHANICAL PHYSICS**

*By H. Dingle. Ronald Press Co., New York, 1942. 248 pp., diagrs., 8 x 5 in., cloth, \$2.25.*

The author divides physics into "mechanical" physics and "sub-atomic" physics, and confines himself here to the first division—the properties of matter, heat, and vibrations and sound. The text is of college grade and aims to present physical principles in a manner that will bring out especially their applications in aeronautics and related subjects.

#### **MICROWAVE TRANSMISSION (International Series in Physics)**

*By J. C. Slater. McGraw-Hill Book Co., New York and London, 1942. 309 pp., diagrs., tables, 9½ x 6 in., cloth, \$3.50.*

In this book on ultra high-frequency systems, the author presents the general theory underlying the methods used for transmitting these waves from generator to receiver, including the intermediate stage of radiation from one antenna and absorption by another. The treatment is based upon the theory of conventional transmission lines and on Maxwell's equations. The book is an advanced text and reference book.

#### **MODERN TRIGONOMETRY**

*By M. J. G. Hearley. Ronald Press Co., New York, 1942. 168 pp., illus., diagrs., charts, tables, 8 x 5 in., cloth, \$1.75.*

An elementary textbook presenting the numerical side of trigonometry in a form adapted to students with little mathematical background. The problems are practical ones, and the applications of trigonometry in astronomy, navigation and mechanics are discussed. The book is designed especially for students of aeronautics.

#### **MOTION AND TIME STUDY (Rochester Technical Series)**

*By G. W. Chane. Harper & Brothers, New York and London, 1942. 88 pp., diagrs., charts, 9½ x 6 in., cloth, \$1.40.*

A simple discussion of methods of time and motion study, and their use in shop management is offered in this concise text. The book is intended as a guide to assist management personnel in increasing efficiency.

#### **NATURAL TRIGONOMETRIC FUNCTIONS to Seven Decimal Places for Every Ten Seconds of Arc, together with Miscellaneous Tables**

*By H. C. Ives, 2 ed. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 351 pp., diagrs., tables, 10 x 7 in., cloth, \$9.00.*

These tables give the natural sines, cosines, tangents and cotangents. They also include eleven other tables frequently needed by surveyors. Errors in the previous edition have been corrected, and a table giving the tangents and cotangents to single seconds from 0 to 2 degrees have been added. The tables are clearly printed and very readable.

# PRELIMINARY NOTICE

of Applications for Admission and for Transfer

FOR ADMISSION

November 30th, 1942.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.\*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the January meeting.

L. AUSTIN WRIGHT, General Secretary.

\*The professional requirements are as follows:—

A Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

ALLAN—JOHN CHARLES, of 5 Fleming Place, Peterborough, Ont. Born at Toronto, Aug. 3rd, 1902; Educ.: B.A.Sc., Univ. of Toronto, 1925; R.P.E. of Ont.: 1931-32, teaching automotive electricity, drafting and science, North Bay Collegiate Institute and Vocational School; with the Canadian General Electric Co. Ltd., as follows: 1925-26, test course, 1926, switchboard engrg. dept., 1926-27, distribution transformer engrg. dept., 1927-28, power transformer engrg. dept., 1928-30, apparatus sales dept., transformer section, 1934-38, panelboard engrg., Ward St. Works, 1938-40, panelboard engrg., Royce Ave. Works, 1940-42, acting supervising engrg., Royce Ave. Works, and at present, asst. industrial control engrg., Peterborough, Ont.

BOUX—JOHN WILLIAM, of 450 St. Jean Baptiste St., St. Boniface, Man. Born at St. Boniface, Feb. 24th, 1916; Educ.: B.Sc. (Civil), Univ. of Man., 1940; 1940-42, tool and jig designing for fabrication and assembly of aircraft, aircraft plant layout, planning and control of production, etc., and at present, staff engrg., airport divn., Macdonald Bros. Aircraft, St. James, Man.

References: A. E. MacDonald, G. H. Herriot, W. F. Riddell, J. Hoogstraten.

KEANE—EDWARD JOSEPH, of Montreal, Que. Born at Ebbw Vale, Monmouthshire, England, June 2nd, 1900; Educ.: 1914-18, Technical Institute of Engineering, Ebbw Vale. 1914-19, apprenticeship—2 years, machine shops, 2 years, patent shop and foundry, 1 year, drawing office, Ebbw Vale Steel, Iron and Coal Co.; 1919-23, gen. engrg. draftsman, with same company; 1923-39, in practice on own account (partly architecture); 1939—, asst. chief mtce. engrg., Richard Thomas & Co., Monmouthshire; 1939-41, chief draftsman and tool designer, Edward Curran & Co., cartridge case makers, Cardiff, Waes, 1941-42, technical adviser and asst. mgr. of associated company, Curran Bros. Ltd., in Canada, and at present, director, secretary-treasurer and chief engrg., Paul Curran Limited (Canada).

## NOTICE

Technical personnel should not reply to any of the advertisements for situations vacant unless—

1. They are registered with the War-time Bureau of Technical Personnel.
2. Their services are available.

A person's services are considered available only if he is—

- (a) unemployed;
- (b) engaged in work other than of an engineering or scientific nature;
- (c) has given notice as of a definite date; or
- (d) has permission from his present employer to negotiate for work elsewhere while still in the service of that employer.

Applicants will help to expedite negotiations by stating in their application whether or not they have complied with the above regulations.

## SITUATIONS VACANT

**CHEMICAL OR METALLURGICAL ENGINEER** with flotation experience for work in fluoride department at Arvida, Que. Apply to Box No. 2592-V.

**ELECTRICAL ENGINEER** for plant and townsite electrical maintenance work at Mackenzie, British Guiana. Apply to Box No. 2596-V.

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.

**CONCRETE DETAILER** for Arvida, Quebec. Apply to Box 2597-V.

**MINING METALLURGICAL OR CHEMICAL ENGINEER** for aluminum plant at Arvida. Industrial smelting or mining experience for experimental and technical work and supervision in remelt and shipping departments. Apply to Box 2599-V.

**DESIGNING ENGINEER WANTED** for a permanent position as chief engineer with a machinery manufacturing concern in Eastern Canada. State age, salary expected and give details of past experience. Apply to Box No. 2604-V.

**MECHANICAL ENGINEER** for Arvida, Que., to take charge of repair and maintenance of equipment, ordering spare parts, etc. Apply to Box No. 605-V.

**CHEMICAL, MECHANICAL OR CIVIL ENGINEER** for Arvida, Que. Supervision of operations and labour in alumina plant. Apply to Box No. 2606-V.

**CHEMICAL ENGINEER** for Arvida, Que., to assist in the supervision of operations and labour in the aluminum fluoride plant. Apply to Box No. 2607-V.

**DRAUGHTSMAN** for La Tuque, Que., experienced in equipment installation to take charge of engineering work. Apply to Box No. 2608-V.

**CHEMICAL, METALLURGICAL OR MINING ENGINEER** for Beauharnois, Que. To assist pro-

duction superintendent in supervision of pot rooms. Apply to Box No. 2609-V.

**CHEMICAL ENGINEER** for Arvida, Que. Assist in supervision of process control of precipitation department. Apply to Box No. 2610-V.

**GENERAL DRAUGHTSMEN** to make layouts for various kinds of plant equipment including drives, etc., for important war work in Montreal. Apply to Box No. 2611-V.

## SITUATIONS WANTED

**ENGINEER, M.E.I.C., A.M.I.Mech.E.** Available for essential responsible position. Apply to Box No. 704-W.

**ENGINEERING MANAGER, B.A.Sc., M.E.I.C., Registered Professional Engineer, Canadian, married, 20 years' thorough experience in industrial management; mechanical and electrical construction and development, production planning, precision manufacturing, very well versed in organization methods. At present in complete charge of an extensive programme now nearing completion by a large company of designers formed in Toronto about a year ago. Really responsible position with well-established company desired. Available immediately. Will go anywhere. Apply to Box No. 2437-W.**

## PRELIMINARY NOTICE

(Continued from page 724)

**STEAD—HARRY G.**, of London, Ont. Born at Wilton Grove, Ont., Jan. 26, 1908; Educ.: passed E.I.C. Exams for Junior 1938, passed mil. exam. for qual. as Lieutenant, R.C.E.; London Tech. Sch. (night classes), corres. course, Br. Inst. of Science and Technology; R.P.E. of Ontario; with E. Leonard & Sons Ltd. as follows: 1923-27, apprentice dftsmn., 1927-31, mech. dftsmn., 1931-38, chief dftsmn., and 1938 to date, chief engr., i/c design estimates and all engr. work on boilers, tanks, pressure vessels, high vacuum equipment, power plants, etc. (Jr. 1938).

### A.C. WELDERS

Canadian Westinghouse Company, Limited, Hamilton, Ont., have just issued a 12-page bulletin, No. 3136, entitled "Westinghouse A.C. Welders." This bulletin is designed to emphasize the outstanding features of a.c. welders and to provide a guide to the selection of the proper equipment for many of the present industrial jobs. Action photographs show the welders being used for different classes of welding work, while other illustrations accompany detailed descriptions of the various models. A table of specifications is included.

### AIRCRAFT TUBE, PIPE & HOSE FITTINGS

An 102-page catalogue, No. A 300-A, recently published by Weatherhead Co. of Canada Ltd., St. Thomas, Ont., is divided into six sections and presents descriptive and tabular specifications covering the numerous items under each of the the following main divisions: Hose specifications; Army Air Corps and Navy standard hose assemblies; Miscellaneous hose assemblies; Naval Aircraft Factory tube fittings; A.C. 811 tube fittings; Pipe fittings and hose nipples. Illustrations and dimensional drawings are provided throughout the text.

### ALL-PURPOSE CLEANER

"Annite Red Label" is the title of a 4-page bulletin, No. 122, being distributed by Quigley Co. of Canada Ltd., Lachine, Que. This product is described as a highly active colloidal detergent all purpose cleanser which is effective in any water. Its application in a wide variety of cleaning jobs is described and illustrated. The company has also published a booklet entitled "Directions for Using Red Label Annite."

### COMBINATION SLITTING SHEARS, PUNCHES & BAR CUTTERS

A recently issued bulletin, No. 360, containing 24 pages, by Canadian Blower & Forge Co., Ltd., Kitchener, Ont., describes and illustrates the Buffalo "Armor-Plate" Universal Iron Workers, Nos. 0,  $\frac{1}{2}$ ,  $1\frac{1}{2}$  and 2. All important features are designated on a large size illustration, while each unit is treated separately in detail. A two-page spread shows close-ups of features common to all units. A series of tables gives the capacities of each machine for different classes of work in various materials. These machines have both notching and coping operations available without changing tools.

### FUSES

An 8-page bulletin, No. 200-E, issued by Powerlite Devices Ltd., Toronto, Ont., describes the Schweitzer & Conrad type "SM" fuses for heavy duty—severe short circuit conditions. These fuses are manufactured in Canada by Powerlite Devices Ltd. Construction and operation features are given, accompanied by illustrations, and a series of drawings are provided with the tables of dimensions for various types of "SM" fuse holders.

### SPEED REDUCERS

Abart Gear & Machine Company, Chicago, Ill., have prepared a 20-page bulletin, No. 800A, describing their line of single reduction type, fractional horsepower worm speed reducers, with ratios  $5\frac{1}{2}$  to 1 up to 100 to 1 and ratings of 1/50 to 2 h.p. Large illustrations, dimensional drawings and tables of horsepower ratings at input r.p.m. are included for each of the various horizontal and vertical types of units. A phantom drawing is used to describe the construction characteristics of these speed reducers. Enterprise Agencies Limited, Montreal, Que., have been appointed Canadian distributors for "Abart" products.

### GLOBE & GATE VALVES

Crane Limited, Montreal, Que., have for distribution Bulletin No. 5, in the series of bulletins entitled "Piping Pointers" designed and produced to help industrial maintenance men keep piping systems working at peak efficiency. Each bulletin presents, in a simple but effective manner, valuable information on some important feature of pipe line maintenance. Five such bulletins have been issued to date and all are available upon application to the company. They are excellent for training purposes and for posting on shop bulletin boards.

### HEATING ECONOMY HINTS

C. A. Dunham Co., Ltd., Toronto, Ont., have issued a 24-page book in looseleaf form, presenting a brief and timely survey of the possibilities of fuel saving by the proper maintenance of heating plants now in service, with suggestions which may bring economies of value to plant owners and to the nation in wartime. Based on statistical data the subjects of day and night temperature, balanced heat distribution, proper circulation, and insulation, are discussed, while suggestions are included for the care of equipment.

### INSULATIONS FOR ELECTRICAL EQUIPMENT

A 16-page bulletin prepared by Fiberglas Canada Ltd., Oshawa, Ont., designated as Fiberglas Standards H9.3.1, features the use of various "Fiberglas" products as insulating material in the manufacture of electrical equipment. Describing, first, the forms in which "Fiberglas" insulations are made, it then gives detailed descriptions of the application of these products for the insulation of wires, coils for motors and generators, ground insulation, transformers, etc. Descriptive drawings, photographs and tables are included.

### PLASTERING

A 20-page booklet prepared by Gypsum, Lime & Alabastine, Canada, Ltd., Toronto, Ont., presents historical facts, development of methods and materials and present-day achievements in the art of plastering. Many illustrations accompany the descriptions of: types of plaster work; texture finishes; ornamental work; acoustical plasters; exterior stucco; bases for plaster; how construction details affect plastering; conditions affecting quality, and the merits of plastering.

### INDUSTRIAL MEASUREMENT AND CONTROL INSTRUMENTS

A 48-page catalogue, No. 95-A, has just been published by The Foxboro Company, Ltd., Ville LaSalle, Que. This is the most comprehensive bulletin the company has ever issued, describing its full line of instruments for the measurement and control of industrial process conditions. The contents have been arranged to make it easy for the user to choose the type of instrument best fitted to his needs. There are over two hundred illustrations. It comprises ten sections, six of them grouping and describing all the instruments, accessories and supplies appropriate to a particular field of application, such as Temperature, Flow, Pressure, Level, Humidity; while the remaining sections cover combination instruments, valves, instrument panels, and similar subjects. Thorough cross-indexing of the contents, plus an ingenious use of colours, makes it a convenient and useful reference handbook of modern instrumentation.

### DRILLING MACHINES

Canadian Blower & Forge Co., Ltd., Kitchener, Ont., have issued a 12-page bulletin, No. 2989-E, which features the Buffalo "No. 22" drill, with large size illustrations of various types, including round column and pedestal, sensitive and power feed, single and multiple spindle types. Detailed specifications are included covering drive, spindle assembly, sliding head, feeding mechanism and control, column, tables and bases, lubrication, motor and controls, capacity, and safety features. Dimensional drawings and available special equipment are also shown.

### MODERN LABORATORY APPLIANCES\*

Fisher Scientific Co., Ltd., Montreal, Que., have prepared a 966-page catalogue, No. 90, with hard cloth cover. This book of Modern Laboratory Appliances is much more than a catalogue; it is really a technical reference book of all types of apparatus and appliances required for chemical, metallurgical and biological laboratories. In it are described and illustrated the latest and most-up-to-date laboratory supplies, of which large stocks are maintained in Montreal. Obviously the items covered are far too numerous to mention here. Well over 3,500 illustrations with accompanying descriptions and reference data are included and the material, which complete, is condensed to provide more valuable information in fewer pages than used in previous editions.

\*NOTE: This catalogue is available only to Canadian organizations maintaining a laboratory, to whom it will be mailed without charge.

### SOFT PLAITED COIL PACKING

A 4-page bulletin issued by The Anchor Packing Co., Ltd., Montreal, Que., features Anchor "Angora", which is a soft plaited coil packing made from cotton and wool yarn, impregnated by a special process with graphite and lubricant. It is an ideal packing for circulating pumps, boiler feed pumps, stock pumps, white water pumps or other rotary type equipment handling non-destructive liquids.

### LECTURES AVAILABLE FOR PRESENTATION

Canadian General Electric Co., Ltd., Toronto, Ont., has published in a 4-page folder details describing a series of fourteen lectures which are designed for presentation, by C-G-E speakers only, before engineering societies, service clubs, and industrial and other groups. The company states that these lectures are presented without charge and that, while it may not be possible to accept every request, arrangements will be made for as many as possible. The folder gives the name of author and a brief outline of the subject of each of the lectures, which are identified by the following numbers and titles: (1) "Magic of the Spectrum"; (2) "Electricity in Modern Warfare"; (3) "Plastics"; (4) "Cemented Carbide—The Magic Metal"; (5) "Electric Heating in War Industries"; (6) "Some Recent Trends in Industrial Applications of Electricity"; (7) "Win the War with Welding"; (8) "Infra-Red Drying"; (9) "Power to Win"; (10) "Fluorescent Lighting"; (11) "Electronics in Industry"; (12) "Radio and Television To-day"; (13) "Power Factor Control and Correction"; (14) "The Story of Lightning." The time required for each lecture is given, and also a list of three sound film lectures which are available. This folder and additional information are available on request.
