THE ENGINEERING JOURNAL

INDEX TO VOLUME XXVI JANUARY TO DECEMBER, 1943

	Page		Page
Abstracts of Current Literature	25, 88, 142, 211, 349, 415 467, 519, 577, 627, 683	C.N.R. Terminal Development Project in Montreal	411
Agreement between the Association of Professional Engineers of Manitoba and the Institute	535	Canadian Surveys and Maps in Peace and War, F. H. Peters	556
Air Transportation, J. A. Wilson	264	Canada's War Production, H. J. Carmichael	609
Aircraft, Development of Post-War, James T. Bain	606	Carmichael, H. J., Canada's War Production	609
Aircraft Manufacture, Ralph P. Bell	277	Carrière, Major J. P., Engineer Training in Canada	18
Alaska Military Highway, Brigadier-General C. L. Sturdevant Correspondence	117 425	Chabot, Arthur J., Painting Underwater Steel	341
Alternative Fuels for Motor Vehicles, W. A. Lang	449	Chemical Industry, H. McLeod	270
Discussion	454	Civic Morals of Science, Clement C. Williams	515
ASME-EIC Joint Meeting in Toronto	355, 422	Cline, C. G., Preservation of Niagara Falls—Hydraulic Aspects of the Remedial Weir	394
Tentative Programme	475	Cochrane, H. G., Post-War Pattern	187
Programme	528	Discussion	197, 336
Report of Meeting	587	Cochrane, H. G., Victory now would find us unprepared for peace	530
Annual General and Professional Meeting, Fifty-Seventh, Programme	28	Coes, Harold V., The Engineers' Contribution to the War Effort in the U.S.A.	148
Report of Meeting	136	Collective Bargaining for the Engineer	354, 633
Annual General and Professional Meeting, Fifty-Eighth	423, 687	Committee on Reconstruction, Dominion Government	31, 186
Appley, Lawrence A., Manpower Utilization in the United States	678	Committee on the Investigation of Long-Span Suspension Bridges	215
Arc Welding, Electric, W. R. Stickney	62	Compulsory Labour Legislation and the Engineer	354
Arch Ties Heated to Reduce Secondary Bending Stresses, Frank E. Stens	337	Concrete Mixes, Notes on the Design of, S. D. Lash and J. Douglas Lee	444
Armstrong, J. E., Railway Transportation	260	Conservation of Resources, The Continuing Need for the, Howard Coonley	616
Army Regulations for Selection, Training and Rank of Techni- cal Personnel	470	Conserving Welding Electrodes, G. R. Langley	10
Association of Professional Engineers of Alberta	231	Construction in our National Economy, The Position of Manufacturing and, G. R. Langley	513
Association of Professional Engineers of Manitoba	535	Construction Industry in Post-War Economy, O. J. Firestone	191
Association of Professional Engineers of New Brunswick	231	Coonley, Howard, The Continuing Need for the Conservation of Resources	616
Association of Professional Engineers of Ontario	104	Corporation of Professional Engineers of Quebec	232
Association of Profanada Engineers and The Engineering Institute of Canada	568	Correspondence	33, 218, 307, 360, 425, 474, 530, 637, 691
Australian War Production, E. R. Jacobsen	408	Cotton Yarn Dyeing, Robert J. G. Schofield	457
Automotive Industry, T. R. Elliott	275	Coventry, Professor A. F., Soil and Water Conservation	194
Bailey, E. G., Steam Generation for Marine and Stationary Service in the United States, 1939-1943	673	Cross, J. G., Iron Ore Occurrences in the Lake Superior Dis- trict	20
Bain, James T., Development of Post-War Aircraft	606	Darwin, C. G., The Statistical Control of Quality	11
Batt, William Loren, Hon. M.E.I.C.	581	Days Ahead, The, Dean C. R. Young	115
Bell, Ralph P., Aircraft Manufacture	277	DeCew Falls Development, Otto Holden	548
Book Reviews	379, 434, 484	de Jong, S. H., A Simple Direct Method of Deriving Stirrup Spacings in Reinforced Concrete Beams	343
Branches, Membership and Financial Statements of	82	Desbarats, Georges J., receives honorary degree	150
<i>Branches, News of—</i>		Devorss, J. W., Vibration Absorption with Structural Rubber	509
Border Cities	41, 102, 168, 317, 369, 432, 595	<i>Discussions—</i>	
Calgary	168, 317, 480, 643	Proceedings of the Session of the Institute Committee on Industrial Relations held at the Annual Meeting	133
Cape Breton	373	Proceedings of the Session of the Institute Committee on Post-War Problems held at the Annual Meeting	186, 336
Edmonton	369, 480, 700	Fishway Problems on Quebec Rivers, Percy E. Nobbs	207
Halifax	41, 169, 226, 317, 370, 644	The Training and Education of Engineers, S. D. Lash	360
Hamilton	102, 226, 317, 371, 644, 700	The Statistical Control of Quality	401
Kingston	41, 102, 228, 701	Alternative Fuels for Motor Vehicles, W. A. Lang	454
Lakehead	371, 645, 702	Dubuc, A. E., receives honorary degree	151
Lethbridge	645	Duperron, A., Urban Transportation	262
London	42, 645	Durland, D. C., Electrical Equipment	288
Moncton	42, 371, 432	Dwight, T. W., The Use of Statistical Methods in Forestry	400
Montreal	42, 169, 227, 372, 596, 646, 703	Discussion	401
Niagara Peninsula	44, 171, 318, 480	East, L. A. W., Telegraph Communications	251
Ottawa	44, 103, 171, 228, 318, 433, 646	Education of Engineers, The Training and, S. D. Lash	199
Peterborough	44, 103, 172, 230, 319, 373, 433, 481, 704	Elections and Transfers	36, 96, 163, 221, 311, 363, 428, 534, 586, 639, 695
Quebec	46, 482, 647	Electric Arc Welding, W. R. Stickney	62
Saguenay	172, 319, 482, 596	Electrical Equipment, D. C. Durland	288
Saint John	103, 229, 374	Electrodes, Conserving Welding, G. R. Langley	10
St. Maurice Valley	174, 229, 483	Elliott, T. R., Automotive Industry	275
Saskatchewan	104, 173, 230, 375, 648, 704	Employee Relations, A Scientific Approach to the Problem of, Morris S. Viteles	126
Sault Ste. Marie	46, 104, 173, 230, 320, 376, 433, 706	Discussion	133
Toronto	47, 174, 230, 320, 376, 649	Engineer as Planner, Ralph E. Flanders	625
Vancouver	175, 320, 376, 649, 706	Engineer in the Civil Service, Institute Committee on the	145, 580
Victoria	707	Engineer Training in Canada, Major J. P. Carrière	18
Winnipeg	708	Engineering Features of Civil Defence, Institute Committee	306, 355
Cabinet Committee on Reconstruction	31, 186	Engineering Institute of Canada and the Provincial Associa- tions of Professional Engineers	568
Cameron, J. C., Trends in Industrial Relations	671		
Cameron, Kenneth Mackenzie, Biography	149		
Campbell, M. R., A Quarter Century of Steel Production at Sydney	455		
Camsell, Dr. Charles, Mineral Industries	268		
Canada and the Tools of War, C. D. Howe	246		

	Page		Page
Engineering Renaissance, Fraser S. Keith	303	Lee, J. Douglas, Notes on the Design of Concrete Mixes	444
Engineers' Contribution to the War Effort in the U.S.A., Harold V. Coes	148	Lefebvre, Dr. O. O., Ottawa River Power Sites Agreement	334
Engineers' Council for Professional Development Committee on Professional Training	215, 582	Legget, Robert F., An Engineering Study of Glacial Drift for an Earth Dam near Fergus, Ont.	502
Annual Meeting	633	<i>Library Notes</i>	48, 105, 176, 233, 322, 378, 434, 486, 539, 597, 650, 708
Engineers in Ordnance	524	Lumber Industry, W. J. LeClair	294
Engineers in the Services	18, 214, 470, 471, 524, 531	Mackenzie, C. J., National Scientific Research	248
Engineers in the Construction Industry, J. B. Stirling	293	Mackintosh, W. A., International Aspects of Post-War Problems	676
Engineers' Wives Associations	635	MacMorland, Brig.-Gen. E. E., Weapon Maintenance in Battle	620
Evolution of a 1300-Ton Press, R. H. Ferguson	622	Manitoba Electrification Enquiry Commission, Summary of Findings and Recommendations	347
Fabrication of Laminated Timber Members, Verne Ketchum	58	Manpower Utilization in the United States, Lawrence A. Appley	678
Fairfield, H. H., Statistical Analysis of Inspection Results	492	Manufacture and Construction in our National Economy, The Position of, G. R. Langley	513
Farm Electrification in Manitoba	347	Maps in Peace and in War, Canadian Surveys and, F. H. Peters	556
Ferguson, R. H., Evolution of a 1300-Ton Press	622	Marr, Norman, Preservation of Niagara Falls, The Problem in General	390
<i>Financial Statements</i> —		Massue, Huet, Heating of Dwellings	404
Of the Institute	72	Maxwell, Colonel R. B., Royal Electrical and Mechanical Engineers	464
Of the Branches	82	McIntyre, R. B., Some Design Features of the Mosquito Aeroplane	658
Firestone, O. J., The Construction Industry in Post-War Economy	191	McLeod, H., Chemical Industry	270
Fishway Problems on Quebec Rivers, Percy E. Nobbs	202	McNaughton, A. G. L., Hon. Mem. A.S.M.E.	582
Discussion	207	Meek, Victor, Water Power Development	284
Flanders, Ralph E., The Engineer as Planner	625	<i>Meetings of Council</i>	35, 95, 159, 218, 308, 361, 426, 532, 584, 638, 693
Forestry Problems in Reconstruction, John C. W. Irwin	195	Membership of Branches	82
Forestry, The Use of Statistical Methods in, T. W. Dwight	400	Message from the President, K. M. Cameron	113
Discussion	401	Metallizing in Maintenance Work, R. S. Tuer	345
Gifts to the Institute	525	Military Engineering, Major-General C. S. L. Hertzberg	244
Gill, Sir Frank, Popular Exposition of the Application of Quality Control	13	Mineral Industries, Dr. Charles Camsell	268
Glacial Drift for an Earth Dam near Fergus, Ont., An Engineering Study of, Robert F. Legget	502	Morrison, Carson F., Modern Timber Engineering	560
Gliddon, Claude, Painting Underwater Steel	341	Mosquito Aeroplane, Some Design Features of the, R. B. McIntyre	658
Gohier, Ernest, Highways	296	National Construction Council	357
Goodspeed, F. G., Public Works	291	National Research Council Serves War Departments	61
Hall, J. G., Steam Power	281	National Scientific Research, C. J. Mackenzie	248
Handling Large Capacity Transformers, Herbert L. Wagner	210	National Selective Service	30
Heating of Dwellings, Huet Massue	404	Newly Elected Officers of the Institute, Biographies	152
Hertzberg, Major-General C. S. L., Military Engineering	244	<i>News of Other Societies</i>	104, 176, 231, 596
Highways, Ernest Gohier	296	Niagara Falls, Preservation of, Norman Marr and C. G. Cline	390
Hogg, Dr. T. H., Ottawa River Power Sites Agreement	334	Nobbs, Percy E., Fishway Problems on Quebec Rivers	202
Holden, Otto, DeCew Falls Development	548	Discussion	207
Howe, C. D., Canada and the Tools of War	246	<i>Obituaries</i> —	
Imperial Army, R.E.M.E.	147	Adams, Dr. Frank Dawson	40
In Retrospect	298	Aggiman, Jacques Nessim	99
Industrial Relations Executive in Company Management, The Role of the, Bryce M. Stewart	122	Allison, John Logie	225
Discussion	133	Archibald, Ernest M.	99
Industrial Relations, Institute Committee on	92, 122	Baker, James Davidson	478
Industrial Relations, Trends in, J. C. Cameron	671	Buckley, Rex Elmer	40
Inspection Results, Statistical Analysis of, H. H. Fairfield	492	Burnett, Francis Charles Edward	166
Institute Committee on Engineering Features of Civil Defence	306, 355	Campbell, G. J. William	316
Institute Committee on Industrial Relations	92, 122	Clark, George Silas	478
Institute Committee on Post-War Problems	186	Colhoun, George Andrews	593
Institute Committee on the Engineer in the Civil Service	144, 580	Condon, Frederick Oxley	166
Institute Prize Winners, Biographies	157	Cornish, Wilfred Ernest	699
Institution of Electrical Engineers	94	Crowley, Charles James	368
Iron Ore Occurrences in the Lake Superior District, J. G. Cross	20	Farquharson, Stanley	699
Irwin, John C. W., Forestry Problems in Reconstruction	195	Fetterly, Philip Austin	478
Jacobsen, E. R., Australian War Production	408	Flahault, Jean	593
Jacobsen, E. R., Letters from Washington	33, 95, 306, 356, 472, 527, 583, 636, 690	Harkness, Dr. A. H.	167
Jamieson, William, Design and Construction of Scanlon Dam, B.C.	4	Harrington, Conrad Dawson	100
James Committee	31, 186	Harrington, John Lyle	225
James Watt International Medal	216	Hole, John	478
Joint Meeting ASME-EIC	355, 422	Howse, George Wesley	479
Tentative Programme	475	Jackson, John Herbert	40
Programme	528	Kennedy, William	167
Report of Meeting	587	Kugel, Emil	594
Keith, Fraser S., An Engineering Renaissance	303	Larner, Chester Waters	225
Kellogg, Paul, Pulp and Paper	272	Libby, Philip N.	700
Kennedy, William, Jr., Biography	93	Livingstone, Robert	368
Ketchum, Verne, Fabrication of Laminated Timber Members	58	Mackinnon, John George	40
Killikelly, Desmond, Steel	279	Main, Daniel Todd	594
Laidlaw, Robert Everett, Appointed to the Bench	217	Matheson, Arthur John	479
Laminated Timber Members, Fabrication of, Verne Ketchum	58	McBride, W. G.	539
Lang, W. A., Alternative Fuels for Motor Vehicles	449	Nicholson, John B.	594
Discussion	454	Nowlan, Brete Cassius	594
Langley, G. R., Conserving Welding Electrodes	10	Ord, Lewis Redman	368
Langley, G. R., The Position of Manufacturing and Construction in our National Economy	513	Pacy, Ernest Harold	479
Lash, S. D., Notes on the Design of Concrete Mixes	444	Paine, Nathan Deane	225
Lash, S. D., The Training and Education of Engineers	199	Pollev, Edward Victor	431
Discussion	360	Shanly, James	100
LeClair, W. J., Lumber Industry	294	Souba, William Henry	41

THE ENGINEERING INSTITUTE OF CANADA

MEMBERS OF COUNCIL - 1942

PRESIDENT

C. R. YOUNG, Toronto, Ont.

VICE-PRESIDENTS

*A. L. CARRUTHERS, Victoria, B.C.
†H. CIMON, Quebec, Que.

PAST-PRESIDENTS

†T. H. HOGG, Toronto, Ont.

COUNCILLORS

†E. D. GRAY-DONALD, Quebec, Que.
†J. HAIMES, Lethbridge, Alta.
*J. G. HALL, Montreal, Que.
†R. E. HEARTZ, Montreal, Que.
†W. G. HUNT, Montreal, Que.
†E. W. IZARD, Victoria, B.C.
†J. R. KAYE, Halifax, N.S.
*E. M. KREBSER, Walkerville, Ont.
†N. MacNICOL, Toronto, Ont.
*H. N. MACPHERSON, Vancouver, B.C.
*W. H. MUNRO, Ottawa, Ont.

TREASURER

E. G. M. CAPE, Montreal, Que.

GENERAL SECRETARY

L. AUSTIN WRIGHT, Montreal, Que.

†J. L. LANG, Sault Ste. Marie, Ont.
†G. G. MURDOCH, Saint John, N.B.

†C. J. MACKENZIE, Ottawa, Ont.

†T. A. McELHANNEY, Ottawa, Ont.
*C. K. McLEOD, Montreal, Que.
†A. W. F. McQUEEN, Niagara Falls, Ont.
†A. E. PICKERING, Sault Ste. Marie, Ont.
†G. McL. PITTS, Montreal, Que.
†W. J. W. REID, Hamilton, Ont.
†J. W. SANGER, Winnipeg, Man.
*M. G. SAUNDERS, Arvida, Que.
†H. R. SILLS, Peterborough, Ont.
*J. A. VANCE, Woodstock, Ont.
*A. O. WOLFF, Saint John, N.B.

*For 1942 †For 1942-43 †For 1942-43-44

*H. W. McKIEL, Sackville, N.B.

*DR GASPE BEAUBIEN, Montreal, Que.
*K. M. CAMERON, Ottawa, Ont.

†J. E. ARMSTRONG, Montreal, Que.

DESIGN AND CONSTRUCTION OF SCANLON DAM, B.C.

WILLIAM JAMIESON, M.E.I.C.

Field Engineer, Powell River Company Limited, Powell River, B.C.

Paper presented before the Vancouver Branch of The Engineering Institute of Canada, at Vancouver, B.C., on October 22nd, 1942

This dam was recently built to supply additional power to the large paper and pulp manufacturing plant of the Powell River Company Limited, at Powell River, 80 miles up the coast from Vancouver, B.C., and is situated about 16 miles S.E. from the paper plant.

The dam derives its name from one of the pioneer directors of the Powell River Company. Before proceeding with a description of its construction, brief reference will be made to the hydroelectric developments of which it forms a part, and the circumstances leading to its present construction.

The only source of hydro power available for operation of the paper mills at Powell River, up to 1930, was the Powell lake watershed, an area estimated at approximately 580 sq. mi., the run-off from which was utilised to the maximum of its economic development by a turbine plant capable of developing approximately 51,000 h.p. The power developed from this source is used partly for mechanical power which drives the grinders for making ground-wood pulp, and partly for conversion to electrical power for the operation of the paper and numerous other machines and tools necessary for pulp and paper manufacture. The hydroelectric plant consists of four generators of a total capacity of 21,000 kva.

In 1929, demands for greater production made it necessary to find a further source of power, and the water rights for the adjoining watershed to the south draining into the Lois and Pasha Lakes were obtained.

This Lois river development 13 miles by air line and 17 miles south by road from Powell River, takes its supply from a chain of lakes known as the Lois or Gordon Pasha Chain. The three main lakes actually included in the reservoir are the Lois, Gordon Pasha, and Khartoum Lakes. North of these is a mountainous country from which they are fed by streams from Horseshoe, Nanton, Dodd, Lewis and Windsor Lakes, and from other lakes at higher levels, two of the higher lakes having recently been added to those accessible to fishermen by the construction of roads for logging operations.

Studies of this potential source of power were greatly facilitated by surveys that had been carried out for a series of years by the Surveys and Engineering Branch of the Department of Mines and Natural Resources, and the Water Rights Branch, of the Provincial Lands Department, and the economical capacity of the development was found to be 27,000 h.p., continuous delivered at Powell River, or 31,800 h.p. on a mill-day basis.

Fig. 1—Power house and surge tank at Scow Bay.

The total storage capacity when the dam is finally completed will be about 450,000 acre-feet, and the drainage area is estimated at 184 sq. mi.

The additional power required for certain extensions of the plant at Powell River contemplated in 1930, amounted to 16,000 h.p. or about half the available capacity of this potential development. For economic reasons it was decided to construct a temporary log dam across the Lois River, which could later serve as a coffer-dam during the building of a permanent concrete dam.

In order to ensure that the site selected for the permanent dam was suitable and to have its location definitely determined, a thorough examination of the site was made by stripping the overburden except for the river bed, and a short length near the top, and a considerable amount of exploration work was also done by drilling.

Dr. Victor Dolmage, M.E.I.C., of Vancouver, was called in to examine the geological features, and in his report he described the rock as granodiorite or quartz—diorite of a geological formation known as the Coast Range batholith, and he concluded that this would prove a satisfactory formation for a dam structure. Later this opinion was confirmed when all fractured and weathered rock had been removed.

With the site of the permanent dam approved, the location of the mile-long tunnel which with the connecting penstocks conveys the water to the power house could then be determined, and the construction of the initial development was started in 1930.

This work consisted of a log crib dam which formed a reservoir of 72,000 acre-feet, with a head of 350 ft. above tail water and allowed for a continuous usage of 730 cu. ft. per sec.

The water was delivered through a wood stave penstock 10 ft. dia. and 2,726 ft. long, which extended from the log dam to a point a short distance behind the site selected for the permanent dam. From this point the water was conveyed through a reinforced concrete penstock 12½ ft. dia. for a distance of 776 ft. to a tunnel 5,851 ft. in length. From the lower end of the tunnel a steel penstock 2,591 ft. in length and varying from 12 to 11 ft. in diameter, connects with two 7¾ ft. branches leading to the power house at tidewater on Scow Bay. (See Fig. 1).

The log dam and wood penstock were regarded as being but temporary structures, but the remainder of the installation including the power house with an 18,000 kva. generator, and the surge tank, perhaps one of the most conspicuous landmarks on the Coast were all designed and built as part of the permanent development. The size and height of the surge tank are notable. It is of the Johnson differential type, 30 ft. in dia. and 187 ft. high, carried by a pedestal 121 ft. in height. The tank was designed to function with the log dam whose crest is at Elev. 450 and later with the concrete dam, with crest at Elev. 522.

The Johnson valve for the second generator was also installed and provision was made in the power house for this second generator but this has not yet been obtained.

Due to the deterioration of the wooden structures, after a lapse of nine years, more particularly the head gate section of the dam and the penstock saddles which were attacked and badly damaged by rot and termites, the necessity of making replacements and repairs had to be considered. In view of the large expense involved, and the fact that the permanent dam might soon be required, it was decided to put the money that would have to be expended on repairs into permanent construction, and to build the

concrete dam to Elev. 502 with a spillway at Elev. 490, 40 ft. higher than the log dam. Only the section carrying the headgate and headgate machinery was to be built up at once to the full height, Elev. 522.

DESIGN FEATURES

A comparison was made of the cost of different types of dams, and the variable-radius arch design was selected, this being found to be the most suitable and economical type for the site.

In this design, radii vary with the height and the radii of the extrados are struck from centres different from those of the corresponding intrados. The object of this design is to produce the maximum strength with the minimum amount of material. When the dam is loaded and tends to deform, besides the axial compressive stresses, tensile stresses tend to develop in varying degrees at varying distances from the centre due to shrinkage and other causes, and to take care of these stresses without using reinforcing steel, the variable radius arch design was developed. It is covered by U.S. patents, and while the validity of some of these patents is open to question, the Powell River Company deemed it advisable to pay certain fees on this account, rather than to risk becoming involved in possible litigation. A plan of the dam is shown in Fig. 2.

The limiting stress used in the design was 700 lb. per sq. in.

The main dimensions of the dam are:

Length of crest 680 ft.
 Length of thrust block 115 ft.
 Length of wing wall 187 ft.

Total length 982 ft.
 Radial thickness at top 8' 0" (10' 0" over parapet walls)

Radial thickness at bottom 37' 0"
 Maximum height 205' 0"

The concrete crest at Elev. 502 has been temporarily surmounted with wooden flash-boards 7 ft. in height.

The wing wall was provided to guide the waste water to a point below the dam before permitting it to fall into the river, this being done to avoid excessive erosion of the bank carrying the penstock between the dam and the tunnel.

When the dam is raised to its full height an extension in a radial direction from the thrust block at the west end will be provided with five Taintor gates 20 ft. wide and 21 ft. deep and one Taintor gate 10 ft. wide and 10 ft. deep to pass trash and small discharges.

With a view to facilitating contraction and cooling of the

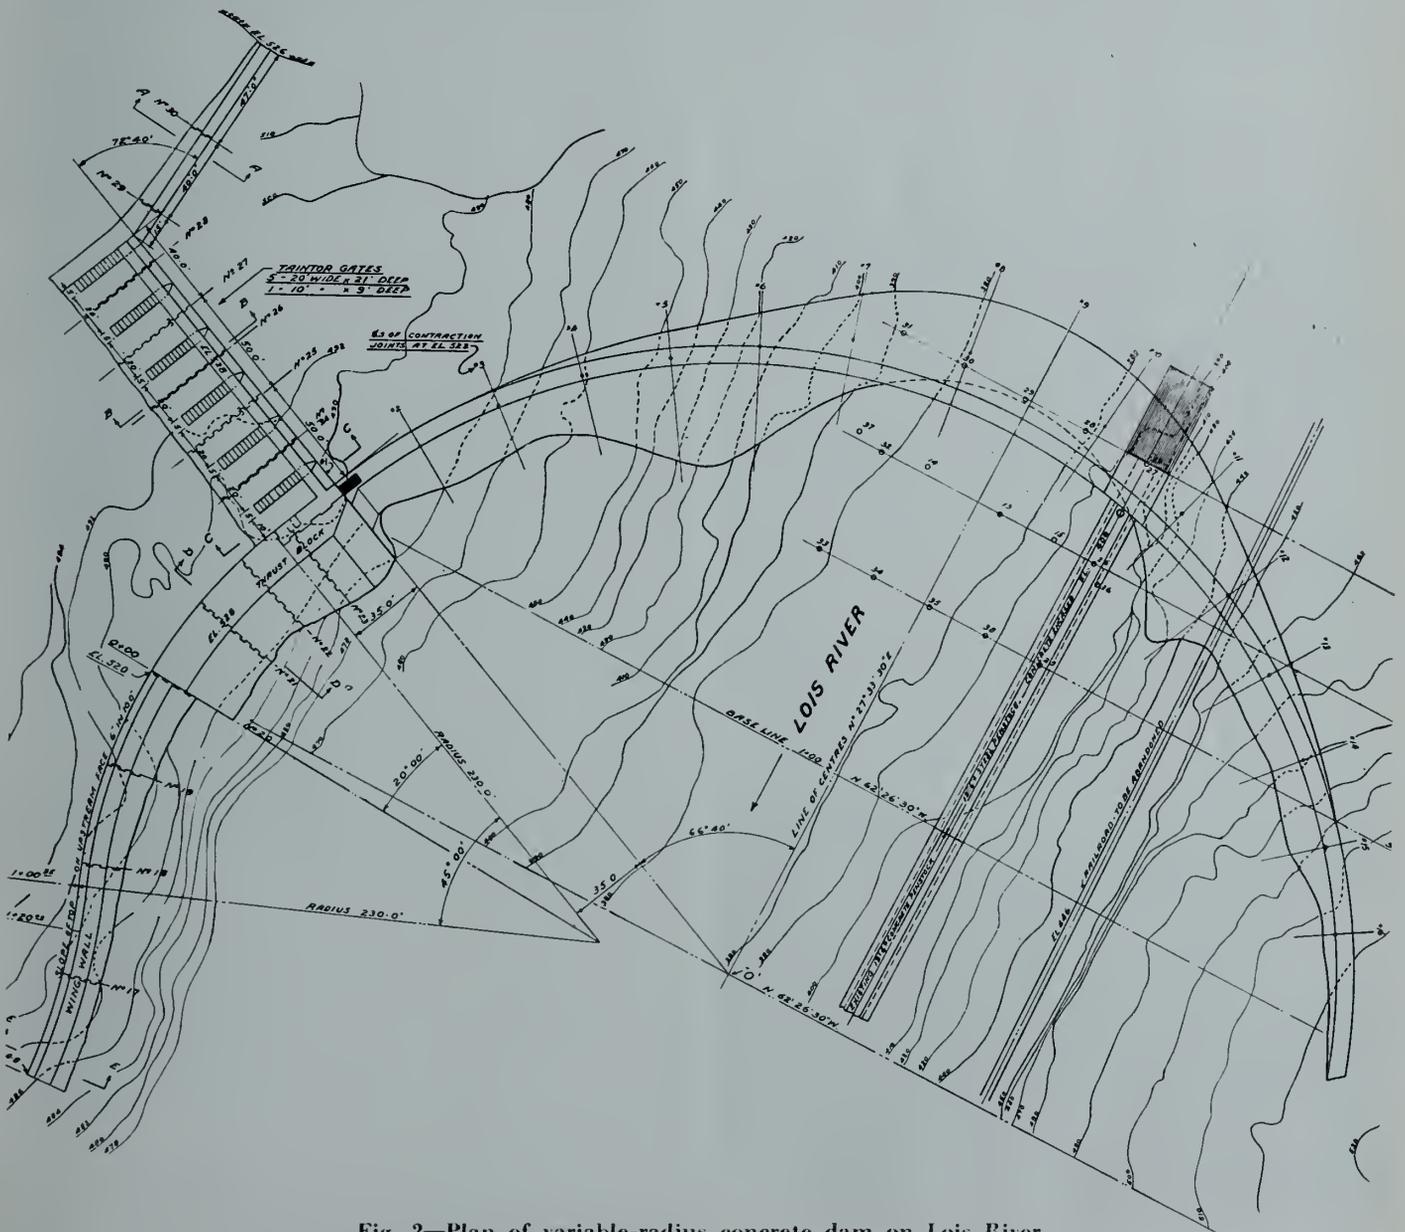

Fig. 2—Plan of variable-radius concrete dam on Lois River showing layout of dam and wing wall.

concrete the dam was divided into sections by radial lines approximately 40 ft. apart and as each of these sections formed one continuous pour, with the time between successive pours set at 72 hours, the structure was virtually built up with a number of arched blocks keyed together on radial lines. (See Fig. 3).

The keys on section lines are 2 ft. 6 in. by 1 ft.

WATER STOPS

Vertical copper water stops formed from 20 in. wide copper sheets weighing 3 lb. per ft. were located near the upstream face of every construction joint. The various sections of these stops are riveted and brazed together, making them continuous from top to bottom, with the bottom buried in the concrete, below the start of the construction joints. (See Fig. 4).

Horizontal stops of $\frac{1}{2}$ in. galvanized iron weighing 1.5 lb. per sq. ft. were set four inches in the concrete and projecting four inches to join with the next pour. The different sections of iron are riveted together and also riveted at the ends to the copper stops. The joints also soldered to make them watertight.

To provide for the passage of water through the dam while the closure was being made, a 6 ft. dia. culvert was incorporated in the dam as seen in Fig. 3. The ends of this culvert were afterwards plugged, and the culvert filled and sealed with concrete, poured down through 8 in. dia. pipes that had been carried up from the soffit of the culvert for this purpose.

FORM OF CONTRACT

The form of contract decided upon provided for a fixed fee, covering all the work specified.

The contractor supplied all personnel, material and equipment necessary for the work, subject to the approval of a duly appointed representative of the company.

A fixed monthly sum for the rental of certified equipment was stipulated, and the payment of this rental was for a definitely stated period, based on the estimated time for completion, and regardless of whether it would be required for a longer or shorter time.

The salaries of the manager and superintendent were also limited to a fixed time, so that there was ample incentive to get the work completed within the scheduled period.

The contractors also took over the operation of the Company's Stillwater railway and wharf, which they used for bringing in supplies, and for hauling logs, freight and passengers in connection with logging operations on the lakes.

The contract covered all phases of the work, with the exception of the provision of drawings for the actual dam structure and appurtenances, which were supplied by the Powell River Company. No penalties were specified, but

the company reserved the right to take over the work if not satisfied with the conduct of the work or the progress made by the contractor.

The contract having been duly signed, a progress schedule was drawn up in detail, modifications being made from time to time as found advisable or necessary. Generally, except where changes were due to change of policy such as speeding up the work by extra night shifts, the schedules were closely adhered to and were of great value in planning for deliveries of equipment and materials.

SETTING OUT

Setting out on the ground a structure of this kind naturally involved a large amount of instrument work, and calculating machines were kept busy for many weeks to provide data required for the field work.

The first thing to be done was to establish the centre line. On this line were located the centre of the curve for the elevation of the top of the dam, and the focal point of the radii of the construction joints. This central point, when determined, was marked on an iron belt set in concrete and duly referenced. As the work proceeded the value of being able to readily pick up the centres of the various curves became obvious and all these were marked on 10 by 10 timbers well secured, extending down the centre line.

On the drawings supplied for the work one common point for each construction joint was given with the radius and angle to it, measured from the centre line at Elev. 522. From these points all subsequent angles were calculated and the distances to the sides of the dam at the various elevations. As the line of the bulkhead for each construction joint was the same as the downstream radius produced through these common or locus points, the bulkheads had to follow the radial line for each 10 ft. in elevation, and they were distorted and twisted to gain this effect, as shown in Fig. 4.

The most practical way of establishing the locus points for each 10 ft. lift or difference in elevation was found to be by means of ordinates from parallel lines established on either side of the canyon, high enough up to be above the top of the dam, and far enough away not to be disturbed. Fortunately the topography of the district made this easy. With the locus points determined, the curves for the extrados and intrados could be run. This procedure in theory appears to be quite simple, but it often happens that in laying out work numerous difficulties are encountered which have to be dealt with as they crop up; the laying out of a variable arch dam is no exception.

In order to keep track of the excavation work, cross sections were taken at close intervals. These levels and cross sections formed a grid over the entire foundation area; a number of points were marked beyond this area, so that the grid at any point could be readily re-established. In laying out and re-establishing these grid lines, some ingenuity was needed as some of the places marked were on unscalable and overhanging cliffs.

The next problem was to establish the outline of the foundations of the dam at each and every elevation so that the excavation, which was for the most part rock, could be taken out the correct width and no wider.

The dust from the rock drills and the blasting made the use of crayon or stakes a waste of time, so lines for the front and back of the dam were run in and painted on the surface of the rock. These curves referred only to the lines of the dam at a particular elevation, and it was also found necessary to paint the contour lines at 5 ft. intervals on the rock walls of the canyon. Starting at Elev. 372 all contour lines at elevations ending in the figure two were painted red and at those ending in seven, white.

The heights of the various contour lines were marked with twelve-inch figures wherever possible on the smooth surface of the rock, and were plainly visible from either side of the canyon. The painted contour lines were about 60 ft. in length, extending well beyond the limits of the excavation.

Fig. 3—General view of west side of dam showing entry gate section, culvert, and method of pouring successive sections.

As the rock work spread out and gangs were set to work at different elevations, a colour scheme was also devised to mark out the excavation required between any two contours, and for this purpose six different paints and combinations of them were used. For example between contours 437 and 447 the limits of the excavation would be marked with blue paint, between 427 and 437 with yellow, etc. Actually these lines were continually being obliterated, but enough of them were usually left to enable the others to be readily re-established.

The centre section or river bottom was excavated in three sections, and the bed-rock was found to be about 50 ft. below the stream bed. The true curve was staked out, and the timbered shafts were sunk a little wider than called for. The curve was then marked out on the top timber.

This brief description of the work of setting out will serve to indicate the methods adopted, which, were found to be satisfactory. It is not necessary to enlarge on the many difficulties that are incidental to such work, when carried out among swinging derricks, rushing trains and trollies, and dripping cement. There were also the smoke and heat caused by rubbish fires and boiler settings, the infernal din of air driven tools and machinery, and the movements of some 300 men working in the confined area in which these operations had to be done.

Our contractors were fortunately able to obtain for us the services of a very capable man for this setting out work.

EXCAVATION

As previously stated the overburden had been removed over most of the site, and with the exception of the river bed practically all the excavation was rock work. A compressed air plant was installed, comprising one Worthington compressor, one portable Diesel and one gasoline compressor.

Excavation work was started in May, 1940, on the west side, all broken and fractured rock being removed down to bed-rock. The work was arranged as far as possible so as to avoid having to work in the river bed at the time when flood conditions would normally be expected.

Favourable weather conditions and some regulation of discharge and wastage enabled the work to proceed without any serious interference throughout the winter and spring run-off seasons. This regulation was effected by controlling the discharge from the Horseshoe Lake dam, by manipulating flashboards on the log dam, and by the opening and closing of the second Johnson valve at the power house, when it became expedient to do so.

The first section to be carried down to any depth, was the bank on the east side, on which the penstock rested. As it was necessary to keep the generator in operation, special precautions had to be taken to hold the penstock (a 10 ft. dia. wood pipe) in position, while the ground under it was removed. A Howe truss was built to carry this, the ends of the truss resting on sills at either end of the cut. Before the work had progressed very far, the ground at one end of this truss, shewed signs of giving way, and it then became necessary to carry down a shaft to bed-rock, and to build concrete reinforced piers to support the truss. These concrete piers were afterwards incorporated in the body of the dam.

To keep the excavations dry the following pumps were used. One deep well pump capable of delivering 1,400 U.S. gal. per min., with another of 225 U.S. gal. per min., two hand pumps, and three No. 7 sludge pumps. There was also a system of well points which was moved down as the work progressed and proved very satisfactory. The well points consisted of 2 in. dia. steel pipes, drawn to a point at the lower end and drilled with entrance holes which were protected by copper mesh screens. Several of these points, spaced about 5 ft. or other convenient distance apart, were driven about 20 ft. into the gravel, and the upper ends were connected six-inch headers. The water was then drawn up by a special set of pumps supplied by the

Moretrench Company, the manufacturers of the points. As the excavation became deeper, the points or another set were driven or worked down into the gravel ahead of the excavation, to bed rock in the river bed.

For breaking up the ground to enable it to be loaded into skips, clay diggers operated by compressed air were found to be very useful.

CONCRETE

When the original estimates for the dam were being considered, naturally the question of the concrete mix, and particularly the cement content was discussed. It was noted that similar structures in the United States, American engineers had been using one American barrel (376 lb.) per cu. yd.

A review of published records indicated that with proper control, low water-cement ratio, proper grading and the use of vibrators, satisfactory results could be expected if this same cement content were used, and the estimates were made on this basis.

The grading of aggregates was also carefully considered, and it was decided that the maximum size of coarse aggregate should be 4 in., that the gravel should be segregated into three gradings and combined at the mixer, and that the fineness modulus should be very close to 3.0, with a slump varying from 1½ to 3 in.

Washed sand and gravel for the concrete aggregate, came from Howe Sound, and was shipped by scow to Stillwater, where it was unloaded into hoppers. From there it was transported by rail to the dam site in 5 cu. yd. dump boxes mounted on flat cars, with four-car trains carrying 60 cu. yd. per trip. At the dam a spur track built over the aggregate bins permitted dumping directly from the cars.

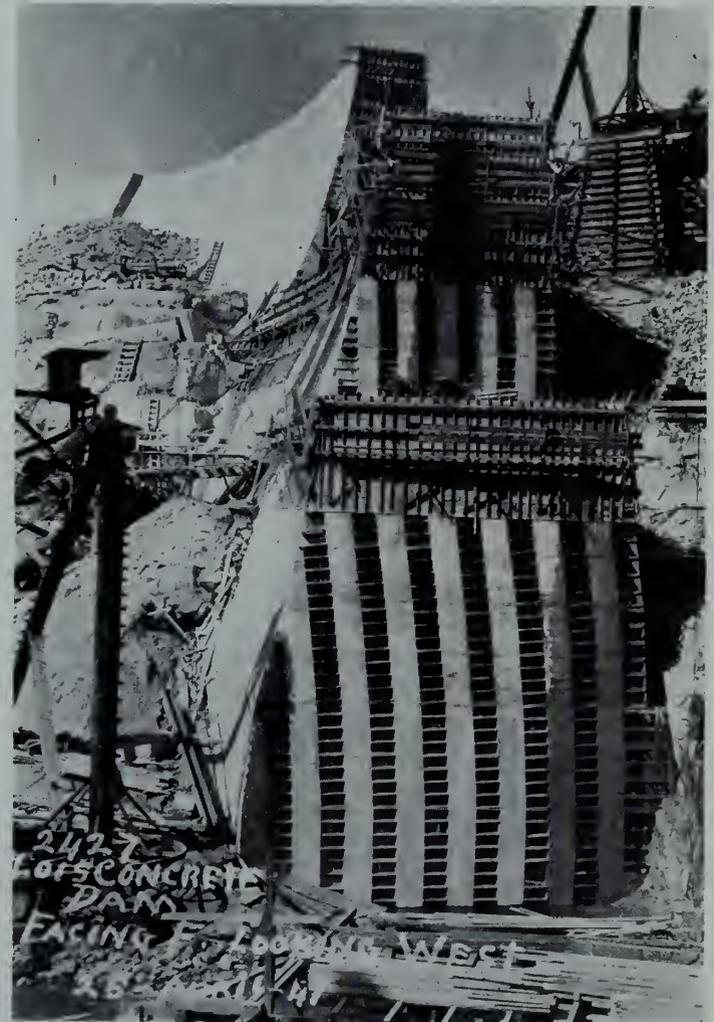

Fig. 4—Construction joint, showing water stops and distortion or twisting of bulkheads.

Total storage capacity was 574 cu. yd. in five bins of which two were used for sand and one each for the gravel, in gradings of 4 to 1½ in., 1½ to 1 in., and 1 to ¼ in. From these bins, the aggregate was carried on an 18-in. conveyor belt to bins above the mixing plant with a capacity of 400 cu. yd.

Cement was unloaded from the ships at Stillwater dock, and was transported on a 14-in belt conveyor to sheds on shore having a storage capacity of 16,000 sacks. From there it was carried in box cars to the dam site, and emptied into a silo, having a capacity of 2,500 sacks. From the silo it was conveyed by a 14-in. belt up to a 50-sack hopper built into the weighing house, above the mixing plant.

Cement batches were weighed manually in a hopper on a platform scale and dumped when required into eight-inch pipes, which ran down to the charging hoppers. Here were three Smith tilting type mixers, one of which was 1½ cu. yd. and the other two were 1 cu. yd. capacity. The mixed concrete was delivered by means of three narrow-gauge tracks, running from the mixing plant, to points which could be reached with concrete buggies or derricks. These are shown in Fig. 5.

The wing wall, thrust block and sections A and B of the arch, were placed by using buggies. The majority of the arch sections were placed directly with derricks, and the balance was placed by using derricks and then buggies.

The buckets used were of 2 cu. yd. capacity, and designed as a conical hopper with a gate in the bottom 12 by 24 in. They discharged low slump concrete with practically no segregation.

Two vibrators were used. The larger, which was the more satisfactory, was a Chicago Pneumatic No. 518, and the smaller which was used along the forms was a No. 417 of the same make.

Macdonald & Macdonald, Testing Engineers, were in charge of concrete control. They designed the mixes and made all field and laboratory tests.

The original mix for mass concrete was:

Cement.....	370 lb.
Sand.....	1,135 lb.
Gravel ¼ in. - 1 in.....	735 lb.
1 in. - 1½ in.....	550 lb.
1½ in. - 4 in.....	915 lb.
Slump—3 in.	

Just sufficient water was added to give a water-cement ratio of 0.58 to 0.60 by weight. This water-cement ratio was used throughout the work.

For the first few pours some experimenting on the mix was done, using as low as 330 lb. (3.75 sacks) per cu. yd. Only a few yards were poured with this quantity of cement.

Fig. 5—General view of construction works showing mixing plant, narrow-gauge tracks, etc.

After this field adjustment was made, the mix used until the end of 1940 was:—

Cement.....	370 lb.
Sand.....	1,226 lb.
Gravel ¼ in. - 1 in.....	794 lb.
1 in. - 1½ in.....	566 lb.
1½ in. - 4 in.....	974 lb.
Slump—1 in. - 2 in.	

Some difficulty was experienced at the gravel pit to get the aggregate in this ratio without wasting some sizes, so at the beginning of 1941 the mix was changed to the following and used for the balance of the work:

Cement.....	370 lb.
Sand.....	1,226 lb.
Gravel ¼ in. - 1 in.....	935 lb.
1½ in. - 1.....	700 lb.
1½ in. - 4.....	700 lb.
Slump—1 in. - 2 in.	

In the river bottom, where there was considerable water for the first pours, the cement was increased to 570 lb. to the cu. yd., the 4 in. gravel was reduced and the concrete poured so as to flow under the water, which was kept deep enough to prevent currents which would wash out the cement. Slump of this concrete was six inches.

The mix for the penstock encasement was:—

Cement.....	480 lb.
Sand.....	1,420 lb.
Gravel ¼ in. - 1 in.....	1,200 lb.
1 in. - 1½ in.....	900 lb.
Slump—6 in.	

During the early period of the work, a great many slump tests were made, usually three in the forenoon and three in the afternoon. The tests ran as high as three inches, but the majority were around one inch. After the mixing routine had been established it was possible to control the water by visual examination, and these tests were made less frequently, usually at the same time that test cylinders were made.

Sieve tests were made on the sand twice a week, and the average fineness modulus averaged 3.12.

Test cylinders were taken quite frequently until the mix was established, after which time a cylinder was taken every 600 cu. yd. of concrete poured. These were made in test cylinder cans and shipped to Vancouver for testing. Out of 77 reports examined the lowest breaking stress was 3,104 lb. per sq. in., the highest 4,526 lb. per sq. in. and the average 3,578 lb. per sq. in.

All cement was tested by the inspection engineers before loading at the cement plant.

MIXING AND PLACING CONCRETE

The batching was done by weigh batches. After all the aggregates were weighed in the charging hoppers, the cement was delivered to the hopper through a pipe from the weigh house, above the mixing plant.

The mixing time was maintained at three minutes for charging, mixing and discharging as nearly as possible, but on most of the work the time required for transportation and placing set the governing time.

The concrete for the wing wall, thrust block and the western two sections of the arch was delivered by car to a hopper from which it was conveyed and deposited by buggies into chutes.

The balance of the concrete was dumped from the mixers into the buckets set on flat cars and hauled to points that could be reached by derricks. The derricks were then able to place most of the concrete directly from the buckets to its place in the pour.

The concrete was poured in layers about 20 inches thick, there being three layers to a pour.

After depositing from the buckets, the concrete was vibrated with the large vibrator. Efforts were made not to use the vibrator for moving the concrete into place. Only

enough vibration was used to bring the paste to the surface, and care was taken to vibrate deep enough to work the upper layer into the previous layer.

A small vibrator was used along the forms to ensure a good appearance of the concrete when stripped.

The surfaces of concrete pours were cleaned off by means of air water jets. This was done from four to twelve hours after the pour was completed, so as not to injure the surface by loosening the aggregate.

On starting a pour, a layer of about $\frac{1}{4}$ in. of mortar was broomed over the surface.

As previously stated, the time between the completion of one pour and the beginning of the next in the same section was set at 72 hours, although in a few instances this was reduced to a minimum of 40 hours.

Forms were left on where possible for three weeks or more, except bulkheads which had to be removed for adjacent pours. During warm weather sprinklers were maintained where possible.

Steam heated water was used when the temperature was below 40 deg., and the temperature of the water was raised 110 deg. which gave the concrete at the mixer a temperature of 50 deg.

GROUTING

Seams in the foundation rock were pressure grouted to minimize seepage. The depth of the holes drilled in the centre sections varied from 24 to 27 ft. The depth was determined by test holes drilled to 50 ft. or more if sound rock were not encountered. Grouting pipes were also inserted in cracks where it appeared that seepage might take place.

The holes on the upstream side were drilled and grouted before those on the downstream side, and each hole was grouted before the adjoining hole was drilled.

The drilling operations were conducted as follows:—

After the excavation had been carried down to bed rock, 2-in. dia. pipes were installed at points where grout holes were required and extended above river level. This allowed the drilling to be carried on without interfering with concrete pouring.

The drills used were the coring type diamond drill. The diameter of the core was 0.8 in. and that of the drill hole slightly under $1\frac{1}{2}$ in. No difficulty was experienced in drilling through the 2-in. dia. pipes which were approximately 50 ft. long.

The rate of drilling varied, about 27 ft. being a good average for eight hours.

Before inserting any grout, each hole was filled with water and the leakage was determined by finding the time required to empty a 2-gal. pail of water into the hole, keeping the hole just full of water. Leakage was found to vary from zero to 16 gal. per min. and for the majority of holes was between $1\frac{1}{2}$ and $4\frac{1}{2}$ gal. per min.

Grout was mixed in an air driven mixing machine, and forced by air into a barrel which acted as a reservoir for the grout pump. An Ingersoll Rand pump (size 7 by $1\frac{1}{2}$ by 7) was used for pumping into the drill holes.

Grouting started with a thin grout, and if this was taken up freely, the next batch was thickened. This procedure was followed until the hole was taking grout freely at $\frac{2}{3}$ of the limiting pressure. Pumping grout of this consistency was continued until refusal. The limiting pressure varied from 60 to 150 lb. p.s.i.

Thirty-seven holes were drilled into the rock and thirty-

Fig. 6—General view looking east, showing connection to penstock. October, 1941, completed.

one pipes were set in cracks. The quantity of cement forced in this way into the seams, amounted to over 700 sacks.

PENSTOCK

The wood penstock was kept in operation until the contractors were ready to build the headgate section. A closedown period of nine days was then required to install the 200 ft. of steel penstock from the existing concrete pipe to the new headgate, and to set up the gate frame, and the 4-ft. dia. vent pipe. The new work can be seen in Fig. 6.

With the exception of this interval and two days required for disconnecting the old penstock, the penstock was kept in continuous use throughout the construction of the dam.

HEADGATE EQUIPMENT

The electrically operated headgate is of the Broom type. It weighs 25 tons, and travels in girders on a roller caterpillar. The gate and frame were designed by Phillips & Davies of Kenton, Ohio.

The trash racks protecting the head-gate entry, are built of 3 by $\frac{3}{8}$ in. steel bars set vertically, welded to rectangular girders and bolted to the beams of the concrete structure. The total width of the rack is 20 ft. and it runs from the bottom of the head-gate section to the top of the dam.

A mechanical rake, also electrically operated, is installed to keep the racks clean, built to the design of the Newport News Shipbuilding & Drydock Company of Newport News, Virginia.

QUANTITIES

The quantities involved in the present structure included:

50,000 cu. yd. rock and river excavation.

61,000 cu. yd. concrete.

191,000 sq. yd. forms.

Contingent work included a railway diversion and loading works for logging operations.

The cost amounted to approximately \$1,100,000.

The erection of the dam was under the supervision of the Powell River Company's engineering department, and Mr. B. C. Condit, Consulting Engineer, Oakland, California, who not only designed the dam, but was also responsible for the conception of the complete development.

Stuart Cameron & Company, Vancouver, were general contractors, and MacDonald and MacDonald, Vancouver, were inspectors of cement and aggregates.

CONSERVING WELDING ELECTRODES

An article based on notes kindly furnished by G. R. Langley, M.E.I.C., engineer, Canadian General Electric Company Limited, Peterborough, Ont.

Welding electrodes have heretofore always been used wastefully. Under the urge of wartime need for conservation of materials, many electrode users have taken steps to cut down the wastage. The general manager of a large American factory recently issued the following notice:—

"In view of the tremendous increase in the use of welding electrodes for the fabrication of war products, with the inability of electrode manufacturers to fill orders in spite of increase after increase in production, every effort must be made to use every piece of electrode to the fullest advantage. Furthermore, some of the electrode coating materials are on the critical list and must be conserved. Hereafter all stub ends must be turned in for salvage and any stub ends longer than $2\frac{1}{2}$ inches will be returned to the operator for further use."

This case is typical of the majority of electrode users in both the U.S.A. and Canada and the total wastage is above 30,000 tons per year with a value about \$5,000,000.

The cause of this waste is found in the universal use of "stripped electrodes" i.e., electrodes with the flux ground off one inch at one end to allow insertion in electrode holders. The electrode cannot be burned to closer than one inch from the holder without danger of burning the holder. Several attempts have been made to avoid this waste. One user tried leaving a stub in the holder and welding a

Fig. 1—Standard holder and separate stub.

new electrode to it. Each electrode added an inch or so to the length of the stub so that it soon had to be discarded. The stub being the same size as the new electrode heated badly and the operator had to pause till it cooled sufficiently to permit a new rod to be welded on. The saving was not large and the scheme did not come into general use. Another plan involved an ingenious special electrode holder for use with "full fluxed" rods. Electrode manufacturers objected to making two varieties of electrodes—full fluxed for the new holder and stripped electrodes for standard holders, and this scheme also failed of adoption.

The following plan overcomes the objections to the previous schemes and permits elimination of all waste.

A piece of steel rod 2 to $2\frac{1}{2}$ in. long, and of a diameter greater than the electrode is inserted in any standard electrode holder as shown in Fig. 1. Full fluxed rods are used. With the helmet in the open position, one end of the electrode is firmly grounded and the stub approached close to the electrode as illustrated in Fig. 2. At this point the helmet is dropped and the stub moved the short remaining distance to make contact with the electrode. The stub and electrode do not have to centre accurately. Excellent results will be obtained with them well off centre. With a little practice operators become quite proficient. The time involved is not noticeably greater than required to place

Fig. 2—Illustrating the joining of full fluxed electrode to separate stub.

an old style stripped rod in the holder and since the standard electrode is 14 in. long, electrodes will be changed only $12/14$ times as often.

In addition to the wastage of stubs 2 in. or longer there has been considerable loss due to operators bending electrodes to facilitate reaching certain locations. Bending usually cracks the flux and the electrode cannot be burned past the cracked spot. With the proposed scheme the full fluxed rod can readily be welded on at any desired angle (see Fig. 3), thus obviating the need for bending the electrode itself.

Hand shields are used occasionally and in rare cases the operator may have to work in such cramped quarters as to make the stubbing operation awkward. In such cases a number of full fluxed rods can be welded to stubs before-hand.

It is understood that this conservation plan is already being used by the Canadian General Electric Company, Peterborough Works, Canadian Westinghouse Company, Steel Company of Canada and Hamilton Bridge Company, and is in process of adoption by a number of shipbuilding firms.

The general adoption of this plan would of course result in a decrease in sales of electrodes not only during the present emergency, but after the war. The attitude of the electrode manufacturers that have so far been contacted has nevertheless been entirely unselfish, and their whole-hearted support be relied on.

It is hoped that this article will result in still further extension of the use of the scheme described.

Fig. 3—Showing electrodes welded on to stubs at various angles.

WAR PRODUCTION PROBLEMS— THE STATISTICAL CONTROL OF QUALITY

A subject scheduled for presentation at the Fifty-Seventh Annual Professional Meeting of the Engineering Institute of Canada, Toronto, 12th February, 1943.

INTRODUCTORY NOTE

As will be seen from the preliminary programme for the impending Annual Meeting of the Institute, to be held in Toronto, the morning of Friday, 12th February is to be devoted to one general session at which war production problems will be discussed. The conservation of critical materials will be the main subject for discussion, the Institute being privileged to co-operate with the Department of Munitions and Supply in reference to this vital matter. In addition, it is planned to devote some time to a topic of very live interest in manufacturing circles—the use of statistics, and the theory of probability, in the control of quality. The importance of inspection in all manufacturing processes is widely recognized but it is only in relatively recent years that inspection has been subjected to mathematical analysis. There are some who think that the use of statistical analysis can, and should, radically change many inspection practices. There are others who consider that such “advanced mathematics” has no place in production control.

The subject is therefore of lively and topical interest; it is hoped that varied and diverse opinions with regard to the matter will be aired at the Toronto Meeting. This was recently the case in London, England, at a remarkable meeting held in the Main Hall of the Institution of Civil Engineers, jointly by the Institutions of Civil, Mechanical and Electrical Engineers. Attended by 720 people, including the Minister of Supply, the meeting lasted for several hours, and was wholly devoted to the subject of the statistical control of quality in production. The topic was introduced by Dr. G. C. Darwin, Director of the National Physical Laboratory, and a general exposition was then presented by Sir Frank Gill, Director and Vice-President, International Standard Electric Corporation. By special permission of the Institution of Mechanical Engineers (in whose *Journal* appeared the record of this notable meeting) The Engineering Institute of Canada is privileged to present these two outstanding contributions, for the general information of its members and for the special guidance of all who are going to participate in the Toronto meeting.

GENERAL INTRODUCTION

C. G. DARWIN, M.C., M.A., Sc.D., F.R.S.

Director, National Physical Laboratory, London, England.

I have long been interested in the general subject of tolerances, first from the point of view of pure science and later from the more practical point of view; but the practical viewpoint became much accentuated when I went to the National Physical Laboratory, where a great deal of work has to be done in connexion with verifying manufacturing and inspection gauges. Internal evidence furnished by some of the drawings and gauges led me to the conclusion that certain defects must exist in the principles employed in assigning tolerances. I therefore tried to find how tolerances were fixed. For some months, whenever I met an engineer engaged in any branch of the industry I asked him how the tolerances were determined in the work with which he was concerned. The results were disappointing; some could not answer at all and some gave a partial answer, not sufficient to satisfy my appetite.

As a caricature of the diagnosis at which I arrived, I conceived that when a new machine was to be made the inventor or chief engineer sketched it freehand, perhaps marking the dimensions to the nearest inch. That sketch went to the senior draughtsman, who did the actual design work, dimensioning it all to 1/1,000 inch and then instructing his junior assistant to mark the tolerances. Orders were given that the tolerances should be made as easy as possible; but in his inferior position the junior assistant would take no risks, so he took the smallest number that he knew and halved it. That description of the procedure would be recognized as a caricature and it had much of the absurdity of a caricature; but it had also a little of the resemblance. At all events, rightly or wrongly, I concluded that in the case of a good many engineers there was a defect in the habits of thought which they had been taught. I would not like to say that that applied only to engineers; nearly all education in this and many other countries had suffered from the same sort of thing until comparatively recently. People were taught to think of a dimension or quantity as an exact number or magnitude, whereas the proper way to think about every dimension was to regard it as having a figure, as being a number plus or minus a little bit, and

the magnitude of that little bit was a very important quality of the number.

Without any clear idea of what could be done to improve matters, I was sent, a little more than a year ago, on a tour of duty to the United States. There I came across the method of statistical control of mass-production, and it was obvious at once that that method provided the right approach. A good deal of similar progress had been made in this country too; in particular much brilliant and successful work had been done by the staff of the General Electric Company and by a Committee of the Royal Statistical Society, and it was perhaps ill luck that I never came across it before crossing the Atlantic. That, however, suggested that it was not very widely known, so the present occasion is justified. The method is not by any means widely used yet in America either, though its use is spreading. In both countries it has been principally used in industries associated with electricity, such as the telephone industry, but I want to emphasize that it should be of even greater importance in the mechanical industries, and that it is specially applicable to the manufacture of munitions in all their aspects.

One of the important points in the new method is that it gives reasoned instead of guessed values to the tolerances. I will take as an example the making of time fuses for anti-aircraft purposes, and I am giving away no military secrets in doing so, since the example is fictitious and the data are intentionally inaccurate. Suppose that the lethal area of a bursting shell is such that, if it explodes within $\frac{1}{10}$ second of the set time, it will make a kill. The gunner therefore demands of the manufacturer a fuse with accuracy of $\frac{1}{10}$ second. The manufacturer then works out his method of manufacture, but finds that whereas it is easy to get accuracy to $\frac{1}{2}$ second, he would have a lot of trouble to work to $\frac{1}{10}$ second, and, indeed, he might estimate that for the same effort of work and cost he could not hope to get more than one-quarter as many fuses if they must have the accuracy of $\frac{1}{10}$ second. He therefore tells the military authorities that they can have four times as many

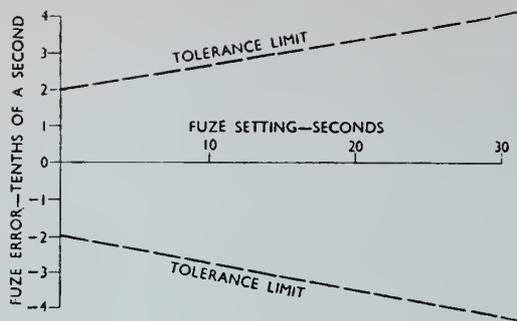

Fig. 1.—Characteristics demanded in time fuse

shells with an accuracy of $\frac{1}{8}$ second as with $\frac{1}{10}$ second. The military authorities will see that by accepting the inferior fuse they can get four times as many shells, of which half would do what is required, and therefore the rate of killing will be doubled.

I have over-simplified that example, but it illustrates the point that in a properly organized system of manufacture the user and the maker of the machine ought to confer when deciding the tolerances, because the maker has no direct knowledge of what tolerances would be reasonable. That course would probably be to a certain extent resented by the designer or the user at first, because there might be a feeling of loss of freedom in the choice of the machine. Such freedom is, however, more apparent than real since in practice the user is obliged to make the tolerances as easy as possible, but he has no guidance as to what will be easy. Contact with the manufacturer would enable him to decide the matter so as to avoid on the one hand an unattainably high standard, and on the other, tolerances so easy that the manufacturer could provide him with a better machine without extra trouble. To summarize, the custom has been for the user to demand from the maker a machine to be made as well as possible, whereas he ought to demand that it should be made as badly as possible—or, perhaps more accurately, as badly as permissible. It is in that aspect that statistical control gives the right information.

A good many varieties of procedure are called for in the circumstances of applying statistical control. First, there are the two classes of control, according to whether quantity or quality was concerned. It may be a measure, say of a length or perhaps an electrical resistance, which has to fall within certain prescribed limits; for such examples, measurements of each specimen are recorded for analysis. In other cases the test is qualitative, i.e., the specimen either passes or fails to pass a test. For example, a vessel is either water-tight or it is not; and even the measure of a length might fall in that class if it is tested with a gauge. There is another distinction which divides either type of work into two classes. Some tests, such as a measure of length, can be applied to every article made, but other tests are destructive. In measuring the tensile strength of a bar the test must of necessity be done only on a sample, and it is obviously important to have the sample as small as permissible. Moreover, even when every specimen could be tested, great economy will result in testing a sample only. Sampling is thus one of the main features of the process; and the determination of the advisable fraction of the whole number to be sampled forms an important part of the duty of the statistician. Then again the practical problem of statistical control itself falls into two parts, for there is first the business of starting a new process and applying statistical control, and then the business of continuing it, after the control has been established. All these matters are described in War Emergency Publication No. B.S. 1008, of the British Standards Institution.

I will take as an example a time fuse, and again I will intentionally falsify some of the facts. I learned of this example from Colonel Simon, who has shown great bril-

liance in developing methods of statistical control for munitions in the U.S.A. arsenals. Certain limits of tolerance have been assigned by gunnery experts. Figure 1 shows the characteristics required in the time fuse. The horizontal line shows the different timings of the fuse, and the two widening dotted lines show the tolerances which the military authorities allowed to the manufacturers. The dotted lines expand a little to the right, since it is easy to get a fuse to behave accurately at a short time and comparatively difficult at a longer time. The fuses failed to fulfill the tests assigned, since at the longer times the band of tolerances was too narrow at both ends. The matter was then handed over to Colonel Simon, and he succeeded brilliantly in putting it right.

To simplify the story, I will assume that Colonel Simon had been called in at the beginning. In that case, Colonel Simon would first of all separate the batches of fuses from different localities, and he would group the fuses from a single locality into batches of five. All the fuses would then be set at 20 seconds; each fuse would then be timed and the average time and the "range" (the difference between the shortest and longest among the five) would be worked out for each batch and plotted on separate graphs. From the "range" chart it is possible, with the help of tables constructed by statisticians, to draw on the average time chart a pair of limits within which the dots should fall.

If the points plotted for fuses made by one particular tool fall outside these limits, it is a sure indication that something is wrong with the process; the statistician cannot say what the fault is—though in some cases he can go so far as to say either that there is only one thing wrong or else certainly several things wrong. It is for the engineer to re-examine the process and find the fault. Next, of course, similar work must be done at the other fuse settings. Once that has been done, and the whole system is in control (supposing that the accuracy is good enough for the user) much less sampling is needed; but at intervals a group should be taken and tested in the same way. Such sampling nearly always gives warning of impending trouble, before the trouble is so bad that the fuses would actually fail in their test.

When I was preparing my present remarks, I tried to make a diagram similar to Fig. 2 by plotting sets of points taken at random, as I thought that that would suffice to illustrate the process. However, in checking to see whether the actual values that would be derived from my chart would be anywhere near correct, I found that they were hopelessly wrong. Then I tried to amend the chart to make it more nearly right, and again failed entirely. Finally, I selected a chart from one of the British Standards Institution publications, plotted from actual results. The point I wish to make is that it would be almost impossible for anybody to cheat by the method of statistical control; no ordinary man could make up out of his head anything that corresponds to the laws of probability. That is a very surprising fact, which ought to increase confidence in the process, because any attempt to fake results would at once be apparent to an inspector if he had any knowledge of statistics.

Figure 3 shows the results obtained for fuses made by one of four or five manufacturers. It will be seen that at

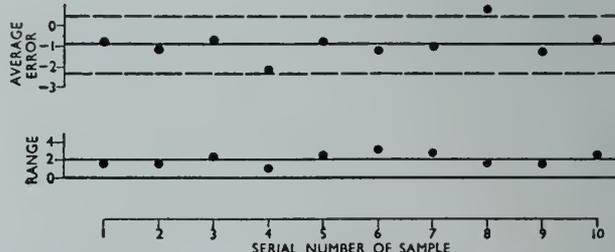

Fig. 2.—Average error \bar{X} and range R

about 25 seconds a considerable number fall well outside the tolerances given by the Army, yet their tolerances are much finer than those specified. Of fuses made by the remaining manufacturers, some give curves like that shown and some give curves with an upward tendency; and it was by mixing all the fuses of all the makers together in the original test, without examining them separately, that the idea arose that the designed tolerance was unnecessarily severe.

Having obtained the curves referred to, it is only necessary to re-graduate the time markings on the fuses. As a result, an article which systematically fails to pass its test was, with a quite trivial change, found to be actually better than had been asked for. As a consequence of his work, Simon found that the old tests had destroyed something like twice as many of the fuses as were destroyed under the method of statistical control and he was thus able to make an important reduction in the number tested.

When I first came across the method of statistical control in the United States, I was convinced that it was of the highest importance and that it ought to be adopted widely in England, but I had considerable misgivings as to whether it could be started in the middle of a war. When visiting the Bell Telephone Laboratory, New York—the premier works in which the process had been introduced in America—I asked Dr. Shewhart whether he thought that the process could be introduced during the war. Dr. Shewhart's reply was quite definitely that there was no reason why it should not be applied piecemeal to one article after another, in the middle of the war, that it would not delay production, and that people would soon get used to the change.

As bearing out this view, I would mention that when I visited Frankford Arsenal, a large military shell factory, I asked one of the chief colonels there what he thought about the introduction of statistical control in munitions work. (Although the method had been in existence for a good many years, in munitions work it is rather new, and

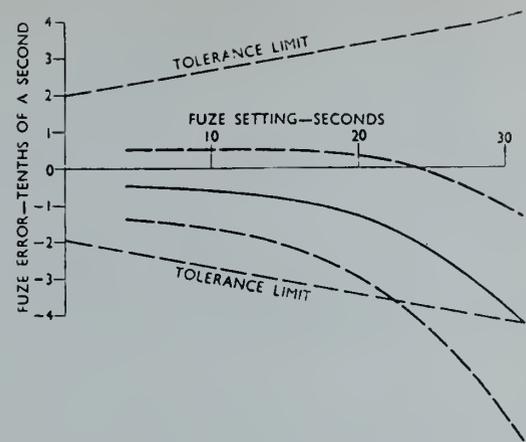

Fig. 3.—Limits demanded and results obtained with time fuses

I therefore expected that, Frankford being an old-established arsenal, those in authority there would be rather conservative.) The reply I received was that statistical control seemed to be the only sensible method to apply.

In many works statistical control will be no great novelty, since in many instances all the records necessary for establishing statistical control are already being kept, and it would merely involve a slightly different way of utilizing those records to make them yield up two or three times as much information as they had given in the past.

It could not, of course, be expected that the method was a panacea for all troubles, and I expect that in some cases it may prove unsuitable, but I venture the forecast that the opposite would much more often be the case, and that many processes to which, at first sight, it seemed inapplicable, would later be found to benefit greatly by the introduction of statistical control.

POPULAR EXPOSITION OF THE APPLICATION OF QUALITY CONTROL

SIR FRANK GILL, K.C.M.G., O.B.E.

Director and Vice-President, International Standard Electric Corporation, and Chairman, Standard Telephones and Cables, Ltd., and of Creed and Company, Ltd.

(1) *Introduction.* The following is a simple, popular, but incomplete exposition of the statistical foundations of quality control, easily grasped by busy engineers.

We have not the necessary knowledge to manufacture articles in large quantities and all having identical essential qualities, therefore tolerances are introduced into specifications. If a number of similar articles are taken and some quality, illustrated here as a dimension,† is measured in each, we get a frequency distribution such as illustrated in Fig. 4, where the majority of the articles cluster round about the average measurement.

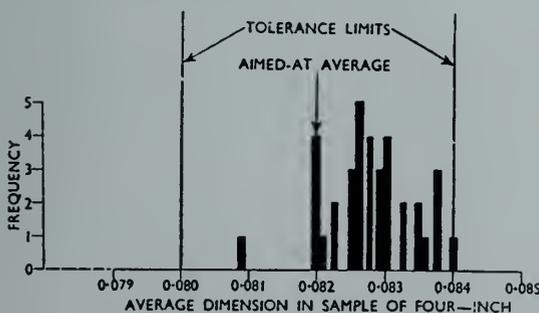

Fig. 4.—Frequency distribution

†For brevity, these remarks do not refer to quality control as related to proportion defective.

Using the data given by these measurements we can, by the probability theory, convert this figure, obtained from a relatively small number of measurements, into what it would be if a very large number were taken. This is shown in Fig. 5. The area in Fig. 5 has been very exhaustively studied and its properties are so known that it may be applied to a chart of the type shown in Fig. 6, on which frequent measurements, for example, the product of a machine tool can be plotted. This chart shows (a) the nominal dimension required, and (b) the plus and minus tolerance limits.

In Fig. 7, three lines are added to the chart: (c) the average dimension actually produced and (d) two statistical control limits, rather finer than the tolerance limits and set quite easily by the simple application of multipliers to the figures obtained from the measurements. These multipliers are based on probabilities.

The chart shows, as news and not as history, current information of the degree to which the desired qualities are being embodied in the product, the extent to which variation must be expected and be therefore inevitable and harmless, and the cases where the samples show harmful tendencies or actual "action points," so giving warning for instant action before the tolerance limits are reached. The main object of quality control is to improve the uniformity of the product up to the point where a "state of control" exists, that is when all, or substantially all, the plotted

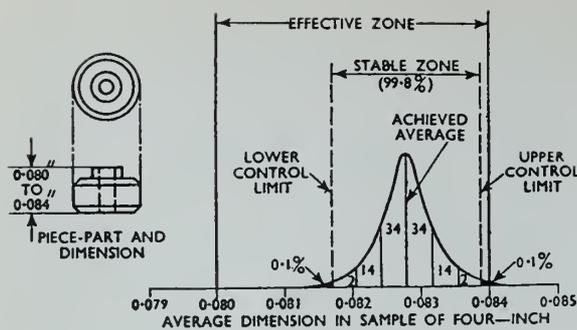

Fig. 5.—Probability curve

points lie within the two statistical control limits. When this is attained a train of benefits accrues.

In broad outline nothing in the new technique *appears* to be very new; but there *is* much in it which is different from the ordinary practice of factories. The following table shows the steps in parallel columns:—

Without quality control	With quality control (measurement)
INSPECTOR Takes samples when he thinks necessary measures	INSPECTOR Takes samples regularly—to plan measures records averages plots records cumulative averages records cumulative ranges uses probability control limits exhibits continuous news, open to production dept., of quality being produced, thus tending to prevent rejections.
Uses purchase specification tolerances Passes or rejects	Uses purchase specification tolerances Passes or rejects

These changes are not difficult to make; but their effect is important.

(2) *Application.* Prolonged research has established so much, that a tool has been made and, as is the case with many tools, can now be used by those who know little of the design. The operating instructions are what must be known, not a checking up of the research already done. Anyone interested may study the statistical fundamentals and will be the more expert for so doing, but it is wrong to think that nothing can be done to apply this technique until statistical experts are available.

Statistical assistance is useful if coupled with factory experience; but care is required to prevent an unpractical mind from disturbing production. What, therefore, should be the attitude of the manufacturing man wishing to investigate this technique yet unable to add statistical knowledge to his factory experience? Many factory engineers are competent to take the simple directions and to do useful work without a statistical expert, if one is unobtainable; while so doing they will find their knowledge expand, so that there will be fewer cases in which such help is required, thus relieving the difficulty caused by the assumed fact that not very many statistical experts with factory experience are available.

Factory engineers should at once begin to study the rules for the application of quality control and not by studying the statistical foundation. They should accept this foundation as already established and proceed with practical study.

(3) *First Steps.* The first steps seem to be:

- (i) To study War Emergency Publication No. B.S. 1,008 (1942), of the British Standards Institution.

This Standard is simple and direct and will enable the factory man to set up quality control charts, using measurements,* and to put such charts into practice.

- (ii) To decide which of the products on which the factory is engaged is suitable for the use of quality control. Obviously the first thought is of repetition work, whether continuous flow or in batches of considerable size.
- (iii) To answer the question, "Which cases and how many for a start?" The short answer seems to be, "Look for cases where the rejects are high; select a few of the most troublesome of these and set up charts for very few, say not more than six at first."
- (iv) To explain fully to all concerned what is being done and what is aimed at; the explanation should be so full that the element of surprise (so often the cause of misunderstanding) shall be absent.
- (v) To make detailed written instructions for each step and each class of shop personnel concerned.
- (vi) To begin plotting charts of the selected processes for a few days without putting in the control limits. Where no queries arise, perhaps one week will be sufficient.
- (vii) To use the average of the averages given by the trial period, set up the control limits and maintain the charts.
- (viii) To introduce quality control gradually in those places where it is appropriate as a regular part of the factory routine.

A copy of the written instructions actually given in one case is shown on p. 15.

(4) *Should Quality Control be Introduced During War Time?* This war is unlike any other in our experience; whether we recognize it or not, all are involved in a struggle which affects all we value and may affect our very lives. Effective, fast production is tremendously important, yet to-day production is subject to numerous unusual causes of hindrance, such as: less skill in labour, poorer maintenance, fatigue, illness, worries, less tractable materials, or substitutes for normal materials. All these adversely affect manufacture, and the results may be summed up in two words "more rejects"; or, better still, more man-hours, machine-hours, etc., rendered ineffective through rejects.

Less rejects will, in effect, give reduced waste in man-hours, machine-hours, space, materials, etc., and so result in greater production; waste is always costly. This is surely a strong appeal to all interested in speed and in effective production.

Because the effectiveness of a firm's inspection can be so well judged by the control charts, quality control should be a method which appeals to those interested in the philosophy of the Services Inspection Departments, namely, that when they are satisfied that a firm is doing a first-class inspection job, the Services will leave inspection

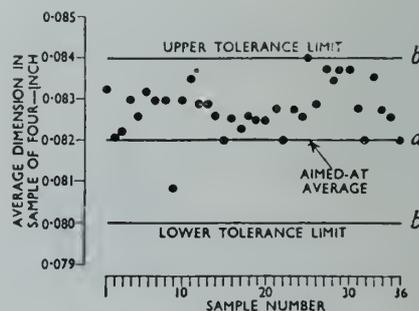

Fig. 6.—Direct plottings

*See footnote, p 13.

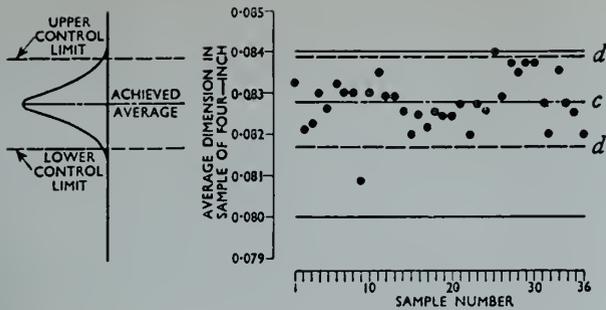

Fig. 7.—Control limits

to the firm. If a firm has a job suitable for quality control and uses it, not only should the quality of its product improve, but it will also have clear evidence of the quality of its inspection which can be used to justify the Services Department leaving inspection to the firm, with full confidence in the result. Obviously, however, the mere use of quality control charts does not justify leaving inspection to the firm, or inspection by samples, unless the quality has been brought into the "state of control."

The foreword in the British Standards Institution's publication No. B.S. 1,008 (1942) is highly significant. What was it which caused the War Department to request the American Standards Association to issue an Emergency Defence Standard on this matter? It is believed to be because, while a certain number of large undertakings were using quality control, very many smaller concerns were not, perhaps owing to the clouds and complexities by which it was surrounded; and so we get this very simple and direct instruction arising out of the war. Just because we are at war, every method of increasing production and every technical improvement are necessary. Recent events must have made everyone realize how important is production and that everything leading to speed and accuracy is vital. (An example of a simple quality control system is given below, and is followed (on p. 17) by Sir Frank Gill's concluding observations.)

Illustration of a Simple Quality Control System as Actually Applied in a Factory.*

Instructions for Control of Quality of Product through Percentage Inspection †

General Instructions

1. The following procedure is designed to govern the inspection of all manufactured items on which the nature of the work performed can be measured quantitatively, e.g. weight of explosive charge in various components, explosive power of detonators in terms of weight of sand crushed, specific gravity of cast or pressed materials, burning time of fuses, etc., except where 100 per cent inspection is performed.

2. *Sampling Schemes.* The sampling scheme described herein is based on a sample of five items per hour, and is practical on the majority of production orders. In some instances, however, the cost of sampling may prohibit this procedure; whereas, in others, more extensive sampling may be advisable, especially at the beginning of an order. Hence, the shop inspector will submit his recommended sampling scheme to the department chief for approval prior to production. The procedure for other sampling schemes is covered in notes on sampling schemes.

Duties of the Foreman

3. *Sampling.* Take a sample of five items from the assembly line each hour, day or other period of time, as instructed by the shop inspector.

*Taken from Appendix C of *An Engineer's Manual of Statistical Methods*, by Leslie E. Simon. Published by John Wiley and Sons, Inc., New York; and Chapman and Hall, Ltd., London, 1941. Reproduced here by special permission of the publishers.

†The author has pointed out that the system illustrated is not of general application.

4. *Recording Observations.* Accurately measure each sample with regard to size, weight, explosive power, or other characteristic described by the respective drawing and specification and record the measurements in the order taken.

5. *Computing Data.* (a) Take the sum of the five recorded measurements of the group and divide it by 5. This figure is known as the "average" or "mean," and is designated by the symbol \bar{X} (bar X).

(b) For each group of five, subtract the smallest recorded measurement from the largest recorded measurement. This figure is a measure of dispersion and is commonly known as "range" or "maximum dispersion," and is designated by the symbol W_i (W sub i).

(c) Table 1 shows a sample of foreman's data.

(EXTRACTED FROM) TABLE 1

Foreman's Data for First Day's Sampling			
1st group of five.....	39.0	1st highest.....	39.0
	38.0	1st lowest.....	36.5
	36.5		
	37.6	1st range.....	2.5

Average of 8 averages...	38.15	Average of 8 ranges....	2.15

Computation of Control Limits

- See paragraph 10 (a) † Average of 8 averages, $38.15 = \bar{\bar{X}}$.
 " " (b) Average of 8 ranges, $2.15 = \bar{W}_i$.
 " " (c) $\bar{W}_i \times 0.594$ on "average" chart = 1.28 = \pm Spread of control limits.
 " " (d) $\bar{W}_i \times 2.08 = 4.47 =$ Upper control limit on "range" chart.
 $\bar{W}_i \times 0.254 = 0.55 =$ Lower control limit on "range" chart.

6. *Plotting Data.* (a) Plot the chart described below on cross section paper. Head the chart "Control Chart for" (inserting the name of the item sampled), "Samples of five" followed by the production order number. On the face of the chart indicate the lot number or batch from which the samples were taken, the approximate daily production, and the designated measurement that the items should meet, e.g. weight of charge 30.0 gr. \pm 2.0 gr., per drawing 70-1-11, revised 6-20-36. (See Figs. 8 and 9).

(b) On the pieces of cross-section paper mark a horizontal scale across the top for the working days of the month, e.g. September 1st, September 2nd, etc. Ordinarily, 1 linear inch for each day is convenient. If the paper has eight divisions to the inch, one division will represent a working hour of the working day.

(c) Mark two vertical scales on the left-hand margin of the paper—one near the top for the purpose of recording the averages (\bar{X}), and one a moderate space below it for recording the ranges (W_i).

(d) Plot the observed average (\bar{X}) for each group of five (see paragraph 5 (a) above) opposite the vertical scale for averages (see paragraph 6 (c) above), and under the horizontal scale for date and hour (see paragraph 6 (b) above).

†On page 16.

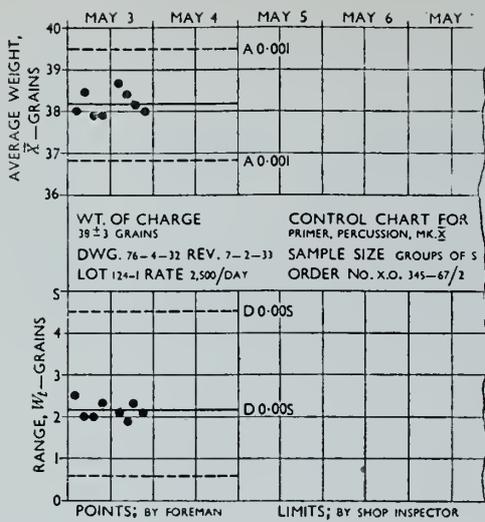

Fig. 8.—Chart for quality control

(e) In like manner plot the observed range (W_i) (see paragraph 5 (b) above) opposite the vertical scale for range and under the appropriate date and hour. Data should be plotted as promptly as practicable, and at least prior to the observation of the next group of data.

7. *Foreman's Interpretation of the Chart.* Limits will be placed on the chart by the shop inspector within which practically all points should fall (see paragraphs 10 and 13 below). If any points fall outside of these limits call the shop inspector without delay.

8. *Disposition of Charts.* The Foreman will conspicuously post the chart in the nearest office to the place of work while the work is in progress and, upon the completion of the production order, will forward the chart to the department office for file, as a record of the quality of the product.

9. *Delegation of Duties.* In lieu of personally performing the functions outlined in paragraphs 1-8 inclusive, the foreman may designate one or more trusted assistants to do them under his supervision. Such assistant may not in any case be the workman who performs the work being sampled.

Duties of the Shop Inspector

10. *Computing and Plotting Control Limits.* (a) After the data from between eight and eighty groups of five have been plotted (see paragraph 11 below), compute the average of the observed averages. This figure is designated as $\bar{\bar{X}}$ (bar bar X). Draw a heavy horizontal line on the chart for averages at the computed figure and under the hours for which the samples were taken. See Figs. 8 and 9.

(b) Compute the average of the eight to eighty observed ranges. This figure is called $\bar{\bar{W}}_t$ (bar W_t sub t). Draw a heavy horizontal line on the chart for ranges at this value and under the hours for which the samples were taken.

(c) Multiply $\bar{\bar{W}}_t$ by 0.594 and plot two heavy dotted lines on the chart for averages parallel to the heavy line at $\bar{\bar{X}}$ and located at $\bar{\bar{X}} \pm 0.594 \bar{\bar{W}}_t$. Mark each of the lines A 0.001.

(d) In like manner, plot two heavy dotted lines on the chart for ranges, one at $2.08 \bar{\bar{W}}_t$ and one at $0.254 \bar{\bar{W}}_t$. Mark each of these lines D 0.005.

11. *Judging and Interpreting of Charts.* (a) Practically no plotted values of \bar{X} should fall outside the dotted limits A 0.001 (theoretically only one above and one below in a thousand). Hence, the presence of a point outside the dotted limits is a very strong indication that the general level of quality (weight of material in a component, size, strength, or other quality) is changing from time to time. The shop inspector will advise the foreman to investigate at once to determine if someone is doing something wrong,

if some machine is functioning wrong, if a change has been made in the raw material, etc., and the shop inspector will also report the situation to the department chief without delay.

(b) A significant deviation of \bar{X} from the mean value designated by the drawing or specification obviously calls for measures to bring the average of the product in closer alignment with the designated average, and the shop inspector will advise the foreman accordingly. The \bar{X} from eighty groups of five is generally so near the true value of the product sampled that for purposes of control it may be treated as such.

(c) Practically no plotted values of W_i should fall outside the dotted limits D 0.005 (theoretically only five above and five below in a thousand). The presence of a point outside these limits is a strong indication that the variation in the product (lack of uniformity) is greater than it should be. The same action will be taken as outlined in paragraph 11 (a) above.

(d) With respect to both charts, the plotted dots should be scattered rather evenly on both sides of the central line; the greater portion should be near the central line, and only relatively few should fall near the dotted limits. Trouble can frequently be forestalled by a study of the charts. If there is a general drift of the plotted points on either chart toward the bottom limit or the top limit, a timely investigation may eliminate the cause of the drift and prevent the occurrence of a point outside the limits. In like manner the too frequent occurrence of points at a value other than in the immediate vicinity of the central value indicates erroneous observations probably due to a faulty measuring instrument, use of an instrument not sufficiently sensitive for the work involved, or bias on the part of the observer. Action same as outlined in paragraph 11 (a) above.

12. *Number of Groups on which Limits should be based.* In the interest of accuracy, convenience, and economy of labour, it is desirable to have limits plotted on the data from eighty groups of five (a normal 10-working-day period). However, at the beginning of a job, limits should be calculated on the first eight plotted points; then after a total of sixteen have been accumulated, then after a total of forty, and finally after eighty, all preceding points included in each successive calculation. The next set of limits will be based on the next eighty points, namely, points No. 81 to No. 160 inclusive, etc.

13. *Predicting Limits.* The importance of these charts lies not so much in disclosing that trouble occurred yesterday, or last week, as in disclosing it instantly, or before it occurs. Hence, it is most important that limits exist for

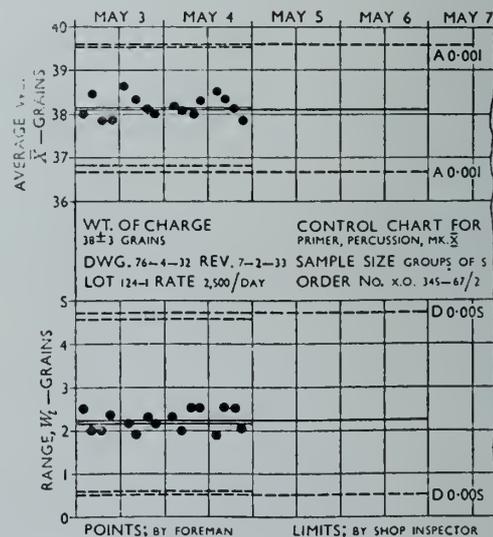

Fig. 9.—Chart for quality control

the plotted points (*see* paragraph 7 above), *before the points are plotted*. To accomplish this purpose, the shop inspector will, at the time he computes and plots a set of limits for a period of from eight to eighty plotted points, extend these limits in light lines for the next data period. These extended limits are binding upon production for the next period during which another set of plotted points are being accumulated (*see* paragraph 7 above). The limits from the accumulated data will then serve as a check on these extended limits and as a basis for new extended limits. This procedure is clearly illustrated in Figs. 1 to 7 inclusive. Thus, when limits are calculated as detailed in paragraph 10 and extended as detailed in this paragraph, there are always limits predicted ahead, except for the first eight points. Even this deficiency can be supplied by taking advantage of data from a previous order, and this procedure should be followed if such data are available.

14. *Meeting Drawings and Specifications*. The meeting of drawings and specifications (as most of them are now written) is often more a matter of engineering, judgment, and interpretation than of mathematical statistics. In general, the drawing or specification will state that the product (presumably meaning every item thereof) will be $A \pm d$. Actually, there is no way of knowing if every item falls within the limits $A \pm d$ unless every item is sampled and, if the sampling be destructive, there is no product left. However, if the product has showed "control" during manufacture; i.e. practically no points have fallen outside the control limits; no exhibition of a pronounced drift or trend; and, if the number of plotted points be large (e.g. forty or more) then it can be said with reasonable certainty that approximately 90 per cent of the individual items will lie between $\bar{X} + 0.707 \bar{W}_i$; 95 per cent between $\bar{X} + 0.843 \bar{W}_i$; and 99½ per cent between $\bar{X} + 1.21 \bar{W}_i$. (For \bar{X} and \bar{W}_i , *see* paragraphs 10 (a) and 10 (b) respectively). Upon completing each period of eighty points the shop inspector will note on the chart "approximately 99½ per cent within $\bar{X} \pm 1.21 \bar{W}_i$," substituting for \bar{X} its numerical value and for $1.21 \bar{W}_i$ its numerical value.

Notes on Sampling Schemes

15. *Time not a Factor*. It is not necessary that the groups of five be taken each hour. All the rules outlined above apply with equal force if the groups of five be taken every half hour, every five minutes, day, week, or other period of time, just so long as the observations are grouped in fives. Hence, in devising sampling schemes, sampling may be increased or decreased at will by merely varying the time interval.

16. *Grouping*. Groups of four can be used just as readily as groups of five by changing all 5's to 4's and changing constants as follows:—

- Paragraph 5 (a).....Divide by 4 instead of 5.
- Paragraph 10 (c).....Change 0.594 to 0.750.
- Paragraph 10 (d).....Change 2.08 to 2.26; and
0.254 to 0.185.
- Paragraph 14.....Change 0.707 to 0.798;
0.843 to 0.952; and 1.21
to 1.36.

Groups of 10 can be used instead of groups of five by changing all 5's to 10's and changing constants as follows:—

- Paragraph 5 (a).....Divide by 10 instead of 5.
- Paragraph 10 (c).....Change 0.594 to 0.318.
- Paragraph 10 (d).....Change 2.08 to 1.755 and
0.254 to 0.439.

Paragraph 14.....Change 0.707 to 0.536;
0.843 to 0.637; and 1.21
to 0.913.

For a given number of observations, the relative precision of results obtained by the use of groups of 4, 5, or 10 under the method outlined is practically the same. However, the smaller groups are to be preferred because of their greater sensitivity to a changing cause system, which is of relatively great importance in manufacture.

Revised: 1/15/37

Leslie E. Simon,
Capt., Ord. Dept.

(Sir Frank Gill's concluding observations, in continuation (from p. 15) of the text of his exposition of the subject, are given below.)

(5) *Conclusion*. Many persons say, "We have used Quality Control for years," really meaning that they have used methods for controlling quality, but not *quality control* as now understood. The marks which distinguish quality control from all other methods seem to be:—

- (i) Regular measurement of small samples.
- (ii) Instant charting of sampling results.
- (iii) Control limits fixed by statistical method, not by guesswork or by the junior assistant.
- (iv) Exhibition of charts where the production force can easily fulfil their duty of knowing the information on them and when to take action. It would not be of much use for the railway signals engineer to provide perfect signals unless the driver of the train could see them and realize his duty to obey them.

Inspectors following this method will enlarge their role from that of merely guarding quality turned out to that of also assisting production—a more satisfying job.

Increased production is not to be obtained merely by encouraging shouts from onlookers urging more effort and longer hours. It is also affected by expert planning, the maintenance of smooth unbroken flow of materials, machine tools, labour, orders and the use of best methods, and one of these—in the appropriate cases—is quality control. In the first instance the burden of investigation and application of this new aid lies with the management of factories and, with the two British Standard Specifications, they now have the means to push this matter with all the intense energy that the war situation demands.

But in addition, the Government has a place; in paragraph 33 of its Eighth Report, 26th March 1942, the Select Committee on National Expenditure, while agreeing that the primary responsibility of ensuring the best use of materials and labour must rest with the management of factories, stated: "The Government has an important duty in checking up how this responsibility is in practice discharged both in its own establishments and in industry generally." Lastly, on the 24th and 25th March 1942, the Minister of Production, in the House of Commons, referred to subjects which affected all three Production Ministries and asked for suggestions, particularly for increasing production without increasing plant or labour force. Engineers now offer to Mr. Lyttelton—in quality control—a real contribution to these subjects referred to by himself, and by the Select Committee. Perhaps it will not be indiscreet to say that undoubtedly engineers will be interested to know what use the Minister finds for it.

ENGINEER TRAINING IN CANADA

MAJOR J. P. CARRIÈRE, S.C., R.C.E., M.E.I.C.

General Staff Officer, Directorate of Military Training, National Defence Headquarters, Ottawa.

ARMY REQUIREMENTS

It has been truly said that this is an engineer's war. The need for engineers is felt in all activities relating to the war effort, in the army, in the air force, in the shipyards and in munitions, arms and other factories on the home front.

The unprecedented development of Canadian industries since the beginning of the war and the subsequent employment of engineers in these industries, together with the demands of the army, navy and air force, has drained the existing supply of professional Canadian engineers. The annual production of engineers from our universities is far from sufficient to fill the continued requirements.

Faced with this problem, the army is forced to train as engineer officers, candidates of a lower standard of education than that of graduate engineers. The immediate need of the army is for reinforcement officers possessing a general knowledge of military engineering science, capable of personal development as experience is acquired, and capable of commanding efficiently a section of engineers in the field (approximately 60 men).

DISTINCTIVE FEATURES OF MILITARY ENGINEERING

Engineering practice in civil life to-day is characterized by specialized organization, resulting in rapid and efficient execution of works in which cost and durability are the important factors.

In military engineering, in wartime, the necessity for speed, often combined with lightness and mobility of plant, equipment and materials, override technical perfection and (within limits) cost.

The distinctive features of the organization and technique of military engineering are:

- (a) The almost complete absence of specialization.
- (b) The wide range of general engineering embraced.
- (c) The necessity for speed.
- (d) The capacity for improvisation.

In connection with this last feature, military engineering has been described in lighter vein as: "The art of employing tools, equipment and materials for totally different purposes than that for which they were originally intended."

The necessity for exploiting the wide resources of engineering science to military purposes renders it essential that military engineers should be in close touch with the latest developments in civil practice.

DUTIES OF ENGINEER OFFICERS

The duties of engineer officers in the field can be stated broadly as follows:—

- (a) To advise the commander on engineer problems affecting contemplated plans of operations.
- (b) To execute engineer projects required in the furtherance of adopted plans of operations.
- (c) To assume tactical command of mixed forces in the field, when necessary.

It therefore follows that the training of engineer officer candidates must aim at teaching:

- (a) A full appreciation and understanding of engineering problems which affect all types of military operations.
- (b) Methods of executing engineer works required in the field, by means of standard equipment or by improvisation from the slenderest resources.
- (c) The characteristics, tactics and limitations of mixed forces in the field in all types of military operations.

SELECTION OF PERSONNEL

To make up for the present shortage of professional engineers, the army accepts as candidates for commissions in the Corps of Royal Canadian Engineers, individuals who have a knowledge in mathematics sufficient to allow them to learn and understand simple formulae relating to the design and execution of simple engineering structures, the use of explosives and other military engineering activities, who are alert and keen and who possess qualities conducive to good leadership. Preference is given to men who have been employed in engineering activities in their civil employment.

Such candidates are taken either from civil life or are selected from the ranks in the army.

Personnel selected as suitable officer candidates are posted to one of the Canadian officers' training centres.

OFFICERS' TRAINING CENTRES

The function of officers' training centres is to impart to selected soldiers from the rank and file, and to civilians, the elementary knowledge essential to the formation of junior officers of all arms of the service.

This includes studies of the principles of modern warfare, the characteristics, functions and employment of the various arms, and the theory of administration and command of military forces. This is supplemented by elementary studies of the detailed characteristics and functions of that arm of the service to which they have been allotted.

The course at officers' training centres is of twelve weeks duration. During the first six weeks, the candidates are given instruction in the appreciation of military situations, the correct method of issue of orders and messages, first aid, the elements of gas warfare, leadership and morale, military law, map reading, organization and administration, methods of training troops and infantry weapon training. They are hardened physically by means of drill, physical training, marches and sports and are also taught to operate motorcycles.

The following two weeks of the course are devoted to tactical exercises in the field.

For the final four weeks of the course, the candidates are grouped in accordance with the arm of the service to which they have been allotted, for preliminary studies of specific subjects related to that arm.

Canadian Army Photo

Fig. 1—Standard floating bridge equipment.

Canadian Army Photo

Fig. 2—Improved bridge.

In the case of engineer candidates, these subjects comprise field defences, organization of engineer works, the use of ropes and spars, the design and erection of improvised bridges and ferries, the theory and use of explosives, the theory of water supply, methods of making engineer reconnaissances in the field and the preparation of military engineering reports.

R.C.E. candidates who successfully complete the course are granted commissions as 2nd lieutenants in the Corps of R.C.E. Then they proceed to one of the Canadian engineer training centres for advanced training.

ADVANCED TRAINING FOR OFFICERS

The functions of Canadian engineer training centres, as regards officer training, is to complement the elementary instruction given at officers' training centres, to train officers in the practical application of the subjects taught and to practise officers in the actual command of small bodies of troops.

The training at Canadian engineer training centres is divided into two main stages:

- (a) A twelve weeks course.
- (b) "Apprenticeship" lasting from one to three months.

The course is a continuation of and complement to the course given at officers training centres. The subjects taught are: Chemical Warfare, Weapon Training, Drill, Training Methods, Motor Transport, Map Reading, Air Photo Interpretation, Military Law, Leadership, Organization and Administration, Reports, Appreciations and Orders, Security and Intelligence, Field Defences, Mining, Water Supply, Accommodation and Sanitation, Obstacles and Mines, Demolitions, Roads and Tracks, Concrete Design in the Field, Signal Training, Tactics, Combined Operations and Bridging.

It will be observed that to cover such a wide range of subjects, (many of which are technical subjects) in a period of 12 weeks, is a big undertaking. However, it is not intended to produce specialists in any subject but to impart a general military engineering knowledge to all candidates; on the assumption that they will improve this knowledge during their period of "apprenticeship" and in the field.

The period of "apprenticeship" which follows the course varies from one month to three months duration. The length of time depends entirely on the aptitude and keenness of individual candidates. The commandants and instructors at Canadian engineer training centres are the judges who decide when an officer is suitable for despatch in the field as a reinforcement section commander.

The maximum period of training given at organized

training centres, provided the candidate does not fail on any course, is therefore, nine months. If we add to this the time spent in examination of the candidates before selection, the time necessary to move from one training centre to the other, the time spent on travel from Canadian engineer training centres to the army in the field, and other unforeseen delays, we can safely say that it takes ten months to a year to produce and despatch each reinforcement officer.

SPECIALISTS TRAINING

Reinforcement officers are despatched to an Engineer Reinforcement Unit where they may be held for further training, or from which they may be sent direct to units in the field. Demands for the replacement of casualties is the governing factor. While at either Engineer Reinforcement Unit or with a unit in the field, a selection is made of officers who show special aptitudes. These specially selected officers are given special training in one or more advanced engineering subjects.

At the moment, most of this specialized training is carried out at the School of Military Engineering, England. Special courses are given in Fieldworks, Bridging, Demolitions, Motor Transport, Engineer Intelligence, Tunnelling and Bomb Disposal. Three specialized engineer courses for officers are given in Canada at the moment: Camouflage, Bomb Disposal and Driving and Maintenance of Military Vehicles (wheeled and tracked).

Experienced engineer officers are also selected from time to time to attend senior officers' courses or staff courses leading to senior or staff appointments.

TRAINING OF OTHER RANKS

Training of other ranks for the Corps of Royal Canadian Engineers follows the policy adopted for the training of officers.

Recruits are allotted to the Corps by Army Examiners after interviews and tests. They then go through an eight weeks course of basic training and follow this up by an eight weeks course of advanced training at Canadian Engineer training centres.

On completion of this latter course, sappers are posted to trained soldier companies where further training is carried out pending despatch to the field as reinforcements.

This applies to non-tradesmen only. In the case of trade trainees, these have to complete advanced training and quality as sappers before attending trades schools, where courses of from 3 to 16 weeks duration are given, depending on the trade. They are then posted to a trained soldier

Canadian Army Photo

Fig. 3—Standard bridging equipment.

Canadian Army Photo

company pending despatch to the field as reinforcements.

The requirements for tradesmen in engineers are about seventy-five per cent of the total requirements for reinforcements.

CONCLUSION

Summarizing the above, it can safely be stated that the time required to qualify candidates as engineer reinforcements is as follows:

Officers.....	10 to 12 months
Tradesmen.....	6 to 10 months
Sappers.....	5 to 6 months

Provided the input of officer candidates and recruits is maintained at a level to conform with the theoretical output for which the training machinery has been set up, reinforcements for the Canadian Army will continue to be produced at a suitable rate.

IRON ORE OCCURRENCES IN THE LAKE SUPERIOR DISTRICT

With special reference to the Steep Rock Occurrences.

J. G. CROSS, M.E.
Port Arthur, Ont.

Paper presented before the Lakehead Branch of The Engineering Institute of Canada on November 11th, 1942.

There are six producing ranges on the American side of the Lake Superior area. These are: the Vermilion range, the Mesabi, the Cuyuna, the Gogebic, the Marquette, and the Menominee (Fig. 1). These ranges are expected to produce this year about 100,000,000 tons of iron ore.

The Mesabi range is by far the greatest producer, and also has one of the greatest ore reserves. This range produces about eighty-five per cent of all the iron ore produced in the Lake Superior area. The range itself is about one hundred miles long, of which seventy miles is productive.

The highest grade ore is produced from the Vermilion range, but the quantity is small. Some of the other ranges produce special types of iron ore, such as the Cuyuna range, where iron ores high in manganese are mined. Different mines on the same range produce different types of ore, and, in fact, several different types of ore are often mined from the same mine.

The iron content of the ore is not the determining factor in the grade. Silica, sulphur, phosphorus, and other impurities are very important factors in determining the value of the ore. For example, for certain types of steel, phosphorus is very undesirable, and for other types, such as spring steel, it is necessary. It is important, therefore, for the steel maker, that a great variety of ores should be available for him to choose from, in order to make a product which will meet various exacting specifications.

The question naturally arises why there are so many extensive deposits on the American side, and so few on the Canadian side. Why have the Americans over four hundred iron mines, against our one—the Helen? The areas are not widely separated, and the rocks are similar.

The answer to this is fourfold:

1. The rocks on our side of the line are largely of the igneous type, while those of our neighbours to the south are largely sedimentary. The sedimentary rocks are more favourable host rocks for iron ore, particularly hematite, than rocks of igneous origin.

2. Folding and deformation of the strata are necessary, in order that surface waters may circulate through the iron-

bearing formations, and remove such impurities as silica and so enrich the iron content of the residue. Iron ore of commercial grade is the result. The depth of folding of the strata, and the nature of surrounding terrain, will, of course, act as factors determining the depth to which circulating ground waters can penetrate. This, in turn, governs the size, richness, and vertical extent of the ore bodies. Other factors enter also, but they need not be discussed here.

3. Erosion has been much more intense on the Canadian side than on the American. Probably any ore bodies that did occur in our area, and did not go to great depths, such as those at Steep Rock, have been removed. Across the border, erosion was also extensive, and much of the richer ore of the Mesabi range was removed by erosion and glaciation, but enough still remained to make this the most extensive of all the iron ranges in the Lake Superior area.

4. The Mesabi range extends across the border into our own particular area, between Loon Lake and the boundary, but no iron ore deposits have ever been found, either in this area, or for the forty miles or so that it extends into the state of Minnesota. The reason for this is that the iron formation, at the time the greatest concentration of ore was going on, over a period of millions of years, in Precambrian days, was covered by a mantle of igneous rocks, and so protected from surface waters, and other concentrating agencies. The remnants of this igneous covering still remain as sills that top the high hills around Thunder Bay, such as Mount McKay, Pie Island, Thunder Cape, etc. These tough-weathering, igneous cappings give our district a rugged and pleasing topography, but at the expense of iron ore deposits that undoubtedly would have occurred, had cappings not been there. Once the iron formations emerged from beneath these igneous rocks, the weathering agencies had a chance to act upon them, and rich iron ore concentrations were the result.

IRON ORE OCCURRENCES AT STEEP ROCK LAKE

This area is well within the Precambrian Shield, so it might reasonably be asked: Why are there such extensive

occurrences of iron ore here? The answer is that a terrific convulsion of nature caused such a deep fold that even the extensive erosion and glaciation to which the area was subjected failed to remove the iron ore bodies completely. It must be remembered, however, that millions of tons of ore were removed by glaciation, but as in the Mesabi range, there was still some left.

The Steep Rock area was first deeply folded along an east and west axis. This folding was intense, and the flat-lying sediments were folded into an almost vertical attitude. Later, a series of sharp folds occurred with a north and south axis. This folding was super imposed on the original East and West fold, and the result is a very complicated structure. These foldings, particularly the latter, with the north and south axis, produced intense fragmentation and shattering of the strata, which had its greatest intensity at the apex of the folds, as might be expected.

These areas of greatest deformation formed channels through which iron bearing, circulating waters could move. However, in the case of Steep Rock, the mineral-bearing solutions came up from below, and not from the surface downward. No doubt there was some enrichment from surface waters, but any ore formed in this way has possibly been removed by glaciation and erosion. The Steep Rock occurrence is not unique in this respect, many iron ore deposits have occurred by this "replacement" process, but it is not common on the American side of the Lake Superior Basin. This replacement type of ore body is a favourable indication that the ore will continue to possibly great depths, since the mineralization came from below and not from above.

SIZE AND EXTENT OF ORE BODIES

The iron ore occurrences at Steep Rock Lake are extensive, and give promise of a very large tonnage (Fig. 2). The "A" ore body was the first discovered, and this, as far as explored, has a length of nearly a mile and a maximum width of over two hundred and fifty feet. The "B" ore body, a mile and a half to the south, has a length of about a mile as far as explored, and a maximum width of over one hundred feet. The "C" ore body, three miles to the north-east, has not been sufficiently explored to give any dimensions, but indications are that it is quite large, possibly

larger than the "A" ore body. Furthermore, there is a strong probability that other ore bodies will be found, one west of the "A," and one or more south of the "C" ore body.

In reality, the Steep Rock occurrence is an iron range that is completely submerged, with a length of about fifteen miles, following the folding of the strata. The ore-bearing possibilities of this area have been only partially explored, and, no doubt, when the lake is drained, further ore bodies will be found.

NATURE OF THE ORE

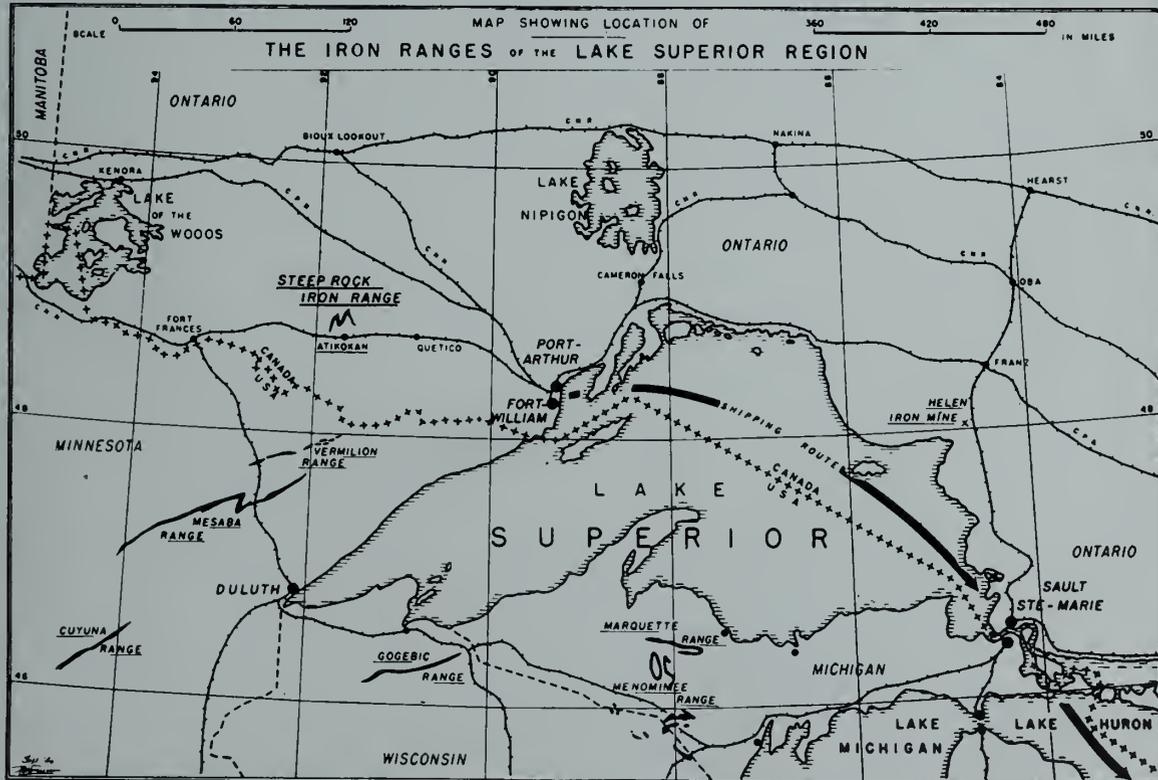

The Steep Rock ore is exceptionally high grade, averaging about sixty per cent iron, low in impurities. A test made very recently showed that it gave excellent results in the open hearth furnace, and, of course, it would be excellent material in the blast furnace. As an iron ore, it has no peer, not even the much touted Swedish ore. Much of the ore produced will be "hard" ore, which is in such great demand for making steel by the open hearth process. There will soon develop in the United States, and in this country, a shortage of this type of iron ore.

POSSIBILITY OF FINDING OTHER IRON ORE OCCURRENCES IN THIS AREA

By "this area" is meant the Lake Superior area on the Canadian side of the line. The sequence of unusual geological events that gave rise to the Steep Rock occurrences of iron ore, is remarkable. It is hardly to be expected that ore occurrences on such a vast scale will be found elsewhere within the Lake Superior district. However, the Precambrian Shield is large; and to the north, in Labrador, and around the Hudson Bay watershed are great areas of rocks where iron ore might be found.

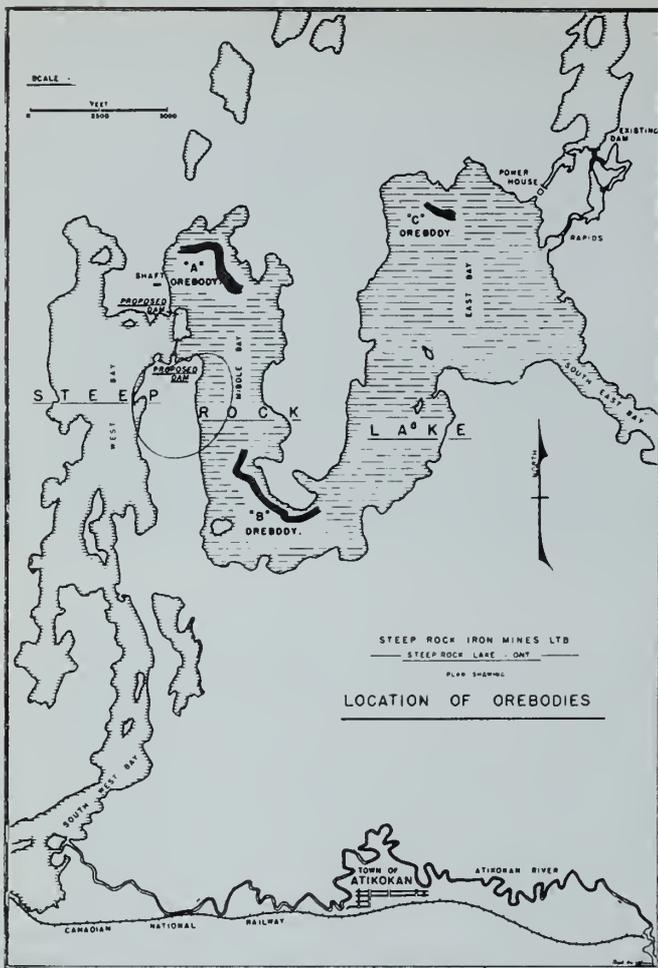

The recent discovery of ore in Labrador is an example. No doubt, other important iron ore discoveries will be made when these vast hinterland areas are more thoroughly prospected.

We must not lose sight of the fact, however, that ores that might be concentrated or beneficiated occur in great abundance, in this particular area, tributary to the head of the lakes. It is not intended to discuss these at the present time, but undoubtedly these low grade ores will be used in

ever increasing amounts as our supply of high grade ores diminishes. There are extensive areas of iron formation in the vicinity of Shebandowan, Shabaqua, east of Lake Nipigon, and west of Fort William to the American boundary, that might produce large quantities of commercial iron ore through some method of concentration and beneficiation or both. The New Helen Mine at Michipicoten, is an example of this.

Canada is a big consumer of iron and steel. Hitherto we have had to import most of the iron ore for our purposes, and also many millions of dollars worth of iron and steel as manufactured products. At the present time we are paying staggering amounts for such manufactured products, the exchange alone, last year, amounting to over twenty-five million dollars.

Iron ore and coal are the life blood of any country, and the great prosperity of our neighbour to the south has been due in large measure to an abundance of these commodities. Now that we have an abundance of iron ore ready to be developed, we should use this bountiful gift to our greatest advantage.

We should manufacture all the iron and steel we ourselves need, and much more, for export. Special steels, such as alloy steels should not be neglected. Electrolytic iron will probably have a considerable field for special purposes, such as seamless tubing, etc. We should be well to the fore in securing an adequate supply of cheap electric power for this purpose. We are not so well supplied with coal, but we have water power, and we should see that our water power supply is kept well in advance of requirements. Where there is water power available at reasonable cost, there industry will develop. Electric alloying furnaces and electrolytic iron-producing plants require large quantities of power, and we should have this power available. A dollar's worth of iron ore will produce fifty dollars in finished products. Let us not be hewers of wood, and drawers of water. We have the brains, let us see that we use them to the best advantage. Let us adopt and adhere to the policy: Canadian Iron for Canadian Industry!

THE SPIRIT OF A PEOPLE

JAMES W. PARKER

President, The American Society of Mechanical Engineers

SUMMARY—It is necessary for the country's welfare that thinking people exert leadership among their fellows. Public opinion will be formed by the kind of thinking the better informed element of the population is doing. Men must discriminate between truth and fallacy, lest the public mind mistake shadow for substance. Turn over in your minds the political doctrines of the past three decades. In innumerable instances we have plainly allowed professionalized politicians, professionalized teachers, and professionalized publicists to mislead us. We have let our system of primary and secondary education be taken so far out of the hands of the public it serves that certain professional educators seriously question the people's right to be heard. Human incentives to work and progress will be destroyed if some of these teachings are followed to their logical conclusion.

Whose duty is it to combat false doctrines? Whose but the intelligent people now so much engrossed in their private undertakings? We are committed to the perpetuation of the great ideal of a government which shall reflect in its courses the faith and the aspirations of a new nation. Its people are becoming amalgamated to an extent we do not yet realize by the pressure of great events. They are united now in a common cause. Men are re-examining their beliefs in the light of the realities of the present day. I believe devoutly that the people are returning to the faith of their fathers, inarticulately but surely.

That this customary address by the President to the members of the Society is, by that same custom, given at the end of his term of office, implies at least an expectation that he will report something of the year's experience. I have visited many of the sections and student branches during the past twelve months although by no means all of them. My acquaintance with members has been considerably increased and I have learned much from them of their observations of other people and of their own attitudes of mind.

The younger men in the student branches are almost all of them affected directly by the war. Most of these engineering students expect shortly to be in the armed forces and they are puzzled to know whether or not they will be given opportunity to make use of their engineering training or will be able to resume that training after the war. A wiser national policy might have obviated that problem and have prevented the almost irreparable waste of trained man-power now threatened. It is, I suppose, one more consequence of the country's mental unpreparedness for which a price must be paid. Because of my belief that there will be great need in the future for men with a thorough training in the fundamentals of technology, I have urged these young men to finish their engineering education whenever circumstances permit; to finish it now if the time is afforded them before entering military service, to come back and finish after the war if need be. I have seen enough of the effects of the last war on young men's careers to give them that advice without hesitation.

The members of the Society themselves are for the most part deeply immersed in the war effort. They are busy in the traditional ways of engineers, their efforts directed toward the effective adaptation of American industry to the manufacture of the materials of war. The techniques of quantity production are applied. Hitherto closely guarded methods are being pooled to that end. We can be everlastingly grateful that without significant exception, responsible men in industry have made common cause with their peacetime competitors. Their engineering staffs are working joyously in this new-found freedom from commercial restraint.

Presidential Address delivered at the Annual Meeting, New York, N.Y., Nov. 30-Dec. 4, 1942, of THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS. Dr. Parker, who is vice-president and chief engineer of the Detroit Edison Company, Detroit, Mich., is well known to many Canadian engineers. His address is reproduced here through the courtesy of *Mechanical Engineering*, where it appears in the January, 1943, issue.

It is not surprising, I supposed to have found men, nevertheless thoughtful about the future. The admonition of Past-President Batt in his address to the Society in 1940 that engineers give heed to the changes that will inevitably be upon us after the war, has given the impetus to some of this thinking. People are aware of impending social-economic change. They are aware of the coming impact upon the existing order of an acquired internal debt of unimagined proportions, of the seriousness of the job of shifting into peacetime pursuits the army of workers now being trained in the special skills of war production. The productive capacity of industry is being greatly enhanced, but there can be no doubt that the genius that made possible such a conversion of product for war will find means for shifting back to the ordinary uses of a world at peace. The question about which men's minds are puzzled is what kind of a world we shall be living in, what the incentives, what the opportunities. Engineers are wondering whether the product of so vast an industrial machine can find a market or, if not, how the men and women workers now so much in demand can find employment. There is something significant in the fact that members of the engineering profession are turning their thoughts to such matters. When changes come, as come they will, the country should this time have the benefit of the thinking that engineers can contribute.

After going about the country, my strongest impression is that the nation is more homogeneous in thought and purpose than we ourselves have been believing. The variety, even the diversity, of races that have merged themselves to make up the American people has brought not disunion but a marked toughening of the fabric. The racial contributions have been many and they vary from the stamina and innate courage of some elements to the imagination, the high intellect, and the sheer inventiveness of others. They are evidenced by the breadth of scientific research, going forward, the capacity for organization, the very adaptability of the workers. Our fathers planted more wisely than we in this later generation have believed, and the fruits of their planting are the manifold accomplishments of a nation formed out of the raw materials of older countries that have come to a new world of infinitely greater freedom and opportunity. One finds proof of it in so many ways. The very names in the Membership List of the Society bear witness to the color and variety of the pattern in which this nation is woven. And with all the singleness of purpose encountered everywhere, one is aware of an absence of rancor, as of an older people who have attained tolerance with their maturity. It is one of the strongest indications one sees of their confidence in the ultimate outcome of the world conflict. It is implicit, for instance, in the action of our Government in removing all civil disabilities from the half million or more of Italian folk rated until a few weeks ago as enemy aliens.

History is a melancholy record of the decay and overthrow of institutions and beliefs built up for generations with long painful effort and devotion. Time and again nations have indomitably faced devastation and still lived. They have survived military defeat and revolution and even the sweeping away of religious concepts and still lived. Whether a people can survive such changes will depend upon the toughness of its spirit.

Our national fabric will be tested even though we shall be spared military defeat. I believe our people now are facing a trial of their faith in self-government, challenged as it has not been challenged for generations. Part of the serious thinking that men are doing is about their own beliefs and the things their sons are growing up to believe.

And they are beginning to discover unsuspected instinctive preferences such as determine the character of a people. They are the key to deeply rooted beliefs it has been too much the fashion to flout in these latter days. It is not much wonder that strangers have misunderstood the spirit of the American people. We have ourselves misunderstood it.

Years ago a poet whose authorship some of you will recognize wrote these verses describing the North American as seen through the eyes of his own spirit:

His easy unswept hearth he lends
From Labrador to Guadalupe;
Till, elbowed out by sloven friends,
He eamps, at sufferance, on the stoop.

Calm-eyed he seoffs at Sword and Crown,
Or panie-blinded, stabs and slays;
Blatant he bids the world bow down,
Or eringing begs a crust of praise;

But, through the shift of mood and mood,
Mine ancient humour saves him whole—
The cynic devil in his blood
That bids him moek his hurrying soul;

That bids him flout the Law he makes,
That bids him make the Law he flouts,
Till, dazed by many doubts, he wakes
The drumming guns that—have no doubts;—

That stings some, even yet; but have we held ourselves in much better repute? Have we not been believing prosperity has weakened our fiber? The brave concept of a new country offering sanctuary to the oppressed people of the earth is well-nigh gone. Jacob Riis and his almost religious belief that America is a melting pot of diverse peoples from which a finer civilization will be east have grown dim in our minds. Our bookshelves have abounded with historical fiction whose authors' purpose seems to have been to prove all we had been taught to revere was but the apocryphal account of legendary figures little resembling the far different and less admirable characters of the actual past.

And, as a matter of fact, have we followed very closely the paths we laid out for ourselves when we were a younger people? We know now we might have guided better and encouraged our immigrant population. We have suffered injustice and discrimination to mar the record of our industrial growth. In a spirit of sheer selfishness we have unnecessarily limited access by other peoples to our markets, and in admitting this we must admit our own share of responsibility for the troubles of impoverished peoples abroad after the armistice of 1918.

I believe men are beginning now to understand these things better, for I think we have been facing realities since the Japanese attack at Pearl Harbor. We have had to look to the leaders of our Government to reach grave decisions—decisions that may make or mar the future of the country; and I believe we have come to examine those leaders with

a more discriminating sense. As one thinks over the lives of the country's statesmen in past eras, the anxieties and doubts of men faced with awful decisions become very vivid. I see now no lack of reverence for Washington and Grant and Lincoln. They stand out of the past, figures of great moral and intellectual stature. I think Will Shakespeare was indulging a playwright's impulse to write claptrap when he said, "The good is oft interred with their bones." We have so many to indulge the public taste from sensationalism that one must see plays and read newspapers with more than ordinary discrimination.

It is necessary for the country's welfare that thinking people exert leadership among their fellows. Public opinion will be formed by the kind of thinking the better informed element of the population is doing. Men must discriminate between truth and fallacy, lest the public mind mistake shadow for substance. Turn over in your minds the political doctrines of the past three decades. In innumerable instances we have plainly allowed professionalized politicians, professionalized teachers, and professionalized publicists to mislead us. We have let our system of primary and secondary education be taken so far out of the hands of the public it serves that certain professional educators seriously question the people's right to be heard. Human incentives to work and progress will be destroyed if some of these teachings are followed to their logical conclusion.

Whose duty is it to combat false doctrines? Whose but the intelligent people now so much engrossed in their private undertaking? "We have left undone those things which we ought to have done" and I feel certain our sins of omission, judging from the results, outweigh a hundred times all the crimes of those Theodore Roosevelt called malefactors of great wealth.

Ladies and gentlemen, we are committed to the perpetuation of the great ideal of a government which shall reflect in its course the faith and the aspirations of a new nation. Its people are becoming amalgamated to an extent we do not yet realize by the pressure of great events. They are united now in a common cause. Men are re-examining their beliefs in the light of the realities of the present day. I believe devoutly that the people are returning to the faith of their fathers, inarticulately but surely.

In the 1917 sequel to the verses I quoted earlier in this address, Rudyard Kipling described well the hard road we must travel:

Not at a little cost,
Hardly by prayer or tears,
Shall we recover the road we lost
In the drugged and doubting years.

But, after the fires and the wrath,
But, after searching and pain,
His Mercy opens us a path
To live with ourselves again.

The times cry out for a leader of the spirit of this people.

Abstracts of Current Literature

A TECHNOLOGICAL HIGH COMMAND

From *Proceedings of the I.R.E.*, July 1942.

How fast is the U.S. moving toward it? Too slowly, for the movement is measured by the rate at which technical men move up into decisive positions in the military and war administration.

Technology as a whole—science, development engineering, industry, and technical labour—is the driving force against the two great inertias that lose wars.

The first is the inertia of the military mind. Charged with the safety of its country in war and the leading of men in battle—responsibilities from which flow its unassailable right to choose its own weapons—the military mind rests heavily on the tried and traditional, and is the least open to innovation of any segment of society. Its technical branches, therefore, are mainly specification and testing adjuncts to the top procurement divisions, which, over the years, have built up close connections with big industrial suppliers and depend heavily on those suppliers' engineering departments.

The second great inertia, closely linked with the first in modern war, is the inertia of industry's heavy investment in plant and equipment. It tends to hold on to old methods, machines, and products and resist any sudden changes or innovations, such as wars demand. This inertia becomes so great in an advanced industrial society, even in peacetime, that some of the most advanced technological corporations, like General Electric and General Motors, spend many millions of dollars a year combating it. They set up development engineering groups—distinct and separate from the corporation's bread-and-butter engineers working on products in production. These development groups have no other purpose in life than to prove that everything the company makes is no good and can be made better. On the broader scale of the country and the war, development engineering is the great missing link in the structure of U.S. technology for war.

A quick look at three broad technological areas will show that all is not yet well. The points at which technical decisions are made today are the most critical spots in the world. For nothing moves—neither money, nor plants, nor production, nor armies—until the technical decision has been made as to what is to be produced. Technology is the initiating force. If the wrong decision is made, or it is flubbed, or delayed, it may upset a whole series of technological imponderables that can only be measured approximately in terms of time, money, and lives wasted.

Take the case of the Napier Sabre liquid-cooled engine. More than a year ago a British group brought a Napier Sabre to Washington, fresh from successful tests in England, to offer it to the army and OPM. It claimed 2,000 hp. It was looked at by OPM production and looked over by OPM's aircraft section. Then from March to August, 1941, the engine rested on blocks at Wright Field, the army testing grounds, waiting to be tested. Army engineers were too busy on the military equivalent of bread-and-butter engineering, or work in production, to get around to it. It never did get around to NACA—for NACA, though it is top body in U.S. aeronautical research, is only advisory and in many cases must wait until a problem or an engine is presented to it. If the army sits on the problem or the engine, nothing happens. So still without a test, the Napier Sabre was turned down by a joint munitions committee of the U.S. and Britain at Washington. Brass-hats pooh-poohed its claim to 2,000 hp. and doubted whether that power could be supported in a frame—though the Napier Sabre was then flying over England. Not much later, further development of the Sabre in England shot its performance well beyond 2,000 hp. to a revolutionary new peak in engine output.

Abstracts of articles appearing in the current technical periodicals

The second great technological area is in shortages and allocations of raw materials. This area is so vast and complicated that no more than a side glance can be given it here. By an intricate series of relationships, the great shortages in metals and materials that develop as the U.S. goes to total war move back upon one another until finally there are shortages in everything except wood, clay, and glass. Unless the highest technological skills in each industry are brought into full play for maximum expansion of production, conservation of materials, substitution of other materials, and allocation of what materials there may be, this can be the most destructive phase of total war for the whole U.S. economy. The total result is a further, unhealthy concentration of the economy that may never be reversed. Destruction cannot be escaped in war. Only by making the highest technology of an industry the guiding line—which means free exchange of technical advice and know-how, pooling of patents, and free creation of new competitive plants and processes—can the destruction be limited and shortages attacked at their source.

Except for a few bright spots, mostly in the allocation of hard-pressed strategic metals, this is the darkest side of the war administration's record. The OPM businessmen resisted any big expansion to begin with, and then administered the resulting shortages and necessary allocations generally on the principle that existing corporate hierarchies must be maintained so that all might come out of the war in nearly the same order and positions as they entered it. Nothing is more vain than the belief that life can be picked up at some future date where it left off in 1939, and events are already crumbling the illusion. One of the first fronts upon which it began to crumble was aluminum, where war shattered the notion that production could be expanded without creating permanent competition for the Aluminum Company of America. But the belief hangs on and still produces delay.

The third large area of technological action is conversion of industry to war, meaningless without a clear technical plan. Production may roar on at a terrific pace and still produce *matériel* inferior to or merely equal to the enemy's weapons. For the technology of conversion is again conversion to what? The army, for lack of any independent development engineering, has never had any clear plans for such relatively new weapons as tanks, beyond over-all and general combat specifications. Not until late last February did the tank corps establish its first laboratory to get the basic physical and psychological data for picking tank men and adapting machines to them.

Instead of designing a tank engine—a six months' job for any crack engineering group, and a job that the British did in three months, the U.S. rushed its M-3 tanks into production by pulling a Wright radial airplane engine off the shelf and making it do. It is now generally admitted that the radial engine is unsatisfactory for tanks, and M-3's are being partly discontinued.

Detroit is going about making tanks as it made automobiles, with all the rigid, corporate lines still up, instead of settling for one bang-up standardized model in which each company unit would concentrate all of its engineering skill on developing a part. Instead of working as a co-operative whole, engineering staffs are to all practical intents split into three corporate compartments, each working on a whole tank, and each duplicating part of the work of the others. This might be the best way to go about development, if the army followed up by picking the best tank or best units out of all three tanks and standardizing on them. But the need for tanks is now so pressing that,

once the tanks are along toward production, no army supply division will have the opportunity to pick and choose. So the army will use all of them. This will mean a servicing and supply problem in the field of major proportions; spare parts for three different engines and transmissions, in addition to two different kinds of fuel for the gasoline and Diesel power units. Such makeshifts may be the burning order of the day. But they don't represent the highest technology of the world's leader in standardized mass production, and two years have been frittered away for lack of any real technical plan or forethought. It is never too late to make a start.

THE PIG IRON MARKET

From *The Engineer*, (LONDON), OCTOBER 16, 1942

The allocations of pig iron show for fourth-quarter delivery that there will be no contraction in the demand. For some time past consumers' principal anxiety has been to obtain the better qualities of pig iron. Far more hematite could be used than is available, and in consequence there is a heavy demand for low phosphoric and refined irons, which are used as substitutes to an increasing degree. For work in which the use of hematite is essential the Control releases this quality, but it is becoming more and more difficult to obtain licences and, of course, consumers who ask for this quality for purposes for which, in the opinion of the Control it is not absolutely necessary, have little chance of obtaining it. Months ago the call for substitutes created some tightness in the market for pig iron, which could be most easily substituted for hematite, and the stringency shows a tendency to become more acute. By carefully supervising distribution, however, the licensing authority has been able to maintain adequate supplies of these alternative irons to consumers employed upon essential work. It is probable, however, as time goes on that the release of refined and low-phosphoric pig iron will be even more restricted. Liberal supplies of high-phosphoric foundry pig iron are available, and whilst the light castings industry is poorly employed, it is probable that stocks will increase. It has been found difficult to utilize the plant of the light foundries in war work, but over the last few months a certain amount of work of this description has come their way. The shadow of concentration, however, still hangs over the light castings foundries and the tendency which has been noticeable for foundries to restrict their buying to hand-to-mouth quantities until full details of the scheme are available is still apparent in the market. On the other hand, the heavy foundries and engineering foundries are important consumers of pig iron, but their requirements are chiefly of the higher qualities.

OIL AND THE ALASKA HIGHWAY

From *Trade and Engineering*, LONDON, SEPT., 1942

Construction of the Alaska Highway through Canada and requirements of oil in connection with defence of the north Pacific coast have given a new importance to the oil resources in the Fort Norman area on the lower Mackenzie river. Somewhat drilling in the Fort Norman field has been done last summer and it is expected that practically all the petrol requirements of the Northwest Territories will be supplied from the Fort Norman production.

The actual output from the Turner Valley is limited by "allowables" to keep within the capacity of the present pipe-line to Calgary. Although no plans have been announced for an additional pipe-line from this field, additional carrying facilities undoubtedly will be provided as soon as the proved available supply of oil warrants it. Further detailed investigations of the extensive oil sands in the McMurray area of northern Alberta have been made by engineers of the Consolidated Mining and Smelting Company of Canada on behalf of the Dominion Government, and efforts are being made to solve certain technical problems of production and marketing. On the recommendation

of the Oil Controller, the Governments of the Dominion and the Province of New Brunswick are co-operating in making a serious exploration of the oil shales which are found in extensive areas in New Brunswick.

WOOD MANHOLE LIDS FILL WARTIME NEED

From *National Lumber Manufacturers Association*, WASHINGTON, D.C.

Wooden manhole covers are helping war booming communities solve a problem posed when the War Production Board banned the ordinary iron variety.

First tried by Los Angeles county, California, the wooden manhole covers built of solid timbers specially treated with a salt preservative to resist termites and decay, have proved highly successful.

The WPB order was designed to save 500 pounds of critical metal which normally goes into each cast iron installation—250 pounds in the lid and 250 pounds in the frame. Some cities already have experienced delays in the installation of sewage facilities for war housing projects due to a shortage of metal manhole covers.

The Los Angeles county surveyor's office developed the wooden substitutes and Surveyor Alfred Jones asserts the idea is suitable for city and county use throughout the nation.

These wooden lids may be constructed in either circular or hexagonal design by laminating short lengths of plank. They may be built in local wood-working shops without extensive fabricating equipment. Tests show that the pressure-treated wooden covers have ample strength and durability.

Alfred Jones, Los Angeles County Surveyor, explains the wooden manhole installation to Miss Beverly Hoyt.

ECONOMY IN THE USE OF NON-FERROUS METALS

From *The Engineer*, (LONDON), SEPT. 18, 1942

The following statement has been prepared by the Non-Ferrous Metals Control and issued by the British Standards Institution on behalf of the Control:—The enormously increased demand for non-ferrous metals for war purposes and the restriction of supplies make it necessary for the most stringent economies to be effected in their use. It is no longer possible to maintain peacetime standards of perfection and it is the duty of all to ensure that the quality of the material employed is never higher than is absolutely necessary. The need for economy applies to all non-ferrous metals, including those most commonly used in cast copper alloys, such as tin. Approximately one-third of all the tin used in this country goes into copper alloys. It is essential, therefore, that tin-bearing alloys should never be used if a tin-free material can be employed, and that, where this is not possible, the tin content should be reduced to a minimum. To assist users to meet this urgent need, a new range of standards for copper alloy ingots and castings, Nos. 1021-8-1942, has been prepared and issued by the British Standards Institution at the request of the Non-Ferrous Metals Control. Attention is drawn to these standards, which immediately supersede certain existing standards. The following general considerations should be borne in mind:—(a) Never use a non-ferrous metal or alloy unless it is certain that there is no substitute available which is in more plentiful supply; (b) where a non-ferrous material is necessary, use the least possible weight of the lowest possible grade; (c) make sure that all scrap is kept clean and free from contamination, use the highest possible proportion of scrap, but never of a higher grade than is absolutely necessary; (d) do not hoard your scrap; if you cannot use it for approved purposes, sell it and put it back into circulation; (e) if you are accumulating in your works residues such as skimmings, casters' ashes, sweepings, etc., and cannot re-use them in your own products, the Control will advise you where this material can most usefully be directed. With particular reference to British Standard alloys, the following points are of importance:—(1) Practically all requirements for cast gun-metals and brasses can be met from the following alloys:—For very special applications, 88/10/2 (B.S. 382-3), 88/8/4 (B.S. 1021-2); for high-grade work, 86/7/5/2 (B.S. 1023-4); for general work, but only where a tin-bearing alloy is essential, 85/5/5/5 (B.S. 897-8); for general work in place of tin-bearing alloys, type A brass (B.S. 1035-6); for all work where a copper alloy is not required to have any special properties, type B brass (B.S. 1027-8). (2) The most efficient use of scrap is essential. On no account should the grade of scrap used be of higher quality than that of the alloy in which it is to be incorporated, unless to counter-balance the use of a still lower grade of material. (3) When sufficient supplies of scrap are not available to meet demands, virgin material must be provided. As far as possible, it must be used only in the highest grades of alloy (e.g., B.S. 382-3, B.S. 1021-2, or 2 B 8 phosphor bronze). Virgin metal or material of comparable quality should preferably be employed in castings of alloys made direct in one melting stage. This releases ingot-making capacity for the production of lower-grade alloys from mixed or other scrap of an indefinite composition which requires to be melted in bulk under properly controlled conditions. (4) B.S. 1025-6, type A, casting brass, has been designed to take care of the lower grades of scrap unsuitable for the better qualities of wrought products. The aluminium content has been kept low to ensure a good casting material. Elements other than copper and zinc are impurities and are allowed up to the limits stated only to cover such quantities as may be present as impurities in the scrap from which the brass is produced. (5) B.S. 1027-8, type B brass, has been designed to take care of the lowest grades of scrap only; principally material more highly contaminated with aluminium, which is allowed as an impurity up to 1.25 per cent. Allowable elements other

than copper and zinc are impurities only and must never be added intentionally. If proper care is taken to avoid the contamination and mixing of scrap and swarf the quantity of material available for use in type B brass should be greatly reduced.

THE INTERNATIONAL CONTROL OF TIN

From *The Engineer*, (LONDON), OCTOBER 16, 1942

Countries supplying more than half the world's total supplies of tin have been overrun by the Japanese and in these circumstances the International Tin Agreement, which has been published as a White Paper, has an appearance of unreality. The signatories to the Agreement are the Governments of Great Britain, Belgium, Bolivia, and Holland. The agreement provides for the setting up of an International Tin Committee, upon which Malaya has five votes, Bolivia and the Netherlands Indies four each, and the Belgian Congo and Nigeria two each. It also provides for three consumers' representatives, one representing the Government of the United States, one consumers in the United States, and one consumers outside the United States, who are to "tender advice" to the Committee. By the misfortune of war, the Governments of Belgium and Holland are operating from London, whilst the tin resources of Malaya and the Dutch East Indies are in the hands of the Japanese. The Belgian Congo, however, remains under the control of the Dutch Government. In the opening paragraph it is stated that the signatory Governments "consider that it is necessary and advisable that steps should be taken to regulate the production and export of tin in and from producing countries, with the object of keeping world's stocks at a normal figure, adjusting in an orderly manner supply to demand, and, at the same time, making available all the tin that may be required and preventing rapid and severe oscillations in price." The Agreement provides for standard tonnages, which are defined as the annual rate of permissible metallic tin when the quota is 100 per cent; quotas are the percentage of standard tonnages which may be exported in any quarter of the year. The standard tonnages are given as Belgian Congo, 20,178 tons; Bolivia, 46,768 tons; Malaya, 95,474 tons; Netherlands Indies, 55,113; Nigeria, 15,367 tons; total, 232,900 tons. The agreement provides that the stocks of tin and tin in concentrates within any territory shall not at any time exceed 25 per cent of the standard tonnage of that territory. The International Tin Committee may, however, permit this percentage to be exceeded in particular cases. Needless to say, under the present conditions of restricted supply the present quotas are fixed at 105 per cent. Probably, the idea in entering upon a restrictive agreement at this time is to ensure, so far as possible, the continuation of the international control over the production and export of tin after the war.

MORE CANADIAN AIR SERVICES

From *Trade and Engineering*, (LONDON), SEPT., 1942

The Canadian Pacific Railway Company has brought under its control ten air transport companies serving Labrador, northern Quebec, north-western Ontario, the northern reaches of the Prairie Provinces and British Columbia, the Yukon, and the shores of the Arctic Ocean, and has now inaugurated regular air services to vast areas in the Dominion's "hinterland".

This replacement by a single system—namely, Canadian Pacific Air Lines—with an excellent organization and strong financial backing of the former independent companies sometimes referred to as "bush lines," establishes northern commercial aviation in Canada on a sound basis. It has special importance at this time because of the great increase in air traffic in connection with the defence of the Pacific coast and Alaska, but it will have a longer range value as well in facilitating the opening of the northern territories and the utilization of their rich natural resources.

FIFTY-SEVENTH ANNUAL GENERAL MEETING

TORONTO — R

THURSDAY AND FRIDAY

THE ENGINEER

PROGRAM

W. S. WILSON
General Chairman

ROBERT F. LEGGET
Chairman of the Papers Committee

STANLEY R. FROST
Chairman of the Publicity Committee

THURSDAY, FEBRUARY 11th

9.00 a.m.—REGISTRATION.

9.30 a.m.—ANNUAL GENERAL BUSINESS MEETING. Announcement of election results. Address of retiring president, Dean C. R. Young.

11.00 a.m.—THE ENGINEERING FEATURES OF CIVIL DEFENCE.—A general discussion, under the chairmanship of John E. Armstrong, of the work of the Institute's Committee on this subject.

12.30 p.m.—LUNCHEON MEETING, to be addressed by BRIG.-GENERAL C. L. STURDEVANT, *Assistant Chief of Engineers, U.S. Army, Washington, D.C.* on *The Alaska Highway*.

2.30 p.m.—INDUSTRIAL RELATIONS—Presentation of certain fundamentals, as a basis for discussion. PROFESSOR M. S. VITELES, *Professor of Psychology at the University of Pennsylvania*, and *Director of Personnel Research and Training for the Philadelphia Electric Company*, will speak on *A Scientific Approach to the Problems of Employee Relations*. DR. BRYCE M. STEWART of the *Industrial Counselors Inc., New York*, until recently *Deputy Minister of Labour for Canada*, will speak on *The Role of the Industrial Relations Executive in Company Management*.

7.30 p.m.—ANNUAL BANQUET AND DANCE. (Dinner Jaekets).

AN EXHIBITION

The Conservation of Critical Materials

The Department of Munitions and Supply has organized at 55 Bathurst Street, Toronto, a remarkable exhibition of machine parts, components, castings, forgings, etc., illustrating what can be achieved in conserving critical materials. All who have seen it agree that the exhibition is a remarkable testimony to engineering skill in design, fabrication, and production.

The exhibition will be open throughout the meeting but special arrangements are being made to accommodate members of the Institute, and of the Association of Professional Engineers of Ontario, during Saturday morning, 13th February.

NICOL MacNICOL
Chairman of the Entertainment Committee

Special return tickets are supplied by the railways at the rate of one and a half of the

AND PROFESSIONAL MEETING

ROYAL YORK HOTEL

FEBRUARY 11th and 12th, 1943

AND THE WAR

TIME

FRIDAY, FEBRUARY 12th

9.30 a.m.—**TECHNICAL PROBLEMS OF WAR PRODUCTION.** This session is planned in close consultation with the Department of Munitions and Supply. **Conservation of Critical Materials** is the first general subject which will be discussed.

The subject of **Statistical Control of Quality in Production** will then be introduced to the meeting. Reference to pp. 11-17 of this issue of the *Journal* will show the interest aroused by this matter in Great Britain. A discussion will follow.

12.30 p.m.—**LUNCHEON MEETING** to be addressed by **DESMOND A. CLARKE**, *Director-General of Shipbuilding, Department of Munitions and Supply*, on **The Battle of the Shipyards.**

2.30 p.m.—**POST-WAR PLANNING AND RECONSTRUCTION.** **WARREN C. MILLER**, *chairman of the Institute Committee on Post-War Problems*, will preside. **PRINCIPAL F. CYRIL JAMES**, of *McGill University*, and *chairman of the Federal Government's main Committee on Reconstruction* will open the discussion. General discussion will then be invited.

3.30 p.m.—**JOINT SMOKER** with the Association of Professional Engineers of Ontario.

DR. F. A. GABY
Chairman of the Finance Committee

DR. A. E. BERRY
Chairman of the Hotel Arrangements Committee

C. F. MORRISON
Chairman of the Registration Committee

LADIES' PROGRAMME

A special programme of entertainment for the ladies is being arranged which includes visits, an afternoon tea and an informal party on the Friday night.

Visiting ladies will be the guests of the Branch at both luncheons.

W. E. BONN
Chairman of the Reception Committee

ular one-way fare for persons travelling in groups of ten or more on the going trip.

NATIONAL SELECTIVE SERVICE

By the time these words are read National Selective Service as an entity will have disappeared. After almost ten months of trial on another basis, the Government has decided to turn over to the Department of Labour all controls for manpower. There will not be great changes in legislation, and in form at least, the new set-up has much in common with that established by the former director, Elliott M. Little. It is inevitable that some revisions will be required, and doubtless the announcements about to be made will take care of them.

In theory at least the control of manpower through the regular divisions of the Department of Labour is a sensible plan, but no plan is as important as the people who administer it. It is to be hoped that the officials of the department do not overlook this fundamental truth. Up to the time of writing, with only a part of the plan disclosed, there are insufficient indications of the acceptance of this principle.

Selective Service properly recognized and administered should be larger than the Department of Labour itself. If it is planned to make it only an adjunct of the department, nothing but miserable failure can follow, and frankly there have been enough of these already in our manpower and labour policies. It is the wish and hope of every citizen that the Government sees the size and importance of the task to be done, and makes its immediate plans accordingly. In times like these we cannot afford the luxury of bungling.

Probably no group of people are more concerned with manpower supply and control, than are the engineers. Themselves, a substantial section of manpower, they are interested almost beyond any other group in labour—both skilled and unskilled. The success or failure of a system of labour supply and control is of great importance to them, not only in their own projects but in the broader field of their interest in the welfare of the country.

In this instance, Canadian engineers have still another interest. Up until recently, selective service had been largely in the hands of engineers. With the sudden and resounding resignation of the director, who was an engineer, questions entered the minds of members of the profession. *The Engineering Journal* is not the medium through which the answers to these questions should be conveyed, but it should be safe ground to make unbiased comment on the work done by the director and these engineers on his staff who supported him.

Few people, not themselves a part of the service, will have any idea of the size and complexities of the setting up and operating of a national service for manpower control. Starting with only a director, and an assistant, and unsuitable legislation, about which selective service itself had absolutely no say, and almost no knowledge up to the day it was announced, it struggled valiantly and intelligently through months and months of days and nights, to gather information and make plans without which it could not possibly succeed, and without which it should never have been inaugurated.

At the time of the director's resignation, much had been accomplished. New and more suitable legislation had been obtained; a greatly augmented field force had been established; divisions that had to do with statistics, planning, allocation, public information, enforcement and so on were working efficiently, public support was being received from all sides, both labour and management were cooperating and supporting the service excellently, and the controls were working.

The director's resignation was so well publicized that everyone must be familiar with it. He stated simply that in view of the needs, the work was not being done sufficiently well, and that without the addition of some clarifying legislation and necessary cooperation, he could not hope to

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

accomplish the task which he had assumed when accepting office.

All this is reviewed here, not to unduly eulogize or embarrass anyone, but to indicate clearly that as engineers, the readers of the *Journal* may be well satisfied with the contribution to public service made under unusual and adverse conditions, by a member of their own profession. Canada is much better off for having had Elliott Little inaugurate and establish National Selective Service, and fellow engineers have good reason to be proud of his contribution to the solution of one of the nation's greatest problems.

THE GENERAL SECRETARY RETURNS

The resignation of the director of National Selective Service, and the subsequent reorganization of that service, have made it possible for the assistant director—our general secretary—to withdraw from that activity and again devote his full time to the affairs of the Institute. While the Institute was pleased to perform a national service by lending him to the federal Department of Labour, it has felt that increasing activities within our organization have made his return to headquarters very desirable.

Mr. Wright's original purpose in going to Ottawa was to aid in establishing a system of controls for technical manpower. He was made assistant director of the Wartime Bureau of Technical Personnel, and remained in that office for over a year. Upon the appointment of E. M. Little, then director of the Bureau, as director of National Selective Service, Mr. Wright, with Council's consent, transferred with him, as assistant.

For almost two years, Mr. Wright has been working strenuously in the interests of the engineering profession and of labour. His main achievement, perhaps, was the establishment of the Wartime Bureau of Technical Personnel. He was a member of the delegation that interviewed Dr. Bryce M. Stewart, then deputy Minister of Labour, to arrange for the establishment of the Bureau. It was he who recommended E. M. Little to the other societies as a "possible" for the post of director, and it was he who persuaded the officers of Mr. Little's companies to permit him to undertake this work. Mr. Wright's ability to appraise people was shown not only by his recommendation of Mr. Little as director, but also by his selection for the Bureau of such persons as H. W. Lea, J. M. Dymond and I. S. Patterson, the three principals of the Bureau today. The Bureau, still carrying on its important work under the guidance of these gentlemen, must be a source of much satisfaction to Mr. Wright.

Mr. Little's transfer to National Selective Service took Mr. Wright into that field also. In the first hectic months of that new activity, he had to play many parts aiding the director in fields of administration, organization, planning, and enforcement. Ultimately, in the clarification that came with time, he became head of the division of enforcement.

Notwithstanding the many other calls upon him during the past two years, Mr. Wright has found time for frequent consultations with the officers of the Institute and with headquarters, and has managed to attend all meetings of Council.

Officers and members of the Institute, and the headquarters staff, will certainly welcome his return to full-time duty with the Institute. We appreciate his work at Ottawa, which has made the Institute's good name known in so many new directions, but his return to our ranks will fill a long-felt want and we shall be glad to have him back at Mansfield Street.

R.J.D.

POST-WAR RECONSTRUCTION

During the month of November, members of a sub-committee named by the Dominion Government held a series of informal conferences in western Canada to discuss the development of Canada's water and power resources in relation to post-war problems. This committee was headed by Dr. J. B. Challies, M.E.I.C., vice-president, The Shawinigan Water and Power Company, and formerly director of the Dominion Water and Power Bureau, and included Dr. J. J. O'Neill, M.E.I.C., dean of engineering, McGill University, Dr. L. C. Marsh, formerly director of social research at McGill University, and Mr. Victor Meek, M.E.I.C., Controller of the Dominion Water and Power Bureau, who acted as technical consultant.

Dr. Marsh is research adviser to the Committee on Reconstruction set up under the chairmanship of Dr. F. Cyril James, principal of McGill University, as an advisory body to report to a Dominion Committee of the Cabinet on reconstruction policies and activities in Canada and abroad following the war. Under this main committee, a sub-committee under the chairmanship of Dr. R. C. Wallace, HON.M.E.I.C., principal of Queens University, has been working on the relationship of post-war problems to the conservation and development of Canada's natural resources. Dr. Challies and Dr. O'Neill, as members of the latter committee, have been concerned particularly with the post-war development of Canada's water and power resources.

Since these water resources are largely administered by the provincial governments it was considered advisable to hold a series of regional conferences. Accordingly, four western Canada meetings with provincial officials and others directly interested in the development of water resources were held at Winnipeg, Regina, Calgary, and Vancouver. The purpose was to obtain a wide view of the present situation with respect to water and power resources and the overall planning necessary for further development of these resources in the post-war period as an aid to rehabilitation. Several of the provinces have already been studying the problem and it was felt that the exchange of views and informal discussions at these conferences were of real value in co-ordinating the Dominion and provincial viewpoint with respect to the utilization of water resources in post-war planning.

The discussions at Vancouver indicated that the province of British Columbia possesses immense reserves of undeveloped water power but the extent to which these water resources could be used to advantage is dependent on finding suitable industries to use the energy produced. It was suggested that the possibility of locating industries in British Columbia to produce aluminum, magnesium, iron, steel and other products requiring large blocks of power be investigated in relation to probable markets after the war.

In the prairie provinces the water supply is mainly interprovincial and international. The prairie region, with its comparatively low precipitation, is in itself not conducive to a reasonably dependable surface water supply and is dependent on water originating in the Rocky Mountains on the West and in the innumerable natural lake reservoirs of the Canadian Shield draining into Manitoba from the East. The entire settlement and further development of the prairies in the post-war period is dependent on the conservation and utilization to the fullest extent to the available water resources for irrigation, water power, domestic, municipal and industrial purposes. It was emphasized at the conferences that overall planning on a watershed basis is essential to ensure that the limited water supplies available are used to the best advantage.

It was suggested that the construction of further irrigation projects within the drought area offered particular advantages for inclusion in post-war rehabilitation plans. Attention was directed to the St. Mary and Milk Rivers irrigation project as an example, and through the courtesy of Mr. P. M. Sauder, M.E.I.C., director of water resources

for Alberta, members of the committee were given an opportunity of spending several days looking over the present irrigation development in southern Alberta. The committee were favourably impressed with the possibilities of the St. Mary and Milk Rivers project to provide employment and land settlement opportunities during the immediate post-war period.

The St. Mary and Milk Rivers are international streams which are apportioned between Canada and the United States by treaty. The project is designed to provide the necessary storage reservoirs and diversion canals for the full use of Canada's share of these waters to irrigate an additional 345,000 acres at a cost of about \$43.00 per acre. The Engineering Institute Committee on Western Water Problems, under the chairmanship of Mr. G. A. Gaherty, M.E.I.C., president of the Montreal Engineering Company, Limited, Montreal, Que., in a report dated June 15, 1941, strongly recommended that an agency be constituted by the Dominion and provincial governments to undertake the development and that funds be made available for an early start on construction.

More recently a committee representing the interested departments of the Dominion Government and the Province of Alberta was established by Order in Council under the chairmanship of Mr. Victor Meek, M.E.I.C., controller, Dominion Water and Power Bureau, to make a thorough study and comprehensive report on all aspects of the proposed St. Mary and Milk Rivers irrigation development. The final report of this committee, dated February 16, 1942, recommended the development as a post-war measure under the terms of a suggested co-operative agreement between the Dominion and the Province of Alberta, providing for a division of the cost and a programme of development extending over a period of 15 years. Members of the Institute who are interested in this report may obtain copies from the Dominion Water and Power Bureau Department of Mines and Resources, Ottawa, Ont.

FRIENDLY CRITICISMS

From time to time, the General Secretary's mail contains letters calling attention to some matter which, in a member's opinion, deserves consideration. Such letters are welcome, because they may give an opportunity for Council, or for the appropriate committee, to make desirable changes in procedure, or to do something which otherwise might be overlooked. In any case they are valuable as indicating the views of at least a part of the membership on the way in which the Institute's activities should be conducted.

One of our members who joined the Institute soon after his recent arrival in Canada, has noted some features in our branch meetings which, he thinks, could be improved. As a comparatively new member, he feels somewhat diffident in expressing his views, but he asks the Council to take such action as they may consider advisable in the matter.

His courteous letter makes certain suggestions which are timely, and his very proper action is appreciated.

The course he has followed is much more helpful than that of persons who merely grumble about such sins of omission or commission as in their opinion mar the record of a governing body or a committee of the Institute, but who do nothing about it.

Our correspondent is grateful for the welcome he has received in Canada since he has benefited by the meetings he has attended, he desires to add to the usefulness of the Institute, particularly as regards its branch meetings, by suggesting certain changes in the way they are handled. He thinks that on many occasions our technical meetings would be more satisfactory (a) if they began more punctually; (b) if the time taken by the author for his presentation were more strictly limited, or indeed, when advance copies are available, if the author would present his paper in abstract only, taking say 20 minutes; and (c) if at least 45 minutes were retained for the discussion, the author being

allowed a further 15 minutes for his closure. In short, our kindly critic thinks that some lack of system is apparent at our meetings.

We can assure him that none of the points he raises are now brought up for the first time. In fact, they involve a number of old familiar difficulties which have so far resisted all efforts to cope with them effectively. Time and again, they have been scotched but not killed. But the struggle is not yet over.

Take the starting problem first. Here we think there is usually little cause for complaint. But what is a chairman to do when the author is late or the slides are not at hand, or the audience insists on staying and talking outside the hall? These are only a few of the possible causes of delay. Obviously, punctual commencement depends on the co-operation of a considerable number of people, and can only be secured if they all do their part.

As regards the author, his paper and the manner of its presentation, it must be remembered that our technical papers—particularly those presented at branch meetings—are prepared, often at considerable personal inconvenience, by people who have many other and more pressing duties. It is not surprising, therefore, that it is seldom possible for the author to send in his manuscript (and illustrations) so long ahead of the meeting date that it can be printed in time for distribution then. And authors have a way of wanting to revise their papers as soon as they see them in print, also their original illustrations are not always suitable for reproduction. If there can be no advance copies of a paper it is hard to arrange for adequate discussion, because the speakers have had no opportunities to consider the author's views.

The plea for brevity in the author's presentation has real appeal, as also has the idea of having the paper read in abstract. But at our Institute and branch meetings, the audience generally and rightly includes many whose detailed engineering knowledge does not cover the precise subject of the paper. Thus a somewhat fuller presentation is desirable than would be needed if all were specialists with the same specialty. The author has to bear his audience and readers in mind when he is writing. The abstract system has been tried and has been found possible to only a very limited extent. Although all authors are asked to prepare abstracts, not all of them do so.

Reams might be written about the organization and conduct of technical meetings, but enough has been said to indicate the kinds of difficulties which have to be met by the paper committees of the Institute and its branches, by our branch secretaries, by the annual meeting committees, and by the headquarters staff. It seems fair to add, that when one considers the large number of technical sessions held annually by the Institute and the great variety of local conditions under which the meetings take place, it is gratifying to find that cases of friction or dissatisfaction are so rare. Our speakers, chairmen, and branch secretaries are in fact to be congratulated on the effective manner in which their duties are performed. It is only on exceptional occasions when some unexpected difficulty arises that real cause for criticism appears.

COMING MEETINGS

Canadian Construction Association.—Annual Convention, Log Chateau, Seignior Club, Que., January 20-22, 1943. General Manager, J. Clark Reilly, Ottawa Building, Ottawa, Ont.

Canadian Pulp & Paper Association.—30th Annual Meeting, January 27th, 28th, 29th, Mount Royal Hotel, Montreal. Secretary, A. E. Cadman, 3420 University St., Montreal, Que.

The Engineering Institute of Canada.—57th Annual General Professional Meeting, Royal York Hotel, Toronto, Ont., February 11-12, 1943. General Secretary, L. Austin Wright, 2050 Mansfield St., Montreal, Que.

Several months ago this letter commented on the Canadian war effort as seen from Washington. I recently returned from a week's hasty visit to Montreal, Ottawa, and Toronto, to take a closer look at certain aspects of Canada's war production. I visited a number of plants covering a representative cross-section of Canadian production and, while in Ottawa, talked to a number of key people. My visit certainly sustained the impression that Canada is doing a marvelous job. True, the closer view revealed one or two "stresses and strains". For instance, the manpower affair was a little unfortunate. A few words of comparison on several scores may be of interest.

Part of my work in Washington has involved finding my way around the various scientific and semi-scientific bodies in the United States. Much of the research work on the instrumentalities of war is conducted at the instigation of the Army or Navy by the Office of Scientific Research and Development which was set up not long ago and which draws its authority directly from the President. Under the O.S.R.D., which is under the direction of Dr. Vannevar Bush, is the National Defense Research Council and also the Committee on Medical Research. In addition, of course, both the Army and the Navy have research facilities of their own. For instance, the Quartermaster Corps carries out a considerable research programme and, of course, the Ordnance Department does a great deal of work in its own field and issues a number of reports. To carry out research in the actual production field, the Office of Production Research and Development was recently set up under the direction of Dr. H. N. Davis. This Office will function in cooperation with the War Production Board. There is also the National Research Council and the National Academy of Science. The National Academy of Science, founded by President Lincoln in Civil War days, is in the nature of a Scientific Senate. In addition to these scientific bodies, there are also the permanent bodies such as the Bureau of Mines, the Bureau of Standards and the various scientific offices of the Department of Agriculture. Most of these scientific organizations "farm out" a considerable amount of their work to Research Departments of major universities, such as Massachusetts Institute of Technology or the Stevens Institute. If we consider a specific problem such as synthetic rubber, we find that nearly all these bodies are doing work of some sort in connection with the problem and that there is also a Technical and Research Division under the Rubber Controller. The above résumé only scratches the surface of the vast network of scientific bodies in the United States. The various branches of the War Production Board such as the paper section, or chemical or rubber or metals section, have really excellent scientific bureaux attached to them; the Board of Economic Warfare has a well staffed industrial and technical section. While the end result of all this activity is very commendable, there is a great deal of duplication and considerable possibilities of confusion.

By comparison, the Canadian situation is very much simpler. As in all other phases of Canadian war organization, a considerable degree of unification has been achieved. All scientific research and development is under control or supervision of the National Research Council. The National Research Council, in turn, maintains a complete liaison with all of the various scientific bodies in the United States and the United Kingdom. Through this one body, Canada is kept fully abreast of scientific developments throughout the world, and is at the same time in a position to make a very real contribution by virtue of being able to bring to bear the fully coordinated scientific resources of the Dominion. The National Research Council is headed by Dean J. C. Mackenzie, who, of course, is well known to all members of the Engineering Institute of Canada. The various war technical bodies are closely related to the National Research Council. For instance, the Inventions Board, and the War Technical and Scientific Development Committee are both chaired by Dean Mackenzie, and the Army Tech-

nical Development Board includes Dean Mackenzie as a member. In discussing the scientific set-up with Dean Mackenzie recently, he admitted that the unity of control which had been achieved by the National Research Council would probably not be possible in a country much larger than Canada.

One of the most interesting and important lines of endeavour in connection with war production is in the field of conservation. The Conservation Division of the War Production Board is a very large and well organized unit. The Canadians are represented on this Board by Mr. Hilton Wilby, and, as a result, it is my understanding that the liaison between Canada and the United States is very much more complete than for any other part of the Empire. The new Conservation Committee recently set up in Canada by direction of Mr. H. J. Carmichael, under the chairmanship of Mr. C. B. Stenning, has already accomplished much useful work. The meeting in Toronto of munitions manufacturers and the conservation exhibit was a brilliant and (insofar as I am aware) a new venture in conservation technique. It was my privilege to discuss this work with Mr. Carmichael and to attend the Conservation Committee Exhibit at Toronto, and one cannot fail to be impressed by the importance of the work which is being accomplished.

Another point for the record as far as Canada's war effort is concerned is her appointment as a full fledged member of the Joint Production and Resources Board in full partnership with the United States and United Kingdom. This move was made in recognition of the fact that Canada is now the third largest producer in the United States-British Commonwealth group.

One cannot emphasize too often the splendid job which is being done by Canadian shipbuilding yards. Statistical studies indicate that, in the main, Canadian shipbuilders are holding their own against the Kaiser records, and, in some cases, even doing better. During my visit to Canada, I was invited to witness the launching of one of the 10,000 ton freighters. Canada's projected part in the merchant ship programme for 1943 is very far in excess of her per capita share. The difficulties of the shipping situation are taxing the creative genius of the engineering profession in many ways. Far reaching experiments are being conducted with all types of cargo carrying vessels. A large programme of concrete ships is at present underway in the United States, although little is being said about this programme until the ships have been fully tested. Many novel methods of construction, forming, concrete placing, reinforcing, etc., are being tried out in this programme. When the story can be told, the art of reinforced concrete construction will be considerably further advanced. Then, of course, there was the Sea-Otter and its successor the Sea-mobile which is now being built for full scale tests. Some publicity has also been given recently to the so-called Phantom ship which travels in a convoy and is operated by remote control. One of my most interesting experiences recently was a visit to the U.S. Navy Yard gun factory. Here again, advances made in recent years will make very interesting reading when they can be told. One gets a tremendously favourable impression as well as a vast sense of the complication of modern war from a visit such as this. It is a real experience to stand next to the breech mechanism of a 16-inch gun!

E. R. JACOBSEN, M.E.I.C.

CORRESPONDENCE

Hamilton, Ont.,
December 13th, 1942

L. Austin Wright, Esq., M.E.I.C.

General Secretary,

The Engineering Institute of Canada, Montreal, Que.

Dear Mr. Wright,

As I approach my last chapter as secretary of the Hamilton Branch, I am mindful that it has been only a very insignificant portion of the great history the Institute is writing for Canada.

It has been a great honour and a greater pleasure to serve with those like you and Louis Trudel and if I may be permitted to say that if my term has been one of success to the branch it is because of your help and that of the various chairmen and every member.

Engineers have often been looked on as a little slow in the battle of life, but it seems to me that, perhaps, instead of being slow the true engineer has a little of the happy and contented philosophy of the Chinese. In all the six years of my duties I have never seen one hand grasping for personal aggrandizement or delivering a dirty blow.

I have tendered my resignation because there are some other matters I hope to be able to give useful attention to and also because it seems only fair that another member should have an opportunity to enjoy the many pleasures that present themselves to the secretary-treasurer of a Branch.

Bill Brown is a true gentleman and my help will always be at his disposal.

I know that at the Annual Meeting they will thank me for what I have been able to do, however small it may have been, but I am very sincere when I tell you that my own feeling is one that calls for my thanks to every officer and member that it has been my privilege to do business with.

Wishing you a very Happy Christmas,

I remain, yours sincerely,

(Signed) A. R. HANNAFORD, M.E.I.C.

9 Waterloo Place, London, S.W.1., July 25th, 1942.

Dear Mr. Wright,

It was indeed a pleasure to receive your letter of June 1st informing me that the Council had again remitted the fees to the Institute of members in this country. I am sure that my fellow members over here will agree that it is an honour largely undeserved, though much appreciated, because we read and hear many reports of the great expansion of Canadian industry to take care of the ever-rising output of war-like stores. This is, of necessity, largely due to our fellow members who have stayed behind and without whom it would not have been possible.

I personally, have left active soldiering for the time being, to take up an appointment with the Armaments Inspection Department on the inspection and proof of gun carriages and mountings. It is most interesting work and is giving me very valuable experience in British manufacturing methods and conditions.

The *Journal* is arriving regularly and I find it most interesting as do English friends to whom I pass it on.

Thanking you for your kind thoughts, I am,

Yours sincerely,

(Signed) R. B. WOTHERSPOON, JR. E.I.C.

HENRY HAGUE VAUGHAN

On the afternoon of December sixteenth the many friends of Henry Hague Vaughan assembled at Christ Church Cathedral, Montreal, to take part in his funeral service. Six past presidents of the Engineering Institute of Canada, representatives of other technical societies of which he was an honoured member, railway officials, business associates and fellow engineers joined in paying respect to the memory of one of Canada's foremost mechanical engineers and administrators. He died on December eleventh. Had he lived a few days longer, he would have passed his seventy-fourth birthday.

Born in England, at Forest Hill, Kent, he was educated at Forest House School and at King's College, London. He then served his time as a special apprentice at Patricroft, Lancashire, in the shops and drawing office of Nasmyth, Wilson & Company, the works originally established by James Nasmyth, inventor of the steam-hammer. The training received there, together with extensive later shop experience elsewhere, gave him that thorough grasp of mechanical details and engineering processes which was afterwards to serve him in such good stead.

In 1891, after some months of work in the locomotive shops of two English main line railways, he went to the United States, entering railway service there first as machinist, later as draftsman, and then as assistant engineer of tests at St. Paul, for the St. Paul Minneapolis and Manitoba Railroad.

In 1898, he became mechanical engineer of the Philadelphia & Reading Railroad, and then of the Q. & C. Company, Chicago. After two years as Assistant Superintendent (and later as Superintendent) of Motive Power at Cleveland for the Lake Shore and Michigan Southern, he came to Montreal, in February, 1904, in the same capacity for the Canadian Pacific Railway. In December, 1905, he was appointed assistant to the vice-president, a position in which he had general charge of the design and construction of locomotives and car equipment, the maintenance of equipment east of Fort William, and the operation of the well-known Angus shops. At that time the road was at the beginning of a ten year period of rapid growth and the responsibility of obtaining and maintaining the necessary equipment was no light one.

His first task was the standardization of the many types of locomotive then in service on the Canadian Pacific Railway, this resulted in greatly simplified maintenance. He undertook a great deal of experimental work on new types of equipment. Considerable saving followed his adoption of thermostatically controlled feed water heaters. Later he was a pioneer in the successful application of superheated steam to locomotives, a course which he first advocated in 1905. This required extensive investigation of problems regarding valve design, new types of piston packing, and cylinder lubrication. The Canadian Pacific Railway adopted superheating some years before the United States roads

recognized the advantages of the practice. The many other developments in which Mr. Vaughan was interested included improvements in the balancing of locomotives to avoid rail breakages, and the design of what were at that time the most powerful rotary snow ploughs in North America. They were needed to deal with the huge snow slides which occur from time to time in the mountain divisions of the road. Mr. Vaughan was in fact an inventor, and always had tests and experiments under way. Many of these resulted in notable economies in operation.

He remained in the service of the Canadian Pacific Railway until 1915, his last achievement before his resignation being the adaptation of the Angus shops and equipment to various forms of necessary war work. In this way he became one of the leaders in improvising and designing machinery for the mass production of shells and cartridge cases, the manufacture of which was one of Canada's main contributions to the war effort in 1915-1918. An example of the way in which the Angus shops, under his direction, met urgent needs, was the design of four 250-ton and one 300-ton presses for making shell forgings followed by their successful construction and delivery in twenty and thirty days respectively from the time the order was first discussed. Similarly, prompt action was taken in respect to the 800-ton hydraulic presses needed for the production of 18 ft. brass cartridge cases. In these and other instances the manufacturing processes were of a kind which had not been carried out previously in Canadian workshops, except on a very small scale in the Dominion Arsenal at Quebec. The Arsenal's information and experience, however, were freely placed at the service of munitions contractors, and proved of very great value in the early stages of their work.

After resigning his executive position with the Canadian Pacific, Mr. Vaughan was retained by the railroad as a consulting engineer. His activity continued, however, as regards the production of munitions, for he became president of the Montreal Ammunition Company and subsequently vice-president of the Dominion Copper Products Company. In 1916 he became vice-president of the Dominion Bridge Company. All these firms were then engaged in war work.

After the war his consulting work developed along administrative and financial rather than strictly technical lines. He became president of the Canadian Foreign Investment Corporation, and held directorships in a number of other concerns. In recent years he took a leading interest in the establishment and operation of the Portland cement industry in Brazil.

In 1906 he joined the Engineering Institute of Canada (then the Canadian Society of Civil Engineers), holding office as a member of Council in 1910-1911, as vice-president in 1912, 1913 and 1914, and as president in 1918. He was largely instrumental in the work of reorganization which

H. H. Vaughan, M.E.I.C.

culminated in the change of the Society's name in 1918 and he was in fact the first president of the Engineering Institute of Canada. He was concerned not only with the active functioning of the Institute as regards the dissemination of professional knowledge but also as regards the recognition and legal establishment of the engineer's professional status in Canada, and the regulation of professional practice. In his presidential message he pointed out that "the change in name implies the attempt to unite all engineers in Canada, to whatever branch of the profession they may belong, into one society." He followed with interest the discussions which took place on these matters between 1920 and 1930 and in that year succeeded past president S. G. Porter as chairman of the Institute Committee on Relations of the Institute with the Professional Associations. That committee's work terminated in the formation of the "Committee of Four" (all representatives of the Associations), a body which gave rise to the present Dominion Council of the Engineering Profession. Mr. Vaughan lived to see the conclusion of formal agreements between the Institute and several of the Professional associations.

Mr. Vaughan was active also on other professional societies. He was a member of the Institution of Civil Engineers, Great Britain, serving as a member of its council for 1925-26. He was also a member of the Institution's advisory committee in Canada.

In 1940 the American Society of Mechanical Engineers conferred an Honorary Membership upon him. He joined that Society in 1899, serving as vice-president in 1910 and again in 1923. He was a member of the A.S.M.E. Boiler Code Committee (Locomotive Sub-Committee) and represented the Society on the American Engineering Standards Committee. He was also a member of the American Society for Testing Materials. Mr. Vaughan was president of the American Railway Master Mechanics Association in 1908 and of the Canadian Railway Club in 1909.

He took an active part in the work of the Canadian Engineering Standards Association, of which he was chairman for some years. His work was recognized in 1939 by the award of Honorary Life Membership in that Association.

This outline of Henry Vaughan's career can give but little idea of his personality and character. Those who were privileged to work with or for him soon learned to appreciate his ability, his helpful co-operation or supervision, his professional competence, and his great store of technical knowledge. As the presiding officer of a council or committee his immediate grasp of the essential features of a proposal and his promptness in decision were characteristic. Widely read, interested in a great variety of topics, his views on questions of the day were always worthy of consideration. It would indeed be hard to fill the gap in the engineering fraternity which is left by his passing.

MEETING OF COUNCIL

A meeting of the Council of the Institute was held at Headquarters on Saturday, December 19th, 1942, at ten o'clock a.m.

Present: President C. R. Young in the chair; Vice-Presidents deGaspé Beaubien and K. M. Cameron; Councillors J. E. Armstrong, J. H. Fregeau, J. G. Hall, R. E. Heartz, W. G. Hunt, C. K. McLeod and G. M. Pitts; Secretary-Emeritus R. J. Durley, General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel.

Council noted with deep regret the death of Past-President H. H. Vaughan which had taken place suddenly in Philadelphia on December 11th, 1942. On the motion of Mr. Armstrong, seconded by Mr. Heartz, the following resolution was passed unanimously, and the general secretary was directed to send a copy of his family:

"The Council of the Engineering Institute learned with profound regret of the death of Past-President H. H. Vaughan, a distinguished member of long standing, who

rendered signal service to the Institute and to the profession.

"During his long service as Councillor, Vice-President and President of the Institute, he always had the interests of the Institute at heart. His ability, integrity and professional experience made him outstanding in his chosen profession. Few members of the Institute contributed more constructively to the upbuilding of the profession of engineering.

"Council desires to express to the members of his family its deep sympathy in their irreparable loss."

Mr. Trudel submitted a copy of the programme of the Annual Meeting as it will appear in the December number of the Journal. He commented briefly on the various items, and pointed out that the Association of Professional Engineers of Ontario was meeting on the Saturday following the Institute meeting. A joint luncheon was being arranged on that day to which are invited any members of the Institute who are still in Toronto. President Young reported that Principal James of McGill would open the discussion at the Friday afternoon session on "Post-War Planning and Reconstruction."

The general secretary read a letter from Mr. Cameron, expressing appreciation of the report which he had received from the Institute's Committee on Post War Problems on the form "Considerations for Evaluating Projects". The great care which had been taken by Mr. Miller's committee in considering this matter, and the representative nature of the report, covering, as it does, such a large cross-section of the engineering profession in Canada, made it of very definite and constructive value. The letter was noted, and the general secretary was directed to send a copy to Mr. Miller.

Mr. Hall and Mr. Hunt were appointed scrutineers to open the ballot for Honorary Membership for Professor Frederick Webster. Their report showed that a favourable ballot had been returned by every member of Council.

Professor Webster was declared elected an Honorary Member of the Institute, and the general secretary was directed to notify him by wire, and request his formal acceptance of this distinction in accordance with the by-laws.

In presenting the report of the Membership Committee, Mr. Hall expressed appreciation of the very constructive comments which had been received from members of Council and branch executives, some of which had been of great assistance to his committee in preparing its final report. His committee now submitted a proposed "Memorandum to Branch Executives—re Qualifications for Membership", together with a suggested form for the use of branch executive committees in tabulating all the information available regarding an applicant.

Mr. Hall pointed out that as one or two of the branches had strongly objected to the use of the form, his committee was recommending that it be left to the individual branches to decide whether or not they returned the completed form to Council with their recommendation. The use of the form was recommended so that all branches would have some uniform system of evaluating the qualifications of an applicant.

Councillor F. W. Gray of Sydney had brought up the question of engineers from the Old Country, who, although not holding a degree, had had special apprenticeship training, including extensive night study at the local university or technical school. Such cases were not covered by the form, and in his opinion should receive special consideration.

A prolonged discussion followed, in which all councillors took part. There was some difference of opinion as to the interpretation which should be given to the various items on the proposed form. Many important points were raised, and it was felt that the report should not be adopted until all members of Council had had an opportunity of studying it. It was suggested that copies be circulated and the report

discussed at a later meeting of Council. This resolution was carried unanimously.

During the discussion it had been suggested that it might be desirable to appoint an Admissions Committee to consider all applications before they are presented to Council. It was decided to leave this suggestion with the Membership Committee, which could make a recommendation to the new Council if considered advisable.

Mr. Armstrong presented a brief progress report from his Committee on the Engineering Features of Civil Defence, giving the complete membership of the committee to date.

President Young reported that up to the present time no positive action had been taken by the government on the joint submission which had been sent to the Prime Minister on November 3rd, concerning the setting up of an organization to look after the repairing of engineering structures damaged by enemy action. The communication had been acknowledged by the Prime Minister's secretary, but no further word had been received. Recently President Young had heard that steps were being taken in Ottawa to organize a similar set-up under military control. It seemed desirable to take some action, and he had drafted a follow-up letter to the Prime Minister, which, with the approval of Mr. Pitts and Mr. Stirling, the presidents of the Royal Architectural Institute of Canada and the Canadian Construction Association respectively, he would like to send out immediately. The approval of both these gentlemen having been secured, the president undertook to prepare a final letter for submission to the Prime Minister.

It was noted that after consultation with the chairman of the Committee on Industrial Relations, President Young had nominated Mr. E. G. Hewson, M.E.I.C., Office Engineer, Central Region, C.N.R., Toronto, as the Institute's representative on the new Committee on Unionism as Related to Engineers and Technologists to be established by the Engineers' Council for Professional Development.

The financial statement to the end of November had been examined, and it was noted that in spite of the remission of fees to those resident in combatant areas and to members overseas, the Institute's position was somewhat better than at the same time last year.

The following resolution was presented from the Toronto Branch Executive Committee:

"Whereas engineers form an important part of our modern army and whereas in general we have civil and mining engineers commissioned in the R.C.E., and mechanical and electrical engineers commissioned in the R.C.O.C., as O.M.E.'s, and

"Whereas there may be a movement on foot to follow in the Canadian army the newly formed "Royal Electrical and Mechanical Engineers" of Great Britain, and

"Whereas there may be some advantage in having all army engineering activities grouped in one organization under the title "Royal Canadian Engineers", be it resolved

"That Council be asked to nominate a Committee to study the above matter and bring in a report to Council."

Mr. Wright commented briefly on the newly formed organization in England, which is reported to be working out very satisfactorily. It is a strictly professional group, receiving professional allowances, and it is hoped that a similar set-up in the Canadian Army would solve the problem of professional recognition for engineers, a matter which has been before the Council of the Institute over a long period of time.

On the motion of Mr. Pitts, seconded by Mr. Beaubien, it was unanimously resolved that the president and the general secretary be asked to name a special committee to investigate this matter and report to Council.

The following resolution was presented regarding a paper entitled "Industrial Democracy and Its Survival" by Paul Ackerman, M.E.I.C., which had been presented at a recent meeting of the Montreal Branch:

"A resolution was passed at the branch meeting held on November 5th, as follows: "That, considering the importance and magnitude of the subject and the need for its study, it is resolved that this meeting request our branch executive to ask the Council of the Institute to appoint a committee to examine the value of this paper, in respect of post-war reconstruction, and give it such publicity as it merits."

On the motion of Mr. McLeod, seconded by Mr. Pitts, it was unanimously resolved that this resolution be referred to the Committee on Post-War Problems for study and recommendation.

Mr. Pitts suggested that this would be an appropriate time to tell Mr. Wright how glad Council was to know that he will be back at the Institute on a full-time basis, and to tell him how much his work in Ottawa and his efforts on behalf of the Institute have been appreciated. President Young stated that he was very glad that Mr. Wright had been able to do this work. While in some respects the Institute may have had to contract its efforts because of his absence, he felt that on the whole it had been a very fine gesture on the part of the Institute to allow the general secretary to carry on the work in Ottawa.

A number of applications were considered and the following elections and transfers were effected:

ADMISSIONS	
Members.....	12
Juniors.....	4
Students.....	64
TRANSFERS	
Junior to Member.....	18
Student to Member.....	4
Student to Junior.....	23

It was noted that the next meeting of Council would be held in Montreal on Saturday, January 16th, 1943, following the annual meeting of the Montreal Branch on Friday evening, January 15th, at which the president would be the guest of honour.

The Council rose at twelve-thirty p.m.

ELECTIONS AND TRANSFERS

At a meeting of Council held on December 19th, 1942, the following elections and transfers were effected:

- Members*
- Cranswick**, Jack Edwin Boyd, B.Sc. (Elec.), (Univ. of Man.), sales engr., Canadian Westinghouse Co. Ltd., Edmonton, Alta.
- deGuise**, Paul Ernest, B.A.Sc., C.E. (Ecole Polytechnique), consltg. engr., deGuise & Desaulniers, Montreal, Que.
- Graydon**, Edgar Ross, B.A.Sc. (Univ. of Toronto), structural engr., Dominion Bridge Co. Ltd., Toronto, Ont.
- Heyland**, Kenneth Vaughan, B.A.Sc. (Univ. of Toronto), asst. mgr., Construction Equipment Co. Ltd., Montreal, Que.
- Lovell**, John (Plymouth Tech. Coll.), engr. Hamilton Bridge Co. Ltd., Hamilton, Ont.
- Richardson**, John Maxwell, B.Sc. (McGill Univ.), elect'l engr., Southern Canada Power Co. Ltd., Montreal, Que.
- Serivener**, Robert Massey, B.Sc. (McGill Univ.), gen. mgr., Toronto Shipbuilding Co. Ltd., Toronto, Ont.
- Wyllie**, James Murdoch, contracting engr., engrg. dept., Canadian Bridge Co. Ltd., Walkerville, Ont.

- Juniors*
- Brunskill**, Harry Talmadge, B.Sc. (Mech.), (Univ. of Sask.), engr., Plant engrg. dept., Ford Motor Co. of Canada, Windsor, Ont.
- Lindsay**, Donald Lorne, B.Eng. (Mech.), (McGill Univ.), sub-lieut. (E), R.C.N.V.R., Halifax, N.S.
- Rounthwaite**, Cyril Frederic Thomas, B.Arch. (Univ. of Toronto), structural designer, 69 Howland Ave., Toronto, Ont.
- *Upton**, Franklin Howard, production planner, John Inglis Co. Ltd., Toronto, Ont.

*Has passed the Institute's examinations.

- Transferred from the class of Junior to that of Member*
- Baekler**, Irving Saul, B.Eng. (McGill Univ.), consulting engineer, Montreal, Que.
- Bates** Harold Carey, B.Sc. (Civil), Queen's Univ., county engr., Stratford, Ont.

Cowie, Norman Claude, B.A.Sc. (Univ. of Toronto), engr., Great Lakes Power Co. Ltd., Sault Ste. Marie, Ont.

Craig, James William, B.Eng. (Ceramic Engrg.), B.Sc. (Chemistry), (Univ. of Sask.), mgr., development and research, Canadian Refractories Ltd., Montreal.

Dyer, John Henry, B.Sc. (E.E.), (N.S. Tech. Coll.), elect'l switchgear dftsmn., English Electric Co. of Canada, Ltd., St. Catharines, Ont.

Gislason, Stefan Ingvar, B.Sc. (E.E.), (Univ. of Man.), asst. design engr., Defence Industries, Ltd., Jean Brillant, Que.

Hinton, Eric, hydro-electric engr. and asst. mgr., H.E. Dept., Bowater's Newfoundland Pulp & Paper Mills, Ltd., Deer Lake, Nfld.

Lynch, John Franklin, B.Sc. (E.E.), B.Sc. (C.E.), (Univ. of N.B.), res. engr., Defence Industries Ltd., Brownsburg, Que.

Lyons, Gerald S., B.Sc. (Elec.), (Queen's Univ.), engr., Bell Telephone Co. of Canada, Ltd., Montreal, Que.

Matheson, Murray Alexander, B.Sc. (Mech.), (Univ. of Sask.), asst. chief engr., Talara Refinery, International Petroleum Co. Ltd., Talara, Peru.

Smith, Maurice Howie, B.Sc. (E.E.), (Univ. of Man.), inspecting officer (E.E.), Inspection Board of United Kingdom and Canada, Peterborough district, Peterborough, Ont.

Timm, Charles Ritchie, B.Sc. (E.E.), (McGill Univ.), elect'l engr., Central engineering dept., Dominion Rubber Co. Ltd., Montreal, Que.

Watier, Arthur H., B.Eng. (McGill Univ.), asst. to asst. supt. of generating stations, Shawinigan Water & Power Co., Shawinigan Falls, Que.

Weslake, Edward Joseph, B.Sc. (E.E.), (Univ. of Man.), reinforced concrete designer, Cowin & Co., Winnipeg, Man.

Willows, Fred, B.Sc. (C.E.), (Univ. of Man.), field engr., Beauharnois Light, Heat & Power Co., Ltd., Beauharnois, Que.

Transferred from the class of Student to that of Member

Evans, Edward Norton, B.Sc. (McGill Univ.), sales representative, Champion Spark Plug Co. of Canada, Ltd., Windsor, Ont.

Hayes, Ronald Abram Hughson, B.Sc. (McGill Univ.), asst. chief engr., Aluminum Laboratories, Ltd., Montreal, Que.

Hubbard, Sewell Fortescue, B.Eng. (Chem.), (McGill Univ.), Chemicals & Explosives Prodn. Branch, Dept. of Munitions & Supply, Montreal, Que.

Lacombe, Jean Louis, B.Eng. (McGill Univ.), dftsmn., mtce., mech. designer, Quebec North Shore Paper Co., Baie Comeau, Que.

Nichols, Judson Timmis, B.Eng. (Mech.), (McGill Univ.), mtce. engr., Aluminum Company of Canada, Ltd., Arvida, Que.

Reinhardt, Gerard Victor, B.Sc. (Mech.), (N.S. Tech. Coll.), dftsmn. engr. office, Aluminum Company of Canada, Ltd., Arvida, Que.

Transferred from the class of Student to that of Junior

Bélanger, Lucien, B.A.Sc., C.E. (Ecole Polytechnique), engr., and dftsmn., Royal Canadian Naval Service, Deep Brook, N.S.

Bourgeois, Claude, B.A.Sc., C.E. (Ecole Polytechnique), asst. engr., Plessisville Foundry, Plessisville, Que.

Carey, Leslie Clement, B.E. (Civil), (N.S. Tech. Coll.), junior engr., Hydraulic Dept., Hydro-Electric Power Commission of Ontario, Toronto, Ont.

Clark, Alvin Ira, B.Sc. (M.E.), (Univ. of Sask.), mech. engr., Aluminum Company of Canada, Ltd., Arvida, Que.

Cousineau, Emile, B.A.Sc., C.E. (Ecole Polytechnique), surveying and gen'l engr., Quebec Streams Commission, Montreal, Que.

Decarie, Yves Stanley, B.A.Sc., C.E. (Ecole Polytechnique), foundry division, Canadian Car & Foundry Ltd., Longue Pointe Works, Montreal, Que.

deTonnancour, L. Charles G., B.Eng. (Chem.), (McGill Univ.), asst. to Development engr., Shawinigan Chemicals Ltd., Shawinigan Falls, Que.

Forest, Clement, B.A.Sc., C.E. (Ecole Polytechnique), inspector for Dept. of Transport (Civil Aviation Divn.), Montreal, Que.

Grout, Raymond Edward, B.Sc. (Elec.), (Univ. of Alta.), elect'l designing engr., Shawinigan Engineering Co. Ltd., Montreal, Que.

Hoba, Joseph G., B.Sc. (Queen's Univ.), asst. engr., Aircraft Division, Kelsey Wheel Co., Windsor, Ont.

Hunter, Lawrence McLean, B.Sc. (Queen's Univ.), mgr., production dept., Coca Cola Co. of Canada, Ltd., Toronto, Ont.

Kirkpatrick, Robert Evans, Capt., R.C.A. B.Eng., (McGill Univ.), inspecting officer, Propellants and Cartridges, Inspection Board of United Kingdom and Canada, Ottawa, Ont.

Laquerre, Maurice L., B.A.Sc., C.E. (Ecole Polytechnique), field engr., Angus Robertson Co. Ltd., Villeray plant of D.I.L., Montreal, Que.

Larose, Gérard, B.A.Sc. (Ecole Polytechnique), special products dept., Northern Electric Co. Ltd., Montreal, Que.

Lemieux, Henri Julien, B.A.Sc., C.E. (Ecole Polytechnique), office engr., engrg. dept., Foundation Company of Canada, Shipshaw, Que.

Madill, Floyd Alexander, B.Sc. (Civil), (Univ. of Alta.), asst. party chief, gravity meter surveys, producing dept., Imperial Oil Ltd., Calgary, Alta.

McColeman, Hugh Alexander, B.Sc. (Univ. of Alta.), elect'l dftsmn., Aluminum Co. of Canada, Ltd., Montreal, Que.

Oatway, Harold Callaghan, B.Eng. (McGill Univ.), Flight-Lieutenant, R.C.A.F., aeronautical engr., Aircraft Development Officer (Design & Production), Ottawa, Ont.

Papineau, Marcel L., B.A.Sc., C.E. (Ecole Polytechnique), Flying Officer, R.C.A.F., aeronautical engr. officer, No. 3 I.T.S., Victoria-ville, Que.

Pearce, Eldridge Burton, B.Sc. (Queen's Univ.), dftsmn., tool design, Canadian Car & Foundry Co. Ltd., Amherst, N.S.

Phemister, William Ian, B.Sc. (Mech.), (Queen's Univ.), photo-reproduction supervisor, National Steel Car Corp., Niagara Falls, Ont.

Smith, Allan Garfield, B.Eng. (Elec.), (McGill Univ.), sales engr., Illumination Divn., Northern Electric Co. Ltd., Toronto, Ont.

Taylor, Dudley Robert, B.Eng. (McGill Univ.), radio engr., Trans-Canada Airlines, Winnipeg, Man.

Students Admitted

Beaton, William Henry (McGill Univ.), 3484 Westmore Ave., Montreal, Que.

Charton, Herman (McGill Univ.), 336 Woodland Ave., Verdun, Que.

de la Chevrotière, Jean-Marie (McGill Univ.), 6588 St. Denis St., Montreal, Que.

Mackenzie, Arthur Drury (Univ. of Toronto), 506 Huron St., Toronto, Ont.

Maclure, James Hubert Crocker (McGill Univ.), 602 Victoria Ave., Westmount, Que.

Morison, George Alfred (Univ. of Man.), 54 Maryland St., Winnipeg, Man.

McKinney, Charles Donald (Univ. of N.B.), 44 Ludlow St. West, Saint John N.B.

Reid, Robert Arthur, B.Eng. (Mech.), (McGill Univ.), 944 Davaar Ave., Outremont, Que.

Ritchie, Ross A. (McGill Univ.), 3592 University St., Montreal, Que.

Tivy, Robert Harrison (Univ. of Man.), 54 Maryland St., Winnipeg, Man.

Waldron, John Ross (Univ. of Man.), 54 Maryland St., Winnipeg, Man.

Weber, Thomas Eugene (Univ. of Man.), 409 Sherbrook St., Winnipeg, Man.

Weller, Robert Charles (Univ. of Toronto), 588 Huron St., Toronto, Ont.

Students at the Ecole Polytechnique, Montreal, Que.

Baillargeon, Robert A., 12,200 Valmont St., Montreal, Que.

Baril, Roland Gérard, St. Hilaire, Que.

Beaudoin, Bernard, 3783 Botrel St., Montreal, Que.

Beaupré, Louis, 34 Hazelwood Ave., Outremont, Que.

Beland, Jean Armand, 807 Wilder Ave., Outremont, Que.

Bisailon, Gérard Albert, 1956 Rachel St. East, Montreal, Que.

Boucher, Jean-Paul, 1305 Panet St., Montreal, Que.

Boulva, Francis, 824 Cherrier St., Montreal, Que.

Bourassa, Jean, 1615 Bernard Ave., Outremont, Que.

Bouthillette, Roland, 1899 Leclair St., Montreal, Que.

Brais, Pierre, 127 Chambly Road, Longueuil, Que.

Brissette, Jacques L., 788 Jean-Talon St. W., Montreal, Que.

Brissette, Paul, 2549 Chapleau St., Montreal, Que.

Clément, Albert, 2501 Orleans St., Montreal, Que.

Cormier, André, 837 Dunlop Ave., Outremont, Que.

Courchesne, Armand, 5621 Côte des Neiges Road, Montreal, Que.

Dagenais, Camille, 3876 Harvard Ave., N.D.G., Montreal, Que.

Deniger, Jean, 2500 Sheppard St., Montreal, Que.

Dion, Louis Armand, 4323 Western Ave., Montreal, Que.

Dugas, Jean, 454 Outremont Ave., Outremont, Que.

Farand, Henri-Paul, 2612 Ste. Catherine Road, Outremont, Que.

Faubert, Guy-Albert, 369 Ville de Léry, Chateauguay Co., Que.

Ferraro, Silvio, 7166 Casgrain St. Montreal, Que.

Gagnon, Adrien, 1957 Kent St., Montreal, Que.

Gendron, Lucien, 800 Gilford St., Montreal, Que.

Giroux, Léopold, 217 Aqueduc St., Quebec, Que.

Grenier, Guy, 4251 DeLorimier Ave., Montreal, Que.

Houde, Raymond, 308 Baldwin St., Montreal, Que.

Laganière, René, 4702 Lafontaine St., Montreal, Que.

L'Anglais, François, 3493 DeLorimier Ave., Montreal, Que.

LeBlanc, René, 194-A Querbes Ave., Outremont, Que.

Lemieux, Philias, Lauzon, Que.

Leroux, Jean-Jacques, 696 St. Joseph St., Lachine, Que.

Marier, Jean Jacques, 187 Blainville St., Ste. Thérèse, Que.

Matte, Gilbert, 36-2nd Ave., Ville St. Pierre, Montreal, Que.
Murray, Hubert, 1851 Theodore St., Montreal, Que.
Parent, Albert, 8041 St. Michel Blvd., Montreal, Que.
Partous, Georges Jean, 1638 Bennett Ave., Montreal, Que.
Pontbriand, Joseph Edmond, Sorel, Que.
Pouliot, Georges Aimé, 4270 St. Hubert St., Montreal, Que.
Renaud, Robert, 6869 Fabre St., Montreal, Que.
Ricard, Julien, 1653 Ontario Street East, Montreal, Que.
Rolland, Paul-André, 5470 Notre Dame de Grâce Ave., Montreal, Que.
Roy, Jacques, 1847 Theodore St., Maisonneuve, Montreal, Que.
St-Marie, Jean E., 5314 Brodeur St., Montreal, Que.
St-Pierre, Fernand O., 8271 Henri-Julien St., Montreal, Que.
Scharry, Leo, 4743 Berri St., Montreal, Que.
Tessier, Laurent, 6253 deLaroche St., Montreal, Que.
Thomas, Jean-Marie, 386 de Lasalle Ave., Montreal, Que.
Tourigny, Paul, 456 Sherbrooke St. East, Montreal, Que.
Vincent, Jacques, 837 Hartland Ave., Outremont, Que.

By virtue of the co-operative agreement between the Institute and the Association of Professional Engineers of Nova Scotia, the following elections and transfers have become effective:

Members

Cameron, Clyde Fraser, (Grad. R.M.C.), M.Sc. (Mass. Inst. Tech.), Major, D.A.Q.M.G. (E), Atlantic Command H.Q., Halifax, N.S.
Coy, Vincent Michael, B.Sc. (Elec.), (N.S. Tech. Coll.), distribution engr., Nova Scotia Light & Power Co. Ltd., Halifax, N.S.
Reid, George Gideon, B.Sc. (Mech.), (N.S. Tech. Coll.), 34 Regina Terrace, Halifax, N.S.
Ward, William Albert, engr. dftsman., Dept. of Public Works, Halifax, N.S.

Transferred from the class of Junior to that of Member

Duff, Duncan Clemens Verr, B.Sc. (Civil), (N.S. Tech. Coll.), senior asst. engr., Works & Bldgs. Br., Dept. of National Defence, Halifax, N.S.

Transferred from the class of Student to that of Member

MacKinnon, Archibald Hugh, B.Eng. (Mech.), (N.S. Tech. Coll.), designing engr., I. Matheson & Co. Ltd., New Glasgow, N.S.

Personals

William N. Kelly, M.E.I.C., is the newly elected chairman of the Vancouver Branch of the Institute. Born at Douglas, Isle of Man, he was educated at Belfast Technical College and at Liverpool University. He served an apprenticeship as engineer with Combe, Barbour and Combe Ltd., Belfast. From 1903 to 1908 he was employed with various firms of engineers at Liverpool. He came to Canada in 1909 and was engaged in various engineering projects in British Columbia. Later, he was appointed superintending engineer with Consolidated Whaling Corporation and North Pacific Sea Products Co. In 1925, he joined the staff of Yarrows Limited at Vancouver. In 1926, he entered private practice as a consulting engineer at Vancouver and has since been carrying on successfully as mechanical engineer and marine surveyor. Mr. Kelly is surveyor to the British Corporation for the Register of Shipping and Aircraft.

William N. Kelly, M.E.I.C.

R. H. Parsons, M.E.I.C., city engineer at Peterborough, Ont., has been elected vice-president of the Canadian Institute on Sewage and Sanitation.

Dr. A. E. Berry, M.E.I.C., director, Sanitary Engineering Division of Ontario, was re-elected secretary-treasurer of the Canadian Institute on Sewage and Sanitation at the convention held in Toronto, last October.

Squadron-Leader Wilfrid E. Hobbs, M.E.I.C., has recently been promoted from the rank of Flight-Lieutenant and has been transferred from R.C.A.F. headquarters in Ottawa to No. 2 Training Command at Winnipeg, Man. Before his enlistment in the R.C.A.F., he was employed as assistant to the manager in the Land Department of Hudson's Bay Company at Winnipeg.

News of the Personal Activities of members of the Institute, and visitors to Headquarters

Gordon McL. Pitts, M.E.I.C., is a new member of the City Council of Montreal, having been appointed as one of the representatives from McGill University. Mr. Pitts is a member of the firm of Maxwell & Pitts, architects.

Flying Officer John W. Lucas, M.E.I.C., is now back in the R.C.A.F. after having been recalled by the Department of Public Works at Ottawa, for three months, early last year, and he is at present stationed in Halifax, N.S., at Eastern Air Command Headquarters.

T. A. S. Munford, M.E.I.C., has been appointed division engineer at London, Ont., with Canadian Pacific Railway Company. He was previously assistant engineer, Bruce Division, at Toronto.

David Hutehison, M.E.I.C., has been elected chairman of the Edmonton Branch of the Institute. Born at Owen Sound, Ont., he was educated at Queen's University where he graduated with honours in 1924. Upon graduation, he joined the staff of Foundation Company of Canada and was employed on bridge underwater inspection for two years. In 1926 he went with Power Corporation of Canada Limited at Montreal and became construction superintendent. In 1938 he joined the Hudson's Bay Company as manager of Mackenzie River Transport, at Edmonton.

Roland Saint-Pierre, M.E.I.C., has obtained leave of absence from the Quebec Department of Highways and has joined Bombardier Snowmobile Limited at Valecourt, Que. After a certain period of time spent at Valecourt, Mr. Saint-Pierre will come to Montreal where he is expected to take charge of engineering in the assembly plant. A graduate of Ecole Polytechnique, in 1935, he has been connected with the Department of Highways of Quebec since graduation, his last position being that of division engineer at Beauceville, Que.

Commander B. R. Spencer, R.C.N., M.E.I.C., has been transferred from Esquimalt, B.C., where he was in charge of the Mechanical Training Establishment, to Halifax, N.S., where he occupies the same position.

H. O. Brown, M.E.I.C., has recently accepted a position with Massey-Harris Limited at Toronto. He was previously with Ste. Anne Paper Company at Beaupré, Que.

H. C. Anderson, M.E.I.C., who was lately district engineer for the Department of Public Works of British Columbia at New Westminster, B.C., is now assistant chief engineer of the Department at Victoria, B.C.

C. K. McLeod, M.E.I.C., has recently been elected managing director and appointed chief engineer of Walter Kidde & Company of Canada Limited. He has been associated with the company since 1925 in charge of engineering and sales in Canada. He was instrumental in the establishment, in June, 1941, of the Company's factory in Montreal, where fire protection products are manufactured for the aircraft and allied industries.

Mr. McLeod retains his connection with Permutit Company of Canada Limited, having been their engineering representative in the provinces of Ontario, Quebec and the Maritimes for a number of years.

where his work brought him into relation with Quebec Power Company engineers. In 1930 he was invited to go to Quebec as assistant superintendent of that division. In 1937 he was appointed superintendent of that division and in 1939 he became assistant general superintendent of the company.

Last year he resigned his position with Quebec Power Company upon his appointment as Director of the new department of electrical engineering which was being established at Laval University. He had been lecturing at Laval University, in the Mining and Metallurgical Department, for the two years previous.

Rodolphe Dubuc, M.E.I.C.

C. K. McLeod, M.E.I.C.

René Dupuis, M.E.I.C.

Rodolphe Dubuc, Affl.E.I.C., has been appointed to the City Council of Montreal, representing the Canadian Manufacturers' Association. Mr. Dubuc is assistant tax agent in the property and tax department of Shawinigan Water & Power Company which he joined in 1926 as a draughtsman. He is a graduate of McGill University and University of Montreal.

R. A. Campbell, M.E.I.C., is assistant superintendent and production engineer with R. Melville Smith Company Limited, project managers, Canadian-Alaska Highway, at Fort Saint John, B.C. He was previously supervisor of forest operations with the Government of Ontario at Toronto.

D. M. Dunlop, M.E.I.C., has been transferred to Kenora, Ont., as assistant superintendent of the Canadian Pacific Railway Company. A graduate in civil and electrical engineering from the University of Manitoba, he joined the Canadian Pacific Railway in 1936 as an instrument man. Lately he had been stationed at Ignace, Ont.

W. E. S. Dyer, M.E.I.C., consulting and designing engineer, has opened an office in Buffalo, N.Y., besides carrying on practice in his Canadian office, at Toronto. Since 1902, Mr. Dyer has been engaged in the designing, construction and installation of power plants and factory equipment in Canada, the United States and Europe. One of his recent projects was the design of the new power plant of the Algoma Steel Company at Sault Ste. Marie, Ont.

René Dupuis, M.E.I.C., is the new elected Chairman of the Quebec Branch of the Institute. He is Director of the Department of Electrical Engineering at Laval University.

Mr. Dupuis began his engineering education at McGill University, Montreal, and completed his course at Nancy, France, where he obtained his diplomas in Mechanics and Physics. He also studied Political Economy. Returning to Canada, Mr. Dupuis was employed for two years by the Canadian Westinghouse Company, Hamilton, Ont. From 1928 to 1930, he was employed in the repair shop of the Shawinigan Water & Power Company at Trois-Rivières,

J. E. Goodman, M.E.I.C., has recently joined the McNamara Construction Company Limited of Toronto as a construction engineer. He was previously a county road engineer at Kingston, Ont.

C. V. Dunne, Jr.E.I.C., is now resident engineer with the Naval Service of the Department of National Defence at Sydney, N.S. He was previously construction engineer with E. B. Eddy Company, Hull, Que.

R. C. Robson, Jr.E.I.C., has left the staff of Bloedel, Stewart & Welch Limited, at Trail, B.C., to join the British Columbia Electric Railway Co. Ltd., at Vancouver, B.C.

Sydney M. S. Dunne, Jr.E.I.C., is on the staff of Defence Industries Limited at Jean Brillant, Que. He is a graduate of the University of Toronto, in the class of 1940.

P. R. Martin, S.E.I.C., has left the St. Maurice Power Corporation Limited, LaTuque, Que., to join Electric Steels Limited at Cap de la Madeleine, Que.

VISITORS TO HEADQUARTERS

Léon Dancose, S.E.I.C., Division Engineer, Office, Canadian National Railway, Levis, Que., on December 12th.

S. W. Gray, M.E.I.C., Wartime Bureau of Technical Personnel, Halifax, N.S., on December 15th.

T. A. McElhanney, M.E.I.C., Forest Products Laboratories, Department of Mines, Ottawa, Ont., on December 22nd.

Capt. V. R. Davies, M.E.I.C., Royal Military College, Kingston, Ont., on December 23rd.

Lieutenant J. P. Leroux, Montreal, on December 23rd.

Lucien Allaire, Jr.E.I.C., Provincial Highways Department, Metabetchouan, Lake St. Jean, on December 23rd.

J-Ovide Couillard, Affl.E.I.C., field engineer, Bell Telephone Co. of Canada Limited, Quebec, on December 28th.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

FRANK DAWSON ADAMS, Hon.M.E.I.C.

Among the eminent persons who have been elected Honorary Members of the Engineering Institute of Canada, Dr. F. D. Adams was notable as a man of science, educator, philanthropist, and churchman. He died at his home, in Montreal, on December 26th, 1942. Much of his geological work—especially that done for the Geological Survey of Canada and his later research work on the flow of rocks—had direct bearing on the work of the engineer. His term of office as Dean of the Faculty of Applied Science at McGill showed his grasp of the many problems of engineering education. He gave active support to organizations for social and religious service, particularly in connection with unemployment, the Boy Scouts, and the Y.M.C.A.; he was the author of a History of Christ Church Cathedral, in

Frank Dawson Adams, Hon.M.E.I.C.

Montreal, the church to which he was so devoted and where his funeral service was held.

Frank Dawson Adams, PH.D. (Heidelberg), D.Sc. (McGill), F.R.S., Emeritus Professor of Geology at McGill University, was born in Montreal in 1859. He was educated at Montreal High School and at McGill University, studying also at Yale, Heidelberg and Zurich.

He joined the staff of the Geological Survey of Canada in 1880, and returned to McGill nine years later as lecturer in Geology. In 1893 he was made Logan Professor of Geology on the retirement of Sir William Dawson. He became Dean of the Faculty of Applied Science (Engineering) in 1908, vice-principal in 1921 (when Sir Arthur Currie became principal) and Dean of the Faculty of Graduate Studies in 1922, holding the two posts concurrently. He retired from active University work in 1924.

A complete list of his degrees, honours and appointments would be a very long one. Among them may be mentioned: Fellow of the Geological Society (London, 1895), Fellow of the Royal Society (London, 1907), president Canadian Institute of Mining and Metallurgy (1910-12), president Royal Society of Canada (1913), president Geological Society of America (1918). He was an honorary member of the Institution of Mining and Metallurgy (London), The American Institute of Mining and Metallurgy and of the Engineering Institute of Canada; six universities conferred doctorates upon him.

During 1918-19 he was deputy director of the Educational Department of the Canadian Expeditionary Force, with the rank of lieutenant-colonel and rendered enthusiastic service in the rehabilitation of Canadian soldiers.

A geologist of world-wide reputation, his long career at

McGill University brought him into contact with six principals of the university and many generations of students. In the words of Principal Cyril James, "many of those he met during six decades of university life have been privileged to know him as a friend whose wisdom of counsel was equalled by his personal charm."

The community in which he lived, and the country of his birth, will not soon forget his many contributions to their welfare, and the quiet unobtrusive way in which these services were rendered.

Dr. Adams was elected Honorary Member of the Institute on October 23rd, 1917.

Rex Elmer Buckley, M.E.I.C., died at Glen Ferris, West Virginia, on October 1st, 1942, after an illness of two months. He was born at Niagara Falls, Ont., on November 17, 1889, and received his engineering education at Valparaiso University, Indiana. In the first years of his career, he was engaged in municipal engineering and hydroelectric power development at Niagara Falls. From 1914 to 1916 he worked on the construction of the Welland ship canal. In 1916 he joined the staff of the Canadian Niagara Power Company of Niagara Falls and remained with the firm for several years.

Later he went to the United States where he was engaged in the construction of power developments. In 1928 he was in charge of construction for the New Power Company at Glen Ferris, West Virginia, where he was still located at the time of his death.

Mr. Buckley joined the Institute as an Associate Member in 1919 and he became a Member in 1940.

John Herbert Jackson, M.E.I.C., died at his home in Toronto on September 25, 1942. He was born at Windsor, Ont., on January 30, 1878, and was educated at Windsor Collegiate Institute, and at the School of Practical Science, University of Toronto. He served an apprenticeship, for three years, in the office of the city engineer, at Windsor, Ont. In the early years of his career, he was employed in the office of the late Brigadier-General C. H. Mitchell, at Niagara Falls, Ont., on municipal work and hydraulic investigations. From 1903 to 1908 he held the position of city engineer at Niagara Falls. In 1908 he became superintendent, and later chief engineer and general manager, of what is now the Niagara Parks Commission. Under his guidance this park project grew and expanded until it embraced a series of parks from Lake Erie to Lake Ontario, joined by a Government-owned highway along the whole length of the Niagara River, and known as the Niagara River Parkway. Following his retirement in 1934, he took up residence in Toronto.

Mr. Jackson joined the Institute in 1899 as a Student, transferring to Associated Member in 1905. He became a Member in 1932.

John George MacKinnon, M.E.I.C., died in the hospital at Montreal on October 19, 1942. Born at Underwood, Ont., on October 19, 1884, he received his engineering education at the University of Toronto where he graduated in 1909. During the early years of his career he was employed on railway location in the Canadian West, and from 1912 to 1914 was resident engineer for the Canadian Northern on construction of the line through the Yellow Head Pass. In 1915 he engaged in private practice and was also retained by the Department of Public Works, Government of Alberta, as roadway engineer for the constituencies of Stettler and Coronation. From 1916 to 1919 he served overseas as a lieutenant in the 3rd Battalion, Canadian Railway Troops. After his return to Canada he was associated with the firm of Parsons-Ed, Limited, on the construction of the hydroelectric power installation at Grand Falls, N.B. Later, he returned to private practice. A few months before his death he was appointed chief engineer at No. 31 Personnel Depot, R.C.A.F., Moncton.

Mr. MacKinnon took an active interest in public affairs.

John George MacKinnon, M.E.I.C.

He was secretary of the local Board of Trade and a past chairman of the Moncton Branch of the Institute.

He joined the Institute as an Associate Member on March 25, 1925. In 1940 he became a Member.

William Henry Souba, M.E.I.C., died at Minneapolis, Minn., on September 23, 1942. He was born at Hopkins, Minn., on June 6, 1884, and received his education at the University of Minnesota where he graduated as a mechanical engineer in 1909. From 1910 to 1912 he was engaged on grain elevator construction as mechanical draftsman and designer with Barnett & Record Company at Minneapolis. In 1912 he came to Canada at Fort William, Ont., in a

similar capacity with Barnett, McQueen Company Limited. In 1914 and 1915 he worked as an assistant engineer for the Board of Grain Commissioners of Canada at Saskatoon, Sask., Calgary, Alta., and Vancouver, B.C. In 1916 he joined the staff of Mr. C. D. Howe at Port Arthur, Ont. The following year he became a partner in the firm of C. D. Howe & Company, consulting engineers. In 1933 he returned to Minneapolis, Minn., where he resided at the time of his death.

Mr. Souba joined the Institute as a Member in 1922.

Frederick Stanley Walton, M.E.I.C., died suddenly at Prince Rupert, B.C., on October 18, 1942. He was born at Hull, Eng., on June 12, 1888, and received his education in the local schools.

He began his engineering career with the Grand Trunk Pacific Railway in Saskatoon, in 1911, and was there until August, 1914, when he enlisted at the outbreak of the Great War. He was made prisoner of war in April, 1915, and made several unsuccessful attempts to escape until the Armistice.

In May, 1920, he resumed service with the railway as an instrumentman on the Smithers Division. In 1925, he was promoted to be a roadmaster at Smithers and in October, 1926, he was transferred to the same position at Prince Rupert, B.C.

In the past year Mr. Walton had been particularly active owing to developments resulting from the war and at the time of his sudden death he was directing operations on the clearing of an obstruction on the line.

Mr. Walton joined the Institute as a Junior in 1911, transferring to an Associate Member in 1926. He became a Member in 1940.

News of the Branches

BORDER CITIES BRANCH

J. B. DOWLER, M.E.I.C. - *Secretary-treasurer*

The monthly dinner meeting of the Border Cities Branch was held at Windsor on November 27th 1941, at 6.30 p.m. Thirty-three members and guests were present.

After dinner, the chairman, H. L. Johnston, introduced P. E. Adams, the chairman of the branch committee on "Structural Defence Against Bombing." Mr. Adams reported on the activities of the committee both in the branch and at headquarters and announced that he would be available for consultation with anyone who wished to review the notes of the Professor Webster lectures. He also exhibited copies of the Institute booklet "Structural Defence Against Bombing" and reviewed the contents. He announced that the booklets were for sale to the public and also that T. H. Jenkins of Windsor had been very active in the preparation of the material.

G. G. Henderson then introduced the speaker of the evening, W. R. Stickney, welding engineer of the Canadian Bridge Company.

The subject of Mr. Stickney's address was **Electric Arc Welding**—a general review of the metal arc industry to-day. The address was illustrated by sound and colour films entitled "The Inside of Arc Welding" shown by Mr. Wilson of the Canadian General Electric Co.

Mr. Stickney introduced his subject by saying that at the time of the last war, arc welding was merely a convenient or makeshift method of making repairs or fastening small parts to structures, whereas to-day welding is one of the major production method for vital war materials.

There are three major types of fusion welding, that is welding which does not require pressure, namely, electric arc welding, thermite welding and oxy-acetylene welding. The former only was discussed in the paper.

Originally, all arc welding was done with bare electrodes but it is only because of the development of electrode

Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

coating that a.c. welding and the welding of high tensile alloy steels are made possible. The speed of modern welding would be impossible without this development.

In the choice of arc welding equipment for any installation, we must consider the following alternatives; either direct or alternating current; manual or automotive equipment, single or multiple operator outfits power from a transformer or motor-generator set, and many other factors.

The training of the welding operator must be very carefully conducted. Most welding schools try to instruct in the fundamentals but the operator must be further trained on the job in the particular methods of welding to be used. The great number of variables which enter into every job must all be considered and mastered. Usually an operator will become reasonably efficient after 4 to 6 months time.

Mr. Stickney concluded his address with a short résumé of the recent developments in this field.

After the discussion period, J. F. Blowey moved a vote of thanks to the speaker.

The meeting adjourned at about 10.30 p.m. on motion of W. P. Augustine.

HALIFAX BRANCH

S. W. GRAY, M.E.I.C. - *Secretary-Treasurer*
G. V. ROSS, M.E.I.C. - *Branch News Editor*

The annual meeting of the Halifax Branch was held on December 17, at the Halifax Hotel. Percy Lovett, retiring chairman, reviewed the activities of the past year and S. W. Gray, secretary-treasurer, gave the financial report. The Halifax Branch has grown in recent years until it is now the fourth largest in Canada, having 191 resident and 90 non-resident members.

The new executive officers elected were Prof. A. E. Flynn,

chairman; K. L. Dawson, L. E. Mitchell, and C. V. Duff, resident; and R. B. Stewart, New Glasgow, and John Clarke, Bridgewater, non-resident.

When Prof. Flynn had taken over the chair, he introduced the speaker, Mr. R. L. Dunsmore, of the Imperial Oil Co. Mr. Dunsmore showed a film and gave a talk on the three new pre-load concrete oil storage tanks recently constructed here. These tanks are 130 feet in diameter, 42 feet high with a dome roof and have 100,000 barrel capacity. Last November, Mr. Walsh, chief engineer of the Gunite and Waterproofing Co. Ltd., spoke to the branch on the design and construction of the tanks they then proposed to build, and Mr. Dunsmore's folk and film provided an interesting follow up now that construction has been completed. Several changes were made during the construction period, as these are the first tanks of this type to be used for petroleum products, and the designers and builders had to feel their way along.

Sixty-three members and guests were present.

KINGSTON BRANCH

[R. A. Low, M.E.I.C. - *Secretary-Treasurer*

The Kingston Branch opened its winter programme on November 10th, at which the guest speaker was Professor J. C. Cameron, Head of the Industrial Relations Section, Queen's University. Professor R. A. Low acted as chairman for the meeting, and introduced the speaker.

Professor Cameron made it quite clear that any study of the problems of industrial relations must proceed primarily from the standpoint of management. This is because problems of procedure in handling human relations are essentially problems of managerial technique. To be complete the analysis must attempt to the worker the difficulties of management, and to management the difficulties of the worker. It must, moreover take cognizance of the larger social interests which impinge at various points on equitable relations in industry and business.

In an interesting discussion period, the speaker emphasized that the economic organization of a country is a means to an end rather than an end in itself. That end is dominantly social: the enrichment of human life through the satisfaction of natural wants and desires. From a social point of view, the achievement of that end through the exploitation of the workers is undesirable and unjustifiable.

Following the meeting the election of officers took place.

OFFICERS FOR 1943

<i>Chairman</i>	K. M. Winslow, M.E.I.C.
<i>Vice-Chairman</i>	S. D. Lash, M.E.I.C.

LONDON BRANCH

H. G. STEAD, Jr., M.E.I.C. - - - *Secretary-Treasurer*
A. L. FURANNA, Jr., M.E.I.C. - - - *Branch News Editor*

The last regular meeting of the year, held on Monday, December 7th, was occasioned by President C. R. Young's visit to the branch. Prior to the meeting the president was entertained by the branch members at a private dinner in the Hotel London.

After being introduced to the meeting by Mr. J. A. Vance, the president spoke on the Institute's activities during the past year. The first problem facing the Institute was to determine whether or not it should remain active during the war. However, it was decided that the Institute would carry on as usual and it may now be seen that the

achievements of the past year alone have justified that decision.

President Young outlined the purpose of the Institute under three headings, namely the preparation of scientific papers, the encouragement of interest in engineering activities and the promotion of the engineer's welfare. Under Mr. H. F. Bennett's Committee on the Young Engineer a book was published for the guidance of prospective engineer students. This book has been distributed to the high schools and technical schools. Besides, the branches have selected a committee who will make themselves available to students seeking advice as to their desire of a career in engineering. Also a manual was published for the guidance of these counselling committees.

The war has given rise to several special activities. The Institute has published an abridgment of the lectures given by Prof. Webster, Deputy Chief Engineer for the Ministry of Home Security in England. This book is now being distributed throughout the Civilian Defence Committees. Members of the branches have also become local technical advisers to the C.D.C. on engineering problems. Another committee deals with the problems of structural defence against bombing, the repair of engineering works and the protection of existing and future plants against bombing.

The Institute is very much concerned with the reconstruction programme after the war. Mr. W. C. Miller is chairman of a committee on Post-War Problems. It will be the duty of this committee to help evaluate engineering projects put forth for government consideration. Another committee is studying the problems of Industrial Relations.

The president expressed his confidence for the future. He said that great reserves were being created by the war and that great quantities of material would be required. As shining examples of this he pointed out the tremendous requirements of the railways and city water and sewage systems. Besides this, he predicted that many new lines would be developed out of war research efforts and that great new industries would be carried on in Canada after the war.

Finally, Dean Young declared a fear that the vast numbers of technologists developed by the war would create a severe problem. He advised that there is a need for a professional outlook rather than that of the technologist, the basic difference between them being that the engineering profession as such has a knowledge of the art with a firm realization of its professional trusteeship.

President Young was thanked for his address and visit by Mr. E. V. Buchanan. A number of his former students also took the opportunity of expressing their pleasure in being able to see and hear him again.

MONCTON BRANCH

V. C. BLACKETT, M.E.I.C. - *Secretary-Treasurer*

On November 11th a combined meeting of the Moncton Branch and the Engineering Society of Mount Allison was held in the Science Building of the University at Sackville. James Fraser, president of the Engineering Society, was in the chair. A series of Canadian General Electric technicolour sound films, entitled "The Inside of Arc Welding", were shown. The following evening, November 12th, the films were screened at a branch meeting in Moncton. H. J. Crudge, chairman of the branch, presided. The meeting was open to the public, and, in addition to Institute members, a number of railway welders and vocational school pupils were in attendance.

MONTREAL BRANCH

L. A. DUCHASTEL, M.E.I.C. - *Secretary-Treasurer*
WILLIS P. MALONE, M.E.I.C. - } *Branch News Editors*
W. W. INGRAM, S.E.I.C. - - }

Through the courtesy of the Dominion Bridge Company Limited, a visit was made to their Lachine plant on October 29th, by about 350 members.

The trip was particularly interesting in view of the work that is being carried on in the plant at the present time.

Operations such as forging, union melt welding, heavy forming of heads for Scotch marine boilers, frame bending and prefabrication for ship construction, were in progress. The mold loft, where templates are made for the fabrication of ships' plate, and the various furnaces used in bending and forming work proved of special interest.

After the tour through the plant, refreshments were served.

Transportation to and from the plant was provided through the kindness of the Montreal Tramways Company.

Industrial Democracy and Its Survival was the topic of an address given by P. Ackerman, on November 5th.

The industrial age in which we live, where machine power has gone so far to replace manpower, has introduced social and economic problems that must be solved if industrial democracy is to survive. A plan was presented to solve these problems by assuring equity in "duties of all" and in "benefits for all" which would lead to ever-growing maximum security, comfort and freedom to all. The alternative is "industrial anarchy," with outcast and privileged classes, resulting in discontent, unrest, class war and leading to perpetual insecurity, want and human slavery.

The goods that are required by man can be produced by a fraction of the population. Therefore, some means must be used to avoid having superfluous labour, or as we usually call it—unemployment. The proposed plan would take care of the situation by the retirement of everyone at an early age, with their future secured by means of a national mutual retirement insurance. All workers would be taxed for the purpose during their working years and all would receive at least an adequate pension for life on retirement. Workers would not be compelled to retire on attaining the normal retirement age, but there would be no advantage in their working beyond it.

Provision is made for sickness, accident and disability insurance, for rehabilitation after the war, for retirement of the national debt, for a revised monetary system, for foreign trade, and for economic and social needs.

The plan promises economic freedom and social security by means of a "healthy national reorganization of industrial society."

The discussion lasted about an hour and showed a keen interest in the subject. It culminated in the voting of a resolution that the Montreal Branch ask Council to create a committee to study the subject further. Mr. Duchastel pointed out that there already is a committee on post-war reconstruction to which the matter might be referred. The question was left for Council to decide.

Mr. H. E. Ziel, head of the ventilating and air conditioning staff of Albert Kahn, Associated Architects and Engineers, Inc., Detroit, gave a lecture on November 12th, his subject being **Ventilating Buildings Manufacturing War Equipment**.

The aircraft factory of to-day is a vast building of one storey and basement. One such building covers 47 acres. For purposes of fire protection these plants are divided into sections of 350,000 square feet with fire walls between.

Air-conditioning is designed to provide cleanliness, controlled temperature and humidity, and the movement of air, and is a necessity in these plants where the use of various metals with different co-efficients of expansion demands a maximum temperature of 85 deg. F.

The fans are placed on the roof; wooden ducts six feet square are used with branches running down. In aircraft plants the discharge is usually made at floor level, the air being delivered at high temperature and high velocity. The work centres around the fuselage and the workers are far enough away from the duct outlets that they suffer no discomfort. In other plants, the conditioned air is dis-

charged at an angle just below the roof, with enough velocity to cause circulation. Practically all heat loss of these buildings occurs through the roof.

The entrances of the buildings lead to the basement and the employers reach their work by nearby staircases, without disturbing operators of the previous shift by parading along the ground floor. The basements are also used for locker and wash rooms, cafeterias and kitchens, and recreation rooms.

The meeting of November 26th was devoted to the subject of **Manpower Control and Employer-Employee Relations**. L. Austin Wright spoke on the manpower control features of National Selective Service and Mr. Douglas B. Chant described the work that is being done with respect to employer-employee relations.

Mr. Wright outlined the restrictions on seeking employment and on hiring employees under the Selective Service programme. The restrictions are designed to keep selective service officers informed as to available labour, and as to the requirements for labour, so that workers can be placed where they are needed most. A great effort is made to provide men with employment in the district in which they live and thus eliminate unnecessary movement of workers about the country. At times, however, it is necessary to transport labour to locations where the demand is expanding rapidly and the local supply is exhausted.

Speaking of the expansion in personnel since the Unemployment Insurance offices were taken over by the Selective Service last spring, Mr. Wright stated that the number of offices had increased from 115 to 210 and the Selective Service staff from 2,500 to 4,000. Great care is exercised in the choosing of Selective Service officers because of the responsibility and authority vested in them. Each Selective Service officer has full responsibility for the operation of the programme in his area.

With reference to employer-employee relations, Mr. Chant said that the troubles between management and labour are usually the result of misunderstanding and that a lot of the difficulty can be avoided by establishing a definite company policy, preferably in writing, and by instituting a joint labour-management agreement committee. The tendency to-day is for labour to take the initiative and demand these committees.

Mr. Chant made certain recommendations regarding these committees, namely, that management and labour be equally represented, that labour representatives be below the grade of foreman, that democratic elections be held with representation by departments or other suitable divisions, that powers be advisory and recommendatory only, that a committee cover one plant only with separate committees for other plants of the same company, that there be no third party, that wages and hours of service not be dealt with, that if any machinery already exists for handling grievances the committee not enter that field.

In the discussion that followed, the questions of how to deal with absenteeism and loafing on the job were raised. It was suggested that these could be minimized by pointing out to the employee the importance of his work with relation to that of the other employees and the effects on production if he is not on the job. Persistent cases can be classed as "serious misconduct" and the employer may dismiss the employee in such cases without the usual seven day's notice.

On Thursday, Dec. 3rd a paper on **Design, Manufacture and Installation of 120 kv. Oil-Filled Cables in Canada**, was presented by Messrs. D. M. Farnham of the Montreal Light, Heat & Power Cons. and O. W. Titus of Canada Wire & Cable Company.

In the first section of the paper, Mr. Farnham spoke on the design of the system involved. Due to the load carried by the medium tension ring and the transformers installed,

it was impossible to carry power for any interconnection work. It was therefore necessary to choose a high tension line to act as a tie between two large transmission systems. As an overhead line would be rather long and considerable right-of-way would be required, it was most economical to use an underground oil-filled cable system. The duct line was laid to give the straightest line possible and also the most suitable contour for the cable so as to reduce as much as possible, oil pressures within the cable.

In the second section of the paper, Mr. Titus spoke on the manufacture and installation of the cable. He outlined briefly the construction and theory of solid type cable which has no central oil channel and is impregnated with a viscous petroleum compound. Under load the cable sheath expands and upon cooling small voids are formed due to the contraction of the compound. Ionization takes place in these low pressure areas and may finally cause cable breakdown. In the oil-filled cable the impregnant is a fluid oil and the cable has a hollow core which allows the oil to flow in the cable core. Thus under load the oil expands as in a solid type cable and, on cooling, the oil which is under pressure flows along the cable core and prevents the formation of voids. The life of the cable is thus increased. If the oil pressure in the cable is kept above atmospheric pressure under all conditions, the cable is protected against electrical damage due to sheath punctures.

The cable lengths were kept under pressure from an oil supply even during the pulling of the cable into the ducts. All the joints were flushed with fresh degassed oil and vacuum treated to remove any contamination due to wiping operations and to remove all traces of gas. The potheads were made with connections for the oil supply as were also the stop-joints. Oil feed points were so spaced as to keep the pressure always above atmospheric pressure. The cables have been in service for some time now and data is being collected on their operation. Several slides were shown of construction and installation details of the cable.

NIAGARA PENINSULA BRANCH

J. H. INGS, M.E.I.C. - *Secretary-Treasurer*
J. W. BROOKS, Jr.E.I.C. - *Branch News Editor*

On November 26 the Branch held a dinner meeting at the Leonard Hotel, St. Catharines. Mr. J. M. Galilee, assistant advertising manager of the Canadian Westinghouse Company, was the speaker of the evening, choosing as his subject **Recent Advances in Electrical Research**. Mr. Galilee's talk was illustrated by considerable equipment, including sterilamps, ultra-violet light, luminous powders, and a rather remarkable comparison between the efficiencies of incandescent and fluorescent lighting.

At an executive meeting held immediately after, one of the main topics of discussion was the increasing prevalence of Category AA gasoline ration books among the local engineers. In a widely-scattered branch such as this, the matter assumes considerable importance as far as monthly meetings are concerned.

OTTAWA BRANCH

A. A. SWINNERTON, M.E.I.C. - *Secretary-Treasurer*
R. C. PURSER, M.E.I.C. - *Branch News Editor*

An informal discussion on P.R.P. (Production Requirements Plan) took place at a noon luncheon of the branch at the Chateau Laurier on December 17, 1942, led by G. L. Jennison of the Department of Munitions and Supply. The discussion, which was not open to the press, took the form of a few brief remarks by Mr. Jennison followed by questions from the audience, which he answered. The questions, for the most part, were based upon actual problems that had arisen amongst the members in the operation of the plan. Many of the members availed themselves of this opportunity for enlightenment on various aspects of the subject.

PETERBOROUGH BRANCH

A. R. JONES, Jr.E.I.C. - - - *Secretary-Treasurer*
J. F. OSBORN, S.E.I.C. - - - *Branch News Editor*

Branch activities for the 1942-3 season began on October 24th with a visit to the plant of Fiberglas Limited and Duplate Limited in Oshawa. About 35 persons inspected the facilities of the company and later enjoyed dinner as guests of Fiberglas and Duplate.

Mr. R. N. Fournier, industrial heating specialist, Canadian General Electric Company, Montreal, addressed the first regular evening meeting Thursday, November 5th. Mr. Fournier spoke on **Electric Heat in Industry**, a topic receiving particular attention at present in view of its importance in war industry. A full report of Mr. Fournier's paper has been made in connection with its presentation at other branches.

Nearly a hundred members and guests gathered for the 24th Annual Dinner of the Peterborough Branch on Thursday, November 26th. The meeting was addressed by Dean C. R. Young, president of the Institute and dean of the Faculty of Engineering, University of Toronto, and by Mr. K. M. Cameron, president elect of the Institute and chief engineer, Department of Public Works, Ottawa.

Branch Chairman D. J. Emery, presented a brief report on branch activities and introduced the guests. Among the latter was Louis Trudel, assistant general secretary of the Institute who commented favourably on the impression gained on his first visit to the local organization. Mayor Hamilton welcomed the guests on behalf of the city. His Worship took the opportunity to express the communities' gratitude for activities of Peterborough engineers, singling out Mr. Emery for special notice in connection with his A.R.P. duties.

Mr. A. L. Killaly introduced Mr. Cameron, tracing his outstanding career of public service.

Mr. Cameron, an ardent and effective exponent of planning for post war action, stated plainly that engineers are bearing an increasing responsibility in the war and must be prepared to carry an even greater burden in the peace to follow. He felt that Peterborough with a great engineering industry was an appropriate place for engineers to assume the lead.

Dean Young was introduced by Mr. Ross Dobbin, an early pupil of the president.

Dean Young began with general observations on the affairs of the Institute, mentioning specifically the Civil Defence Committee. He went on to define the place of the engineer in society, with attention to the training and employment of the young engineer. The president distinguished three different groups of technical men, namely, technicians, technologists and engineers. The technician possesses manual and other skills but with little, if any, theoretical background. The technologist is a person highly trained in theory and to some extent in application but in a very narrow field. The engineer on the other hand is concerned with organizational economic and managerial aspects as well as with the technical skill and knowledge of his work. He must be familiar with many sciences and must be able to relate his own ability and that of others to the problem at hand. The young man was advised to acquire a broad professional training, then specialize if the situation required it. Dean Young stressed the moral obligation the engineer owed society to serve it to the best of his ability. There is an element of trusteeship in engineering as a profession. He assured the meeting that there would be a tremendous backlog of engineering work to be done at the end of the war and that engineers will be busier than ever.

The speakers were thanked by the chairman on behalf of the meeting.

Mr. Jules Mercier assisted by Mr. Ross Dobbin led group singing. Entertainment was provided by Mr. N. Thomas of the Training Centre.

PETERBOROUGH BRANCH ANNUAL DINNER

Above: Vice-president K. M. Cameron speaks in a light vein. On his right, Chairman D. J. Emery and President C. R. Young; on his left, Immediate Past-Chairman John Cameron.

Top right: G. R. Langley, Councillor W. H. Munro of Ottawa, President Young, Past-President J. M. R. Fairbairn, Chairman D. J. Emery. In the foreground, Past Vice-President R. L. Dobbin.

Above: R. A. Elliott of Deloro, president-elect of the Association of Professional Engineers of Ontario, A. L. Killaly and Past-President J. M. R. Fairbairn.

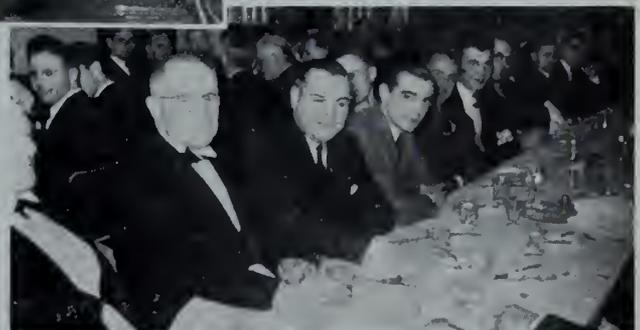

Above: A. L. Malby, former secretary-treasurer, discusses Branch affairs with President Young and Chairman Emery. In the background, John Barnes.

Left: Jules Mercier, "the life of the party," leads community singing.

The assistant general secretary, Louis Trudel, reports on Headquarters' activities.

A happy group. *From left to right:* R. L. Dobbin, Dr. M. H. Yelland, president of the Ontario Medical Association, John E. Keyes and D. Doty.

QUEBEC BRANCH

PAUL VINCENT, M.E.I.C. - *Secretary-Treasurer*

Samedi après-midi, le 12 décembre, les membres de la Section de Québec visitaient le nouvel Hôpital St-Michel Archange à Mastai. Organisée par Yvon-R. Tassé, cette visite de l'institution qu'on prétend être la plus moderne du genre dans toute l'Amérique du Nord, a grandement intéressé les ingénieurs.

L'édifice central et ses trois pavillons abritent actuellement un personnel de 4,300 personnes. Il n'y a donc pas lieu de s'étonner d'y trouver réunies toutes les particularités d'une véritable petite ville.

La façade principale mesure 600 pieds de longueur et les huit étages représentent quelque 650,000 pieds carrés de plancher. Trois autres ailes de 600 pieds chacune s'édifieront avec le temps pour former un carré autour des centrales d'électricité et de chauffage. Les quatre bâtisses sont réunies par 48,000 pieds carrés de plancher souterrain s'étendant sur une longueur de plus d'un mille.

Tout a été construit et organisé en vue de l'expansion future et les autorités n'ont rien épargné pour que l'organisation soit la plus parfaite possible à tous points de vue. L'hôpital a son usine électrique en propre. L'électricité est produite par la vapeur provenant de l'usine de chauffage. Trois chaudières, dont deux fonctionnent régulièrement, brûlent chacune environ 3,000 lb., par heure, de charbon pulvérisé amené à la chambre de combustion par des stokers pulvérisateurs. Toutes les opérations et les pressions sont mesurées automatiquement sur un tableau d'instruments de toutes sortes. La ventilation et l'air climatisé offrent aussi beaucoup d'intérêt.

La construction de l'édifice central a été l'objet d'une étude particulière de la part des membres. La structure est de béton armé et tout est à l'épreuve du feu. La chapelle, une fois terminée, pourra recevoir 2,800 personnes. Le procédé par lequel le plafond est suspendu est très remarquable. Des fils d'acier attachés aux poutres d'acier soutiennent le plafond de plâtre et ce n'est qu'en l'examinant par dessus qu'on peut constater le mode de suspension qui élimine toutes les colonnes. En regardant de l'intérieur, il nous semble que de grosses poutres soutiennent le plafond, quand, en réalité, ce n'est que soufflage.

Le théâtre, que l'on est également à terminer, a les mêmes particularités et, comme dans la chapelle, tous les murs intérieurs sont isolés au liège pour amortir les bruits et éliminer la condensation qui pourrait être néfaste aux fils d'acier. Les matériaux acoustiques y sont amplement utilisés dans ces deux endroits.

L'éclairage se fait par le système fluorescent dans tout l'édifice.

L'installation des cuisines et des garde-manger, des plus moderne, est faite avec la même perfection du détail et de l'ensemble. Les repas sont servis dans un temps minimum par un système de cafeteria qui est, sans contredit, ce qu'il y a de plus moderne dans toute la ville de Québec.

Les communications entre les départements sont nombreuses et faciles, les ascenseurs, en particulier, étant complètement automatiques.

L'appareil électrique, pour les traitements aux malades de catégorie spéciale, a retenu l'attention des visiteurs. On traite depuis un an une foule de patients à l'électricité par des méthodes moins pratiques. Des statistiques ont démontré que, sur 1,160 patients traités, on avait obtenu une guérison complète pour 60 à 70 pour cent de ce nombre.

M. Emmanuel Fournier, chef-ingénieur diplômé de l'Université de Michigan et du Massachusetts Institute of Technology a guidé les quarante visiteurs en leur donnant les explications techniques.

Le 14 décembre 1942, la section de Québec tenait son assemblée annuelle générale dans l'amphithéâtre de l'École des Mines, Faculté des Sciences de l'Université Laval, Boulevard de l'Entente.

En l'absence de Monsieur L.-C. Dupuis, président de

notre section pour 1941 et 1942, Monsieur René Dupuis présidait la réunion.

Après lecture des procès-verbaux et des rapports financiers de l'année, l'on présenta à Monsieur Cyrille Dufresne un certificat pour le prix de \$25.00 de l'Engineering Institute of Canada, qu'il avait gagné au mois de juin dernier, pour ses succès comme étudiant de troisième année en génie minier. Ce certificat lui fut remis par Monsieur A.-O. Dufresne, sous-ministre au Ministère des Mines de la Province de Québec.

En attendant le rapport des scrutateurs sur l'élection des officiers, les présidents des divers comités de la section ont présenté le rapport de leurs activités durant l'année.

Le rapport des scrutateurs fit connaître à l'assemblée que Monsieur René Dupuis était élu président de la section de Québec pour 1943. M. Dupuis est directeur de l'École de Génie Electrique récemment créée à la Faculté des Sciences de l'Université Laval de Québec.

Monsieur E. D. Gray-Donald, assistant surintendant général de Quebec Power a été élu vice-président et Paul Vincent, ingénieur en chef au Ministère de la Colonisation, secrétaire pour un autre terme.

Les nouveaux conseillers, élus pour une période de deux ans, sont MM. Gustave St-Jacques, Euclide Paré et Yvon-R. Tassé.

Après l'allocation du nouveau président M. René Dupuis qui remercia les membres du témoignage de confiance qu'ils lui faisaient en l'élisant à ce poste, l'on procéda à la formation des comités de Bibliothèque, Législation, Recrutement, Nomination, Orientation des Etudiants, Programme et Engineering Features of Civil Defence.

M. Robert Sauvage nous donna ensuite une courte causerie sur **La Théorie et les Effets des Bombes**.

Pour terminer cette soirée, les membres prirent des rafraîchissements tout en discutant avec leurs confrères.

SAULT STE. MARIE BRANCH

O. A. EVANS, J.E.I.C. - - - *Secretary-Treasurer*
N. C. COWIE, J.E.I.C. - - - *Branch News Editor*

The sixth general meeting for the year 1942 was held in the Grill Room of the Windsor Hotel on Friday, November 27th, 1942, when 28 members and guests sat down to dinner at 6.45 p.m.

The business portion of the meeting began at 8.00 p.m., with Chairman L. R. Brown in charge. The minutes of the previous meeting were read and adopted. The chairman then called upon A. H. Russell to bring in the Nominating Committee's slate of officers for the year 1943. The chairman explained to the members that they were free to nominate any other member for the executive. After a lapse of some minutes and no further names being nominated the nominations were closed.

The chairman then called upon C. Stenbol to introduce the speaker of the evening, Professor A. E. MacDonald of Manitoba University, which he did in a few well chosen words.

Professor A. E. MacDonald in his opening remarks brought greetings from the Winnipeg Branch to the Sault Branch. In his address entitled **Foundation Problems in the Winnipeg Area**, the speaker advised the members to pay particular attention to the geological structure of the land when constructing any building or edifice. Winnipeg was built on the bed of old Lake Agassiz. Great masses of powdered rock were deposited in different layers between the soil on the surface and the limestone bed rock some 60 feet below. Some of these clays contain as much as 30 per cent water and in Winnipeg these clays have been drying up due to the almost 100 per cent run off of moisture from the city streets. This drying up is not general around the building and as a consequence the clay on one side of the building may dry up and let the building sag on one end. He also quoted incidences where this dried up clay had taken moisture in again and as a result raised the floor of

the basement in humps, causing the centre beams to raise and the doors and windows jam in the household. He also informed the members that driving piles in the clay was worse than useless as the load was then distributed over a smaller area. This only aggravated the sag. There were a number of ways to overcome this problem among which were to drive pillars down to bed rock or to allow for a certain amount settlement. His address was well illustrated with slides.

A. E. Pickering in his vote of thanks said that every engineer encountered this problem in his career and that Professor MacDonald's address was full of useful information.

TORONTO BRANCH

S. H. DEJONG, M.E.I.C. - - - *Secretary-Treasurer*
G. L. WHYIE, A.F.I.C.E. - - - *Branch News Editor*

The second meeting of the Toronto Branch for the 1942-1943 season was held in Hart House, Friday, November 20th. After the regular routine business was disposed of the Branch chairman, Col. W. S. Wilson, handed the meeting over to the chairmanship of Prof. R. W. Angus, particularly in view of the latter's long association with the speaker of the evening, Mr. O. Holden, chief hydraulic engineer, Hydro-Electric Power Commission of Ontario.

Mr. Holden's paper dealt with the design and construction of the DeCew Falls power development near St. Catharines, Ont. Beginning with the early development of the district by John DeCou and other prominent pioneers in the early part of the 19th century, Mr. Holden traced the growth of water power development at this site which culminated in the existing 50,000 hp, 66 $\frac{2}{3}$ -cycle generating plant of the old Dominion Power & Transmission Co. He then depicted the various features which comprise the new 65,000 hp, 25-cycle development at DeCew Falls now under construction. The work involved in this extends from the intake from No. 3 Welland Canal at Allanburg northwards to the control and outlet works at Port Dalhousie, a distance of approximately 10 miles. Between these points lie improvements to existing water channels and storage basins, the headworks structure and the 2,000 ft. long canal in solid rock leading to it, the penstock and power house structures, the improvement in alignment of Twelve Mile Creek which forms the tailrace channel, the removal at St. Catharines of No. 2 lock on the second Welland Canal with installation of a large weir structure in the deepened and widened channel there, together with sundry minor works. Design of the various structures was described by the speaker who also briefly indicated some of the construction problems encountered. The whole lecture was illustrated by lantern slides in both black and white and colour, and was listened to with considerable interest by an audience of about 70. After some interesting discussion the meeting was brought to a close with a vote of thanks proposed by Mr. W. E. Bonn.

Surface Hardening by Induction was discussed by Dr. H. B. Osborn, Jr., Tocco Division, Ohio Crankshaft Company, Cleveland, before a joint meeting of the American Institute of Electrical Engineers, Toronto Section, and the Engineering Institute of Canada, Toronto Branch, at the Mining Building, University of Toronto, Friday, November 27, 1942.

All arrangements for this meeting were made by the Toronto Section A.I.E.E., and the chairman, D. W. Callander, presided.

According to Dr. Osborn, induction hardening was first introduced in the production of crankshafts. This successful application led to further investigation of the possibilities of the process and it is now being applied for many purposes including important items of war material.

While the exact method of operation and the equipment varies with different applications, the general principle involved is the heating of the surface layer of the metal by placing the part in a high frequency alternating field. In

practice the principal source of heat is from eddy currents which are confined largely to the surface layers of the metal when the frequency employed is high.

Induction hardening apparatus consists essentially of a source of high frequency current and a suitably designed water-cooled inductor coil. The inductor usually has holes through which water may be sprayed on the heated parts to quench it. The source of high frequency current may be a motor-generator set, a spark gap oscillator, or a vacuum tube oscillator. Good inductor design is an important factor in the successful operation of the process and in each case the inductor must be adapted to the particular parts to be treated and the area which it is desired to harden. In many cases where large numbers of similar parts are being hardened by induction, ingenious devices are incorporated to handle the parts and carry out the sequence of operation to accurate timing.

The speaker discussed the method of controlling the process according to the maximum temperature and depth of hardening desired, and the size of piece to be heat-treated. The factors varied are the electrical input, the frequency, and the length of time of heating.

Among the applications of induction hardening are the treating of gear teeth, bearing surfaces, and pins; the heating of tubes in shell production, and the brazing of nose-pieces for high explosive shells. Advantages of induction hardening are that distortion is minimized, the short heating time eliminates formation of scale and avoids grain coarsening, and mass production is possible.

The lecture was illustrated by slides showing sectional view of surface hardened materials and some of the surface hardening equipment now in use.

At the conclusion of a lively discussion, the vote of thanks was moved by W. S. Wilson, chairman of the Toronto Branch, Engineering Institute of Canada.

Glass in National Defence was discussed by C. J. Phillips, sales manager, Insulation Division, Corning Glass Works, Corning, N.Y., before the Toronto Branch, of the Institute, at Hart House, on Thursday evening, December 3rd.

After opening the meeting, Branch Chairman W. S. Wilson called upon W. H. M. Laughlin to act as chairman for the evening.

In order to provide a background for some of the newer developments in glass, the speaker pointed out that glass definitely dated back to 1500-2000 B.C. and was an early article of commerce. From 1300-1400 A.D. the secrets of glass-making were very zealously guarded in Venice but shortly after 1500 A.D. glass-making had spread through practically all the European countries. The glass industry has a long tradition of hand-working and until very recently many of the tools of glass-making were identical with those of the early Egyptians. However, within the last forty years some portions of the industry have been highly mechanized; a typical instance is a machine which will turn out 1,000 electric light bulbs a minute.

From various viewpoints glass may be defined as any one of a great variety of commercial objects (Corning makes 35,000 different glass articles), as an almost separate and distinct state of matter, or as the result of mixing, fusing and cooling of mixtures of chemicals in such a way that they do not crystallize.

Approximately 90 per cent of the glass manufactured is the basic soda-lime-silica type common in window glass, bottles, etc. Countless modifications may be made through the use of other oxides and in an average year at Corning Glass Works some 350 different kinds of glass are employed, while the company's files list tens of thousands of glass formulae.

Through such modifications, glass may be prepared in colours from clear to jet black, densities from 2.1 to 8.5, coefficients of expansion from 8×10^7 to 120×10^7 per deg. C., with a modulus of elasticity varying from 7-14 million, restivity from 10^{10} to 10^{18} , and refraction from

1.4 minimum to over 2. Great variations in chemical resistance are also experienced.

The speaker referred to the difficulty of predicting the mechanical strength to glass. Under proper conditions, glass rods drawn from the furnace and not touched save at the ends (one-quarter inch in diameter) may have a tensile strength of 140-150,000 lb. per sq. in. If a little sand is drawn over the surface of the rod, the tensile strength may drop to 25,000 lb. and with a bit of rough handling down to 10,000 lb. Very fine glass fibres which have not been touched have given tensile strength as high as several million pounds per square inch.

The heat treatment of glass, setting up compression on the outside and tension on the inside, is used in the production of baking ware, armour plate glass, and gauge glasses.

The metallizing of glass is one of the interesting recent developments. By this process a metal coating is fused tightly to glass, permitting the subsequent soldering of metal bases or other metal parts to glass articles.

Wire is being wound in grooves on glass with the threads cut to a tolerance of plus or minus 2/1000 or better. Grooves are cut in a lathe in which a revolving disc and a screw mechanism grinds the thread.

Another interesting operation is the production of precision bore tubing with inside diameter held at plus or minus 5/10,000. In order to accomplish this a glass tube is placed over a specially designed mandrel of the proper diameter. The tube is heated and a vacuum applied through the mandrel making the glass conform exactly to the mandrel. Tubing of this type is used in level indicators in aeroplanes in which a glass ball moves in the tube.

Perhaps the outstanding accomplishment described by the speaker was the development and application of 96 per cent silica glass. This type of glass is ground, suspended with a few per cent of water and slip cast in plaster of Paris moulds. This material may also be extruded or dry pressed and provides an easy means for the production of glass articles with holes which were formerly difficult to place at right angles to the direction of formation. Articles of this 96 per cent glass which are relatively fragile after casting, are fired, shrinking 15-20 per cent in the process.

This glass is playing an important part in replacing scarce stearite in certain phases of radio transmitter work.

Briefly reviewing the war uses of glass, the speaker referred to optical glass for instruments, binoculars, range finders, sights, periscopes, etc.—armour plate or bullet-proof glass for aeroplane and other uses—glass for lenses of searchlights, beacons, and signalling devices—glass for ship portholes, insulators for radio equipment, laboratory ware for industrial and medical purposes, and many other items.

Dr. T. H. Hogg, chairman of the Hydro-Electric Power Commission of Ontario, addressed a joint meeting of the Toronto Branch, Engineering Institute of Canada, and the Royal Canadian Institute, at Convocation Hall, on Saturday evening, December 5th, on the subject **Saving Hydro Power for Victory**. Prof. T. H. McIlwraith, president of the Royal Canadian Institute, presided.

In the introductory part of the lecture, Dr. Hogg pointed out that Canada entered the present war with supplies of hydroelectric power several times greater than those available at the close of the last conflict. This increase in hydroelectric power output may be traced largely to the expansion of manufacturing facilities to a point far in excess of domestic requirements, through Canada's position as the fifth exporter in the world.

The Hydro-Electric Power Commission of Ontario at the beginning of the war had a 35 per cent reserve over its primary peak load. In spite of the further extension of generating capacity, and improved co-ordination of generation and distribution, certain restrictive measures and voluntary reduction in the consumption of power are now necessary to meet this winter's heavy load.

Dr. Hogg proceeded to show pictures of two new hydro developments, the one on the Muskoka River and the other at Barrett Chute on the Madawaska River, as instances of what is being done to expand electrical output. Other slides and a motion picture served to demonstrate very clearly how important savings of electrical power could be made in the home.

Mr. W. S. Wilson, chairman of the Toronto Branch, Engineering Institute of Canada, moved the vote of thanks to the speaker.

Library Notes

ADDITIONS TO THE LIBRARY

NEW C.E.S.A. SPECIFICATIONS

The Canadian Engineering Standards Association has recently issued the following new standards.

A56—1942 Round Timber Piles:

This specification covers the material requirements only, of round timber piles to be used untreated, or treated by standard preservatives. 50c.

C77—1942 Oil Circuit-breakers:

This specification applies to both indoor oil circuit-breakers for a.c. only, having interrupting capacities of 500,000 kva or less at rated voltage and having voltage ratings of 15,000 volts or less. 50c.

C83—1942 Pole Line Hardware:

Since the publication of this specification in June 1942, the following five sets of additional drawings have been published for insertion in the above-mentioned specification. Recipients of this specification are urged to secure copies of these drawings in order to keep their specification up-to-date. 25c. a set.

Set No. 2—

- G-1 Metal pole gain
- L-1 Reinforcing link

Book notes, Additions to the Library of the Engineering Institute, Reviews of New Books and Publications

- S-2 Guy straps
- S-4 Pole bracket straps
- S-6 Storm guy strap
- S-7 Reinforcing straps

Set No. 3—

- A-1 Transformer kick arm
- B-9 Phantom transposition bracket
- G-3 U cable guards
- I-1 Break irons
- R-6 Span wire ring
- S-8 U cable guard straps

Set No. 4—

- B-8 Single point transposition bracket
- B-13 Diagonal braces
- B-14 Vertical braces
- S-9 Aerial cable support
- T-1 Guy thimbles
- T-4 Communication thread

Set No. 5—

- B-4 Extension back braces
- I-2 Pulling-in irons
- N-2 Eye nuts
- P-2 Wood thimble steel insulator pin
- P-3 Wood thimble steel insulator pins
- T-2 Wood thimble

Set No. 6—

- F-1 Crossarm pole top extension fixture
- G-5 Flat gauge

- G-6 Ring gauge
- P-4 Lead thimble steel insulator pin
- P-5 Lead thimble steel insulator pins
- T-5 Steel insulator pin lead thimble

CESA ELECTRICAL STANDARDS

The following six revised and new standards are Approved Specifications under Part 2 of the Canadian Electrical Code, the requirements of which must be met in order to obtain CESA approval of the electrical devices concerned. These standards were prepared in collaboration with interested manufacturers and industrial associations and are based on laboratory tests and record in service.

C22.2 No. 3—1942 Electrical Equipment for Oil-burning Apparatus, 2nd ed.:

This specification applies to electrical equipment for use on supply circuits of 750 volts and less in conjunction with electrically operated or electrically controlled oil-burning apparatus intended to be employed and installed in accordance with the rules of Part 1 of the Canadian Electrical Code. It does not apply to (a) oil burners intended for use on industrial process:—(b) The construction of electrical components of

oil burners (e.g. motors, controls, transformers). Due to the present restrictions on the manufacture of the type of equipment covered by this specification the "effective date of new production" will be set by the CESA Approvals Administrative Board when these restrictions have been withdrawn. 50c.

C22.2 No. 46—1942 Electric Air-heaters, 2nd ed.:

This specification applies to both portable and stationary air-heaters for potentials of 250 volts and less, designated to be employed in accordance with the rules of Part 1 of the Canadian Electrical Code. Effective as of December 31, 1942 for new production. 50c.

C22.2 No. 61—1942 Electric Ranges:

This specification which has just been issued applies to both stationary and portable electric ranges for potentials up to and including 250 volts between conductors, designed to be employed in accordance with the rules of Part 1 of the Canadian Electrical Code. The specification is applicable to general domestic and commercial purposes (e.g. in homes, restaurants and similar establishments). Effective as of October 31, 1942 for new production. 50c.

C22.2 No. 64—1942 Cooking and Liquid-heating Appliances (Domestic and Commercial Types):

This specification applies to both portable and stationary cooking and liquid-heating appliances for potentials of 250 volts and less, designed to be employed in accordance with the rules of Part 1 of the Canadian Electrical Code. It applies to toasters, waffle irons, hot-plates (table-stoves), sandwich toasters, grills, coffee makers, kettles, chafing dishes, water-heaters, doughnut cookers and similar devices. It does not apply to portable (rangerettes) or stationary electric ranges, humidifiers, stills, sterilizers or industrial heating appliances. Effective as of February 15, 1943 for new production. 75c.

C22.2 No. 72—1942 Heating and Heater Elements—Replacement Types:

This specification applies to replacement (those which are intended for general sales to the public and as such will be used in various makes of heating appliances) heating elements and heater elements for domestic heating appliances, for potentials up to and including 250 volts between conductors and designed to be employed in accordance with the rules of Part 1 of the Canadian Electrical Code. Effective as of May 15, 1942 for new production. 50c.

C22.2 No. 77—1942 Inherent Overheating Protective Devices for Motors:

This specification applies to inherent overheating protective devices for mounting in or on motors (and affected therefore, to some extent by heat from the motor) for potentials up to and including 600 volts between conductors and for motors rated at 1 hp or less, designed to be employed in accordance with the rules of Part 1 of the Canadian Electrical Code. It includes inherent overheating protective devices for both the automatic-reset type and the manual-reset type. They may be actuated by the heat from the motor alone or by a combination of the heat from the motor and the motor current passing through the device. Effective as of December 31, 1942 for new production. 50c.

Copies of these standards may be obtained from the Canadian Engineering Standards Association, National Research Building, Ottawa.

TECHNICAL BOOKS

Principles of Electronics:

Royce Gerald Kloeffler. N.Y., John Wiley and Sons, Inc., 1942. 6 x 9 1/4 in. \$2.50.

Heat:

2nd ed. James M. Cork. N.Y., John Wiley and Sons, Inc., 1942. 6 x 9 1/4 in. \$3.50.

American Diesel Engines:

Their operation and repair. E. F. Goad. N.Y., Harper and Brothers (c. 1942). \$2.75.

Ferrons Production Metallurgy:

John L. Bray. N.Y., John Wiley and Sons, Inc., 1942. 6 x 9 1/4 in. \$4.00.

Engineering Materials Machine Tools and Processes:

W. Steeds. Toronto, Longmans Green and Co., 1942. 5 1/2 x 8 3/4 in. \$4.75.

TRANSACTIONS, PROCEEDINGS

The Royal Society of Canada:

Transactions. 3rd series, volume 36, Section 5—Biological Sciences. May, 1942.

REPORTS

Ohio State University Studies—Engineering Series—Bulletin:

No. 112—Nepheline syenite in low temperature vitreous wares.

Purdue University—Engineering Experiment Station—Bulletin:

Research series No. 85—Report of the research and extension activities, engineering schools and departments for the session of 1941-42.

University of Missouri—Engineering Experiment Station—Bulletin:

No. 31—Cross-connection survey in Calhoun County, Michigan, by Edward Lee Stockton.

University of California—Department of Geological Sciences—Bulletin:

Volume 27, No. 1—A skull of bison latifrons from the pleistocene of northern California.

Cornell University—Engineering Experiment Station—Bulletin:

No. 30—The specific heats of certain gases over wide ranges of pressures and temperatures. Air, CO, CO₂, CH₄, C₂H₄, H₂, N₂, and O₂.

Quebec—Department of Mines—Division of Mineral Deposits:

Special report on the iron deposits of the province of Quebec.

St. Mary and Milk Rivers Water Development Committee:

Report on further storage and irrigation works required to utilize fully Canada's share of international streams in southern Alberta. February, 1942.

U.S.—National Bureau of Standards—Building Materials and Structures Reports:

BMS88—Recommended building code requirements for new dwelling construction with special reference to war housing:

Edison Electric Institute:

Utilization voltage standardization recommendations. A joint report of the Electrical Equipment Committee and the Transmission and Distribution Committee. E.E.I. publication No. J3, October 1942.—Boilers and Combustion 1941. A report of the Boilers and Combustion Subcommittee of the Prime Movers Committee. E.E.I. publication No. J7, October 1942.

Electrochemical Society—Preprint:

No. 83-1—The electrode position of silver on magnesium.

McGill University:

Annual report 1941-42.

Illinois Institute of Technology:

Annual report of the President for the year ended August 1942.

American Institute of Consulting Engineers:

Lesson of the last world war by Dr. James T. Shotwell with discussions.

Canada—War Time Prices and Trade Board:

Quarterly summary, July to September, 1942.

AIR RAID PRECAUTION AND CIVIL DEFENCE

The following literature has been added to the Institute Library since the last published list in the December Journal.

Office of Civilian Defence—Medical Division—Sanitary Engineering Bulletin:

No. 1—Protection and maintenance of public water supplies under war conditions. 34 pp.

No. 2—Municipal sanitation under war conditions. 26 pp.

Indiana State Defence Council—Emergency Water and Sewerage Committee:

Bulletin No. 4—Waterworks school for emergency wartime training and waterworks training course (proposed syllabus). 82 pp.

BOOK NOTES

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet the books are not in the Institute Library, but inquiries will be welcomed at headquarters or may be sent direct to the publishers.

ACCOUNTING FUNDAMENTALS

By R. E. Strahlem. Ronald Press Co., New York, 1942. 365 pp., diags., charts, tables, 9 1/2 x 6 in., cloth, \$3.50.

This textbook is intended for students in engineering and industrial schools who must acquire a knowledge of accounting fundamentals in a relatively short course. From the first, the emphasis is on accounting for manufacturing corporations, and the problems all relate to industrial companies.

AERIAL NAVIGATION (Flight Lesson Text No. 41)

By W. E. Dyer. American Technical Society, Chicago, 1942. 64 pp., illus., diags., charts, tables, maps, 9 x 6 in., paper, 75c.

The method of aerial navigation called dead reckoning is thoroughly explained in this practical text. Many diagrams and illustrations are used to depict just how the process works. Actual problems with solutions, and a set of review questions are included.

Air Raid Precautions Training Manual No. 1, 1st ed. Amended reprint, August, 1942.

BASIC TRAINING IN AIR RAID PRECAUTIONS

His Majesty's Stationery Office, London, 1942. 57 pp., illus., diags., tables, 8 1/2 x 5 1/2 in., paper, 6d. (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, 15c.)

This is the first of a series prepared by the British government to further uniform practical training of air raid precautions personnel. The present manual sets out the basic principles of personal protection against air attack and is intended to cover the first stage of training for air raid precautions workers. Protection against incendiary bombs, high explosives and gas are explained, and the elements of first aid are set forth.

AIRCRAFT SPOT AND SEAM WELDING

By G. Kuntz. Pitman Publishing Corp., New York, and Chicago 1942. 108 pp., illus., diags., charts, tables, 8 1/2 x 5 1/2 in., cloth, \$1.25.

The theory and practical operation of spot and seam welding equipment are concisely

presented in this small volume. The object is to enable the welder to understand his machine, and to provide the aircraft designer with information that will enable him to utilize these welding processes to the best advantage.

ALTERNATING-CURRENT MACHINES

By A. F. Puchstein and T. C. Lloyd, 2 ed. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 655 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$5.50.

In dealing with the various types of alternating-current machines, each topic is treated approximately in the following order: construction; discussion of operating characteristics; calculation of operating characteristics from tests; discussions and analysis of various related phenomena. The revised edition has been brought up to date by the inclusion of new methods of analysis and recent standardization practices. As in the previous edition, only steady-state phenomena are covered with a few important exceptions.

AUDELS ELECTRICAL POWER CALCULATIONS with Diagrams

By E. P. Anderson. Theo. Audel & Co., New York, 1941. 421 pp., illus., diags., charts, tables, 6½ x 5 in., fabrikoid, \$2.00.

This is a collection of practical electrical problems and their solutions. It puts special emphasis on the fundamental laws of electricity and includes the necessary mathematical formulae. Complete solutions are given for 275 electrical problems selected from the average practice of electrical men. The book is divided into two parts: direct current and alternating current, which includes the subjects of power transmission and radio circuits.

FUNDAMENTALS OF ELECTRIC WAVES

By H. H. Skilling. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 186 pp., diags., charts, tables, 9 x 6 in., cloth, \$2.75.

In this introductory study of electric waves, the principles of wave action and, in particular, the basic ideas of Maxwell's equations are presented in a way that has proved to be understandable to students. These ideas are discussed and used in simple examples in order to increase the students' familiarity with them. Physical concepts are stressed without neglecting mathematical exactness or the requirements of engineering practice.

Great Britain, Dept. of Scientific and Industrial Research.

INTERNAL COMBUSTION ENGINES

By J. A. Polson. 2 ed. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1942. 548 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$5.00.

A textbook for junior or senior students of mechanical engineering "who have had a thorough course in fundamental thermodynamics and have a fair conception of the operation of internal combustion engines." This edition has been completely rewritten and considerable new material added on cams, air cooling and the performance of aircraft engines. A new chapter on gas turbines has been added.

INTRODUCTION TO ENGINEERING ECONOMY

By B. M. Woods and E. P. De Carmo. The Macmillan Co., New York, 1942. 441 pp., illus., diags., charts, tables, maps, 9½ x 6 in., cloth, \$4.00.

This textbook for engineering students is intended as an introduction to the subject, in which the relation of such subjects as economics, accounting, statistical methods, etc., to the economy of engineering enterprises is set forth.

MERRIMAN'S STRENGTH OF MATERIALS, revised by E. K. Hankin, 8th ed.

John Wiley & Sons, New York; Chapman & Hall, London, 1942. 148 pp., illus., diags., charts, tables, 9 x 5½ in., cloth, \$1.50.

The new edition of this well-known textbook has undergone a thorough revision and rewriting. The reviser has designed it as a basic textbook for nontechnical students and mechanics, and has made it more practical than before.

OIL PROPERTY VALUATION

By P. Paine. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 204 pp., charts, tables, 9½ x 6 in., cloth, \$2.75.

This book reviews the meaning and scope of valuation in the oil business, discusses the factors which enter a valuation and describes the methods of applying these factors. The object is to show the influences other than the mere amount of oil and gas available which affect the value of a property.

(An) OUTLINE OF NAVAL ARCHITECTURE AND SHIP CONSTRUCTION, 2 Vols.

By C. L. Wright, Jr. 2 ed. rev. Graduate School, Dept. of Agriculture, Washington, D.C., 1942. Vol. 1, 145 pp.; Vol. 2, 130 pp., diags., charts, tables, 10½ x 8 in., paper, \$2.00 each Vol.

Presented entirely in outline form, this guide is intended for persons whose interests require a general knowledge of the design and construction of ships. The treatment is essentially practical, and numerical examples are fully worked out. For detailed information concerning any particular phase of the work, this outline must be supplemented by publications such as those listed on the reference page.

PAPERMAKING ABSTRACTS

Compiled by TAPPI Committee on Abstracts and Bibliography, edited by R. G. Macdonald and V. F. Waters. Published by the Technical Association of the Pulp and Paper Industry, 122 East 42nd St., New York, 1942. 270 pp., 11½ x 9 in., paper, \$2.00.

This volume provides abstracts of articles and patents relating to the manufacture and technology of pulp, paper, paperboard and paper products which have appeared during recent years. Special attention is given to foreign publications, which are abstracted very fully. Author and subject indexes are included.

PLASTICS FOR INDUSTRIAL USE, an Engineering Handbook of Materials and Methods

By J. Sasso. McGraw-Hill Book Co., New York and London, 1942. 229 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$2.50.

This manual discusses the plastics which are particularly suitable for industrial use. The comparative properties of the various types, methods of molding, the design of molds and the machining and finishing of plastic parts are described. Separate chapters are devoted to specific plastics. A directory of trade names, suppliers and molders is appended.

PRINCIPLES OF HEAT ENGINEERING

By N. P. Bailey. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 284 pp., diags., charts, tables, 9½ x 6 in., cloth, \$2.75.

The principles of heat engineering covered in this book may be considered as the minimum requirement for any engineer. The theoretical material presented is expressed quantitatively for use in the solution of engineering problems, of which a large group is included at the end of the text. The early chapters deal with general concepts, while the

later ones cover respectively such engineering topics as internal-combustion and steam engines, turbines, boilers and refrigeration.

STRUCTURAL DEFENCE AGAINST BOMBING

Engineering Institute of Canada, 2050 Mansfield St., Montreal, Canada. Oct., 1942. 56 pp., illus., diags., charts, tables, 11 x 8½ in., paper, \$1.00.

This booklet, prepared by a committee of the Engineering Institute of Canada, presents an excellent outline of methods of protection that will give citizens sufficient protection against aerial attack and will prevent undue dislocation of industrial plants and public services. The methods are based upon British experience and practices. Air raid shelters, bomb resisting structures, shelter ventilation, the protection of glass, structural protection against fire, the protection of industry and vital plant, and building design in relation to air attack are considered. There is a bibliography.

STRUCTURE AND PROPERTIES OF ALLOYS

By R. M. Brick and A. Phillips. McGraw-Hill Book Co., New York, 1942. 227 pp., illus., diags., charts, maps, tables, 9½ x 6 in., cloth, \$2.50.

This text seeks to establish the correlation among alloy phase diagrams, microstructures and properties. Special attention has been directed to the effect of industrial practices in casting, working and heat treating alloys on the application of, or departure from, theoretical principles. One hundred and thirty-six photomicrographs, with full descriptions of their origins, illustrate normal and abnormal structures of most standard alloys.

(A) SYMPOSIUM ON PETROLEUM DISCOVERY METHODS

Conducted by the Research Committee of the American Association of Petroleum Geologists, P.O. Box 979, Tulsa, Okla., 1942. 164 pp., tables, 11 x 8½ in., paper, \$1.00.

This symposium brings together the views of a large number of petroleum geologists as to the best approach to the problem of oil and gas discovery, both now and in the future.

THE STEAM LOCOMOTIVE

By R. P. Johnson. Simmons-Boardman Publishing Corp., New York, 1942. 502 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$3.50.

In this book, the first on the locomotive to be published in many years, the Chief Engineer of the Baldwin Locomotive Works has set down certain fundamentals of locomotive theory and operation. In addition, attention is paid to the economics of the steam locomotive and to comparison with the Diesel-electric variety. The book contains much of interest to designers and those concerned with railroad motive power.

(The) VANDERBILT RUBBER HANDBOOK, 8th ed., 1942, edited by J. M. Ball

R. T. Vanderbilt Co., 230 Park Ave., New York, 1942. 464 pp., illus., diags., charts, tables, 8½ x 5½ in., cloth, \$5.00.

This work brings together a large amount of technical information upon rubber, especially upon compounding for various purposes and upon testing methods. Both dry rubber and latex are discussed.

WHAT THE CITIZEN SHOULD KNOW ABOUT SUBMARINE WARFARE

By D. O. Woodbury. W. W. Norton & Co., New York, 1942. 231 pp., woodcuts, charts, 8½ x 5½ in., cloth, \$2.50.

A nontechnical account of the development of the submarine and its uses, and of the measures developed against it. The author tells something of the history of the submarine and the torpedo, describes the life and training of submarine crews, and analyses submarine warfare from 1914 to date.

(Continued on page 53)

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

FOR ADMISSION

December 30th, 1942.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the February meeting.

L. AUSTIN WRIGHT, General Secretary.

*The professional requirements are as follows:—

A Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

BJARNASON—BARNEY SVEINN, of 177 Davisville Ave., Toronto, Ont. Born at Cold Springs, Man., July 25th, 1906; Educ.: B.Sc. (E.E.), Univ. of Man., 1931; Summers: 1927, '28, '30, and 1931-32, Dept. of Highways, Prov. of Man.; Surveying and gen. engng., 1933-35, Vanson Manitoba Gold Mines Ltd., and 1936 (May-Dec.), Ardeen Gold Mines Ltd., Kashabouine, Ont.; 1937-42, with Hans Lundberg Ltd., Toronto, geophysicists and geologists. I/c of laboratory, directing development and constrn. of various geophysical instruments for field exploration work; at present, test engr. radio insp. and test dept., Research Enterprises Ltd., Leaside, Ont.

Employment Service Bureau

NOTICE

Technical personnel should not reply to any of the advertisements for situations vacant unless—

1. They are registered with the War-time Bureau of Technical Personnel.
2. Their services are available.

A person's services are considered available only if he is—

- (a) unemployed;
- (b) engaged in work other than of an engineering or scientific nature;
- (c) has given notice as of a definite date; or
- (d) has permission from his present employer to negotiate for work elsewhere while still in the service of that employer.

Applicants will help to expedite negotiations by stating in their application whether or not they have complied with the above regulations.

LIBRARY NOTES

(Continued from page 50)

POSTWAR PLANNING IN THE UNITED STATES

By G. B. Galloway. *Twentieth Century Fund, New York, 1942. 158 pp., tables, 9 x 6 in., paper, 60c.*

This report summarizes the activities, personnel and publications of the various agencies engaged in research upon the economic and social problems that will face us when the war ends. A considerable bibliography is appended.

PRINCIPLES OF EMPLOYMENT PSYCHOLOGY

By H. E. Burt. Harper & Brothers, rev. ed. *New York and London, 1942. 568 pp., diags., charts, tables, 9 x 6 in., cloth, \$4.50 trade ed.; \$3.75 school ed.*

An interesting, readable presentation of the principles of psychology and of their application in the selection and training of business and industrial personnel. Mental and trade tests are described. The book can be used as a textbook or by business men for reference. The new edition has been completely rewritten.

PRIVATE PILOT'S HANDBOOK

By A. G. Norwood. *Pitman Publishing Corp., New York and Chicago, 1942. 258 pp., illus., diags., charts, maps, tables, 9 x 5½ in., cloth, \$2.50.*

This book aims to provide in a single volume the information necessary to prepare for the examination for a certificate as a private pilot of aircraft. The elements of flight theory, meteorology, aerial navigation, the use of radio, the civil air regulations and the test flight are considered. Typical examination questions are appended.

ROADWAY AND RUNWAY SOIL

MECHANICS DATA, *Permanency of Clay Soil Densification. (Engineering Experiment Station Series No. 67, School of Engineering)*

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.

MINING, METALLURGICAL OR CHEMICAL ENGINEER for aluminum plant at Arvida. Industrial smelting or mining experience for experimental and technical work and supervision in remelt and shipping departments. Apply to Box 2599-V.

MECHANICAL ENGINEER for Arvida, Que., to take charge of repair and maintenance of equipment, ordering spare parts, etc. Apply to Box No. 2605-V.

CHEMICAL, MECHANICAL OR CIVIL ENGINEER for Arvida, Que. Supervision of operations and labour in alumina plant. Apply to Box No. 2606-V.

CHEMICAL ENGINEER for Arvida, Que., to assist in the supervision of operations and labour in the aluminum fluoride plant. Apply to Box No. 2607-V.

DRAUGHTSMAN for La Tuque, Que., experienced in equipment installation to take charge of engineering work. Apply to Box No. 2608-V.

CHEMICAL ENGINEER for Arvida, Que. Assist in supervision of process control of precipitation department. Apply to Box No. 2610-V.

JUNIOR ELECTRICAL ENGINEER OR DRAUGHTSMAN for Arvida, Que. Two or three

years experience, for work on draughting or design combined with usual engineering office work. Apply to Box No. 2612-V.

RESEARCH ANALYST for Kingston, Ont. Analytical work in conjunction with research work carried on at aluminum laboratory. Apply to Box No. 2613-V.

SITUATIONS WANTED

ENGINEER, M.E.I.C., A.M.I.Mech.E. Available for essential responsible position. Apply to Box No. 704-W.

ENGINEERING MANAGER, B.A.Sc., M.E.I.C., Registered Professional Engineer, Canadian, married, 20 years' thorough experience in industrial management; mechanical and electrical construction and development, production planning, precision manufacturing, very well versed in organization methods. At present in complete charge of an extensive programme now nearing completion by a large company of designers formed in Toronto about a year ago. Really responsible position with well-established company desired. Available immediately. Will go anywhere. Apply to Box No. 2437-W.

By H. C. Porter. *Texas Agricultural and Mechanical College, College Station, Texas, 1942. 121 pp., illus., charts, tables, 9 x 6 in., paper, gratis.*

This bulletin on the permanency of clay soil densification is the first of a series of eleven which are to deal with soil mechanics. The experimental procedures used in determining the data are described, the results are discussed, and a synopsis of the conclusions reached is given. Both tables and graphs are used in presenting the numerical results.

READING ENGINEERING DRAWINGS

By G. F. Bush. *John Wiley & Sons, New York; Chapman & Hall, London, 1942. 60 pp., illus., diags., charts, blueprints, 11½ x 9 in., linen, \$2.00.*

This book has for its object the teaching of the reading of engineering drawings and of their reproductions in a clear, brief and systematic manner. Only those basic ideas common to all branches of the subject are introduced, and the important branches of airplane drawing, machine drawing and structural drawing are treated in detail. Actual working drawings are provided as examples.

REPORT OF THE RESULT OF THE INVESTIGATION INTO THE WORKING OF THE FINANCIAL PROVISIONS OF THE AIR RAID PRECAUTIONS ACT, 1937, under Section 10 of that Act, presented by the Secretary of State for the Home Department and Minister of Home Security to Parliament by Command of His Majesty, May, 1942.

His Majesty's Stationery Office, London. 4 pp., 9½ x 6 in., paper (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, 05c.).

The Air Raid Precautions Act, 1937, provided that a percentage of the approved expenditure of any local authority would be paid by the British National Exchequer.

Certain revisions in these payments are indicated in this report.

SHORT COURSE IN SURVEYING

By R. E. Davis and J. W. Kelly. *McGraw-Hill Book Co., New York and London, 1942. 330 pp., illus., diags., charts, tables, maps, 7½ x 5 in., lea., \$2.50.*

This small book presents the essential principles and practice of elementary plane surveying, in a form useful for rapidly training rodmen, chainmen, instrumentmen and draftsmen during the present emergency. Numerous field problems are included, as well as the necessary tables.

SKILLED WORKERS FOR DEFENSE INDUSTRIES

By C. S. Slocombe. *Personnel Research Federation, Lincoln Bldg., 60 East 42nd St., New York. 79 pp., charts, tables, 12 x 9 in., paper, \$2.00.*

This pamphlet reports the results of a survey of the experience of various companies obtaining skilled labor during boom periods. Methods of hiring, upgrading and training are discussed, as well as such questions as the use of central placement offices, surveying anticipated requirements, estimating the employees capable of upgrading, selection of those to be trained and the results of training. A wide variety of methods and results is described.

SMOKE PREVENTION ASSOCIATION OF AMERICA, PROCEEDINGS, 36th Annual Convention, Hotel Statler, Cleveland, Ohio, June 2-5, 1942

Smoke Prevention Association of America, 139 N. Clark St., Chicago, Ill. 136 pp., illus., diags., maps, charts, tables, 11 x 8½ in., paper, \$1.00.

The major part of this volume consists of the technical papers presented at the convention. The topics treated include atmospheric pollution, chimney performance, fuel conservation and smoke abatement practices. Several papers contain discussions of the relation of the subject to the war effort.

ACID-PROOF CEMENT

An 8-page booklet recently issued by G. F. Sterne & Sons Ltd., Brantford, Ont., features "Penchlor," the trade name of a new acid proof cement developed to combat acid corrosion common in chemical plants, pulp and paper mills, oil refineries, smelting plants, steel mills and other industries. Its characteristics are clearly set forth and it contains a number of illustrations showing methods of application.

ELECTRICAL INSULATION

"What Keeps the Wheels Turning" is the title of a 20-page bulletin published by Fiberglas Canada Ltd., Oshawa, Ont. This bulletin illustrates the applications of "Fiberglas" to the insulation of electrical machinery and its importance in maintaining production. It shows many conditions of extreme heat and corrosiveness, where the use of "Fiberglas" has prevented consistent outages. These include steel mills, textile and dyeing mills, dry kilns, coal mines and street cars. The different forms in which "Fiberglas" may be obtained are described.

BLOWERS AND FORGES

Canadian Blower & Forge Co. Ltd., Kitchener, Ont., have for distribution catalogue No. 811-C, 24 pages, which presents the company's line of portable and stationary forges, hand and electric blowers, tuyeres, and anvils. Specifications and illustrations accompany the description of each item, and compressed air and oil-burning forges are also featured.

TOOL STEEL

"Jessop R. T. Water-Hardening Tool Steel" is the title of an 8-page bulletin, No. 642, issued by Jessop Steel Co. Ltd., Toronto, Ont. This bulletin features the characteristics of R. T. tool steel which is extremely tough and strong. In addition to the general description there are also included a typical analysis, a list of applications, details of heat treatment with a temperature range chart, details of hardness tests and a chart of physical properties.

THE WELD-IT

Issue No. 16 of "The Weld-It," published by Commonwealth Electric Corp. Ltd., Welland, Ont., features the Taylor-Winfield "Hi-Wave" welder and control panel, with a full and well illustrated article on the new "Hi-Wave" welder control panel.

OFFICE EQUIPMENT

A 12-page catalogue recently issued by The Steel Equipment Co. Ltd., Ottawa, Ont., features the "Strongarm" line of tempered pressed wood office equipment, including both letter and cap size filing cabinets with three or four drawers; stationery cupboards; lockers, transfer cases, etc. These units are supplied in two standard colours, olive-green and grey-green, and in two standard finishes, smooth and krinkle.

TIN-FREE GEAR BRONZE

The Hamilton Gear & Machine Co., Toronto, Ont., have prepared a report dealing with the results of a series of researches to find a tin-free bronze to take the place of the conventional metal used in the production of gears. After trying many combinations, a copper-nickel-antimony bronze was tried, and, to quote the report—"this is really good—better for our purpose than the peace time bronze." Details of proportions and physical properties are given. The report concludes with, "We are not applying for patent nor imposing restrictions. This is a free gift for the Allied Nations." This alloy is obtainable in ingot form from Canada Metal Co., Toronto, Ont.

ELECTED PRESIDENT

Mr. W. T. Randall was elected President of Neptune Meters Limited at the annual directors meeting held recently. Earlier this year Neptune Meters Limited opened a large new plant in Long Branch, Ont., which is engaged 100% in the manufacture of precision instruments for war purposes. The Neptune line of Trident and Red Seal liquid meters is still being manufactured at the Neptune factory in Toronto.

RECESSED HEAD SCREWS

Different types of "Stelco Phillips" recessed head screws and bolts and drivers are shown in a 6-page bulletin just issued by The Steel Co. of Canada Ltd., Hamilton, Ont. A few of the many uses of these products are featured and illustrated and the advantages they offer are demonstrated.

TOOLMAKERS' GUIDE

Atlas Steels Ltd., Welland, Ont., have issued a revised edition of their "Toolmakers' Guide", which is in the form of a wall hanger, measuring 17 x 24 inches, attractively printed in colour and shows at a glance the characteristics of their various tool steels and which should be used on any given job.

WOOD TANKS

A 6-page bulletin prepared by Ajax Engineers Ltd., Toronto, Ont., describes the construction of wood tanks, and illustrates different forms, round and rectangular, horizontal and vertical; also tanks fitted with agitators and other mechanisms used in process work. It contains a ready reference giving capacities of various shapes and dimensions.

PAINTS, VARNISHES AND ENAMELS

A 28-page catalogue recently issued by The Northern Paint & Varnish Co. Ltd., Owen Sound, Ont., features in the layman's language the description, uses and application of the company's paints, varnishes, and enamels for mining, pulp and paper, power, marine, architectural, engineering and general industries. The catalogue is divided into three sections designating the general class of surface to be covered, i.e., metal, wood and plaster; and porous surfaces, concrete, and for slip prevention. A simplified index indicates the particular product required for specified industries. The company's products are manufactured for industries and institutions only and are distributed by direct representatives.

DRESSING AND TRUING GRINDING WHEELS

Canadian Koebel Diamond Tools Ltd., Windsor, Ont., have prepared a booklet entitled "For Grinder Men Only—Ladies Night," which is offered by this company, singly or in quantity, without cost to employers for distribution to employees. Recognizing the need for specialized training of women new to industry who may be called on to dress and true grinding wheels, the booklet clearly and simply explains how a wheel should be dressed, the necessity for care in the handling of diamond tools, the importance of taking light cuts, the use of a "drag" angle, correct speed, and other factors bearing on the economical and efficient utilization of diamond tools and grinding wheels.

INSULATING MATERIAL

A series of bulletins prepared by Webster & Sons Ltd., Montreal, Que., feature "Tartan Vermiculite Insulation" which is fabricated in various forms in combination with building material to provide heat and sound insulation. "Tartan" insulation is fire-proof, rot-proof, vermin-proof, odorless and a non-conductor of electricity. It does not dissolve, disintegrate or give off odors when wet, and melts at about 2500° F.

OVERHEAD ELECTRIC CRANES

Systematic maintenance and care in operation of "Morris" overhead electric cranes are stressed in an 8-page bulletin, Section 10-M, prepared by The Herbert Morris Crane & Hoist Co. Ltd., Niagara Falls, Ont. The bulletin also contains descriptive cross-sectional drawings, with each detail of the crane designated by a number and tabulated for reference.

VARNISHED INSULATION

Irvington Varnish & Insulator Co. of Canada, Ltd., Hamilton, Ont., have published a 20-page book designed to enable the user to become better acquainted with this company's products and its laboratory and manufacturing facilities. This book describes and deals with the uses of varnished cambric, canvas, paper, silk, fibreglas and tubing. It also includes technical data and details regarded as necessary to select and specify the product required.

NORTHERN CIRCUIT

The December 1942 issue of "Northern Circuit," published by Northern Electric Co. Ltd., Montreal, Que., contains a message from the president, Mr. Paul F. Sise, to the company's employees stressing three direct contributions every citizen of Canada should make to the general cause. A visit by employees to a minesweeper; a most interesting item on "Uncle Tom's Cabin" at Chatham, Ont.; the proposal of a "National Electrical Federation" in a speech by Mr. Arnold L. Brown; and many items of special interest to the employees form the contents of this issue.

DECEASED

McKenzie James Morgan, district sales manager of the Canadian Ohio Brass Co. Ltd. died suddenly on December 12th, in Niagara Falls, Ont. Born in Wales, Ont., in 1895, Mr. Morgan had been with Canadian Ohio Brass since August 1920; first at the Chicago office and the past twenty years with the Canadian Office. (Continued on page 24)

When Engineers Figure Costs

VITRIFIED CLAY PIPE

is always specified

The best is never expensive when a competent engineer is figuring costs. This is particularly true of sewers—where true costs are not so much a matter of installation but of maintenance and amortization over a period of years.

Judged by sound standards and proved engineering practice, the record of Vitrified Sewer Pipe stands high. It meets the tests of the Canadian Engineering Standards Association and the American Society for Testing Materials with a wide margin. In the vital acid, crush and capacity tests, it stands pre-eminent. Truly the ideal and everlasting material for the sewage-disposal systems of today's industrial communities.

PERMANENT AS THE PYRAMIDS

WHY SOLID NICKEL HERE?

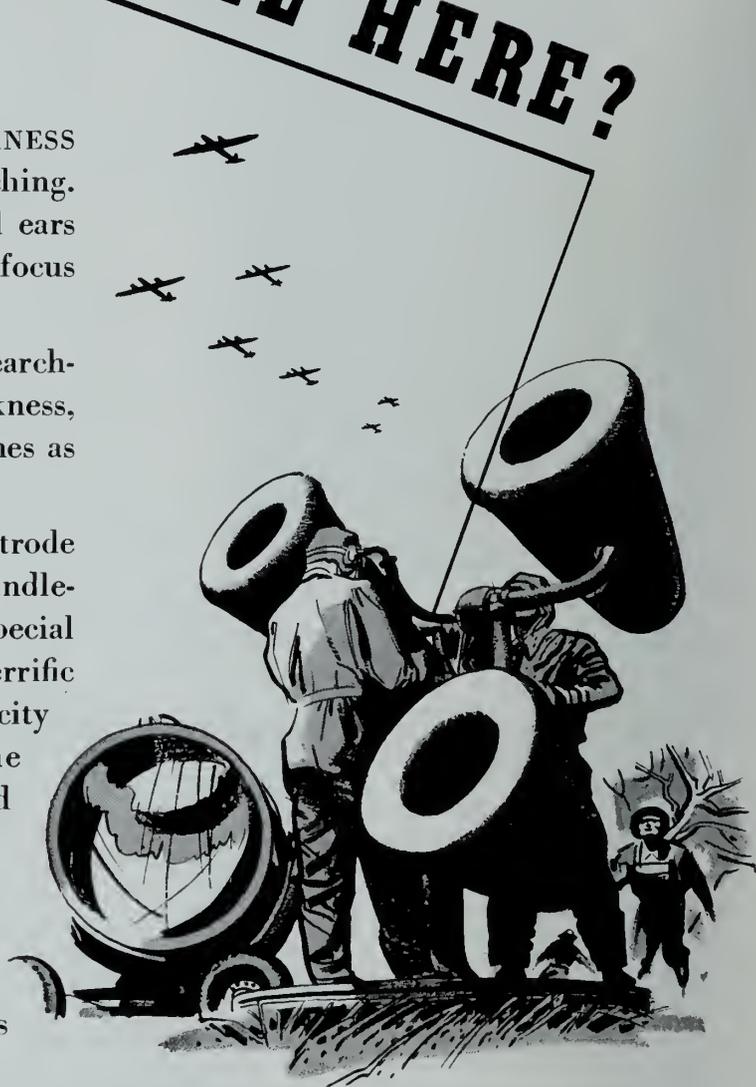

MILES AWAY IN THE DARKNESS enemy bombers are approaching. Automatically the mechanical ears of the Sperry searchlight focus on the invisible planes.

Suddenly . . . Flash! The searchlight cuts through the darkness, and reveals the far-away planes as pin-points of light.

To find a material for the electrode contacts of this 800 million candle-power searchlight was a special problem. Resistance to terrific heat while conducting electricity was the requirement. The answer was found in solid nickel.

On the electrical, food and chemical "fronts", Nickel is enlisted for victory. Nickel is hard, strong, tough, rustless and corrosion resistant.

In the present national emergency Nickel can be supplied only in accordance with government allocations.

"On-the-Job" Power FOR ARC WELDING, TOO!

Powered by a Chrysler Industrial Engine, this Westinghouse 300-Ampere Flex Arc Welder is used to weld tools and casings in oil fields.

Chrysler Industrial Engines serve the Empire's Armed Forces, Industry, Agriculture and Construction in Hundreds of Different Ways

Powering generators for electric arc welding is just one of the hundreds of uses to which Chrysler Industrial Engines are daily being applied in industry, agriculture and other fields.

Three sizes of Chrysler Industrial Engines meet a wide variety of power needs with maximum efficiency at minimum cost.

*Nation-wide Service
and Parts Facilities*

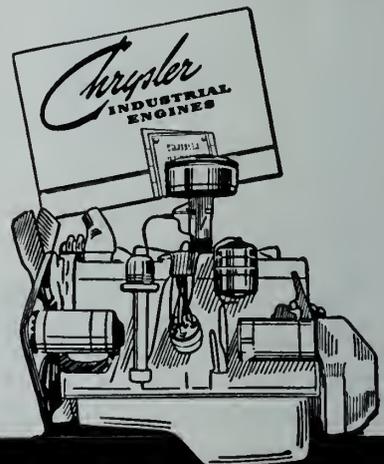

Famous *Chrysler Fluid Drive* is also available to reduce shock loads on the driving mechanism, and greatly prolong the life of valuable equipment.

Have you a power problem? Chrysler engineers would like to consider your needs and submit proposals. Write us today.

Hundreds of Chrysler Corporation of Canada dealers handle parts for Chrysler Industrial Engines and are equipped to give prompt, efficient service.

Write for FREE Booklet

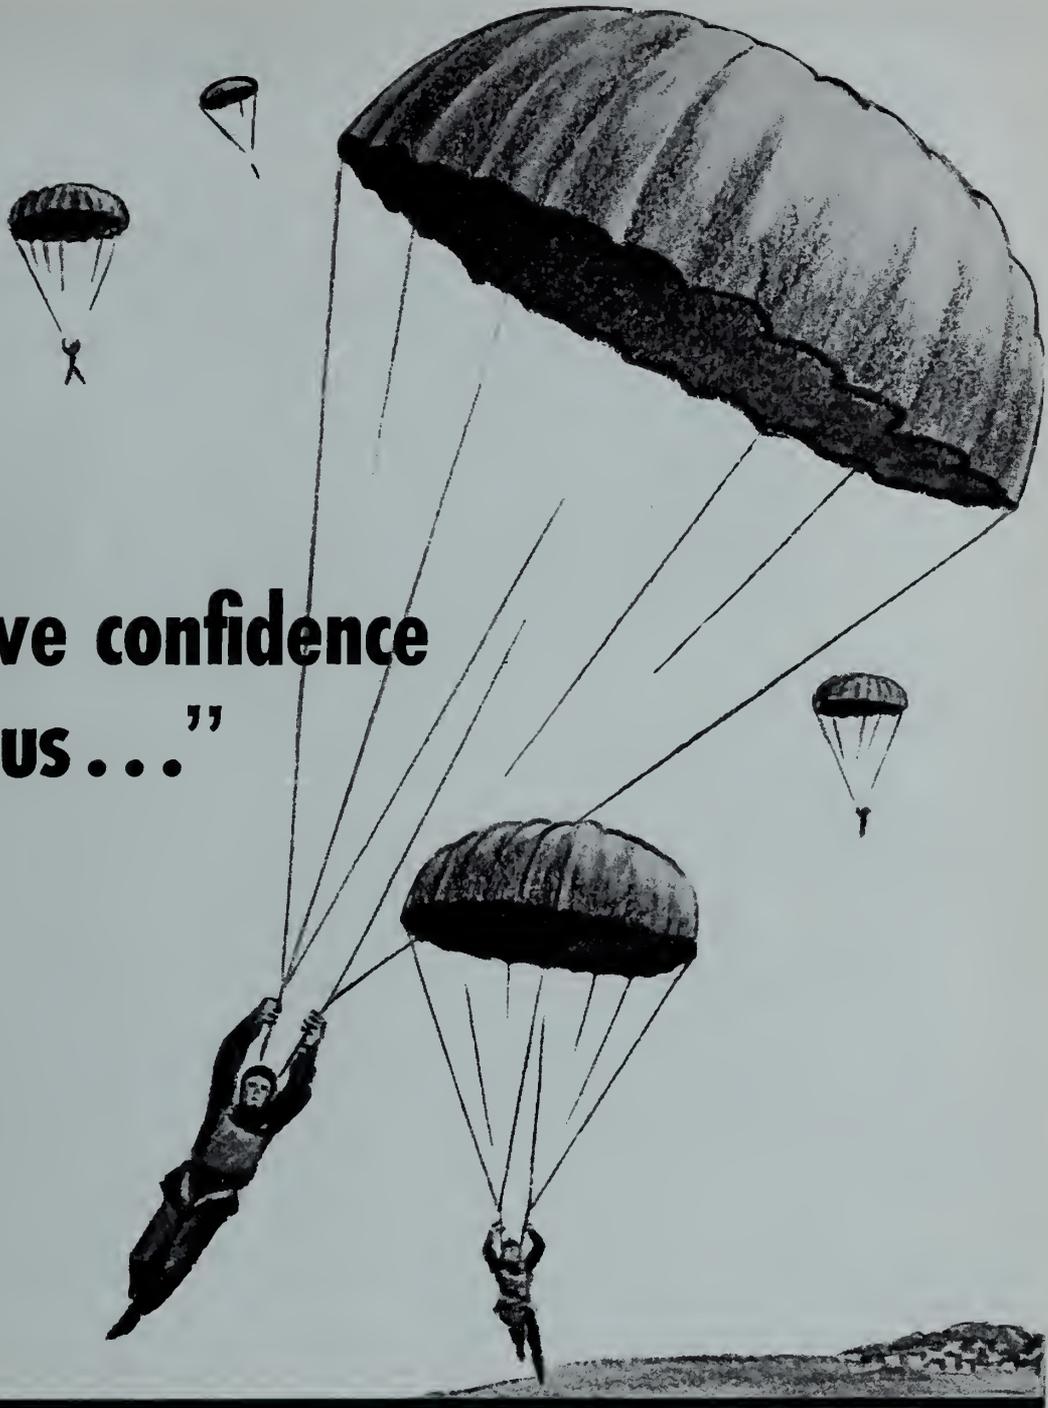

We will be glad to mail you a free booklet showing Chrysler Industrial Engines in action in a wide variety of cases. Complete description, specifications and net horsepower and torque charts. Address Industrial Engine Division, Chrysler Corporation of Canada, Limited, Windsor, Ontario.

AN OFFER

with a very small string attached!

Let us send you, with our compliments, two Venus Pencils in whatever degrees you select. We do this because we want Venus to speak for itself, right in your drawing hand.

Now, the string. It's simply this. We ask you to forget pencil names and reputations, prejudices and inclinations, hearsay, habit and present preference. Just try VENUS on its own merit for

the kind of work you are doing, and let VENUS speak for itself. You'll find its absolute smoothness and precise grading to your liking. There's a mighty good reason why more artists, architects and engineers buy VENUS than any other drawing pencil.

Just drop us a postcard giving us your name and title, your firm name and address. Specify the two degrees you wish to try.

STELCO

Flame and smoke burst forth as another carload of Stelco Blast Furnace Coke leaves the oven.

Many a manufacturing headache has resulted from the swing to war production. If YOU are a manufacturer of war materials—whether you use Stelco products or not—we will gladly help solve your steel problems. Because we are familiar with every phase of steel manufacture from ore to finished products our metallurgists may be able to give you helpful advice on how to speed up forging, save time in welding, reduce machining schedules or make other suggestions leading to modifications in methods to meet the exacting standards and the high physicals vital to all-out war production. This service is part of Stelco's all-out war effort—it's yours for the asking.

POWER

POWER—More than nine million horsepower from such units as those pictured above has, more than any other single factor, made the development of Canada's tremendous Armament Industry possible.

WESTINGHOUSE, pioneer of the Alternating Current System, on which this tremendous power is based, proudly

points to more than several million horsepower of Westinghouse Generating Equipment doing a 100% job "on active service."

Many hundreds of thousands of additional horsepower have been harnessed since 1939 to supply Canada's vast new war industries, and this additional power will be available for the post-war needs of Canadian homes and factories.

ENGINEERING, FABRICATION, ERECTION...

Canada's railways are performing a Herculean task in transportation. And to do a great job better, spur lines, short cuts are continually added to feed industry faster. Hamilton Bridge Company plays a large part in this stepping-up of transportation! Massive railway bridges—engineered, fabricated and erected by Hamilton Bridge—span valley and river in record time to help speed delivery of war materials. This type of strong, durable construction has a vital place too, in times of peace. For then, Hamilton Bridge may once again devote full time to the Nation's march of progress.

Is this how a precision instrument appears to your workmen under the lights of your factory? Good lighting is essential to accuracy, high speed production and accident prevention. *Good light keeps old eyes active,* and young eyes from growing old too quickly. It adds manpower to the war effort.

Whether or not you may have new lighting units, you can have better light.

* For essential industries, Amalgamated Electric makes a new non-metallie Benjamin fluorescent lighting unit that offers all the high lighting efficiency of the former steel units.

If you cannot modernize your lighting system now with this new equipment, clean all reflectors and replace blackened lamps regularly. Repaint walls, ceilings and other reflecting surfaces with light paints of high reflecting value. Ask your electrical contractor or your electrician how your present lighting units may be re-arranged for greater efficiency and better morale in your plant.

UP UP UP GOES CANADA'S PLANE PRODUCTION

6500 planes, including 9 different types of combat and training aircraft, now on active service, came from the assembly lines of Canada's aircraft industry during the 30 months ending December 31, 1942. In addition to older types, Canada now produces newer, faster, more deadly aircraft including Mosquitos, Catalinas, Lancasters and Curtiss Navy Dive-bombers . . . a total of nearly 5000 planes yearly.

This is truly a miracle of production . . . a miracle of organization, tenacity and skill by the more than 75,000 people now employed in the industry. This great army of workers is still rapidly expanding, and the present rate of aircraft production is daily mounting to greater heights.

Every Canadian has cause for pride in this splendid record . . . especially those who, like us, have helped to make that record possible by the supply of a vast variety of essential equipment.

Fairbanks-Morse is playing an important part in winning the battle of production. Listed below are some of the more essential "Tools of Production" that we are supplying to Canada's Wartime Industry.

Gear Drive Units of Every Type

Where ever high speed power is applied to low speed use, our worm gear units give efficient service. Any type of drive can be supplied from our sixty standard patterns, most of the smaller series being carried in stock.

This is a type VO vertical worm unit and motor on a welded steel bedplate, with a shear-pin coupling half integral with the second-reduction spur pinion.

Chester B. Hamilton Jr.

President.

Slow downs may mean . . . "Bare Hands vs. Bayonets"

IT TAKES MORE than courage alone for soldiers to win battles today.

It takes specialized fighting equipment . . . as much as our vast industries can produce, working every last hour on the clock. For we are sending thousands of men against a mechanized foe, and our men must have fighting tools to stand a fighting chance. Nowadays, a *poorly* equipped soldier would stand little more chance than a man with bare hands against bayonets.

Thus time . . . production time . . . has become the most vital element in the war right now. We simply cannot afford to sabotage war effort by allowing a slow down

where that slow down can be prevented.

There is one type of industrial slow down that *can* be prevented . . . the interruption caused by failure of the valves that control vital power and production fluids in your plant. The way to prevent this type of slow down is to *avoid valve trouble before it starts!*

Keep your valves operating efficiently, *continuously*, by inspecting them *regularly*. Renew worn parts before they cause destruction of the

whole valve. And when valves must be replaced, have the new valves selected by experts, installed by experienced men. Above all, train *new* workers to operate and maintain valves properly.

Jenkins Engineers are ready to assist any management in developing a practical program of valve conservation.

JENKINS BROS. LIMITED

617 St. Remi Street, Montreal

Branches: Toronto, Winnipeg, Vancouver and 6 Great Queen St., Kingsway, W.C.2. London, Eng.

JENKINS VALVES

For every industrial, engineering, marine and power plant service . . . in Bronze, Iron, Cast Steel and Corrosion-Resisting Alloys . . . 125 to 600 lbs. pressure.

LOADING DRY DOCK

... Built in Canada

LOCATED at a Canadian port, this floating Dry Dock, the first of its kind to be constructed in Canada, was fabricated and erected by Dominion Bridge Company, Limited, for the Department of Munitions and Supply. Constructed and in operation in the short space of a little over a year's time, it represents an outstanding achievement in Canada's War Effort.

RUBBER TRANSMISSION BELTS

**KEEP UP
THAT
DRIVE**

10 ways to lengthen the life of **RUBBER TRANSMISSION BELTS**

1. Don't run belts too tight. This stretches belts unduly—results in premature breakdown, causes excess strain on pulley bearings and drive shaft.
2. A belt too wide or too heavy wastes rubber and power. Make sure you have right size of belt for the job.
3. Be sure pulleys are correct diameter. Pulleys too small for number of plies of belt cause ply separation and loss of horsepower transmitted due to reduction in arc of contact.
4. Check pulleys for proper alignment. Misaligned pulleys pull belt out of shape, cause uneven stress on pulleys and shaft.
5. Never force a belt over pulleys spaced too widely apart. Likely you will stretch belt bias-wise causing it to run unevenly and to jump pulleys.
6. Don't throw off belt until machine comes to a full stop. Throwing a belt while machine is running results in sharp bends and twists in belt.
7. When installing belt, be sure ends are cut absolutely square. Use a belt square.
8. In applying fasteners, be sure they are the right size and do not work loose. Follow instructions of fastener manufacturers and be sure of true-running installation.
9. Keep belt free of oil and grease. Clean off with laundry soap and water.
10. Don't use dressings on Rubber Belts unless recommended by manufacturer. If Belts become glazed, clean with cloth lightly moistened with gasoline while belt is not running.

Inspect your Rubber Transmission Belts regularly, thus conserving vital rubber by avoiding needless replacements, often preventable by proper care. For information about belts, consult Dominion Rubber men. They know!

Better Care Saves Needless Wear

Every extra hour, every precious moment of added production is vital to this biggest of all jobs — WINNING THE WAR.

Full rated capacity of every machine is imperative — nothing else is good enough.

On the production line, Rubber Transmission Belts are making the wheels hum on thousands of drives, turning out vast quantities of goods urgently needed by a nation at war. Those Rubber Transmission Belts are even more important today than ever before. They give long trouble-free service, therefore are often forgotten and neglected. A little extra care now, will pay big returns in increased belt life, saving of time and money and in uninterrupted production.

DOMINION  **RUBBER**
COMPANY LIMITED

Manufacturers of largest range of industrial rubber goods in Canada.

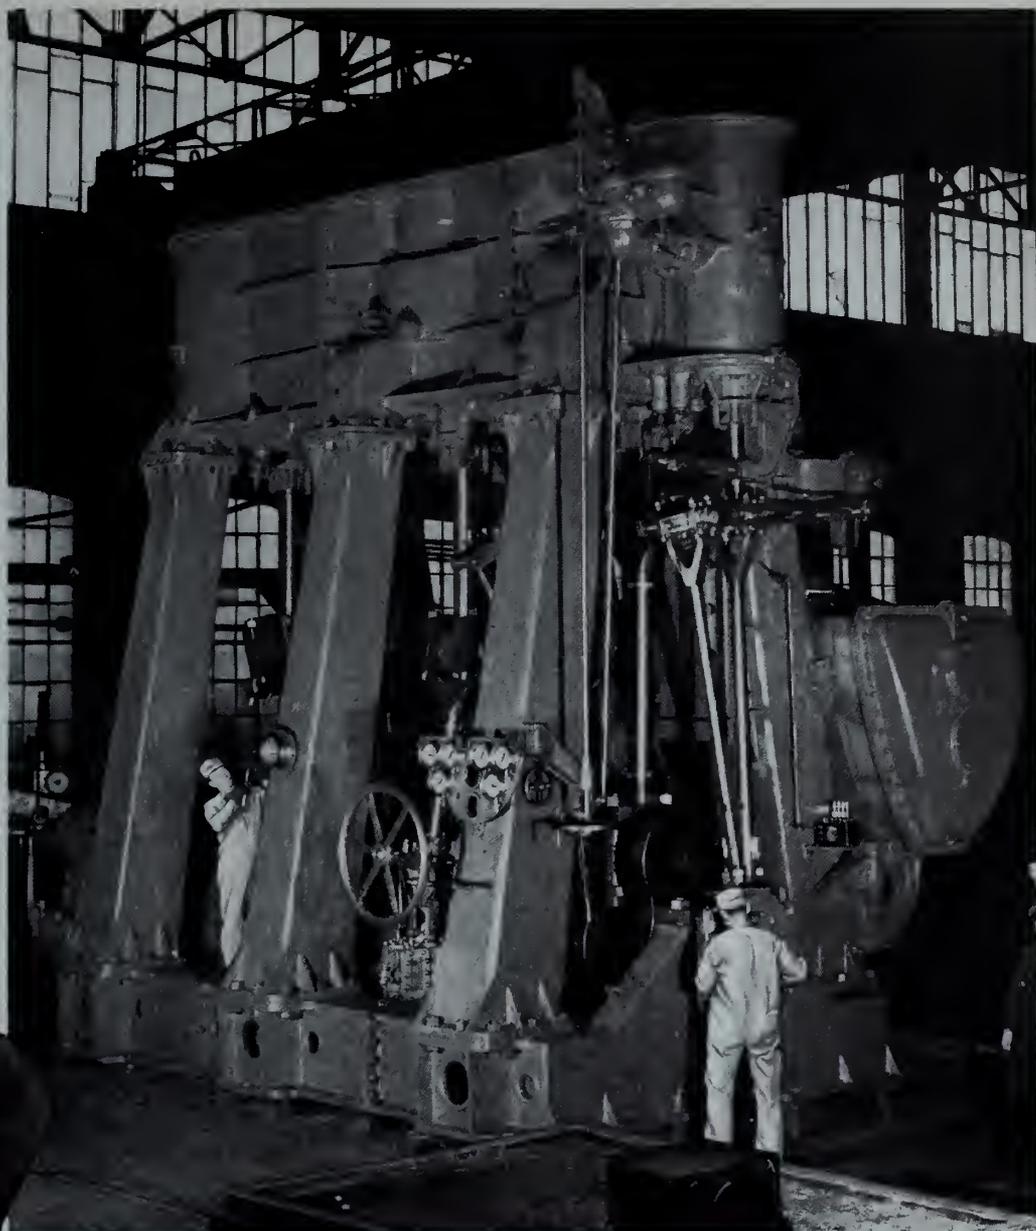

WE BUILD THE

Ships

WE BUILD THE

Engines

TOO

The heart of any ship is its engine. And every Vickers ship—swift Corvette or sturdy Cargo carrier—has one or more of these Triple Expansion Engines, designed and built by Vickers. These are the pulsing giants that give our Cargo Vessels and Corvettes their tremendous power.

Canadian Vickers are also serving the "home front"...for we are making Vickers-Keeler Boilers and Kidwell Boilers for industry. Many installations have been made which stepped up tremendously the productive capacity of important war plants. Inquiries invited.

IF IT FLOATS OR FLIES VICKERS CAN BUILD IT!

ASBESTOS-INSULATED WIRE AND CABLE SERVES CANADA AT WAR!

● Because of its exceptionally high resistance to flame, Deltabeston Asbestos-Insulated Wire and Cable is finding a wide variety of applications in land, sea and air equipment for Canada's fighting services. Positive control of raw materials and manufacturing processes, and rigid inspection of the finished product have established for Deltabeston, a leadership in the field of felted-asbestos-insulated conductors. In order to obtain uniform high quality, Deltabeston Cables are subjected to a series of tests which ensure maximum strength, flexibility and resistance to heat, moisture and abrasion. The Deltabeston Wire and Cable range includes power cables, switchboard wire, fixture wires and cords, locomotive cords and magnet wires.

GROWING PLANTS

Selective cutting under scientific woods management has harvested over-age trees and left a healthy, vigorous forest. New seedlings for tomorrow's forest will spring up where sunlight can reach down to the forest floor.

The TECO Ring Connector spreads the load on a timber joint over practically the entire cross-section of the wood . . . brings the full structural strength of lumber into play.

LIST OF INSTITUTE MEDALS AND PRIZES

Sir John Kennedy Medal.....For outstanding merit or noteworthy contribution to science of engineering, or to benefit of the Institute.

Julian C. Smith Medal.....For achievement in the development of Canada.

Duggan Medal and Prize Medal and cash to value of \$100....For paper on constructional engineering involving the use of metals for structural or mechanical purposes.

Gzowski Medal.....Gold medal.....For a paper contributing to the literature of the profession of civil engineering.

Plummer Medal.....Gold medal.....For a paper on chemical and metallurgical subjects.

Leonard Medal.....Gold medal.....For a paper on a mining subject, open to members of the Canadian Institute of Mining and Metallurgy as well as The Engineering Institute.

Students and Juniors....Books to the value of \$25 (5 prizes)....For papers on any subject presented by Student or Junior members.

University Students.....\$25 in cash (11 prizes).....For the third year student in each college, making the best showing in college work and activities in student or local branch of engineering society.

FABRICATION OF LAMINATED TIMBER MEMBERS

Principles Employed in Design and Manufacture of Built-Up Units

VERNE KETCHUM, M. Am. Soc. C. E.

Chief Engineer, Timber Structures, Inc., Portland, Ore., U.S.A.

Paper presented at Fall Meeting of the American Society of Civil Engineers, held jointly with the Engineering Institute of Canada, at Niagara Falls, Ont., on October 15, 1942

SUMMARY—Wooden beams with spans as great as 70 ft., and wooden trusses as long as 200 ft. are now possible through the use of glued laminated construction. One of the pioneers in this field, Mr. Ketchum, has promoted the development of commercial procedures that permit the economical use of smaller lumber sizes for the building of larger structures.

Use of laminated timber in construction has increased steadily during the last few years. Especially during 1942, with the shortage of structural steel, the rate of increase has been greatly accelerated. Although lumber in various forms has to a large extent taken the place of steel for trusses and building frames, even in steel shop plants, the design and manufacture of laminated members and structures is subject to daily developments and improvements, and many new designs and details will be tested and used. However, some general information on fabrication processes has been established and can be given.

The basic principle in this type of construction is the combination of lumber, adhesives, and other materials to secure a structurally adequate product at a low price. It is not the aim to produce the most excellent structure that can be made, as that would entail a waste of materials, plant, and man-power. The aim is rather to secure reasonable strength by the most economical means.

For instance, where joints in the laminations are outside the section of maximum stress, butt joints are generally used because, though not the strongest type of joint, they are sufficiently strong in this position. It is a waste of lumber, glue, labour, and plant to furnish scarf joints which give 100 per cent strength when this full strength is not required.

Laminated construction using dry lumber has the distinct advantage of producing a member that will not check, warp, or distort after it has been put in place. The lumber is dried in small sizes, providing a better member in a much shorter time. Also, laminated members can have their sizes increased at the critical sections without increasing the size of the entire piece. With this type of construction, curved, cambered, or tapered members, which are pleasing to the eye, can be economically molded or shaped to the design size. These have been used extensively for curved and straight chords in trusses, for two-hinged and three-hinged arches, and for beams and columns.

It is now possible to construct beams of 70-ft. span, wood trusses 200 ft. long, and wood arches 200 ft. or more in span, using glued laminated construction. Columns can be built to take care of combined vertical loads and bending stresses and can be provided with corbels or enlarged ends.

The bowstring has long been considered one of the most economical types of trusses. Prior to the extensive use of laminated construction, it was necessary to build up the curved top chord at the site using 1 or 2-in. pieces and spiking or bolting them together to the desired curvature. Overlapped segmental pieces which had the top side band-sawed to the desired curve were also used. The top chords of these trusses may now be built up using glued laminated construction, which gives the strength and appearance of a single solid piece.

STANDARD LUMBER SIZES USED

To-day, nearly all laminated construction utilizes either Douglas fir, yellow pine, or hemlock. These species are the most plentiful of those suitable for such construction. The sizes of lumber used depend largely on whether the finished

member is to be straight or curved. It is not practical to dry lumber for this purpose in thicknesses greater than the standard 2-in. commercial plank and this is the most economical thickness. Practical experience has shown that the thickness of a lamination should not be more than $1/150$ of the radius of curvature. Such pieces bend readily and do not build up high initial stresses. Lumber of almost any width and length can be used provided that the lateral and horizontal splices are properly staggered and jointed.

Lumber used in laminated construction may be Dense Select Structural or lower grades. A very large percentage at the present time is No. 1 common lumber with a slope of grain of 1 to 10, conforming to Paragraph 215 of "Standard Grading and Dressing Rules" authorizing the use of a stress grade of 1,200 lb. per sq. in. This classification is for ordinary solid lumber cut green and air-dried under ordinary conditions.

The Douglas Fir Use Book states: "In dimensions sizes 4 in. and less in thickness, the development of defects during seasoning does not offset the increase in strength from drying as much as in larger sizes, and in these sizes used in dry locations, working stresses in extreme fiber in bending and compression parallel to grain are increased proportionately from equal grades of larger timbers."

This condition applies to practically all laminated construction since the requirement here is for small sizes of dry lumber. It would seem, therefore, that the use of the next higher stress grade or an increase to 1,400 lb. per sq. in. for laminated lumber under Paragraph 215 would be fully justified. The values given in Table I are those used and recommended by Timber Structures, Inc., of Portland, Ore.

TABLE I

VALUES IN POUNDS PER SQUARE INCH, FOR NO. 1 COMMON DOUGLAS FIR ACCORDING TO PARAGRAPH 215

	Solid—No Guarantee on Moisture Content	Laminated Dry Gluing Stock
Bending compression	1,200	1,400
Direct compression	1,000	1,100
Compression across grain	325	325
Horizontal shear	120	120
Modulus of elasticity	1,600,000	1,600,000

We recommend that the values for other stress grades be increased accordingly. On Government work specifications allowing much higher stresses for the duration of the war emergency are now being used.

MOISTURE CONTENT OF LUMBER

For wood used in casein laminated construction, the moisture content may be from 10 to 20 per cent, and no close control of this content is necessary to produce good work. A moisture content from 10 to 15 per cent is ordinarily the most suitable. The moisture content of the lumber should be close to what it will attain in the actual structure to avoid a tendency for the glue joint to work during the seasoning process. It has been found that wood under cover in various parts of the United States will, under ordinary conditions, eventually reach a moisture content of from 8 to 15 per cent. Timber attains its maximum expansion at a moisture content of 28 to 30 per cent, and a greater content does not change the shape or size of the piece.

Two general types of glue are used in ordinary laminated construction—waterproof resin glue and water-resistant

casein glue. The resin glue, while being as cheap per pound as the casein, and requiring less glue per unit of area, has other disadvantages which have cut down its use. It requires an operation temperature of over 70 deg. F., a higher finish than is found on commercial lumber, more care in spreading, higher pressures, and much more care in all other operations of manufacture. These requirements restrict resin gluing to work done by experts in temperature-controlled factories and prohibit its use at building sites.

Casein glue is now used almost entirely for ordinary construction. It is sold in powder form, usually in barrels, and must be stored in a dry place. One pound of the powder is usually mixed with two pounds of cold water to form from 1½ to 2 quarts of glue mixture, which will cover about 35 sq. ft. of surface. Small gluing operations can be done with a standard 12-quart pail but large ones require a mechanical mixer. In small operations the glue may be applied to the lumber using a 3-in. brush or larger, made of stiff vegetable fibers which will withstand the alkaline action of the glue and retain sufficient stiffness for efficient spreading. On large operations it is almost necessary to have a mechanical spreader. It will also be necessary to have a number of strong clamps for applying pressure. A sufficient number of clamps will have to be used to allow them to remain on the finished pieces until the glue has properly set.

Mixing of casein glue is usually done in a large tank by mechanical means and should be under the control of one man only per shift. The glue powder should be added slowly to the water and mixed for some 3 to 5 minutes until the mass thickens. The mixer should then be stopped and the mass allowed to rest for 15 minutes. After this period it should be again mixed for 2 to 3 minutes until the glue smooths out like heavy cream, ready for use.

Casein glue remains liquid and usable for a period of 6 to 8 hours at 70 deg. F., and 4 to 6 hours at 90 deg. F., but it gradually thickens into a rubbery mass which must be discarded. Therefore, only enough should be mixed at one time for one working shift.

MECHANICAL APPLICATION OF GLUE

Glue is spread on the lumber with one of the standard types of spreaders which have been in use in various mill working plants for years. The spreader consists of sets of motor-driven rolls which revolve in a tank of glue and apply the glue to the board as it passes between the rolls. The rolls, being corrugated and under light pressure, apply a thin film to one or both sides of the board, as required. Depending on assembly time, moisture content of wood, and working temperature, sufficient glue should be applied so that the film will be moist when the pressure is applied. An ordinary lumber carrier can be used to move up the raw materials and to take away the finished product.

The working temperature for casein gluing may be anywhere above 50 deg. F., either for indoor or outdoor work. The glue and the lumber should be about the same temperature, and the water should be between 60 and 75 deg. F.

After the glue has been applied and the lamination put in place, it is necessary to apply pressure to the member. This may be done by either of two methods. The first consists of driving nails long enough to extend through at least two full laminations. Sufficient nails should be used so that for each 8 sq. in. of glued joint, there is at least one nail passing through a lamination on each side of the joint. For example, when laminating boards 2 in. thick, there should be one 20d nail head for each 8 sq. in., or one 60d nail head for each 16 sq. in. The other method of applying pressure consists of the use of standard clamps, which may consist of a commercial type of C-clamp or a homemade clamp using angles and bolts. Where laminated work is manufactured in a shop, the usual practice is to use nails only to hold down the ends of pieces, and to employ clamps for all the rest of the work. At the building site, where clamping equipment is not often available, nails are used

entirely, as this method lends itself readily to use by inexperienced workmen with meager equipment. Practice has shown that it is better to use clamps throughout, even on the ends of pieces, than to use nails. It is the opinion of experienced manufacturers that the nailing method is inadequate to develop the pressures necessary for good work.

The pressure on glued joints should range from not less than 100 lb. per sq. in. to not more than 200, and should be applied by the use of jacks, clamps, or other equipment. Pressure should be applied within 20 minutes after the glue is spread on the lumber if it is applied to both faces meeting at a joint. If the glue is applied to one face only, the pressure should be applied within 15 minutes and should be maintained for at least 12 hours after the addition of the last lamination. As a general rule, the pressure should remain on the finished piece from 6 to 12 hours, depending on the moisture content of the wood and the temperature of the operation.

SEVERAL TYPES OF JOINTS USED

Scarfed joints may be formed in several ways, either by using a straight tapered bevel for both ends of the jointed members or by using various combinations of daps and bevels. Tests made by some authorities have indicated that a scarf with a straight bevel from 1:8 to 1:15, depending on the kind of wood used, will produce a full-strength scarf. It is recommended that a standard of 1:12 be adopted. Four types of joints are shown in Fig. 1.

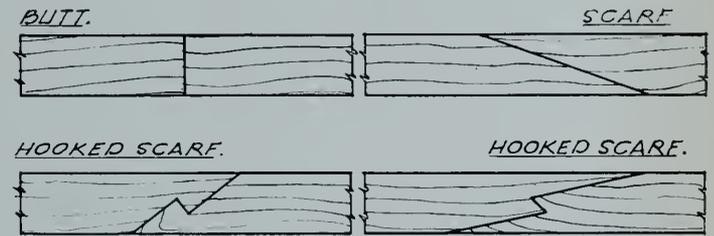

Fig. 1—Four types of joints for laminated members.

The location of scarf joints in compression members is not very important, and providing the two ends are in bearing no loss in strength results. A good bearing between butt joints, however, is very hard to obtain. For members in tension, such as the bottom chords of trusses or the tension side of beams, either the laminations must be scarfed and glued to full strength, or the loss of strength in the lamination must be taken into account in the design.

It is apparent that the laminations of beams which are spliced in areas of no tension can be butt-jointed without loss of design strength. Similarly, in areas of small tension, some laminations can be butt-jointed. In areas of high or full tension stress, however, lamination splices should be scarfed for full design strength. By careful arrangement, it would seem that in most cases all laminations could be butt-jointed and such joints located outside the areas of high tension. While the locations mentioned are more or less arbitrary, it should be recalled that nearly all beams are designed by arbitrary methods, and lamination splices may be considered in the same way.

A consideration of the distribution of stress through a beam will show that a lamination near the quarter point of the depth of the beam has a working value of only about 1/3 that of a lamination at the top of the beam, and a lamination at the center has practically no working value in tension or compression at all. It is thus apparent that a lamination in the middle of the beam may be composed of lumber having a lower stress grade, or may be butt-jointed with a relatively small loss of strength to the beam.

Since the maximum bending moment in a beam under static load occurs at one point only, the full design strength is required only at that point. In a beam of uniform section

there is a reserve of strength in all other parts. Speaking now only of bending moments, we find that the full strength of a lamination in tension is required in only one lamination at only one point, and that is the extreme lamination on the tension side at the point of maximum bending moment. The reserve of strength in the remainder of the beam may be taken into account when considering splices and the stress grade of lumber to be used. Of course the stress grade of the timber will also have to be considered for the lamination under extreme compression at the point of maximum bending moment.

Authorities recommend that unscarfed joints be not closer together longitudinally than 40 times the thickness of the lamination so that there will be sufficient length for the proper transfer of the stress around the joint. It is also recommended that scarfed joints be placed not closer together than 25 times the thickness. Wherever possible, the outer lamination should be in one piece, but if not, at least it should extend in one piece across the section of maximum stress, as it is very difficult for the full stresses in the outer lamination to be transferred around a splice. All joints in curved members should be scarfed, as otherwise it is almost impossible to hold the jointed ends in position to form a satisfactory member. Some manufacturers scarf-splice all laminations in advance of assembly. First, the ends of the boards are scarfed and glued to form a lamination the full length of the member. When dry, this lamination is run through a planer to bring the scarfed joint to the same thickness as the remainder of the lamination. This planing is usually necessary as the ends of scarfed joints tend to "ride up" on each other, producing a thickening in the splice. Such a splice, if placed in the member without planing, would produce a bulge and adjoining opening. These laminations may then, of course, be treated the same as a full-length lamination without

scarfs and can be assembled into the member to produce a very satisfactory although more costly unit.

Thus two methods are available—the pre-glued scarf lamination just described, and the method of placing all the laminations directly in the member and gluing all the boards and joints in one operation. The choice between these two methods may well be based on the type, cost, and quality of the structure. Some successful manufacturers use the plain pre-glued and planed scarf-joint type throughout in preference to the butt or stepped scarf joint and maintain that they are thus able to produce a better product at little or no additional cost.

Many designers have insisted that steel stitch bolts be placed at short intervals through glued laminated members to help hold them together. These bolts are apparently intended to bolster up the strength of the glue for fear it will fail after the structure has been put together. We believe that glued, laminated construction as built during the last few years has given such satisfactory results that this lack of faith in glue is entirely unwarranted.

It is very hard to hold the extreme end of a lamination to a predetermined curve, and curved members will tend to straighten out slightly when the clamps and forms are removed. This springback is not great, but may sometimes be $\frac{1}{4}$ or $\frac{3}{8}$ in. in a 40 or 50-ft. truss chord. It seems to require some experience to forecast the amount of this springback, which can only be prevented by slightly distorting the curve, that is, by slightly accentuating it at the ends, from a point 3 or 4 ft. back.

PREPARATION OF LUMBER FOR GLUING

All surfaces to be joined by gluing should be finished or machined; rough lumber should not be used. With casein glue, the ordinary finish such as is found on commercial 2-by-4's and 2-by-6's is satisfactory. The lumber to be used should be free of grease, dust, and dirt. To produce a good finish on the assembled member, exposed surfaces may be planed or sanded. Such finishing may be done as soon as the glue has hardened. An ordinary floor sander has been used for this work. Where it is intended to plane or sand the finished top chord of trusses or other members, the changed dimension should be considered in the design and in the detailing of any adjoining connections. For example, a top chord built up out of 2-by-6's would have a lateral dimension of $5\frac{1}{2}$ in. assembled, but after planing it would be cut down to approximately $5\frac{1}{8}$ in.

From experience to date, it seems safe to assume that casein-glued laminated construction will last as long as solid wooden members of any but the more durable species or treated material. The longest experience for glued prefabricated construction in the United States is about six years, and 30 years for built-in-place structures. The characteristics of casein glue render it unsuitable for use in members in contact with damp earth or where the moisture content of the wood may repeatedly exceed 20 per cent. Properly made glued joints on all woods commercially used for construction framing have a shear strength of 3,000 lb. per sq. in. This means that under extreme strain breakage would be in the wood rather than in the glued joint. Test pieces used by the glue manufacturers must be made of hard maple in order to secure any breakage in the joint.

Fireproofing treatments consist of impregnating the wood with various salts and compounds under pressure in sealed cylinders. During the treatment the moisture content is increased to between 60 and 75 per cent under a pressure of 100 to 160 lb., and the temperature is 125 to 175 deg. F. Glue manufacturers claim that casein-glue joints will maintain 100 per cent joint value during any known fireproof treatment but that casein glue cannot be applied to lumber that has previously been fireproofed. Laminated members using resin glue will not stand up under fireproof treatment, but resin glue can be applied to lumber that has previously been fireproofed.

Glued-up laminated members using resin glue cannot

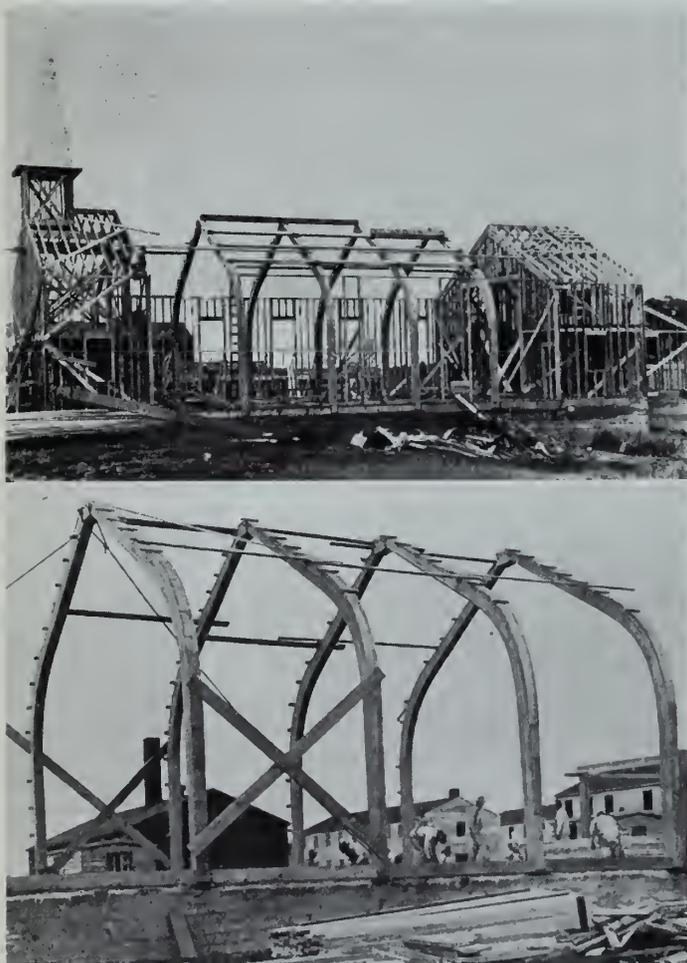

Fig. 2—Laminated arches provide a simple but sturdy frame for an army camp chapel.

later be treated by the Wolmanizing process of preservative treatment, but finished members using casein glue can later be treated by this process. Casein glue cannot be used on laminations that have been treated by the Wolmanizing process, but resin glue can be. Laminated built-up members can receive preservative treatments using a creosote base, but laminations that have been treated with a creosote material cannot be later glued either by resin or by casein glue.

At present, laminated construction is somewhat more costly than solid construction. Quotations for some recent jobs would indicate that the construction costs of laminated material delivered to the job were about 35 per cent higher, per thousand board-feet, than those for solid construction. The laminated construction gives a superior product and often this higher cost is justified. Also, laminated construction often permits the construction of larger structures and longer spans than would otherwise be feasible. Connecting hardware, ironwork, assembly, erection, engineering, and general overhead would be the same for both types of construction.

Where members are glued up at the site, they may be finished to any size which can be erected by the available equipment. Where they are built at a shop, at a distance from the site, splices must be used so that the pieces can be transported. It is usually not practical to transport pieces larger than 8 by 40 ft. on railroad cars, and highways have overhead clearances and legal restrictions that must be considered.

Laminated construction requires the very minimum of bolts, connectors, washers, and other steel items, and often avoids the use of steel entirely except for anchorage details. While laminated construction is relatively new in this country, the design follows old established principles, and the proper manufacture can be easily and quickly

Fig. 3—Fabrication of a truss web member in the shop. Note that one end is giving a square cut and the other end a bevel cut at the same time.

learned by men experienced in other lines of building construction. Both laboratory and field tests give conclusive proof of the usefulness and durability of this type of construction, and conservative owners and engineers should not hesitate to use this valuable material.

Further progress in the manufacture of glues, and the development and simplification of fabrication processes for laminated members are continually improving this product and reducing its costs.

NATIONAL RESEARCH COUNCIL SERVES WAR DEPARTMENTS

Scientific research in Canada during the past three years has been directed almost wholly to the solution of new and urgent problems arising out of the war. The National Research Council is serving as a central co-ordinating body directing research within its own laboratories and in the universities and industry. The Council has been appointed the official research station of the Navy, Army and Air Force in Canada. The close co-operation between Service personnel and research staff thus made possible has been a large factor in promoting the application of science to military problems.

FOR THE NAVY

Scientific problems arising in connection with the work of the Navy are studied jointly by officers from Naval Headquarters and civilian personnel on the Council's staff. Decisions can thus be taken promptly and work started without delay. The National Research Council maintains civilian scientific groups at several points on both the Atlantic and Pacific coasts who work in the closest co-operation with the Naval stations. A sizeable group is also located in Ottawa and contact is maintained with similar research stations in the United States and Great Britain.

Many of the problems presented relate to the supply of materials and the preparation of specifications. Highly technical problems have arisen from anti-submarine warfare and minesweeping operations. Several sections of the Division of Physics and Electrical Engineering are concerned almost exclusively with research and development programmes for the Royal Canadian Navy. In the electrical engineering section a shock and vibration machine based on standard British Admiralty design has been installed. The specifications for building the machine were modified to permit the use of Canadian materials. This machine is used for testing resistance to shock of various electrical equipment, such as switches, rheostats, junction boxes, lighting fixtures used

by Navy and merchant ships. From the results obtained, specifications for all electrical equipment for the purposes enumerated are being developed as required. Problems investigated in the electrical engineering section have included studies of gear for magnetic minesweeping. A rocking machine to simulate the rolling of a boat has been constructed and tests of various instruments have been made on this unit.

In the Division of Chemistry many problems of interest to the Navy have been investigated. Work on paints, rubber, low-alloy high-strength steels and aluminum alloys, and sea-water resistance of various coatings and inhibition of corrosion of various metals by chemicals may be mentioned. In the Division of Mechanical Engineering likewise, the several laboratories are engaged on numerous problems for the Navy, notably in matters relating to engines and their lubrication, the design and test of boats of various types.

FOR THE ARMY

For the Army and also for the other Services all kinds of supplies have had to be tested to determine whether they are acceptable according to required military standards. Apparatus has been developed and constructed for work in ballistics on an increasing scale. Measuring equipment for munition proof and gun proof has been developed and is in continuous service at proving grounds. Problems on the direction of gun-fire have been attacked with success. Numerous tests have also been made on the armouring properties of various materials and work is in progress on the improvement of anti-aircraft projectiles.

An important war service was rendered in 1939 by promoting the development in Canada of optical glass manufacture for the production of precise optical parts for military equipment. The project is now being carried forward in production by a Government-owned company.

ELECTRIC ARC WELDING

W. R. STICKNEY, M.E.I.C.

Welding Engineer, The Canadian Bridge Co., Ltd., Walkerville, Ont.

Paper delivered before the Border Cities Branch of the Engineering Institute of Canada
on November 27th, 1942

INTRODUCTION

It is not necessary to cite examples or give statistics to show the rapid increase in the use of metallic arc welding during recent years. This process is no longer a convenient or makeshift method of making repairs or fastening unimportant parts in place but has become the preferable, and in many cases the *only* satisfactory means of joining parts of important structures. Whereas the last Great War stimulated the use of welding in repair work, this war sees arc welding as perhaps the most important "victory tool" in history. The modern fighter planes and flying fortresses could not be built without it; the speed records we have seen established for fabricating cargo vessels and warships, the rapid production of military vehicles, tanks, guns and shells—in all these fields and more arc welding has proved to be one of the major factors in the successful production of all vital war materials.

This widespread use is due to improvement in the quality of weld metal made possible partly by better welding equipment, partly by the greater experience of engineers, operators and supervisors, but primarily, as will be shown later, to the development of modern electrodes.

Much of the following material has been abstracted from published papers and reports, and may serve to point out some of the outstanding features of present day metal arc welding practices, such as processes, electrodes, equipment, qualification and training of operators, preparation for welding, heat and mechanical problems, inspection and testing, and some recent developments.

WELDING PROCESSES

A weld may be defined as a localized consolidation of metals by a welding process, made with or without filler metal, for uniting like metals in order to transmit considerable stress. The definition, however, includes subsidiary processes such as brazing and soldering, in which unlike metals are to be joined but whose products are not usually intended to transmit much stress. All welding processes require the application of heat, but some of them, for example forge and resistance welding, require the simultaneous application of pressure and heat.

There are three major types of welding which do not require pressure, namely electric arc welding, thermit welding and gas or oxy-acetylene welding: as a group they are classed as fusion welding in specifications and codes governing the fabrication of welded products and all have identical basic design requirements. In electric arc welding there are again three types of welding processes,—atomic hydrogen, carbon arc and metal arc. This paper will be confined to a discussion of the latter process.

Metal arc welding consists of a localized progressive melting and flowing together of adjacent edges of base metal parts by means of temperatures of approximately 10,000 deg. F. from a sustained electric arc between an electrode and the base metal. The melting electrode furnishes the filler metal, the arc being maintained by manually or automatically feeding the melting electrode at a uniform rate toward the base metal. 'Weld metal' is, therefore, that portion of the base and filler metals which has been melted during the welding operation.

When using direct current for welding, the heat developed at the positive terminal is greater than that developed at the negative terminal. Therefore, in view of the greater heat required to bring the base metal, or work, to the welding temperature, it is customary to attach this to the positive terminal of the generator, and the electrode to the

negative terminal; this is called straight polarity welding. Under certain conditions, as when welding thin material or using some types of coated electrodes, the connections are reversed, giving rise to the expression—"welding with reversed polarity."

WELDING RODS AND ELECTRODES

The ideal weld is one having the same properties as the parts joined. Such a weld when made in any arc welding process can be obtained only by effectively protecting the molten filler metal from the oxidizing and nitrogenizing effects of air during the entire range of liquification and solidification. Originally, all metal arc welding was done with bare electrodes; then it was discovered that a thin coating of lime gave much greater stability of arc and ease of welding. Bare rods of this type are seldom used today, since the welds are quite brittle, show very little elongation and have a low ultimate tensile strength. This is because the molten metal, being exposed to the air when passing through the arc, readily forms iron oxide and iron nitride which are hard and brittle. The melting rate of a bare rod is also much less than that of the same size of coated electrode.

The first covered electrode used was a bare rod wrapped in cardboard; the heat of the arc burned the cellulose producing carbon monoxide and hydrogen, both of which are splendid de-oxidizing agents, and resulting in a tougher and more ductile weld metal. Later on, mineral salts were used as a shielding medium and later still it was found that various minerals and their oxides added to the coating resulted in greatly improved properties in the weld metal. As a result of extensive development, the major functions of present day electrode coatings are as follows: to stabilize the arc, to protect, purify and refine the molten metal as well as control its viscosity, penetration, burn-off rate and hence speed of welding, to control the viscosity, surface tension, brittleness and porosity of the slag and therefore the type of bead or fillet deposited, and to add alloying ingredients to the deposited metal. The coatings are usually composed of a binder, a flux, a de-oxidizer, organic materials such as cellulose, and arc-stabilizing, slag and alloying ingredients. They might be classified in three types: (1) organic-coated or gas shielded, (2) organic and mineral coated or semi-slag shielded and (3) purely mineral coated or slag shielded. The gas shielded rods may be used for all positions of welding but will work on reverse polarity only; the semi-slag shielded rods can also be used in all positions especially where the fit-up is poor and will work equally well on either straight or reverse polarity. The slag-shielded electrode can be used only in the downhand or flat position, although there is one special type which has been developed for making horizontal fillet welds where the fit-up is good.

While it is of lesser importance, it is essential that the wire core be of normalized grain structure as the specific resistance of mild steel in this condition is most suitable for purposes of metal arc welding. Lack of uniformity in the final heat treatment of the wire is often responsible for the erratic behaviour of electrodes whose coatings are processed under identical conditions.

The importance of electrode coatings might be summed up by saying that no other development in welding has been as responsible for its widespread use today. Without them we could not have a.c. welding nor would it be possible to weld the high-tensile alloy steels. We could not obtain the speeds in welding now possible, nor could we effect the weight savings in the design of many structures and machines

made possible by the joint efficiencies permissible when using covered electrodes.

EQUIPMENT

Sources of the electric arc are both direct and alternating current. Motor driven generators are the commonest means of obtaining direct current, and for alternating current, either transformers, rotating motor generators, frequency changers or combinations of motor generators and frequency changers are generally used. There are two types of welding equipment—manual and automatic.

Manual Arc Welding Equipment—The direct current generators are of two kinds: (1) single or multiple operator, constant voltage generators, and (2) single operator, variable voltage generators. The first is a generator set which supplies a constant voltage to the welding system which in turn may supply one or a number of operators each of whom controls his welding current through an adjustable resistance. The second type delivers constant electrical energy to the welding system: i.e. sudden increase in the arc voltage (which is dependent on arc length) causes a decrease in the welding current and vice versa; this self-regulating feature results in greater arc stability and enables operators to make consistently sound welds. Setting the machine for the desired current output is done by means of precalibrated dials or indicator plates.

Welding machines which are built to N.E.M.A. standards can usually be depended on to give satisfactory performances. In selecting the type, size and rating, the character of the work contemplated and the available source of primary current should be considered. Multiple operator sets are advantageous where a large number of low-current arcs, at low operating factor (ratio of arc time to total time) are grouped in a limited area. Single operator sets are portable, and have greater independent adjustment and control of arc characteristics.

Not so many years ago, a.c. welding was used to a very small extent and only on light work, because of the difficulty in maintaining an arc with bare electrodes. Since the development of special covered electrodes, however, a.c. welding processes have greatly increased, and now they are used on all types of work and are very popular in present day ship-building yards.

Alternating current welding transformers should have a sufficiently high open circuit voltage to make the arc easy to strike but not too high to be dangerous and the method of current adjustment should be simple. Specially designed coatings on electrodes help to make the proper voltage possible, and the current is controlled by varying either the resistance or the reactance of the circuit. One disadvantage of a welding transformer is that being single-phase it imposes an unbalanced load on a polyphase circuit; if more than one transformer is used this may be compensated for to some extent by distributing them on different phases of the circuit.

The motor generator a.c. welding sets are somewhat like d.c. motor generator sets in that their mechanical details are similar and they also supply constant electrical energy to the welding system. They are generally controlled by a variable reactance, however, and generate alternating current at the required welding voltage but at a much higher frequency which improves arc characteristics and stability. The chief advantage of the rotating a.c. welder is the fact that it does not create an unbalanced load on a polyphase circuit.

There are many other relative merits and demerits of alternating and direct current welding equipment but one chief advantage of a.c. welding might be mentioned here. In making heavy welds on thick sections in restricted places and corners, using direct current the high currents changing direction around the weld cause magnetic forces to act on the welding arc and create what is called "arc blow." This results in an erratic arc causing blowholes and slag inclusions in the weld at the point of disturbance. Magnetic arc blow is greatly reduced if not entirely eliminated when using any

a.c. welding equipment, and this feature has led to its widespread use in heavy welding industries.

Automatic Arc Welding Equipment.—An automatic welding head is a device for automatically striking and holding the arc between the electrode and the work to be welded. The success of any metallic arc welding operation is dependent on the maintenance of a uniform arc of proper length. In manual welding this is the duty of the operator, whose ability to hold a steady arc depends on his physical condition and degree of fatigue. Automatic welding equipments remove this variable and make it possible to obtain good sound welds even with an inexperienced welding operator.

There are many methods in use for automatically feeding the arc and striking the electrode but all contain three essential parts: (1) a motor to feed the electrode, (2) a means of control to strike and maintain proper arc length, and (3) a means of conducting electric current to the electrode. In addition some means must be provided for either moving the welding head over the work or the work past the welding head at a steady, uniform rate. The current may be either

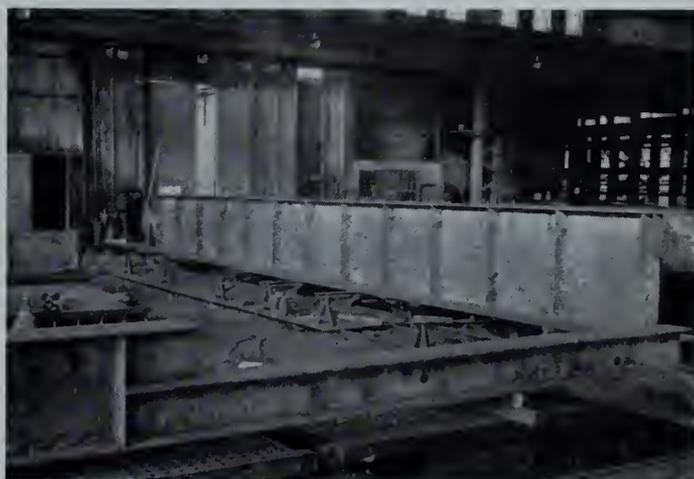

Fig. 1—Girders and columns for mill buildings fabricated by welding rolled plates.

alternating or direct, and the electrodes for the majority of automatic machines are bare or lightly coated, some independent means of shielding the molten weld metal being provided. The wire is usually fed into the machine from a coil, eliminating stops and stub ends of electrodes; then, too, much higher currents can be used resulting in greater speeds in welding. This type of welding machine, however, requires special precautions in preparation of the joints—a most accurate bevelling or grooving being necessary to secure good results. They are limited in application, and are still used mainly on production work or where there is a large quantity of long, straight seams to be welded.

TRAINING AND QUALIFICATION OF OPERATORS

As yet it is impossible to define the term "welder" or "welding operator." Any attempted definition or specification of the term would vary between one industry and another and even between individual plants in the same industry. One plant may position all their arc-welding work and use large electrodes and alternating current. A first class operator with years of experience here would be of limited and perhaps no value on construction work or in a shipyard, where direct current may be used and a large part of the welding would be in the vertical and overhead position. Or, an operator may be highly skilled in welding thin sheet and have no training or experience in heavy plate fabrication or pipe welding. While many of the processes and their applications rest on the same fundamentals, a man trained only in those fundamentals has far to go before qualifying as a welding operator and being of value in any plant.

Assuming, then, that an employer has developed definite

job specifications, the important thing is to obtain, in the shortest time, an operator who can perform work to those specifications. This can be done either within the plant itself or by an outside welding school.

When training is done in the plant, the employer selects the trainees, provides space, equipment, materials and instructors, and all instructions and qualifications are arranged for the specific requirements of that plant. The trainee is first taught safety practices, then how to strike an arc and lay down a neat, sound bead. Then he learns to tack pieces together and make the easier types of welds, progressing to the more difficult ones, until in possibly four to six weeks he may be ready to start on the simpler forms of work in the shop. In the meantime he is taught some of the theory of welding, and if necessary for that particular plant, how to read welding symbols and blueprints. In from four to six months' time the average operator should be reasonably proficient in the use of the arc as a fabricating tool in that plant.

Welding schools generally train a would-be operator differently, i.e. he gets no specialized training but general instructions in the fundamentals of various welding processes, both practical and theoretical and the observance of safety practices. Before such a man can be of value to any industry or workshop he must first undergo a period of further training with his employer. This period, of course, should be much shorter than the time required when the operator is trained in the plant.

Fig. 2—Positioner for all-welded ship, allowing downhand welding.

In metal arc welding, the physical properties of the weld metal, such as tensile strength and ductility, will be determined by the particular procedure of welding that is used. The reliability of the welded joint will be determined by the degree to which that weld metal is kept free of foreign materials and by the degree to which it is fused to the base material. Under a fixed procedure of welding these two latter factors are the only ones over which the welding operator has control. It is not considered necessary, therefore, to test the welds of every operator for tensile strength and ductility.

The first step in welding should be to adopt a procedure in which all essential variables are fixed within definite limits. This procedure should then be investigated to determine whether it will produce welds with the desired physical properties. Having established that a given procedure is satisfactory, comparatively simple tests, intended primarily to determine the ability of an individual to make a sound weld, may then be used for the qualification of welding operators.

HEAT AND MECHANICAL PROBLEMS

The electric arc is particularly suitable as a source of energy for welding because the heat may be effectively concentrated on the surface of the metal being welded, and, in the case of the metal arc, the temperature is such as to boil the electrode away rapidly.

One of the factors controlling temperatures during welding is the dissipation of heat from the place where it is generated. Since the physical properties of solid steel are influenced by the maximum temperature of its liquid phase and the rate and manner of solidification, therefore, the

manner in which cooling takes place will have a profound effect on the properties of the weld and adjacent metal. Characteristics inherited from these temperatures and cooling rates are only partly removed by later extensive mechanical and thermal treatment of the metal. Differences between weld metal and forged or cast metals are partly due to the high heat of fusion in welding and the rapid solidification rate which follows.

The rate of cooling depends chiefly on convection, radiation and thermal conductivity. In thin sections the heat loss is chiefly by convection and radiation, whereas in heavy sections it is mostly by thermal conductivity. Preheating is, therefore, often used for heavy sections where the welds are small in comparison to the mass of base metal in order to lower the cooling rate and to decrease the hardening and chilling effects on the heat affected zone.

The most common and widely known effect of temperature on metals is expansion on heating and contraction in cooling in all three directions, length, width and thickness. Since welding is a local operation and metal deposited in the arc is in a highly superheated molten state, the extent to which the base metal will be heated and cooled will be very limited and there will be little possibility of free expansion and contraction. Because of this, a state of constraint will be originated in all welded articles, and this constraint is conveniently expressed in terms of stresses. These stresses may or may not disappear when room temperature is reached, and those which remain are usually referred to as "locked up" or "residual" stresses due to welding. Heat input, however, is not always responsible for residual stresses since they readily result from machining and cold forming operations. Any process subsequently applied which results in a reduction or removal of such stresses is called stress-relieving.

Residual stresses then, in welded work are introduced by the partial heating of the metal adjacent to the weld followed by irregular cooling. Their magnitude depends not only on the rate and sequence of welding, but chiefly on the rigidity or resistance to distortion of the surrounding parts. The cooling of mild steel welds from the molten state down to 600 deg. F. is accompanied by considerable yielding but below this temperature the residual stresses will develop rapidly; should they become sufficiently high to cause yielding of the structure or member, distortion will result, with a corresponding decrease in residual stress.

In general, the more a structure distorts during or after welding, the less will be the residual stresses, but this does not necessarily mean that because the welded structure is not distorted it will have high residual stress. Proper joint design and preparation, symmetrical arrangement of welds about neutral axes of the member of structure and a carefully planned sequence of welding will go a long way toward keeping both distortion and residual stress to a minimum.

There is considerable evidence that residual stresses, whether induced by cold work or hot work, tend to distribute themselves in time and reduce in value particularly when subjected to external loading. In the majority of members of mild steel subject to gradually applied load stresses or to steady stresses, they are not of serious importance. In cases where the loads are suddenly applied or in members of high-strength steel, plastic deformation may not have time to develop so that high residual stresses may become serious. In such cases, stress relief either by heat treatment or static preloading is highly desirable. Metals which will be subject to low temperatures, members which are to be machined after welding and vessels subject to corrosion should all be stress relieved.

The most common method of stress relief is by heat treatment. For mild steel, the yield point stress at 1,200 deg. F. is reduced to 8,000 lb. per sq. in. or less, therefore, stresses above this amount will produce a flow in the steel and will be relieved. To do this it is necessary to heat the member slowly and uniformly in a suitable furnace, and hold it at the above temperature a sufficient time for plastic

flow to take place, after which it is allowed to cool gradually and uniformly.

Other methods of stress relief are to peen the member or structure after welding or to slowly preload a structure before it is placed in service. In Europe it is not uncommon to apply internal pressure to welded containers of uniform thickness until the yield point of the metal is reached.

JOINT DESIGN AND PREPARATION

In the design of welded joints there are two general types of welds used, butt welds and fillet welds. These welds may be used in making many types of joints such as ordinary butt and fillet joints between parallel plates, tee joints between plates joining each other at an angle, corner joints and lap joints. The proper selection between butt and fillet welds is of importance both from the standpoint of economy in fabrication and service life of the structure, but no set rule can be applied for selecting the proper type.

Fillet welds, in general, require less preparation of the parts before welding because the parts may be lapped together without spending a great deal of time in bevelling and preparing the plate edges. If the plates are lapped it is not essential that their dimensions be held to close tolerances.

In joints where the plates are butted at right angles to each other it is necessary that the edge of the abutting plate be cut at right angles to the plate surface. This requires a single cutting operation with a shear, cutting torch or planer, but the prepared edge must be straight so that it will fit uniformly to the abutting plate. A space or gap between the two plates will reduce the effective size of the fillet welds and require the weld size to be increased by the amount of the gap, thus increasing the amount of weld material required.

Butt welds require a better fit of the parts to be joined and usually at least one of the plates is bevelled. For such welds in plates one quarter inch or less in thickness the edges are usually spaced about one eighth inch apart and are trimmed square. For plates over this thickness, the edges should be bevelled, either using a single vee, double vee, or U-type groove.

The inherent shape of a fillet weld is such that it produces abrupt changes in contour of the sections it joins, and consequently develops points of stress concentration, which may have to be considered in cases of dynamic loading. Most butt welds, especially those with little or no reinforcement, on account of their form, do not possess characteristics which produce stress concentrations; however, for the same reason they generally produce greater residual stresses, because greatest shrinkage takes place directly across the weld where the parts are not usually free to move. While the contraction in fillet welds is relatively the same, there is a possibility of a small movement occurring between the plates and in addition, the contraction is in such a direction it tends to bend or distort the parts thus lessening the residual stresses in them.

In order to increase the speed of welding it is desirable to deposit weld metal in the downhand position with large diameter electrodes. Butt welds are ideal for this purpose and are generally preferred. Fillet welds are of such a nature that usually one fusion zone is in the vertical plane. This necessitates either the use of small diameter electrodes or the use of welding jigs, manipulators or positioners to turn the work and permit downhand welding.

Another factor in connection with a selection between butt and fillet welds is that higher design stresses are often permitted for butt welds. The non-uniform stress distribution in fillet welds often results in secondary bending stresses or moments and so the permissible stresses are usually lower than for butt welds.

The preparation of the edges to be joined is of particular importance in welding. This procedure includes the preparation of the edges so as to provide the best possible conditions for welding, the cleaning of the metal edges, and

the making of allowances for expansion and contraction caused by heating and cooling.

In preparing edges for tee joints and open, square butt welds, the plates should be cut so they will match accurately when assembled for welding. This cutting may be done either by mechanical means or by the oxyacetylene cutting blowpipe. For single and double vee butt welds the edges are bevelled by whatever economical means will produce the desired results, using flame cutting, edge planing, chipping or grinding. U-grooves are usually made with either oxyacetylene gouging nozzles or by means of a specially shaped tool on an edge planer.

Preparation for welding also involves making sure that the edges are clean and free of oil, grease, paint, rust, scale or slag from the flame cutting operation. With the edges properly bevelled and cleaned for welding, steps should be taken to insure that the finished job will be in correct alignment, the accuracy of such alignment, of course, depending on the type of work being welded. Short lengths of welds called tack welds placed at intervals along the joint are used for this purpose. They are either chipped or melted out during the welding operation or they may become part of the finished weld. Lengths of bars, strips of heavy plate or various shapes of steel, V-blocks, clamps, jigs and fixtures are all employed in various ways for maintaining alignment. The importance of careful preparation of material and a good fit-up at welded joints cannot be stressed too strongly.

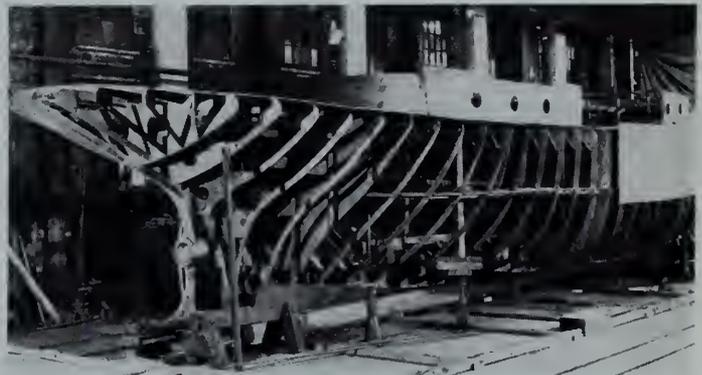

Fig. 3—Framing for all-welded ship, with plating partly assembled.

Not only will good fit-up reduce the amount of weld metal deposited but it will facilitate assembly and lower the residual stresses or distortion of the structure. When the decreased efficiency of the operator, greater waste of electrodes, straightening operations, etc., are taken into consideration, the cost per foot of weld will often be tripled as a result of poor fit-up.

For large or complicated work it is advisable to give careful study to the sequence of operations. This means a consideration of the location of all welds with reference to one another, the probable effect of expansion and contraction, the method of securing proper alignment and the order in which the welds should be made. Time spent in determining such a sequence of operations in advance will be well repaid by results during the subsequent welding operation.

INSPECTION AND TESTING

As in the case of much fabricated work, what is done by a welding process often requires inspection during the course of construction, either by the manufacturer, purchaser, or an agency which furnishes such services. The structures on which inspection is required will vary widely in design and type of welding application, so that no one class of inspectors can be expected to be proficient in all of them.

The inspector should enter a shop with two main thoughts in mind—namely, to obtain a good job properly fabricated to the applying code or specification, and to expedite the completion and delivery as much as possible. This involves

(1) good judgment on his part in the interpretation and application of such code requirements (since even most carefully prepared rules are not always clear and complete) and (2) full co-operation with the manufacturer in obtaining desired results and maintaining friendly relations between purchaser and fabricator.

As yet no method of testing comparable to "tapping rivets" has been devised although some have been put forward which are partially successful. Most of them work best with butt-welds and are not as applicable to the fillet welds more commonly used in structural practice.

The most effective but also the most costly are the X-ray or Gamma-ray methods, in which photographs of the welds are taken, utilizing the penetrating radiations of the X-ray tube and of radium to detect the character and extent of defects. For most pressure vessels, the various codes make X-ray examination one of the requirements of their fabrication.

Where radiographic equipment is not available, examination is sometimes made by trepanning or cutting sections from the welds. These sections should be taken at points where the welds look most questionable, and polished, etched and examined for objectionable defects.

The "magnaflux" or magnetic powder method of testing may also be used on finished welded products of ferrous metals which can be magnetized. This consists of first magnetizing the work, then sprinkling iron filings on a paper over the weld. The filings collect at points where defects occur, but considerable experience is required to properly apply and judge the results of this test.

For structural welding the visual inspection by a competent inspector during and on completion of welding is satisfactory, but in addition there are several definite things which can and should be done to insure workmanship of good quality. First, none but properly qualified welding operators should be permitted to do any welding where strength is a requisite consideration. Second, a definite procedure control should be followed. This involves correct preparation of the parts to be welded, selection of proper electrodes, the technique of the welding process and provision for adequate supervision. Third, joint surfaces should be clean and free from dirt, grease and paint which would interfere with the welding process.

These three steps will go a long way toward producing sound welds of the required strength. There is left the visual inspection of the finished weld. Observation of the welder at work will furnish information as to the character of his welds such as proper arc, amount of penetration, and correct settings of current and voltage. The surface of the weld should be fairly smooth without blowholes and cracks, and the edges should appear to thoroughly merge with the base metal, with no overlapping or undercutting. Fillet welds should be of the correct size and outline, and butt welds which are reinforced must be between the minimum and maximum height tolerances.

Pressure tests are sometimes used for closed containers such as low pressure vessels, tanks and pipes; these may be either hydrostatic or air but the use of air for testing is dangerous unless the correct type of safety valve is properly installed first.

RECENT DEVELOPMENTS

Great advances in welding techniques and equipment have been made which will influence the extent and character of future welding. Perhaps one of the most important developments of the past year is the successful introduction to industry of alternating current electrodes suitable for producing highest quality welds in the vertical and overhead positions. This means that many shops which were using a.c. welding for flat work only can now avoid the necessity of changing to direct current for vertical and overhead work, and obtain the inherent advantages of alternating current in all positions of welding.

Another development is the use of larger electrodes and higher welding currents where work conditions permit. By using larger electrodes it is possible to deposit two and even three times as much metal in a given time, obtaining faster production at great savings in cost. Arc blow is particularly troublesome when using high currents in d.c. welding, so that this development has been made possible only through the use of a.c. electrodes and equipment.

Recently there has been put on the market new welding equipment which has been developed especially for light gauge steel; this is leading to a tremendous increase in the use of metal arc welding in sheet metal work.

Armour plate, alloy steels in aircraft and other high-tensile steels are now being welded successfully with appropriate electrodes and technique. We can, therefore, build structures with welded high tensile steel and obtain double savings from the economy of welded shapes and details and the use of higher stresses permissible with such steels.

These are only a few of the many developments in welding processes and methods, but there are still many unsolved problems which offer fine opportunities for research and investigation. These problems will be largely solved by welders, metallurgists and engineers.

In the field of design, rigid frame structures are coming more and more into use, due to the ease with which they can be fabricated by welding with resultant economies in weight. Also, a great many items which were formerly made of cast iron or steel are now being replaced by weldments, but so far the welded part has been a close copy of the case one in size and shape. Here, then are wonderful opportunities for re-design whereby the amount of cutting, bending, welding and other operations may be reduced, and the full economy of metal arc welding may be realized. Welded joints well thought out by a designer who knows the action of a structure can be as near the attainment of ideal joints as practical and economic considerations will allow.

REPORT OF COUNCIL FOR THE YEAR 1942

TOGETHER WITH COMMITTEE AND BRANCH REPORTS

"Another year of war has come and gone, and through it all the Institute has continued to function in all its departments. Emphasis has been placed on certain activities and others have been allowed to subside, but on the whole it has been a year of greater activity. Increases in membership, and a substantial financial statement indicate that even under the disturbed conditions of to-day the engineers still look on the Institute as a vital part of the life of Canada, and an integral part of the war effort."

The above quotation is the opening paragraph of last year's report of Council. It is just as true of conditions throughout 1942 as it was for 1941. In fact, almost every section of last year's report could be used over again for this year. This is a good sign because it shows that the improvement and steady acceleration in Institute affairs is being well maintained.

Members are becoming spread over wide areas and in all parts of the world. New and greater responsibilities are being accepted on all sides. Unfortunately, only a few items of news get through, and it is impossible to form any adequate picture of the national service being rendered by the profession. It will be a happy day when the whole thrilling story can be told.

It is interesting to observe the difference in the effects of this war and the last one on Institute affairs. Between the first and the third years of the last war the membership increased only by sixty-nine. During the similar period of this war the membership has increased by eight hundred and thirty-eight. In one case the income increased by over Three Thousand Dollars and in the other case it has increased by over Nine Thousand Dollars. The more careful distribution of technical personnel, and the great industrial development in this country, have reduced the number of members on active service. In the last war thirty-six per cent of the entire membership was in the services.

In civilian affairs members continue to make great contributions. In Government departments and in industry engineers continue to occupy positions of administrative control, and technical responsibility. In the younger groups there is still the urge to leave peaceful industry for combatant activity, but many a young man, under pressure of his more important duty, has stayed at his industrial occupation while his interests and spirit were driving him to "go active".

Many members have been honoured—in the active forces and others in civilian occupation. Some have been wounded and others killed in action. Detail mention of these events is made from time to time in *The Engineering Journal*, as the information becomes available. Again it is apparent that the whole story will not be disclosed until hostilities have ceased, but the news that has come out in small amounts is an indication of the honourable part that is being and will be played by those who make up the membership of this organization. In the last war a great record was established. In this war it may even be surpassed.

BRANCH ACTIVITIES

The affairs of the branches have prospered in varying degrees. Those in large industrial centres have carried out active programmes, and have enjoyed increased membership. Some few branches have been less fortunate in that some of their members have moved to other areas and there has been no compensating movement into their areas. This tends to reduce activities and curtail expansion, but in spite of these conditions, all branches report a successful year.

VISITS TO BRANCHES

The president visited every branch in Canada, and attended every meeting of Council. His inspirational ad-

resses have been a stimulus to Institute affairs right across the country. He spoke also to many other organizations, and during his western trip included six visits with branches of the Alumni Federation of the University of Toronto. In all these public appearances, both in Canada and the United States, he did much to enhance the prestige of the Institute and the profession.

COUNCIL MEETINGS

Following established procedure, Council held several meetings away from Headquarters. These were at Vancouver, Niagara Falls, Toronto, and Halifax. In all, thirteen Council meetings were held throughout the year with an average attendance of twelve. Out of a total of forty-three councillors thirty-five attended at least one meeting, representing twenty-two out of twenty-five branches.

FINANCES

Perusal of the reports from the Treasurer and the Finance Committee indicate that finances are in good shape. The largest surplus that has been accumulated in many years is shown. The collection of arrears of fees has reached a new high level, being \$1,492.00 higher than last year. This is attributed to the fact that members are now all well employed, and that Headquarters has made a special drive to turn these paper assets into cash.

It is comforting to know that the Institute can operate with increasing financial stability even though fees are remitted to members overseas, and to members resident in combatant areas.

It is also of some satisfaction to see that in spite of new and increased activities which require substantial financial support, such as the Webster lectures and new committee undertakings, the balance sheet is still favourable.

ANNUAL MEETING

A review of the work of the year would not be complete without comment on the annual meeting held in Montreal. There seems to be unanimity of opinion that this was a record meeting from every point of view. The registration ran to eleven hundred and every function was patronized to the capacity of the facilities.

The good fortune of having Lieutenant General McNaughton as the banquet speaker was of itself a factor that would assure success. In addition to this as special guests were the presidents and secretaries of the seven leading engineering societies of the United States.

INTERNATIONAL RELATIONS

It is always a pleasure to report on the relations with sister societies in the Old Country and in the United States.

While the advent of war has made it more difficult to communicate with societies overseas, it has done much towards developing closer relationships. The common danger and the common effort to overcome it, have brought the British Isles and Canada closer together. The presence of so many Institute members "over there" has materially increased the number of contacts whereby each group has become better known to the other.

Many members of British Institutions are in Canada. Every effort has been made to locate such persons so that through the branches the facilities and hospitality of the Institute may be extended. Several branches report that they have frequently as guests engineers from across the Atlantic. It is to be hoped that these opportunities to welcome fellow members of the profession will be extended in 1943.

The presence of the presidents and secretaries of the

seven leading American societies at the 1942 Annual Banquet in Montreal was one of the best indications of the further development of the already good relationship with the sister societies south of the border. This was a most unique and impressive compliment to the Institute, much appreciated by all members.

Very close contacts with these societies are steadily maintained. The Engineers' Council for Professional Development is a splendid medium for this purpose. The visits of officers of the Institute to American meetings and joint meetings, such as that held at Niagara Falls, in October, are natural channels through which flows a steadily increasing volume of understanding and good-will. Engineering societies on both sides of the border are splendid agencies for this wholesome development.

ENGINEERS' COUNCIL FOR PROFESSIONAL DEVELOPMENT (E.C.P.D.)

In the second year of membership in this international co-operative body, it has been made even more apparent than before, that the Institute membership therein has placed it in a unique position to aid the profession and those aspiring to become a part of the profession. The continued study of problems by committees representing all eight member societies has produced new thoughts in the important general problems of professional development.

Committees on Engineering Schools, Student Selection and Guidance, Professional Training, Professional Recognition, and Engineering Ethics, have turned in annual reports which show that much time and thought has been expended by the prominent engineers who constitute their membership. The recommendations of these reports are the basis for the work of 1943, and indicate that this year will be productive of many more things helpful to the profession.

JOINT MEETING

One of the most successful and pleasant features of this year's programme was the joint professional meeting held in October at Niagara Falls, Ontario, with the American Society of Civil Engineers. It would be difficult to find a meeting that would be richer in those splendid qualities of good fellowship and professional interest.

Outstanding papers and inspirational non-technical addresses were delivered by members of both societies. Members of the Institute were particularly pleased with the contributions made by Canadians. President C. R. Young's luncheon address on "The Place of the Engineer", and Dr. H. J. Cody's banquet speech were reproduced in the December *Journal*.

It was the opinion of everyone that meetings of an international nature such as this should be held more frequently, not only because of the professional advantages, but also because of the opportunities afforded for developing better understanding between the individuals and the nations.

The Institute is glad to assure the officers and members of the American Society of Civil Engineers that visits such as this will always be welcome, and that the Institute will always be ready to co-operate to the fullest extent.

OVERSEAS CHILDREN

Up to the present there has been no report on the assistance given by the Institute and by members of the Institute to children and parents sent here from England for safety. This work has been so personal that it has not been thought wise to give any publicity to it. However, members will be glad to know that certain necessary assistance has been made available in many parts of Canada.

Members in such places as Halifax, Montreal, Toronto and Winnipeg are in contact with cases, and have been happy to lend aid and assistance. The Institute has been very active in some instances where the families of engineers have been involved, and has aided in supplying many of the necessities of life. The interest in these families will be continued as long as the need exists.

COMMITTEES

During the year three new and important special committees have been established. The work of these committees is related directly to national problems and, because of its importance, members of the committees are making heavy personal sacrifices to see that real progress is achieved.

Reports of the committees follow, and it is recommended that members not already familiar with the work read them carefully in order to have an appreciation of what is being attempted. The committees are—Committee on The Engineering Features of Civil Defence, Committee on Industrial Relations and Committee on Post-War Problems.

WARTIME BUREAU OF TECHNICAL PERSONNEL

The Bureau continues to do good work. Early in the year, Elliott M. Little and L. Austin Wright transferred from Director and Assistant Director respectively to the same positions in National Selective Service, and H. W. Lea and J. D. Dymond were selected to fill these vacancies in the Bureau.

Order-in-Council 638 passed in March gave the Bureau more power and authority, and provided certain controls which have aided materially. This legislation was the first attempt in Canada to apply compulsion in the manpower field.

Without having any legal obligation to do so, the Bureau functioned as a division of Selective Service, thereby orienting its work with the larger activity in order to aid in providing a complete coverage in a co-operative manner. Changes now being contemplated by the Department of Labour may make this relationship even closer. It is to be hoped that the new plans do not contemplate the total absorption of the Bureau into the Department, and the transfer of the administration to the Department in place of leaving it with the professional societies themselves as at present.

The Bureau was set up in February, 1941, by an Order-in-Council which named The Engineering Institute of Canada, the Canadian Institute of Mining and Metallurgy, and the Canadian Institute of Chemistry to "organize the placement of technical personnel".

ROLL OF THE INSTITUTE

The membership of all classes now totals 5,652, which is again a new record. New names added to the roll for the year 1942 amounted to 485, but deaths, resignations and removals reduce the net figure to a gain of 279. This is a gratifying figure, particularly in face of the fact that all persons three years or more in arrears have been removed from the membership list. It is likely that the present outstanding total of arrears is the lowest that has obtained for many years.

During the year 1942, four hundred and sixty-nine candidates were elected to various grades in the Institute. These were classified as follows: One Honorary Member; one hundred and seventy-seven Members; sixteen Juniors; two hundred and fifty-six Students, and nineteen Affiliates. The elections during the year 1941 totalled four hundred and thirty-nine.

Transfers from one grade to another were as follows: Junior to Member, fifty-nine; Student to Member, thirty-two; Affiliate to Member, one; Student to Junior, eighty-eight; Student to Affiliate, one; a total of one hundred and eighty-one.

The names of those elected or transferred are published in the *Journal* each month immediately following the election.

REMOVALS FROM THE ROLL

There have been removed from the roll during the year 1942, for non-payment of fees and by resignation, sixty-one Members; twenty-one Juniors; sixty-eight Students, and one Affiliate, a total of one hundred and fifty-one. Sixteen reinstatements were effected, and twenty-one Life Memberships were granted.

During the year 1942 the deaths of fifty-four members of the Institute have been reported as follows:

HONORARY MEMBER

Adams, Frank Dawson. Montreal, Que.

MEMBERS

Aggiman, Jacques Nissim New York, N.Y., U.S.A.
 Andrewes, William Edward London, Ont.
 Archibald, Ernest M. West Palm Beach, Florida, U.S.A.
 Armstrong, Thomas Styraker Port Arthur, Ont.
 Baltzell, Willie Henry Pittsburgh, Pa., U.S.A.
 Bang, Claus Marius Deer Lake, Newfoundland
 Buckley, Rex Elmer Glen Ferris, West Virginia, U.S.A.
 Byers, Archibald Fullarton Montreal, Que.
 Cregeen, Kenneth Thomas Montreal, Que.
 Dennis, Earle Munro Ottawa, Ont.
 Duckworth, Walter Ritchie Vancouver, B.C.
 Duncan, G. Rupert Fort William, Ont.
 Evans, John Maurice Montreal, Que.
 Fuller, Royden John Toronto, Ont.
 Jackson, Donald Alphonse Chatham, N.B.
 Jackson, John H. Toronto, Ont.

Respectfully submitted on behalf of the Council,

C. R. YOUNG, M.E.I.C., *President*.
 L. AUSTIN WRIGHT, M.E.I.C., *General Secretary*.

The President and Council:

As can be seen from the financial statement your Institute has had a successful year from a financial point of view, all of which is covered in the report of your Finance Committee. The securities for your investment account which are shown in the statement as totalling \$16,588.51 have been checked and found in order. The actual market value of these securities as at to-day's date is approximately \$18,000.00.

Respectfully submitted,
 E. G. M. CAPE, M.E.I.C., *Treasurer*.

FINANCE COMMITTEE

The President and Council:

It is with much pleasure that your Finance Committee reports a satisfactory financial year for The Engineering Institute of Canada.

The Balance Sheet, which has been prepared by the Auditors, shows a surplus of \$3,208.56 for the year's operations, and that notwithstanding the fact that a new Special Building Fund Reserve was created, and that an unusual expenditure was incurred in publishing Professor Webster's lectures.

Your Committee feels that a Special Building Reserve should be created covering any possible future repairs or replacements of major character, and has set aside, for this purpose, an amount of \$3,500. The reserve for the Building Maintenance has been increased from \$1,350 to \$2,000, which should cover the usual repairs.

The amounts covered by these special reserves, as well as that of the excess of the Revenue over Expenditure, for the year, has been invested in Government Bonds.

You have decided, last year, that the Past-Presidents' Fund, which is made up of private subscriptions, for a special purpose, should be reported to Council only. In consequence, the investment, represented by this Fund which amounted, in last year's report, to \$6,212.90, has been withdrawn from the list of investments in this Report.

Respectfully submitted,
 DEGASPÉ BEAUBIEN, M.E.I.C., *Chairman*.

BOARD OF EXAMINERS AND EDUCATION

The President and Council:

Your Board of Examiners and Education for the year 1942 has had prepared and read the following examination papers with the results as indicated:

	Number of Candidates	Number Passing
I. Elementary Physics and Mechanics	2	1
II. (a) Strength and Elasticity of Materials	3	2
VII. (a) General Paper on Structures	2	1
VII. (b) (1) Structural Steel Design	1	1

Respectfully submitted,
 R. A. SPENCER, M.E.I.C., *Chairman*.

COMMITTEE ON POST-WAR PROBLEMS

The President and Council:

Your Committee on Post-War Problems begs to submit the following résumé of its activities for 1942.

The early part of the year was spent in organization. An endeavour was made to have where possible a reasonable distribution of membership that would be representative of all parts of the country as well as of both the public services and private industry.

After organization, a study was made of the memorandum

entitled "Considerations for Evaluating Projects" submitted by the Sub-Committee on Post-War Construction Projects of the James Committee on Reconstruction of the Federal Government. This memorandum was subjected to critical examination by each branch of the Engineering Institute. The comments from the various branches were then studied by your Committee, the reports co-ordinated, certain suggestions originating with members of the Committee incorporated and the final results reported to Council for their approval and transmission to the proper quarters.

At the suggestion of the chairman of the Sub-Committee, each branch of the Institute was communicated with and given a list of local Citizens' Committees concerned with the Rehabilitation of Returning Soldiers. It was suggested that the branches might give some assistance to these committees. Each local Citizens' Committee of record, about one hundred in all, was written and offered the services of engineers in their work. The combined response of these letters indicated that in several branches active work was going on along these lines. A number of letters were received expressing appreciation of the offer of help and intimating that it would be accepted. One branch of the Institute in a centre in which there is no local Citizens' Committee has offered to give leadership in the organizing of such a group.

It is recommended that the Council give every encouragement to Institute Branches for the study of post-war problems both as a branch and by way of assistance to local representative Citizens' Committees, particularly in endeavouring to see, in the formation of the latter, that interested engineers are included in their personnel. This work presents an opportunity for disinterested public service on the part of the profession, and each engineer, to the extent that he makes a contribution to this work, will not only assist it constructively but will also be the means of impressing on the non-engineering members, and through them citizens generally, with the place that our profession can take in the general councils of a post-war economy. A great opportunity is before us. What we do with it is up to ourselves alone.

Respectfully submitted,

W. C. MILLER, M.E.I.C., *Chairman.*

COMMITTEE ON WESTERN WATER PROBLEMS

The President and Council:

Your Committee on Western Water Problems has been advocating the construction of further works to utilize fully Canada's share of the St. Mary and Milk Rivers in Alberta. By Order-in-Council dated February 17th, 1941, the Dominion Government named the following committee to study the matter:

Victor Meek (Chairman), Controller, Dominion Water and Power Bureau, Ottawa, designated by the Minister of Mines and Resources;

George Spence, Director, Prairie Farm Rehabilitation Branch, Regina, designated by the Minister of Agriculture;

William E. Hunter, Accounts Branch, Department of Finance, Ottawa, designated by the Minister of Finance.

This Government Committee prepared a comprehensive report which has recently become available in printed form. We quote its general recommendations as follows:

"The Committee is not unmindful of the tremendous burden placed upon the Federal treasury because of the War. We realize the necessity of minimizing expenditures which are not essential to the war effort. We realize that the commencement of construction at this time would involve the employment of labour, skilled and unskilled, and the use of materials essential to war industry. We believe, however, that the St. Mary and Milk Rivers Development should be included as a part of the Dominion's post-war rehabilitation programme and we recommend:—

"(1) That the proposed development be reserved as a post-war measure.

"(2) That the Dominion and the Province of Alberta enter into an agreement, to be confirmed by legislation, setting out the general principles governing the development as a co-operative undertaking.

"(3) That surveys and investigations be continued so that construction may be begun without delay after the war.

"(4) That this report be referred to the Committee on Reconstruction."

In view of its importance we suggest that members of the Institute make a point of studying this report. Those wishing to obtain a copy should write the Director, Prairie Farm Rehabilitation Branch, Department of Agriculture, Regina.

In November, 1942, informal meetings were held in the West under the auspices of the Sub-committee on Natural Resources of Dr. James' Reconstruction Committee and the sites of the proposed St. Mary River works were visited. Dr. James' Committee was represented by Dr. J. B. Challies, M.E.I.C., Prof. J. J. O'Neill, M.E.I.C., and Prof. L. C. March. Members of your Committee were invited to present their views and at the various sessions your committee was well represented.

Respectfully submitted,

G. A. GAHERTY, M.E.I.C., *Chairman.*

COMMITTEE ON ENGINEERING FEATURES OF CIVIL DEFENCE

The President and Council:

In April, 1942, Professor F. Webster, Deputy Chief Engineer of the Ministry of Home Security, London, England, gave a series of lectures in Toronto, under the auspices of The Engineering Institute of Canada. In May, the general secretary of the Institute requested the chairman of each Branch of the Institute to appoint a Branch Committee to deal with the local application of the information presented at those lectures.

In June, the Committee on Engineering Features of Civil Defence was set up, to consist of members appointed by the president of the Institute and of the chairmen of the Branch Committees appointed under the general secretary's request. During the year, 21 branches appointed Branch Committees, one of which is serving two branches. The personnel of this Committee now consists of 13 members appointed by the president, 6 of whom are also Branch Committee chairmen, and 15 other Branch Committee chairmen, making a total of 28.

In connection with the engineering features of civil defence, this Committee has co-operated with the Hon. Dr. R. J. Manion, Director of Civil Air Raid Precautions, and the Branch Committees have co-operated with Dr. Manion's appropriate Provincial A.R.P. Committees and with local A.R.P. organizations. This Committee, with the hearty co-operation of the Canadian Engineering Standards Association, has maintained contact with that Association, and through the Branch Committee chairmen, has acted in an advisory capacity to the Branch Committees, all with a view to avoiding duplication of effort.

This Committee has had prepared and Council has had printed and placed on sale through Headquarters of the Institute, a 55-page book entitled "Structural Defence Against Bombing." This reference book on the engineering features of civil defence as applied to structures has been well received by engineers and architects.

This Committee, jointly with authorized representatives of the Royal Architectural Institute of Canada and the Canadian Construction Association, prepared a memoran-

dum suggesting an organization to cover an essential field in civil defence not now covered by either Dr. Manion's A.R.P. organization, or by military organizations. With an appropriate letter of transmissal dated November 3, 1942, this memorandum was forwarded to the Prime Minister as a joint submission over the signatures of the presidents of these three organizations. It was promptly acknowledged, but so far no action on it has been reported.

This Committee is continuing its work on specifications and instructions relative to the engineering features of civil defence in connection with air raid shelters and the protection of existing and proposed hotel, apartment, office, store, plant and other buildings and dwellings, and of the personnel and equipment in them.

Respectfully submitted,

JOHN E. ARMSTRONG, M.E.I.C., *Chairman*.

MEMBERSHIP COMMITTEE

The President and Council:

During the past year your Membership Committee made a careful study of those sections of our By-Laws relating to the classifications of "Branch Affiliate," "Institute Affiliate" and "Member". In doing so they gave consideration to the resolutions from Montreal and Toronto Branch Executives, also, suggestions submitted by officers and members of the Institute from coast to coast.

The basis of our study was an endeavour to simplify the procedure and ensure a uniform interpretation of our By-Laws with regard to the election of Members until more normal conditions return, when our By-Laws can be revised.

Final recommendation was submitted to Council at its December 19th meeting in Montreal, and included a memo to be sent to all Branch Executives, together with a form to be used in summarizing the qualifications of each applicant.

Respectfully submitted,

JOHN G. HALL, M.E.I.C., *Chairman*.

COMMITTEE ON PROFESSIONAL INTERESTS

The President and Council:

The Committee on Professional Interests is glad to report that during 1942 another definite step forward was taken towards the goal of Dominion-wide professional solidarity when, on January 12th, at Saint John, an agreement between the Institute and the Association of Professional Engineers of the Province of New Brunswick was consummated.

It is the opinion of the Committee that each of the co-operative agreements that have been entered into to date affecting the provinces of Nova Scotia, Saskatchewan, Alberta and New Brunswick is proving its real worth. They add up to an impressive total and indicate a trend toward a common membership between the national engineering society and the provincial registration bodies that should in time become Dominion-wide.

In the four provinces mentioned, practically all the corporate members of the Institute now enjoy the advantage of registration.

A draft of a co-operative agreement between the Institute and the Association of Professional Engineers of the Province of Manitoba has been worked out by a joint Manitoba committee representing both the Institute and the Association. The draft has been agreed to in principle by the Council of the Institute and when approved of by the officers of the Association will be submitted for formal endorsement by the Institute as required by Section 78 of the By-laws.

During the year, preliminary discussions were instituted by the Montreal Branch looking to a co-operative agreement between the Institute and the Corporation of Professional Engineers of Quebec.

As for the provinces of Ontario and British Columbia, the readiness of the Institute's committee to discuss co-operation in any form with the efficiently operated registration bodies is well known.

Respectfully submitted,

J. B. CHALLIES, M.E.I.C., *Chairman*.

COMMITTEE ON INDUSTRIAL RELATIONS

The President and Council:

At its meeting in Toronto on April 25th, 1942, the Council of The Engineering Institute of Canada passed a resolution instructing the president to draw terms of reference for an Industrial Relations Committee and recommended to Council the composition of such a committee. At its meeting in May, 1942, the Council ratified the recommendations of the president and a Committee on Industrial Relations was formed. In selecting the members of this Committee, representation was secured from engineers engaged in Industrial Relations work and the broader field of administration, as well as from those engaged in presenting courses on this subject in the three universities of McGill, Queen's and Toronto.

The first meeting of this committee was held in Toronto on July 25th, 1942; further meetings have been held September 11th, October 16th, November 25th, 1942, and January 22nd, 1943.

Naturally, as the subject of industrial relations was new to the work of the Institute, the Committee has spent a considerable amount of time in general discussion and in study of the broad subject as well as in consideration of the special approach which engineers and the Institute should make in order to develop constructive suggestions and a sound programme for the future. As part of its general programme, it has arranged for the publication in the *Journal* of the Institute of articles on industrial relations and reprints of outstanding articles which have appeared elsewhere.

In reviewing the general subject, it was early found that some universities and engineering colleges were teaching certain phases of industrial relations. Letters were sent to the universities in Canada and details of the various courses being taught were gathered together and tabulated. Information of this tabulation was sent to the universities with the recommendation that study be given to the expanding of the present courses in industrial relations and offering the assistance of the Committee if they so desired. The Committee at the present time has a sub-committee working on a suggested syllabus dealing with a course in industrial relations, particularly applying to engineering colleges.

Through the co-operation of the Papers Committee, a letter was sent by that Committee to all branches, recommending that during the session one or more papers dealing with industrial relations be presented before the Branch and offering the assistance of this Committee in obtaining speakers if it was desired. Correspondence has been carried on with the branches and papers have been presented before various branches of the Institute and other papers are scheduled.

At the request of the committee in charge of the Annual Meeting, this Committee has assumed the responsibility for one session at the Annual Meeting and has arranged for Professor Viteles of the University of Pennsylvania and in charge of Personnel Research of the Philadelphia Electric Company, to present a paper on "A Scientific Approach to the Problems of Employee Relations" and Dr. Bryce M. Stewart, Director of Research, Industrial Relations Counselors, Inc., New York, formerly Deputy Minister, Department of Labour for Canada, to speak on "The Role of the Industrial Relations Executive in Company Management"; arrangements are also being made for thorough discussion of these subjects.

Your Committee has been greatly encouraged by the interest shown in this subject and in its activities by many of the university heads who have been contacted and by

many members of the Institute. Progress made by the Committee since its appointment would indicate that while little in the way of concrete results can be shown, a good start has been made and in the subject like the one before it, hasty action might defeat the whole purpose of its discussions. It is hoped that enough has been done to show the necessity for such a committee and that future committees will extend the work that has been started.

Respectfully submitted,
WILLS MACLACHLAN, M.E.I.C., *Chairman.*

LEGISLATION COMMITTEE

The President and Council:

No legislation affecting the interests of the Engineering Institute or of the engineering profession in general, came to the attention of the Committee during 1942. There is consequently nothing to report.

Respectfully submitted,
JOHN L. LANG, M.E.I.C., *Chairman.*

COMMITTEE ON THE TRAINING AND WELFARE OF THE YOUNG ENGINEER

The President and Council:

The Committee on the Training and Welfare of the Young Engineer asks leave to make its fourth annual report.

During the year you have asked for reports on several matters referring especially to the younger members of the profession. These included—

- (a) The continuance of the five Student and Junior prize competitions; and
- (b) The possibility of Government grants-in-aid to engineering students after the war ends.

Council has taken action on our report on the first, and it is hoped that competition will be increased in the several Zones. The second question will require further and continued study before any definite recommendations can be offered.

STUDENT SELECTION AND GUIDANCE

The brochure "The Profession of Engineering in Canada" was printed in February and upwards of 9,000 free copies have been distributed to all the high schools of all the provinces of Canada, and to the universities, with instruction in the English language. In December, through the generosity of Dr. J. B. Challies and his associates, 5,000 copies of a French translation were printed. These are being distributed to all the high schools and classical schools in Quebec and the other provinces where instruction is in French.

BRANCH STUDENT GUIDANCE COMMITTEES

These have been set up in 21 of the twenty-five branches. The personnel in every case is composed of outstanding members of our profession. This augurs well for the success of the undertaking. Each of these committees, and also the Branches which have not yet appointed committees, have been supplied with information as to the objectives of our committee, instructions on the approach to students, copies of "Engineering as a Career" and of the "Manual for

Counsellors," both of the Engineers' Council for Professional Development, and of the Institute brochure. You will doubtless be interested in some of the results.

The Halifax Branch, under the leadership of Professor A. E. Flynn, M.E.I.C., has organized the whole province, including the Cape Breton Branch district, and District Vocational Counsellors have been appointed to cover the forty schools from which the greater number of students are graduated. The Provincial Science Library has purchased books on guidance for the use of these counsellors. There is definite co-operation evident among all those interested in engineering education.

The Montreal Branch has given definite leadership in Quebec under Jacques Benoit, M.E.I.C. The Quebec, Saguenay and Saint Maurice Valley Branches are now co-operating fully and the issue of the French edition of the brochure has stimulated interest.

Through the efforts of G. R. Langley, M.E.I.C., chairman of the Peterborough Branch committee, a general Vocational Guidance Committee was set up by the Peterborough Board of Education and three members of the Engineering

We have audited the books and vouchers of The Engineering Institute of Canada for the year ended 31st December, 1942, and have received all the information we required. In our opinion the above Statement of Assets and Liabilities and attached Statement of Revenue and Expenditure for 1942 are properly drawn up so as to exhibit a true and correct view of the Institute's affairs as at 31st December, 1942, and of its operations for the year ended that date, according to the best of our information and the explanations given to us and as shown by the books.

(Sgd.) RITCHIE, BROWN & Co.,
Chartered Accountants.

MONTREAL, 19th January, 1943.

Institute of Canada are members of that committee. The E.I.C. activities have been extended to other municipalities in the branch district.

At Toronto, The Engineering Institute of Canada and the University of Toronto Alumni Guidance Committees have joined forces to cover all the schools in that city. Professor R. F. Legget, M.E.I.C., has given this work his personal attention. The branch holds a successful Students' Night every year and with more than 1,400 engineering students at the University of Toronto, this feature will no doubt be emphasized in the future and help to bring the students in contact with practicing engineers. The recent formation of a Junior Section in Toronto should go a long way toward increasing the interest of the younger engineers in the affairs of the Institute.

The Border Cities and London Branches have depended largely on the efforts of individual members to carry out the guidance programme, with a fair degree of success. The work at Windsor has been divided between C. G. R. Armstrong, M.E.I.C., and T. H. Jenkins, M.E.I.C., and many students have received valuable advice from them. The London Branch interviews have not been as numerous, but were equally effective and they extend into the four cities of the district.

In the Western Provinces committees have been formed in all the branches except Lethbridge. The principal activity has been in the Calgary and Saskatchewan Branches. Unfortunately, Professor H. R. Webb, M.E.I.C., who had been appointed chairman of the Edmonton Branch Committee, met a tragic death early last summer.

At Calgary, where student guidance work had been carried on for a number of years by service clubs in co-operation with the school board authorities, the Institute committee is working through the present local organization, and under the chairmanship of J. B. deHart, M.E.I.C., increased activity is expected.

D. A. R. McCannel, M.E.I.C., Chairman of the Saskatchewan Branch committee, has organized local committees in the several cities of the province. The Collegiate Institute Boards have welcomed these advisors and it is expected that the coming year will show definite results.

The Winnipeg Branch has been active under the chairmanship of Professor A. E. Macdonald, M.E.I.C., and they have adopted a programme embracing the schools of the city of Winnipeg and of the province of Manitoba. The committee is ready to supply speakers and it is discussing the matter of student guidance with the educational authorities.

Both branches of the Institute in British Columbia have set up committees and these are co-operating with the local organizations in presenting the needs for the engineering profession to interested students.

PROGRAMME FOR 1943

It is evident that several methods of approach may be adopted in order to present the information which we have concerning engineering guidance. In some communities, addresses to student bodies and individual interviews have been used with very good results. The distribution of the Institute brochure has brought enquiries from individual students all over Canada. It is evident that this booklet alone has brought to the young men sufficient information to compel them to think seriously of their approach to further studies. The work of these committees has now started along a definite course and your committee is sure that the interest of the branches will increase provided, of course, the general committee continues its activities.

The circumstances of the war has taken many of our young engineers from their normal activities and from contacts with the older members of the profession. Some day these men will return, more experienced, more disciplined and ready to take their rightful place in the Canadian

professional, economic and social life. To these will be added the increased number of students graduating from our universities. What will we have to offer them? Those who will return to former employment may not adapt themselves readily to changed methods and conditions. A rehabilitation process must be evolved to meet this situation.

Others will come back to no former employment. We must associate ourselves with the study of post-war problems if for no other reason than that we have a moral obligation to help these men. It is evident not only in Canada but in the United States, that national and local governments will be embarking on extensive post-war reconstruction projects. For this work the young engineer should be especially trained not only technically but to handle the administration under a governmental set-up. Other engineers will be used in industries and ultimately move on to managerial positions and again, research will require a greater number of technically trained men who are adapted to this type of work.

The Professional Training Committee of the Engineers' Council for Professional Development is preparing a booklet for distribution to young men, giving a lead in such matters as have been described. It will be the duty of our committee to watch the progress, to study the local situations, and to present concrete proposals to the Institute. It is our hope that many of the senior members of the Institute will give some attention to this problem and their advice will be welcomed.

Respectfully submitted,

HARRY F. BENNETT, M.E.I.C., *Chairman.*

LIBRARY AND HOUSE COMMITTEE

The President and Council:

This committee reports as follows for the year 1942:

Owing to the fact that a great deal of building repair work was done in 1941, repairs were held to absolute essentials during the year. The largest items, outside of minor routine repairs, being re-roofing the new section of the building that had been already authorized in 1941 and repairs to the front entrance steps which will be continued next spring.

Routine work was handled very efficiently and economically by the staff.

LIBRARY

Tabulated below is a summary of the accessions to the library in the past year together with the number of requests for information received by the librarian:

Books borrowed.....	406
Bibliographies (a total of 29 pages).....	22
Photostats furnished:	
Negatives.....	229
Positives.....	171
Figures.....	13
Requests for information:	
By telephone.....	779
By letter.....	373
In person.....	412
Books presented by publishers for review in the Journal	46
Books presented to the library.....	13
Proceedings and Transactions.....	27
Reports (including Standards and Tentative Standards)	373
ARP and Civilian Defence.....	11

We also acquired material published by the Office of Civilian Defence, Washington, D.C.

The above figures show an increase in the use of the library for the past year. It is recommended that a complete survey of the library be made with a view to removing

obsolete material from the shelves. It might be possible, for this purpose, to obtain the advice of members of the Institute well versed in the various branches of engineering.

Publishers of technical books in the United States and Great Britain should be requested to send review copies of their new books in acknowledgment of the Book Notes appearing monthly in the *Journal*. Thus it would be possible, at little cost, to provide the library with the newest books.

Respectfully submitted,

WALTER G. HUNT, M.E.I.C., *Chairman*.

EMPLOYMENT SERVICE

The President and Council:

The marked decrease in the activities of the Employment Service as shown in the accompanying table is due mainly to the new legislation of the Wartime Bureau of Technical Personnel.

	1941	1942
Registered members	77	34
Registered non-members	75	45
Number of members advertising for positions ..	14	19
Replies received from employers	9	48
Vacant positions registered	229	134
Vacancies advertised in the <i>Journal</i>	35	58
Replies received to advertised positions	110	101
Men's records forwarded to prospective employers	302	35
Men notified of vacancies	306	117
Placements definitely known	71	30

On March 23rd, 1942, the Wartime Bureau of Technical Personnel was given control over the distribution of technical manpower. Under these regulations, it became compulsory for our members, along with other technically-trained persons, to register with the Wartime Bureau if they had not already done so, and to report to the Bureau if afterwards they became unemployed or available. The same regulations make it necessary for the employer to notify the Bureau of each specific need for technical personnel and to apply for permission to employ any technically-trained person.

The effect of these regulations has been an important decrease in the number of inquiries from employers filed with our Employment Service Bureau and, correspondingly, a smaller number of applications for employment from engineers. The additional time thus made available to our Bureau staff has been well taken up by other activities which had to be taken care of during the absence of the general secretary, on loan to the National Selective Service at Ottawa.

The establishment during the year, by the Wartime Bureau, of regional offices in Montreal and other centres, has afforded closer co-ordination of effort between the Bureau and our Employment Service. Members and other engineers who have applied to us during the year have been properly instructed as to the governmental regulations with which they were expected to comply and have been directed to the regional offices of the Wartime Bureau. Useful exchanges of information have been made between the Ottawa office of the Bureau and our Employment Service. Again this year, the Employment Page of the *Journal* has been open to members and employers and has proved of distinct value in establishing contacts.

Assistance has been continued to the armed forces in recruiting their technical personnel. In this connection, the assistant general secretary is a member of a committee, in Military District No. 4, for the selection of potential French Canadian officers.

Respectfully submitted,

L. AUSTIN WRIGHT, M.E.I.C., *General Secretary*.

COMMITTEE ON INTERNATIONAL RELATIONS

The President and Council:

Conditions accompanying the war and the generally disturbed state of affairs, have not been conducive to formal international relations, so that there has been little for the Committee to do. The intimate contacts between Great Britain, the United States and Canada, incident to war contracts and supplies, has, however, greatly strengthened informal relationships.

As far as the United States is concerned, the Engineers' Council for Professional Development, on which the Institute has three members, apart from five others who are members of its Committee, has kept up connection between us and them, and some account of the work of this Council has already appeared in the Journals of the Societies. Several members of the International Relations Committee have attended the professional meetings of some of the American founder societies, and at least one paper was presented by one of the members in that connection.

One event of unusual importance was the joint meeting, held at Niagara Falls, Ontario, October 13th to 15th, 1942, of the American Society of Civil Engineers and The Engineering Institute of Canada. The total attendance was about 400, and many of our members were present at the meetings, and our president and others took a prominent part therein. Civilian defence of Canada and the United States was one of the subjects discussed, and members of both societies were greatly pleased by the spirit of friendship and good feeling existing between these two adjacent nations.

The Committee records its profound sorrow over the recent death of Past-President H. H. Vaughan, one of its members. Mr. Vaughan had a very close connection with our own Institute, The American Society of Mechanical Engineers and the Institution of Mechanical Engineers, and was in a position to create very harmonious relations amongst members of the profession in different countries. He is a distinct loss to the Committee.

Respectfully submitted,

ROBERT W. ANGUS, M.E.I.C., *Chairman*.

COMMITTEE ON DETERIORATION OF CONCRETE STRUCTURES

The President and Council:

The Committee on Deterioration of Concrete Structures has nothing to report this year. The members of the Committee are all busy men and due to war conditions it seems to me inadvisable to press them in connection with committee work unless some special problem should come up which was related to the present emergency.

At the beginning of the year I questioned whether or not this committee should be continued if it could not be active, but there is plenty of work for the committee to do in more favorable times; and I am now inclined to the belief that we should maintain it in its present form ready to work actively when the war is over, for at that time there will be much deferred maintenance to be carried out on concrete structures and the work of the committee will become of interest to a great many of the Institute's members.

Respectfully submitted,

R. B. YOUNG, M.E.I.C., *Chairman*.

PUBLICATION COMMITTEE

The President and Council:

The Publication Committee submits the following report for the year 1942:

As usual, the principal work of the committee has been the publication of the *Engineering Journal*, and we feel that in spite of the difficult and strenuous times through which we are passing the standards have been well maintained.

It is a source of satisfaction to point to the many contributions the *Journal* has received from special correspondents overseas. Most of these have been along aeronautical lines, and our correspondents have been experts in that field. Correspondence from members in the United States has also been an important feature of several numbers of the *Journal*. The committee is indeed grateful to these people for their contributions.

The Institute's membership in the Engineers' Council for Professional Development has brought to us several excellent papers which appeared simultaneously in the publications of all the societies making up the membership of the Engineers' Council. These articles all related to the professional and ethical side of engineering.

Several excellent papers have been submitted to the committee for which publication was denied because the censors failed to give approval.

An important publication for the year was the French translation of the booklet "The Profession of Engineering in Canada." The English version was printed last year. This publication and translation was carried on under the auspices of the Committee on the Training and Welfare of the Young Engineer, but it also received the approval of the Publication Committee. The Institute is much indebted to Messrs. Huet Massue and H. Gaudefroy for their assistance in preparing an excellent translation.

Another publication which has entailed a lot of work and expense was the printing of the notes of Professor Fred Webster's lectures on "Structural Defence Against Bombing." Since the original confidential notes were printed, an abridged edition has been published which has already gone into the second printing. The work associated with these publications was very largely attended to by the Institute's Committee on the Engineering Features of Civil Defence, and the Publication Committee is glad to take this opportunity to acknowledge the excellent work of that Committee.

Although it involves no work for the Publication Committee, it is interesting to report that the advertising portion of the *Journal* continues to operate on a quite satisfactory basis. The volume of advertising is being well sustained.

In May of 1943, the *Engineering Journal* will celebrate its 25th Anniversary. It is proposed to fittingly acknowledge this anniversary by means of a special number.

Respectfully submitted,

C. K. McLEOD, M.E.I.C., *Chairman*.

PAPERS COMMITTEE

The President and Council:

The Papers Committee has not accomplished as much during the year as it had hoped to do. The war work undertaken by the various members is restricting most other activities. However, some meetings have been arranged, and the following is a brief outline.

Harry F. Bennett of London, Ontario, chairman of the Institute's Committee on the Training and Welfare of the Young Engineer, made a tour of all the four maritime provinces early in the year. These meetings were well attended and his visit was very much appreciated.

Professor Fred Webster, deputy chief engineer, Ministry of Home Security, London, England, visited seven branches, Halifax, Saguenay, Montreal, Ottawa, Toronto, Vancouver, and Victoria. His topic was "The Structural Features of Defence Against Bombing."

The committee would like to emphasize the value of regional meetings of Council. Such meetings promote co-operation between engineers, and are stimulus to closer relationship between branches, inasmuch as they bring together officers of the Institute and councillors from all branches in the zone.

A perusal of the reports of branches indicates that the papers through the year have been of a high standard. The

committee believes that assistance to branches could be extended by a better supply of motion picture films as well as papers.

It is encouraging to see that the officers and members of the Institute are developing the practice of visiting branches when, for business or other reasons, they travel in different parts of Canada.

Respectfully submitted,

JAMES A. VANCE, M.E.I.C., *Chairman*.

STUDENTS' AND JUNIORS' PRIZES

The reports of the examiners appointed in the various zones to judge the papers submitted for the prizes for Students and Juniors of the Institute were submitted to Council at its meeting on January 16th, 1943, and the following awards were made:

H. N. Ruttan Prize (Western Provinces). No papers received.

John Galbraith Prize (Province of Ontario), to Robert J. G. Schofield, Jr., M.E.I.C., for his paper "Cotton Yarn Dyeing."

Phelps Johnson Prize (Province of Quebec—English), to Paul O. Freeman, S.E.I.C., for his paper "Cold Rivetting—Its Principles, Procedure and Advantages".

Ernest Marceau Prize (Province of Quebec—French), to René Dansereau, S.E.I.C., for his paper "Etude comparative de la construction, par la rivure et par soudure, d'un pont-route en acier."

Martin Murphy Prize (Maritime Provinces). No papers received.

GZOWSKI MEDAL COMMITTEE

The President and Council:

It is the unanimous recommendation of your Committee that the Gzowski Medal for the year 1942 be awarded to Dr. S. D. Lash, M.E.I.C., for his paper, "Notes on the Analysis and Design of Rectangular Reinforced Concrete Slabs Supported on Four Sides," as published in the September, 1941, issue of the *Journal*.

Respectfully submitted,

H. V. ANDERSON, M.E.I.C., *Chairman*

DUGGAN MEDAL AND PRIZE COMMITTEE

The President and Council:

Your Committee, consisting of Messrs. J. M. Fleming and R. C. Flitton together with the writer, has examined carefully a number of papers presented to the Institute during the year ending June 30, 1942 which appeared to meet the conditions prescribed for this award.

Having reached a unanimous decision, the members of your Committee would recommend that the award be made to J. H. Maude, M.E.I.C., for his paper, "The New Oil-Hydraulic Press in Munitions Manufacture," as published in the February, 1942 issue of the *Journal*.

Among other papers of outstanding interest, your Committee would like to mention the paper by Howard Johnson, M.E.I.C., on "Shipyard Production Methods," and W. F. Drysdale's paper on "The Manufacture of the 25-Pounder in Canada."

Respectfully submitted,

JOHN T. FARMER, M.E.I.C., *Chairman*.

PLUMMER MEDAL COMMITTEE

The President and Council:

Your Committee has considered the papers presented during the prize year, July, 1941 to June, 1942, and recommends that the Plummer Medal for 1942 be awarded to Professor E. A. Allcut, M.E.I.C., for his paper, "Producer Gas for Motor Transport," as published in the April, 1942 issue of the *Journal*.

Respectfully submitted,

C. R. WHITTEMORE, M.E.I.C., *Chairman*.

LEONARD MEDAL COMMITTEE

The President and Council:

Among the papers submitted for consideration for the Leonard Medal award there are several considered by your Committee to be of a high standard, and it has not been easy to differentiate in making a selection for the award. However, a substantial majority of the Committee approves for first place, the paper entitled, "The Ore Deposits of Nickel Plate Mountain, Hedley, B.C." by Paul Billingsley and C. B. Hume, as published in the October, 1941 issue of *The Canadian Mining and Metallurgical Bulletin* and your Committee therefore recommends this paper for the award.

Respectfully submitted,

JOHN McLEISH, M.E.I.C., *Chairman.*

JULIAN C. SMITH MEDAL COMMITTEE

Carrying out the instructions pertaining to the award of the Julian C. Smith Medal for 1942, the special committee consisting of Past Presidents Hogg, Mackenzie, and myself has made a selection of names.

The regulations pertaining to the medal require this committee to select not more than two names from the nominations and that these names shall be submitted by open letter ballot to all Councillors not later than October 1st of each year. The two names that have been selected are the following:

Dr. H. G. Acres, Consulting Engineer, Niagara Falls, Ont.
Mr. R. M. Smith, Deputy Minister of Ontario.

Respectfully submitted,

C. R. YOUNG, M.E.I.C., *President.*

Abstracts of Reports from Branches

BORDER CITIES BRANCH

The Executive Committee held nine meetings during the year for the transaction of branch business.

During the year, the Executive appointed two very important committees which have functioned in such a way as to greatly increase the usefulness of the Engineering Institute to the community at large.

Mr. C. G. R. Armstrong was appointed chairman of the Branch Committee on Student Guidance and Counselling and has been very active in this connection. His report shows that the response to his efforts has been very gratifying.

Mr. P. E. Adams has been appointed chairman of the Branch Committee on Structural Defence Against Bombing. The members of the committee are drawn from those who attended Professor Webster's lectures in Toronto on April 22nd, 23rd and 24th. This committee will become of increasing value to the public as its activities become more widely known and deserves the hearty support of all Institute members.

Seven Branch meetings were held during the year, including the Annual Meeting, and the joint meeting with the A.S.M.E. of Detroit, at which our president, Dean Young, presided.

The meetings held were as follows, attendance being shown in brackets.

- Feb. 20—Mr. James N. Livermore, of the Engineering Department of the Detroit Edison Company, spoke on **The Adaptation of Air Conditioning to an Existing Office Building** (37).
- Mar. 13—Mr. Warren C. Miller, of St. Thomas, president of the Association of Professional Engineers of Ontario, spoke on **The Work of The Associations of Professional Engineers**. (35).
- April 10—Mr. A. E. Davison, transmission engineer of the Hydro Electric Power Commission of Ontario, presented a paper on **220 Kilovolt Lines in Ontario 1941** (44).
- May 22—The speaker was Mr. W. H. Furlong, chairman of the Board of the Sandwich, Windsor and Amherstburg Railway, who spoke on **Canada's War Effort as shared by the S.W. & A.** (26).
- Oct. 16—This dinner was held in honour of the president of the E.I.C., Dean C. R. Young, of Toronto, and the president of the A.S.M.E., Mr. J. W. Parker, of Detroit. The meeting was attended by members of the Detroit section of the A.S.M.E. (100).
- Nov. 27—Mr. W. R. Stickney, of the Canadian Bridge Company of Windsor, spoke on **Electric Arc Welding** (33).
- Dec. 11—The Annual Meeting and election of officers. Mr. T. H. Jenkins, designing engineer of the Grand Trunk Western Railway, spoke on **Wartime Railroad Transportation**. (21).

We record with regret the passing of three of the Branch's charter members: Messrs. J. E. Porter, F. H. Kester and W. H. Baltzell.

CALGARY BRANCH

The following report covers the activities of the Branch for the year 1942. Attendances are shown in brackets:

- Jan. 12—**Anglo-American Responsibilities**, by Mr. Max Ball. (100).
- Jan. 29—Programme in charge of and convened by Juniors and Students. Mr. B. A. Monkman spoke on **The Minnewanka Lake Power Project**. Motion Pictures—**Manufacture of Army Vehicles**, courtesy of the Ford Motor Company (47).
- Feb. 12—Motion Pictures—**Rainbows in the Rockies**. Commentary by Mr. V. A. Newhall. **Copper Mining in Arizona**, courtesy of Mr. Gaddis, of Canada Wire & Cable Company (44).
- Feb. 26—Motion Picture—**Construction of the Hydro Plant near Yellowknife, N.W.T.**, Commentary by Mr. A. G. Bennett of Bennett and White Construction Company (47).
- Mar. 14—Annual Meeting, following luncheon (31).

Note—For Membership and Financial Statements see pages 82 and 83

- April 10—Dean C. R. Young, president of The Engineering Institute of Canada, visited the Branch; following the President's talk, lunch was served (76).
- July 29—**Effects of Aerial Bombing**, by Professor I. F. Morrison. (50).
- Sept. 25—Mr. C. A. Price on **Recent Electrical Developments**. Motion Pictures—**Arc Welding**, courtesy Canadian General Electric (109).
- Oct. 28—Mr. S. N. Green on **History of Aircraft Construction over the Past Thirty Years** (44).
- Nov. 12—**The Edmonton Power Plant**, by Mr. R. R. Couper (38).
- Nov. 26—Mr. James Fowler spoke on **The History and Scope of The Provincial Institute of Technology, and its Function in Relation to the War Emergency Programme** (25).
- Dec. 10—Showing of coloured pictures, **The Flora of the West**, Commentary by Mr. McAlla. This was our annual Ladies' Night. Luncheon was served following lecture (82).

During the year the Branch Executive Committee met nine times.

CAPE BRETON BRANCH

During the year the branch held three meetings, the first on **The St. Lawrence Waterway and The Young Engineer** at which Mr. H. F. Bennett was the speaker; the second on **Air Raid Precautions and Civil Defence** by Messrs. Ira McNab and G. Clarke.

The third meeting was a dinner in honour of the visit of the presidential party in August, the speakers being the members of the party and several local representatives of industry.

EDMONTON BRANCH

During the year 1942 there has been a large influx of American engineers to Edmonton; invitations have been given to these to attend our regular meetings and interesting additions to our discussions have been obtained thereby.

In order to meet these engineers from the U.S.A., the Branch held a reception or cocktail party on November 6th which was attended by 31 Canadians and 25 American guests. The Americans responded by inviting our members to a similar party in December.

The following is a summary of our regular meetings with attendances shown in brackets. Except for the July meeting, these were all preceded by a dinner.

- Jan. 21—**Geophysical Methods of Oil Exploration** by W. H. Gibson of the McColl-Frontenac Oil Co. (40).
- Feb. 24—**The Cascade Power Development** by B. A. Monkman, Field Engineer for the Calgary Power Company (50).
- Mar. 27—**Chemicals and the War Effort** by Dr. E. H. Boomer of the Department of Chemistry at the University of Alberta (43). Election of Branch Officers for the 1942-43 Session took place at this meeting (43).
- April 9—Dean C. R. Young, president of the E.I.C. visited the Branch and gave an interesting and instructive address on the work being done by the Institute (37).
- July 20—Prof. I. F. Morrison, one of the Edmonton Branch's delegates to the Webster lectures spoke on **The Effects of Aerial Bombing** (35).
- Nov. 13—**Development of Natural Resources in Relationship to the Railways** by G. M. Hutt, Assistant Development Commissioner of the C.P.R. (32).
- Dec. 9—**The Work of Ducks Unlimited in Canada** by G. R. Fanset, Chief Engineer of Ducks Unlimited Canada (38).

HAMILTON BRANCH

The Executive Committee held nine business meetings with an average attendance of seven members. The figures in the brackets show the attendance at the meetings of the Branch.

Jan. 9—The Annual Business Meeting and Banquet was held at the Royal Connaught Hotel. The guest speaker, Professor E. A. Allcut, University of Toronto, spoke on **Substitute Fuels for Gasoline**. President C. J. Mackenzie and the general secretary, L. Austin Wright were present and each addressed the gathering. W. A. T. Gilmour closed the meeting by introducing the new chairman, Stanley Shupe who replied in a few words.

Feb. 10—**Hardening by Induction**, by Dr. H. B. Osborne, Jr., research and development engineer, Tocco Division, Ohio Crankshaft Company. This was a joint meeting with American Society of Metals (Ontario Chapter) also the American Institute of Electrical Engineers (Hamilton Group) and was held in the Westinghouse Auditorium. (135).

Mar. 20—**Cotton Yarn Dyeing**, by R. J. G. Schofield, Jr., E.I.C., **The Application of Electric Drive to Machine Tools**, by Andrew M. Swan, S.E.I.C., and **A History of Water Power Development on the Saguenay River**, by K. R. Knights, S.E.I.C.

This was the annual Junior and Student night and the three contestants submitted excellent papers. After the contest, Chancellor G. P. Gilmour, as our guest speaker gave a most interesting address entitled **Useful and Useless Learning** (62).

Mar. 31—**Essential Air Raid Precautions**, by E. Arthur Pinto, M.E.I.C., at the Delta Collegiate Auditorium, when the following were our guests; Hamilton Civil Guard, under the command of Lieut. Col. H. S. Robinson; Officers and men of the Army Trades School, under the command of Col. White, M.E.I.C.; Auxiliary Firemen and A. R. P. workers under the command of Major Wilson and the Women's Auxiliary Defence Corps and Band, under the command of Brigadier Molly Mockler. Cash prizes were awarded to A. M. Swan and R. J. G. Schofield who had been judged the winners of the contest of the previous meeting (1121).

April 10—**Trends in Design of A. C. Generators**, by C. M. Laffoon, Manager, A. C. generator engineers, Westinghouse Electric and Mfg. Company, Pittsburgh. This was a joint meeting with the A.I.E.E. (Hamilton Group) and was held in the Westinghouse Auditorium (176).

May 5—**Magnesium: Lightest Commercial Metal**, by Dr. L. M. Pigeon, Metallurgist, Dominion Magnesium Company, located at Halleys. This meeting was held at McMaster University (48).

June 23—**Welding and War**, by E. W. P. Smith, B.Sc.E., consulting engineer, The Lincoln Electric Company, Cleveland, Ohio. This meeting was a joint meeting with the Niagara District Electric Club and was held in McMaster University (96).

May 16—**Insulation and Condensation in Buildings**, by W. W. Cullen, chief engineer of insulation, H. W. Johns-Manville Company, New York. This was a joint meeting with the Hamilton Chapter, Ontario Association of Architects and Geo. T. Evans, M.R.A.I.C., president of the local Chapter conducted the meeting as chairman (38).

Aug. 7—Official opening of the **Shand Dam**, near Fergus, Ontario, was conducted by Premier Mitchell Hepburn who gave an important address to the engineers, contractors, distinguished guests and public gathered to witness this ceremony. Executive members of the Hamilton Branch attended as guests of the management.

Oct. 6—**P.P.C. Street Railway Cars**, by J. A. M. Galilee, Assistant Advertising Manager, and L. A. Shaver, control engineer, both of the Can. Westinghouse Company. This was a joint meeting with the Hamilton Group of the A.I.E.E. (150).

Nov. 18—**Air Bombing and Structural Defence**, by D. C. Tennant, M.E.I.C., engineer, Ontario division, Dominion Bridge Company. Meeting was held at McMaster University (63).

The main activities of the year have been the formation of a branch committee on Engineering Features of Civil Defence and the participation in the work of the Hamilton Council of Adult Education Agencies.

Some surveys and reports have been made in connection with the civil defence effort but the public does not appear to feel the need for proper precautions in case of actual danger.

The matter of adult education was promoted by Professor C. H. Stearn of McMaster University and the Branch took part in this work from its inception and it is hoped and expected that we may be of use to this new organization.

In response to the request of the Vocational Guidance Department of the Hamilton Y.M.C.A., for volunteers from

a number of professional societies to participate in an experimental project to determine if there were any personality differences between occupations on the professional level, a number of members of the Branch volunteered. The test chosen for this experimental project was the Rorschach Psychodiagnostic Group method. The branch was later informed of the result.

HALIFAX BRANCH

During the year, four regular dinner meetings, one evening meeting, and two special dinner meetings, were held, all of which were found to be interesting and enjoyed by those present. These meetings were as follows:

Feb. 27—Mr. H. F. Bennett, of the London, Ontario Branch, and chairman of the Institute Committee on the Young Engineer. His subject was **The Engineer of To-morrow**.

Mar. 11—Prof. F. Webster, a member of the Research Experimental Staff of the Ministry of Home Security, London, England. He spoke to us on **Engineering Features of Civil Defence**.

Mar. 20—A moving picture was shown in the Nova Scotia Technical College Assembly Hall on **Photoelastic Stress Analysis**, prepared by Prof. A. E. MacDonald, of Engineering, University of Manitoba.

April 23—Dr. Allen E. Cameron, Deputy Minister of Mines for the Province of Nova Scotia. His subject was, **The Development of Nova Scotia Resources**.

Aug. 7—On this occasion we were privileged to be visited by the president of the Engineering Institute of Canada, the vice-presidents for Ontario, Quebec, and the Maritime provinces, the general secretary, and the assistant general secretary. During the morning a regional council meeting was held which was well attended. In the afternoon, a very pleasant trip on the harbour was arranged through the courtesy of His Majesty's Canadian Navy, through the good offices of Rear Admiral G. C. Jones. In the evening, a dinner was held in honour of the President, at which the President was the guest speaker; his subject being, **The Institute and the Engineering Profession**.

Oct. 22—Mr. J. R. Sutherland, Editor of *The Evening News*, New Glasgow, whose address dealt with a six week's visit which he has just made to the British Isles.

Nov. 19—Mr. D. B. Lindsay, Manager, Clark Ruse Aircraft Ltd. His subject was, **Aircraft, Overhaul and Repair for the R.C.A.F.**

During the year, the executive held ten meetings, at which ordinary routine business was transacted.

Since the last annual meeting, the Halifax Branch has become one of the "Big Four" and is now privileged to be represented by two councillors. The executive recommended to Headquarters that Mr. J. R. Kaye, be appointed as a second councillor from this branch, and his appointment was unanimously confirmed by Headquarters. Mr. Kaye was also appointed the representative of the Halifax Branch on the Joint Finance Committee of the Halifax Branch of the Engineering Institute of Canada, and the Association of Professional Engineers of Nova Scotia.

Two special committees have been set up by the executive, they being the Committee on Engineering Features of Civil Defence, with Mr. Ira P. Macnab as chairman, and the Committee on the Guidance and Welfare of Young Engineers, of which Prof. A. E. Flynn, was appointed chairman.

The chairman was also asked to appoint a committee to co-operate with the local committee on post-war reconstruction, of whom the local chairman is Mr. Fred Alport. It was decided that the executive as a whole, would act as a committee.

KINGSTON BRANCH

The following meetings were held by the Branch this year:

Mar. 20—A very interesting address on **Aircraft in War** was given by Wing-Commander Morgan Keddie of the Norman Rogers Training School at a meeting held at the Badminton Club.

Nov. 10—Guest speaker at the opening meeting of the winter programme was Professor J. C. Cameron, Head of the Industrial Relations Section at Queen's University.

Dec. 8—A special meeting was held at the LaSalle Hotel to welcome the president, Dean C. R. Young of the University of Toronto. Mr. K. M. Winslow, chairman of the Branch, presided and Dean Young was introduced by Col. Le Roy Grant.

LAKEHEAD BRANCH

The following meetings were held by the Branch this year:

- Jan. 14—Mr. Z. Kryzwoblocki of the Canadian Car and Foundry Co. Ltd., Fort William, gave an address on **The Rocket Wing-Bomb and Rocket Torpedo**.
- Feb. 13—The Annual Dance of the Lakehead Branch was held in the Norman Room of the Royal Edward Hotel in Fort William.
- April 4—A special dinner meeting was held in the Prince Arthur Hotel, Port Arthur, to welcome the president of the Institute, Dean C. R. Young.
- June 10—The annual dinner meeting of the Lakehead Branch was held at the Port Arthur Golf and Country Club.
- Nov. 11—**Iron Ore Occurrences in the Lake Superior District** was the subject of an address given by Mr. Jules J. Cross, M.E., well-known engineer of Port Arthur and discoverer of the great hematite ore body at Steep Rock Lake near Atikokan, Ontario.

LETHBRIDGE BRANCH

During the year 1942, the following meetings were held:

- Jan. 31—Joint dinner meeting at the Marquis Hotel with the Association of Professional Engineers of Alberta. Wing-Comdr. Jones spoke on **Bombing and Gunnery Training** (49).
- April 8—Annual meeting and election of new officers.
- April 11—Afternoon meeting in the Marquis Hotel to welcome the president of the Institute, Dean C. R. Young.

Three executive meetings were also held during the year with an average attendance of six.

LONDON BRANCH

During the year 1942, the executive held seven business meetings. Eight regular and special meetings were held as follows. Attendance is given in brackets.

- Jan. 21—Annual meeting and election of officers held at the Grange Tea Rooms, London. **The Rise of The University**, by Dr. Floyd Maine, of the University of Western Ontario. (35).
- Feb. 27—Regular Meeting held in the Officers Mess, Talbot Street Armouries, London, **Madawaska Development**, by Otto Holden, M.E.I.C., Chief Hydraulic Engineer, Hydro Electric Power Commission of Ontario (45).
- Mar. 18—Regular Meeting held in the Officers Mess, Talbot Street Armouries, London. **Drainage Systems**, by Geo. A. McCubbin, M.E.I.C., Drainage Engineer, Chatham, Ont. (35).
- April 21—Regular Meeting held in Board Room, Public Utilities Commission, London, F. T. Julian, M.E.I.C., Branch Chairman, Report of Annual Meeting and Institute Affairs (28).
- May 21—Special Dinner Meeting. Complimentary Dinner to Warren C. Miller, M.E.I.C., President of the Professional Engineers of Ontario. Held at the London Hunt & Country Club. (35).
- Sept. 25—Regular Meeting held in the Board Room of the Public Utilities Commission, London, Dr. A. E. Barry, M.E.I.C., Director of Public Health, Toronto, **Some Changing Concepts in Public Health Engineering**.
- Nov. 4—Regular Meeting held in the Board Room of the Board of Education, City Hall, London. **The Effect of Bombing on Structures**, by H. F. Bennett, M.E.I.C., District Engineer, Dept. Public Works, London (70).
- Dec. 2—Special Supper Meeting for President C. R. Young at Hotel London, followed by a regular meeting in the Williams Memorial Library (35).

MONCTON BRANCH

The Executive held six meetings during the year. Seven meetings of the branch were held, at which addresses were given and business transacted as follows:

- Feb. 25—A meeting was held in the City Hall. H. F. Bennett, B.Sc., District Engineer, Department of Public Works, London, Ont., gave an address on **The Great Lakes System**.

Mar. 24—A meeting was held in the City Hall. Films dealing with **Photoelastic Stress Analysis** were shown. C. S. G. Rogers gave a running commentary.

June 1—A dinner meeting was held in the Brunswick Hotel. H. Franklin Ryan, B.Sc., General Electric Co., Halifax, N.S., gave an address on **Plastics**. Mr. Ryan placed on display numerous samples, and his remarks were illustrated by slides. Nominations for branch officers for 1942-43 were made at this meeting.

June 29—The annual meeting was held on this date.

Aug. 3—A dinner meeting was held in the Y.M.C.A. The guest speaker was Dean C. R. Young, president of the Engineering Institute of Canada. Addresses were also given by Vice-President K. M. Cameron and Assistant General Secretary Louis Trudel.

Nov. 11—A combined meeting of Moncton Branch and the Engineering Society of Mount Allison was held in the Science Building, Mount Allison University, Sackville. A film entitled **The Inside of Arc Welding** was shown.

Nov. 12—A meeting was held in the City Hall, at which the film **The Inside of Arc Welding** was shown.

MONTREAL BRANCH

The outstanding event of the year was the fifty-sixth Annual General and Professional Meeting. With a registration of over 1,000, it was a complete success. The Institute was fortunate in being able to greet Lieutenant General and Mrs. A. G. L. McNaughton at the Annual Dinner. The General Committee on arrangements was under the able chairmanship of Mr. Walter G. Hunt. The Executive Committee is much indebted to the various chairman and members of the sub-committees who were responsible for this most successful meeting.

PAPERS AND MEETINGS COMMITTEE

(Chairman—C. A. PEACHEY)

Eight meetings of the Committee were held during the year and in spite of the war little difficulty was experienced in filling the autumn programme. The spring programme (1943), however, was more difficult to complete.

A feature of the year was the special meeting held to hear Professor F. Webster of England, lecture on the effects of bombings on structures.

As usual the annual plant visit was a decided success. About 350 members visited the plant of the Dominion Bridge Co. and were tendered a reception by the officials of the company.

Previous to his paper on **Industrial Democracy and Its Survival**, delivered before the Branch on November 5, Mr. P. Ackerman gave a course of five lectures which were attended by several members as a preparation to discuss the subject at the meeting.

It may be said that the meetings were, in general, exceptionally well attended, especially during the fall, as shown by the figures given in brackets in the following list of papers delivered during the calendar year of 1942:

- Jan. 8—**Shipyard Production Methods**—An Outline of Building Operations for Steel Vessels, by Howard Johnson (185).
- Jan. 15—Annual Meeting of the Branch (140).
- Jan. 22—**The Problems Encountered in Erecting Canada's First Directive Broadcast Station**, by E. O. Swan (70).
- Jan. 29—**Airplane Transport Design**, by John T. Dymont, M.E.I.C. (90).
- Feb. 5 & 6—Annual General and Professional Meeting.
- Feb. 12—**Photoelastic Stress Analysis**, by C. G. Axworthy (130).
- Feb. 19—**Plates in Shipbuilding**, by W. B. McCreery (80).
- Feb. 26—**Subcontracting in Canada's Munition Industries**, by F. L. Jeckell (75).
- Mar. 5—**Synthetic Rubber**, by Dr. R. S. Jane (215).
- Mar. 12—**An Engineer Looks at Music**, by S. T. Fisher, Jr. E.I.C. (140).
- Mar. 19—**The Modernization of a Puerto Rico Electric Generating Station**, by John T. Farmer, M.E.I.C. and E. A. Goodwin, M.E.I.C. (55).
- Mar. 26—**Blackouts and Protective Lighting**, by Samuel G. Hibben (150).
- April 9—**The Electron Microscope**, by Dr. D. A. Keys (160).
- April 28—**Effects of Bombings on Structures**, by Professor F. Webster (175).

- Oct. 8—**Aquifers and Water Wells**, by J. W. Simard, M.E.I.C. (175).
- Oct. 15—**Air Power Theories and Aviation Progress in Reality**, by Z. Krzywoblocki (145).
- Oct. 22—**Engineering Aspects of Air Bombing and Structural Defence**, by D. C. Tennant, M.E.I.C. (200).
- Oct. 29—**Plant Visit**—Dominion Bridge Co. Ltd. (350).
- Nov. 5—**Industrial Democracy and Its Survival**, by P. Ackerman, M.E.I.C. (175).
- Nov. 12—**Ventilating Buildings Manufacturing War Equipment**, by H. E. Ziel (125).
- Nov. 19—Annual Student Night (165).
- Nov. 26—**Manpower Control and Employer-Employee Relations**, by L. Austin Wright, M.E.I.C. and Douglas B. Chant (200).
- Dec. 3—**Design, Manufacture and Installation of 120 KV Oil-Filled Cables in Canada**, by O. W. Titus and D. M. Farnham (110).
- Dec. 10—**Mechanization and Modern Military Tactics**, by Capt. A. C. Rayment, M.E.I.C. (80).

JUNIOR SECTION

(Chairman—J. E. HURTUBISE)

The activities of the Junior Section have been somewhat curtailed this year; all the papers that were arranged for the spring session had to be cancelled because the authors had either joined the army or were too busy with war work. The attendance at the meetings was smaller than usual for the same reasons.

Mr. Graham Wanless, who was Branch News Editor and a member of the executive of the Junior Section resigned when he joined the staff of National Research Council. His departure for Ottawa deprives the Branch of his valuable services.

The Student Night, which took place on November 19, was very successful. Mr. P. E. Salvat of Ecole Polytechnique took the first prize with an interesting talk on the "Launching of Ships," and Messrs. Maclure and G. Bisailon were awarded second prizes for original papers on "Introduction to Wooden Shipbuilding" and "Long Range Cruising Control" respectively.

Mr. W. G. Hunt addressed the McGill students and Mr. L. Trudel the students of Ecole Polytechnique with regard to enrolment in the Junior section of the Institute explaining the advantage to be gained. The results of their talk have been most gratifying.

The following is a list of the Junior Section meetings with the attendance given in brackets:

- Jan. 26—Annual Meeting—Mr. Jean Flahault, S.E.I.C., spoke on **Some Engineering Aspects of the German Army**. (83).
- Feb. 16—**Nomography**, by A. Looker, S.E.I.C. (14).
- Mar. 16—**The Experimental Study of Stress**, by Raymond A. Frigon, M.Sc., S.E.I.C. (18).
- Mar. 30—**Modern Trends in the Maintenance of Lubricating Oil**, by Bruce M. Scriver, S.E.I.C. (15).
- April 13—**Some Mechanical Properties of Rubber**, by Graham G. Wanless, Jr., E.I.C. (24).
- Oct. 19—Opening Night, the secretary of the Branch, Mr. L. A. Duchastel, gave a short talk, replacing the chairman, Mr. J. A. Lalonde who was unable to attend (70).
- Nov. 19—Student Night. **Design and Production of Marine Engines**, by R. A. Ritchie (McGill); **Launching of Ships**, by P. E. Salvat (Ecole Polytechnique); **Introduction to Wooden Shipbuilding**, by J. H. Maclure (McGill); **Long Range Cruising Control**, by G. Bisailon (Ecole Polytechnique) (160).

MEMBERSHIP COMMITTEE

(Chairman—HENRI GAUDEFROY)

The Executive Committee was called upon to approve a recommendation that no more Branch affiliates be admitted.

After a careful study, a motion to that effect was passed and approved at the November meeting.

No further Branch affiliates will therefore be accepted by the Montreal Branch. It was also recommended that the present ones who do not pay their fees regularly be automatically dropped.

It has been observed that although many students of

L'Ecole Polytechnique belonged to the Institute, there was a lack of participation by senior graduates. It was decided to ask the Membership Committee to organize a campaign with a view to obtaining their adherence.

A group of eighteen members were assembled to carry out the work and a total of 175 circular letters were issued to prospective members. The group contacted 87 of these persons during the year but so far only 8 new applications have been received; however, it is expected that if the work is carried out next year, there are good possibilities that at least 44 new members should be enlisted.

OBITUARIES

It is with regret that we record the names of those who have died during the year and we wish to extend to their families the most sincere sympathy of the Branch.

HONORARY MEMBER—Dr. Frank Dawson Adams

MEMBERS

Archibald Fullarton Byers	John Palmer
Kenneth Thomas Cregeen	Leonard Ernest Schlemm
John Maurice Evans	Charles Rowlett Townsend
Lyall Radcliffe McCurdy	Henry Hague Vaughan

RECEPTION AND ENTERTAINMENT COMMITTEE

(Chairman—M. S. MACGILLIVRAY)

Refreshments were served at the Annual Meeting and the opening fall meetings of the Branch and of the Junior Section and also at the Student Night. Out-of-town speakers were entertained by members of the Papers and Meetings Committee as it was decided last year to suspend regular courtesy dinners for the duration. The Branch Smoker was held as part of the entertainment provided by Mr. W. W. Timmins and members of his Committee during the Annual Meeting of the Institute. A record attendance of 794 was established.

COMMITTEE ON PROVINCIAL PROFESSIONAL INTERESTS

(Chairman—J. A. LALONDE)

In view of the progress being made in several provinces towards closer co-operation between the Institute and the provincial professional associations, this committee continued this year to explore the possibilities in this province.

Several meetings were held between February and June, at which the agreements passed in four other provinces were closely studied, and a draft of a proposed agreement between the Institute and the Corporation of Professional Engineers of Quebec was drawn up. This draft was submitted to the Executive Committee of the Branch and subsequently to Council. Authorization was obtained to discuss its contents informally with the Institute Committee on Professional Interests, the other Branches of the Institute in the province and the Corporation of Professional Engineers of Quebec.

Copies of the proposed agreement were forwarded the St. Maurice Valley, Quebec and Saguenay Branches and the Committee met with their official representatives on September 11th, 1942.

The chairman of the Committee was invited to a Council Meeting of the Corporation on October 24th, 1942.

Finally, on December 11th, a joint meeting was held with the representatives of the various Branches and three representatives from the Corporation.

A draft of the agreement, as proposed at this meeting, is now being written. It is the intention of your Committee to send a copy of this draft together with recommendations to the Council of the Institute.

COMMITTEE ON THE ENGINEERING FEATURES OF CIVIL DEFENCE

(Chairman—G. McL. PITTS)

Upon recommendation of the Institute this special committee was formed following the lectures given in Toronto by Prof. F. Webster and is composed of all members of the Branch who followed the lectures. Meetings were held

⑥ Includes contribution to annual meeting of the Institute.

⑥ Includes \$500.00 for building fund received in 1941 and disbursed in 1942.

to consider the type of study most needed and it was agreed to undertake specific studies in accordance with items 4 and 5 of the terms of reference of the Institute Committee on the Engineering Features of Civil Defence.

STUDENT GUIDANCE COMMITTEE
(Chairman—JACQUES BENOIT)

This Committee was formed following a recommendation of the Institute Committee on the Training and Welfare of the Young Engineer and its activities comprised the following:

- 1—Preparation of a list of High Schools and private schools of both French and English language in the Branch area.
- 2—Preparation of a letter addressed to each school principal informing him of our aim to assist the student and asking for an opportunity to discuss this matter, which letter will be mailed before the end of the year.
- 3—Distribution of French version of engineering profession booklet through the Institute Headquarters.
- 4—Study of methods used by the Engineering Council for Professional Development in meeting and advising boys about to decide on a vocation. Also study of instructions received from Mr. H. F. Bennett, chairman of the Committee on the Training and Welfare of the Young Engineer.
- 5—Preparation of short guide to be used by the Committee members in addressing the students.

Most of the work has been of a preliminary nature but following the distribution of the proposed circular letter, it is planned next year to visit schools and talk to students in groups and individually and possibly arrange visits to engineering enterprises.

PUBLICITY COMMITTEE
(Chairman—GORDON D. HULME)

At the request of the chairman of the Annual General and General Professional Meeting of the Institute, the Branch Publicity Committee handled all publicity matters for the Annual Meeting of the Institute. Several meetings were held for the members of the press and they were supplied with all available information concerning the Institute and all the functions of the meeting. Besides articles in periodicals, items were found in 71 newspapers and a survey showed that 25 per cent more publicity was given on this meeting than on the one held the year before.

The Montreal newspapers received information regarding Branch meetings held during the year and several visits were made to the press in order to maintain friendly relations. In some cases the newspapers were urged to have a reporter cover meetings but when the topic under discussion was not of general interest and only of a technical nature, this practice was omitted. From casual observations of articles published it is felt that the relationship between the Branch and the newspapers is on the most satisfactory basis.

NIAGARA PENINSULA BRANCH

The Branch Executive held five business and one electoral meeting during the year in order to conduct the affairs of the branch.

The outstanding event for the year was, of course, the joint convention of the Engineering Institute of Canada and the American Society of Civil Engineers, held in Niagara Falls, October 14-15. The branch was pleased to be able to assist, in a small way, the planning of this meeting.

The programme committee arranged and conducted the following professional meetings:

- Jan. 22—Joint dinner meeting with the Niagara District Chemical and Industrial Club, held at the Welland House, St. Catharines. The speaker was Mr. Douglas Lorimer, who talked on **The Wartime Control of Chemical Resources**.

- Feb. 26—Dinner meeting held at the General Brock Hotel, Niagara Falls. Messrs. J. P. Skillen and C. Vrooman, of the Canadian Westinghouse Company, spoke on the **Application of Relays and Meters for Industrial Substations**.

- Mar. 19—Joint dinner meeting with the Buffalo Section of the American Society of Civil Engineers, held at the Mather Arms, Fort Erie. Mr. D. B. Niederlander, of the John W. Cowper Company, spoke on **The Construction of the Pine Camp Cantonment**.

- April 15—Joint dinner meeting with the Canadian Section of the American Water Works Association, during their convention at the General Brock Hotel, Niagara Falls. Messrs. A. E. Berry and W. Storrie spoke on **Modern Practice and Developments in the Water Works Field**.

- May 21—Annual dinner meeting of the branch, held at the Leonard Hotel, St. Catharines. Our president, Dean C. R. Young, spoke to us on Institute Affairs and **The Engineer and The War**.

- June 24—Special evening lecture, held in the Page-Hersey Auditorium, Welland. The late Mr. E. W. P. Smith, consultant to the Lincoln Electric Company, Cleveland gave a review of **Modern Electric Welding** and how it may assist the war effort.

- Oct. 14-15—The usual October meeting was cancelled in order that the branch might attend and co-operate with the Activities of the Joint Convention of the E.I.C. and the American Society of Civil Engineers. The sessions were held at the General Brock Hotel, Niagara Falls.

- Nov. 26—Dinner meeting held at the Leonard Hotel, St. Catharines. Mr. J. M. Galilee, of the Canadian Westinghouse Company, gave a demonstration talk on **Recent Advances in Electrical Research**.

OTTAWA BRANCH

During the year the Managing Committee held nine meetings for the transaction of general business.

It is with deep regret that we report the deaths of two of our members: Mr. E. M. Dennis, M.E.I.C., and Mr. R. H. Swingler, S.E.I.C.

As in previous years the Branch donated two sets of draughting instruments to the Ottawa Technical School for presentation as prizes for proficiency in draughting. A copy of "Technical Methods of Analysis" by Griffin was presented to the Hull Technical School to be awarded to one of its students.

The following is a list of meetings held during 1942, with attendance figures in brackets. Unless otherwise indicated, these were luncheon meetings at the Chateau Laurier.

- Jan. 8—Annual evening meeting, National Research Laboratories. Address by J. W. Bateman, B.A.Sc., M.I.E.S., Manager, Lighting Service Department, Canadian General Electric Company Limited; **Magic of the Spectrum**, with demonstration equipment and lantern slides in colour. (265).
- Jan. 22—F. Cooksey, District Chief Drill Master, Fire Brigade, Ottawa; **Incendiary Bombs** (84).
- Feb. 19—R. E. Hayes, B.Sc., M.E.I.C., Manager, Engineering Department, The General Supply Company of Canada Limited, Ottawa; **Earth Moving Takes Wings**, with a sound film (77).
- Mar. 5—M. S. Kuhring, Division of Mechanical Engineering, National Research Council, Ottawa. **Engine Testing Tribulations** (65).
- Mar. 26—P. Lebel, M.E.I.C., Asphalt Technologist, Imperial Oil Company of Canada, Montreal. **The Portland-Montreal Pipe Line**, with a sound film in colour (140).
- April 9—W. R. Campbell, City Traffic Manager, Trans-Canada Air Lines, Ottawa. **Skyway Across Canada**, with a sound film in colour (108).
- April 17—Evening meeting, held jointly with the Canadian Institute of Mining and Metallurgy and the Society of Chemical Industry; Auditorium, National Research Laboratories, Ottawa. Address by A. E. Byrne, Glyptals and Insulating Materials Section, Supply Department, Canadian General Electric Company Limited, Toronto. **Plastics** with demonstration equipment and lantern slides (250).
- April 20—Evening meeting, Auditorium, National Research Laboratories, Ottawa. Address F. Webster, Dean of Engineering, University of Rangoon. **Bombs and Structures** with a slow-motion film. (175).

SAGUENAY BRANCH

During the year 1942 the Branch held eleven general meetings as follows:

- May 7—Evening meeting, Auditorium, National Research Laboratories, Ottawa. Address by C. E. MacDonald, B.A.Sc., C.I.M.M., A.S.M., Manager of Domestic Sales, International Nickel Company of Canada Ltd., Toronto. **The Mining, Smelting, and Refining of Nickel-Copper Ores**, with a sound film (35).
- Sept. 16—C. R. Young, B.A.Sc., C.E., M.E.I.C. **Post-War Importance of Engineers** (84).
- Sept. 25—Evening meeting, held jointly with the Society of Chemical Industry. Address I. M. Rabinovitch; **Chemical Warfare**, with lantern slides (280).
- Oct. 22—Evening meeting, held jointly with the Canadian Institute of Mining and Metallurgy, Auditorium, National Research Laboratories, Ottawa. Address O. W. Titus, B.A.Sc., A.I.E.E., Chief Engineer, Canada Wire and Cable Company Limited, Toronto. **Copper Mining in Arizona**, with a silent film (60).
- Nov. 5—R. M. Gooderham, B.A.Sc., M.E., Shipbuilding Branch, Department of Munitions and Supply, Ottawa; **Increasing Welded Production**, with a sound film in colour. (121).
- Nov. 19—Evening meeting; Auditorium, National Research Laboratories. Address by George L. Long, Bell Telephone Company of Canada, Montreal. **Your Voice as Others Hear It** with demonstration equipment (285).
- Dec. 17—G. L. Jennison, Priorities Branch, Department of Munitions and Supply, Ottawa; **PRP** (88).

PETERBOROUGH BRANCH

The following meetings were held during the year, with attendances shown in brackets:

- Jan. 22—Mr. Frank O'Byrne, of Associated Screen News, on **Visual Aids for the Industrialist** (56).
- Jan. 24—Social Evening (Ladies Night).
- Feb. 5—Mr. F. R. Pope of Western Clock Company, Peterborough, on **Alarm Clocks—How they are made** (30).
- Feb. 19—E. V. Leipoldt of the Shawinigan Engineering Co., Montreal, **Electrical Design of the LaTuque Development** (59).
- Mar. 12—Dr. H. B. Osborn of Ohio Crankshaft Co., Cleveland, Ohio. **Surface Treating by Induction** (55).
- Mar. 26—Mr. H. M. Dunkerley, Inspection Board, Dept. M. & S., United Kingdom and Canada. **Mechanism in Warfare** (55).
- April 9—Messrs. G. R. Langley, R. L. Dobbin, J. W. Pierce, A. J. Girdwood, J. F. Osborn, all of Peterborough Branch, on **Discussion of Post-War Problems** (57).
- April 23—Mr. G. E. Bourne of C.G.E. Co., Toronto, on **Electricity in Modern Warfare** (60).
- May 7—Student Night, Mr. R. Scott and Mr. A. M. McQuarrie (49).
- May 20—Annual Business Meeting (34).
- Nov. 5—Mr. R. N. Fournier of C.G.E. Co., Toronto, on **Electric Heat in Industry** (40).
- Nov. 26—Annual Dinner with President C. R. Young, and Vice-President K. M. Cameron as speakers (96).
- Dec. 10—Mr. Montague of the H.E.P.C. of Ontario, on **The DeCew Falls Development** (52).

QUEBEC BRANCH

During the past year, seven meetings of the Executive Committee were held at which the attendance averaged eight members or sixty per cent.

Seven general Branch meetings were also held through the year as listed below with the attendance given in brackets:

- Mar. 24—**Aerial Photography**, by Mr. Théo. Miville Dechêne, M.E.I.C., at School of Mines Theatre, Laval University. (53).
- Mar. 30—**Aluminium, Strategic Metal**, by Mr. P. M. Haenni, p.sc. Métallurgie, at the School of Mines Theatre, Laval University (80).
- July 31—**Dinner Meeting** in honour of **Dean C. R. Young's visit** at the Garrison Club (45).
- Aug. 17—**Second Annual Golf Tournament** at Levis and distribution of many prizes (45).
- Sept. 28—**Electric Welding**, by Mr. R. N. Fournier, specialist of General Electric Company, at the School of Mines Theatre, Laval University (45).
- Dec. 12—**Visit of the New St-Michel-Archange Hospital**, organized by Mr. Y. R. Tassé (40).
- Dec. 14—**General Annual Meeting** and election of Officers of the Quebec Branch, at The School of Mines Theatre, Laval University. **Bombing and its effects**, by Mr. Robert Sauvage, M.E.I.C. (40).

- Jan. 15—**Man As An Engineering Miracle**, by Prof. D. L. Thomson, Dept. of Biochemistry, McGill University. The motion picture, **Tacoma Bridge Failure**, was shown. After the lecture, tea was served by the Junior Red Cross.
- April 22—**The Lions Gate Bridge**, illustrated lecture by Dr. Philip L. Pratley, D.Eng., Consulting Engineer.
- May 18—**Air Raid Precautions**, by Prof. F. Webster, Deputy Chief Engineer of the Ministry of Home Security, Great Britain.
- June 11—**The Portland-Montreal Pipe Line**, industrial film was shown and a running commentary was given by Mr. Paul Lebel, Consulting Engineer, Technical Service, Imperial Oil Co. Ltd. **Electrical Fibre Glass**, industrial film was shown with a running commentary by Mr. C. A. Booth of the Fibre Glass Co. of Canada Ltd.
- Aug. 13—Annual Meeting. Dean C. R. Young was our honorary guest and he was accompanied by Vice-Pres. de Gaspé Beaubien, and K. M. Cameron and the assistant-general secretary of the Institute, Louis Trudel.
- Sept. 2—**Welding**, Mr. L. T. Larson, welding expert of the Allis-Chalmers Co. Milwaukee, Wisconsin.
- Oct. 8—The motion picture **Inside Arc Welding** was shown.
- Oct. 15—**The Aluminum Industry and the War Effort**, by Mr. A. W. Whitaker, Jr., General Manager of the Aluminum Co. of Canada Ltd.
- Oct. 30—**Processing Equipment—Mills and Kilns**, by Mr. F. T. Agthe, Engineer with the Allis-Chalmers Co. of Milwaukee, Wisconsin.
- Nov. 19—**Automatic Combustion Control**, by Mr. A. G. Stewart, Vice-President and General Manager of the Bailey Meter Co. Ltd., Montreal.
- Dec. 17—**Welding**, by Mr. P. H. Thae, welding engineer, Canadian General Electric Co. Ltd., Toronto.

SAINT JOHN BRANCH

During the year the Executive Committee held eight meetings for transaction of general business. Average attendance was six members.

With deep regret we report the death, in June, of Lt.-Colonel H. F. Morrissey, M.E.I.C., Councillor of the Institute representing the Saint John Branch. A. O. Wolff, M.E.I.C., was appointed to fill the vacancy until the next annual election.

Seven general branch meetings were held as follows, with attendance thereat given in brackets:

- Jan. 12—Joint dinner meeting with Moncton Branch and the Association of Professional Engineers of New Brunswick. Special guests were Premier J. B. McNair, Premier of New Brunswick; K. M. Cameron, Vice-President of the E.I.C., for Ontario, and L. Austin Wright, General-Secretary of the E.I.C. A joint co-operative agreement was signed between the Institute and the Association by Messrs. Cameron and Wright for the Institute and Messrs. G. L. Dickson and C. C. Kirby for the Association. Witnesses were Messrs. A. Gray and H. W. McKeil for the Institute and Messrs. A. A. Turnbull and G. A. Vandervoort for the Association. The Premier spoke on **Canada's War Effort**. F. O. Condon, chairman of the Moncton Branch was in the chair (60).
- Feb. 24—Supper meeting, Harry F. Bennett, chairman of the Committee of the Young Engineer, spoke on **The Engineers of To-morrow**, and reported on the work done by the Committee. Guests were Dr. E. J. Alexander, Principal of Saint John High School; W. B. Main, Director of Vocational School and Dr. W. J. Shea, Principal of St. Vincent's High School (23).
- Mar. 26—Supper meeting. A moving picture entitled **Photoelastic Stress Analysis** was shown. Prior to showing the picture a description of the film and explanation of the theory of the photoelastic stress analysis was read by Sidney Hogg. The paper was prepared by Prof. Macdonald of the University of Manitoba (28).
- May 7—Annual dinner and election of officers of the Branch. Before the business meeting was called to order some very fine coloured motion pictures of fishing and hunting in New Brunswick were presented by H. P. Lingley. D. R. Smith reported verbally on his attendance at lectures given in Toronto by Prof. Webster, Deputy Chief Engineer to the Ministry of Home Security in Great Britain, on the various phases of bombing action (28).

May 22—Luncheon meeting to entertain the visiting Dominion Council of the Association of Professional Engineers of Canada. Ten delegates were present from other provinces and seven officers of the New Brunswick Association. President D. A. R. McCannell, Regina, representing the Saskatchewan Association, spoke on the vital part engineers are playing in the war effort, and the burden that would be theirs in post-war reconstruction programmes (33).

Aug. 10—Supper meeting. Special guests were Dean C. R. Young, president of the Institute; K. M. Cameron and deGaspé Beaubien, vice-presidents, Louis Trudel, asst. general secretary and G. A. Gaherty of the Montreal Engineering Company. Dean Young spoke on the present activities of the Institute, its various committees and the importance of their work. He outlined a scheme proposed by the Government to finance worthy students in college in order to alleviate the scarcity of trained technicians which was facing it. Mr. Cameron asked for better recognition of the student and junior members and also spoke on post-war reconstruction and its problems. Each of the other guests also spoke (40).

Dec. 29—Supper meeting. A paper entitled **The Effect of Aerial Bombing on Structures**, prepared by Dean I. F. Morrison, Professor of Applied mechanics, University of Alberta, was presented by D. R. Smith, chairman. The lecture was illustrated by lantern slides (35).

ST. MAURICE VALLEY BRANCH

Six meetings were held during the year; three at Shawinigan Falls, two at Three Rivers and one at Grand'Mère. A brief summary of these meetings, with the number of people attending in brackets, is as follows:

Mar. 20—At Shawinigan Falls High School. A film entitled **From Rapids to Electricity**. Speaker: Mr. Guy Rinfret, M.E.I.C. (400).

April 22—At Cascade Inn, Shawinigan Falls. A dinner and the Annual Branch Meeting with installation of new officers. A talk was given by Dr. R. S. Jane on **Synthetic Rubber—Its Possibilities and Development** (80).

June 25—At Chateau de Blois, Three Rivers. A dinner meeting and speech on **Electric Heat in Industry**, by Mr. R. N. Fournier (40).

July 30—At Laurentide Inn, Grand'Mère. A dinner meeting to welcome President Young and his party, which included Past President Lefebvre, Vice-President Cameron, Councillor Armstrong, Asst. Gen. Secretary Trudel and Huet Massue (60).

Sept. 24—At the Technical School in Three Rivers. A film entitled **The Inside of Arc Welding**, by the Canadian General Electric Company (40).

Oct. 22—At Cascade Inn, Shawinigan Falls. A speech by Mr. A. W. Whitaker, Jr. on the subject of **Aluminum in War-time** (100).

SASKATCHEWAN BRANCH

Thirty-three members are on active service with His Majesty's Forces, all holding commissions in the Navy, Army or Air Force.

With the exception of one special meeting, all meetings were held jointly with the Association of Professional Engineers, to which the members of the Saskatchewan Section of the American Institute of Electrical Engineers were invited. The respective programmes were as follows:

Jan. 23—Ladies Night, at which Mr. E. Dickinson gave an illustrated lecture on his experiences in Bolivia during the past several years.

Feb. 20—Annual Meeting, addressed by S. J. Latta, Commissioner, Bureau of Publications, Saskatchewan, on **Our Way of Life**.

Mar. 10—(1) Film on **The Manufacture of Plywood**, shown by F. C. Leroux, S.E.I.C., Vancouver, B.C. (2) Film shown by F. Heseltine, Manager, Saskatchewan Division, Canada Wire and Cable Co., on **Copper Mining and Refining in Arizona**.

April 20—Special meeting to welcome Dean C. R. Young, President, Engineering Institute of Canada.

Oct. 19—A visit to the Crime Detection Laboratory, R.C.M.P. Barracks, Regina; the main speaker being Surgeon (Dr.) Maurice Powers, Director of Criminal Investigation for Canada.

Nov. 19—(1) Address by Dr. John Mitchell, Head of Soils Department, University of Saskatchewan, on **The Soils of Saskatchewan**. (2) Film, in colour, presented by Geo. E. Kent, M.E.I.C., showing conditions in Peru and Ecuador.

Dec. 17—(1) Address by Mr. R. T. Blackmore, Technical Service Department, British American Oil Co., on **The Fuel and Oil Requirements of the Modern Gasoline**

Engine. (2) Film shown by Mr. R. M. Pugh, Provincial Apiarist on **Bees and the Production of Honey in Saskatchewan**.

The average attendance at these meetings was 48.

SAULT STE. MARIE BRANCH

The Executive Committee met on January 13th, 1942 and appointed standing committees. The committees and their respective chairmen are as follows:

Papers and Publicity A. E. PICKERING
 Membership W. D. ADAMS
 Entertainment J. L. LANG
 Junior Engineer's T. F. RAHILLY

The Executive Committee met four times during the year to transact and promote the activities of the Branch and Institute.

During the course of the year two additional committees were appointed. One headed by the chairman and secretary, whose purpose was to advise prospective students in engineering. The other, consisting of J. L. Lang, E. M. MacQuarrie, P. P. Martin, K. G. Ross and G. W. MacLeod, was established to study Post War Problems and Rehabilitation.

As usual the Branch Affiliates took an active part in the Branch affairs. At one meeting the discussion was led by a Branch Affiliate.

We were honoured with the visit from the president of the Institute, C. R. Young and Vice-President K. M. Cameron on April 2, 1942.

Seven dinner meetings were held during the year. The average attendance was twenty-five members and guests. The meetings were usually on Friday night, but this rule was not rigidly adhered to, as some meetings were arranged to suit the convenience of the speaker.

Programmes of the meetings were as follows:

Jan. 30—**Progress and Design in the Operation of High Efficiency Power Plants**, by W. E. S. Dyer, M.E.I.C.

Feb. 27—An illustrated address on **Some Recent Trends in Industrial Applications of Electricity**, by Fred. A. Becker, field engineer, Canadian General Electric Company.

April 2—Visit of President C. R. Young and Vice-President K. M. Cameron.

April 24—**New Principles in Heating Becker Coke Ovens**, by Wm. Seymour, M.E.I.C.

Oct. 30—Open discussion on **Post War Reconstruction and Rehabilitation**.

Nov. 27—**Foundation Problems in the Winnipeg Area**, by Professor A. E. MacDonald, University of Manitoba.

Dec. 18—Annual Meeting.

The executive regrets the loss of the following resident members through change of address: W. E. S. Dyer, Wm. VanEvery, F. Smallwood and Wm. Seymour. The last two mentioned had served on the executive for many years and were past chairmen of the branch.

TORONTO BRANCH

The Annual Meeting of the Branch was held in the Debates Room, Hart House, University of Toronto. The meeting was preceded by a paper given by W. B. Redfern, M.E.I.C., on **Waterworks and Sewerage Installation for Wartime Housing Projects**.

During the past year the Executive Committee held twenty-one meetings with an average attendance of ten.

The regular meetings held during the year are listed below with the attendance given in brackets.

Jan. 15—Students' Night. **Frequency Modulation Receiver**, W. O. Cartier. **The Successful Engineer**, D. Schmidt. **Pre-Stressed Concrete Construction**, W. S. Glynn. **On Spinning of Aeroplanes**, C. B. Livingstone. **Centrifugal Pumps**, A. B. Extence. **Mercury Arc Power Rectifiers**, C. W. Shearer (78).

Jan. 29—**Design and Construction of a Concrete Head Frame for the Hollinger Mine**, Dr. A. H. Harkness, M.E.I.C., and R. J. Fuller, M.E.I.C. (75).

Feb. 19—**Hydraulic Misbehaviour in Water Power Units**, Mr. Forrest Nagler (85).

Mar. 5—**The Organization and Work of Research Enterprises, Limited**, Lt.-Col. W. E. Phillips, D.S.O., M.C. (85).

- Mar. 19—**Power Transformer Station and Transmission Line Problems with Particular Reference to Burlington 220 K.V. Station and Associated Lines**, Mr. C. F. Publow, and Mr. A. E. Davison (75).
- April 23—**Air Raid Damage to Structure**, Prof. F. Webster.
- Nov. 5—**Welding Large Electrical Equipment**, Mr. H. Thomasson (70).
- Nov. 20—**DeCew Falls Development of H.E.P.C. of Ontario**, Otto Holden, M.E.I.C. (65).
- Nov. 27—**Surface Hardening by Induction**, Dr. H. B. Osborn, Jr., Joint Meeting with Toronto Section, A.I.E.E.
- Dec. 3—**Glass in National Defence**, Mr. C. J. Phillips (85).
- Dec. 5—**Saving Hydro Power for Victory**, Dr. T. H. Hogg, M.E.I.C. Joint Meeting with the Royal Canadian Institute.

Previous to each regular meeting, dinner was held at Hart House, attended by the members of the Executive, speakers and members of the Branch.

On April 22, 23 and 24 a series of lectures by Professor F. Webster dealing with **Structural Defence Against Bombing**, was given before representatives of the engineering profession from all over the Dominion, except the Pacific Coast. General arrangements were made by Headquarters of the Engineering Institute and local arrangements were made by the Toronto Branch.

It is with deep regret that the Toronto Branch records the deaths of the following members of the Branch during the year: Professor W. J. Smither, Robt. McDowall, R. J. Fuller, A. Ross Robertson, and John H. Jackson.

VANCOUVER BRANCH

The following meetings of the Branch were held this year:

- Jan. 20—First meeting of the branch in 1942. The speaker was W. D. McLaren, general manager of the West Coast Shipbuilders Ltd., a company engaged in building standard cargo vessels for Wartime Merchant Shipping Ltd. His subject was **Ships: Selection of Type**.
- During the month, members of the branch were guests at a meeting on the subject of arc welding held under the auspices of the British Columbia Chapter of the American Society for Metals. The principal speaker was Mr. James F. Lincoln, president of the Lincoln Electric Company of Cleveland and director of its allied companies in Canada, England and Australia. His subject was **Electric Welding Developments**.
- April 17—Dinner meeting held in the Georgia Hotel in honour of the president of the Institute, Dean C. R. Young. Branch Chairman W. O. Scott presided and forty members and guests were present.
- The Branch was exceedingly fortunate in having three lectures delivered by Professor F. Webster of London, England, on the subject of air raid shelters and the making of structures bomb-resistant. A large attendance of members and specially invited guests at each lecture indicated the degree of interest in the subject.
- May 27—At a meeting held in the Medical-Dental Building, Professor Frank Forward, professor of metallurgy at the University of British Columbia, spoke on **Metallurgical Progress in the War**.
- Sept. 17—An address entitled **The Failure of the Tacoma Narrows Bridge** was given by A. H. Finlay, associate professor of civil engineering at the University of British Columbia.
- Oct. 22—**The Design and Construction of the Scanlon Dam** was the subject of a paper given before the Branch by William Jamieson, field engineer for the Powell River Co. Ltd., Powell River, B.C. Following his address Mr. Jamieson displayed many interesting photographs and plans of the work.
- Nov. 9—Members of the Branch were guests at a meeting of the Vancouver section of the American Institute of Electrical Engineers. Dr. H. S. Osborne, plant engineer of the American Telephone and Telegraph Company, and national president of the American Institute of Electrical Engineers gave an interesting address on **The Conservation of Critical Materials**.

VICTORIA BRANCH

Five meetings of the executive committee, six general branch meetings, two lecture meetings and one industrial visit were held during 1942 as follows:

- Jan. 16—Dinner meeting. Annual meeting and election of officers. Introductory talk by Mr. W. H. Mathews of the Provincial Dept. of Mines on **Polarized Light** followed by a film **Photoelastic Stress Analysis**.
- Apr. 2—Dinner meeting. Mr. A. S. G. Musgrave gave a very interesting talk on **Aerial Photography and Mapping in the Great War**, accompanied by still pictures, maps and photographs of Palestine, Egypt and France.

- Apr. 15—Dinner meeting. In honour of President Young and the occasion of the presentation of the "Julian C. Smith" medal to Mr. Charles Alexander Magrath, an honorary member of the Institute and a famous engineer. "A pioneer in the development of the West, a surveyor qualified to practice in every province and an expert in the conservation and use of water."
- May 11—Lecture meeting. **Structural Defence Against Bombing**, by Professor Webster, Deputy Chief Engineer, Ministry of Security, Great Britain, attended by members, members of other engineering associations, architects and members of public utilities, A.R.P., etc.
- May 19—Lecture meeting. **Making and Shaping of Steel**, courtesy of United States Steel Corporation and introduced by Mr. F. Wilkinson of the United States Steel Export Co. of Vancouver, B.C. Two-reel film depicting steel from mine to finished product. Attended by members, other engineers, machinists, shipyard workers, etc. Sponsored by Victoria Branch, of the Institute, Yarrows Ltd. and the Victoria Machinery Depot Ltd.
- Aug. 12—Luncheon meeting. **Methods of cleaning Water Main**, described by Mr. L. S. Olding of the National Water Main Cleaning Co. of New York, followed by a visit to operations of this company in Oak Bay Municipality.
- Dec. 2—Dinner meeting. **The Alaska Highway**, describing "Topographical Features," "Details of Construction," "Personal Experiences on Construction." "Maps and Photographs" in the order named by Messrs. F. C. Green, Surveyor General of the Province, A. L. Carruthers, Chairman of the B.C. Highway Board, H. C. Anderson, Assistant Chief Engineer, Provincial Dept. of Public Works and Norman Stewart, B.C.L.S.
- Dec. 17—Luncheon meeting. Nominations for Branch officers and general business.
- Dec. 19—Industrial visit. Members and their wives were invited to visit Yarrows Ltd., Yard No. 2, to observe methods of organization and construction and to witness the launching of a corvette. Courtesy of Mr. Norman Yarrow, and Mr. E. W. Izard.

WINNIPEG BRANCH

The following meetings were held by the Branch during the year 1942:

- Jan. 8—Meeting in Theatre F of the University at which Mr. G. A. Howard, Supervisor of Apprentices, C.N.R. Western Region, gave an interesting talk on **The Selecting and Training of Apprentices**.
- Feb. 5—Annual Meeting. Following the reports of the various officers and committee chairmen, a very interesting film on **Copper Mining Methods** was shown by courtesy of the Canada Wire and Cable Co.
- Feb. 19—Meeting in Theatre F of the University when an address by Dr. F. D. White, Professor of Biochemistry, Medical College, Winnipeg, on the subject of **The Present Status of Gas Warfare** proved very instructive and interesting.
- Mar. 5—Meeting in Theatre F of the University when the modern method of construction of **Prefabricated Houses** was described by Mr. Ralph Ham, since deceased.
- Mar. 19—Meeting in Theatre F of the University at which two Student papers were given. Mr. W. A. Bowman spoke on **Construction of Temporary Grain Storage Annexes** and Mr. C. H. Glenn spoke on **Electric Arc Furnaces**.
- Apr. 2—Meeting in Theatre F of the University when a seven-reel film entitled **The Making and Shaping of Steel** was shown.
- Apr. 6—Special Luncheon Meeting in the Hudson's Bay Company Dining Room when we were privileged to have the president and his party as our guests. In the absence from the city of both the chairman and vice-chairman of the Branch, Mr. J. W. Sanger, councillor, occupied the chair.
- Apr. 16—Meeting in Theatre F of the University when a talk and film on the subject, **Rubber in Defence** was presented by Mr. J. McGale, Branch Manager, the B. F. Goodrich Rubber Co. of Canada.
- Oct. 15—Special closed meeting held in Theatre F of the University when Mr. F. S. Adamson, assistant engineer, City Engineers Department, gave a very interesting paper on the material received in the lectures at Toronto by Prof. Webster. The subject of the paper was, **Structural Defence Against Bombing**.
- Nov. 5—Meeting in Theatre F of the University at which Mr. C. A. Smith, Branch Manager, Ford Motor Co. gave an interesting paper on **Mechanical Transport**. This paper was followed by a very instructive film depicting assembly, testing, and actual service of this type of equipment.
- Dec. 3—Meeting in Theatre F of the University at which two films were shown. **The Erection of the Golden Gate Bridge** and **The Manufacture of Sheet Steel**.

RUBBER FROM GUAYULE

From *The Engineer* (LONDON), DECEMBER 18, 1942

While the synthetic rubbers serve many purposes as well as does the natural product—are even better for some, it is said—there are some products for which they are not so well adapted, at least when used alone. In the manufacture of tyres, for example, it has so far been found necessary to use a certain proportion of natural rubber for satisfactory results.

The great need for rubber of any kind, and especially the need for some natural rubber, has caused the United States government to intensify investigations into rubber-bearing plants adapted to culture in that country, and to start actual production of the more promising ones. There are a number of such plants, both native and imported, which are capable of producing greater or lesser amounts of rubber. This article is concerned with guayule. Guayule rubber is the same kind of rubber as that produced by the Hevea tree of the East Indies, and while the two have slightly different properties in some respects, they are readily interchangeable for most purposes. Guayule rubber makes excellent tyres, used either alone or in conjunction with other rubbers.

Guayule is a shrub, with the botanical name *Parthenium argentatum*. It looks a good deal like sagebush, and grows wild in North-Central Mexico and an adjacent area in the "Big Bend" section of Texas. The mature shrub is usually 3 ft. or less in height, and has crooked, brittle branches. Its leaves are slender and greyish-green, with slightly irregular edges, and the many inconspicuous yellowish flowers are borne on short slender stems.

In its native habitat, guayule grows generally on outwash fans of limestone soils, where the soil is light in texture and well drained. As indicated by its natural range, it requires a mild climate, though dormant plants have withstood a temperature of 5 deg. Fah. without being killed. It is very drought-resistant and can live where rainfall ranges from 10 in. to 15 in. per year. Like most other plants, though, the better the growing conditions, the larger and faster it grows.

Unlike the Hevea rubber tree, where the rubber is contained in the sap and is drawn off by tapping the trunk, the guayule shrub deposits pure rubber in the fibres of the plant itself, under the bark. It deposits the rubber when the soil moisture begins to run short, so for most effective rubber production the plant requires a relatively short, wet growing season followed by a long, dry period. This is the condition that obtains where the plant grows naturally, and that must be present where it is to be grown. If moisture is available for growth too much of the year, little rubber is produced.

The guayule plant deposits some rubber each year of its life, and may live for twenty years or more. However, under cultivation the peak of production is reached during early maturity, and since the plant is destroyed in recovering the rubber, the most economical cropping period is four or five years. Under optimum growing conditions, the rubber content of the shrub, when dry, ranges from 18 to 22 per cent of its weight. In case of need, it may be harvested earlier, but with a corresponding reduction in yield. The rubber occurs in both the branches of the plant and the roots, and extraction is accomplished by crushing and pulverizing the shrub and floating the rubber particles off on water.

It was not until 1904 that large-scale production of guayule rubber got under way, with the erection of processing plants in Mexico and Texas. By 1909, 30 million dollars of American capital was invested in the business, and the factories have exported some 4,000 tons of rubber annually. The figure for 1940 was 4,106 tons. There is no longer a factory in Texas, but four of them operate in Mexico.

Abstracts of articles appearing in the current technical periodicals

One of the early operators in Mexico was the Intercontinental Rubber Company. In 1912 the company decided to try domesticating guayule in the United States, and Dr. W. B. McCallum, chief botanist for the company, collected seeds from several hundred strains of the plant, which he took to southern Arizona. There experimentation was started, looking both to improving the productiveness of the plant and to finding situations suitable for growing it commercially.

Later, it was decided that the Salinas Valley of California offered the best climatic conditions for both continued experimentation and commercial production, and the operation was moved there in 1924-25. A mill capable of producing about 10,000 lb. of rubber per day was built, and since that time about 8,000 acres of guayule has been grown in the valley and processed in the mill. The rubber has been sold under the trade name "Ampar", and used for many purposes, including the manufacture of tyres.

Of much greater importance, however, is the fact that over the intervening thirty years Dr. McCallum kept up an elaborate and painstaking experimental programme, which has greatly increased the productiveness of the guayule shrub. The wild shrub, which, of course, is of all ages when harvested, turns out on the average about 10 per cent of its dry weight in rubber, while the best of the improved strains make around 20 per cent at five years of age. At the same time experiments were carried on to discover the strains best suited to various situations of growth. The hundreds of strains with which the research programme originally started have been boiled down to about ten, of which four produce the bulk of the actual planting stock. There is no reason to suppose that the limit has been reached in breeding up the plant in productiveness or in adapting it to diverse growing conditions. Thirty years is a very brief time in which to improve a long-lived plant such as guayule.

Because of the generally low world price of rubber, the company had never felt justified in embarking on a large production programme, but it did perfect machinery and methods of culture and processing adapted to production on any scale, should occasion ever warrant expansion. Of still greater importance, when the country began looking for a source of rubber supply to take the place of East Indian imports, was the fact that some 23,000 lb. of seed from the best strains of guayule had been collected and were in storage available for planting. This seed, together with all its equipment and properties in California and patents in this country, the company offered to the Government. By an act adopted March 5th, 1942, Congress authorized the Secretary of Agriculture to acquire them and to embark on a 75,000-acre production programme.

As indicated previously, guayule requires certain conditions of soil and climate for successful culture, and a reconnaissance survey of California was made to locate the areas adapted to it. More intensive surveys within these areas are made as required in connection with the leasing programme. In general, the areas are found in the coastal valleys from Monterey County south, along the west side of the Sacramento and San Joaquin valleys, the Imperial Valley, and scattered small areas in Riverside and Imperial counties. Further expansion of the Project is possible in Arizona, New Mexico, and Texas, where adaptable lands are known to exist.

As time goes on, the shrub may be found to be adapted to other areas now considered infeasible for one reason or another, or the plant itself may, by selection and breeding, be adjusted to other conditions. Already a large number of

indicator and test plots have been set over the suspected possible range of the plant, and experimentation is under way looking toward producing strains resistant to some of the principal hazards which now prevent otherwise excellent land from being considered for guayule culture.

Production of guayule rubber from plantations has so far been on so small a scale, and costs have been influenced by the developmental character of the operation, that there are no existing figures that would be of much value in forecasting the cost of such rubber under full-scale production. The present Governmental production programme is a war effort, aimed entirely at helping to relieve the critical rubber situation, but it is not beyond the bounds of possibility that it may also result in developing both a permanent at-home source of rubber crop, it is "easy" on land, occasioning less drain on soil resources than many other crops, and since genetic research in connection with the plant itself is really only in its infancy, there is every probability that both its productiveness and its tolerance to growth conditions will be improved.

MR. C. P. EUGÈNE SCHNEIDER

From *Engineering* (LONDON), NOVEMBER 27, 1942

Very many people in all walks of life in France, and the numerous friends he had in this country, will have learned with deep regret of the sudden death of Mr. Charles Prosper Eugène Schneider, which occurred in Paris on November 17. Mr. Schneider was the grandson of Mr. Joseph Eugène Schneider, the founder of the works at Le Creusot, and was born in that town on October 29, 1868. He had been head of the firm of Messrs. Schneider et Compagnie for over 40 years and we have no doubt that his death was hastened by the fact that all his firm's establishments, at Le Creusot, Chalon-sur-Saône, Paris, Le Havre, Caen and Bordeaux, were occupied by the enemy as a result of the events of June, 1940, and that the works at Le Creusot were subjected to a heavy daylight air attack by the Royal Air Force on October 17. Moreover, he had never fully recovered from the blow caused by the death of his eldest son, Mr. Paul-Henri Schneider, who was killed in 1917 over the enemy lines when serving in the French Air Force. Mr. Schneider's two other sons also served in the war of 1914-18.

Over a period of many years, and mainly under the administration of Mr. C. P. Eugène Schneider, the company greatly extended its scope and kept fully abreast of the times. New Works were built and interests in others, both in France and abroad, were acquired. It is interesting to note that as early as 1876, Messrs. Schneider started the manufacture of all-steel armourplates, while they have been long renowned for the excellence of their artillery. It would, however, be a mistake to consider the firm and its late head as having been employed mainly upon the design and manufacture of munitions of war. This is very far from being the case, since prior to the outbreak of hostilities, at all events, their ordinary industrial products were much more numerous than their manufactures of war material. The former covered a wide range, including the rolling of merchant bars, plates, sheets, and sections, and the construction of bridges, piers, locomotives, electrical machinery and plant, internal-combustion engines, steam turbines and other mechanical and civil engineering work. Moreover, Mr. Schneider and all the members of his family have always appeared to attach as much importance to the benevolent institutions which they established at Le Creusot at their own expense, as to the actual manufacture of iron, steel and the products derived therefrom. These institutions include first-rate arts and crafts schools; a hospital staffed by eminent surgeons, doctors and nurses; dwelling houses at cost price on easy terms; and the provision of pensions, of sports grounds, and of home for the aged and infirm.

Owing to the development of the firm, Le Creusot ceased, some years ago, to be the central governing organization, and Mr. Schneider found it necessary to reside in Paris and to direct the business from the city, but that Creusot benevolent institutions never ceased to function smoothly under

the careful attention devoted to them by him and his family. Similar relations exist between master and man in other establishments outside Le Creusot which have been acquired by the firm.

For many years the Creusot works had at their disposal iron mined at no great distance, sufficient to keep the blast furnaces supplied. These iron-ore mines, however, became exhausted some years ago and the blast furnaces gradually ceased to function. The Creusot works had therefore to be adapted to meet the situation, but they have never ceased their activities in all other directions. After the war of 1914-18, Mr. Schneider acquired a controlling interest in the Skoda Works at Pilsen, in Czechoslovakia, a venture which was lost to the firm when Germany seized that country. A few years ago the firm also acquired what might be termed a technical interest in Marine Industries, Limited, of Sorel, in the province of Quebec, Canada. The Canadian company is independent of Messrs. Schneider's establishments, but entered into an agreement with them in regard to technical collaboration, so that Messrs. Schneider sent engineers and technical men to the Sorel works to assist in the design and manufacture of various products.

INDUSTRIAL SAFETY AND MANPOWER CONSERVATION

From *Mechanical Engineering* (NEW YORK), JANUARY, 1943

According to a recent statement, since Pearl Harbor 85,000 persons have been killed by accidents in the United States and 7,700,000 have been injured. Of the fatal accidents, 42,000 were to workers; and it is said that only one out of eight industrial establishments is fully covered by a safety programme. Even assuming it would be possible to institute effective safety programmes to guard persons during working hours, there would still remain the hazards of street, home, and recreational pursuits which claim three out of five workers.

Obviously, industrial safety is, in more than one sense, a personal responsibility. No one seriously argues that employers have no responsibilities, but the modern tendency of the public to regard all questions affecting their security and welfare as obligations laid upon others—their government and their employers, for example—and to assume that safety regulations and compensation insurance relieve the individual of the necessity of exercising prudence and caution, is futile nonsense. No one has yet been able to discover all the ways by which a fool may be saved from the consequences of his folly. Safety is still, fundamentally, a personal responsibility.

The toll of accidents which this nation has grown to accept with callous disregard is brought into sharp relief by comparison with recently published figures of civilian casualties in air raids in Great Britain. These casualties, from September, 1939, through September, 1942, totaled 103,379, of which 47,498 represented persons killed. The population of Great Britain is, of course, much smaller than that of the United States. The dramatic background of war and aerial bombardment has greatly emphasized the wastage and tragedy of human lives resulting from air raids. Because we have stupidly grown accustomed to everyday accidents we have no public concern over their importance comparable to what we feel when the casualty lists of war and bombings are made public. Yet the loss resulting from the 42,000 fatalities among workers since Pearl Harbor must be admitted to be a loss of production capacity which affects our nation, for the most part needlessly, at a time when manpower is being used to the limit in the defense of our own way of life.

Industry must assume a large measure of responsibility in the effort to reduce accidents. By intelligent study of hazards to eliminate them as much as possible and by administrative and disciplinary procedures, accidents can be practically abolished. Many plants in the most hazardous industries have gone for years without lost-time accidents because they have made a business of industrial safety.

Management and worker have co-operated to this end and are equally proud of fine records. What has led to the spoiling of some of those records lately has been the increase in production, the change in the kinds of work done, and great numbers of new workers and supervisors that have been employed.

Mounting accident wastage at a time when production facilities and manpower have been strained to the limit has led the President to call upon the National Safety Council "to mobilize its nation-wide resources in leading a concerted and intensified campaign against accidents." Accordingly, the Council has organized the War Production Fund to Conserve Manpower, of which William A. Irvin, former U.S. Steel Corporation president, is chairman and Thomas W. Lamont, of J. P. Morgan and Company, is treasurer. A five-million dollar fund is being raised and a national committee of 600 is being formed. Detailed plans for re-energizing the safety movement have been laid. New safety councils in war-production centres, training programmes in public schools, trade schools, and engineering colleges, and public education by means of the press and the radio are contemplated.

FAST FIGHTERS

From *The Engineer*, (LONDON), DECEMBER 11, 1942

So frequently does one read of some new wonderful performance in speed or climbing capacity of the latest fighter aircraft that one cannot but wonder whether the pace can last. It is not merely that speeds have risen since the last war from the neighbourhood of 150 to 400 miles an hour, but that nearly the whole of this immense advance has been concentrated in the last ten years. The increase in engine power alone has not done this, since to force the aeroplane of the day from 150 to 400 miles an hour would require between ten and twenty times the power, whereas the actual improvement, great as it is, would not be much over four to one. Most of the change has been due to improvements in the airframe, partly to the drastic alteration from biplane to monoplane construction, with its absence of struts and therefore of wetted area and of aerodynamic interference in the streamline flow, partly to the use of undercarriages that can be tucked up, and partly to the meticulous cleaning up of all excrescences, including miscellaneous instrumental gear formerly carried outside. In a lecture given before the Lilienthal Gesellschaft just before the present war, Dr. Heinkel, the aircraft designer, estimated that whereas six years earlier nearly 40 per cent of the total drag was caused by struts, exposed landing chassis and the like, by 1938 the whole of this had disappeared. So aerodynamically clean are aircraft now that even the gun mountings and turrets do not usually reduce top speed by more than a few miles an hour.

It is worth considering how much further the aircraft designer can go. Little of such a character as instantly to strike the eye seems left to him, but there is a good deal that is less obvious. Rivet heads, when not finished flush, cause an extra drag that can and must be avoided; new wing shapes in which the air stream follows the contour further back than used to be the case are a vitally important field of study, since success in this direction at once puts down the drag. Bold pioneers, in Germany as well as elsewhere, have experimented with methods of sucking the turbulent air into the wing, or, in the alternative, of blowing it backwards, in order to reduce still further the wing resistance which accounts for some half of the total resistance of the modern aircraft. Engine power is being steadily pushed up at the same time, and the end of that endeavour is far from being in sight. But with all these possible developments and other which cannot be mentioned, and some still no doubt to be discovered, a very steep hedge is being approached. If the drag invariably rose at no steeper rate than the square of the speed, a change from 400 to 600 miles an hour would merely lead to a drag increase in the ratio of 16 to 36, but owing to the close approach of the higher

of these two speeds to the velocity of sound—the highest speed at which any sudden disturbance in the air can move itself away—the actual increase in drag, as many wind tunnel tests have shown, is likely to become tenfold, and no ordinary increase of engine power, however substantial in itself, can surmount such a barrier, especially when the airscrew efficiency is known to drop substantially once this range of speed is entered. The search for a way around or over this hedge is assiduous.

The new German fighter, "FW190", has shown a remarkable capacity for climbing fast, and the Junkers "86" has an unusually high ceiling but even these improvements, considerable as they are, have not given either craft appreciably greater safety when in combat with the R.A.F. Many "FW190s" have been shot down and we note that over the African fighting zone at least three Junkers "86s", although flying close to their lofty ceilings, have been engaged and destroyed by our indomitable "Spitfires". An exceedingly high ceiling may indeed be useful for photographic aircraft and well worth striving for, but for bombers hardly at all, since little surplus lifting capacity is possessed by any aircraft built for stratospheric flying. Despite, therefore, the technical skill of the German designers, we have ample reason to feel confidence in our own men—designers, constructors and flyers alike. What the future has in store is always and everywhere carefully concealed, but each time the curtain is drawn slightly aside we realise how effectively each move of the enemy is matched, and more than matched, by our side in this Homeric contest. In air warfare quality counts even more than quantity, but the lead in quality once assured, the advantage of overwhelming numbers is one which steadily mounts. The crisis of the war seems to be close upon us, and as engineers we are justified in feeling as well served in the technical efficiency of our fighting equipment as we are in the Air Force that so confidently uses it. In the severe air fighting that lies immediately ahead the performance of the R.A.F. will, we feel sure, to borrow Mr. Churchill's modest but confident phrase, be "well worth watching"!

AXIS DEPRIVED OF NORTH AFRICAN GOODS

From *Trade and Engineering* (LONDON), DECEMBER, 1942

The allied advance in North Africa and the Mediterranean has had some noteworthy economic effects. Not the least important is that between 200,000 and 300,000 tons of merchant shipping will be taken over by the allies. About 120,000 tons were tied up in ports there, and another 120,000 tons represent one-third of the tonnage which is estimated to have been operating between France and North Africa. The enemy will lose not only this useful shipping but also quantities of goods which the vessels helped to bring from North Africa and over three-quarters of which were seized for war purposes.

These products included minerals, phosphate rock, vegetable oils and seeds, grain, and other foodstuffs. Hitler increased his imports of iron-ore from North Africa nearly eight-fold in 12 months. It is of special quality with very low phosphoric content and represent about 16 per cent of the total Axis consumption of this high-grade material. While alternative supplies may be available from Sweden, Spain and Norway, the two first-named have a habit, which seems likely to prove awkward for the Germans, of requiring payment. Moreover the journey which Swedish ore has to make is rendered very hazardous by the activities of the Allies. Good quality ore is also available in the Donetz Basin, but not easily, because of shortage of man-power and difficulties of transport. Similarly the cutting off of other products will accentuate Nazi troubles and deficiencies.

The new situation in French West Africa should make useful supplies available to the United Nations and deny them to the enemy. Such products include a number of vegetable oils, notably groundnut and palm oil, (reported to have been used in fuelling submarines at Dakar), fibres, gums, hides and skins, rubber, and tapioca.

LARGE WATER TREATMENT PLANT FOR CHICAGO

From *The Engineer*, (LONDON), DECEMBER 4, 1942

While Chicago, with 1,500,000 population, has the vast reservoir of Lake Michigan as a source of water supply, the south end of the lake is subject to serious pollution, especially with sewage and industrial wastes from a group of manufacturing cities. As a result of this condition, the city has nearly completed a filtration and treatment plant having a capacity of 320 million gallons daily, and estimated to cost £5,400,000. This will serve only the southern section of the city, and eventually two somewhat similar plants will be required. Two special features are its construction as a pier or structure extending into the lake, and its use of a novel treatment by the sodium-silicate conditioning process. This process, developed in the experimental studies for the plant, serves to toughen or consolidate the coagulated matter, thus making it possible to use smaller settling basins and higher filtration rates, and consequently reducing the cost. Water is taken through shafts about two miles from shore, and pumped to a head of 18 ft. above lake level, there flowing by gravity through the filtration and treatment works. Chemicals are to be added as the water flows through a channel equipped with agitators for rapid distribution, and then a channel so fitted with baffles as to ensure a uniform velocity of flow in the entire depth of the stream of water. The settling basins are of two-storey design. There are eighty filters of 1,400 square feet area, with a depth of 13 ft. 6 in., and each having a capacity of 4,000,000 gallons daily. The gravel, graduated in sizes from 1/12 in. to 2½ in., will be about 20 in. thick, covered with two feet of sand. Chemicals will include alum, iron compounds, lime, ammonium sulphate, activated carbon, sodium silicate, sulphuric acid, and possibly sodium hexametaphosphate. In addition, the chlorination equipment includes fourteen chlorinators having maximum capacities of 300 lb. to 2,500 lb. per twenty-four hours. Beyond the main pumping plant, the works are divided into three identical units.

THE "AUSTERITY" LOCOMOTIVES

From *The Engineer*, (LONDON), NOVEMBER 27, 1942

Notices have appeared in the Press about the locomotives specially designed by the Ministry of Supply for the use of the British Army, and a few details of a technical character will be welcomed by engineers.

The design is of the most simple description and is governed by the availability of materials and labour. The employment of steel castings is strictly limited, and complicated forgings are avoided wherever possible. Constructional details are reduced in number to the lowest limit consistent with efficient working, and as far as possible renewable parts are duplicate with those of L.M.S.R. standard locomotives.

Materials will be the best obtainable of their respective kinds, and tests are to be in accordance with British Standard Specifications so far as these are applicable. Workmanship will be of the highest standard throughout.

The boiler barrel is parallel and the fire-box casing of the round-topped type. The fire-box is to be of copper, stayed to the outer casing by steel water space stays riveted over on the inside only, and by copper stays in the breaking zone, riveted over both inside and outside. The crown is to be supported by steel direct stays screwed and riveted over at both ends. The boiler as a whole follows good modern practice.

The main frames are to be of steel plate and the stretchers are to be of flanged plates and fabrications, while the smoke-box saddle will be of cast iron. The stretchers will be secured to the frames either by turned and tightly driven bolts or by hot steel rivets closed by hydraulic pressure.

The cylinder block is of cast iron, and the slide bars, made of steel, will be of the double overhead type to suit the "Laird" type of crosshead, which is to be a steel casting.

The slide blocks will be of cast iron lined with white metal. The pistons will be of the box type, of cast iron, each with three narrow rings of cast iron. The valve gear is to be Walschaerts, operating piston valves arranged for inside admission. Holes with wearing surfaces will be fitted with cast iron bushes, and hand screw reversing gear arranged for left-hand drive is to be fitted.

The driving wheel centers are to be steel castings, and those of the leading intermediate, and trailing wheels of cast iron, all with balance weights incorporated in the castings. Tyres will be fitted to the coupled wheels only.

The springs will be of the laminated type.

Steam brakes will be fitted to the engines, with dual automatic brake apparatus for train working.

Steam sanding will be arranged at the front of leading and front and rear of driving wheels. The boxes are to be of fabricated plate with cast iron lids.

The two-wheel truck at the front end of the engine will be of the three-pin swing-link type. The wheels, which also incorporate the tyre section, will be of disc form and made of steel, forged and rolled.

For lubricating the cylinder barrel and steam pipes a sight-feed lubricator having four feeds will be provided. Other important points requiring lubrication will be siphon fed.

TENDER

The wheels of the tender, which also incorporate the tyre section, will be of disc pattern and made of cast iron chilled on the tread. All the wheels of the tender will be braked by steam and hand brakes, and for train working dual automatic brake apparatus will be fitted. The brake rigging will be compensated.

Leading particulars of the locomotive and tender are given in the accompanying table.

The tank will be of welded construction throughout.

The fuel space will be so arranged as to make the bunker self-trimming.

ENGINE

Cylinders	19 in. dia. by 28 in. stroke
Coupled wheels	4 ft. 8½ in. diameter
Front bogie wheels	3 ft. 2 in. diameter
Coupled wheel base	16 ft. 3 in.
Rigid wheel base	16 ft. 3 in.
Total wheel base	24 ft. 10 in.

Heating surface:

Tubes	1,512 square feet
Fire-box	168 square feet
Total	1,680 square feet
Superheater surface	338 square feet
Grate area	28.6 in.
Working pressure	225 lb. per square inch
Tractive force, 85 per cent working pressure	34,215 lb.

TENDER

Tank capacity	5,000 gallons
Fuel capacity	9 tons coal
Wheels	3 ft. 2 in. diameter
Wheel base	15 ft. 9 in.

ENGINE AND TENDER

Wheel base	53 ft. 1¾ in.
----------------------	---------------

ESTIMATED WEIGHTS

Engine in working order	About 72 tons
Tender in working order	About 56 tons

Approximate weight distribution
in working order:

Truck axle	10 tons
Coupled axles	15½, 15½, 15½, 15½ tons
Tender axles	14, 14, 14, 14 tons

From Month to Month

HONORARY MEMBERSHIP FOR PROFESSOR WEBSTER

All those members who had contact with Professor Fred Webster of London, England, during his stay in Canada, will be delighted to know that Council has elected him an Honorary Member of the Institute.

Not many people more adequately meet the requirements for this honour than does Professor Webster. His services in many parts of the world, both in practice and in instruction, have done much to enhance the prestige of the engineer. The wide dissemination in Canada of his expert knowledge on effects of bombing was made possible only by real sacrifices of time and effort on his part.

Prof. F. Webster, Hon.M.E.I.C.

Professor Webster's quiet, modest manner did much to conceal from the public the breadth of his experience and the depth of his knowledge and understanding. Even those who were privileged to be with him most found it a rare occasion upon which he talked about himself. One has but to read the following sketchy biography to realize how well he has kept to himself those things which most people are inclined to display on any suitable occasion.

Professor Webster was graduated from the University of Liverpool in 1913 with the degree of Bachelor of Engineering. His early experience was mostly on structural design having to do with harbours and docks in many parts of the world. He became assistant to the chief engineer of the Mersey Docks and Harbour Board, but early in the war left this work to enlist as an engineering officer. He served in France with the B.E.F. as Commanding Officer with the 155th Field Company, R.E. During this service he was awarded the Military Cross. He served for some time as Captain and Adjutant, R.E., of the 16th Division, and afterwards with the 156th Field Company R.E.

After the armistice he was engaged on the restoration of railway lines in Belgium, and late in 1919 he returned to his former work with the Mersey Docks and Harbour Board.

He joined the staff of the University of Liverpool as a lecturer in civil engineering, which position he held until 1930. During this time he did much research work on the failure of concrete structures and on the movements and methods of stabilizing sands on the River Dee tidal basin.

In 1930 he became senior lecturer in civil engineering, and later principal of the government Technical Institute at Burma. In 1931 he joined the civil engineering staff of University College, Rangoon, and by 1938 was professor of engineering, and head of the Engineering Department of the University. The University operated an Honours School of Civil Engineering and Final Schools in Mechanical and Electrical Engineering and Civil Engineering; also diploma courses in mechanical and electrical engineering.

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

In addition to teaching and administration, he was responsible for the testing and standardization work in the province, and he did much research work.

In 1939 he returned home on leave, and on the outbreak of hostilities, joined the staff of the chief engineer of the Ministry of Home Security, Sir Alexander Rouse, becoming Deputy Chief Engineer, with the special care of structural design and related experimental work for the large programme of civil defence construction undertaken in Great Britain. He has lectured extensively on this subject throughout Great Britain and has been selected for important official missions to other countries.

Professor Webster made many friends amongst Institute members from coast to coast. He spoke to branches at Halifax, Arvida, Montreal, Ottawa, Vancouver, Victoria and Toronto and under Institute auspices, gave a three-day series of lectures on the engineering features of defence against bombing. This series and the complete notes which were subsequently prepared by him for printing constituted a huge undertaking but they were the means by which was made available in Canada the most authoritative and up to date information on this important topic.

It is in recognition of this service and of his own sterling characteristics that the Institute now honours him. In honouring Professor Webster, the Institute is indeed honouring itself.

INDUSTRIAL RELATIONS AND THE ENGINEERING STUDENT

The Institute's Committee on Industrial Relations has made inquiries at all Canadian universities where engineering is taught, to determine the amount of instruction that is now given in this increasingly important topic. The result shows a great variation, both in content and in degree. All universities canvassed give some time to it, but no one seems to offer a course that is both comprehensive and specifically directed at industrial relations.

The survey indicates clearly that all universities are alive to the changes in our economic existence, that make a study of these matters of prime importance. The real difficulty is to find a place on an already crowded curriculum, that would permit of adequate instruction and study. It has been suggested that the subject should be left for post-graduate study or for extra curricula instruction. Both these suggestions are worthy of study and investigation.

The following letter was sent to Canadian universities by the Institute committee. It is published herewith as a matter of interest to all members:

"To the Universities:

A short time ago we wrote to you enquiring into the course in industrial relations as it applied to the engineering students. At this time we also wrote to a number of other universities and colleges in Canada and we are attaching hereto, a summary of the replies.

This matter has been the subject of extended discussion in the Committee on Industrial Relations of The Engineering Institute of Canada and the committee desires to present to you some thoughts relative to this matter.

The engineer in his work is dealing with materials and the forces of nature, and naturally in the university training, courses are developed to equip him from a theoretical and practical standpoint so that he can solve practical problems as presented to him during his career. There is, however, another phase of the engineer's work that is receiving more and more attention. Whether or not he is placed in administrative work, he must be able to work in the society of

WILLIAM KENNEDY, JUNIOR!

Since this article was written, news has come of the death, on January 31st, of Mr. Kennedy. An obituary will appear in the March issue.

The above title suggests a word of comment because it is not the name of one of our younger members. On the contrary, William Kennedy, Junior, has just celebrated his 95th birthday and is actually a very senior member. On January 25th, he was good enough to receive the General Secretary, the Assistant General Secretary and the Secretary Emeritus, who called upon him at his home in order to present the felicitations and good wishes of the Institute. The deputation was heartily welcomed and found Mr. Kennedy looking well and enjoying his well-earned leisure.

Born near Prescott, Ont., on January 4th, 1848, Mr. Kennedy belongs to a large family many of whose members have long been leaders in engineering progress in Canada. In 1858, his father (the Senior William Kennedy) founded the well-known engineering works at Owen Sound which are still maintaining their reputations for hydraulic machinery of high quality. After working with the firm for some years, William Kennedy, Junior, came to Montreal in 1893 and established a consulting practice. During the following thirty years he planned and supervised the construction of a score of dams, waterworks, and hydro-electric power plants, from Nova Scotia to British Columbia. His work included consultation, advice, reports and valuation on many questions of water power and supply.

In 1886 he took part in the movement which led to the formation of the Canadian Society of Civil Engineers, and with his older brother—who later became Sir John Kennedy—joined that body on its establishment in February of the following year. His long and successful professional career ended with his retirement in 1925. Since then he has travelled widely, and is still a member of the Institute and a resident of Montreal. Institute members hope he will long remain on our membership list.

William Kennedy, Junior, M.E.I.C.

other human beings in such a manner as to obtain the best results. If he is placed in a managerial or administrative position as is the case with most senior engineers, he is confronted with all of those problems dealing with the relations of human beings, individually and in groups; also matters dealing with wage scales, and remuneration, methods developed to protect employees in health and to provide for their general security.

In viewing the courses in the universities, we have a feeling that much has yet to be done to equip the young engineer with the necessary fundamentals for dealing with the human phase of his work, which incidentally is as necessary, if not more necessary, than in dealing with the material phase. It has been generally recognized that most of the so-called failures among engineers who do not reach positions of large responsibility and remuneration are due to shortcomings on other than the technical side.

We would also raise the point that not only theoretical phases of psychology and economics are important to the engineer, but that their practical application is of paramount importance. It is felt, therefore, that in presenting these subjects to the undergraduate engineer, the practical application should be kept well to the fore.

We would very definitely draw to your attention the great desirability of giving adequate attention to the subject of industrial relations in courses for undergraduate or graduate engineers and should you desire, this committee would be very happy to have the opportunity of discussing it with you along detailed lines."

LATE DELIVERY OF JOURNALS

These days one becomes accustomed to the disjuncting of routines and habits that have been established over a period of years. Some of these are serious; others are of much less importance. Perhaps among these latter can be included the increasing inconveniences attached to the publishing of *The Engineering Journal*.

Many things continue to retard the monthly appearance of the Journal—shortage of materials and labour being the principal ones. Members have not complained, due doubtless to their appreciation of changing conditions, but nevertheless an explanation is due.

Ordinarily the *Journal* appears not later than the tenth of the month. Recently it has been from one to two weeks late. The January number set a new record, and at the moment of writing it is still not in the mail and the printers cannot give any definite date. The fault seems to be a set of conditions over which there is no control.

The *Journal* is not alone. Other publications, too, are having difficulty, and it is possible that conditions may be worse before they get better. The company doing the printing and mailing is one of the largest and most highly regarded in Canada, and is in as good a position as anyone to overcome or meet the new conditions. Readers may be assured that everything possible will be done to re-establish the schedule but, in the meantime, it is only fair to express appreciation of their patience.

RESEARCH WORK ENCOURAGED

To encourage research work in chemistry and chemical engineering, the Shawinigan Chemicals Limited has donated four thousand five hundred dollars to the Faculty of Science of Laval University, at Quebec, distributed over the next three years. This grant is to be used to establish nine scholarships of \$500 each, and the awards will be known as "The Shawinigan Chemicals and Research Scholarships." The scholarships will be awarded to chemists and chemical engineers doing post-graduate work at Laval University.

The vital importance of continued research is well utilized by Shawinigan Chemicals Limited, which has two research departments employing over twenty chemists devoted entirely to research. The history and achievements of the company have amply proved the wisdom of its policy.

ENGLISH HOSPITALITY FOR MEMBERS OVERSEAS

The following letter from the secretary of the Institution of Electrical Engineers (London, England) has special interest for those members who are now and who may be later in England, but it will be of general interest to the whole membership. It is a splendid illustration of the co-operative relationships which exist with our sister societies.

THE INSTITUTION OF ELECTRICAL ENGINEERS SAVOY PLACE

Victoria Embankment, London, W.C.2

22nd December, 1942.

L. Austin Wright, Esq.,
General Secretary,
The Engineering Institute of Canada,
2050 Mansfield Street,
Montreal, Canada.

Dear Mr. Wright:

The arrangements which have been made to place the facilities of The Institution at the disposal of engineers from overseas have recently been under review, with the object of ensuring that the members of sister Institutions abroad and other engineers now stationed in this country, should receive details of the meetings which it is open to them to attend if they so desire.

There has, of course, already been correspondence between us during the war on the subject of the reciprocal extension of facilities for visiting members, and in my letter of the 29th August, 1941, I referred to the Canadian Forces and also to those Canadians who are here in civilian occupations. As to the former an early contact with General McNaughton on his arrival has been followed up and we now have three links at Canadian Military Headquarters to ensure that all those concerned in the various Units will receive our programme of meetings. I have no doubt, therefore, that members of your Institute who are in the services here will be kept advised in this way.

With regard to those of your members who are in Great Britain in a civilian capacity, we are anxious to make sure that they also will be advised of the position and I am wondering whether a note could be published in your Journal drawing attention to the arrangements between the two Institutions and advising any civilian members who may be in this country to get into touch with me. If in addition it would be possible for you to write direct on the matter to those whose addresses here are known to you, then I think we should be on much firmer ground in the effort to make as many contacts as possible.

For my own part, in reference to the reverse operation of the scheme, I enclose a list of our members who have gone to Canada for war work since the list enclosed with my letter of the 29th August, 1941, was drawn up. As previously stated, it is difficult to compile a complete list as the visits of some of our members are regarded with greater secrecy than those of others and we do not always know the nature of their visits. I shall shortly, however, be publishing a reminder in our Journal of the arrangements with the various sister Institutions abroad, and this will serve the purpose not only of bringing the scheme to the notice of our members already in Canada, but also to any others who are likely to go there in the near future.

I should like to take this opportunity of sending to you my very best wishes for 1943 and of expressing the hope that your Institute will have a very successful year.

Yours sincerely,

(Signed) W. K. BRASHER,
Secretary.

Sometime ago negotiations with the three leading engineering societies in England lead to reciprocal arrangements being made whereby the members of the Institute in the Old Country could enjoy the facilities of those institutions, and

their members in Canada could enjoy similar facilities with the Institute.

All branches were notified of these arrangements and from time to time, as they were received, names of Old Country engineers were forwarded to the branches concerned. These branches have put the names on their mailing lists, and have assured the visitors of a welcome at all meetings. In some cases it has been possible to render a really special service, and such opportunities are taken up with alacrity and enthusiasm.

Branch officers and members are urged to remind persons going overseas of these privileges. If names of such persons are sent to Headquarters, the information will be forwarded to the Institutions, and every endeavour will be made to see that suitable arrangements are completed. It is a rare privilege for Canadians to visit these old British institutions which are the progenitors of similar societies in all parts of the world.

The institutions at which members of the Institute will be welcomed, in addition to the Institution of Electrical Engineers, are the Institution of Civil Engineers, and the Institution of Mechanical Engineers.

R.C.E. BAND

During the course of the annual meeting at Hamilton in 1941, a collection was taken to aid the Royal Canadian Engineers at Petawawa in the purchase of instruments for a band. This contribution was a substantial part of the total required, but it was not until some time later that the fund was completed.

For the Institute's part in this worthy objective, a framed photograph of the band has been presented to Headquarters. It is reproduced herewith. The inscription on the plate reads:

"Presented to the Engineering Institute by (A 5) C.E.T.C. of Canada in grateful acknowledgment of the assistance given in forming this band."

Royal Canadian Engineers Band

BIBLIOGRAPHY ON AUTOMATIC STATIONS

The fourth bibliography of technical literature entitled "Bibliography on Automatic Stations, 1930-1941" is soon to be issued by the American Institute of Electrical Engineers. This publication sponsored by the AIEE committee on automatic stations supplements earlier bibliographies on the subject published previously in AIEE *Transactions*.

The entries in this bibliography are numbered consecutively by sections and listed alphabetically by years. The material is divided into the following sections: general; supervisory and remote control; telemeter and telemetry; automatic and remote-controlled switches and switchgear; automatic features of generating stations using fuels; automatic boiler and combustion control, automatic hydro-electric plants; automatic substations.

The "Bibliography on Automatic Stations, 1930-1941" is a 26-page pamphlet, 8½ x 11 inches. It may be obtained from AIEE headquarters, 33 West 39th Street, New York.

N.Y., at 25 cents per copy to Institute members (50 cents to non-members) with a discount of 20 per cent for quantities of 10 or more mailed at one time to one address. Remittances, payable in New York exchange, should accompany orders.

Members of the Engineering Institute may obtain copies of the bibliography at 25 cents each from their own Headquarters. This is made possible owing to the exchange arrangements between the Institute and American Societies.

WASHINGTON LETTER

Our Washington correspondent, E. R. Jacobsen, M.E.I.C., has recently left for Australia on a technical mission which will probably take the better part of the next two months. Preparations for his departure have prevented him from contributing his monthly letter. It is hoped that on returning he will have something of interest to readers of the *Journal*.

Mr. Jacobsen is Engineering and Technical Assistant to the Director, Commonwealth of Australia War Supplies Procurement, at Washington. He is on loan from Dominion Bridge Company, Limited, Montreal, where he was structural designer.

MEETING OF COUNCIL

A meeting of the Council of the Institute was held at Headquarters on Saturday, January 16th, 1943, at ten o'clock a.m.

Present: President C. R. Young in the chair; Vice-Presidents deGaspé Beaubien and K. M. Cameron; Councillors J. E. Armstrong, J. G. Hall, R. E. Heartz, W. G. Hunt, C. K. McLeod and G. M. Pitts; Treasurer E. G. M. Cape; Secretary-Emeritus R. J. Durley, General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel.

The general secretary reported that in accordance with Council's instructions, he had sent to each member of Council, with a request for comments or suggestions, a copy of the proposed Canons of Ethics for Engineers as prepared by a committee of the Engineers' Council for Professional Development (E.C.P.D.). Replies received from seven members of Council indicated a general approval, although there was some feeling that the Canons were too numerous and too detailed. One member of Council had submitted a completely revised draft.

Mr. Pitts suggested that a small committee of possibly three senior members should be appointed to consider the replies received and prepare a memorandum covering the Institute's recommendations for submission to E.C.P.D. After some discussion it was decided to bring the matter up for further consideration at the annual meeting of Council in Toronto on February 10th.

The general secretary read a cablegram from Professor Frederick Webster accepting election as an Honorary Member, and expressing his great pleasure and appreciation of the honour conferred upon him. He also read a letter from Professor Webster extending greetings to the many friends he had made during his recent visit to Canada.

The financial statement for the year 1942, as prepared by the auditors, had been examined by the Finance Committee and approved. The finances of the Institute were in excellent condition in spite of certain substantial expenditures of an unusual nature, such as the Webster lectures. The surplus on the year's operations was the largest that had been recorded for some time, and the collection of arrears of fees, amounting to over \$5,000.00 was perhaps the largest ever recorded. It had been decided to set aside from the surplus \$2,000.00 towards a reserve for maintenance of the building, and \$1,500.00 towards a reserve for a building fund.

A letter from the Canadian Manufacturers Association asking the Institute's approval of the Pay-as-you-Earn Income Tax Plan had been received. The Association is endeavouring to indicate to the government that this plan

is approved by a substantial number of citizens so that the government may be influenced accordingly. The recommendation of the Finance Committee that the Canadian Manufacturers Association be given the support requested was approved.

It was unanimously RESOLVED that W. H. Munro, M.E.I.C., of Ottawa, be appointed chairman of a Striking Committee, whose duty it is to make recommendations to Council regarding chairmen for the various Institute committees for the year 1943. It was left with Mr. Munro and the president-elect to name the other members of the committee.

At this point, the president and the general secretary retired from the meeting, and Vice-President Cameron took the chair.

The following resolution was presented from the executive of the Winnipeg Branch.

"The executive recommends that the American Standard Abbreviations for Scientific and Engineering Terms as approved by the American Standards Association, March, 1941 (ASA-Z101-1941) be adopted by the Winnipeg Branch; and that the Secretary be instructed to write Headquarters recommending these abbreviations for consideration by Council with the view to adoption by the Engineering Institute of Canada."

A letter from the secretary of the Canadian Engineering Standards Association intimated that that body had already adopted the American Standard Abbreviations but that publication had been deferred pending a decision as to whether or not certain items of a purely Canadian or British interest should be added to the lists contained in the A.S.A. standard.

In view of the fact that all Canadian standard specifications are now handled through the C.E.S.A., it was felt that no action was necessary on the part of the Institute Council or any of its branches. However, in order to clarify the situation, it was unanimously resolved that Mr. Durley and Mr. Trudel be asked to review the situation from the time the Institute handled such specifications, and prepare a memorandum for the records and for the information of the Winnipeg Branch.

On returning to the meeting, President Young explained to Council that he and the general secretary had just met in the secretary's office with Mr. James Wilson, president of the Shawinigan Water and Power Company. Mr. Wilson had attended at the president's invitation in order to receive from him a replica of the Julian C. Smith Medal.

The president had made this presentation knowing of the co-operation and assistance given to the Institute by Mr. Wilson and his company, and because of his particular interest in the establishment of the Julian C. Smith Medal. The replica was to serve as a personal record and a keepsake. The inscription read as follows: "Presented to Mr. James Wilson, a friend of the Institute and the immediate successor to Mr. Smith as president of the Shawinigan Water and Power Company."

The president commented on the value of the support given to the Institute by commercial organizations. The establishment by outright contribution or by endowment of worth while objectives such as medals, prizes or scholarships, was very helpful.

The following resolution was presented from the Canadian Institute of Chemistry.

"That Council of the Canadian Institute of Chemistry is in favour of recommending to the Honourable Minister of Labour that the principle of compulsory transfer for technical personnel should be adopted, and is of the opinion that the views of the Engineering Institute of Canada and the Canadian Institute of Mining and Metallurgy should be sought as to their feelings for the purpose of sending a joint recommendation."

After considerable discussion Council decided that in

view of the proposed changes in National Selective Service procedures and the government's policy towards conscription, it would be inadvisable and ineffective to present a resolution along the lines suggested.

The president reported that early in January he had had a conversation with C. S. Kane, president of the Canadian Institute of Steel Construction, in which Mr. Kane outlined a proposal to institute some inquiry relative to the part to be played in post-war reconstruction by the heavy industries. In response to the president's suggestion Mr. Kane had submitted a proposal in writing. This proposal was read to the meeting by the general secretary. It suggested that as the members of the Institute were interested in heavy industry the Institute might care to name a representative to a joint committee that might be established to investigate this proposal.

Mr. Cameron pointed out that on Dr. James' Committee on Post-War Reconstruction there is a member who represents industry. The purpose in having him on the committee is to have a contact with industry so that it might be organized to fit into the other general activities. Mr. Cameron suggested that Mr. Kane might get in touch with this representative to see if his group of industries could work along the same lines as other industries.

It was agreed that this whole proposal be submitted to the Institute Committee on Post-War Problems.

It was noted that the next meeting of Council would be held at the Royal York Hotel, Toronto, on Wednesday, February 10th, 1943, convening at ten o'clock a.m.

A number of applications were considered, and the following elections and transfers were effected:

ELECTIONS AND TRANSFERS

At the meeting of Council held on January 16th, 1943, the following elections and transfers were effected:

Members

- Allan, John Charles**, B.A.Sc., (Univ. of Toronto), asst. industrial control engr., Canadian General Electric Co., Peterborough, Ont.
Howard, Ernest E., C.E. & B.S., (Univ. of Texas), D.Eng., (Univ. of Nebraska), senior partner, Howard, Needles, Tammen & Berquedoff, cons. engrs., Kansas City, Mo.
Lundy, Homer Shannon, struct'l designer, H. G. Acres & Co., Niagara Falls, Ont.
Pascoe, Thomas, (City & Guilds London Institute), senior asst. engr., M.D. No. 13, Suffield Experimental Station, Suffield, Alta.

Transferred from the Class of Junior to that of Member

- Allaire, Lucien**, B.A.Sc., C.E., (Ecole Polytechnique), asst. division engr., Highways Dept. of Quebec, Metabetchouan, Que.
Anderson, Roderick Victor, B.A.Sc., (Civil), (Univ. of B.C.), chief dftsmn., Welland Chemical Works, Niagara Falls, Ont.
Baker, John Arthur, B.A.Sc., (Univ. of B.C.), inspector, Canadian Underwriters' Association, Toronto, Ont.
Bradford, George Allen McClean, B.Sc., (Mech.), (Univ. of Sask.), mech. designer, H. G. Acres & Co., Niagara Falls, Ont.
Brown, William Edward, B.A.Sc., (Univ. of Toronto), wire rope engr., The B. Greening Wire Co. Ltd., Hamilton, Ont.
Craig, William Royce, B.Sc., (Elec.), (Univ. of Alta.), asst. engr., B.C. Sugar Refining Co., Vancouver, B.C.
Crain, Harold F., B.Sc., (Queen's Univ.), vice-pres., Crain Printers Ltd. Ottawa, Ont.
Ehly, Lucas Joseph, B.Sc., (Chem.), (Univ. of Alta.), res. engr., Dept. of Transport, Lethbridge, Alta.
Higgins, Edgar Clarence, asst. engr., Hydro Electric Power Commission of Ontario, Toronto, Ont.
Johnston, Orval Ellsworth, B.A.Sc., (Univ. of Toronto), designing engr., Hydro Electric Power Commission of Ontario, Toronto, Ont.
Marcotte, Roland, B.S., (Sch. of Engineering, Milwaukee, Wis.), operating engr., Saguenay Power Co. Ltd., Isle Maligne, Que.
McCann, William Neil, B.Sc., (Civil), (Univ. of Man.), engr., McColl Frontenac Oil Co., Toronto, Ont.
Oddleifson, Axel Leonard, B.Sc. (Elec.), (Univ. of Man.), junior engr., Winnipeg Electric Co., Seven Sisters Falls, Man.

Stead, Harry G., chief engr., E. Leonard & Sons, Ltd., London, Ont.
Tames, John Alex, B.Sc. (Elec.), (Univ. of Alta.), sales engr., Canadian Westinghouse Co. Ltd., Vancouver, B.C.

Warkentin, Cornelius Paul, B.Sc. (Civil), (Univ. of Man.), engr., Imperial Oil Co. Ltd., Sarnia, Ont.

Willis, Ralph Richard, B.Sc. (Civil), (Univ. of N.B.), chief engr., Ross Engineering of Canada Ltd., Montreal, Que.

Transferred from the class of Student to that of Member

Peters, Henry F., B.Sc. (Civil), (Univ. of Man.), (Fl./L.), Works Officer, No. 12 S.F.T.S., R.C.A.F., Brandon, Man.

Ramsdale, Donald Osland Dallas, B.Eng. (Elec.), (McGill Univ.), Prob. Sub-Lieut., R.C.N.V.R., Halifax, N.S.

Transferred from the class of Student to that of Junior

Belle-Isle, Joseph Gérard Gerald, B.A.Sc., C.E., (Ecole Polytechnique), P/O, R.C.A.F., St-Basile-le-Grand, Que.

Crook, Donald Gordon, B.Sc. (Civil), (Univ. of Sask.), production engr., Neon Products of Western Canada, Ltd., Vancouver, B.C.

Dick, William Arthur, B.Eng. (Mech.), (McGill Univ.), plant engr., American Can Co., Montreal, Que.

Edwards, Milton Chalmers, B.Sc. (Elec.), (Univ. of Alta.), F/O, signals officer, R.C.A.F., Winnipeg, Man.

Ellis, Gwilym Lionel Townshend, B.Sc. (Mech.), (Univ. of Sask.), asst. engr., Weathermakers (Can.) Ltd., Toronto, Ont.

Hindle, Walter, B.Sc. (Univ. of Alta.), erecting engr., Canadian Westinghouse Co., Ltd., Hamilton,

Hugill, John Templeton, B.Sc. (Chem.), M.Sc. (Phys. Chem.), (Univ. of Alta.), Capt., R.C.A., chief experimental officer, Experimental Station, Suffield, Alta.

Ingram, Wallace Wellington, B.Sc. (Elec.), (Univ. of Man.), foreman, lead and impregnating depts., Phillips Electrical Works, Montreal, Que.

Jacobs, Clifford Roy, B.Sc. (Chem.), (Univ. of Alta.), asst. inspector, at Atlas Powder Co. Plant, Joplin, Mo., for Inspection Board of the United Kingdom and Canada.

Jones, David Carlton, B.Eng. (Mech.), (McGill Univ.), chief ground instructor and chief link instructor, No. 5 E.F.T.S., High River, Alta.

Klodniski, Nicholas Albert, B.Sc. (Elec.), (Univ. of Alta.), engr. dftsmn., Canadian National Railways, Montreal, Que.

LaRivière, Marcel Gérard, B.Eng. (Civil), (McGill Univ.), junior engr., Dept. of Public Works of Canada, New Westminster, B.C.

Marantz, Oscar, B.Sc. (Civil), (Univ. of Man.), demonstrator, Faculty of Engineering, University of Manitoba, Winnipeg, Man.

Mercier, Jules Mathias, B.A.Sc., C.E., (Ecole Polytechnique), meter engr., Canadian General Electric Co., Peterboro, Ont.

Moule, Gerald William, B.Sc. (Elec.), (Univ. of Man.), elect'l engr., Defence Industries Ltd., Montreal, Que.

McEown, Wilbert R., inspector of electricity and gas, Dept. of Trade & Commerce, Winnipeg, Man.

Weston, Norman Owen, B.Sc. (Elec.), (Univ. of Alta.), illumination engr., Canadian Westinghouse Co., Hamilton, Ont.

Wright, Austin Meade, B.Eng. (Elec.), (McGill Univ.), Sub-Lieut., R.C.N.V.R., Overseas.

Students Admitted

Betnesky, Abraham David, (Montreal Tech. Inst.), dftsmn. Dominion Bridge Co. Ltd., Lachine, Que., 3921 Drolet St., Montreal.

Gerrard, James Herbert, (Univ. of N.B.), 263 York St., Fredericton, N.B.

Heinze, Laurence Sherwood, (Univ. of N.B.), 752 Union St., Fredericton, N.B.

Janigan, George Gregory, (N.S. Tech. Coll.), 705 Barrington St., Halifax, N.S.

McElwain, Donald Melvin, (Univ. of N.B.), 618 Brunswick St., Fredericton, N.B.

Muirhead, Charles Randolph, (Univ. of Man.), Kingsley Apts., Winnipeg, Man.

Tod, James Alexander, (Univ. of Toronto), Lundy Ave., Newmarket, Ont.

Vaillancourt, Rosaire, (Ecole Polytechnique), 8131 Berri St., Montreal.

By virtue of the co-operative agreement between the Institute and the Association of Professional Engineers of Saskatchewan, the following election has become effective:

Member

Hay, Charles Cecil, B.Eng., (Univ. of Sask.), refinery supt., Hiway Refineries, Ltd., (Petroleum Products), Saskatoon, Sask.

Personals

News of the Personal Activities of members of the Institute, and visitors to Headquarters

Major-General G. R. Turner, M.C., D.C.M., M.E.I.C., has been made "Companion of the Most Honourable Order of the Bath." He is deputy adjutant and quartermaster-general of the first Canadian Army overseas.

He was born at Four-Falls, N.B., in 1890, and was educated at Andover, N.B. He enlisted at sixteen in the 3rd Field Company, Royal Canadian Engineers, and served in France as a sergeant and sergeant-major, being commissioned in September, 1915. He was promoted to captain a year later. His subsequent appointments included regimental and staff service and in May, 1918, he was promoted to major. He was mentioned in despatches, awarded the Distinguished Conduct Medal and the Military Cross and bar.

In 1920 he was appointed to the permanent force with rank of captain, and studied at the School of Military Engineering, Chatham, England. Returning to Canada,

a Commander of the Order of the British Empire. He is director of works and buildings at R.C.A.F. Headquarters, Ottawa. Marshal Collard was born at Belmont, Ont., and received his education at Kitchener. In 1906 he joined Warren Bros. Company and rose from the position of foreman to that of general superintendent when engaged on construction work in the western provinces. In 1922-23 he was president and general manager of Warren Bros. Co. at Honolulu, Hawaii. In 1924 he joined the staff of Carter, Halls Aldinger Company Limited at Winnipeg and in 1927 he became vice-president of the firm. In 1933-34 he organized the Acadia Construction Company Limited, Halifax and became managing-director a position which he still holds.

Major-General G. R. Turner,
C.B., M.E.I.C.

Rear Admiral G. L. Stephens,
C.B.E., M.E.I.C.

Air Vice-Marshal R. R. Collard,
C.B.E., M.E.I.C.

he became instructor in military engineering at the Royal Military College, Kingston. In 1924 he attended the Staff College at Quetta, India, and in 1927 he was appointed district engineer-officer of Military District No. 10, Winnipeg, Man. In 1929 he became assistant director of engineer services, National Defence Headquarters, Ottawa, Ont. In 1938 he attended a course at the Imperial Defence College, London, England, and on his return, in 1939, he was on the General Staff at M.D. No. 11 Headquarters, Esquimalt, B.C.

At the outbreak of this war he went overseas as general staff officer, grade 1, with the 1st Division. He was promoted to colonel and later brigadier, and on formation of the Canadian Corps was appointed deputy adjutant and quartermaster-general of the corps.

Engineer Rear-Admiral G. L. Stephens, R.C.N., M.E.I.C., has recently been promoted from the rank of engineer captain and, in the King's new year honours list, he was made "Commander of the Most Excellent Order of the British Empire." His promotion to Engineer Rear-Admiral makes him the first Canadian to hold that rank.

Admiral Stephens was born and received his first naval training in England. He joined the Canadian Naval Force in 1910 as engine-room artificer. His advancement to the commissioned rank came during the Great War and he has since served as senior engineer on both coasts. In 1941 he was appointed engineer in chief of the Royal Canadian Navy and came to Ottawa in the Naval service, in the Department of National Defence.

Air Vice-Marshal R. R. Collard, M.E.I.C., has been made

Air Vice-Marshal G. O. Johnson, M.E.I.C., who was commanding officer at No. 1 Training Command, R.C.A.F., at Toronto, has been named commander of the Eastern Air Command at Halifax.

Major-General C. R. S. Stein, M.E.I.C., has recently been promoted from the rank of Brigadier and named to succeed Lieutenant-General E. W. Sanson to the command of a Canadian Armoured Division overseas.

General Stein is an engineer officer of long experience and at 46 is one of the youngest men of his rank in the army. He joined the 6th Field Company of the Canadian Engineers, in the Non-Permanent Active Militia in 1914 as a sapper and after graduating from the Royal Military College was commissioned a lieutenant. From 1917 to 1919 he saw service in France and Belgium.

After the war he served as district engineer officer in M.D. 5 (Quebec); attended the Staff College at Quetta, India; he was promoted to major in 1931, and served at Defence Headquarters. At the beginning of the war he was confirmed in the rank of lieutenant-colonel and appointed to command the engineer training centre. He went overseas in 1940 as an Assistant Adjutant General in personal services. In 1941 he was appointed Adjutant and Quartermaster-General of a Canadian Armoured Division, was made a brigadier commanding a Canadian Armoured Brigade, and then went to the General Staff, an appointment he held until his new promotion.

George L. Watson, M.E.I.C., consulting engineer of New York City, has been recalled to active duty in the United States Army as a colonel.

Paul A. Béique, M.E.I.C., was elected president of La Chambre de Commerce de Montréal at the annual meeting held last month. Mr. Béique is a native of Montreal and received his early education at Collège Ste-Marie, Montreal, and St. Charles College, Baltimore. He later undertook his engineering studies at the Ecole Polytechnique, Montreal, from which he received the degrees of Civil Engineer and Bachelor of Applied Science, in 1906.

His first work was with a firm of engineers and architects. Subsequently he accepted the position of draughtsman with the Quebec, Montreal and Southern Railway.

In 1907, Mr. Béique joined the staff of Messrs. O'Brien and Mullarkey, railway contractors, in the capacity of inspector, and in the following year he was appointed superintendent for the same company on construction of the Quebec, Montreal and Southern Railway. In 1909, he

Paul Béique, M.E.I.C.

Aimé Cousineau, M.E.I.C.

R. S. Eadie, M.E.I.C.

became associated with a firm of civil engineers and land surveyors who were engaged in private practice. In 1913 he entered consulting work, and in addition to his general practice was acting town engineer for the town of Ville Lasalle, Que., and was a member of the Consulting Board of the Metropolitan Commission of Montreal. He has since carried out a successful practice, specializing in valuation and municipal work. For several years he was a member and later vice-president of the Montreal Tramways Commission.

Professor E. G. Cullwick, M.E.I.C., head of the Department of Electrical Engineering at the University of Alberta has been granted leave of absence from the university in order to assume the position of director of electrical engineering at Canadian Naval Headquarters, Ottawa, with the rank of Commander (Electrical). Commander Cullwick was born in England and educated at Cambridge University. He served his apprenticeship with British Thompson-Houston Company Limited, in England, and after his arrival in Canada, in 1926, he took the test course with Canadian General Electric Company at Peterborough, Ont. In 1928 he was appointed assistant professor of electrical engineering at the University of British Columbia. In the years 1934-1935 he lectured in electrical engineering at the Military College of Science, Woolwich, Eng. He returned to the University of British Columbia, in 1935, as assistant professor of electrical engineering and in 1937 he became professor and head of the Department of Electrical Engineering at the University of Alberta.

Wing-Commander Denton Massey, M.P., M.E.I.C., is now overseas. Until recently he had been posted for some time as Commanding Officer of No. 3 Initial Training School, R.C.A.F., Victoriaville, Que.

R. S. Eadie, M.E.I.C., is the newly elected chairman of the Montreal Branch of the Institute. He is a graduate of McGill University in the class of 1920, his engineering course having been interrupted during his service with the R.C.E. in the last war. In 1922 he received the degree of M.Sc. from McGill. He lectured in the Faculty of Applied Science of McGill until 1924 when he joined the Dominion Bridge Company Limited as a designer. He became designing engineer in 1935 and in 1937 he was appointed assistant chief engineer of the company, a position he still holds.

Aimé Cousineau, M.E.I.C., has been appointed director of the City Planning Department of Montreal, replacing H. A. Terreault who died recently. Mr. Cousineau is a graduate of the Ecole Polytechnique of Montreal, of Massachusetts Institute of Technology and Harvard University. He has been active for a number of years in

city planning work in Montreal and has lectured for many years on the subject at the Ecole Polytechnique.

J. C. Aitkens, M.E.I.C., is now employed in the engineering department of Ford Motor Company of Canada at Windsor, Ont. Since 1937, he had been employed with Madsen Red Lake Gold Mines Limited, at Madsen, Ont.

E. A. Beman, M.E.I.C., is chief engineer of the Chesterville Larder Lake Gold Mining Company Limited at Kearns, Ont. He was previously with Pandora Limited at Cadillac, Que.

Henri Gaudfroy, M.E.I.C., a member of the teaching staff at the Ecole Polytechnique, has been appointed secretary of the Faculty and assistant to the Dean. Born in Montreal in 1909, Mr. Gaudfroy received his high school education at Mont Saint-Louis College, in Montreal, and then studied engineering at the Ecole Polytechnique from 1929 to 1933, being awarded the degree of Bachelor of Applied Science. After graduating from the Ecole Polytechnique he studied for some time at the Massachusetts Institute of Technology, which conferred upon him the degree of Sc.B., in electricity, in 1934.

From 1935-1939 Mr. Gaudfroy was with the Bell Telephone Company. Since 1939, he has been assistant professor of mathematics at the Ecole Polytechnique. Mr. Gaudfroy is chairman of the Membership Committee of the Montreal Branch of the Institute.

N. I. Edwards, M.E.I.C., has joined the Royal Canadian Naval Volunteer Reserve as Engineer Lieutenant. He has been on the staff of Franklin Railway Supply Company of Canada, Montreal, since 1924.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

R. H. Moore, M.E.I.C., has left his position with Hudson Bay Mining & Smelting Company Limited, Flin Flon, Man., and has joined the staff of Babcock-Wilcox & Goldie McCulloch Limited, Galt, Ont.

Flying-Officer M. S. Layton, Jr.E.I.C., was awarded the D.S.O. last December. According to news which reached here recently he was navigator on an aircraft escorting a convoy. The crew fought off, during several hours, enemy submarines and prevented them from attacking the convoy.

2nd Lieutenant J. E. Beamish, Jr.E.I.C., has left his position with the Dominion Experimental Station at Swift Current, Sask., to enlist and is at present training with the R.C.E. at Chilliwack, B.C.

J. M. Thomas, Jr.E.I.C., lately of Montreal is now located at Pictou, N.S., with Foundation Maritime Limited, Shipbuilding Division.

G. F. Webster, S.E.I.C., is at present serving as a lieutenant with the R.C.E. He graduated from the University of Saskatchewan in 1942.

D. Hutchison, M.E.I.C.

The new chairman of the Edmonton Branch

VISITORS TO HEADQUARTERS

R. E. McMillan, M.E.I.C., Aluminum Company of Canada Limited, Arvida, Que., December 30th, 1942.

Ls. P. Cousineau, M.E.I.C., Dufresne Engineering Company, Passe Dangereuse, Que., January 6th, 1943.

P/O. M. L. Papineau, Jr.E.I.C., R.C.A.F., Cap de la Madeleine, Que., January 6th.

Gustave St-Jacques, M.E.I.C., Public Service Board, Quebec, January 6th.

P/O. J. A. Lamb, Jr.E.I.C., Saskatoon, Sask., January 21st.

Lieutenant Jacques Leroux, M.E.I.C., Petewawa, Ont., January 21st.

P/O I. H. Wilson, School of Aeronautical Engineering Lethbridge, Alta., January 21st.

J. A. Reynolds, M.E.I.C., Department of Munitions and Supply, Army Engineering Design Branch, Ottawa, Ont., January 21st.

Colonel Edward C. Thorne, M.E.I.C., N.D.H.Q., Ottawa, Ont., January 25th.

D. S. Thomas, M.E.I.C., Mining Engineer, Toronto, Ont., on January 26th.

J. A. Van den Broek, M.E.I.C., Professor of Engineering Mechanics, University of Michigan, Ann Arbor, Mich., U.S.A., January 26th.

Lieut. C. W. Elliott, R.C., Jr.E.I.C., Calgary, Alta., January 30th.

W. E. Brown, M.E.I.C., Secretary-Treasurer of the Hamilton Branch of the Institute, Wire Rope Engineer, Sales Department, The B. Greening Wire Company Limited, Hamilton, Ont., January 30th.

Jacques Nessim Aggiman, M.E.I.C., died on July 22, 1942, in Washington, D.C. He was consulting engineer and owner of Aggiman Engineering & Construction Company at Ankara, Turkey. Born on March 7, 1892 at Monastir, Turkey, he received his engineering education at McGill University, Montreal, where he graduated as a B.Sc. in 1917. Before attending McGill he worked as a draughtsman from 1911 to 1915 with the St. Lawrence Bridge Company, at Montreal, on the Quebec bridge project. In 1916 and 1917 he was a designer with St. Lawrence Pulp & Lumber Company at Chandler, Que. Upon graduation he joined the Ha-Ha-Bay Sulphite Company at Port Alfred, Que., as superintendent of construction on the pulp mill. In 1919-1920 he was chief engineer of the company.

From 1921-1924 he was chief engineer of construction for the Standard Oil Company of New York in the Near East. In 1924 he established a consulting practice at Constantinople and later founded the contracting firm of which he was still the owner at the time of his death.

During his engineering career in Turkey, Mr. Aggiman was connected with the design and construction of several public buildings such as the palace of the president of the Turkish Republic, several embassies buildings as well as commercial buildings. In particular he was retained as consulting engineer and contractor for the Turkish Parliament, the Ministry of Works and Buildings of Great Britain, various diplomatic missions and the Embassy of the United States. He held decorations from the Government of Yugoslavia and Persia.

Mr. Aggiman joined the Institute as a Student in 1916 and transferred to Junior in 1917. In 1919 he transferred to Associate member and became a Member in 1929.

Ernest M. Archibald, M.E.I.C.

Ernest M. Archibald, M.E.I.C., died suddenly at his home, at West Palm Beach, Florida, U.S.A., on September 19, 1942. A native of Nova Scotia, he was graduated from McGill University in the '99 Science class, with honours. In 1900 he joined the engineering department of Crocker-Wheeler Company at Ampere, N.J. From 1901 to 1904 he was employed with the American Locomotive Company at Richmond, Virginia, and in 1905 he returned to the Crocker-Wheeler Company at St. Louis, Missouri, as a sales engineer. In 1906 he went to the Dominion Coal Company at Glace Bay, N.S., as electrical engineer and assistant mechanical engineer, at the inception of the electrification of the collieries. He then went over to Europe, where he spent much time studying and investigating the latest developments in industrial power and colliery practice. In 1912, Mr. Archibald turned his attention to general contracting, and carried

out a number of important contracts, such as the successful completion of the substructure of the Annapolis Bridge, also the Moncton, N.B., bridge substructure, which was a difficult compressed-air undertaking and carried out under extreme tidal conditions, and said to be one of the most difficult projects ever undertaken. Mr. Archibald also built 100 miles of macadamized highway under contract with the Nova Scotia Highway Board, and carried out the entire paving programme for the city of Halifax for the season of 1922. He then returned to the contracting business, and became associated with the E. F. Power's Construction Company of Saint John, N.B. In 1926 the firm moved to Florida and entered into the construction of highways and bridges throughout the State. From 1928 to 1934 they constructed many miles of levees on the Mississippi River, with the then new electrical dirt moving equipment.

As Power & Archibald Inc. they were engaged in road building, and later in airport construction work throughout the State. At the time of Mr. Archibald's death, Power & Archibald Inc., were constructing an airport at Homestead, Florida.

Mr. Archibald joined the Institute as an Associate Member in 1906. He became a Member in 1940.

C. D. Harrington, M.E.I.C.

Conrad Dawson Harrington, M.E.I.C., vice-president and general manager of the Anglin-Norcross Corporation Limited, Montreal, died at the hospital in Montreal, on January 26, 1943, after a short illness. Mr. Harrington was born at Montreal on November 17, 1884, and received his early education at the Montreal High School. He entered the Royal Military College at Kingston in 1902 and completed his engineering studies at McGill University where he was graduated as a B.Sc. in 1907.

He became associated with the Anglin-Norcross concern upon his graduation, when it was known as Byers and Anglin. Later, the firm became known as Anglins Limited and Mr. Harrington was appointed vice-president. When the new firm Anglin-Norcross Corporation Limited was established he became vice-president and chief engineer.

Among the notable engineering projects carried out by the company, under Mr. Harrington's supervision, are the Royal York Hotel in Toronto, the Canadian Bank of Commerce building also in Toronto, the church of St. Andrews and St. Paul in Montreal, the Supreme Court building in Ottawa, the Chateau Frontenac in Quebec and the Imperial Tobacco Company Limited buildings in Montreal.

The firm of which Mr. Harrington was general manager has taken a very active part in the construction programme for industrial expansion in Canada since the beginning of the war. Mr. Harrington has been responsible particularly for the expansion of the Quebec arsenal, and in the words of the Honourable C. D. Howe, Minister of Munitions and Supplies "There is no doubt that his untiring efforts to rush through that important job affected his health."

Mr. Harrington was a former president of the Montreal Board of Trade and of the Canadian Construction Association. He was president of Anglin-Norcross Quebec Limited and Anglin-Norcross Ontario Limited. He also served on the Canadian board of directors of the Yorkshire Insurance Company Limited.

Mr. Harrington joined the Institute as a Member in 1940.

James Shanly, M.E.I.C., died suddenly at Kenogami, Que., on December 18, 1942. He was born at Montreal, Que., on January 5, 1897, a son of the late James Moore Shanly, widely-known engineer. Educated first at the local schools, he entered McGill University to study engineering. In 1916, however, he broke off his course to enlist with a unit of the Royal Canadian Engineers, going overseas with the rank of lieutenant.

Returning to Canada in 1919, the late Mr. Shanly entered the service of Price Brothers Company Limited at Kenogami, Que., as a draughtsman. Later he became field engineer on construction and maintenance of the plant and townsite. In 1926 he was appointed assistant to the mechanical superintendent and, in 1931, he became assistant general superintendent. Later he was appointed to the position of manager of the paper division. During his residence at Kenogami he became a strong supporter of all the activities of the community and, at the time of his death, he was head of the Canadian Red Cross Society in the Lake St. John district.

Mr. Shanly joined the Institute as a Junior in 1920 and was transferred to Associate Member in 1933. He became a Member in 1940. He was chairman of the Saguenay Branch of the Institute in 1935.

Lewis Stockett, M.E.I.C., died in the hospital at Vancouver, B.C., on December 19, 1942. He was born at Ashland, Penn., U.S.A., on March 31st, 1861. He received his education in the local high school and under private tutors. In 1875 he entered the office of the division engineer of the Lehigh Valley Coal Company for the purpose of studying mining engineering. He remained with this firm until 1882 when he was appointed engineer of the Westmoreland Coal Co. near Pittsburgh, Pa. In 1884 he was appointed superintendent of the Park Collieries in the anthracite region, Park Place, Pa., and in 1887 became chief engineer of the Consolidated Coal Co. at St. Louis. He remained there until 1891 when he went into private engineering practice in Illinois. In 1892 he became secretary-treasurer of the Wabash Mining Company, in Indiana, and held this position until 1895, when he went to the Great Northern Railway as mining engineer. From 1897 until 1904 he was general manager of the Great Northern Coal Mines at Great Falls, Mont. Then he came to the Calgary district in 1905 as manager of the Canadian Pacific Railway's Bankhead coal mines, near Banff.

He was also manager of the company's mines at Hosmer, B.C., and in 1912 he was appointed general superintendent of the coal mines branch of the Department of Natural Resources and came to Calgary to reside.

After his retirement in 1929 he lived for several years at the Ranchmen's Club at Calgary and travelled extensively through England and Scotland, the United States and to Hawaii. He always took a keen interest in community affairs and was a member of the Calgary Board of Trade, of the Ranchmen's Club and the Calgary Golf and Country Club. He went to live at Vancouver in 1932.

Mr. Stockett joined the Institute as a Member in 1916.

Charles Taylor, M.E.I.C., died suddenly at his home at Selkirk, Man., on December 11, 1942. He was born in London, England, on June 25th, 1872. From 1896 to 1900 he was employed with Canadian Pacific Railway at Winnipeg and Moose Jaw. From 1901 to 1902 he was engaged in bridge construction with the Canadian Northern Railway. He joined the Department of Public Works of Canada in 1903 and worked on design and construction in Manitoba

until 1911 when he was appointed superintendent of dredges for the Department in Manitoba, Saskatchewan and Alberta. In 1920 he was appointed engineer for the town of Selkirk, Man., which position he held until his death.

Mr. Taylor joined the Institute as an Associate Member in 1912 and in 1940 he became a Life Member.

H. E. Wingfield, M.E.I.C.

Harold Ernest (Pat) Wingfield, M.E.I.C.—The death of "Pat" Wingfield, on January 14th, 1943, removes from the ranks of the profession, and from the ranks of good citizenship, one of the most likeable and useful persons in Canada. At the age of forty-two, in the midst of a multitude of activities, of which he was an essential part, he succumbed to an illness which for a long time he had hidden from all but a few friends and relatives. Medical authorities had advised him to retire in order to lengthen his days, but he chose to go on to the end, making his contributions to the many causes in which he was interested. Had he chosen otherwise, he would not have been true to himself.

H. E. Wingfield was born in England, and came to Canada at the age of nine. He attended public and high school at Dunnville, Ontario, and entered the University of Toronto in 1919, graduating with honours as a Bachelor of Applied Science in Electrical Engineering with the famous class of '23.

Upon graduation he joined the engineering staff of the Turnbull Elevator Company, Limited, at Toronto, remaining there until 1933, four years of this time being spent at Winnipeg as branch manager. Upon his return to Toronto he was made sales manager of the company. In 1933 he became industrial engineer with the Toronto Industrial Commission. At the time of his death he was vice-president and director of sales, advertising and purchases, with the Imperial Rattan Furniture Company, Limited, Stratford. He was also vice-president of V. H. McIntyre, Limited, of Toronto.

No mere chronological account of education and business experience can give any conception of the full life lived by Pat. Successful in all his business endeavours, he still had time to devote to unselfish interests. To his intelligence, energy and enthusiasm many societies owe much of their

success, and his departure will leave them all with an irreparable loss. It is to be hoped that in each instance some person, fired by the inspiration and attainments of his predecessor will arise to carry on the good work. He would wish it so.

Among the varied interests just mentioned can be included the Boy Scouts Association, of which he had been a district commissioner, the Engineering Alumni of the University of Toronto, the Kiwanis Club, and the Church of England. He was buried in the uniform of the Boy Scouts, and Dr. Cody, President of the University of Toronto, assisted in the ceremony.

The Engineering Alumni was particularly fortunate in receiving a large portion of his attention. Many of the good works accomplished within the last ten years, were inspired and carried out under the impetus of his enthusiasm and energy. Starting in 1933 as treasurer, he served in succession as vice-president and president, occupying each office for three years. His conduct of the reunion in November, 1942, was an outstanding performance, and those who saw him then find it impossible to believe that he is gone from us forever.

This man's life and his leaving of it, should be an inspiration to all who remain. A review of the good things he has accomplished, and the friendships he has made should serve as a model for the aspirations of other engineers. The force of his example will carry on for the lifetime of those of us who knew him. His was a brilliant light that burned all too shortly, but in its time both warmed and illuminated those fortunate enough to come within its orbit.

The world is better for his having lived, but he will be missed sadly. The sense of loss experienced by his friends gives them some appreciation of the depth of the bereavement of his wife and son. To them sincere and kindly wishes are extended—and sympathy.—L.A.W.

COMING MEETINGS

Ontario Good Roads Association—Annual Convention at the Royal York Hotel, Toronto, February 24-25. Secretary: T. J. Mahoney, Box 485, Hamilton, Ont.

Canadian Section, American Water Works Association—Annual Convention, Royal Connaught Hotel, Hamilton, Ont., April 7-9. Secretary: Dr. A. E. Berry, director of the Sanitary Engineering Division, Ontario Department of Health, Parliament Buildings, Toronto.

Industrial Accident Prevention Associations—Annual Convention, at the Royal York Hotel, Toronto, April 12-13. General Manager: R. B. Morley, 600 Bay Street, Toronto.

American Society of Mechanical Engineers—1943 Spring Meeting, Davenport, Iowa, April 26-28. Secretary: C. E. Davies, 29 West, 39th Street, New York, N.Y.

American Society of Mechanical Engineers—1943 Semi-Annual Meeting, Los Angeles, California, June 12-14. Secretary: C. E. Davies, 29th West, 39th Street, New York, N.Y.

American Water Works Association—Annual Meeting, to be known as A.W.W.A. Conference on War-Winning Waterworks Operations, at the Carter and Statler Hotels, Cleveland, Ohio, June 14-17. Secretary: Harry E. Jordan, 22 East 40th Street, New York, N.Y.

BORDER CITIES BRANCH

J. B. DOWLER, M.E.I.C. - *Secretary-Treasurer*
W. R. STICKNEY, M.E.I.C. - *Branch News Editor*

The Border Cities Branch held their annual dinner meeting at the Prince Edward Hotel on Friday, December 11. After the dinner Mr. J. B. Dowler gave the Secretary-Treasurer's Report and Financial Statement, and the chairmen of the various committees then gave their annual reports. Following this, scrutineers were appointed and the following officers elected for the coming year: Chairman, G. G. Henderson; Vice-Chairman, J. B. Dowler; Secretary-Treasurer, W. R. Stickney; Executive Committee, J. F. O. Blowey, A. H. Pask, A. H. MacQuarrie.

Mr. G. E. Medlar then introduced the speaker of the evening, Mr. T. H. Jenkins, Designing Engineer of the Grand Trunk Western Railway, whose topic was **Wartime Railroad Transportation**. At the conclusion of his speech a lengthy and interesting discussion took place and after a vote of thanks to the speaker by Mr. C. G. R. Armstrong the meeting adjourned.

HAMILTON BRANCH

W. E. BROWN, Jr., E.I.C. - *Secretary-Treasurer*

The branch held its annual business meeting and dinner on Wednesday, January 13th, in the Royal Connaught Hotel with Chairman Stanley Shupe presiding. We can report that this was one of the most successful in several years and thoroughly enjoyed by all.

The guest of honour and speaker was our president, Dean C. R. Young, who was introduced by H. A. Cooch. Dean Young spoke on the subject, **The Engineering Profession in War Time**. The Dean gave us a very splendid address pointing out that it is not sufficient that the engineer's role in war-time be purely technological in character. The engineer must develop the whole doctrine of professional competency and make his contribution to all aspects of our national life.

In reporting on the activities of the Institute, the president illustrated how the E.I.C. is making that contribution. The Institute is affiliated with the Engineers' Council for Professional Development, which concerns itself with the broader aspects of professional life. The E.I.C. actively supports the policies of that council, and has representation on three E.C.P.D. committees, namely, Committee of Professional Training, Committee on Professional Recognition and Committee on Principles of Engineering Ethics. Furthermore, the Institute has its own Committee on Welfare and Training of the Young Engineer.

Three important committees of the Institute were appointed this year—Committee on Industrial Relations, Committee on Post-War Problems, and Committee on the Engineering Aspects of Civil Defence, which sponsored and financed the Webster lectures on Structural Defence Against Bombing, in Toronto last April.

The president then went on to speak of the things concerning the profession having a more direct relation to the war effort. The demands on engineers have been very great and many are serving with distinction in the armed forces. At home the engineer has been faced with the problem of vast construction and the provision of plant and equipment for the manufacture of the munitions of war.

There also has been the problem of design modification to save critical materials and reduce the amount of materials used. Plastics and synthetic rubber were mentioned, as well as many other ingenious contributions to the war effort.

Concluding, Dean Young remarked that in the years of peace there was a great future for the engineer and every evidence there would be great technological activity, and

Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

the longer the war went on the greater would be the demands. T. S. Glover moved the vote of thanks.

Mayor William Morrison was present and spoke briefly. We were pleased to have the general-secretary with us and to hear his report on interesting Institute activities.

Earlier in the evening the annual reports were received and the various items of business attended to. E. H. Darling moved a vote of thanks to McMaster University and staff for the assistance given to the branch during the past year, to which Chancellor G. P. Gilmour replied.

Presentations were made to the retiring chairman, Stanley Shupe, and A. R. Hannaford, the retiring secretary-treasurer, whose work during the last six years was warmly praised by E. G. MacKay, who made the presentation to him.

T. S. Glover, the new chairman, took over the office and introduced the other officers. The attendance was 78.

KINGSTON BRANCH

R. A. LOW, M.E.I.C. - *Secretary-Treasurer*

The Kingston Branch held a special meeting to welcome the President, Dean C. R. Young, of the University of Toronto on December 8th, at the LaSalle Hotel.

Mr. K. Winslow, chairman of the Kingston Branch, presided at the meeting. Dean Young was welcomed and introduced by Col. Le Roy Grant.

In his address to the Branch, the twenty-third that he has visited during his term of office, the President spoke of the national character of the work that the Institute is doing. It is of much value to the organization for senior officers to visit as many Branches as possible so that the views of members across Canada may be ascertained and may assist in the formulation of policies for the general benefit of the profession.

President Young expressed the view that the engineering societies had a function of particular importance to fill in time of war. There is a great disposition towards narrowing of the training of young engineers into purely technological channels, and efforts should be made to offset this. The meetings of the great engineering societies that have recently been held have all been unusually well attended and in numbers of cases all-time records have been established. The Institute feels therefore that it is eminently justified in holding its annual meeting in the usual form at Toronto, February 11-12, 1943. This is particularly so as the programme will generally gather about the war activities of the Institute.

Speaking of the general and continuing activities of the Institute, the President laid particular stress upon its participation in the enterprises of the Engineers' Council for Professional Development. Representatives of the Institute sit on the more important committees of ECPD. The Institute's Committee on the Training and Welfare of the Young Engineer is working closely in parallel with the ECPD Committees on Student Guidance and Selection and Professional Training. Already, under the guidance of the Institute's Committee, counselling committees have been set up in seventeen of the twenty-five Branches. Nine thousand copies of "The Profession of Engineering in Canada" in English have been distributed and an additional five thousand copies in French have recently been printed.

Strong emphasis was placed by the speaker on the special undertakings of the Institute connected with the war and its aftermath. The Committee on the Engineering Features of Civil Defence, which supervises the general activities of

Branch committees in twenty of the twenty-five Branches, has issued a valuable booklet "Structural Defence against Bombing" and through certain subcommittees is making available to the country generally the expert advice and assistance of the engineer in counteracting the possible effects of bombing and sabotage. The Institute's Committee on Post-War Problems has given important assistance to the Government-appointed Advisory Committee on Reconstruction and is arranging to make available to the one hundred and twenty-five local citizens' committees set up across Canada any assistance that engineers can give to these committees in studying problems of rehabilitation and reconstruction. The Institute's Committee on Industrial Relations is making important progress in drawing the attention of the universities to the need for providing fully adequate instruction to engineering students in this important subject and has arranged for a thorough discussion of the whole matter at the annual meeting in Toronto.

In speaking of the future of the profession, the President expressed the view that the technological advances now being made will ensure the employment of engineers for some time after the cessation of hostilities. A vast demand for the goods and services of peace is being built up which must be satisfied and this will mean not merely the provision of these things according to old time standards but rather according to the best and most modern practices. Out of this desire of the public to profit from the results of discovery and invention a great source of technological employment is sure to arise.

The President spoke strongly of the need for maintaining and extending the professional point of view in the training of young engineers both in college and in the years following graduation. It is imperative that one who is to be a thoroughly qualified member of a learned profession should be characterized by a humanistic outlook and not merely a technological one. Many engineers make the mistake of thinking that all the problems of the world can be solved by a technological approach. A little consideration will show that human advancement comes as a result of many different kinds of workers co-operating to a common end. Each profession and each calling has its own distinctive role to play, and it is the duty of the engineer to realize the necessity of considering many factors other than technological ones when dealing with public questions. To the extent that he acquires a breadth of view his effectiveness as an educated and trained citizen will be advanced.

The speaker was thanked by Dean A. L. Clark, Queen's University.

Following the meeting an informal social hour was spent when members and their guests had the pleasure of meeting Dean Young.

OTTAWA BRANCH

A. A. SWINNERTON, M.E.I.C. - - *Secretary-Treasurer*

At the annual branch meeting, held on the evening of January 14, 1943, at the auditorium of the National Research Laboratories, G. H. Ferguson, chief engineer of Pensions and National Health, was elected chairman for the ensuing year; A. A. Swinnerton, M.E.I.C., was re-elected secretary-treasurer; and W. H. Bevan, M.E.I.C., and J. Byrne, M.E.I.C., were elected to the managing committee to serve two years. Mr. Ferguson succeeds N. B. MacRostie, retiring chairman, who presided at the meeting.

The branch, according to reports presented, held 8 luncheon meetings and 4 evening meetings during the year including the annual meeting, and co-operated in holding 3 more evening meetings with other organizations. Two sets of draughting instruments were donated to the Ottawa Technical School for presentation as prizes for proficiency in draughting and a copy of "Technical Methods of Analysis" by Griffin was sent to the Hull Technical School for presentation to one of its students.

Total membership of the branch increased by 48 during

the year, standing at 434 resident and 119 non-resident members. With deep regret the loss by death of two of the members was reported: E. M. Dennis, M.E.I.C., and R. H. Swingler, S.E.I.C.

Co-operation with the committees set up by the Council of the Institute in Montreal was maintained and according to the secretary-treasurer's report "the close of the year finds the Ottawa branch fully organized to co-operate not only with the regular requests for this co-operation but also to lend assistance in special matters such as Air Raid Precautions and Post-War Reconstruction." During the year the managing committee held nine meetings for the transaction of general business.

At the close of the annual meeting proper, the members listened to an address on **Wardens of Power** by Past-President T. H. Hogg of Toronto, chairman of the Ontario Hydro-Electric Power Commission. Dr. Hogg's address was of much public interest and was well reported in the press. It reviewed conditions relating to electric power supplies in Ontario since the commencement of the war and outlined possibilities for further developments.

Light refreshments were served at the close of the evening's activities.

PETERBOROUGH BRANCH

A. R. JONES, Jr., E.I.C. - *Secretary-Treasurer*
J. F. OSBORN, S.E.I.C. - *Branch News Editor*

A paper of wide interest "DeCew Falls Power Development" was presented before an audience of about 60 engineers at the December 10th meeting. Mr. O. Holden, the author of the paper and Chief Hydraulic Engineer of the H.E.P.C., was detained so the paper was read by Mr. J. R. Montague, Assistant Chief Hydraulic Engineer H.E.P.C.

Mr. Montague dwelt on the difficulties encountered in the development but stated that experimental work and careful preparation have resulted in good progress which will permit an early completion of the undertaking.

The DeCew Falls site is located on the escarpment along Lake Ontario and adjacent to the old Welland Canal. The 65,000 HP which will be immediately developed and the further block of power available in the near future will be of great importance in easing the power shortage in a critical area.

An important feature of the job relates to war economy. By use of a generator and turbine from the Abitibi Canyon Plant, considerable time will be saved and scarce machinery conserved.

This paper which has great current interest will be published in the near future, sponsored by one of the branches at which it has been presented.

Mr. Sills conveyed the thanks of the meeting to Mr. Montague for an excellent paper and for the entertaining remarks accompanying it. Mr. J. Cameron acted as chairman in the absence of Mr. D. Emery, Branch Chairman.

SAINT JOHN BRANCH

G. W. GRIFFIN, M.E.I.C. - *Secretary-Treasurer*

The Saint John Branch held a supper meeting on December 29th, at the Admiral Beatty Hotel, at which there were 35 present.

The technical explanation of what aerial bombing does to material in air raid shelters was given in a paper, **The Effects of Aerial Bombing on Structure**, presented at that meeting.

The paper, prepared by Dean I. F. Morrison, professor of applied mechanics, department of municipal and civil engineering, University of Alberta, was illustrated by lantern slides, and was read by David R. Smith, chairman of the Branch. Various designs for shelters were outlined also in the paper.

In addition to members of the branch, guests from the Ottawa and Moncton branches and engineering students of the University of New Brunswick attended the meeting.

SASKATCHEWAN BRANCH

STEWART YOUNG, M.E.I.C. - *Acting Secretary-Treasurer*

The Saskatchewan Branch, E.I.C., met jointly with the Association of Professional Engineers in the Kitchener Hotel, Regina, on Thursday evening, December 17, 1942. The meeting was preceded by the usual dinner at which the attendance was 25.

Mr. R. T. Blackmore of the Technical Service Department, The British American Oil Company Limited, addressed the meeting on **Fuel and Lubrication Requirements of the Modern Gasoline Engine**, following which Mr. Roy Pugh, Provincial Apiarist, showed a very interesting film on Bees.

Mr. Blackmore reminded his audience that the motive power of the modern mechanized army is the internal combustion engine, which, for the purpose of studying gasolines and how motive power is derived from it, must be considered as a heat engine. The refining of three different types of gasoline was then discussed, the types being straight run, cracked and polymerized gasoline. Automotive Gasolines have a boiling range of from approximately 80 deg. F. to 400 deg. F. Light ends for easy starting, 50 per cent, warm up period, heavy ends for power and economy.

During the past 25 years compression ratios have increased from 4 to 1 to nearly 7 to 1, with consequent greatly increased power output. The increase in compression pressures resulted in detonation or motor "ping", overcome by the introduction into gasoline of tetra ethyl lead. The establishing of an Octane rating on different fuels in a knock motor was illustrated. Spark setting to accommodate No. 1 and No. 2 graded fuels in the modern motor was also covered. For starting purposes both grades of gasoline have equal value, providing distillation ranges are the same and the only difference being in the lead content, No. 1 Gasoline having a higher content than No. 2. Different gasolines for various altitudes and temperatures are necessary.

In the brief discussion of oils Mr. Blackmore ventured the opinion that after the war, all premium priced oils will be of a compounded nature. Compound oils now on the market for diesel and heavy duty gasoline operation are compounded chemically to achieve the following: high detergency, film strength, metal deactivation and oxidation inhibitors.

The illustrated address by Mr. Pugh dealt with the subject of Bees from the larva stage of the honey bee to the final product, honey. The Province of Saskatchewan is the second largest producer of honey in Canada, the total annual

output being 5,000,000 pounds (approximately 250 carloads) all of which is consumed in Saskatchewan.

Both addresses proved very interesting and were followed by numerous questions answered respectively by Mr. Blackmore and Mr. Pugh. A hearty vote of thanks was tendered the speakers on motion of Mr. E. W. Bull.

SAULT STE. MARIE BRANCH

O. A. EVANS, M.E.I.C. - *Secretary-Treasurer*

The annual meeting for the Sault Ste. Marie Branch of the Institute was held on Friday, December 18th, 1942, in the Grill Room of the Windsor Hotel.

Eighteen members and guests sat down to luncheon at 6.45 and enjoyed a tasty meal which was along the traditional Christmas style.

Chairman L. R. Brown called the meeting to order at 8.00 p.m. and asked the secretary to read the minutes of the previous meeting.

The chairman then asked the secretary to bring in his report for the year 1942. The secretary reported a very successful year. The highlights of it were a financial surplus of \$71.55 and seven dinner meetings. One distracting feature was the loss in membership in the non-resident areas.

A. E. Pickering then brought in the report of the Papers and Publicity committee. He explained that due to the pressure of business we were unable to obtain a number of papers as some of the speakers had been called from town and were unable to give their papers when they had promised to do so.

The chairman then asked A. M. Wilson to bring in the report of the election of officers for the year 1943.

L. R. Brown then called upon the new chairman N. C. Cowie to assume the chair. In relinquishing the chair L. R. Brown thanked all the people who had helped in making the past year a success and was pleased to see a younger man as chairman.

Mr. Cowie in assuming the chair thanked all those who saw fit to elect him to the position and called upon the members for their co-operation.

The new chairman then called upon the members for a vote of thanks for the outgoing chairman and executive in providing the members with an interesting year.

O. A. Evans the retiring secretary thanked the members and executive for their co-operation during his term of office.

The members then retired to an adjoining room where a social evening was enjoyed by all.

News of Other Societies

PROFESSIONAL ENGINEERS OF ONTARIO ELECT NEW OFFICERS

R. A. Elliott, General Manager, Deloro Smelting & Refining Co. Ltd., Deloro, has been elected president of the Association of Professional Engineers of the Province of Ontario for the year 1943. Always interested in the affairs of the Association, he took an active part in the legislation programme. In 1938, he was elected councillor in the Chemical Branch and since then has been chairman of the Publicity Committee. He was elected vice-president in 1942 and chairman of the Finance Committee.

Following graduation from Queen's University, Mr. Elliott joined the Copper Queen Mining Co. in 1912 at Bisbee, Arizona, going from there to the engineering staff of the International Nickel Co., Copper Cliff. In March 1915, he was appointed Assistant Chemist of the Deloro Smelting & Refining Co. Ltd. and in the same year was made Superintendent of the Cobalt Oxide Plant and General Superintendent of the Plant in 1917. Mr. Elliott was appointed a Director and General Manager of the Company in 1940.

Items of interest regarding activities of other engineering societies or associations

Mr. Elliott is Reeve of the Village of Deloro and is Vice-President and Treasurer of the Deloro Trading Company. He is a member of the Canadian Institute of Mining and Metallurgy, the American Institute of Mining and Metallurgical Engineers, and the American Society for Metals.

M. J. Aykroyd, Outside Plant Engineer of the Bell Telephone Company, Western Area, has been elected vice-president of the Association of Professional Engineers of the Province of Ontario for the year 1943. He was elected by ballot in 1941 to the Council of the Association, Electrical Branch, and is a member of the Finance and Publicity Committees.

Mr. Aykroyd, a graduate of Queen's University, was with the Imperial Ministry of Munitions during the last war in Toronto, New York and later Montreal. After the war he was engaged in commercial work in Canada, the United States and abroad until 1923, when he joined the Chief Engineer's staff of the Bell Telephone Company in Mont-

R. A. Elliott

real. In 1926 he was transferred to London, Ontario, as Division Plant Supervisor, three years later returning to Montreal as Assistant Division Plant Superintendent. With the formation in 1930 of the western area at Toronto he was made General Plant Supervisor of the area. Since 1934, he has been Outside Plant Engineer.

Mr. Aykroyd is a Director of the General Alumni Association of Queen's University and a Vice-President of the Toronto Branch.

Library Notes

ADDITIONS TO THE LIBRARY TECHNICAL BOOKS

Communication Circuits:

Lawrence A. Ware and Henry R. Reed. N.Y., John Wiley and Sons, Inc., 1942. 6 x 9 in., \$3.50.

Quebec. Statistical Year Book:

For the year 1941. Published 1942.

Bibliography of the Literature Relating to Constitutional Diagrams of Alloys:

Compiled by J. L. Haughton. London, The Institute of Metals (1942). (Institute of Metals Monograph and Report Series No. 2). 5½ x 8½ in. 3s 6d.

Handbook of Scientific and Technical Societies and Institutions of the United States and Canada:

4th ed. Washington, National Research Council, 1942. 6¾ x 10 in.

Wells' Manual of Aircraft Materials and Manufacturing Processes:

T. A. Wells. N.Y., Harper and Brothers (c. 1942). 7½ x 10 in. \$3.50.

PROCEEDINGS, TRANSACTIONS

The Royal Society of Canada:

Transactions, Vol. 36, Section 2.

REPORTS

United States Steel Corporation T.N.E.C. Papers:

Comprising the pamphlets and charts submitted by United States Steel Corporation to the Temporary National Economic Committee, 1940. 3 vols. Vol. 1—Economic and related studies. Vol. 2—Chart studies. Vol. 3—Basing point method.

Carnegie Corporation of New York:

Annual report for the year ended September 30, 1942.

Social Insurance and Allied Services:

Report by Sir William Beveridge. N.Y., MacMillan Co., 1942. 6 x 9¼ in. \$1.10.

Aerial Bombardment Protection:

Harold Everett Wessman and William Allen Rose. N.Y., John Wiley and Sons, Inc., 1942. 6 x 9 in. \$4.00.

Other members of Council for the year 1943 are as follows:
Past-President: Warren C. Miller, M.E.I.C., City Engineer, St. Thomas.

COUNCILLORS: Civil Branch: G. H. Bryson, Street Supt., City of Ottawa, Ottawa. J. Clark Keith, M.E.I.C., General Manager, Windsor Utilities Comm., Windsor. J. L. Lang, M.E.I.C., Lang & Ross, Sault Ste. Marie.

Chemical Branch: J. G. Morrow, Metallurgical Engineer, Steel Company of Canada, Hamilton. E. T. Sterne, Chemicals Controller for Canada, Montreal. H. P. Stockwell, Jr., Chemical Engineer, Ottawa Water Purification Plant, Ottawa.

Electrical Branch: E. V. Buchanan, M.E.I.C., General Manager, Public Utilities Commission & London Railway Commission, London. Lieut.-Comdr. C. P. Edwards, O.B.E., M.E.I.C., Deputy Minister, Dept. of Transport, Ottawa. J. H. Smith, Engineer, Elec. Construction Sales, Can. General Electric Co. Ltd., Toronto.

Mechanical Branch: C. C. Cariss, M.E.I.C., Chief Engineer, Waterous Limited, Brantford. G. Ross Lord, M.E.I.C., Assistant Professor of Mechanical Engineering, University of Toronto, Toronto. R. M. Robertson, Chief Engr., Babcock-Wilcox & Goldie McCulloch Ltd., Galt.

Mining Branch: J. Beattie, Manager, Delnite Mines Ltd., Timmins. G. B. Langford, Professor of Mining Geology, University of Toronto, Toronto. D. G. Sinclair, Assistant Deputy Minister, Ontario Dept. of Mines, Parliament Bldgs., Toronto.

Book notes, Additions to the Library of the Engineering Institute, Reviews of New Books and Publications

University of Toronto—School of Engineering Research—Bulletin:

Lateral support of steel columns and struts by C. R. Young and W. B. Dunbar. Bulletin No. 170, 1942. (Reprinted from the Canadian Journal of Research Vol. 20, August, 1942).

Survey of High Obliques:

The Canadian Plotter and Crone's Graphical Solution by Captain L. G. Trorey. Reprinted from the Geographical Journal, Vol. C, No. 2, August 1942.

Toronto Harbour Commissioners:

Annual report for the years 1939, 1940 and 1941.

The Asphalt Institute—Construction Specifications:

Emergency revisions of the Asphalt Institute Construction specifications, Dec. 3, 1942.

Ohio State University—Engineering Experiment Station—Circular:

No. 44—Travel and trade in twentieth century Ohio.

University of California—Bulletin of the Department of Geological Sciences:

Vol. 26, No. 4—Pliocene vertebrates from Big Spring Canyon, South Dakota, No. 5—Fossil vertebrates from the superjacent deposits near Knights Ferry, California.

U.S. Bureau of Standards—Building Materials and Structures—Report:

BMS92—Fire resistance classifications of building constructions. BMS93—Accumulation of moisture in walls of frame construction during winter exposure.

Stratosphere Flying:

Including navigation for emergencies by Captain E. Cecil Evans Fox. Vol. 1. Complete astro-navigation. Toronto, The Aeronautical Institute of Canada (c. 1942).

BOOK NOTES

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet the books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

A.S.T.M. STANDARDS ON PETROLEUM PRODUCTS AND LUBRICANTS

Prepared by A.S.T.M. Committee D-2; Methods of Testing, Specifications, Definitions, Charts and Tables, October, 1942, American Society for Testing Materials, Phila., Pa. 442 pp., illus., diags., 9 x 6 in., paper, \$2.25.

The 1942 report of the committee on petroleum products and lubricants, the standard and tentative methods of test and specifications pertaining to petroleum are brought together in convenient form.

A.S.T.M. STANDARDS ON TEXTILE MATERIALS

Prepared by A.S.T.M. Committee D-13 on Textile Materials; Specifications, Tolerances, Methods of Testing, Definitions and Terms. October, 1942, American Society for Testing Materials, Phila., Pa. 408 pp., illus., diags., charts, tables, 9 x 6 in., paper, \$2.25.

This pamphlet contains the definitions and terms, methods of testing and specifications for textiles and related materials at present in force. Seventy-three specifications are given, for cotton goods, glass fabrics, jute, rayon, silk and wool. In addition to specifications, the publication contains photomicrographs of the common textile fibers, a yarn number conversion table and other useful information.

AIRPLANE DESIGN MANUAL

By F. K. Teichmann. Pitman Publishing Corp., New York and Chicago, 1942. 440

pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$4.50.

This volume outlines an orderly form of procedure in design, covering such subjects as preliminary weight estimating, the three view and the balance diagram. In addition, information is given on wing design, fuselage design, power plant, control instruments, etc., sufficient to enable the beginner to carry out the design of a new machine, and to supplement works on aerodynamics and structures.

AMERICAN DIESEL ENGINES, Their Operation and Repair

By E. F. Good, Harper & Brothers, New York and London, 1942. 313 pp., illus., diagrs., tables, 9½ x 6 in., cloth, \$2.75.

Intended as an introductory text for vocational classes, this textbook offers an excellent account of the principles of the diesel engine and of its general design and construction, with practical advice on its operation, maintenance and repair. The book is based on long teaching experience.

CHEMICAL ENGINEERS' MANUAL

By D. B. Keyes and A. G. Decm. John Wiley & Sons, New York, 1942. 221 pp., charts, tables, 6½ x 4 in., cloth, \$2.50.

A compact collection of tables and equations constantly used by chemical engineers, presented in a book of convenient pocket size. The equations relate to fluid flow, heat transfer, diffusional operations and separations. The tables include logarithms, integrals, specific heats, thermal conductivities, vapor pressures, safe loads, etc.

COMMUNICATION CIRCUITS

By L. A. Wore and H. R. Reed, John Wiley & Sons, New York; Chapman & Hall, London, 1942. 287 pp., diagrs., charts, tables, 9½ x 6 in., cloth, \$3.50.

The theory of communication circuits is presented as a first course in communication engineering for those training for civilian duties or for service in our armed forces. The basic principles of communication lines and their associated networks are presented, covering the frequency range from voice frequencies through ultra-high frequencies. Special attention is given to ultra-high frequency transmission.

DAVISON'S KNIT GOODS TRADE

52nd Annual, pocket edition, October, 1942. Davison Publishing Co., Ridgewood, New Jersey, 1942. 729 pp., illus., 8 x 5 in., cloth, \$5.50; de luxe office ed., \$6.50.

The 1942 edition of this well-known directory follows the pattern of previous issues and provides a complete, up-to-date register of manufacturers of knit goods, arranged geographically and by products. Spinners, dyers, wholesalers, and chain and large retail stores are also listed.

ENGINEERING DRAWING

By L. M. Sohag, Ronald Press Company, New York, 1942. 394 pp., illus., diagrs., charts, tables, 10½ x 6½ in., cloth, \$2.75.

The aim in this text has been to offer a basic course which will be complete and thorough in subject matter, and also closely articulated with industrial standards and practice. The text is divided into three sections of increasing difficulty, fundamental requirements being taught first. A wide selection of problems is included.

ENGINEERING MECHANICS, a Text-Book for Engineering Students

By B. B. Low, Longmans, Green & Co., London, New York, Toronto, 1942. 252 pp., diagrs., charts, tables, 8½ x 5½ in., cloth, \$4.50.

This book is chiefly concerned with kinematics and dynamics, including instantaneous centers, velocity and acceleration diagrams, analysis of cams, motion of rigid bodies in two dimensions, and vibrations of various kinds. A chapter is devoted to dimensions and dynamical similarity. Although complete in

itself, the book is intended as a companion volume to D. A. Low's "Applied Mechanics."

FERROUS PRODUCTION METALLURGY

By J. L. Bray, John Wiley & Sons, New York; Chapman & Hall, London, 1942. 457 pp., illus., diagrs., charts, tables, mops, 9½ x 6 in., cloth, \$4.00.

An unusually successful attempt to cover the production of iron and steel in a volume of moderate size is provided by this text. The current processes are described in some detail, and the fundamental theories underlying them are presented. Excellent line drawings are used as illustrations. The treatment is thoroughly up to date. Bibliographic references accompany each chapter.

(The) FLOW OF HEAT IN METALS

By J. B. Austin, American Society for Metals, Cleveland, Ohio, 1942. 144 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$2.50.

Contains five lectures intended to present the basic principles of heat flow in metals in a non-mathematical way. The nature of heat, the factors that affect the thermal conductivity of metals, the basic laws of heat conduction and the flow of heat are discussed. Each lecture has a bibliography.

FLUSH PRODUCTION, THE EPIC OF OIL IN THE GULF—SOUTHWEST

By G. Forbes, University of Oklahoma Press, Norman, Okla., 1942. 253 pp., illus., maps, tables, 8½ x 5½ in., cloth, \$2.75.

A history of the Gulf-Southwest oil field, telling the story from the early days of the nineteenth century to to-day. The discoveries, the era of rapid production, the question of regulation, stock speculation, the natural gas industry, the social and economic effects of the industry are described. A considerable bibliography is given.

Great Britain. (Ministry of Labour and National Service Welfare Pamphlet No. 5)

VENTILATION OF FACTORIES, 4 ed.

His Majesty's Stationery Office, London, 1942 reprint. 40 pp., illus., diagrs., charts, tables, 9½ x 6 in., paper, (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, 45c.).

This pamphlet presents the principles which should be applied to secure satisfactory atmospheric conditions in workrooms, describes the standards in force in England and discusses the ventilating apparatus and methods available.

Great Britain. Ministry of Works and Planning, Directorate of Constructional Design

TIMBER ECONOMY, No. 3 (FITMENTS)

His Majesty's Stationery Office, London, 1942, no pagination, diagrs., charts, tables, 13 x 8 in., paper, (obtainable from British Library of Information, 30 Rockefeller Plaza, New York, 30c.).

This bulletin discusses the economical use of lumber in the construction of shelving, drawers, storage cupboards and bins, workbenches, kitchen fittings and other storage equipment. Dimensioned drawings are given.

INDUSTRIAL INSPECTION METHODS

By L. C. Michelon, Harper & Brothers, New York, and London, 1942. 389 pp., illus., diagrs., charts, tables, 11 x 8 in., cloth, \$3.50.

A course of instruction prepared for use in training junior inspectors for the War Department. The book describes the principles, construction and uses of the various instruments for dimensional control, for testing physical properties and for surface inspection. A chapter on the organization of inspection departments is included.

(The) MAN BEHIND THE FLIGHT

By A. Jordanoff, Horner & Brothers, New York, 1942. 276 pp., illus., diagrs., charts, tables, 10 x 7 in., cloth, \$3.50.

This book presents some information on mechanical drawing, elementary electricity and hydraulics, mechanics and physics, accompanied by a brief outline of airplane history. It is offered as a ground course for aviation mechanics and airmen.

MARINE PIPE COVERING

By W. W. Godwin, Cornell Maritime Press, New York, 1942. 142 pp., illus., diagrs., 7½ x 5 in., cloth, \$2.00.

A practical manual on the materials used for insulating piping and on methods of installing them on ships. Molded, curved and flat block and canvas coverings, and plastic cements are described. There are also chapters on covering boilers, on molded cork coverings and on hair felt and asbestos rope.

MECHANICAL DRAWING

By E. Kenison, and J. McKinney, revised by T. C. Plumridge, American Technical Society, Chicago, Ill., 1943. 330 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, \$2.00.

This textbook offers a practical course, adapted for class use or home study.

(The) MECHANICAL TESTING OF METALS AND ALLOYS

By P. F. Foster, 3 ed, Sir Isaac Pitman & Sons, London; Pitman Publishing Corp., New York, 1942. 317 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, 18s. or \$5.00.

Descriptions of modern testing equipment are coupled with its mode of use and combined with the theory underlying current developments in the testing of metals in a very practical way. The book should be useful for reference.

ORE DEPOSITS AS RELATED TO STRUCTURAL FEATURES

Prepared under the direction of the Committee on Processes of Ore Deposition of the Division of Geology and Geography of the National Research Council, Washington, D.C.

Edited by W. H. Newhouse, Princeton University Press, Princeton, New Jersey; Humphrey Milford, Oxford University Press, London, 1942. 280 pp., illus., diagrs., charts, tables, mops, 12½ x 9 in., cloth, \$6.50.

Articles describing the relations of structural features and ore occurrence in over seventy important mines and districts are presented in this volume, the first to be devoted to its subject. The contributors include many prominent geologists, and their opinions as to the relative importance of different structural features in localizing ore vary greatly.

PRINCIPLES OF STRUCTURAL GEOLOGY

By C. M. Nevin, 3 ed, John Wiley & Sons, New York; Chapman & Hall, London, 1942. 320 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$3.50.

The aim of this text for beginners is to discuss the deformations of the earth as simply as possible. The new edition has been thoroughly revised and brought up to date.

PROCESS PRACTICES IN THE AIRCRAFT INDUSTRY

By F. D. Klein, Jr., McGraw-Hill Book Co., New York and London, 1942. 266 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$2.75.

The processes, methods and materials currently used in the aircraft industry are discussed in this book, which is intended as a reference and instruction book for workers in that field. The procurement of raw materials, their marking for identification, the metals,

fabrics and organic finishes used are listed in full and described briefly. Methods of processing are discussed at some length. A great deal of information is compressed into a small book.

QUESTIONS AND ANSWERS FOR MARINE ENGINEERS, Book I—BOILERS

Compiled by H. C. Dinger. *Marine Engineering and Shipping Review* (Simmons-Boardman Publishing Co.), New York, 1942. 168 pp., tables, 8 x 5 in., paper, \$1.00.

During the last twelve years the Marine Engineering and Shipping Review has published answers to readers' questions. This booklet contains a collection of those on the operation of marine boilers and on boiler-room equipment, which answer many problems that arise.

(The) RADIO AMATEUR'S HANDBOOK 20th ed. 1943.

American Radio Relay League, West Hartford, Conn. 478 pp., illus., diagrs., charts, tables, 9½ x 6½ in., paper, \$1.00 in U.S.A.; \$1.50 elsewhere; bound, \$2.50.

The new edition of this well-known manual of high-frequency radio communication follows the model of earlier ones, but has been revised and expanded to meet current conditions. A special new feature is a chapter on the War Emergency Radio Service. The book provides a simple, non-mathematical text on the theory, design and operation of radio communication equipment, with full information on the construction of apparatus.

RADIO TO-DAY, the Present State of Broadcasting. (Geneva Studies. Vol. XII. No. 6, July, 1942)

By H. Huth. Geneva Research Centre, c/o Graduate Institute of International Studies, 132 rue de Lausanne, Geneva, Switzerland. 1942. 160 pp., tables, 8½ x 5½ in., paper, 1.75 Swiss frs. or \$0.40.

The author first discusses the organization and financing of broadcasting, the method of transmission, the programmes offered and the number of listeners. Following this, he describes the broadcasting available throughout the world, and closes with a brief account of recent developments. The study gives an excellent survey of the whole field, with emphasis upon its permanent problems and the solutions that have been devised.

ROGERS' INDUSTRIAL CHEMISTRY, 2 Vols.

Edited by C. C. Furnas. 6 ed. D. Van Nostrand Co., New York, 1942. 1721 pp., illus., diagrs., charts, tables, maps, 9½ x 6 in., cloth, \$17.00.

The new edition of this Manual will be welcomed by students and manufacturers. Like its predecessors, it offers rapid surveys, prepared by specialists, of the essential features of the most important branches of chemical industry. Without being encyclopedic, these surveys meet ordinary requirements and are accompanied by references to sources of further information. The result is a valuable reference book.

SEVEN-PLACE VALUES OF TRIGONOMETRIC FUNCTIONS FOR EVERY THOUSANDTH OF A DEGREE

Compiled by Dr. J. Peters. D. Van Nostrand Co., New York, 1942. No pagination given, tables, 9½ x 7 in., cloth, \$7.50.

These tables are admirably suited for large scale computations with calculating machines. Tables are provided for sines, cosines, tangents and cotangents. Supplementary tables are given for converting minutes and seconds into decimal parts of degrees, and vice versa, and for converting degrees to time and time to degrees.

SHIPBUILDING BLUEPRINT READING

By J. L. Tomlinson. American Technical Society, Chicago, Ill., 1942. 208 pp., (answers, 27 pp. extra), diagrs., blueprints, charts, tables, 11 x 8½ in., stiff paper, spiral binding, \$3.00 with answers, \$2.75 without answers.

The information needed by shipyard workers is presented in a practical way, beginning with the basic arithmetical data and covering methods of projection, relation of views, scales, symbols, etc. Typical drawings, with question sheets, are included. The course emphasizes the reading of ship drawings, rather than the making of them.

STEEL AND TIMBER STRUCTURES

Compiled by a Staff of Specialists; Editors-in-Chief, G. A. Hool and W. S. Kinne, revised by R. R. Zipprodt and D. M. Griffith. 2 ed. rev. and enl. McGraw-Hill Book Co., New York and London, 1942. 733 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$6.00.

This book is one of a series of six designed to be a reference work on the design and construction of structures. It deals with steel and timber buildings, roof trusses, short span steel bridges, timber bridges and trestles, steel tanks, chimneys, and discusses detailing, fabricating, erecting and estimating, and materials. The treatment is thorough and detailed. This edition has been thoroughly revised and brought up to date.

ULTRA-VIOLET LIGHT AND ITS APPLICATIONS

By H. C. Dake and J. De Ment. Chemical Publishing Co., Brooklyn, N.Y., 1942. 209 pp., illus., 9 x 5½ in., cloth, \$3.25.

Some of the uses to which ultra-violet light has been put in criminology, warfare, advertising, medicine, etc., are briefly described in non-technical language.

WITHOUT FAME, the Romance of a Profession

By O. Eisenschiml. Alliance Book Corp., Chicago and New York, 1942. 368 pp., illus., 9½ x 6 in., cloth, \$3.50.

The autobiography of a chemical engineer who came to America as a young man. His career is traced from his first job in a Pittsburgh steel mill to his final success as executive of his own oil plant in Chicago. The story is full of incident, told in interesting fashion.

CAN OUR CITIES SURVIVE? an ABC of urban problems, their analysis, their solutions, based on the proposals formulated by the C.I.A.M. (Congrès Internationaux d'Architecture Moderne, International Congresses for Modern Architecture)

By J. L. Sert. Harvard University Press, Cambridge, Mass.; Humphrey Milford, Oxford University Press, London, 1942. 259 pp., illus., diagrs., charts, maps, tables, 12 x 9½ in., cloth, \$5.00.

This important new book on city planning is based upon many years of study and an analysis of thirty-three American and European cities of varied types. The problems of a modern city are approached from both a realistic and a human point of view. The four elementary functions—dwelling, recreation, work and transportation—are examined with reference to the cultural, social and political needs of large groups, and safeguards against repetition of past errors. Diagrams and illustrations are strikingly used to present the subject.

CHEMISTRY OF ENGINEERING MATERIALS

By R. B. Leighou, rewritten by the following members of the Chemistry Faculty of the Carnegie Institute of Technology: J. C. Warner (Editor), T. R. Alexander, P. Fugassi, D. S. McKinney, H. Seltz, G. H.

Stempel, Jr., and K. K. Stevens. 4th ed., McGraw-Hill Book Co., New York and London, 1942. 645 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$4.50.

The chemical properties of materials are discussed from the viewpoint of the user, to aid in their intelligent selection and use. This edition has been rewritten by a group of teachers and has been enlarged by new chapters on protective coatings, the shaping of metals, abrasives, glass and organic plastics, and alloys.

(The) ELECTRICAL FUNDAMENTALS OF COMMUNICATION

By A. L. Albert. McGraw-Hill Book Co., New York and London, 1942. 554 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, \$3.50.

Intended as an elementary text for students of communication engineering, including telegraph, telephone and radio, this book presents the electrical fundamentals upon which these forms are based. The explanations and illustrations used are taken from the communication industry itself, and not from the power industry, as is usually done.

METEOROLOGY AND AIR NAVIGATION, Air Pilot Training

By B. A. Shields. 2 ed. McGraw-Hill Book Co., New York and London, 1942. 285 pp., illus., diagrs., charts, maps, tables, 9½ x 6 in., cloth, \$2.25.

This is a revision and expansion of parts three and four of the author's previous book, "Air Pilot Training." It contains a course in meteorology and air navigation which covers these subjects sufficiently to prepare one for the written examinations for a private and commercial pilot's certificate. The information is presented in a simple, non-technical style which calls for no advanced educational equipment.

MODERN BUILDING INSPECTION

"The Building Inspector's Handbook," with text by C. N. Dirlam and others, compiled, edited and arranged by R. C. Colling, sponsored by the Pacific Coast Building Officials Conference, Los Angeles, Calif., published by R. C. Colling and Associates, 124 West 4th St., Los Angeles, Calif., 1942. 404 pp., illus., diagrs., charts, tables, blueprints, 9½ x 6 in., cloth, \$5.00.

This is an admirable handbook on the organization and administration of building inspection and on the technical problems that arise in the work. The first section describes the organization and work of an inspection department, the drafting of codes, the forms, fees, reports, etc. Section two is a concise course in structural engineering for the inspector, which includes a chapter on resistance to wind and earthquake forces. The final section deals with legal problems in connection with the enforcement of building codes. Appendixes contain suggested forms of ordinances and procedures, an extensive bibliography and a directory of publications and technical associations.

N.A.M. HANDBOOK ON WAR PRODUCTION

Compiled and published by National Association of Manufacturers, Washington, New York, San Francisco, August, 1942. 184 pp., charts, tables, 8½ x 11 in., paper, \$1.00.

This handbook for manufacturers brings together the information needed by those having war contracts or seeking them. How to go after a contract, how to sell to the Government, and the principles of cost determination under Government contracts are explained. The organization and functions of the War Production Board are described in detail, and the functions of the various agencies set forth. The priorities regulations are given in full, and there is a list of priorities orders, forms, etc.

NATIONAL RESEARCH COUNCIL SERVES WAR DEPARTMENTS *(Continued from page 61)*

Equipment was installed and a staff assembled in the National Research Laboratories for the inspection of gauges used in the production of guns, shells, fuses, bombs and other mechanical items which are now being made in mass production.

Another important activity of the Army which is built on science is chemical warfare. From a small co-operative effort between the National Research Council and the Army, this activity has developed rapidly and is now a highly co-ordinated project operating as a Directorate of the Department of National Defence, but under a Director General who is a civilian scientist on the staff of the National Research Council. Of the active personnel about one-half are civilian scientists and the rest are uniformed officers and men.

Indicators for war gases and chemicals for other war services have been synthesized and studied. The rubber laboratory has investigated for production purposes or improvements, products used by almost every branch of the Armed Forces including surgeons' gloves, ground sheets, gas-mask components, artillery and tank parts, crash and steel helmets. In addition, the laboratory has made numerous acceptance tests on contract deliveries. Recently, much attention has been given to rubber conservation problems and to the study of synthetic rubber processes. Commercial production of fuse-powder charcoal was carried on until recently by the National Research Council; manufacturing has now been turned over to a commercial concern.

Activities in the textile laboratory have been largely in connection with acceptance test work and specifications. Special problems included an investigation of methods to reduce weathering of canvas duck, a study of thermal transmission of blankets, colour analyses of certain types of textile products and work on respirator pads.

Inspections have been made and advice given as to the suitability of a variety of leathers for different military purposes. Examination has been made of numerous dressings and waterproofing compounds for leathers. Tensile strength tests on leathers, and wear-resistance tests, chiefly on composition-sole materials were carried out for the Department of National Defence.

Component parts of certain anti-aircraft protection devices were constructed. Transport sheet resins for military purposes have been tested against specifications; vulcanized fibre identification discs and other objects have been examined, and general consideration has been given to the substitution of plastics for metals in a number of articles and parts related to war materials.

Preservative coatings for use on military vehicles and other equipment for war purposes have been developed. A surprising variety of finishes is required in this field and many of the materials are comparatively new to Canadian industry.

Mention should be made of the establishment of an explosives laboratory to carry out testing required under the Explosives Act and to conduct research on explosives and related compounds. This laboratory is under the joint administration of the National Research Council and the Department of Mines and Resources.

FOR THE AIR FORCE

Establishment of the new aeronautical laboratories just outside of Ottawa has provided improved facilities for research on the multitude of problems arising from modern trends in aviation. Closest co-operation is maintained between the Royal Canadian Air Force and the Council's laboratories through the Associate Committee on Aeronautical Research, the chairman of which is the Air Member for Aeronautical Engineering, R.C.A.F. Much of the work in progress relates to problems that have been suggested by Air Force authorities in Canada, the United Kingdom or the United States.

Horizontal and vertical wind tunnels enable tests to be made on model aircraft of all kinds to determine their characteristics, good or bad, which are likely to affect their behaviour in flight. These studies are very important in the development of superior fighting machines and in working out all possible safeguards for the flying personnel who use them. In the engine laboratory, dynamometer rooms are provided for the testing of aircraft engines, while in the gasoline and oil laboratory complete equipment is provided for physical and chemical testing of aviation fuels and lubricants. A structures laboratory provides for the fabrication of prototypes of aircraft and for the test of component parts.

Experimental work required in connection with scientific problems under investigation in the National Research laboratories is often carried out co-operatively with the Royal Canadian Air Force Test and Development Establishment which is really a full-scale experimental flying station. In this way it has been possible to correlate in a most effective way the results of laboratory and model experiments with full-scale tests and to bring together on a common project civilian scientists and Service operating personnel.

During the year the Radio Section continued to work on the development of secret radio locator equipment with considerable success. There are already in the hands of the Services numerous different equipments which have been developed in the National Research Laboratories. Some of these have already been used successfully against the enemy.

FOR WAR INDUSTRIES

Industrial requirements for war materials have created many new problems on which the National Research Council has been invited to lend its assistance.

The Division of Applied Biology has rendered valuable assistance in the fitting of temporary refrigerators on merchant vessels. The successful transport of perishable food-stuffs demands refrigerated shipping space or the conversion of the material to a less perishable form that can be carried in ordinary stowage. This problem is most acute for bacon which goes forward in large volume. The shortage of refrigerated space has also affected other perishable commodities.

Considerable work has been done on the treatment of shell eggs to avoid deterioration during shipment at ordinary temperatures. All export eggs, however, are now shipped in powder form and the work of this group of investigators is now directed towards the development of methods for assessing quality and developing drying processes capable of producing a dried egg material of high quality.

Dehydration of meat, chiefly pork and cured ham, has been studied and an acceptable quality of product has been obtained. Closely related to food studies on products for shipments overseas is the development of containers in which a substitute for tin plate has been used. Packages based primarily on fibre and wax combinations have been found useful. Dehydrated products require packaging in waterproof materials.

The need for magnesium, the lightest of all metals, for example, led to intensive research and resulted in the development of a process well suited to Canadian conditions of production. A plant of ten-tons capacity per day, built by the Department of Munitions and Supply to use this process, is in operation, while plants totalling about 100 tons per day capacity are being built in several centres in the United States.

The shortage of natural rubber, which is so important for military purposes in this age of mechanization, has stimulated research on the possibility of producing rubber from plants that can be grown on the American continent. Synthetic rubbers of various types are being developed and tested, and plants are being established for the production of the more useful types. In this work and in hundreds of other industrial problems the scientists on the staff of the National Research Council are playing an important part.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

FOR ADMISSION

January 25th, 1943

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the March meeting.

L. AUSTIN WRIGHT, General Secretary.

*The professional requirements are as follows:—

A Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

AUBERT—MARCEL A., of Montreal, Que. Born at Montreal, Jan. 24th, 1905; Educ.: B.A.Sc., C.E., Ecole Polytechnique, 1928; 1924, dam location, Quebec Streams Commn.; 1925, power line constrn., Southern Canada Power Co.; 1926, Dominion Water & Power Bureau; 1927, road location and timber estimating; 1928, mine engr., A. Mailhot, consltg. engr.; 1928-30, asst. engr., new hldg., 1930-35, chief engr., supervising bureau, Univ. of Montreal; 1935-36, bridge designer, Quebec Public Works Dept.; 1936, gen. engr., F. J. Leduc & Associates; 1936-38, surveying, road location, and constrn., L. Bernardin, C.E.; 1938-39, concrete and gen. civil engr., Archer & Dufresne, Quebec; 1939-40, bldg. design, roads, L. Bernardin; 1940, road engr., Quebec Roads Dept.; July 1940 to date, gen. civil engr., Aluminum Co. of Canada, and professor, Montreal Technical School.

Employment Service Bureau

NOTICE

Technical personnel should not reply to any of the advertisements for situations vacant unless—

1. They are registered with the Wartime Bureau of Technical Personnel.
2. Their services are available.

A person's services are considered available only if he is—

- (a) unemployed;
- (b) engaged in work other than of an engineering or scientific nature;
- (c) has given notice as of a definite date; or
- (d) has permission from his present employer to negotiate for work elsewhere while still in the service of that employer.

Applicants will help to expedite negotiations by stating in their application whether or not they have complied with the above regulations.

SITUATIONS VACANT

MECHANICAL ENGINEER, junior, to act as assistant to engineer in charge of maintenance in one division of plant, or other related work such as mechanical installation. Apply to Box No. 2615-V.

CHEMICAL ENGINEER, supervisor to take care of experimental and development work in connection with alumina plants. Apply to Box No. 2616-V.

MECHANICAL CIVIL, MINING, METALLURGICAL OR CHEMICAL ENGINEER, for development and control work probably leading to supervisory capacity if required ability is proven in potrooms. Apply to Box No. 2617-V.

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.

ELECTRICAL ENGINEER with at least five years experience. Design and layout (on draughting board at least part of time) of power and lighting for industrial plant. Apply to Box No. 2618-V.

MECHANICAL ENGINEER. Either capable of making mechanical repairs to shovels, tractors, etc., or willing to learn. Apply to Box No. 2619-V.

GEOLOGIST. To undertake exploration for bauxite under supervision of chief geologist. Apply to Box No. 2620-V.

METALLURGICAL ENGINEER. Technical control and development of light alloy casting procedures. Apply to Box No. 2621-V.

SITUATIONS WANTED

CIVIL ENGINEER, 38, experienced in all types of building construction and in industrial layout work. Wants permanent or temporary position in charge of design or construction. Present location, Montreal. Apply to Box No. 576-W.

ENGINEERING MANAGER, B.A.Sc., M.E.I.C., Registered Professional Engineer, Canadian, married, 20 years' thorough experience in industrial management; mechanical and electrical construction and development, production planning, precision manufacturing, very well versed in organization methods. At present in complete charge of an extensive programme now nearing completion by a large company of designers formed in Toronto about a year ago. Really responsible position with well-established company desired. Available immediately. Will go anywhere. Apply to Box No. 2437-W.

REQUIRED IMMEDIATELY

Chemical, Civil, Electrical,
Mechanical and
Metallurgical Engineers

DOMESTIC AND FOREIGN ASSIGNMENTS ESSENTIAL WAR WORK

Apply to Box No. 2622-V

The Employment Service Bureau
The Engineering Institute of Canada,
2050 Mansfield Street,
Montreal, Que.

TRANSITS, LEVELS and accessories for rent.
Apply to Ralph Kendall, M.E.I.C., 49 Granville
Street, Halifax, N.S.

PRELIMINARY NOTICE (Continued from page 109)

NOAKES—FRANK, of Toronto, Ont. Born at Edmonton, Alta., Oct. 13th, 1913; Educ.: B.Sc. (E.E.), Univ. of Alta., 1937. M.S., 1937, Ph.D. (E.E.), 1940, Iowa State College; R.P.E. of Ontario; 1935-36-37 (summers), rodman, Geol. Survey, road constr., Jasper Banff Highway, survey asst., Dept. of Transport; 1939-40, research asst., engr. experiment station, Ames Iowa; 1940, lecturer in elec. engng., Univ. of Toronto; 1941 (summer), engr., design office, Ferranti Electric, Toronto; 1942 (summer), engr., National Research Council, Univ. of Toronto; at present, lecturer in elec. engng., University of Toronto, Toronto, Ont.
References: C. R. Young, R. S. L. Wilson, E. A. Allcut, W. E. Cornish, R. F. Leggett.

TYLEE—ARTHUR KELLAM, of 150 Argyle Ave., Ottawa, Ont. Born at Lennoxville, Que., April 24th, 1887; Educ.: B.Sc., Mass. Inst. Tech., 1907; 1907-30 (with exception of 1914-20—R.A.F.), with George T. McLaughlin Company, Boston, Mass., various duties, incl. supt., chief engr. and director in charge of production and engng., at present supervisor, overhaul and repair divn., aircraft branch, Dept. of Munitions & Supply, Ottawa, Ont.
References: C. D. Howe, E. P. Murphy, K. M. Cameron, D. Stairs, L. C. Jacobs.

WOERMKE—ORVILLE R., of Buckingham, Que. Born at Arnprior, Ont., Oct. 25th, 1916; Educ.: B.Sc. (Chem.), Queen's Univ., 1939; R.P.E. of Que.; 1934-35, lumber mills of Gillies Bros., Braeside, Ont.; 1934 (winter), highway constr., Dept. Nor. Development; 1939-40, soapmaker, United Chemical Co., Montreal; 1940, instructor, Queen's Univ.; 1940, dftsmn., and 1941 to date, plant designing engr., Electric Reduction Co. of Canada Ltd., Buckingham, Que.
References: R. M. Prendergast, A. Jackson, N. Malloch, A. N. Ball.

FOR TRANSFER FROM JUNIOR

FERRIER—JOHN ALEXANDER, of Renfrew, Ont. Born at Renfrew, May 27, 1909; Educ.: B.Sc., Queen's Univ., 1937; 1935-36 (summers), Ford Motor Co.; 1937-38, Bailey Meter Co.; 1938-40, i/c automatic control equipment, and 1940-42, foundry mtee. and planning, Ford Motor Co.; 1942 to date, base engineer, special branch, R.C.N.V.R., H.M.C. Dockyard, Halifax, N.S. (Jr. 1939).
References: W. Mitchell, J. E. Daubney, B. R. Spencer.

HOOD—GEORGE LESLIE, of 29 Hardy Street, North Bay, Ont. Born at Minnedosa, Man., Apr. 17th, 1910; Educ.: B.Sc. (Elec.), Univ. of Man., 1932; 1934-37, elect'l. mtee., Howey Gold Mine; 1937-38, demonstrator, Univ. of Toronto; 1938 (2 mos.), dftsmn., Toronto Harbour Commission; June 1938 to date, asst. meter and relay engr., H.E.P.C. of Ontario, testing, mtee. and inspection of meter, relay and control equipment. (St. 1930; Jr. 1940).

MONOFILAMENT NYLON BRUSH BRISTLES

Canadian Industries Limited, Plastics Division, Montreal, Que., have prepared a 15-page bulletin describing the development of "Nylon" and its use in monofilament form for brush bristles. In addition to describing the features of these bristles in different applications, their general physical and chemical properties when used for industrial brushes are tabulated; illustrations show different types of brushes employing "Nylon" bristles.

CENTRIFUGAL PUMPS

Bulletin 41-C, 15 pages, recently issued by Darling Brothers Limited, Montreal, Que., features the "Darling" Class B motor driven centrifugal pump, and contains cross-sectional drawings with descriptions of all principal parts. Steam turbine, V-belt motor and gasoline driven pumps are illustrated and described and in addition to specifications, dimensional and rating tables and other data, a number of typical pump installations are shown.

LUBRICATING SERVICE EQUIPMENT

"Alemite Service Equipment" is the title of a 48-page catalogue recently issued by Stewart-Warner-Alemite Corp. of Canada Ltd., Belleville, Ont. This catalogue contains innumerable photographs with specifications and other descriptive matter covering the company's extensive line of lubricating equipment. Many new and exclusive features that have been incorporated in these products are shown. These include the "Super De Luxe" high and low pressure, air and hand operated barrel pumps, the "Master" and "Advance" lines of pumps, "Alemite" cabinets, centre stands, oil bars and departmental service units. Other items include barrel pumps, transfers, loaders, air operated and electric hand and foot operated power-guns and specialized guns and lubrication equipment, etc.

CARTON STITCHERS

Ame Steel Company of Canada, Ltd., Montreal, Que., have for distribution a 6-page folder describing in detail the various standard and special types of "Silverstitcher" carton stitchers available to shippers of war products. Detailed specifications, numerous illustrations depicting special features and various uses are shown.

WORKMAN'S WARTIME PLEDGE CARD

Canadian Koebel Diamond Tools Limited, Windsor, Ont., as part of a continuing programme of tool conservation, has just published a Canadian Workman's Wartime Pledge Card, which stresses the theme "When you extend the life of a tool for a single hour or make that tool do better work, you are making a worthwhile contribution to Canadian ideals and to Canada's future." Cards are available to industry in any quantity, free of charge, upon request to the Company.

WOOD PARTITIONS

An 8-page bulletin being distributed by The Mills Company, Cleveland, Ohio, is fully illustrated with photographs and mechanical drawings, describing a new type of wood partition for offices, cubicles, toilets and factories. These are streamlined in design and are said to be sturdy, rigid and long lasting, and combine the advantages of interchangeability, movability, etc. All office door sections with frames are inter-changeable with 42" wide panel units and the partitions contain ample wiring connections in their bases, posts and cornices; for toilets, each wood panel is ready to erect being pre-fabricated from 3/4 in., five-ply plywood.

NOVA SCOTIA

THE MINERAL PROVINCE OF EASTERN CANADA

The search for war minerals and the prosecution of their production in Nova Scotia is being carried on by such well known Canadian Mining organizations as:—Ventures Limited, Consolidated Mining and Smelting Company Limited, Nipissing Mining Company Limited and Inspiration Mining and Developing Company. The Province is indebted to these corporations for their public spirited co-operation.

THE DEPARTMENT OF MINES

HALIFAX

L. D. CURRIE
Minister

A. E. CAMERON
Deputy Minister

PLANNING AND SPECIFYING LIGHT

Curtis Lighting of Canada Ltd., Toronto, Ont., have issued an 8-page bulletin in the form of a handbook for the planning and specifying of lighting equipment for war production. It contains complete information covering distribution curves, performance tables, dimensions and details of installation and features particularly the company's "X-Ray" reflectors and fluorescent industrial fixtures with "Fluratex" (non-metallic) reflectors and the Curtis "Tranquilux" twin fluorescent luminaire.

AUTOMOBILE AND TRUCK SPRINGS

McRobert Spring Service Limited, Montreal, Que., have for distribution a catalogue, with 1942 supplement, which lists replacement springs for every type of automobile and truck. The data it contains is arranged under the name of each type of vehicle, first for fronts and then for rears, giving stock and manufacturers numbers, models of cars, year of manufacture, number of leaves, length of short and long ends, free arch and bushings.

THE PLASTIC FOR THE TASK

A 4-page bulletin prepared by Duplate Canada Limited, Oshawa, Ont., illustrates and describes the plant facilities and numerous and varied products of this company. It stresses the complete plastic service offered by the company to Canadian manufacturers. It also features the plant of Duplate Tool & Die Limited, a subsidiary company, fully equipped for gauge, jig and fixture making with special equipment for plastic moulds.

SAFETY CLOTHING AND EQUIPMENT

Catalogue No. 45, 64 pages, of The Safety Clothing & Equipment Company, Cleveland, Ohio, illustrates and describes the Company's extensive line of equipment manufactured for the industrial safety field. Variations of each product, the different materials, sizes and styles in which each is available and its particular uses are included under the following headings; hats and helmets; hoods and masks; aprons; asbestos clothing; fireproofed clothing; rubber clothing; leather clothing; gloves; mittens; leggings; face shields; shoes; safety belts; guards; magnifiers; lamps and lanterns; stretchers and litters; skin protective creams and liquids; fire extinguishers; and miscellaneous safety devices and first aid supplies.

MACHINE TOOLS

An 8-page bulletin just issued by Jefferson Machine Tools Company, Cincinnati, Ohio, describes this Company's "Bulldog" precision milling machines; milling machine attachments; conversion attachments for lathes; endless belt sanding machines; swing frame grinding and polishing machines and the gyratory foundry riddle for screening, moulding and core sands, also for fine, medium and coarse dry materials. Each piece of equipment is illustrated and fully described.

REFRACTORY LABORATORY WARE

Norton Company of Canada, Ltd., Hamilton, Ont., have issued a 12-page bulletin which is devoted to the description of various refractory products made from "Alundum"-electrically fused alumina. After describing the source and method of producing the basic product, this bulletin gives the properties of (crystalline) alumina and the properties of "Norton" refractories (Alundum ware). Various shapes are illustrated and tables of stock sizes are included. Among these are crucibles, ignition capsules, melting crucibles, flame collars, filtering devices and combustion boats.

ARC WELDING TECHNIQUE

A booklet recently issued by The Steel Company of Canada, Ltd., Montreal, Que., and Hamilton, Ont., describes an amazingly simple technique in electric arc welding which eliminates the wastage of electrode stub ends, thus conserving critical materials, saving time and reducing costs.

MATERIAL HANDLING AND OTHER EQUIPMENT

"Industrial Time and Money Savers" is the title of a 4-page bulletin recently issued by S. A. Armstrong Limited, Toronto, Ont., featuring the "Reco-Barrett" line of lift trucks and portable elevators. The bulletin also contains illustrations and details covering the company's portable cranes, drum storage racks, two-wheel hand trucks, pressure reducing and regulating valves, pull hoists, electric hoists, automatic combustion control equipment and heat exchangers.

RUBBER STAMPS AND MARKING DEVICES

Dominion Marking Devices Reg'd., Montreal, Que., have prepared a catalogue, 104 pages, which is a comprehensive list of the extensive line of rubber stamps and marking devices handled by this company and included are a great many stamping devices of standard design which have been on the market for years but in which have been incorporated the latest improvements. Among the specialties are various types of time stamps, ticket punchers, lead seals and presses, stencil plates, bronze plates, key tags, and badges of various kinds.

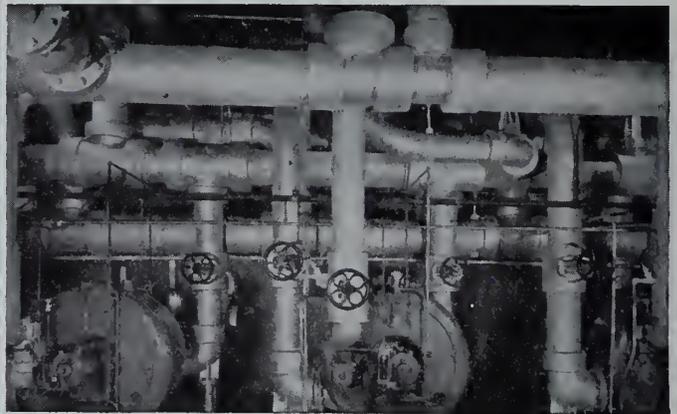

SPRUE CUTTERS

A 4-page bulletin, No. 320-B, by Canadian Blower & Forge Company, Ltd., Kitchener, Ont., illustrates and gives specifications for the "Buffalo" sprue cutters which are built in single and double end types. The ends can be removed permitting other tools to be used for different work. Frames are electrically welded, gears are cut from solid steel blanks, pinions are nickel steel, shafts are chrome nickel steel and bronze bearings are used throughout. These machines are furnished with an "Alemite" lubrication system and equipped with a 10-h.p. motor giving a fly-wheel speed of 250 r.p.m. with 32 strokes of plunger per minute.

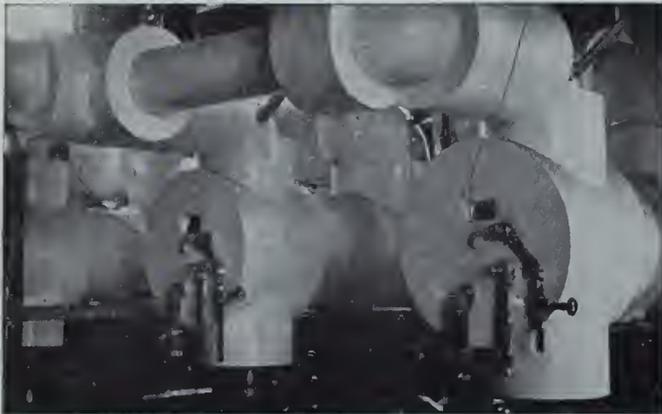

4 JOHNS-MANVILLE AIDS TO

BOILER FURNACES . . . Johns-Manville Superex is the most widely used block insulation for temperatures between 600° and 1900° Fahrenheit. Low thermal conductivity means less thickness required than with any other material of equal heat resistance.

SUPERHEATED STEAM LINES . . . For maximum fuel conservation, Johns-Manville Superex Combination Insulation is recommended. Built up of Superex and J-M 85% Magnesia, it has unusually high insulating value and exceptional heat resistance.

LINES UNDER 600° . . . For greatest economy in service up to 600° F., use J-M 85% Magnesia Pipe Insulation. For many years the standard insulation for steam lines, J-M 85% Magnesia combines light weight with high insulating efficiency.

LOW TEMPERATURES . . . J-M Rock Cork Sheets and Pipe Insulation are recommended for cold storage construction and refrigerating equipment. J-M Rock Cork does not rot or decay. Unusually moisture-resistant, it assures permanently high insulating efficiency.

TRANSITE CONDUIT AND KORDUCT . . . Two types of electrical conduit provide lower installation cost and reduced maintenance expense. Other J-M electrical materials include Asbestos Ebony, Trancell, Cable Fireproofing, Friction Tapes, Splicing Compounds.

SEALING COMPOUND . . . J-M Duxseal is a non-hardening adhesive plastic compound with an asbestos base. Duxseal adheres tightly to duct walls and cables, won't slump or harden in service, and it is insoluble in water and unaffected by ordinary gases and condensates.

POWER PLANT CONSERVATION

GENERAL UTILITY ROD AND VALVE STEM . . . Unusually adaptable, J-M Mogul Packing may be used for a wide variety of services. Soft and pliable at the start, it stays that way . . . does not wilt under sustained heat. Available twisted, and braided—round and square.

AGAINST STEAM, AIR, BRINE, OIL . . . J-M Sea Rings provide a minimum of friction on rods and plungers. They automatically seal on the work stroke, and release on the return stroke . . . thus reducing friction, minimizing rod wear, and conserving power.

MOULDED PACKING PRODUCTS . . . J-M Packing Cups, Seal Rings and other moulded packings are made to the exact shape and size required. They are made from materials proved by long experience to be most satisfactory in the service for which they will be used.

DOOR LININGS, SPECIAL SHAPES . . . Shapes can be cast, quickly and easily . . . and ready for service within 24 hours . . . by use of J-M Firecrete Castable Refractories. Ideal for poured door linings. 3 types: Standard (2400°), High Temp. (2800°), Light Weight (2200°).

Specialists in Conservation for 84 Years

Today, more than ever, power plant conservation is important—indeed, it is essential to the welfare of the nation. J-M brings you the knowledge accumulated during 84 years of experience . . . to help you avoid waste, save fuel, and cut costs.

In power plants all over the coun-

try, J-M Power Products are today contributing to the war effort, and will tomorrow be available for the resumption of peacetime activities.

For complete details on any or all of the products described here, write for Catalog GI-6A, Johns-Manville, 199 Bay Street, Toronto, Ontario.

Bethlehem makes a complete range of structural shapes for war construction

Bethlehem rolls a complete range of structural shapes, including wide-flange, standard, and light sections, all conforming to C.E.S.A. specifications. These shapes are being used in the construction of mills, buildings and blast furnaces; tank arsenals and airplane plants, shipways, hangars, and many other types of structures essential in Canada's war effort.

THIS

Point

IS IMPORTANT

"It's your point" says the badminton player to her opponent. And "it's your point" when you select the new Microtomic Van Dyke Drawing Pencils with HIGHER DENSITY Lead. It will suit you to perfection because it's different and better than any drawing pencil you've ever used. There's less smudging—alterations are more easily effected. Lines are uniformly opaque and therefore more sharply white when blue-printed. All grades — consistently accurate. Ask for Van Dyke Drawing Pencils by name.

Department of Labour
National War Labour Board
GENERAL ORDER

The Dominion Bureau of Statistics has found that the cost of living index number for January 2, 1943, is 117.1 (adjusted index 116.2) as compared with the cost of living index number for July 2, 1942, of 117.9 (adjusted index 117).

The Wartime Wages Control Order, P. C. 5963, provides in Section 48 (iv):

"the amount of the bonus shall not be changed unless the cost of living index number has changed one whole point or more since the last general order of the Board requiring an increase or decrease in the amount thereof."

The index number not having changed by one whole point or more since July 2, 1942, pursuant to the provisions of P. C. 5963 as stated, the National War Labour Board orders that the terms of its General Order dated August 4, 1942, shall continue to apply for the period February 15, 1943, to May 15, 1943, subject to the right of employers or employees to apply to a War Labour Board for authorization of payment of such an amount of cost of living bonus as a Board may determine to be "fair and reasonable," under the provisions of the Order.

HUMPHREY MITCHELL
Chairman, National War Labour Board

Ottawa, Canada
February 4, 1943

LEGEND OF 20 MEN AND HOW A YALE LIFT TRUCK BEAT THEM

• Once upon a time there was a plant manager who said "Oh! I have twenty men who can move light loads in my plant, if necessary." But at the end of six months the boss found that half the men had left him and the other half took far too long to lift and carry the loads. So he got in touch with his local distributor of Yale Hand Lift Trucks . . .

Now Yale Hand Lift Trucks are made to Yale standards—the finest standards—in a wide variety of models so that almost every type of lifting job in every industry can be exactly suited, and if Yale Hand Lift Trucks cannot do the job, there is also

a wide range of Yale Electric Industrial Trucks to choose from. The boss of the twenty men bought the right Hand Lift Truck and thereupon did all his loading and conveying easily, saving time and money on handling costs.

TRADE **YALE** MARK

Dresser Can Make Your RINGS FOR WAR

Dresser's peacetime production is the manufacture of the well-known Dresser Pipe Couplings and Repair Devices. The couplings are essentially a combination of heavy, accurately-sized metal rings.

Today, 90% of our output (many times our total in peace) is the fabrication of these same metal rings for war purposes.

Perhaps you are seeking a competent fabricator. Why not consider Dresser who has 62 years experience and the necessary equipment. Address your inquiries to DRESSER MANUFACTURING COMPANY, LIMITED, 60 FRONT STREET, WEST, TORONTO, ONTARIO.

DRESSER COUPLINGS and other products are available upon proper priority through these distributors:

WM. STAIRS, SON & MORROW, LTD., Halifax and Sydney, N.S.
G. SHERMAN DEARBORN, Saint John, N.B.
SAUNDERS VALVE & SUPPLY CO., LTD., Montreal, Quebec.

ALASKA HIGHWAY

A MAGNIFICENT ACCOMPLISHMENT

This highway, some 1600 miles in length, has been built in the face of tremendous obstacles presented by rivers, lakes, and swamps, involving 200 bridges, and the forests and mountains of a rugged, virgin country. Its construction is a remarkable achievement, and a tribute to all those responsible.

HERE AGAIN

***"Osmose"* IS ON THE JOB!**

"Osmose" products are being used for the economical preservation of wooden bridges, guard rail posts, and 65,000 telephone poles, as specified by the U. S. Engineering Corps, and the U. S. Signal Corps.

"To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

MESSAGE FROM THE NEW PRESIDENT

YOU HAVE conferred on me one of the greatest honours that can come to a Canadian engineer, and I am deeply conscious not only of the honour but of the trust you have placed in me. The honour and trust I feel I share with my colleagues in the Government service.

Every emphasis has been placed on the weight of the Institute and its membership being wholeheartedly, unreservedly and unselfishly devoted to the one objective, to win this war. From Lieutenant-General A. G. L. McNaughton, the able and inspirational commander of the Canadian Army, down through all the ranks of the profession in civilian as well as in service life, the evidence that this task has been accepted by all is unquestionable. The engineering profession in Canada has every reason to be proud of its accomplishments. It is determined to relax no effort. It is firm in its resolve to maintain its contribution. It is unalterably determined to exceed all past performance.

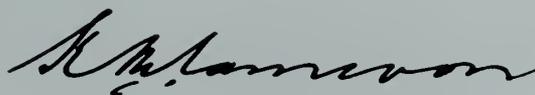

We entered this last year of Institution activities under circumstances which called for an all-out and united effort. That effort was put forth. We now begin to see the effect and are inspired to put forth those supreme exertions which will advance and assure the day of final victory. There must be no let up.

If we wish to retain our self-respect, if we expect from our fellow citizens respect for our profession, if we are to keep faith with our colleagues on active service, we can do no other.

With this determination, and with faith in final victory, we face the great task which lies ahead. In peace, as in war, the engineer's job is never done. The fruits of his ingenuity, developed for the betterment of mankind, have been diverted into the abominable ways of the Nazi ideology. However, with the indomitable spirit of the free peoples of the world, they will be turned on the aggressor, and they will destroy him. Together, they will assure continued peace.

Always in the forefront of man's advancement, the engineering profession must take its place in preparing the way for that better world security, which will ensure enduring peace and prosperity, with freedom. The end must be kept steadily in mind. No opportunity to advance must be missed, no delay tolerated. We must keep faith with those who place their trust in us. There must be no relaxation.

To these tasks the Engineering Institute and its members are pledged. They are conscious of their responsibilities and will discharge them with all honour. We go forward into the future with heads high, and enthusiasm undimmed.

President.

THE DAYS AHEAD

C. R. YOUNG, M.E.I.C.

Dean of the Faculty of Applied Science and Engineering, University of Toronto; President of The Engineering Institute of Canada for 1942.

Presidential address delivered at the Annual General Meeting of The Engineering Institute of Canada, at Toronto, Ont., on February 11th, 1943

For three and a half years the engineers of this country have been engaged in a task at once more extensive and more exacting than any other that has ever confronted them. They have put into the doing of it all of the energy, thought, and initiative that they possess. There has been little time for relaxation and although the way has been long and hard it has been travelled with pride and deep inner satisfaction.

At this time, when our armed forces are entering upon a new phase of the world struggle and when we of the Institute are surveying the work accomplished during the past year, it is not inappropriate that we should attempt to draw aside at least a little the curtains of the unknown. What lies ahead of the engineer? Where is he going, what service can he render in the remaining months or years of the war, and what is the role that he is to play in the days of peace?

I—THE WAY WE HAVE COME

Risking, perhaps, the charge of indulging in professional self-approbation, let us examine the basis for the intensive demand that has arisen for the services of the engineer in these crucial war years.

There is, of course, the obvious ground of professional knowledge and skill. But that is not all. Added unto it is the exploratory faculty of imagination and the ability to devise remedies for old situations and the means of meeting and coping with new ones. Significant although these may be, they are no more than qualities of the intellect. Whatever eminence the engineer may have achieved heretofore is due as much to other characteristics, often of greater import. Colonel H. G. Prout has well said that the engineer reaches the limit of his usefulness from defects of character rather than from want of technical attainments.

The engineer must, of necessity, be a quick and accurate analyst of new problems. Although this faculty may often be shared by the pure scientist, the engineer, faced with the need for rendering decisions upon which immediate and far-reaching programmes must be launched, is often forced to deviate from theoretical exactness and drive straight towards the solution that limitations of time, urgency of the need, or imperfections of materials and workmanship will dictate. It is a case of what is practicable in the circumstances. Here, in war, as in peace, he continues to be a co-ordinator of many sciences, techniques, and arts to the attainment of a desired objective.

The engineer is adaptable. His ordinary employment makes it essential for him to be so. Emergencies confront him daily in the course of any normal enterprise. He must quickly change front, devise remedies, and marshal men, materials, and equipment at the threatened point. In the development of a project, no plans and no specifications are sacrosanct. They are ruthlessly cast aside if a better way of attaining the desired end appears.

In all this the engineer remains imperturbable. He is accustomed to work under pressure and in the midst of distractions. If one who aspires to a place in the profession cannot function in these circumstances with efficiency, he had better seek another calling. The characteristic ability to cut resolutely through obstacles and confusion which differ only in degree from those of actual combat peculiarly fit him for wartime tasks.

It is not strange, therefore, that demand for the services of the engineer has been very great in this war and continues unabated. That demand has rested not only upon his scientific equipment or mastery of techniques. His

practical sense, ability to secure willing and loyal service from those under his direction, and proficiency in whatever of art there is in the practice of engineering has cast him in vital roles. And so he not only provides the technical leadership for normal and wartime industry, but has at the same time taken his place in the armed forces to an extent beyond that which might in the circumstances be expected of him.

In what has the engineer made his chief contribution to the amazing development of war industry in Canada?

With the fall of France in 1940, it was but natural that the engineer should be called upon for intensive service in the sphere of planning and design. Plant locations had to be selected quickly, structures designed, utilizing a minimum of materials, particularly in the case of those that would be in intensive demand for combat, and machinery had to be selected and installed. In the actual production of war equipment itself, design services are still required. Although the original designs have generally been prepared outside of Canada, many revisions have had to be made in order to secure standardization and to facilitate manufacture in this country. As has been pointed out by Mr. H. J. Carmichael, Co-ordinator of Production, Department of Munitions and Supply, ingenious modifications of parts have been made that lessen weight and often replace scarce materials by others that can be more readily obtained. Moreover, original designs of great importance, about which it is not yet permitted to speak, have been made in this country and are serving their purpose with high effectiveness.

As a supervisor or director of construction, either in the role of skilled adviser of a client or employer, or as the technical representative of a construction organization, the engineer has played a vital part in the building of the 125 new airfields in Canada and in the construction of the formidable array of new plants for war industry. These two represent an outlay of over \$300,000,000. He has had a determining hand in the spending of nearly \$750,000,000 of government money on the building, extending, and equipping of war plants. But what is even more stirring than the prodigious expenditure is the speed with which these enterprises were carried out. It has been a case of planning operations as thoroughly and carefully as a military operation in the field.

The engineer has shown his originality and resourcefulness in the modification and improvement of the processes of industry.

Old as is the art of metal casting, striking improvements have been shown to be possible. During the past year a new technique of casting steel by a centrifugal process has been developed. Not only is the quality of the metal markedly improved, but an important saving in the quantity of it has been effected, the amount of labour required is reduced, vital machine-tool hours have been lessened and the production has been increased.

From the days of the classic researches of Frederick W. Taylor, the art of cutting metals has bulked large in the determination of industrial processes. That art has received a new impetus through the development of carbide, the cemented metallic carbide that has revolutionized the machining of metals and the drawing of brass shells and cartridge cases. Due to it the production of shells has been speeded up from three to five times.

The technique of machining has been vastly improved, thanks to engineering inventiveness. In one plant the machining of a supercharger housing took 224 minutes, pro-

ceeding according to traditional methods. By arranging eight machines radially, working on the housing simultaneously, the time was cut to 24 minutes.

Following keenly on the trail of the research worker, the engineer has been able to bring about impressive improvements in manufacturing processes by enlisting the aid of electronics. In the newer rolling mills the reversal of the motors driving the rolls is effected by electronic devices with a gratifying speeding up of output. Rectification of alternating current to direct current is made possible without the use of heavy and expensive rotary equipment. Counting, sorting, and the discarding of imperfect or off-colour products is now being effected by electronic wizardry.

Necessity, born of the war, has forced the engineer so to alter his designs as to utilize substitute materials in large measure. Timber and concrete have been made to lift much of the burden off steel. Plastics or phenolic laminates have been mobilized in substitution for scarce metals with dramatic success. Some of our finest aircraft are in part fashioned of these materials. Even aircraft gasoline tanks have been constructed of them. They have been widely adapted to the manufacture of parts of fire control instruments. Out of plastics an impressive mileage of pipes and tubing has been produced.

With the fall of Malaya our source of tin was largely cut off. Confronted with the impossibility of obtaining the standard gear bronze, one of the members of this Institute, a proprietor of an important metal-working industry, set to work to devise a substitute. After extensive investigation and experimentation, he announced the discovery of a tin-free gear bronze of properties superior to those of the material that had hitherto been employed. And what is of particular significance to this professional body, he freely contributed the results of his enquiry to his competitors for the general benefit of those who fight under the banners of the United Nations.

II—THE WAY AHEAD

And now that engineers have passed, I hope, through the most difficult years of the war with high credit, what of the way that lies ahead?

There is no ground for anxiety so far as technological employment is concerned. The stage is set for its continuance. Unless all our post-war planning is to go for nought, there will be an impressive volume of construction undertaken in the early years of peace. Such forms an important ring stone in the arch of post-war stability that is now being designed. Moreover, a vast and ever-growing backlog of demand is being built up for the goods and services of peace. The longer and more drastic is the restriction of private expenditure, the more vigorous will be the rebound.

The country will be technologically well prepared for the upsurge when it comes. We shall have a well-trained and widely experienced body of qualified engineers. There will be an immense reservoir of men trained in the trades, particularly those of the mechanical type, many of whom but for the war would have remained totally unskilled. We shall still have, despite the heavy production of the war years, vast natural resources, if not in all of the traditional materials then in others that form the basis of effective substitutes. There will at the same time be an excess of available power. The Honourable C. D. Howe has said that ninety per cent of the great war plant built up in Canada will be susceptible to adaptation for peaceful industry.

The circumstance that is most likely to put the breath of life into this tableau is the existence of a formidable backlog of tested discovery and invention ready to be taken in hand by vigorous and enterprising men. Some of it was ready for commercial exploitation when the war broke upon us and some has come as a by-product of intensive war research and development. Indeed, Dr. C. E. Inglis, im-

mediate past-president of the Institution of Civil Engineers, has expressed the opinion that in "mechanical, electrical, aeronautical, and shipbuilding engineering, at least fifteen years of normal progress has been crowded into the past three years."

Moreover, the inventive spirit, vigorously excited by the war, will carry through into the peace. Scientific building stones have been quarried in days of storm and tempest which may now be used to erect vaster and more amazing edifices than we have yet seen. Sir Louis Beale is right in his view that the engineer will hold a large place in a coming world that will present alluring prospects to the adventurous spirit of man.

Great as will be the urge to produce speedily those things of which we shall have immediate need after years of deprivation, the rehabilitation of industry will be based much more upon new products than upon old and standard ones. Once having had a glimpse of the possibilities flowing from new discovery and invention, we are never going to be satisfied with old models, types, or styles. The new will drive out the outmoded and inferior. We shall never go back to pre-war notions of what was adequate.

Consider, for example, the future course of plastics. Dr. Inglis has expressed the view that this group of materials will reduce the ferrous metals to a position of secondary importance. Just as humanity has passed through the ages of stone and bronze, he believes that we are now nearing the end of the iron and steel age.

To the rude jolt thus administered by plastic materials is added the impact of the light metals. The amazing increase in our capacity to produce aluminum and magnesium is bound to have permanent and far-reaching effects.

After bearing the hurried and intense burden of wartime traffic for years, our whole transport system will need overhauling. It is unthinkable that reconstruction and re-equipment will be in close conformity to pre-war standards. The forced and intensive developments of war will profoundly influence the programme. We are not going to overlook the contributory value of light metals and new fuels. Nor can it be doubted that commercial air transport will be vastly important in the new transport order.

There will be widespread re-equipment of buildings. Fluorescent lighting is bustling in. There are some who think they can see the glow of cold light just over the horizon. The firefly had better look to his laurels. Air-conditioning, just nicely started when war came, will grow apace.

Television is coming. It is probable that most of those now here assembled will in their time find it as commonplace as we now find the telephone or the moving pictures.

We have been afforded a glimpse of the amazing field of electronic devices. It has been said that the new industrial god is electronics and the vacuum tube is his messiah. In view of what has already been achieved in devising and putting to work contrivances that see, feel, and hear, it is not unreasonable to look for wizardry around almost any scientific corner. For example, Raymond F. Yates asserts that Russian engineers have perfected a new automatic lathe which operates in obedience to an electronic scanning device that translates the lines on a blueprint into the behaviour of a cutting tool on metal. The control mechanism may be used on one lathe or on a number of them working simultaneously.

Comforting although this appraisal of the post-war material prospects of engineers may be, it constitutes a source of only limited gratification. The engineering profession will be advanced only in a technological sense by such activities. We must not forget that our science, however effective, does not present the whole solution to human problems. We should do well to reflect on the words of Sir Louis Beale:

"From dull, laborious toil, the engineer does save, can save, and will save humanity. He will lead humanity to happier, nobler, and freer lives by his conquest over Nature. He will open up a realm of peaceful living as yet undreamt of. But he will not control the world. He will not mechanise the human soul. He will realise that there is more to life than creature comforts, that man is ever striving toward the Infinite, toward a higher goal than the mere satisfaction of his bodily desires."

It should be the solemn obligation of every engineer here to do what he can to further the concept of the engineer

as a thoughtful and conscientious member of a great and learned profession, in all that that implies. He should endeavour to envisage a fair and spacious field of service in which he, as a loyal and devoted member of society, will play his full part.

In this forereaching we ought to remember, as F. L. Mayer has put it, that

"Nothing really worth while can ever be done except under the inspiration of something much greater than material achievement or personal gain—'Except the Lord build the house, they labour in vain that built it'."

THE ALASKA MILITARY HIGHWAY

BRIGADIER-GENERAL C. L. STURDEVANT
Assistant Chief of Engineers, U.S. Army, Washington, D.C.

Luncheon address delivered at the General Professional Meeting of The Engineering Institute of Canada, at Toronto, Ont., on February 11, 1943

On Monday, February 2, 1942, the author was informed by the War Department that a decision had been reached to undertake the construction of a highway to Alaska. A route connecting a series of airfields from Fort St. John, British Columbia, to Big Delta on the Richardson Highway in Alaska was to be selected and the Chief of Engineers was to carry out the project. A plan for surveys and construction was submitted on February 4th and a formal directive to proceed with the project was received on February 14th.

Permission was promptly obtained to send survey parties into Canada and a formal agreement with the Canadian Government was reached on February 26th which, among other things, provided that the United States would pay for the construction and that rights-of-way would be furnished by the Canadians. On March 9th and 10th, Quartermaster and Engineer troops began arriving at the end of the railroad at Dawson Creek, British Columbia, in sub-zero weather.

The plan submitted to the War Department was necessarily quite general in character but it was apparent at once that the main impediment to rapid progress was the fact that there were only four practicable points of access by land to the entire 1,600-mile route; namely, at the two extremities, at Whitehorse, and at some undetermined point on Teslin River or Teslin Lake which could be reached by steamer from Whitehorse. A fifth and difficult route of access to Watson Lake by way of the Stikine and Dease Rivers was considered but discarded as impracticable.

The magnitude of the project, the need for speedy construction and the limited accessibility indicated the necessity for a two-phase construction programme, the operations in the first phase to provide with utmost rapidity a rough minimum road to make possible the early and extended distribution of many additional crews which in the second phase would improve and complete the road.

Engineer troops are trained and equipped for rapid road construction. Moreover, troops were available for prompt dispatch, whereas a part of the season would probably be lost if civilian forces only were to be utilized. Consequently, engineer regiments were given the mission of building the access road which has been generally referred to as the pioneer road. The specifications for the pioneer road were very brief and were included in the instructions of the Chief of Engineers to troop commanders as follows:

"A pioneer road is to be pushed to completion with all speed within the physical capacity of the troops. The objective is to complete the entire route at the earliest practicable date to a standard sufficient only for the

supply of troops engaged on the work. Further refinements will be undertaken only if additional time is available."

It may be stated at this point that all troops did actually work enthusiastically to the limit of their physical capacity and the capacity of their equipment and without regard to hours. The clearing operations at the heads of columns set the pace and were practically continuous. They did complete their assignments in one short season to a standard far higher than was believed possible when the above instructions were issued.

The Public Roads Administration at the request of the Chief of Engineers employed contractors to improve the pioneer road in rear of troops, to construct certain mileage without the aid of troops and to furnish various engineering services.

WINTER MARCH OF 35TH ENGINEERS

From the railhead at Dawson Creek to Fort St. John there was a provincial dirt road passable in winter and dry weather. From Fort St. John to Whitehorse along the proposed route are nearly 1,000 miles of wilderness inaccessible for heavy equipment except over frozen trails in the winter months. There existed such a winter trail from Fort St. John to Fort Nelson, a distance of about 265 miles. This trail is generally on low, swampy ground and becomes impassable with the spring thaw which may occur in early April. It was decided to send a regiment over this trail to Fort Nelson before the thaw with supplies sufficient for four months and to have the regiment work northward from Fort Nelson. In this manner another point of access was established, thus cutting off 265 miles from the longest inaccessible section of the route.

Selected for this difficult mission was the 35th Engineer regiment commanded by Colonel Robert D. Ingalls, Corps of Engineers. The regiment, equipped with special arctic clothing, began arriving at Dawson Creek on March 10 and after many difficulties and hardships in weather 35 degrees below zero reached Fort Nelson on April 5th with all equipment and some 900 tons of supplies. For men inexperienced in such winter operations, this 325-mile march was a remarkable performance. Accomplishment of its mission by the 35th Engineers furnished the key to the early opening of the road to traffic.

ROUTE LOCATION

The second problem requiring early solution was the general location of the route. Although the road was to serve specified airports the main road did not necessarily have

A heavy fill over a deep culvert.

to touch them as they could be supplied if necessary by branch roads. Thus there was considerable latitude in location. Both the army and the Public Roads Administration sent in exploring parties in February by automobile, airplane and dog teams. Joint parties were organized in several cases. It was soon apparent that the route of the winter trail to Fort Nelson was impracticable for an all-year road and that the higher ground to the west would have to be used, but, having reached this decision, this section remained the most difficult for detailed location as much of the route was in rolling, heavily forested country and did not always follow well defined ridges or streams.

Between Fort Nelson and Watson Lake there were apparently two possible routes: one starting northwest through a considerable stretch of swampy country, and another starting westward, through mountainous terrain. Lack of airplanes and bad weather prevented final decision for some time, but it was finally decided in June to follow a series of water courses through the Rocky Mountains. Following the Tetsa River to Summit Lake, 102 miles west of Port Nelson, is found the highest point on the entire road at an elevation of approximately 4,212 ft. On the west slope of the Rockies the road follows down MacDonald Creek and Racing River and up the Toad River Valley to a low divide which it crosses to the Muncho Lake Drainage. From Muncho Lake it follows down the Trout River to its confluence with the Liard River and follows the north bank of the Liard River to the vicinity of Watson Lake.

After the general location as far as the Liard River had been decided, a great deal of reconnaissance was conducted

Rough grading sufficient to permit passage of truck traffic in weather not too wet.

in an effort to find a suitable route to the vicinity of Lower Post following the south bank, thus eliminating the necessity for an additional major bridge over the Liard. (Access to Watson Lake airport requires one crossing of the Liard). A location on the south bank was found impracticable because of excessive rock excavation, frozen ground and swampy areas. On the other hand the north bank is gently rolling usually with dry gravelly soil and the tributary streams to be crossed are of approximately equal magnitude on both banks.

In the beginning the most uncertain part of the entire route was between Watson Lake and Whitehorse. The air route maps available indicated that any reasonably direct route would have to cross a mountainous plateau not less than 6,000 ft. above sea level which might prove impassable due to heavy snowfall in winter. This was freely predicted by critics who exhausted every means to upset the plans of the War Department. Prior to sled and airplane reconnaissance it was thought that the road might have to be built via Dease River and Lake, Telegraph Creek and Atlin which would have increased its length by nearly 500 miles. However, airplane reconnaissance soon discovered a fairly direct route entirely through forest growth which in this latitude does not exist far above elevation 4,000. This meant

"Drifters" drilling holes for blasting charges.

that the summit was not much over 4,000 ft. above sea level. It turned out to be less than 3,500 ft. high. This route was apparently unknown to any of the local inhabitants and its discovery was an important factor in the early completion of the road. This section between Watson Lake and Whitehorse also follows stream lines for most of the distance—up the Rancheria to the divide between the Mackenzie River and Yukon River drainage basins, thence down the Swift River and across a low divide to the Morley River which it follows to Lake Teslin. It crosses the Teslin River near the foot of the lake and continues southeast along an old trail to Marsh Lake and then follows that lake and the Lewes River into Whitehorse.

For locating the road northwest of Whitehorse to the Richardson Highway in Alaska better maps and reconnaissance reports previously made by the Alaskan International Highway Commission and the Alaska Road Commission were available. After considerable exploration of other possible routes the location recommended by the Alaskan International Highway Commission was adopted with certain minor exceptions. This route follows an old trail to Kluane Lake, 150 miles west of Whitehorse, thence along the south shore of that lake and the south bank of Kluane River to a crossing of the White River at Lower Canyon, thence northward on the north bank of the Tanana River to the

mouth of the Tok River, and thence along the south bank of the Tanana to a junction with the Richardson Highway near Big Delta.

The general route having been selected, the detailed location became a matter for the decision of regimental commanders on the ground with the assistance of airplane photographs. Generally, no more elaborate instruments than the compass and hand level were used. An early effort was made to have the Army and Public Roads Administration engineers work together on detailed location in order that, insofar as practicable, the pioneer road might follow directly upon the location selected for the final improved road. This effort was soon abandoned because of the impossibility of supplying elaborate survey parties sufficiently in advance of the clearing operations to prevent delay in the latter. The army units therefore located the pioneer road by reconnaissance methods, and even so had great difficulty in keeping ahead of the bulldozers in many localities. Time-consuming obstacles were usually avoided, a course which resulted in some crookedness and excessive grades to be eliminated in the final location. For these reasons the Public Roads Administration surveys usually followed in rear of the army units and obtained data for relocations and grade corrections. In spite of the rapid methods used, the army pioneer road was so well located that the bulk of its mileage will be improved directly to the standard of the final road.

Crew engaged in ditching and corduroying.

under Colonel Heath Twichell, arrived about June first and backed up Colonel Lane's regiment by culvert construction, and grading and drainage work thus permitting the leading regiment to advance rapidly without too much danger of having its supply line bogged down.

The 18th Engineer Regiment, under the command of Colonel E. G. Paules, arrived at Skagway, Alaska, and after some delay due to the small capacity of the narrow-gauge railway, arrived at Whitehorse on April 29 with part of its equipment and was assigned the mission of building the road northwest of Whitehorse. This regiment advanced rapidly until about August first for a distance of about 220 miles after which it encountered very difficult going to October 25 when it met the 97th Engineers working southward from Alaska at a point 313 miles northwest of Whitehorse. The cause of this difficulty was permanently frozen ground which required special treatment.

Two other regiments, the 93rd and 340th, also arrived at Skagway in April. They were not originally scheduled to arrive so early but an unusual opportunity permitted the men and light equipment to be forwarded. As shipping was very limited it was necessary to take advantage of this opportunity. However, both regiments remained in Skagway until June awaiting arrival of their road building equipment.

The 93rd Engineers (coloured), under the command of Colonel Frank M. S. Johnson, then moved to Carcross and at the end of July had constructed 99 miles of difficult road from that point to Nisutlin Bay of Lake Teslin. Part of the regiment then dropped back to improve its own pioneer road and the remainder improved the road constructed in the meantime by the 340th regiment.

Carry-all moving earth to a fill.

MOBILIZATION AND TASKS

Except for the early dispatch of survey and administrative personnel and the 35th Engineers for the special reasons previously indicated, there was nothing to be gained by sending in additional construction troops before the passing of severe weather. The 35th Engineers although on the ground on April 5 did not build much road during April, May and early June because of heavy rains, floods and the low wet ground extending west of Fort Nelson for 50 miles to Steamboat Mountain. After July first, however, this regiment averaged three miles per day and on September 24 had reached a point 305 miles from Fort Nelson where it met the 340th Engineers working eastward from Teslin Lake.

Because the 35th Engineers would be inaccessible except by airplane until a road was opened to Fort Nelson every possible effort was made to push a road through from Fort St. John. Two regiments, each with a strength of 1,290 officers and men, were assigned to this section. The 341st, under Colonel Albert L. Lane, arrived about May first and lead the way to Fort Nelson which was reached on August 26, the bridge across the Muskwa near Fort Nelson being completed by detachments of a pontoon company and the 35th Engineers almost exactly on the hour of the arrival of the regiment from the south. The 95th Engineer Regiment (coloured), under Colonel David L. Neuman and later

Building a bridge over Morley River.

Rancheria River crossing.

The 340th Engineers, commanded by Colonel F. R. Lyons, moved in part via Carcross, over the road under construction by the 93rd Engineers and across country to Teslin River and thence by boat to Morley Bay of Lake Teslin where it set up its base camp. The remainder of the regiment with its heavy equipment moved by steamer and barge down the Lewes River and up the Teslin River to Morley Bay. This regiment began work at this point late in June with part of its equipment. Working in both directions it constructed the nine miles of road between Morley and Nisutlin Bays and by September 24 had crossed the Liard River near Watson Lake and had met the 35th Engineers at "Contact Creek," 240 miles east of Nisutlin Bay. It then dropped back to improve its own road.

The 97th Engineers (coloured), under the command of Colonel S. C. Whipple and later under Lieut. Col. L. E. Robinson, landed at Valdez, Alaska, in late May but could not get over Thompson Pass on the Richardson Highway until the middle of June. It then assisted the Alaska Highway Commission in repairing the Richardson Highway and moved to Slana on the Gulkana-Nebesna road where it began construction of a road through Mentasta Pass in the Alaska Range at the end of June. This regiment proceeded through the pass with considerable difficulty due to frozen ground and down the Tok River to the Tanana River. Crossing the Tanana it opened up the road along the north bank of the Tanana, crossed the international boundary and met the leading elements of the 18th Engineers on October 25 in the vicinity of Beaver Creek, which is 194 miles from the starting point at Slana.

The Public Roads Administration was assigned all construction on the 114-mile section of the main route between the mouth of the Tok and Big Delta and also the 50 miles section between Whitehorse and Jakes Corner.

SUPERVISION

For supervision and administration, two sector headquarters were established, one at Fort St. John controlling work southeast of Watson Lake, and the other at Whitehorse controlling the remainder of the work. Brigadier General William M. Hoge organized both offices and supervised all activities until June 6, when Colonel James A. O'Connor assumed charge of the southern sector. Both sector commanders reported directly to the Chief of Engineers until the virtual completion of a route practicable for truck traffic. Enlarged plans for such traffic and extension of other projects in the region led to the organization of the Northwest Service Command under General O'Connor, who assumed charge in September.

EQUIPMENT

All the seven regiments assigned to this project were similarly equipped, although in some cases delivery of com-

plete equipment to the job was delayed. The principal items of interest included, for each regiment, twenty D-8 diesel tractors and bulldozers; twenty-four D-4 and R-4 tractors with bulldozers and trailers for their transportation; three motor patrols; from fifty to ninety dump trucks; various cargo trucks; eleven to twenty $\frac{1}{4}$ -ton trucks (jeeps); twelve pick-up trucks; two $\frac{1}{2}$ -yd. gas shovels; one truck crane; six 12 cu. yd. carry-alls; six tractor-drawn graders; one portable sawmill; and two pile drivers. In addition, each regiment carried the normal assortment of small tools, water purification equipment, and electric lighting plants. Each company was provided with a radio receiving and sending set mounted in a jeep.

Nearly all of the foregoing equipment was new, which proved very fortunate as spare parts were often unobtainable and repair facilities were inadequate. Much ingenuity was displayed in keeping equipment in operation but at the end of the season much of it was on the dead line awaiting repairs or parts.

OPERATIONS

In the typical operations of a regiment engaged in breaking new trail through the forest, we find in the lead, of course, the locating party which indicated the centre line by blazes or pieces of cloth. The clearing crew with three shifts of tractor operators followed. One large bulldozer ran along the marked centre line clearing a narrow trail. Other large machines were then assigned tasks along this trail. Pushing the trees laterally to both sides they made a clearing from 60 to 90 ft. wide. Having finished a task a bulldozer would leap-frog forward to its next similar task. On much of the route the forest growth was dense but the trees were usually not large nor deeply rooted. Where the ground was firm, ten or twelve bulldozers could clear two to three miles through solid forest each day. The smaller bulldozers were used to follow the large tree movers, cleaning off moss, muck and lesser debris. The clearing crew was generally several miles beyond the reach of trucks and had to be supplied by pack train or tractor drawn sleds or trailers. The men slept in pup tents and moved camp nearly every day.

A crew consisting generally of a company followed the clearing crew constructing log culverts and small bridges and was followed in turn by another crew engaged in ditching, corduroying if necessary, and rough grading sufficient to permit passage of truck traffic in weather not too wet.

The remainder of the regiment, perhaps two or three of the six companies, might be distributed along the road thirty to forty miles in rear of the clearing crew and be engaged in widening the narrow places, reducing the worst grades, gravelling soft spots and smoothing with motor patrols. This operation completed the pioneer road which was generally 18 to 24 ft. wide. As means permitted later

A typical bridge over Aishinik River.

in the season, still further improvements in grade and alignment were undertaken both by Army and Public Roads Administration forces and the entire road has now received a light surfacing with gravel.

Two light pontoon companies each equipped with 675 ft. of floating bridge material were parcelled out to the regiments. The pontoon detachments promptly put in floating bridges over streams that could not be forded, or ferries where available material was insufficient for bridges. Pile or trestle bridges were constructed as soon as possible to release the pontoon equipment.

RATE OF PROGRESS

The rate of progress is best indicated by mileage under construction at the end of each month since the road was usable for supply purposes in a very short time after clearing was completed. Such progress is indicated in Table I.

TABLE I

MILEAGE UNDER CONSTRUCTION

To Date Indicated	Miles	Remarks
April 30.....	8	By 35th Engineers
May 31.....	95	By four regiments
June 30.....	360	By seven regiments
July 31.....	794	By seven regiments
August 31.....	1186*	Fort Nelson reached August 26
September 30.....	1479*	Road passable to Whitehorse September 24
October 25.....	1645*	Road passable to Fairbanks

* Includes Public Roads Administration construction.

In conclusion it is believed that nobody can really appreciate the volume of work accomplished without actually making a trip over the road. The main difficulty proved to be supply rather than construction. Progress would have been still better except for lack of adequate water transportation to Alaska which delayed the start of effective work in the Whitehorse area. Much delay was also due to the scarcity of certain supplies resulting from war conditions, particularly spare parts for transportation and construction equipment.

Completed road 40 miles east of Teslin.

The credit for pushing this road through the wilderness in the short span of one working season belongs first and foremost to the ten-thousand-odd American soldiers who took their fine equipment and did the job. This statement does not overlook the excellent and necessary work accomplished by the civilian forces of the Public Roads Administration in following up the troops and improving the Army road.

These soldiers of ours worked early and late. Neither heat nor cold nor all the challenges of the pathless wilderness could stop them. During March the men braved bitter winds and temperatures of 35 below. In July and August, gloved and swathed in netting against swarms of mosquitoes, flies and other insects, they sweltered under 90-degree heat. The rainy weather found them slogging through bottomless mud. They threw into their job the same spirit and the same courage that their comrades-in-arms have thrown into the operations in Algiers, in Morocco and at Guadalcanal. Yes, America can well take pride in the way its soldiers have performed in the building of the Alaska Highway.

INDUSTRIAL RELATIONS

Proceedings of the session held during the Fifty-Seventh Annual General Professional Meeting of The Engineering Institute of Canada, at Toronto, Ont., on February 11th, 1943, under the auspices of the Institute Committee on Industrial Relations. Mr. Wills Maclachlan, M.E.I.C., chairman of the Committee, presided.

THE ROLE OF THE INDUSTRIAL RELATIONS EXECUTIVE IN COMPANY MANAGEMENT

BRYCE M. STEWART

*Industrial Relations Counselors, Inc., New York, N.Y.
From 1940 to 1942 Deputy-Minister of Labour for Canada*

IMPORTANCE OF INDUSTRIAL RELATIONS MANAGEMENT

At the outset, it might be appropriate to refer to the increasing significance of industrial relations in the conduct of industry and for the general social welfare. Different groups—politicians, business men, trade unions—become one after another the most powerful factors in our society. Since the early thirties trade unions have been increasing in strength and influence, and business has lost prestige since it was regarded as responsible for most of our economic ills. For this reason, industrial relations men also lost prestige in some quarters because of their part in business management. However, during the war period, business has played its proper role well; it has achieved production objectives that were regarded as impossible and is winning a higher place in public esteem. It is now becoming quite respectable to be an industrial relations executive and those entering the field at this time have that advantage.

Mr. Walter Lippmann said recently that in the United States, "there is no governing class which has a social position and political power superior to that of the business community. That is why the American business men who manage the greatest industrial plant on earth are in a unique position. That is why their future cannot be discerned by reading analyses and predictions made by thinkers in lands where there is a quite different social structure. And that is why the working philosophy of the American business man is destined to play so decisive a part—for weal or for woe—not alone in his future but in that of this republic and of the world."

One may venture the assertion that in the years ahead the working philosophy of the business man with reference to the relationship between management and workers will have greater social import than his thinking in any other field. It is the function of the industrial relations executive to shape management's philosophy in this area. Mr. Lippmann in the article just quoted raised the question whether in these trying times American business men will assume necessarily "heavy burdens in order to continue to lead our industrial society." He suggests that they must not be diverted from "the conviction that they have a great mission to perform." Surely, therefore, the industrial relations man must exert himself to the utmost to see that the part the industrialist is destined to play in this important field of the relationship between management and employees is for weal and not for woe. What other profession has a greater responsibility or opportunity?

Many trade unions have been inclined to look askance at company industrial relations departments, and many employers have regarded trade unionism as not very constructive, to say the least. In Great Britain and on the Continent, since the turn of the century, unions have been

the major factor in shaping the industrial relations policies of management, and, in general, company industrial relations programmes have had a minor part. In America the reverse condition has obtained. The labour movement had a slow growth over a period of half a century and only a minority of companies had signed union agreements. In these circumstances the most progressive firms developed their own industrial relations policies, practices and departments. In this field American business stands supreme. However, with a marked increase in union membership in the United States and Canada in the last decade the unions now have a much greater influence in the determination of management's labor policies. Interestingly enough, while the rate of growth of trade unionism has been speeding up in America the war has accelerated the development of company industrial relations programmes in Great Britain. What we know as industrial relations management is now receiving greater emphasis in that country. Ernest Bevin, the Minister of Labour and National Service, who before becoming a member of the Cabinet was the general secretary of the Transport and General Workers' Union, has said:

"In the layout of our war effort, sufficient attention was not paid to the personnel problem . . . The longer the war goes on, the more necessary it becomes to pay greater regard to this personnel side of industry. The absence of a proper understanding of the problem has been one of our greatest handicaps in this great struggle. Hence my additional plea for the personnel manager, who should be specially trained to have an equal position in industry with other members of the executive. Indeed, I am sure—and I would emphasize this—that our post-war position will be materially helped and the future prospects of British industry enhanced by a full appreciation of this important fact."

Acting on this view, the British government is giving financial assistance for training in personnel management. Since early in 1942 the Department of Labour of Canada has sponsored and financially aided practical courses in this field at five Canadian universities. Can there be any better evidence of the necessity and importance of company industrial relations policies and of capable industrial relations executives than the action of these governments under the stress of war? This development is a sufficient answer to those trade unionists, employers and others who have held that with increasing determination of management's labour policies by the action of governments and unions, the field of company industrial relations activities and the role of the company industrial relations executive are being progressively restricted and ultimately may disappear. One is surprised and alarmed at the number of employers who in these days take the view that if labour standards are to be established by legislation or union dictation, management should comply submissively and make no effort to

develop and promote its own labour policies. This mistaken attitude serves notice on employees that they must compel employers to make concessions either directly through collective bargaining or indirectly through legislation. It tends to destroy any sense of partnership between management and employees and militates against co-operative effort in the promotion of the enterprise. In short, when management washes its hands of responsibility in these matters it affirms the Marxian thesis that employers and workers are distinct classes whose interests are in no sense identical and that a political dictatorship of the proletariat is the worker's only method of securing better conditions.

Progressive employers can oppose this contention by demonstrating orderly improvement in labour standards on their own initiative. They must prove that more can be gained by peaceful methods than by force, that as co-operative effort makes the enterprise more successful employees will share accordingly. Such employers will always be in the vanguard of the movement for improved conditions of work since collective bargaining and labour legislation must compromise to meet the necessities of marginal firms.

These managements are likely to profit by their foresight. Employees like other humans are prone to co-operate with any regime under which their conditions improve. Further, it pays to anticipate the compulsory standards of the future. A company that has a long established and well financed pension plan does not suddenly have to assume a new burden of costs when a governmental retirement system is introduced. Nor is employee good-will likely to be generated by action taken under compulsion. There can be no doubt that, if the management is imbued with this philosophy, the status of the industrial relations executive will broaden in this time of war and will continue to grow in the post-war period of readjustment as he is confronted with old problems in larger proportions, new problems and new frontiers. This conception of industrial relations is found to have a larger part in the art of industrial leadership.

THE INDUSTRIAL RELATIONS EXECUTIVE AS THE PROPONENT OF DEMOCRACY IN INDUSTRY

Democracy stands for progressive realization of freedom for the individual and his acceptance of his proper share of responsibility for the general well-being. In democratic countries a considerable measure of individual liberty has been achieved, as in freedom of speech, religion and politics. Full enjoyment of these rights by the citizen is conditioned by his measure of economic independence. If his family is starving he is prone, regardless of his convictions, to join the church, political party or labour organization that will help him most. The worker depends on the income from his job and its adequacy by way of rates and continuity, for decent independent living. In short, the hungry man cannot be free. Here and now we are striving for this new freedom, designated in the Atlantic Charter as freedom from want. The major long-term function of the industrial relations executive is to assist his management in the progressive realization of this objective for its employees.

Planned orderly progress in this sector, gauged to the capacity of the business to assume the burden, is the only alternative to direct action by the employees of the plant and to violent change that will shake the foundations of our society. Employees are securing better working conditions, better and steadier incomes, and more leisure through the voluntary action of employers, collective bargaining and labor legislation. The more that this can be accomplished by management with the assistance of a well-equipped industrial relations department, the better. Indeed, it probably is not an overstatement that the future status of industry in the national economy depends upon its achievements in this direction.

Perhaps, at this point, a word of caution is in order. The industrial relations executive is the proponent of democracy

in industry but he should have a clear understanding of that term. In industry both management and employees have their rights and duties. It is not suggested here that either should trespass upon the territory of the other. Management is responsible to the owners for the successful functioning of the business at a fair profit. It must safeguard the investment in the enterprise. Its social obligation is to secure the greatest possible production at the lowest possible cost consistent with fair wages and working conditions. To these ends management has the right and duty to select, allocate, transfer, promote, demote, discipline and dismiss employees. It should be so anxious, however, to ensure the fairness of its policies in these matters that it should stand ready at all times to discuss them with, and have them challenged by, the employees. It should stand ready to modify the policy announced in so far as the suggested changes do not hamper the responsible executives in the discharge of their proper functions. But the final responsibility must rest with management, and management must resist any encroachment upon its prerogatives. Similarly the employees should have complete freedom within their own sphere—for example, to join or not to join any labor organization as they choose. Democracy in industry means that each of the parties stands on its own ground, maintaining its own rights and performing its own duties in a spirit of mutual respect and co-operation for the success of the business upon which the welfare of each is dependent. Especially in these times the industrial relations executive will do well to have this definition of his field of activity constantly in mind.

THE DAY-TO-DAY DUTIES OF THE INDUSTRIAL RELATIONS EXECUTIVE

Having dealt with the long-term objectives of the industrial relations executive, we may now turn to his day-to-day activities. At the outset he must assist the management in the formulation of an industrial relations programme and in the development of the techniques involved, and must supervise the application of the policy throughout the business. The need for a written statement of industrial relations policy for every management available to all employees cannot be over-emphasized, nor can the industrial relations executive work effectively in the absence of such a policy. One may express the conviction that no industrial relations man worth his salt will accept a position with a company unless the management is willing to formulate its labour policy and reduce it to writing.

Nor, of course, should the executive identify himself with the company unless he believes that the policy is fair and workable in the circumstances of the enterprise. Not a few industrial relations men have accepted new positions during the war period only to resign a few months later. They have found the managements according to their own statements too busy with production to develop an industrial relations programme. Such managements think, apparently, that the executive should be an opportunist and deal with cases individually. They refuse to be bothered with the establishment of a grievance procedure, for example, but they would not operate any other department of the business on such a hit-or-miss basis. The industrial relations executive joining a new company should make sure that it has a labour policy with which he is in accord, that the management is keen for its fullest application and will support him to that end.

In its practical managerial aspects industrial relations has been defined for the Scribner's Dictionary of American History by Mr. C. J. Hicks, chairman of the board of Industrial Relations Counselors, Inc., as follows:

Industrial relations, as the term is commonly understood in the United States, is concerned primarily with the position of the worker in relation to his employer and includes whatever is involved in the employee's selection for and relation to his job.

The term *industrial relations* as distinguished from welfare work has grown to include all contacts between labour and all grades of management, connected with or growing out of employment. Specifically it covers items usually classified as personnel work, such as recruiting, hiring, placement, transfer, training, discipline, promotion, layoff, and termination of employees, together with proper service records; also all of the financial relationships such as wages and salaries, overtime rates, bonuses and profit sharing, savings and thrift and stock plans; also education, health, safety and sanitation, recreation, housing and employees' service activities; hours of labour and other working conditions, including days of rest and vacations; reasonable provision to help meet the common economic hazards involved in temporary or total unemployment, sickness, accident, old age, disability and death; also methods used to adjust differences and to promote co-operation between employees and management.

Many of these items have been gradually covered by state and federal legislation, starting with sanitation, accident compensation and safety measures, later dealing with child labour, hours and minimum wages especially for women and minors and more recently extended to include federal legislation on hours and wages.

The dictionary article just referred to contains the following statement concerning the *industrial relations* executive:

Personnel work, which was at first a mere incident in the day's work of the foreman or superintendent, has gradually been broadened into an *industrial relations* programme with increasing emphasis on standardization. The responsibility for developing a uniform company policy and practice as to all *industrial relations* activities in the individual company is increasingly being placed in the hands of an *industrial relations* executive, with the rank of vice-president or responsible to some high official of the company, and having a staff relation to those directly responsible for both employee relations and production.

A number of important factors must be considered in planning the organization for industrial relations administration in a company:

1. The plan of organization must be related to the size and character of the business.
2. The head of the industrial relations department should report to the chief executive of the company.
3. The industrial relations head should have a staff relationship to the line executives and respect their final authority and responsibility.
4. Line executives should consult the industrial relations department in their interpretation and application of the company's industrial relations policy.
5. The industrial relations department should supervise the administration of the company's industrial relations policies and should interpret the viewpoint of employees to the management.

It was stated above that the industrial relations executive should make certain that the management he serves has proven its interest in his field of work by the formulation of a written industrial relations policy. The role of such an executive in a business may be elucidated by the following brief outline of the essentials of an industrial relations programme.

1. An organization plan, accompanied by a full and detailed explanation, that clearly defines departmental functions and relationships, channels of communication and the respective authority and responsibility of line supervisors.
2. The persistent application of the consultative method of administration whereby, through the line organization, supervisors and employees participate in the formulation of policies and decisions vitally affecting their interests.

3. The formulation, reduction to writing and announcement to the whole organization of a definite company policy with respect to personnel relations, so that everyone knows the rules under which the game is being played.

4. The assignment of responsibility for directing administration of the labour policy and for advising management regarding industrial relations to a staff officer who reports directly to the chief executive of the company.

5. Recognition of the line responsibility of supervisors toward their own personnel and delegation of adequate authority to them for the execution of this responsibility.

6. A training programme that will assure the sincere and fair interpretation of the company's labour policy by the supervisory force.

7. Payment of the prevailing rates of wages, establishment of wage differentials or methods of compensation that reflect differences in relative responsibilities, skills and performance, and assurance of the effective administration of this system by the periodic review of individual earnings.

8. A procedure for the consideration and review of grievances that provides channels of appeal to the highest executive of the company for the correction of injustice to the individual employee.

9. A persistent effort, through research, planning and co-ordination, based upon adequate personnel records, to assign each employee to the job for which he is best fitted and to increase stability of employment.

10. Recognition of the social obligations and economic value of providing safeguards against the major hazards of industrial employment such as disability, superannuation and unemployment.

THE INDUSTRIAL RELATIONS EXECUTIVE AS A STAFF OFFICIAL

Industrial relations executives too often err by assuming line functions, a step which usually results in conflict and weakens them in the discharge of their proper duties. It may be well, therefore, to give further attention to industrial relations as a staff function. This conception of industrial relations is predicated upon the ultimate responsibility of the line executives of the company for direction of the labour policies as well as the financial, sales and operating phases of the business. Within the limits of his authority, each member of the executive organization—from the president, vice-presidents and department managers down to the district or plant managers, superintendents and foremen—shares the responsibility for personnel relations. If responsibility for action and results is to be definite and fixed in an organization, there can be no division or delegation of this responsibility. The authority of each executive must of necessity be commensurate with the responsibility conferred upon him and cannot be divided.

The modern industrial relations department in large business organizations has originated out of the need on the part of chief executives for assistance in carrying on the responsibility for personnel relations. The provision of a special assistant does not alter the fact that the chief executives still carry the responsibility and must make the decisions. This is true not only in the field of employee relations, but in engineering, research and other phases of the business.

The head of the industrial relations department is, therefore, a staff assistant, directly responsible to the president, advising and aiding management in the formulation and administration of policies affecting employees. In co-operation with the operating staff his duties involve the co-ordination of personnel activities, the development of efficient procedures and their uniform application so far as practicable throughout the company. It is also the function of the industrial relations director to assist in bringing to top management the viewpoint of the employees so that, in

the development and application of personnel policies, their suggestions and ideas may be given due consideration and their interests may be adequately represented.

It should be clearly understood that the fact that there is a staff assistant to give direction and help to the management with respect to employee relations involves no departure from the established policy of supervisory authority and responsibility for these matters. The execution of personnel policies and the maintenance of co-operative employee relations must continue to be one of the primary duties of each department head, plant manager and supervisor.

Though the industrial relations department must recognize and respect the final authority of the department executives, there is a corresponding and equally binding obligation upon the department executives to recognize the position of the industrial relations department and to co-operate with it in the closest possible manner. Foremen, superintendents and plant executives are responsible for keeping the industrial relations staff currently and promptly informed of all developments in personnel and labour and for consulting and advising with them before making vital decisions on these matters. Department and top executives are committed to consulting with the department in the formulation of policies and major decisions respecting any matters affecting employees. It should be borne in mind that the authority of line executives and particularly of department managers is final or absolute in matters of personnel and labour policy only within the bounds of general policies which have been laid down by the company, and that the formulation, interpretation and supervision of these policies is a major function of the industrial relations director. In a real sense, therefore, responsibility for the administration of the labour policies of the company is shared between the line organization and the members of the industrial relations department.

SECURING COMPLIANCE WITH INDUSTRIAL RELATIONS POLICY

The major responsibility of the industrial relations director and his staff throughout the organization is to see that the labour policies of the company are adhered to by the operating managements in their handling of personnel and labour matters. In most cases differences of opinion are avoided when executives and operating managers consult in advance with the industrial relations department. However, in case of inability to agree as to the proper course or where the personnel representative thinks that the policy of the company is being disregarded or violated, it is his duty to make his protest first to the foreman, superintendent or plant manager concerned and, failing to secure a correct decision, to take up the matter with the chief executive of the unit affected.

The director, while not in a position to order compliance from subordinate line executives, does have the right of access to the chief executive officers of the company from whom in most cases it is possible to get a decision directing that the proper action be taken by the subordinate executives. As a matter of fairness and co-operation, the industrial relations director, having a problem in any department, will first discuss it with the executive head concerned and then take it to the higher executives.

With the right kind of co-operation from the line organization, the headquarters industrial relations department would be currently informed as to the compliance of field managements with company policies respecting wages, hours and working conditions, either on the initiative of the department managers concerned or through the medium of personnel, hour and wage reports. In actual practice, however, it is found that strong and active employee organizations are of tremendous assistance to both department managements and the employee relations officers in seeing

that the day-to-day transactions in the field are in harmony with the wishes of the company as expressed in their written labour policies and departmental working regulations. Likewise, through the medium of periodic conference with the field staff personnel men, the director of industrial relations has an opportunity to keep informed as to the working of the various labour policies in all departments of the organization.

INDUSTRIAL RELATIONS IN LARGE AND SMALL COMPANIES

As between large and small companies the plan or organization for industrial relations will differ. The number of persons on the industrial relations staff depends on many factors besides the total number of employees. One business has widely scattered units operating under a variety of conditions, and a considerable field personnel staff may be required. Another operates entirely in one locality. One firm will have an ambitious programme of broad scope while another more cautious and perhaps not so prosperous will have fewer activities. Accordingly, the industrial relations staff may comprise any number of persons—from one man and a stenographer to ten or twelve individuals (director, employment manager, training supervisor, safety engineer, supervisor of benefits, doctor, nurses and a few clerks); and in companies of considerable size and activity in the field there may be as many as sixty staff members, not including the clerical force.

Two considerations are important. First, no company is so small that it can safely disregard industrial relations. The small concern may at least centralize responsibility for these functions on a part-time basis in one executive. Second, the industrial relations staff should exemplify a spirit of fairness and co-operation, of willingness to recognize and promote the employee's legitimate interests, combined with initiative and fearlessness in urging required steps upon the management. This is more important than any particular plan of organization.

CONCLUSION

The executive in charge of industrial relations in a company that has just begun organized activity in the field will do well to proceed slowly and to develop his department gradually. He should, however, envisage a complete industrial relations programme for his company and should be quick to take advantage of opportunity to introduce new phases of the programme. He must keep in mind that, with the broadening down of democracy in industry, concessions will be made and that employee good-will is to be expected from the voluntary action of management, not from grudging compliance with compulsory requirements.

It seems quite safe to assure industrial relations executives that a great future lies ahead of them. During the war many firms with a few hundred employees have increased their forces into the thousands. Of necessity they have had greater regard for industrial relations and the consequent demand for qualified industrial relations executives cannot be satisfied. It may be predicted that most of these managements will retain this newly acquired interest in this increasingly important field of company management. They will want the assistance of industrial relations specialists in the vastly different problems of the post-war years. There will be difficulty in finding and developing the men. The greatest need at the moment is more adequate professional training in the field and the provision of some kind of internship for the student. But that is a subject in itself. Surely with governments providing instruction in industrial relations and with a life-long trade unionist like Ernest Bevin proclaiming the importance of this department of business management there can be no doubt of its opportunity for greater service to management, to employees and the nation.

A SCIENTIFIC APPROACH TO THE PROBLEM OF EMPLOYEE RELATIONS

MORRIS S. VITELES

*Professor of Psychology, University of Pennsylvania, Philadelphia, and Director of Personnel Research and Training,
Philadelphia Electric Company, Philadelphia, Pa., U.S.A.*

According to one school of historians, the essentially significant details of an era are to be found not in the records of its great battles and great reforms, or in the approved, formal biographies of its military and political leaders, but in the plays, the essays, the dramas, the novels and in the words-of-mouth stories—yes, even the bawdy ones—told during the period.

While perhaps not agreeing fully with this major emphasis upon literature and conversation as a source of historical material, I am in sympathy with the viewpoint that much concerning the actual role of a person or an event or a movement is to be found in the stories about each which appeal to the man on the street. For this reason, as an industrial psychologist, I find something of interest and significance in the comments on psychology and psychologists appearing in a series of articles, originally published in *Punch*, and later brought together in a book entitled "How to Run a Bassoon Factory," with the subtitle "Business Explained."

THE BUSINESS MAN LOOKS AT THE PSYCHOLOGIST

The author of this book points out that: "A hundred years ago our fathers had to manage without psychologies at all. Even thirty years ago they were the privilege of a very few. But nowadays with our cheap methods of production they are to be found in every home."

Addressing himself specifically to the business man, the author goes on to say: "As a modern business man, it is most important for you to realize that your workers want psychologies of their own and to see that they get really first-class chromium-plated ones, with cavity walls. That was why, somewhat earlier on, I placed a psychologist high on the list of *Experts You Can't Do Without*. It is essential to have a man in the place whose expert knowledge tells him that workers are *Human Beings, Not Machines*. The old chap with whiskers who glues the bits of kid on the bassoon keys—he isn't a machine—really he isn't. So don't let your maintenance engineer oil him, and don't think if he breaks down you can just fit a spare part. He is like the author of *Pagliacci*—'a man with a heart like you'—and he can probably be depended upon to keep himself well-oiled. So just keep him bright and healthy, change his water every day, and have a psychologist deal with his soul."¹

I recall that my first reaction upon reading the material cited was one of resentment at what appeared to be an attack upon the dignity of psychology and of the professional psychologist. However, I was quick to recognize that, in fact, this bit of satire gives a fairly close approximation of what the ordinary, practical business man frequently thinks of psychology and of the psychologist. Beneath this good-natured jibing lies a keen appreciation of the essential skepticism concerning the use of psychological methods which has seriously hampered the extension of psychological research and practice in industry and business.

PSYCHOLOGY AND MAGIC

As the years have gone by, I have come more and more to the opinion that such skepticism represents an essentially healthy condition, to the extent that it forces the professional psychologist to work within a sound pattern of real accomplishment in preparing the tools and techniques which

he brings to the aid of business. As a matter of fact, such skepticism is to be preferred to the equally common belief that the psychologist has some mysterious power to penetrate the secrets of the individual's occupational abilities through the use of magic formulae which makes it unnecessary to expend time, effort and money in order to get results.

Actually the psychologist has no such mysterious power. He simply applies to the everyday problems of personnel in industry the more or less humdrum principles and practices, which characterize the scientific approach. For example, industry has discovered that it is highly important to select for each job those workers who are particularly qualified to handle it. This is necessary because the production cost per unit may be two or three times as high with the less competent than with the more competent workers. The intimate relationship between vocational adjustment and the mental hygiene of the worker represents a second reason for giving improved selection an important place in the industrial relations programme. Problems arising when management deals with labour furnish a third and equally realistic reason for continued emphasis upon the quality of initial selection. Contracts and also less formal agreements with labour frequently call for the reinstatement on a seniority basis, regardless of performance, of employees laid off for lack of work. Under such conditions, mistakes made in selection are not easily corrected. Experience also shows that among the most troublesome of grievances are those involving the discharge of an employee because of "unfitness." In such cases management ordinarily finds little sympathy on the part of labour for its plea that the worker is incompetent. "That," says labour, "is a matter which should have been settled prior to employment." And whether or not this stand is justified—and I am of the opinion that it frequently is—the issue is one which contributes to misunderstanding and strife.

THE SCIENTIFIC APPROACH IN SELECTING QUALIFIED WORKERS

It is for such reasons that selection of qualified workers occupies a prominent place in applying science to solving the problems of employee relations. The essential feature of the scientific approach in selecting workers is merely the application to the selection of the testing apparatus of the same rigorous techniques as are applied by the engineer in the selection of equipment required for the industrial plant. In choosing such equipment, the engineer starts by analysing the situation; then writes specifications on the basis of his study; designs the equipment; estimates the cost, and proceeds finally to test the finished equipment under operating conditions before it is finally accepted and approved for use. Similar measures must be taken in the development of scientific techniques for use in picking the right worker for the job. The job must be analysed and specifications written to describe the kind of worker that is needed. Appropriate equipment is then designed to determine whether a man meets the specifications, but this is not finally accepted or approved for use until its effectiveness has been examined under operating conditions and in relation to the cost of replacing and training personnel.

THE SELECTION OF ELECTRIC SUBSTATION OPERATIONS

The methods employed in the development of improved methods for selecting workers, and the results achieved, can

¹ Spade, Mark: *How to Run a Bassoon Factory, or Business Explained*. London, Hamish Hamilton, 1934, pp. 54-57-58.

be illustrated by reference to the experience of the *Philadelphia Electric Company* in the selection of electric substation operators². The management of this system rightly prides itself on the care exercised in the selection of mechanical equipment. In spite of the quality of mechanical equipment there was an average of 36 operating errors per year chargeable to the 140 electric substation operators employed on the system, when, in 1927 the author undertook an investigation of substation personnel*. These errors, it is well to note, were made by operators selected, with more than the usual concern exhibited by electric utilities in the selection of workers, by a well-organized, centralized personnel department which carefully interviewed applicants, reviewed their application blanks, obtained references, and applied other traditional techniques of the employment office in determining fitness for work.

The continued occurrence of operating errors, in spite of the relatively advanced methods of selection, awakened the suspicion that, in part at least, they might be due to the character of the men who had been hired for the job. This suspicion seemed particularly pertinent because, in spite of the similarities of training and experience, certain operators were involved in a number of errors, while others, working under exactly the same conditions, managed to proceed year after year without an operating error. As a matter of fact, an analysis showed that in an experimental group of 84 operators who had been in service for not less than one and not more than ten years, the AVERAGE operators averaged three times as many errors as the BEST; the POOREST operators averaged 7.5 times as many errors as the BEST; the POOREST operators averaged 2.5 times as many errors as the AVERAGE.

The chief purpose of the study was to develop psychological tests for use in measuring the underlying predisposition to error that appeared to be so conspicuously present in the POOREST group and absent in the BEST group of operators. Tests were selected on the basis of a careful analysis of the job to determine the characteristics of the accurate and safe as contrasted with the inaccurate and unsafe operators.

The tests finally chosen for use in measuring the mental abilities and temperamental traits necessary for safe and accurate switching included three series. The test in *Series A* and *B* are used to measure qualities required for accurate switching under normal operating conditions. *Series C* includes one test, known as the Switching Control Test, for measuring adaptability under emergency conditions. It is essentially a fear-reaction test which allows an opportunity for observing and recording changes in accuracy of response under extremely disturbing conditions of electric flashovers, noise, smoke, etc.

As a preliminary to using these tests in the selection of substation operators a study was made of the test scores BEST, AVERAGE, and POOREST operators in the experimental group. The results of this comparison, in so far as *Series A* and *B* are concerned, are presented, in part, in *Chart A*. The average score of the POOREST group is shown to be 27.9 points below that of the BEST group and 15.7 points below that of the AVERAGE group. The average score of the latter group is also 12.2 points below that of the BEST.

A further analysis of test scores showed 75.0 to be the CRITICAL SCORE in distinguishing between satisfactory and

² Viteles, M.S., *The Science of Work*, W. W. Norton, New York, 1934, Chapter 6.

* This investigation was formulated with the co-operation of the supervisory staff of the Station Operating Department, in particular through the interest of N. E. Funk, now Vice-President in charge of Engineering, Philadelphia Electric Co., C. C. Baltzly, General Superintendent, Station Operating Division, and of the late E. O. MacFerran, Superintendent of Substations. In general, the development of improved selection procedures described in this paper have involved the active co-operation of operating personnel from the various departments of the Philadelphia Electric Company.

** From a report by R. M. Pennybacker, Superintendent, Substation Section, Station Operating Division.

unsatisfactory operators, and therefore the one to be used as a minimum "passing score." In *Chart B* is presented a comparison of substation operators reaching this score with those who fail to do so. The percentage of BEST operators with the passing score is double that of AVERAGE operators and about ten times that of POOREST operators. It is important to note that only 7.7 per cent of the POOREST operators would have been hired had they been tested prior to employment, whereas 70.6 per cent of the BEST operators would have been employed. This is of particular significance when the difference between the two groups in number of operating errors is recalled. Moreover the average number of errors of operators who made less than the passing score of 75 proved to be over twice that of men who passed.

Such facts show clearly that scores on *Series A* and *B* differentiate substation operators with respect to predis-

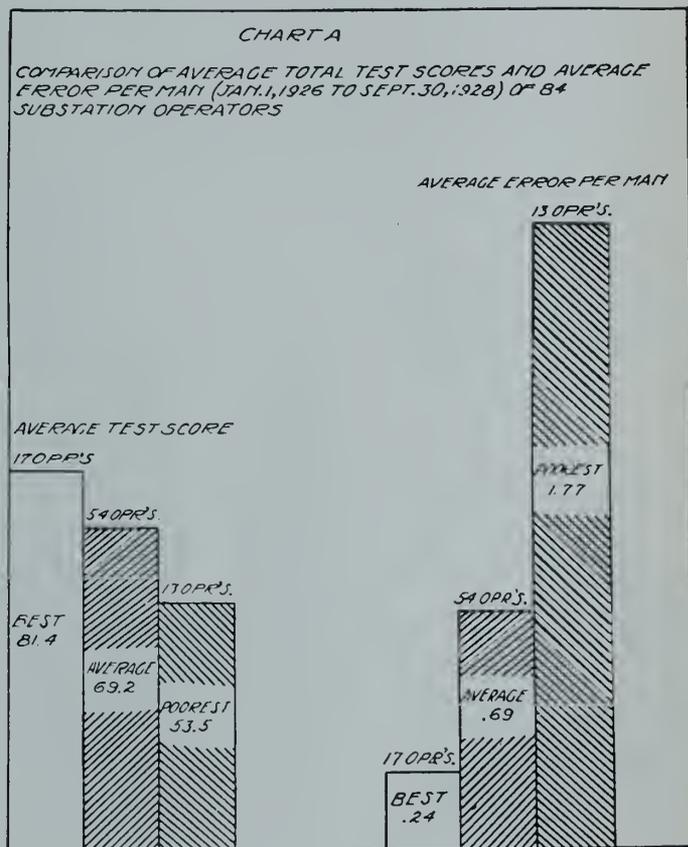

Chart A

position to error in switching. These figures, and numerous others of the same kind gathered by checking other groups, including newly hired assistant substation operators, demonstrated the desirability of using the tests in determining fitness for substation operation. The tests were put into operation in the selection of assistant electric substation operators on April 1, 1928. In addition, substation operators who had not been included in the experimental group were examined and the practice established of reassigning operators in service as well as placing new employees on the basis of test scores. So, for example, operators for newer and bigger stations were chosen largely on the basis of test score. On the same basis, operators with low test score and unsatisfactory working records have been reassigned to the smaller stations.

The net result has been the marked decrease in operating errors, shown in *Chart C*, which started immediately after the first changes on the basis of test scores were made, and has continued in spite of increasing load on the system**. It is also interesting to note that operators with low test scores who have been retained in the service have

added errors to their records at a rate above that of operators with higher test scores.

OTHER ILLUSTRATIONS OF THE USE OF PSYCHOLOGICAL METHODS IN SELECTING WORKERS

Such results have been obtained wherever a conscientious effort has been made to develop improved selection techniques on a sound scientific basis. *The Scovill Manufacturing Company*, for example, reports a marked decrease in the percentage of unsatisfactory apprentices as the result of the use of well-standardized tests in selection. The Scovill Testing Programme was started late in 1923. Following an extended period of research, tests were introduced in 1926 in hiring metal trade apprentices. "The percentage of unsatisfactory apprentices, which had hovered around 40 per cent for the previous five years, dropped to 17 per cent (Table I). In 1930, after a similar study of additional tests, two more were added to the battery, and the percentage

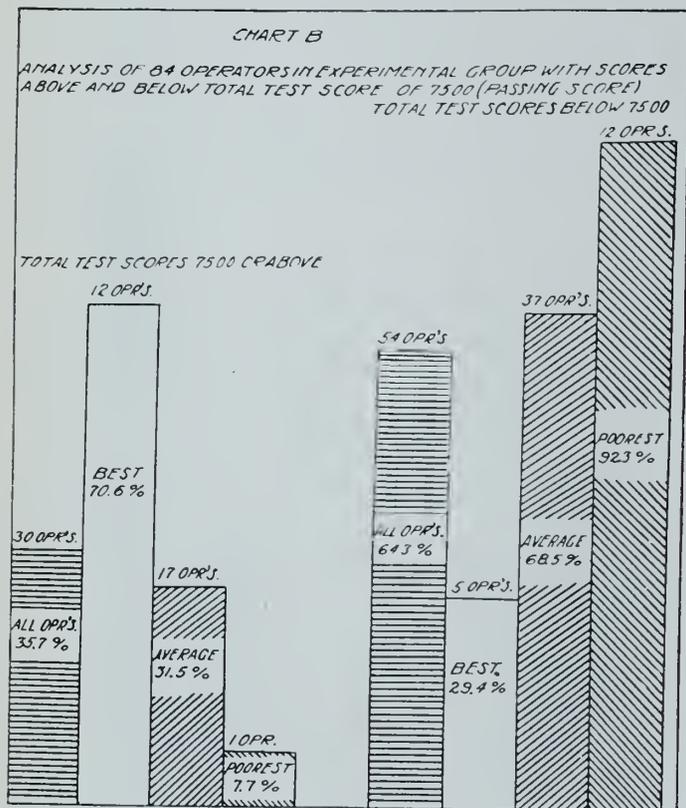

Chart B

of unsatisfactory apprentices dropped to about 8 per cent. The foremen who rated the apprentices on their progress and skill in mechanical work never knew the test scores. Not only was there a sharp decrease in the number of unsatisfactory apprentices with each change, but the unsatisfactory apprentices were more readily dropped by the foreman, instead of being carried along to fail ultimately, when the foreman realized that they could be replaced by better boys."³

In the ten years subsequent to 1930 new and higher requirements for potential development of trainees beyond

the original goals were set, the number of apprentices trained currently increased, etc. Nevertheless, the percentage of failure is still about 8 per cent. This fact is attributed to an enriched interview technique. In other words, in the Scovill works, as in many other plants, experience has brought convincing evidence of the value of psychological methods for employment, and also of the practical advisability of selecting tests and setting the passing marks on the basis of adequate preliminary research.

In adding to its personnel for war the *Westinghouse Electric and Manufacturing Company* is using tests selected on the basis of many years' experience in devising methods of fitting each worker exactly to the task where requirements, talents, and temperament match. Since extremely high standards are set in selection, only 18 per cent of the 10,000 applicants considered since 1937 have passed the tests, but only one per cent of applicants enrolled have failed to make good as skilled workmen.⁴

Similar achievement in improved production, in reduced turnover, in increased sales have been reported both in the United States and abroad. Life insurance firms, for example, have found psychological methods extremely useful in selecting salesmen. It is interesting to note that in this instance tests, as such, prove to be of little value. However, a painstaking analysis of biographical data has revealed that it is possible to use specific items of information obtained from an application blank or a general information blank, such as age, marital status, number of dependents, etc., in selecting those men who are most qualified for the job of selling.

THE USE OF APPLICATION BLANK DATA

The value of this method in selecting life insurance salesmen was demonstrated fifteen years ago in the experience of the Phoenix Mutual Life Insurance Company. This company found that the use of a score obtained by weighting 11 biographical items, was followed by a marked increase in sales and in the stability of those employed.⁵ In 1919, 56 out of every 100 salesmen employed failed to last out the first year. In 1921-22, when the new plan was fairly operating, only 42 out of every 100 salesmen failed to remain one year. Between 1922 and 1925, this figure had been further reduced to 30 out of every 100. Moreover, whereas in 1912 the *Phoenix Mutual Life Insurance Company* employed 1,700 salesmen to sell insurance to the value of \$20,500,000, in 1923, under the new plan, 375 salesmen had sold insurance to the value of \$52,000,000. The same company has within the past few years reviewed the experience of all salesmen* who were under contract in regular agencies from 1927 to 1935 and has developed a promising revision of the original scoring methods applying to various age levels.⁶

While the method of using especially selected personal items has found its widest application in the selection of life insurance salesmen, productive results have been obtained in hiring other kinds of salesmen. So, for example, in a study made by the writer in the taxicab industry, it was found that a "good earner" could be differentiated from a "poor earner" prior to employment on the basis of such personal history items.⁷ This device is also finding wide application in connection with the war effort, particularly in the selection of aircraft pilots.

In passing, it is interesting to note that there has been a tremendous expansion in the use of psychological tests and allied techniques by the armed forces of the United States and of other countries during the present conflict. It is generally known that such procedures are being used in preliminary screening of all recruits in the American Army and Navy as an aid to assignment for training. More important still, wide use is being made of tests and other psychological techniques in measuring aptitudes necessary for the operation of the highly complex machine which characterizes modern warfare. Engineers working for the military services have discovered, for example, that it is not enough to devise mechanisms designed to bring confusion upon the enemy. Such instruments have no value

unless they are handled by qualified men, and the selection of such qualified men has been accomplished through the application of the methods referred to in this paper, which have been successfully applied in industry. Unfortunately, it is not possible to speak at this time about the results which have been obtained in the military services.

In considering such results, as well as those reported for industry, it is to be noted again that they are obtained not by guesswork, but through a careful, painstaking, objective check and recheck of the value of the psychological apparatus and methods in relation to men's performance on the job. Only under such conditions can tests of other psychological techniques serve a useful purpose in increasing the probability of obtaining qualified personnel for various industrial, and also military tasks.

THE CONCEPT OF "PROBABILITY" IN SCIENTIFIC SELECTION

The term "probability" is used advisedly because the psychologist, as other scientists, deals largely with probabilities and not with certainty. In all scientific fields there are only few generalizations which give the same certainty of prediction as the law of gravity. This limitation applies with special force to psychological generalizations, particularly as they refer to the prediction of individual performance in specific work situations. However, on the basis of adequate statistical treatment it is possible to make accurate predictions as to the characteristics of a group hired through the application of improved psychological methods.

The situation is analogous to that found in the field of vital statistics. The actuarial statistician can predict, for example, the number of deaths, the number of cases of pneumonia and of measles which will occur in a given period among men 30, 40, 50 and 60 years of age, respectively. In the same way, the psychologist can predict how many "good" workers, how many "average" workers and how many "poor" workers there will be among men with scores,

let us say, of 60, 70 and 80, respectively, on a well standardized battery of psychological tests.

On the basis of preliminary experimentation a doctor may be able to tell his patient that his chances of surviving an operation are 98 in 100 or he may predict a pneumonia patient's chances of recovery are perhaps 95 out of 100 if sulfanilamide is administered, whereas they would be 75 out of 100 without the drug.⁸ In the same way, if the psychological selection method has been suitably standardized it is possible to say that an applicant with a score, let us say, of 60, has a 75 per cent chance of meeting existing production standards, whereas one with a score of 45 has only a 30 per cent chance of meeting the same production standards. In addition, it is possible and necessary, when applying scientific methods in selecting workers, to indicate the extent to which the selectivity of the tests is better both than that of methods already in use or better than a chance method of choosing workers for a specified job.

These may sound like abstract concepts, but just such data are needed and are obtained by the competent psychologist in order to determine whether it is economical to use the test battery; whether the selectivity of the test justifies the cost of administration. There are also procedures for determining objectively how to make best use of the reservoir of available labour. The larger the reservoir, the higher the test score can be set. Conversely, if the reservoir is small, the test score must be lowered. As has been pointed out in a recent analysis by Professor H. M. Johnson*, of Tulane University, this is a practical issue which can be simply met by a series of tables from which can be determined the number of applicants required to obtain 100 employees at various levels of working proficiency.

IN SUMMARY

It is possible that this section of the paper has been extended to the point of boredom, but there seems merit in presenting this material in detail to indicate the scientific character of the psychological approach and to show the advantages which can be achieved through a scientific approach to the selection of workers. In the future, as in the past, the development of scientific techniques for the selection of workers will continue to represent a productive approval in solving the human problems of industry. Because of the wide differences in suitability for varied jobs which characterize members of the human race, the selection of qualified workers represents an important basis for maintaining employee relations while increasing the capacity of industry to meet the economic demands imposed upon it and upon an advancing civilization.⁹

STRENGTHENING THE WILL-TO-WORK

As is apparent from the above discussion, the development and validation of techniques for hiring workers represents one of the major applications of psychology in industry. Considerable progress has also been made in improving the training programme through a scientific approach to the problems of training. However, no matter how well they are selected, or how well they are trained, employees cannot attain maximum efficiency unless they demonstrate the *will-to-work* on the daily job. The development of this will-to-work is one of the major problems in the present employees relations situation. An outstanding practical problem in industry to-day is to find ways of stimulating the inclination to work; and, at the same time, to further the development of job satisfaction and of the loyalties which lead workers to co-operate fully to keep the organization working smoothly.

THE INADEQUACY OF FINANCIAL INCENTIVES

Perhaps one defect in the industrial situation lies in the dependence placed upon wages and wage incentive plans in arousing the will-to-work. There are, of course, very good grounds for the belief that appropriate wage rates and incentive wage payment plans, properly devised and adminis-

tered, are of great importance in improving performance on the job and in stimulating favourable employee attitudes. The average worker wants a better home, a choicer variety of foods, a bigger and better automobile, a finer radio—more and more of the good things in life which can be procured in increasing amounts as wages increase. Even the Bolsheviks, setting out with the theoretical communistic ideal of sharing everything equally, were quickly forced to come back to wage-incentive plans as a means of stimulating individual workers to reach the maximum levels of productive efficiency. However, the fact which has been overlooked is that pay, and material satisfactions which can be purchased with it, represent but one factor in arousing job satisfaction and in inducing employee co-operation.

At all occupational levels, factors other than wages play an important part in stimulating production, in creating

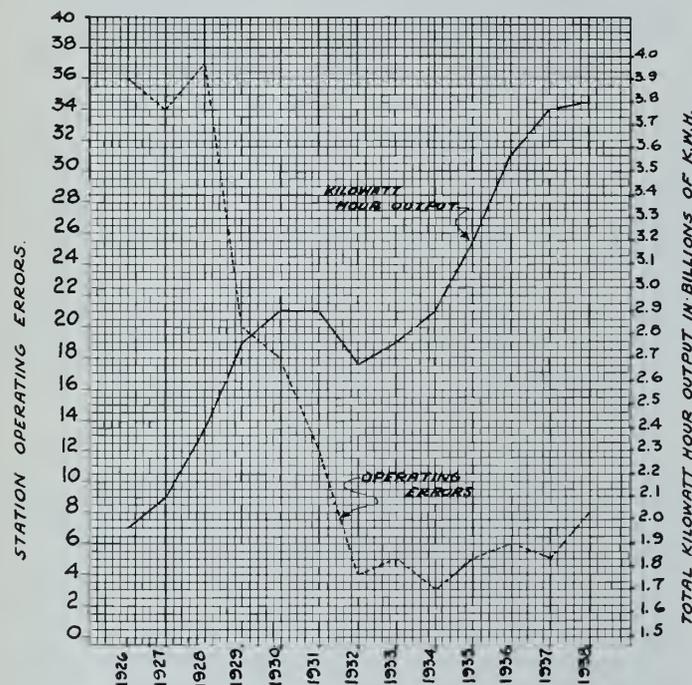

Chart C—Comparison of substation operating errors and kilowatt-hour output, Philadelphia Electric Company.

satisfaction, and in building morale among workers. The nature of the evidence leading to such conclusion is illustrated in a study by English investigators of the relative output, in successive weeks, on different work processes, under three systems of wage payment.¹⁰ The order of worker preference for the operations, determined through controlled interviews with workers, proved to be: *wrapping*—1; *packing*—2; *weighing and wrapping*—3; *weighing*—4; *unwrapping*—5. The findings of the study clearly show that the effect of each wage incentive plan is most marked in tasks which arouse the more favourable feeling tones, and is completely absent in the least preferred processes. In the most popular operation (*wrapping*), rate of output was almost trebled by the end of the experiment, while production on the least popular operation (*unwrapping*), which involved very similar movements, but which appeared to be futile to the workers, showed no improvement.

Both experimental studies and everyday observation of the plan brings growing realization that "pay" in itself is but one factor, and frequently a minor one, in arousing satisfaction and in inducing employee co-operation. One

investigator in the field of job-satisfaction, for example, tells of an express deliveryman who, when asked to recount the things he *liked most* about his job, replied *first of all*, "I'm satisfied with me boss." Every foreman knows of similar instances. The superintendent of a manufacturing plant declined a position with another company at a higher salary because "That concern was harder to work for than this," and because his employers were "particularly human, sympathetic and interested in people."¹¹ Almost every supervisor who likes his job will agree with this superintendent's decision.

At all levels factors other than wages play an important part in stimulating production, in creating satisfaction, and in building morale among workers. As the worker proceeds beyond the hunger minimum, the pay check's ability to buy material things is overshadowed by the ability of the worker to obtain an immaterial something of equal importance and of vastly greater intricacy.

Such findings have led many to question the emphasis upon financial incentives by industrial engineers who have been so largely responsible for the development of elaborate systems of wage payment. There is increasing recognition, for example, that demands for increased wages may represent merely a way of expressing fundamental dissatisfaction with the failure of the industrial organization to satisfy the desire for social approval and recognition, for security, for self-expression, and other deep-seated wants.

WHAT DO WORKERS WANT ?

Questions that naturally arise out of this discussion include: *What are the chief sources, besides pay, of satisfaction and dissatisfaction at work? What do workers want? What do they expect industry to do for them? What devices can be used most efficiently to stimulate attitude and feelings conducive to efficient production, job satisfaction and to the development of employee morale?*

The tendency in the past has been to guess at the answers to these questions. The present tendency, associated with the development of an adequate programme of employee relations and of industrial psychology, is to seek accurate and honest answers by direct appeal to the workers—through the orderly and objective study of employees' attitudes. If management can find out what workers want; if it can determine the true nature, extent and cause of dissatisfaction with particular incentives, with specified policies, practices or working conditions; constructive changes can be made with the view of effectively stimulating and utilizing employee will-to-work.

The objective study of employee attitude usually takes one of three forms. The first of these involves personal interview with the worker, either on the job or in the home, conducted by trained interviewers. This is the method which has been used in the Hawthorne Plant of the *Western Electric Company*. Another method involves the use of unsigned attitude questionnaires to obtain exact information on employee attitudes. In other cases experimental conditions have been set up within the plant and the observation of the effect of changes in experimental situations upon employees' morale.

STUDIES OF EMPLOYEES' ATTITUDES

Numerous surveys have demonstrated that the employee attitude survey can be a particularly practical and useful tool in finding out what is on the worker's mind and indicating where attention is needed in the field of employee relations. The *Armstrong Cork Company* has gone so far as to place the planning and conduct of the employee attitude survey in the hands of the supervisory force, on the theory that since supervisors are directly responsible for employee relations, they are the logical ones to plan and direct the employee attitude survey.

The types of questions used in the employee attitude survey by means of questionnaires can be illustrated from the *Armstrong Cork Company* study.¹² (Appendix I.) An

example of the questionnaire method of analyzing employee attitudes in the public utility field is found in an experiment conducted during 1940 by the *Florida Power and Light Company*.¹³ In this experiment all the employees of the Miami Branch of this utility were asked to fill out a questionnaire containing 32 questions on working conditions in the company having a bearing upon employees' satisfaction. The questionnaires were unsigned and after the employee had filled out the questionnaire, he dropped it into a slot of a large steel box. Each question in the questionnaire was followed by five answers expressing different degrees of satisfaction or dissatisfaction. Each person checked the one answer to each question which expressed his feeling on that question. On the front page the employee printed the name of his department and on the back page printed any additional comments he wished to make having a bearing upon his satisfaction on the job.

A special committee of a dozen employees sorted the questionnaires by departments. The analysis of the questionnaires was made by a disinterested person from outside the company experienced in this type of work and centered particularly upon a study of the comparative "morale" found among employees in various departments of the company as determined from the expressions of employee attitudes towards various policies and practices.

Chart D, entitled "1940 Departmental Morale Profile" shows graphically how much the "morale" of this company varied from department to department. Each bar on the chart represents a particular department, the long bar represents a department with high morale, a short bar stands for a department with a relatively low morale. The wide variations among departments are easily noticeable from an examination of the chart.

Chart E, entitled "1940 Morale Profile" shows the analysis of the morale situation in one of the departments of this utility. The results show clearly that the "morale" problems of this department were not centered around wages, although, as the investigator points out, many people in the company assumed that "money tells the whole story of employee morale." *Questions 23, 24, and 25* refer to wages. The attitudes of employees in this department towards wages are all "in the black", that is above the corresponding company averages by the amounts of 10.6, 12.6, and 6.5 respectively. The largest deviation in terms of unfavourable attitude is with respect to *Question 18*, "Criticism in Public"; the value in this case is the 18.2 below the company average. This item is purely one of leadership. Evidently the well-known principle of refraining from criticising employees in the pres-

ence of others had been violated flagrantly in this department.

Question 13, "Consideration and Courtesy Shown to Subordinates", reveals another source of unfavourable attitudes among employees in this department. In other words, the survey revealed that in this department, and, to some extent the company as a whole, the workers wanted more consideration, better treatment by the supervisory force. Such dissatisfaction as existed was not with the wage plan, but with the failure of the department head and his subordinates to recognize the workers' worth as human beings. The primary source of dissatisfaction was the disregard of the workers' feelings and sentiments—the mainsprings of human conduct.

The chief value of the *employee attitude* survey is to reveal objectively and in numerical terms the specific sources of irritation as a first step in their correction. Another example of how such surveys can be used to find out what employees think about particular employee relations policies and practices, plant condition, and so on is found in a study reported by Bergen.¹⁴ In this, use was made of a questionnaire in measuring the over-all "morale" and reactions to particular policies of 1,000 employees from selected office and factory departments of a manufacturing company.

Among the outcomes of this study are the findings that approximately one-half of the factory workers were dissatisfied with the wage incentive plan; 70 per cent of the hourly workers felt that there should be work sharing before layoff; there was considerable dissatisfaction among the salaried group with respect to promotion policies and practices; 28 per cent of the factory employees were convinced that the company employed labour spies, although this was not the case; 29 per cent of factory employees were of the opinion that management was unfair to organized labour.

WHAT WORKERS THINK OF LABOUR UNIONS

In addition to the studies in individual plants and industries to determine workers' attitudes towards management and working conditions, the survey technique has been used in numerous studies to determine workers' attitudes toward unionism.

Management frequently has ready-made answers to these questions, such as "Workers don't really want to join unions, but they are being forced into them by racketeering labour agitators supported by self-seeking politicians." Labour leaders invariably speak of unionism as a spontaneous expression of solidarity on the part of a universally exploited, dissatisfied class of the population. And as Chamberlin points out, the opinions of labour leaders, particularly those engaged in the administrative work of labour unions, have apparently been accepted by political leaders as representative of the views of at least a majority of the workers themselves.¹⁵

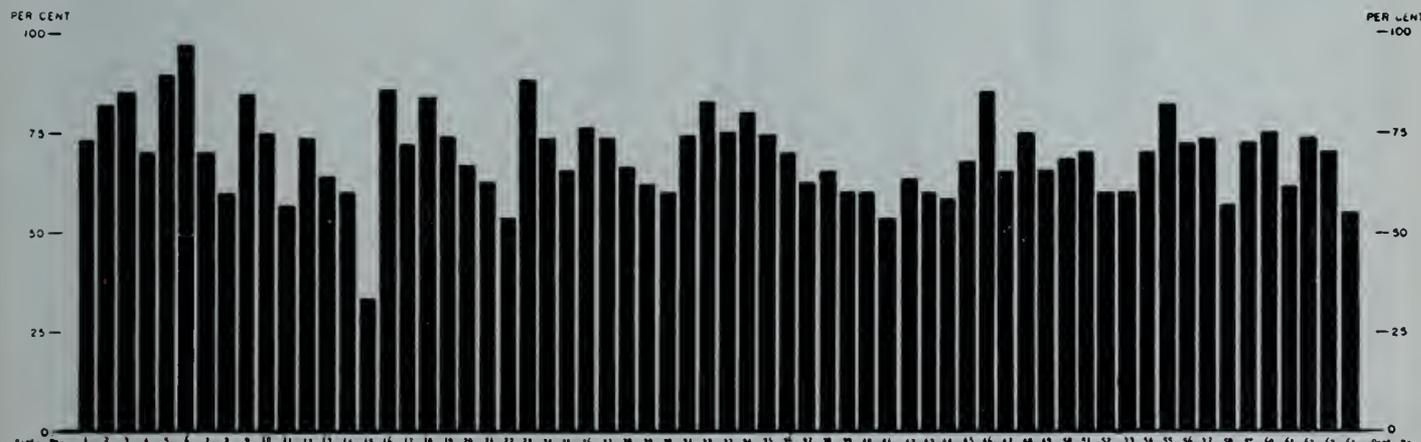

Chart D—1940 departmental morale profile in the Florida Power and Light Company.

In contrast to the vociferousness with which such opinion is expressed, there are studies, such as one reported by Chamberlin, which undertake to answer factually even on a small scale some of the questions of this type. In his investigation Chamberlin interviewed 200 men employed in textile mills in Massachusetts—100 union members and 100 non-union members. Their answers to his queries indicated that 90 per cent of union members and only 38 per cent of non-union members believed that the unions get results.

To a request for reasons for which they would join the union, non-union men gave the following in the order noted: (1) because fellow workers had joined; (2) because they desired a feeling of greater security; (3) because a union is the only way that the working man can get results; (4) because of a liking for such organizations.

The principal objection of non-union men to unions was the failure to get results (45 per cent) with the type of leader running a close second (41 per cent).

Both union members and non-union members showed a remarkable emphatic agreement that the strike is not the only way workers can get results, 87 per cent of union members and 100 per cent of non-union members answering "no" to the question on this item. However, there was close agreement between union members and non-union members that bankers and inventions are the causes of depression. Moreover, 88 per cent of union members and 65 per cent of non-union members agreed that mill owners do not treat the working man like a human being.

Summing up his results, Chamberlin points out that "The typical male textile worker in Massachusetts, who is about 33 years old, thinks that the textile unions are effective in obtaining results, but is unwilling to entrust to his union leaders the management of all of his labour problems, in spite of the fact that he has an adequate knowledge of the mental capacities of these leaders. On the other hand, our typical (textile) worker has no knowledge of what goes on behind the scenes at labour-management conferences.

"If a member of a union, he joined because he felt that it was the only way that the working man could get results, although he is not of the opinion that the only way workers can get results is to strike, and he considers it unfair to be called out on a 'sympathetic' strike. Contrary to the statements of union leaders, our typical (textile) worker is entirely satisfied with the number of hours in the work week, and his chief dissatisfaction is with wages, working conditions and management. As far as unions are concerned, he prefers a national to a company union. He is convinced that he can use his spare time effectively."

IN CONCLUSION

Such are examples of the scientific approach in the study of employee attitudes which underlie the will-to-work and play a predominant role in the development of conflict situations in our modern industrial civilization. Probably the most immediate and most pressing need, to further the harmonious relations so necessary to the war effort, is for a more complete understanding of the nature, the origin, and the operation of such attitudes. To arrive at such an understanding, with the aim of promoting a more effective and more satisfying application of human energy in occupational life—now and in the better years to come—is the major objective in the scientific approach to the problems of employee relations.

APPENDIX I

TYPICAL ITEMS FROM

QUESTIONNAIRE USED IN EMPLOYEE ATTITUDE SURVEY
ARMSTRONG CORK Co.

Hours of Work and Pay

5. On the whole, are you given an equal number of hours of work in comparison with other employees in your department?

1. Always More (); 2. Almost Always More (); 3. Given the Same (); 4. Most Always Less (); 5. Always Less ().

I say so because.....

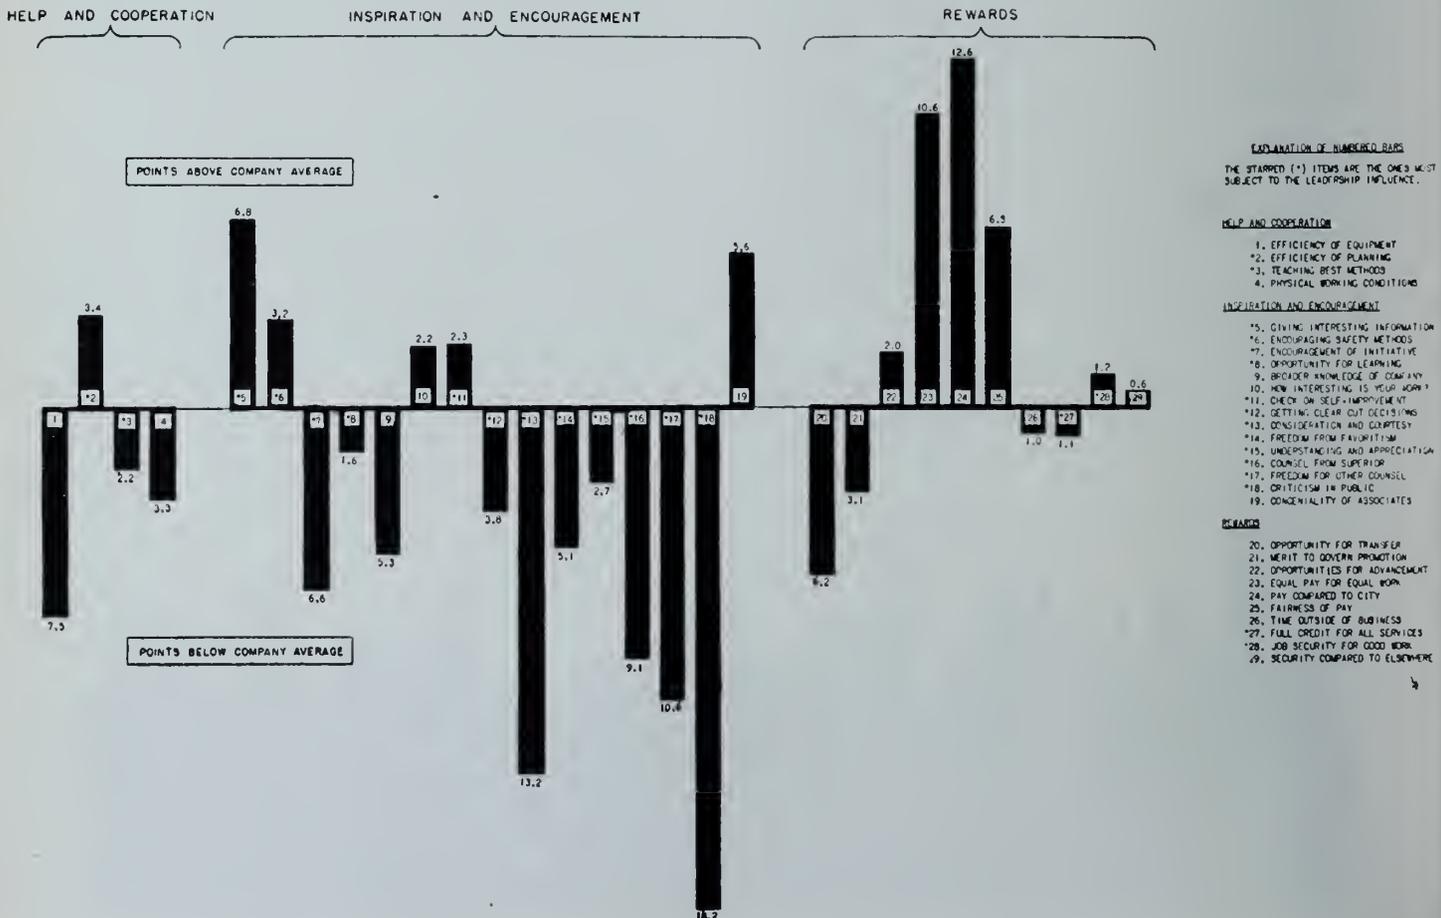

Chart E—1940 morale profile of a single department in the Florida Power and Light Company.

6. Do you understand how your pay is figured?
 1. Yes (); 2. No ().
 I suggest.....
12. All in all, does your superior give you fair treatment?
 1. Always (); 2. Almost Always (); 3. Sometimes ();
 4. Seldom (); 5. Never ().
 I say so because.....
 I suggest.....

13. If you thought you were qualified for a better job that might open up, do you feel that you would be given fair consideration?
 1. Yes (); 2. Probably (); 3. Doubtful (); 4. Would Get None ().
 I say so because.....
 I suggest.....
17. Taking all things in all, I think the Armstrong Cork Company is
 1. The Best Place to Work I Know (); 2. A Poor Place to Work (); 3. As Good as Most Places I've Heard of ().

DISCUSSION

(The Committee earnestly invites further discussion on the subject of industrial relations. Several members of the Institute in their daily task have to deal with this important phase of our social organization. It is requested that they share with their fellow-members the benefit of their experience. Contributions from non-members will be welcomed as well and should be forwarded to Headquarters of the Institute, 2050 Mansfield Street, Montreal, Que.)

CAPTAIN J. A. KITCHEN¹

The Director of Personnel Selection for the Canadian Army was instructed about a year and a half ago to carry out duties in the army similar to those performed by personnel or industrial relations men in industry.

In the army we have men of every type, some of whom are exceptionally brilliant; it is of primary importance that that ability should not be wasted. Now, when these men come into the army we know nothing about them. They may be of any grade of intelligence or capacity. Therefore, they are given a preliminary test, commonly known as the "M Test," which gives some idea as to their ability in various subjects. This includes a very practical short interview, which is not on any particular line, but is a general and friendly conversation. All results are recorded, and as each man goes from his recruiting centre to his place of basic training that information is available to the personnel men at those points. In that way we are able to follow any peculiarity or exceptional ability that a man may have.

For example, officer material is looked for, so that if a man comes up and reaches the necessary standard as he goes through his courses he will be given an opportunity for an officers' training course.

During his training after his basic training, which everyone must take, he is selected for a particular arm—artillery, engineers, ordnance, armoured corps—according to his aptitude and special requirements.

He may be chosen for technical training. For example, in the army, we need highly technical men in connection with devices used by the artillery. We have specific requirements and tests for those men; there are also other highly specialized technicians, in whose case requirements are based on the lines mentioned earlier this afternoon, and shown by the graphs and the charts that were exhibited.

Morale is an important point in dealing with selection. Morale means much in industry, for if you get a man working for you whole-heartedly, putting everything he has into his job, he will do far more than by any driving method. This has been proved by the experience of the last war. Thus it is part of our job as personnel people in the army to encourage men who go behind in their training, or who become despondent.

Frequently men find it difficult to have conversations with their own officers, due to the regimentation that must exist in any army, but any man is always at liberty to contact a personnel officer, and as a result such officers are able to do much to promote morale.

DR. K. S. BERNHARDT²

After listening to Dr. Viteles' paper any psychologist like myself would be proud that our science is making such an admirable contribution to personnel work.

If we were to ask the so-called "man in the street" for his comments about the world in which he lives to-day, he

¹Army Examiner, District Depot No. 2, Military District No. 2, and President of the Trades Testing Board, Toronto, Ont.

²Department of Psychology, University of Toronto.

³Chief Engineer, Water Supply Section, Department of Works, City of Toronto.

⁴Induction Motor Engineer, Canadian General Electric Co., Peterborough.

would probably remark that he is amazed at the enormous strides we have made, technologically, and at what the engineers have been able to do with material, but that he is horrified, to put it mildly, at the messes that we quite frequently get into in terms of social relationships.

Perhaps the most valuable feature in this afternoon's session has been the demonstration that scientific methods and technique can be amplified to problems of human relationships in much the same way that they can be applied to physical materials. We still have a lot to learn and the real demonstration of scientific technique in action in dealing with human material is something that we need more and more of.

There is a feeling on the part of a good many people, especially in industry, that there may be something in these tests that the psychologists talk about. In fact, some industrialists have gone so far as to apply such tests and have been partly disappointed that they did not work, as anticipated, and partly glad, because they did not think the procedure was any good anyway. But the attempt to use such scientific methods without the kind of steps that Dr. Viteles has outlined so well is, of course, doomed to failure.

In Dr. Bryce Stewart's address, one thing that he said near the end should be underlined. After we had followed him through the intricacies of the machinery of industrial relations programmes, we came to the core of the whole problem, namely, as Dr. Stewart suggests, that the spirit of the thing is much more important than the machinery. That means the full recognition of the human factor in the situation.

A. U. SANDERSON, M.E.I.C.³

I would like to ask Dr. Stewart if, generally speaking, he has found that the average working man in Canada is more interested in security for his old age, and if he is married, for his wife, than he is in obtaining the last few cents in wages. I have found that, generally speaking, the labouring man is more concerned about his security for the future than he is about a higher wage.

DR. BRYCE M. STEWART

In the devising and installation of pension plans it has been found almost always that interest in pensions rises with age. There is also a sex factor. In an organization which is composed largely of young employees, and many of those are women, their interest in pensions is quite low.

But you will find in the few that are up around 40 and over, a great interest. So I just put it that way. Men are all like when they are young. They are mainly out for a good time and it is pretty hard then to sell life insurance, as you know. But once they make the turn of the middle thirties and often shortly after they are married, the interest in pensions mounts very rapidly and from that period they are much more concerned in seeing the pension than seeing another dollar or two in the pay envelope.

V. S. FOSTER, M.E.I.C.⁴

Regarding the block tests which Dr. Viteles has mentioned I noticed that if you look at the blocks long enough you see a different number of blocks. I am wondering which answer you base your results upon?

PROFESSOR M. S. VITELES

That is an interesting question; but the change in number occurs only with prolonged exposure of the blocks. That test is taken in three minutes by those to whom it is given and there is not time for the change in point of orientation that you experienced.

That is a very interesting thing. I must have shown these pictures on the screen some fifty times, and you are the first man who has ever noticed that. The first answer is right. That is the one that comes with the short exposure.

PROFESSOR E. A. ALLCUT, M.E.I.C.⁵

Remarked that he did not have the opportunity of seeing the test results and the diagrams of which Dr. Viteles had spoken but he had prepared the following contribution to the discussion.

Professor Viteles draws a parallel between the specification and supply of materials, and the specification of jobs and the supply of suitable workers to do them. If this procedure could be carried out accurately and surely, the process would indeed be scientific, but the field of industrial relations is so full of imponderables and unknown factors, that personnel management appears to be more of an *art* than a *science*. The smaller the knowledge of the inside of a material, the larger is the "factor of safety," or "factor of ignorance," that must be applied to its use. If this be so with materials which can be weighed, measured, analysed and tested, that stay where they are put and can be transported or manipulated at will, still more must it be the case with people, whose reactions are frequently dictated rather by prejudice than by reason, whose ideas and ideals change and who are sometimes mere pawns moved by able and unscrupulous hands. The problems of the psychologist are, therefore, complicated and, while some of us feel that progress is being made toward their solution, we also feel that, in many instances, the consistency and significance of the test results are over-estimated. Too much emphasis is placed on averages and the fact is frequently ignored that there are more exceptions to some of the "laws" than there are examples of them. In the long run, it is the individual who has to be dealt with if misfits, excessive labour turnover and other personnel troubles are to be avoided.

The paramount importance of the personality of the supervisor has been rightly stressed. The forceful, tyrannical type is only a little less obnoxious than the mean, nagging busybody—both are foci of discontent and, on the whole, probably cause more trouble than do questions of wages. Also, in the writer's experience, the form of the wage formula is less important than is the method of *applying* it. Question 6 (Appendix I) has a distinct bearing on this matter, as workers are usually suspicious of what they do not understand and it is important, therefore, that wage incentive systems should be simple and should give prompt returns. Mutual confidence is imperative if satisfactory personnel relationships are to be obtained and maintained.

Another significant remark is that "there was close agreement between union members and non-union members that bankers and inventions are the causes of depression." The writer knows nothing about banking, but the old bogey that research and invention produce unemployment takes a lot of laying. Eighteen new industries introduced within the last fifty years or so are responsible for one fourth of all employment in the U.S.A., and most of the products of the electrical and chemical industries were unknown twenty years ago. If statistics prove anything, they do show that invention has produced far more employment than it has displaced.

⁵Professor of Mechanical Engineering, University of Toronto, Toronto, Ont.

⁶Vice-President and Executive Engineer, The Shawinigan Water & Power Company, Montreal.

DR. J. B. CHALLIES, M.E.I.C.⁶

I remember a very eminent, greatly beloved Anglican Minister in Montreal. People said that all through his life he comforted the afflicted and afflicted the comfortable.

Dr. Stewart and Dr. Viteles have afflicted the comfortable in this case, because the company that I have the honour to be associated with, a utility organization in the province of Quebec, has always been proud of the personnel relations of the four or five thousand people on the staff. It now appears that we have been babes in arms; we have learned to-day from these gentlemen something which will enable us to attempt, with the advice of such experts, to do something far better than has been done so far.

I feel that this year under President Young has been one of the most constructively successful in the history of the Institute, and one of the most satisfactory accomplishments has been the setting up of this Committee on Industrial Relations under the able chairmanship of Mr. MacLachlan.

A. U. SANDERSON, M.E.I.C.

While I appreciate that Dr. Viteles in adopting the test for employment of personnel was trying to choose the best men for a certain type of labour, what would happen to the under-average man if all employers used this scientific method of choosing personnel?

PROFESSOR M. S. VITELES

The answer to that is very simple. The under-average man gets the job in which he ought to be, instead of getting the job he can't handle, and there is a place for the under-average man. The difficulty is that usually he is not recognized as under-average. The problem is one of application and distribution of labour, making the best use of what you have.

What can happen, not only with the under-average man, but also the very-much above-average, is perhaps illustrated in a study made for a department store some years ago. The store was selecting wrapper girls, who spend all day wrapping packages to be handed out to customers. We used a test and discovered that girls who made scores of below thirty on the test did not meet the wrapping standards on that job. On the other hand, girls who made sixty-five on the test did not stay long enough on the job for the company to be repaid for the time and money that was used in training them as wrappers. Evidently for that particular job it was just as undesirable to have a really superior person, as to have an under-average person. What was needed was an average person.

The problem is to take jobs in the plant, classify, pick the under-average man for the under-average job and the above-average man for the above-average job. And it must be remembered that the under-average man for one job may still be bright, he may be intelligent, but he may have poor mechanical dexterity. The fact that he is above average in intelligence, in mental ability, should not be a reason for placing him on any job where a high degree of skill is required. The problem is one of picking the man for the job in terms of exact specifications.

With reference to Professor Allcut's remarks, I should like to recall a statement made by a vice-president in charge of engineering of the Philadelphia Electric Company. He was telling about the installation of lightning protectors on their high tension lines, running a distance of ninety miles into Philadelphia. The question was: Should \$300,000 be spent in putting in lightning arrestors on these lines?

When they started on the problem they found they did not know, to begin with, just how much voltage was generated in a particular stroke of lightning. They found they knew too little about the resistance of certain of the insulators, because they did not feel free to expose the insulators to sufficiently high voltage to test them as they should be tested and as he said there were other variables of which they were ignorant. Notwithstanding all this, they

spent the \$300,000 for the lightning protectors, because it seemed like a good bet.

Now if the engineer is willing to do that, with all his fine technique, and when there are so few difficulties in the handling of material goods, as compared with those involved in the handling of human variables, the psychologist can perhaps be excused if he occasionally makes some guesses about the human element. Actually, the good psychologist does not guess as frequently as is supposed. If the test is adequately developed, the psychologist knows what the standards are, or has estimates for the accuracy of each score, and he can tell you when a man makes a score of 70, it really means that this score lies somewhere between 65 and 75. It is not a score of 70, because there is a standard error of estimate of five points on that score, and for that reason, he knows that the probability of that man making good cannot be expressed as a hundred per cent or as eighty per cent. We would say that the chances are between 70 and 90 per cent that that man will make good.

Here is another man with a score of 35. His score lies somewhere between 30 and 40, but the chances in his case for making good are somewhere between 20 and 30 per cent.

Now, those figures are available in standardized tests. This was not put in the paper but the concept of possibility to which I refer takes care of all the comments which Professor Allcut made. The situation remains one of dealing with probabilities. Actually we are interested in groups, say of a hundred people, available for a job.

We need twenty welders. Picking by chance, we will get ten above-average welders and ten below-average welders. Picking by means of scientific tests we will get 15 men or 17 men who are good or above-average. Let us get the 17, and not worry about the other three until we get the war done with.

GORDON McL. PITTS, M.E.I.C.⁷

This scientific selection of personnel is very instructive. But how does organized labour respond to the acceptance of this principle, and how far do you think that the wages should be affected by the result of these tests?

PROFESSOR M. S. VITELES

Labour, I think, still remains suspicious of tests, just as labour was suspicious of medical examination when it was first introduced. That suspiciousness has largely disappeared, but not completely.

Well, there is the same attitude of suspicion towards psychological tests. I think that suspicion is unwarranted. I think labour will come to recognize, as some unions have already done, that the one way to settle the issue on selection with management is for labour to participate in the creation of the tests and to help set the standards. That would support some of their actions with respect to keeping certain men out of the union, whom they now keep out on a cash basis of fees—it would help to decide which men were most acceptable to the union and would strengthen the union because there would be less strife between management and labour with respect to the retention of certain men.

Such a movement had developed in Germany before the war, where labour unions participated in tests. In Russia, the labour unions were presumably running the tests. Practically all the Institutes where tests developed were supported by the labour unions, although the tests were by the government. In that country it is very difficult to find the dividing line between the labour union and the government. I hope a progressive movement will bring labour into the fold to the advantage of all parties.

With respect to wages, so far as improved production is concerned, I believe that part of that return should go back to the worker. I think that is the attitude of progressive

⁷Member of the firm Maxwell & Pitts, Architects, Montreal.

⁸Professor of Educational Research, University of Toronto.

⁹Manager of Engineering Division, Cooksville Company Limited, Toronto, Ont.

management. It is a matter of education. Labour needs education just as well as management.

CHAIRMAN MACLACHLAN

In the matter of the medical examination, many of us have been emphatic in connection with colour blindness, where there is choosing of colours and distinguishing between a red and a green light, and so on. Yet we were told in this room yesterday that the R.A.F. was using colour blind people to see through camouflage.

In England I personally observed during the last war the use of blind people in winding transformer coils and winding machine coils. They made fewer mistakes than people with sight. Yet many would reject the blind. If you find a place for these various people then you gain the advantage.

By these tests for placement, for selection and use in certain specific things you will get an advantage to management and to the man.

PROFESSOR J. A. LONG⁸

As a psychologist in a gathering mainly of engineers, I would like to put in a brief word for the psychologist.

I have the honour to be a member of the Faculty of the University of Toronto and we have a School of Engineering there, where certain examinations are conducted every year, presumably with the desire of selecting people who will become good engineers, and flunking those who will not. I think they are not a hundred per cent successful, because some who fail, if allowed to continue, would have made acceptable engineers, and some of those who pass do not turn out according to expectations.

I believe that what can be done in two or three hours, by a set-up such as Dr. Viteles describes is almost as successful in picking out, in separating the sheep from the goats, as what the Engineering Faculty does in testing over three or four years.

W. C. SMITH, M.E.I.C.⁹

I find myself rather confused in regard to personnel selection because first, I was raised in a trade union mechanic's home, graduated into engineering and then became involved as an employer.

This transition has given me an appreciation for both sides.

In the lifetime of men who are working there are three distinct periods—the younger period of working, the middle period and the older period, when they are settled.

In my opinion, a great mistake is made in plants where they do not permit the employing of men over 42 years of age. That unsettles men from the age of 38 to 42 to an unbelievable degree. If they are laid off they lose their seniority, they were out on their neck and nobody will hire them. That is one thing that should be corrected from the standpoint of the employers.

Under the selection system, a man on entry is allocated to a certain branch in the plant. If the foreman and the sub-foremen are not conversant with the selective method, then there is not the progress there should be. The selection system should continue so that the man is not stuck in a groove, but allowed to advance in accordance with his merits.

As regards trade unions—they are undoubtedly against scientific selection in a general way. Education will not correct this, in so far as the men are concerned, because their education comes through delegates, to use a polite term—or agitators, to speak less delicately—and there are both classes in labour.

Most men realize their limitations in any operation. Most men are honest in the back of their minds. If they are getting a fair deal they are satisfied and if personnel management, through their foreman and sub-foremen in the large shops are interested in seeing that they get a fair deal, and demonstrate that interest by their improvement from time to time, happier relationships will exist in our plants. But we cannot expect full happiness in our plants until the unions are so organized that they represent the interests of the men and not the interests of the delegates.

THE FIFTY-SEVENTH ANNUAL GENERAL MEETING

Convened at Headquarters, Montreal, on January 15th, 1943, and adjourned to the Royal York Hotel, Toronto, on February 11th, 1943

The Fifty-Seventh Annual General Meeting of the Engineering Institute of Canada was convened at Headquarters on Friday, January fifteenth, nineteen hundred and forty-three, at eight o'clock p.m., with President C. R. Young in the chair.

The general secretary having read the notice convening the meeting, the minutes of the Fifty-Sixth Annual General Meeting were submitted, and, on the motion of deGaspé Beaubien, seconded by John G. Hall, were taken as read and confirmed.

APPOINTMENT OF SCRUTINEERS

On the motion of George H. Midgley, seconded by H. R. Little, Messrs. G. D. Hulme, H. Massue, and A. G. Moore, were appointed scrutineers to canvass the officers' ballot and report the result.

There being no other formal business, it was resolved, on the motion of J. R. Auld, seconded by P. E. Poitras, that the meeting do adjourn to reconvene at the Royal York Hotel, Toronto, at nine-thirty a.m. on the eleventh day of February, nineteen hundred and forty-three.

ADJOURNED GENERAL MEETING AT THE ROYAL YORK HOTEL, TORONTO, ONT.

The adjourned meeting convened at ten o'clock a.m. on Thursday, February 11th, 1943, with President C. R. Young in the chair.

The general secretary announced the membership of the Nominating Committee of the Institute for the year 1943 as follows:

NOMINATING COMMITTEE—1943

Chairman: G. A. VANDERVOORT

Branch	Representative
Border Cities	C. G. R. Armstrong
Calgary	F. K. Beach
Cape Breton	J. R. Morrison
Edmonton	J. Garrett
Halifax	I. P. Macnab
Hamilton	A. Love
Kingston	H. W. Harkness
Lakehead	E. L. Goodall
Lethbridge	N. H. Bradley
London	F. T. Julian
Moncton	H. W. McKiel
Montreal	E. R. Smallhorn
Niagara Peninsula	A. L. McPhail
Ottawa	W. H. Munro
Peterborough	W. T. Fanjoy
Quebec	A. O. Dufresne
Saguenay	S. J. Fisher
Saint John	V. S. Chesnut
Saskatchewan	H. R. MacKenzie
Sault Ste. Marie	L. R. Brown
St. Maurice Valley	M. Eaton
Toronto	Wm. Storrie
Vancouver	W. O. Scott
Victoria	S. H. Frame
Winnipeg	H. L. Briggs

AWARDS OF MEDALS AND PRIZES

The General Secretary announced the awards of the various medals and prizes of the Institute as follows, stating that the formal presentation of these distinctions would be made at the annual dinner of the Institute that evening:

Gzowski Medal—To Dr. S. D. Lash, M.E.I.C., Kingston,

for his paper "Analysis and Design of Rectangular Reinforced Concrete Slabs supported on Four Sides."

Duggan Medal and Prize—To J. H. Maude, M.E.I.C., Montreal, for his paper "The New Oil-Hydraulic Press in Munitions Manufacture."

Plummer Medal—To Professor E. A. Alleut, M.E.I.C., for his paper "Producer Gas for Motor Transport."

Leonard Medal—To Paul Billingsley, Burton, Washington, and C. B. Hume, Hedley, B.C., for their joint paper "Ore Deposits of Nickel Plate Mountain."

Julian C. Smith Medals—"For Achievement in the Development of Canada"—To Henry Girdlestone Acres, M.E.I.C., Niagara Falls, and Robert Melville Smith, M.E.I.C., Toronto.

STUDENTS' AND JUNIORS' PRIZES

John Galbraith Prize—(Province of Ontario)—To Robert J. G. Schofield, Jr., E.I.C., Hamilton, Ont., for his paper "Cotton Yarn Dyeing."

Phelps Johnson Prize—(Province of Quebec)—(English)—To Paul O. Freeman, S.E.I.C., Montreal, for his paper "Cold Rivetting—Its Principles, Procedure and Advantages."

Ernest Marceau Prize—(Province of Quebec)—(French)—To René Dansereau, S.E.I.C., Montreal, for his paper "Etude comparative de la construction par rivure et par soudure d'un pont route en acier."

REPORT OF COUNCIL

On the motion of B. G. Ballard, seconded by R. E. Heartz, it was resolved that the report of Council for the year 1942, as published in the February *Journal*, be accepted and approved.

REPORT OF FINANCE COMMITTEE, FINANCIAL STATEMENT AND THE TREASURER'S REPORT

On the motion of J. E. Armstrong, seconded by G. G. Murdoch, it was resolved that the report of the Finance Committee, the financial statement and the Treasurer's report, as published in the February *Journal*, be accepted and approved.

REPORTS OF COMMITTEES

On the motion of R. B. Chandler, seconded by G. M. Brown, it was resolved that the reports of the following committees be taken as read and accepted: Board of Examiners and Education, Post-War Problems, Western Water Problems, Civil Defence, Membership, Professional Interests, Industrial Relations, Legislation, The Young Engineer, Library and House, International Relations, Deterioration of Concrete Structures, Publication, Papers, and Employment Service.

BRANCH REPORTS

On the motion of J. W. Falkner, seconded by R. C. McMordie, it was resolved that the reports of the various branches be taken as read and approved.

AID TO ENGINEERS' FAMILIES

Having regard to By-law 32 which states "The Council shall not incur any expenditure for extraordinary purposes unless previously authorized to do so at an annual general meeting," and to the fact that because of the war there are in Canada to-day several members of families of engineers ordinarily resident in the British Isles, and that in the future additional persons may come to this country under similar circumstances, on the motion of H. E. Brandon, seconded by J. M. Gibson, it was unanimously resolved that

Council be authorized at this annual general meeting to incur such expenditures as Council may consider to be appropriate to aid in the support of these families, providing such persons are referred to the Institute by sister societies in the British Isles.

RECOGNITION OF TWENTY-FIVE YEARS SERVICE

In appreciation of twenty-five years of loyal and intelligent service to the Institute, the president called Miss Ellen L. Boyden, the Institute accountant, to the platform, and on behalf of himself and Council and all the members, thanked her for all she had done. He then called on Secretary-Emeritus R. J. Durley, and Mr. Durley, speaking on behalf of the three general secretaries with whom Miss Boyden had worked, expressed his pleasure at participating in this ceremony of recognition. On behalf of the Institute he presented her with a bouquet of flowers.

ELECTION OF OFFICERS

The general secretary read the report of the scrutineers appointed to canvass the officers' ballot for the year 1943 as follows:

- President.....K. M. Cameron, Ottawa
 Vice-President:
 Zone A (Western Provinces)..W. P. Brereton, Winnipeg
 Zone B (Province of Ontario)..L. F. Grant, Kingston
 Zone C (Province of Quebec)..C. K. McLeod, Montreal

Councillors:

- Vancouver Branch.....C. E. Webb
 Edmonton Branch.....E. Nelson
 Saskatchewan Branch.....A. M. Macgillivray
 Lakehead Branch.....H. G. O'Leary
 Border Cities Branch.....G. E. Medlar
 London Branch.....J. A. Vance
 Toronto Branch.....H. E. Brandon
 Kingston Branch.....A. Jackson
 Ottawa Branch.....N. B. MacRostie
 Montreal Branch.....E. V. Gage
 J. A. Lalonde
 Saint Maurice Valley Br.....H. J. Ward
 Saguenay Branch.....J. W. Ward
 Saint John Branch.....J. P. Mooney
 Halifax Branch.....C. Scrymgeour

On the motion of E. D. Gray-Donald, seconded by Viggo Jepsen, it was resolved that the report of the scrutineers be adopted, that a vote of thanks be tendered to them for their services in preparing the report, and that the ballot papers be destroyed.

It was announced that the newly elected officers would be inducted at the annual dinner of the Institute that evening.

Before delivering his retiring address President Young expressed his feeling of indebtedness to his friends in the Institute for selecting him as president for the year 1942. It had been a source of great pleasure and satisfaction to him to serve in this position, following, as he had, many men of great eminence in the profession of engineering in this country. His address, "The Days Ahead," will be found on page 115 of this issue of the *Journal*.

On the motion of E. P. Muntz, seconded by A. Mac-Quarrie, it was unanimously resolved that a hearty vote of thanks be extended to the Toronto Branch for their hospitality and activity in connection with the Fifty-Seventh Annual General Meeting.

On the motion of G. E. Booker, seconded by Huet Massue, it was unanimously resolved that a hearty vote of thanks be accorded to the retiring president and members of Council in appreciation of the work they have done for the Institute during the past year.

There being no further business, the meeting adjourned at ten-forty-five a.m.

When planning began for the Annual Meeting of 1943, it was a question whether its activities should be limited to the transaction of such business as is necessary for the proper management of Institute affairs, or whether, under war conditions, it would be proper to hold professional sessions, together with a modest programme of social events. After receiving the approval of the Ottawa authorities, the latter course was adopted; this decision was amply justified by the success of the meeting which has just concluded. Not only were the papers and addresses helpful as contributions to the war effort, but the many members who attended from all over the Dominion had opportunities of meeting informally and exchanging ideas on their wartime activities in a way which would otherwise have been impossible. Further, each technical session was devoted to the discussion of some topic of special importance at this stage of the war. The Toronto Branch deserved and received the thanks of the Institute for the very effective way in which this policy was carried out. Its committees, besides undertaking the detail organization of the meeting, had much to do with the smooth functioning of the professional sessions. As already mentioned, these were all of a somewhat unusual type. They were extremely well attended by members and visitors, who appreciated the effective way in which the subjects were presented and the value of the preparatory work which resulted in such instructive discussions.

A striking feature of the meeting was an exhibition of war material and photographs in the foyer of the Convention Floor of the hotel. This was made possible by the kind cooperation of several of the Canadian companies engaged in the production of basic war equipment, and had the approval both of the Department of Munitions and Supply, and the Wartime Information Board. Among the interesting exhibits may be mentioned components and assemblies of the latest patterns of such weapons as the Browning machine gun, the Bren gun, the Sten carbine and the Lee-Enfield rifle. The products of the newly established Canadian optical glass industry were well displayed, together with the range finders, gun-directors, binoculars and other instruments in which they are being used so successfully. These exhibits, with many others, served well to indicate the diversity of Canadian wartime arms manufacture.

Facilities were also given for visiting the remarkable exhibition of machine parts, components, castings, forgings and so on, organized at 51 Bathurst Street by the Department of Munitions and Supply, to show what has already been accomplished in saving critical materials by changes in design or technique which made possible the use of substitutes for materials previously employed.

In order to avoid any interference with war production, no plant visits were arranged for this annual meeting—a departure from the usual practice which met with general approval.

The first professional session on the morning of Thursday, after the general business meeting, was necessarily a short one. The topic was "The Engineering Features of Civil Defence". Interest in this matter has been stimulated by the lectures delivered last year by Professor Webster and by the activities of an Institute committee which includes members from practically every branch of the Institute, who take part in the work of its various local sub-committees.

The committee's chairman, John E. Armstrong, presided and gave a general statement, after which the chairmen of sub-committees, Messrs. H. F. Bennett, R. F. Legget, I. P. MacNab, and G. McL. Pitts spoke briefly on their respective divisions of the subject which are Structural Defence Against Bombing, Organization for Repair of Damage, Specifications for Air-Raid Shelters, and Protection of Buildings. Although the time available was limited there was a lively discussion and all present agreed that real progress was being made. The material presented will be published in *The Engineering Journal* as space permits.

(Continued on page 140)

CLOSE-UPS OF THE BANQUET PROCEEDINGS

Above: K. M. Cameron takes over from C. R. Young.

Above: Dr. Edward C. Elliott, president of Purdue University, the guest speaker.

Right: H. G. Acres receives from his class-mate, the Julian C. Smith Medal.

Below: H. V. Coes, president of the A.S.M.E., greets the Institute.

President Young introduces Ezra B. Whitman, president of the A.S.C.E.

Prof. E. A. Alleut receives the Plummer Medal.

The president presents the Gzowski Medal to Dr. S. D. Lash.

Right: J. L. Bennett, president of the American Institute of Chemical Engineers, presents greetings from his society.

Below: Past Vice-President E. P. Muntz.

SPEAKERS AT MEETINGS

Brig.-Gen. C. L. Sturdevant speaks on The Alaska Highway at the Thursday luncheon.

Vice-President Lieut.-Col. L. F. Grant introduces the speaker, Desmond A. Clarke, on his right. On his left, K. M. Cameron and R. A. Elliott, president, Association of Professional Engineers of Ontario.

Retiring president's dinner. *Left to right*: Past-Presidents T. H. Hogg and C. J. Mackenzie, Brig.-Gen. C. L. Sturdevant, President C. R. Young, Past-Presidents J. M. R. Fairbairn and O. O. Lefebvre.

Prof. M. S. Viteles of Philadelphia speaks on "A Scientific Approach to the Problems of Employee Relations."

Colonel A. L. Bishop thanks Desmond A. Clarke.

Dr. Bryce M. Stewart contributes to Industrial Relations, his paper on "The Role of the Industrial Relations Executive in Company Management."

APART FROM PROFESSIONAL MEETINGS

Above, from left to right: President K. M. Cameron, H. W. Lea, Nicol MacNicol, Col. W. S. Wilson, Mrs. Wilson, Lieut.-Col. L. F. Grant and J. J. Spence.

Above, left to right: J. P. McRae, J. G. Hall and J. T. Farmer.

Lee-Enfield rifle parts are examined by W. E. Bonn, E. G. Hewson, T. S. Glover and J. R. Dunbar.

Optical glass under the scrutiny of, from left to right: A. R. Hannaford, E. G. Ratz, L. B. Chubbuck and W. B. Buchanan.

A Department of Public Works group. Left to right: O. S. Cox, H. F. Bennett and F. G. Goodspeed.

THE GENERAL PROFESSIONAL MEETING OF 1943

(Continued from page 137)

After luncheon, at which Brigadier-General C. L. Sturdevant, U.S. Corps of Engineers, gave an illustrated address on the work of that Corps in constructing the Alaska Highway, the professional meeting took up problems of Industrial Relations. Two papers were presented and discussed, under the chairmanship of Wills Maclachlan, as follows: "A Scientific Approach to the Problems of Employee Relations" by Professor M. S. Viteles of the University of Pennsylvania, and "The Role of the Industrial Relations Executive in Company Management" by Dr. Bryce M. Stewart of the Industrial Relations Counselors, Inc., of New York. Professor Viteles is Director of Personnel Research and Training for the Philadelphia Electric Co., while Dr. Stewart has, for the past two years, been Deputy

Minister of Labour for Canada. The subjects were thus treated authoritatively by persons of wide experience, and the papers were followed by considerable discussion. They appear in this issue of the *Journal*.

On the morning of Friday, an interested audience gathered to hear about two technical problems of war production—"The Statistical Control of Quality in Production" and "The Conservation of Critical Materials". The chairman at this session was Professor E. A. Allcut, who pointed out that these very broad topics, together with others dealt with at the professional sessions, had been selected for discussion in consultation with officers of the Department of Munitions and Supply.

The development of statistical control in recent years has been rapid, but many of its features are still in the debatable stage. Two papers were recently reprinted in

*The Engineering Journal**, as an introduction to this subject. The first speaker at the meeting was H. H. Vroom, of the Northern Electric Company, who is well qualified to discuss it, in view of the wide application of statistical control in the manufacture of telephone equipment. Following Mr. Vroom, H. H. Fairfield, Metallurgist, Department of Mines and Resources, Ottawa, spoke on the rational interpretation of test data in ordnance work.

The question of conservation of critical materials was considered by C. B. Stenning, Department of Munitions and Supply, who illustrated his remarks by reference to the Bathurst St. exhibition of components and machine parts, already mentioned, showing how substituted materials can be made to give satisfactory and, in some cases, even improved service.

These addresses and the resulting discussions will be duly recorded in the *Journal*.

At the luncheon on Friday, at which Lieut.-Col. L. F. Grant took the chair, the achievements of Canadian shipyards—and some of the difficulties they have overcome—were ably described by Mr. Desmond A. Clarke, the Director General of Shipbuilding, Department of Munitions and Supply. His address was appreciated by an attentive audience of 511 persons.

The closing professional session on Friday afternoon dealt entirely with various aspects of Post-War Planning and Reconstruction. Warren C. Miller, who presided, is chairman of the Institute Committee on that subject and was supported by members of his committee.

The discussion was opened by Hugh G. Cochrane who presented a paper entitled "Post-War Pattern". He was followed by J. C. W. Irwin, speaking on "Forestry Problems in Reconstruction" and Professor A. F. Coventry of the University of Toronto, who treated of "Soil and Water Conservation". There was a general discussion, after which, by special arrangement with and by the kind permission of Dr. H. H. Bennett, Chief of the Soil Conservation Service of the U.S. Department of Agriculture, a new documentary film was shown, entitled "A Heritage We Guard".

The chief non-technical event of the meeting was of course the Annual Banquet of the Institute on Thursday evening at which the induction of President K. M. Cameron took place and Dean Young relinquished the presidential office which he has filled so ably during the past twelve months. The Prizes and Medals of the Institute were presented. The speaker of the evening was Dr. Edward C. Elliott, President of Purdue University and Chief of the Professional and Technical Employment and Training Division, U.S. War Manpower Commission at Washington. His subject was "The Search for Might." In his address, after commenting on the narrow specialization which has now

developed in the engineering profession, he observed that in the world to-day hope has largely been replaced by hate. As a result we are searching for might to destroy those who would destroy us. Our combat lines are held by machines. To produce, control and operate these we are searching for man-power, and must depend on statesmanship, leadership and disciplined strength of our people for a successful outcome. We are finding that the resources of nature and of man are limited. The answer is the broad and effective application of selective service.

The flashes of humour which Dr. Elliott emitted at brief intervals were in contrast with the serious nature of the message he delivered. Incidentally he referred in complimentary terms to the assistance given by the Institute's general secretary—while stationed in Ottawa—to the U.S. officials who are working on man-power problems in that country and have been in consultation with officers of the Canadian Government. The attendance at the dinner was close to 500.

After the dinner, the retiring president and Mrs. Young, the incoming president and Mrs. Cameron, together with the chairman of the Toronto Branch and Mrs. Wilson, held a reception previous to the dance which closed the evening's proceedings.

Other social events included parties on Friday afternoon and evening for the ladies, and a smoker with a variety show, to which members of the Association of Professional Engineers of Ontario were specially invited.

The Annual Meeting of that body was held on Saturday the 13th, and was preceded by a joint luncheon to which all members of The Engineering Institute were invited. This courtesy was greatly appreciated and is a welcome evidence of the spirit of co-operation between engineering societies which is so necessary for the progress of the profession.

The vote of thanks of the Institute to the Toronto Branch which was passed unanimously at the general meeting of the Institute was a sincere recognition of the effective manner in which the officers and members of that Branch had carried out the arrangements for a most successful gathering. Much credit for this result, achieved in spite of difficulties arising from war conditions, goes to the branch chairman, Lieut.-Col. W. S. Wilson, the committee's secretary, J. J. Spence, and to the twenty (or more) members who constituted the nine sub-committees which undertook the supervision of finance, paper and meetings, entertainments, hotel arrangements, registration, the reception and smoker, the exhibition, publicity and, last but not least, the welcome to the ladies. Particular credit belongs to Professor R. F. Legget for the systematic manner in which he attended to the work of the Papers Committee. The attendance throughout the meeting was far larger than had been anticipated, a fact which speaks well for the interest and loyalty of our Institute members. R.J.D

Abstracts of Current Literature

CANADA'S INDUSTRIAL PROGRAMME

From *Trade and Engineering* (LONDON), DECEMBER, 1942

The "all-out" programme of the Dominion authorities to complete the organization of Canadian industry and commerce for the most effective war service has been outlined in unambiguous terms, but many details still have to be formulated and put into operation, Mr. Donald Gordon, the Chairman of the Wartime Prices and Trade Board, told the recent convention of the Canadian Chamber of Commerce that each industry would be expected to submit its own proposals after the board had determined the required extent of curtailment of its civilian production.

One reason for the application of this planned direction to the newsprint industry has been the need to provide additional electric power for the manufacture of aluminium, pending completion of certain large projects now in course of construction. The very large requirements of timber for uses related directly to the war may necessitate diversion of loggers from the cutting of pulp wood and thus curtail the supply of raw material for the paper mills and cause a further reduction of the output of newsprint.

IMPORTANCE OF SMALL ECONOMIES

An illustration of the importance of relatively small economies in civilian consumption is afforded by the statement by one of the Canadian Administrators that the saving in raw material effected by the regulations restricting the manufacture of hairpins and "bobby pins" was sufficient to produce 55,000,000 "of a certain-sized vital airplane bolt."

Successful substitution of Canadian wood pulps for cotton linters as the source of cellulose for use in the manufacture of nitrocellulose explosives is saving several million dollars annually. Experiments were undertaken during 1914-1918, but they were unsuccessful because no means was found to nitrate the wood pulp cellulose evenly. This difficulty has since been overcome, however, and one war-time explosives plant has been operating on wood pulp for more than a year, and two others have been utilizing it exclusively as a source of cellulose for some months.

In order to meet the needs of nickel-mining the Government called on the gold-mining companies in the Porcupine and Kirkland Lake areas in Ontario to provide 700 miners initially, and the Minister of Labour has stated that "upwards of 10,000" gold miners will be transferred to base metal mines and other war industries, in a "planned gradual movement" designed to dovetail with the decision of the United States War Production Board to halt all gold-mining in the United States. Several of the principal base-metal mining companies have decided to employ women on surface work, wherever feasible. It is expected that the curtailment of gold production will release certain equipment and facilitate the more thorough mechanization of the base-metal producers.

Investigation of chrome discoveries in the Bird River area in the Province of Manitoba has proved that the deposits are extensive and seems to justify hopes that they will provide the basis for a large chrome products industry in the Dominion. After a visit to the field by a member of its staff, the *Northern Miner* stated in a leading article that surface sampling and diamond drilling had indicated enough ore on the two main groups of claims to support plants each at least 1,000 tons capacity daily. The chromite occurs in strong bands of great length and good widths, with the chromite oxide content indicated as averaging at least 22 per cent. Utilization of the ore will entail a complex metallurgical problem, because of the high iron-to-chrome

Abstracts of articles appearing in the current technical periodicals

ratio, but Canadian research scientists are making an effort to devise a satisfactory solution.

MORE PIGS AND SHEEP

The 10 per cent advance in hog prices resulting from the new agreement between the United Kingdom and Canada will benefit nearly all Dominion farmers. The expansion of hog production to supply war-time needs has been remarkable, and further impressive gains may be expected, aided by the abundance of feed grain in the prairie provinces. In spite of greatly increased marketings the hog population of the Dominion at well over 7,000,000 is about 1,000,000 greater than a year ago and more than double the number on Canadian farms in 1938. Enlargement of sheep-raising has paralleled closely that of hog production. Canada's sheep population has increased from a little more than 2,800,000 on December 1, 1941, to approximately 4,000,000, which will be available for shearing next year, and it is expected that the total will reach 5,500,000 in 1944. As a result of this expansion the Dominion's 1943 wool production is estimated at 28,000,000 lb., against between 19,000,000 lb. and 20,000,000 lb. this year. Canada's wool consumption amounts to about 150,000,000 lb. annually, but such total includes a large amount of fine wools of types not produced in this country.

Although the adoption of a general system of price ceilings in the United States should help to support the Canadian system, the situation here is still difficult, and there seems to be a need for even closer co-operation of the United States, the United Kingdom, and Canada, not only as regards allotment of supplies, but in respect also of the prices at which commodities are supplied. Prices of woollen fabrics of United Kingdom manufacture provide a case in point. While manufactured woollens sold in Canada are subject to the Canadian price ceilings, British prices on woollen cloths as established by the British Board of Trade were increased recently by 20 per cent with the result that Canadian agents of the British manufacturers were unable to accept orders. Such difficulties undoubtedly will be adjusted, but they could be avoided or at least eased by continuous consultation and close co-operation of the control organizations in the three countries. Canada's Price Stabilization Corporation is continuing its efforts to restrict and curtail cost-adjustment subsidies in respect of both imported supplies and goods of Canadian manufacture, but such subsidies, which represent a part of the cost of the price-ceilings policy, have mounted to an impressive total.

Progress has been made in developing, in Canada, drug ingredients which formerly were imported from Europe or other sources no longer available because of the war. A Toronto pharmaceutical house obtained belladonna seed from botanical departments at Guelph, Ottawa, and Washington, and with the co-operation of a florist has grown sufficient belladonna to provide a valuable reserve stock, replacing supplies which came principally from Bulgaria. The same firm has grown hyoseyamous, a drug used as a sedative, and last year it produced digitalis, but the roots were winter-killed. Peppermint leaves, from which menthol is extracted, are being cultivated from seed at several places in Ontario, and juniper berries also are being grown on a small scale. The experience and discoveries of the National Research Council of Canada in working with the Navy, some years ago, in testing milkweed floss have led to the adoption of this product as a substitute for kapok in life-preservers. United States scientists and industrialists have co-operated and a factory in Northern Michigan recently began commercial production of the milkweed floss.

6,000 MILES ACROSS AFRICA

From *Trade and Engineering* (LONDON), DECEMBER, 1942

Details were disclosed recently of an air route from West Africa to Egypt, over 6,000 miles of equatorial jungle bush, and desert, along which, during the past two years, thousands of British and American aircraft have been delivered to the Middle East Command. It arose out of the difficulties created when France fell, cutting off the normal supply route to the Middle East and creating the necessity for setting up a new one without delay. It was therefore decided to assemble the aircraft on the west coast and fly them across the vast continent of Africa to Egypt.

A small town was chosen originally as the most suitable starting point because of its harbour. There was an aerodrome already in existence but with extremely limited facilities. To-day that aerodrome is one of the biggest and best equipped in Africa, and there are others. The best and quickest route to Egypt from West Africa was found, and thousands of natives cleared big spaces in the jungle and bush to make emergency landing grounds for aircraft *en route*. Very soon everything was ready for the first convoy of aircraft to be flown to the Middle East. Nobody was quite sure how it would work. The difficulties were enormous—they still are, in spite of greatly improved facilities. But from the word go the venture was a success, and it was evident that there was the answer to Britain's supply route problem so far as aircraft were concerned.

POLISH PILOTS

As more aircraft were shipped from Britain and America for assembly and delivery so more pilots were required, and nearly 100 of the most experienced Polish pilots in Britain were sent out to become part of an organization which was rapidly developing. Although practically all fell victims to malaria on arrival, the Poles quickly took their places in the scheme of things and even managed to find time to attend daily classes in English.

At the start it was mostly Hurricanes and Blenheims that arrived at the assembly point, but very soon the first of American Marylands and Tomahawks came along. The machines arrived by ship in crates and had to be assembled in the local workshops, which were expanding daily. At first only two or three convoys of aircraft made the trip each week, but latterly such convoys have been a daily occurrence. Each journey takes over 24 flying hours, excluding putting down at the various landing-grounds *en route*, where aircraft are refuelled and the engines inspected. The fighters carry additional petrol tanks, as otherwise they could not make the long "hops" between the landing-grounds. Naturally enough the daily hazards which accompany this cross-continent ferry service have produced stories of individual exploits and endurance. For the most part, however, the convoys get through without incident. Established along the route now is a chain of aerodromes, each with its R.A.F. ground staff, and with a fresh supply of fuel, spare parts and a workshop.

SHIPS RESISTANCE

From *Trade and Engineering* (LONDON), DECEMBER, 1942

EFFECTS OF FOULING

With the growth of knowledge of naval architecture the power required for propelling a ship in fine weather under ideal conditions has been reduced, but the benefits of this are diminished by the serious loss constantly incurred in service through the fouling of the hull if the intervals between dry-docking and painting are unduly prolonged. This deterioration of the underwater surface results, generally, from the adhesion of seaweed and shell, and the extent to which it occurs depends largely upon the proportion of a ship's time spent in harbour, where, it is thought, the fouling organisms attach themselves. Thereafter the growth increases in direct relation to the length of time between dry-dockings.

LOSS OF SPEED

As a general rule the skin friction of a ship increases at a rate of about $\frac{1}{4}$ per cent a day out of dock in temperate

waters and about $\frac{1}{2}$ per cent in tropical waters. On this basis the speed of a freighter may be reduced by about one knot after 100 days out of dock, and actual trials have shown the speed of relatively fast ships to be reduced by four knots after 120 days' service in tropical waters. A further factor in the problem is that increased resistance of the hull form acts as a drag upon the propeller, so that the machinery is incapable of developing its full output. In considering the matter statistically it must be borne in mind that marine growth is particularly sensitive to the conditions of service, and if the fouled ship enters a fresh-water port the fouling organisms are speedily killed and their growth stopped, although they may adhere to the surface. For this reason there is little fouling with ships on the North-Atlantic trade plying between fresh-water ports on the Clyde and St. Lawrence.

Most anti-fouling compositions incorporate ingredients that will have a toxic effect on the attaching organisms. The efficacy of poisons in ship paint, however, is now being questioned on account of the difficulty of maintaining a sufficient concentration to have the desired lethal effect, and investigations of the effects of light and colour on fouling have been proceeding for some time in America. The tests have shown that the marine larvae responsible for fouling tend to attach themselves in the shaded areas, while the algae responsible for weed growth react positively to light. This confirms the general experience that weeds form thickly over an area four to five feet below the water line and that the worst fouling from shell growth is concentrated on the flat bottom and behind the bilge keels. Tests on panels of various colours have shown that the density of fouling is much less on those of lighter colour, increasing progressively from white, buff, green and red to black. Later experiments carried out in Germany have confirmed these conclusions, showing the extent of fouling on plates of red and green colouring to be in the ratio of six to one. These experiments are particularly suggestive as red is the colour most commonly used in anti-fouling paints.

THE NEW BATTLESHIPS H.M.S. "ANSON" AND H.M.S. "HOWE"

From *The Engineer* (LONDON), OCTOBER 23, 1942

On Wednesday, October 21st, it was officially announced by the Admiralty that two further battleships of the "King George V" class—H.M.S. "Anson" and H.M.S. "Howe"—are now at sea with the Fleet. The "Anson" was laid down in July, 1937, and was built and engined on the Tyne, her hull being entrusted to Swan, Hunter and Wigham Richardson, Limited, and her machinery to the Wallsend Slipway and Engineering Company, Limited. H.M.S. "Howe" was laid down at the Govan yard of the Fairfield Shipbuilding and Engineering Company, Limited, on the Clyde, where she was built and engined. Each ship has the following principal particulars:—Displacement, 35,000 tons; length, 739 ft. 8 in.; beam, 103 ft.; and mean draught, 27 ft. 8 in. The armament includes ten 14 in. guns, sixteen 5.25 in. guns, and four multiple pompoms, besides several smaller guns. The 14 in. guns, it is stated, are of a new model, which has an effective range greater than that of the 15 in. guns which were mounted in earlier ships. The design includes enhanced defence against air attack. Provision is made for the carrying of four aircraft on each ship. The propelling machinery comprises a quadruple-shaft arrangement of Parsons geared turbines, taking steam from Admiralty type three-drum oil-fired boilers. The total shaft horsepower for each ship is about 152,000, corresponding to a speed of something over 30 knots. The complement of officers and crew is 1,500. H.M.S. "Howe" is commanded by Captain C. H. L. Woodhouse, R.N., who commanded the cruiser "Ajax" at the battle of the River Plate, and the "Anson" by Captain H.R.G. Kinahan, R.N. The "Howe" has been adopted by the City of Edinburgh and the "Anson" by the City of London.

CONFUSION IN COLLEGE

Students of engineering in Canadian universities are more fortunate than their neighbours to the south. In Canada, at least the student knows the relationship between his responsibilities to the active services and his educational course. He knows he will be deferred sufficiently from the call-up to allow him to finish his course, providing he meets certain simple but clear conditions, and he knows too that after graduation he will be placed where his technical qualifications can be used to advantage.

In the United States there has been some indecision, many changes, and certain lack of co-operation between the services, with the result that the students seem confused and discouraged, the faculties baffled and bewildered. Even yet it is difficult to discern any final plan for general acceptance. An outsider cannot find the line of reason along which the authorities are working. Conversations with deans, professors and students indicate many differences of opinion.

Apparently, at the present time, every male student upon reaching the age of 18 is inducted into the army. If he has completed one full year of college before reaching this birthday, he is likely to be given a deferment sufficient to let him finish his course, but not otherwise. Consequently there is little use of a prospective student entering university unless he is under 17. This would seem to put an end to most enrolments in the regular way.

In the month of February the writer saw in one university over sixty engineering students lined up at the office counter to receive a refund of their fees. They had been called out and had to report without any regard to the courses they had partially completed. Conversation with one student revealed that in the ordinary way he would have been graduated this spring. Other students were in the third and second years.

Many engineering colleges are receiving drafts of men from the army or navy for special short courses which may run from three to ten months. In most cases, these new entrants have not the usual academic requirements for entrance to university. Looking on this as an outsider, one wonders why qualified students with courses partly completed are taken out of college, and others with little or no preparation are put in. To the uninformed, it looks like a great shuffling of thousands of people, only to reduce the number of engineers available for industry and the services, and to increase the number of partially trained mechanics for the army and navy.

Arrangements are being discussed, whereby students with university entrance qualifications will be put into uniform and sent to the universities for special courses. These would not be the usual engineering courses, although they will have in them some of these elements. It is expected that the courses will include lectures on geography and history. Such students will receive the regular army pay of \$50.00 a month and their keep. There has been some indefiniteness about the curricula, and the suggestions made by the navy differ substantially from those made by the army, both as to content of the courses and as to the period of time involved.

Apparently these arrangements are still in the discussion stage, but it appears likely that definite announcements will be made shortly whereby such procedures will be established.

Doubtless to those who plan these policies, a definite and justifiable objective is clear, but to persons in Canada who have a knowledge of the Canadian situation, the American developments seem confused and confusing. Certain it is that the Canadian policy more nearly meets Canadian needs than would the American plans. Naturally it would be the sincere desire of every Canadian that the American policy should be equally effective for American conditions.

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

NEW ACTIVITIES—NEW COMMITTEES

It is a natural development that in times of national activity an institution should find its programme enlarged. Some time ago, The Engineering Institute established three committees to work on activities which are related to the war and to the engineer. These have been announced previously and in the months since that time have completed their organizations and broken much ground. They are—the Committee on the Engineering Features of Civil Defence, the Committee on Industrial Relations, and the Committee on Post-War Problems.

At the annual meeting of Council held in Toronto in February, two new committees were authorized. The work of these committees is (a) to approach the proper federal authorities on behalf of the engineers in the Civil Service, and (b) to make similar representation on behalf of the engineers in the active services.

Both these fields present great opportunities for improvement. In the case of the Civil Service the principal complaint is that the regular scale of salaries is so far below those available in private enterprise that competent engineers are not being attracted to the service. Government business is just as important as private business and should be permitted to pay salaries that will enable it to compete in this professional field for services that are steadily becoming more and more important.

The situation in the active services is more complicated and more urgent. Ever since the beginning of the war the Institute has been pursuing this interest. Up to now its efforts have produced nothing but negative replies. The new committee is examining the whole case again—this time with new evidence, new tactics and new determination. Once the committee has proven to itself the justness of the case—which should not be difficult—it will make representations to the proper authorities.

From all branches of the services where engineers are used, complaints have come, which refer not only to rank and remuneration, but also to the use of non-technically trained and inexperienced persons in technical appointments. There are frequent comparisons between the treatment accorded engineers and that given medical doctors.

A wide survey of the situation should produce some useful and interesting information upon which to base conclusions and recommendations.

Professor D. S. Ellis, of Kingston, is chairman of the committee.

THE ENGINEER IN THE CIVIL SERVICE

The committee appointed by Council in February to make representations on behalf of the engineers in the Federal Civil Service appeared on March 5th before the special committee appointed recently to advise the Treasury Board on such matters. The Institute committee reports that it was well received, and is hopeful that some substantial relief may be recommended in the report of the Advisory Committee.

The brief presented by the Institute is reproduced herewith (p. 145), along with the diagram that tells the story. To establish and maintain government services that will compare, in efficiency and economy, with private enterprise, would seem to require a substantial improvement in the amount of remuneration.

The Institute is indebted to a small group of employers who hastily made available their salary scale for engineers. In order to establish an illustration that would meet all possible arguments, wage scales were gathered from three

(Continued on page 146)

REMUNERATION OF ENGINEERS IN GOVERNMENT SERVICE

Brief presented by The Engineering Institute of Canada to the Committee Advising the Federal Treasury Board on Administration of Personnel

Ottawa, March 5, 1943.

The Chairman and Members of the Advisory Committee to the Treasury Board, Ottawa, Ont.

Gentlemen,—

1. The Council of the Engineering Institute of Canada has learned, with gratification, that a committee, under the chairmanship of H. J. Coon, Esquire, has been established to advise the Treasury Board with reference to the administration of the personnel of the public service of Canada during the war.

2. The Engineering Institute is the largest professional body in Canada and is interested in all matters of national importance. The economic and efficient conduct of the business of Government is certainly of national importance and, therefore, of interest to the Institute. Accordingly Council has appointed a committee under the chairmanship of N. B. MacRostie, to approach the Advisory Committee in the hope of presenting information which may be useful in these deliberations.

3. This is not the first time that The Engineering Institute has been privileged to make representations on behalf of the members of the engineering profession in the Civil Service. In 1930 a brief was presented to the Royal Commission on Technical and Professional Services under the chairmanship of E. W. Beatty, and the recommendations of the Institute had a definite bearing on the findings of the Commission. The Institute Committee now before you suggests that the findings of the Royal Commission of 1930 are at least equally true to-day, and with the general increase in wages since that time, the conditions described in the report are even more acute now.

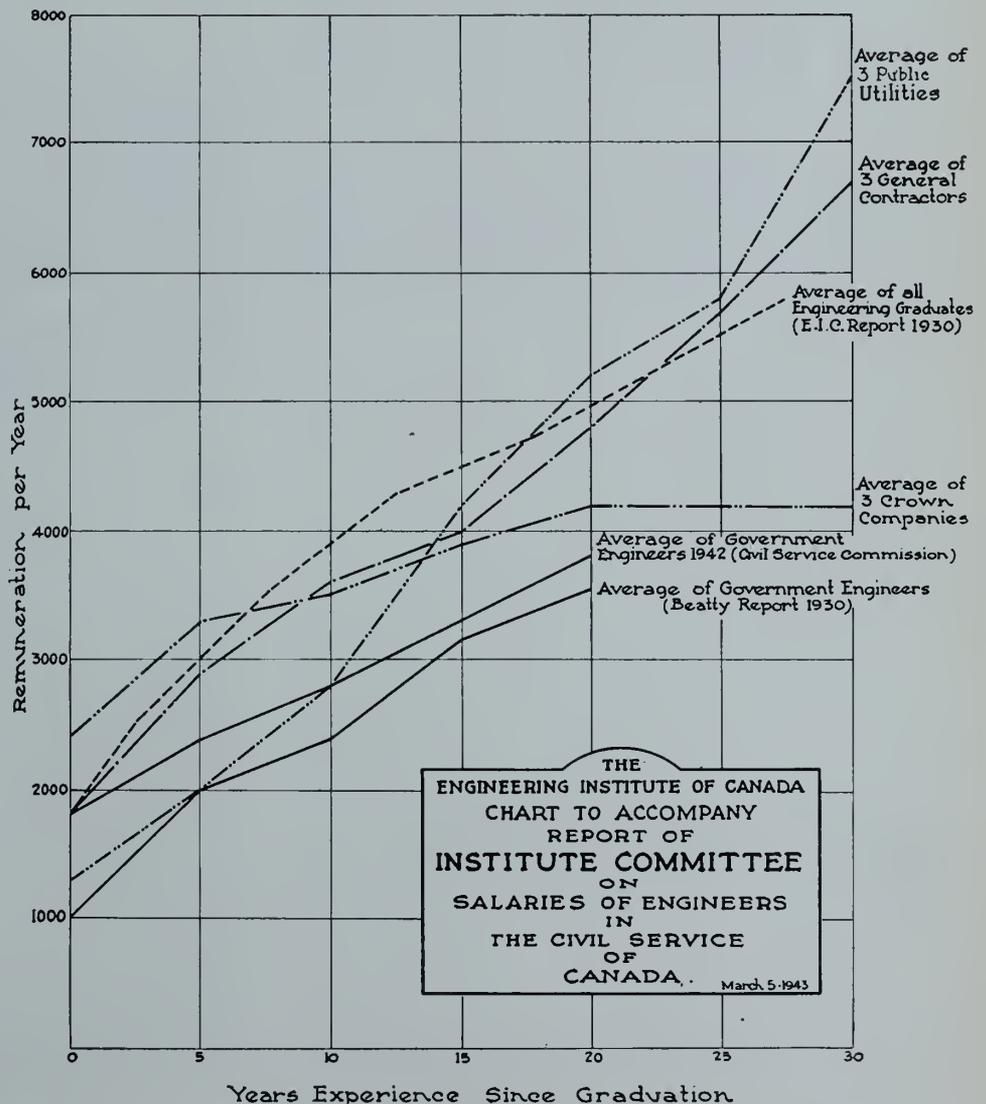

4. It is with much satisfaction that the Institute's committee presents herewith certain details of the employment of engineers in other spheres of activity in the expectation that comparison of conditions will indicate conclusively the wisdom of rewarding government engineers on a basis commensurate with the value of their services and with scales offered by other employers. The figures and statements contained herein are not hypothetical. Through the officers and members of the Institute, who are thoroughly experienced in these matters, it is possible to obtain accurate information on working conditions, as well as the results of adequate and inadequate remuneration.

The Institute's primary interest in this investigation is that it realizes the business of Government is the nation's greatest business and believes that such responsibilities cannot be met satisfactorily under existing conditions. Most employers of engineers have recognized certain fundamental principles, but the

Federal Government, through the Civil Service, has established rates of remuneration, which ignore these accepted principles, and which, in the opinion of the Institute, place the Government under harmful and unnecessary handicaps.

5. The results of an inadequate wage scale may be tabulated as follows:

- The better grades of Engineers, both Junior and Senior, are not now attracted to the Service.
- Men who can be recruited in times of depression leave for other work at more attractive wages when times improve, after the Government has spent time and money training them.
- Experienced engineers leaving the service cannot be replaced in prosperous times, although the need of engineering assistance is greatly increased in these circumstances.
- In the absence of good candidates, persons of inadequate experience have had to be taken into the service. This results in wasted time and increased costs, frequently of great magnitude.
- Failure to obtain qualified candidates results in overworking the present employees. There are many cases where these conditions exist to-day, much to the detriment of the work itself and to the financial disadvantage of the country.

(f) Failure to obtain a sufficient number of engineers of ability and experience, frequently results in the contractor doing the engineering work for the Government, with his own staff. In this way, the Government actually pays rates much higher than those authorized by Civil Service classifications. This puts the Government in a ridiculous position, but under present conditions there seems to be no alternative if the work is to be expeditiously and economically carried out.

(g) There are many examples in the civilian branches of the three active services, of wages well beyond the Civil Service rates. These services found that competent persons could not be employed at the usual low rates, and, in one way or another, they obtained concessions whereby they could carry out the work assigned to them. In these scattered cases the Government has admitted the inadequacy of its wage scale, but, apparently, no attempt has been made to make these increases applicable generally.

6. All the above conditions are based on what might be called normal conditions. Under conditions of war emergency, everything is magnified many times. Therefore, what in times of peace might be called unfortunate circumstances, become matters of tragic importance in times of international strife.

7. The Advisory Committee must recognize certain fundamental facts and conditions:

(a) Competent engineers cannot be obtained at present salaries.

(b) Persons employed for war work do not participate in pensions nor can they look forward to any degree of permanence of employment. They work many hours of overtime with no financial compensation.

(c) Commercial firms are steadily drawing from the ranks of the Civil Service and such losses cannot be replaced.

(d) War conditions have raised wages. Therefore, the Civil Service scale is more than ever out of line. Developments in the last three years have opened new opportunities for engineers. Therefore, the demand is and will be greater than ever before both in Government circles and in industry. How can the business of Government meet these new demands with scales of wages that have been inadequate for at least a generation?

(e) After the war, greater burdens will fall on Government departments. Now is the time to prepare for these inevitable conditions. Organizations cannot be built over night nor can they be built at all unless the wage incentive is sufficient to meet conditions established by employers outside the service.

(f) Crown companies pay salaries far in excess of Civil Service classifications, because competent persons could not be obtained at the regular rates. In such cases the Government has recognized the inadequacy of its own wage scales. If these scales are not sufficient for the Crown in war plants, they are not sufficient for the Crown in its other engineering activities.

8. The standing of the engineer in Government employment is not only high but exhibits a degree of unselfish service beyond that found in many other sections of the profession. This is evidenced by the fact that they serve faithfully under conditions of remuneration far below those commonly in force outside the service. It is not fair to use this sense of loyalty and devotion to the disadvantage of the individual.

9. In conclusion this Committee has endeavoured to prove the following points:

(a) There can be no argument as to the inadequacy of the present scale of wages.

(b) There can be no argument as to the advisability of employing competent engineering services in the interests of economy and efficiency.

(c) There can be no argument but that such persons cannot be obtained or retained under existing scales of wages.

(d) There can be no argument but that Government business is as important as private business.

Therefore, it is apparent that adjustments should be made if Government business is to be carried on as efficiently and economically as private business. Through this Committee, the Institute urges that these cold facts be faced fairly and squarely and that steps be taken now to correct unfair and uneconomic conditions which, unfortunately, have existed for so long.

10. In brief, all that is requested is that the Treasury Board permit such adjustments in the classifications as will be fair and equitable and will meet the scales of remuneration found to be necessary and fair by other employers. It is a fact that industry cannot afford to operate at a loss and, therefore, scales of remuneration have been developed that will permit the employment of competent engineers. In other words, industry cannot afford low wages and of necessity has had to adopt adequate scales of salary. If industry has found by experience that these wages are necessary, it is evident that similar wages are necessary and economical for Government service.

11. The Institute's Committee has not attempted to propose specific wage scales but, if subsequently, the Advisory Committee, or any other body decides to examine such fields, The Engineering Institute will be very pleased to co-operate in any way in establishing new schedules, and to make available information which is already in its possession.

Yours sincerely,

N. B. MacRostie, M.E.I.C.

Chairman of the Institute Committee.

MEMBERS OF THE COMMITTEE

N. B. MacRostie, M.E.I.C., R.P.E.O., Consulting Engineer, Ottawa, Ont., Chairman of Institute's Committee.

deGaspé Beaubien, M.E.I.C., R.P.E.Q., Consulting Engineer, Montreal, P.Q.

L. Austin Wright, M.E.I.C., R.P.E.Q., General Secretary, The Engineering Institute of Canada, Montreal, P.Q.

Representing the Dominion Council of Professional Engineers

L. E. Westman, M.E.I.C., R.P.E.O., Consulting Chemical Engineer, Ottawa, Ont.

THE ENGINEER IN THE CIVIL SERVICE

(Continued from page 144)

employers in each of the following groups: public utilities, general contractors, and crown companies. The graph shows three lines representing the average for each group compared to the scale of the Civil Service.

The crown companies' average shows that the government is already paying wages much higher than the Civil Service scale. The same can be said for the general contractors, as they are engaged principally on government work. The utilities' average shows salaries paid in private enterprises that offer permanent employment and pensions similar to the government. Taken all together this graph seems to provide interesting evidence as to the difficulties under which the government services are trying to operate. It is hoped that the present investigation of Civil Service conditions of employment will result in adjustments that will eliminate unfairness, and at the same time permit a strong and effective organization to be established for post war activities.

The Institute committee consists of Chairman N. B. MacRostie, Ottawa; de Gaspé Beaubien, Montreal, and the general secretary. President Camcron invited W. P. Dobson, president of the Dominion Council to attend with the committee, but at the last moment Mr. Dobson was unable to be present and named L. E. Westman, assistant director of National Selective Service to represent him.

R.E.M.E.

(Royal Electrical and Mechanical Engineers)

From time to time fragments of information have come to Headquarters with reference to a new corps of engineers, adopted by the Imperial Army. At last a fairly comprehensive account of the organization of the Corps has come to hand. It is reproduced herewith.

The Institute is in possession of additional details, including schedules of pay and allowances for officers and men, stories of actual experiences in the North African campaign and statements of advantages as compared to similar work formerly carried out by the Ordnance Corps. Subsequent numbers of the *Journal* will carry more news of this relatively new development, which seems to have altered all former practices and to have produced excellent results in meeting conditions of modern warfare.

The following information is reproduced from the *JOURNAL* of the Institution of Mechanical Engineers, London.

"It is hardly necessary to emphasize to engineers the great and growing importance of the role played by the engineering maintenance services in the Army. Machine war on an ever-increasing scale requires an enormous engineering organization to keep the vehicles, weapons, and instruments in a state of maximum efficiency. Until recently these functions were carried out mainly by the engineering staff of the Royal Army Ordnance Corps, which Corps is also responsible for the supply of all warlike stores, vehicles, and clothing. Certain mechanical and electrical engineering maintenance and provision duties are also carried out by the Royal Engineers and the Royal Army Service Corps. It was therefore deemed desirable to reorganize and co-ordinate some of these mechanical and electrical engineering personnel into a single Corps and thereby give more efficient service to the Army and also effect a saving in technical man-power.

On 22nd May, 1942, the formation of the new Corps with the title "The Royal Electrical and Mechanical Engineers" was authorized by Royal Warrant and it is expected that this Corps will come into full operation as a separate entity about 1st September.

The function of the Corps is, briefly:—

- (i) Inspection and maintenance of tanks, wheeled vehicles, all artillery (including field, anti-aircraft, and coast defence), small arms and machine guns, radiolocation, fire control, and all other instruments, tunnelling equipment, pumping sets, and the installation of coast artillery machinery.
- (ii) Repair of all the above equipments consequent upon ordinary wear and tear, or battle casualties.
- (iii) Investigation into defects of design and recommendations for improvements.
- (iv) Advice on prototype design from a maintenance angle.

There is a complete chain for the direction and co-ordination of the technical activities of the R.E.M.E., starting with the Director of Mechanical Engineering in the War Office, Major-General E. B. Rowcroft, C.B.E., M.I. MECH.E. (*Member of Council*) and passing down through Deputy Directors to the Electrical and Mechanical Engineer, or E.M.E. as he is called, who acts as technical adviser to a Brigade Commander. Each formation—Army, Corps, Division—and certain individual units have their own mobile workshops and engineering staff. Backing these are the great static base workshops in this country and in all theatres of war, where any type of repair to any equipment can be effected and where, if necessary, manufacture of parts on a limited quantity basis can be undertaken.

Experience of the past three years has shown that engineers, especially those attached to units individually or in a Light Aid Detachment ("L.A.D."), must always be fighting soldiers and much doughty work has been done by workshop units in France, the Middle East, and elsewhere. Light Aid Detachments frequently have to do repair work

on tanks, vehicles, guns, and other equipment under fire, and the recovery and evacuation of badly damaged tanks and other equipment, which is an R.E.M.E. responsibility, can be quite an exciting affair when the gauntlet of the enemy's guns has to be run. The new Corps is therefore combatant. Selected officers are sent to the Staff College.

It is intended that the officer personnel of the Corps shall consist of qualified Mechanical and Electrical Engineers who will be graded as E.M.E.'s 1st, 2nd, 3rd, or 4th class. In war time, in order to obtain the required number of officers it has been necessary to introduce an ungraded section of officers not so highly technically or practically qualified, but every effort is made to maintain the highest possible standard. Other ranks will consist of tradesmen such as armament artificers, armourers, fitters, etc., covering nearly sixty different engineering trades, together with such non-tradesmen as are required for regimental and administrative duties.

The Institutions of Mechanical and Electrical Engineers are both keenly interested in the new Corps and have been in consultation with the Adjutant-General to the Forces, General Sir Ronald F. Adam, Bt., K.C.B., D.S.O., O.B.E., who is responsible for its formation and launching and who welcomes the interest and help the Institutions are giving and will be able to give in the future. Many of the members of the Corps are, of course, also members of one or both of the Institutions and it is hoped that friendly and intimate co-operation will be maintained between the Institutions and the Corps.

Modern war is simply an expression of the industrial age in which we live and therefore is largely a contest between engineers. The linkage between user and producer—the engineer in the field and the engineer in charge of manufacturing and design—must be strong and complete. The formation of this Corps should help, in some measure, to bring this about and we wish it all success and honour. Its performance will be watched with the closest interest by all members of the Institution.

ORGANIZATION AND FUNCTIONS OF R.E.M.E.

So much interest has been aroused by the publication, in the September *JOURNAL*, of an account of the organization and functions of the new Corps of Royal Electrical and Mechanical Engineers, that it has been considered desirable to publish a further note setting out the qualifications required for, and conditions of service of, officers in the Corps. This information, which follows below, has been provided by the War Office.

The function of the new Corps, the formation of which was announced in the Foreword of the *JOURNAL* for September, is briefly:—

- (i) Inspection and maintenance of tanks, wheeled vehicles, all artillery (including field, anti-aircraft, and coast defence), small arms and machine guns, radiolocation, fire control, and all other instruments, tunnelling equipment, pumping sets, and the installation of coast artillery machinery.
- (ii) Repair of all the above equipment consequent upon ordinary wear and tear, or battle casualties.
- (iii) Investigation into defects of design and recommendations for improvements.
- (iv) Advice on prototype design from a maintenance angle.

The qualifications required for commissions in the new Corps are as follows:—

Graded Officers (E.M.E.). Candidates must have undergone an apprenticeship of at least three years' duration and, in addition, must

- (a) Possess a degree in engineering of any recognized university; or
- (b) Be a Graduate member of the Institution of Mechanical Engineers; or of the Institution of Electrical Engineers; or have qualifications exempting from the examinations of these Institutions.

The upper age limit is forty years of age.
The emoluments are 16s. 4d. per diem, plus allowances, the latter being tax-free.

The rank is that of Lieut., E.M.E.

Ungraded Officers. Candidates who have the necessary practical experience, but are not in possession of the academic qualifications mentioned in (a) or (b) above may be considered for appointment to the Mechanical Engineering Branch of the R.E.M.E. as 2nd Lieutenant (ungraded), R.E.M.E.

The upper age limit is forty years of age.

The emoluments are 12s. 2d. per diem, plus allowances, the latter being tax-free.

Telecommunication Branch (Wireless and Radio), Royal Electrical and Mechanical Engineers. Upon the training, experience, and technical qualifications of a candidate for employment with the Telecommunications Branch of the R.E.M.E. will depend whether he is considered suitable for service as a commissioned officer, either as Electrical Mechanical Engineer (Wireless) or ungraded officer.

(1) *Graded Officers (Telecommunications).* Candidates must have two years' experience in the radio or telecommunication industry and, in addition, must

- (a) Possess a degree in engineering, physics, or mathematics of any recognized university; or
- (b) Be a Graduate member of the Institution of Electrical Engineers, or have qualifications exempting from the examinations of that Institution.

The upper age limit is forty years of age.

The emoluments are 16s. 4d. per diem, plus allowances, the latter being tax-free.

The rank is that of Lieut., E.M.E.

(2) *Ungraded Officers (Telecommunications).* A candidate who has the necessary practical experience but is not in possession of the academic qualifications mentioned in (1) (a) or (1) (b) may be considered for appointments to the Mechanical Engineering (W) or (R) Branch of the R.E.M.E. as 2nd Lieutenant (ungraded) R.E.M.E., Radio Maintenance Officer, or Wireless Maintenance Officer.

The upper age limit is forty years of age.

The emoluments are 12s. 2d. per diem, plus allowances, the latter being tax-free.

Equivalent Civilian Emoluments. An ungraded 2nd Lieutenant, for example, receives total annual emoluments calculated to be, if single, £368, equivalent to £470 in civilian employment; if married, the total is £433, equivalent to £584 per annum in civilian employment."

The General Secretary of the Institute visited Purdue University at Lafayette, Indiana, last month, on his return from Terre-Haute, where he delivered the commencement address at Rose Polytechnic Institute. Mr. Wright is shown here inspecting one of the electrical laboratories at Purdue in company of, left to right, Dean A. A. Potter of Purdue Schools of Engineering and D. D. Ewing, professor of electrical engineering.

THE ENGINEERS' CONTRIBUTION TO THE WAR EFFORT IN THE U.S.A.

HAROLD V. COES

President, The American Society of Mechanical Engineers

From an address delivered at the Annual Banquet of The Engineering Institute of Canada at Toronto, Ont., on February 11th, 1943

To a very considerable extent this is an engineers' and scientists' war. A few paranoics have plunged us into it, but it is due in large measure to the number of, training, experience and skill of the engineers in your country, in mine and in those of our Allies, that we have been able to meet the challenge with augmented peacetime facilities.

This has been accomplished largely through skill in design; in specification preparation; in selection and layout of productive equipment; in tooling, in jigs and fixtures; also in adopting semi or in-line production methods to the products for fighting the war, whether for small fire control or aviation instruments, or huge tanks and bombers.

I remember talking with a gentleman in the club car of a train just after the President had stated he wanted 60,000 planes of all kinds in 1942. This man said, "That is fantastic, ridiculous and impossible." I replied, "Not fantastic if he tells us what he wants, gives the right of way to the machine tools and materials, partially freezes the designs and bars labour agitation and strikes; he will then get his planes." As a matter of fact we produced 49,000 planes in 1942, many of them of considerably larger size than was contemplated in the original schedule, so in all probability, allowing for this, the President received very nearly the equivalent of the 60,000 planes called for.

To request that 60,000 planes be produced in a year does not produce them, as we know; that is just a requisition for production. These demands set in motion, however, such gigantic engineering projects, for example, as multiplying our aluminum and magnesium production facilities, plane engines, instruments, plane parts and plane assembly facilities. You can readily appreciate the mass of engineering calculations, sketches, drawings and specifications that were required before these facilities could be constructed.

Think of the improvisations that were made to save critical materials, to replace unavailable productive facilities and to overcome unforeseen contingencies, such as developing single purpose engine drilling machines from portable bench drills, changing structural designs from steel to reinforced concrete or timber, relocation of buildings on the site and the like. This affords some comprehension at least of the enormity of the problems that confronted the engineers aside from the stupendous volume of details that had to be meticulously fitted together.

To bring the picture into closer focus let us consider for a moment what this plane production which the engineers have provided for means. At the end of 1943 the total horse power of the engines required for the planes to be produced in the United States will be about 350,000,000 hp. That is like an astronomer's unit of measurement, the light year. Unless it is related to something one can compare it with, the mind does not take it in. This 350,000,000 plane engine hp. is probably from one and a half to two times the installed central station capacity of the world and perhaps six or seven times the combined hp. of the British and the United States Navies.

At Chicago the Chrysler Corporation will soon have the world's largest factory in operation producing plane engines, an engineering feat which in many respects surpasses our Boulder Dam hydro-electric project.

This is what engineering has enabled management to do to support, in an incredibly short time, the armed forces of the United Nations. Truly a marvelous performance on the part of the engineers.

KENNETH MACKENZIE CAMERON

PRESIDENT OF THE ENGINEERING INSTITUTE OF CANADA, 1943

The newly installed president of the Institute is one of the many distinguished engineers in the government service who have held that office. The names of Past-Presidents Marceau, St-Laurent, Camsell and Desbarats come to mind in this connection. Although engineers in the civil service have been responsible for the effective and economical expenditure of large sums of public money, their names are not associated in the taxpayer's mind with any particular outstanding engineering achievements. Thus they do not become known to the public so well as do their brethren who are in private practice or in the employ of prominent industrial or engineering organizations. In fact, the importance of the part which engineers in the civil service have taken in the development of Canada is not so generally recognized as it should be. It is therefore most fitting that The Engineering Institute should now confer the honour of its presidency on one who is at the head of the engineering branch of the Department of Public Works.

The work of the engineering branch covers a wide field as regards design, construction and maintenance. It deals with wharves, piers, breakwaters, and drydocks; dredging and beach protection; hydrographic and topographical surveys for harbour and river work; interprovincial bridges; ferries and the control of works over navigable rivers. Under normal conditions, all this involves an annual expenditure of from five to ten million dollars not including the cost of special major items like drydocks which are of infrequent occurrence. As in the case of other government departments operating under war conditions, its regular activities have been greatly curtailed since 1940, but many of the duties performed by the branch have a direct bearing on war work and must therefore be maintained.

President Cameron was born at Strathroy, Ontario, and received his early education at the Collegiate Institutes at Strathroy and London. In 1901 he graduated with honours at the Royal Military College, Kingston, then proceeding to McGill University where he received the degree of B.Sc. in civil engineering in the following year. After a period of post-graduate work in hydraulics, he was granted the degree of Master of Science, and served as demonstrator in hydraulics and in testing of materials at McGill University. He is the second graduate of the Royal Military College to become president of the Institute—the first was Lieut.-Col. R. W. Leonard.

After some months in the office of the chief engineer of the Canadian Pacific Railway, Mr. Cameron worked for two years as office and inspecting engineer of the Canadian Niagara Power Company at Niagara Falls, Ontario. He was lecturer on surveying and geodesy at McGill University during the 1905-1906 session, and then went to the United States, where he obtained valuable experience in such posi-

tions as transitman at New York on the Pennsylvania main line tunnels under the Hudson; as inspecting engineer on a power station at Ellsworth, Maine; and as resident engineer for the Ambursen Construction Company on hydro-power and irrigation dams in Wyoming. On returning to Canada, in 1908, he did work for Smith, Kerry and Chace, consulting engineers, Toronto, and then joined the Department of Public Works of Canada, serving first in the offices at London, Ontario, and later as district engineer at Sherbrooke, Que. He came to Ottawa in 1912 as senior assistant in the dredging branch of the Department. In September, 1918, he became assistant chief engineer and on April 1st, 1923, he succeeded the late Arthur St-Laurent as chief engineer of the Department, the appointment which he now holds.

Works of major interest completed while Mr. Cameron has been chief engineer include three large drydocks, namely, the Saint John Drydock at Saint John, N.B., the Champlain Drydock, Quebec Harbour, and the Esquimalt Drydock at Esquimalt, B.C.

Long identified with the Institute which he joined as a Student in 1901, Mr. Cameron was chairman of the Ottawa Branch for 1922, and represented that Branch as councillor in 1924-25. In 1941 and 1942 he was a vice-president of the Institute for the province of Ontario.

It is interesting to recall that in 1902 Mr. Cameron was the recipient of one of the four inaugural awards of Student prizes established by Council at that time. In some extent this may explain his continued interest in Student prizes. His subject was "The

Practical Use of Extensometers."

He has served as president of the Professional Institute of the Civil Service of Canada, and represented the engineers of the Civil Service when civil service matters were being considered by the Beatty Commission in 1930. He is a member of the Lake of the Woods Control Board.

Greatly interested in post-war reconstruction problems, he is now chairman of an important sub-committee of the committee appointed by the Dominion Government under the chairmanship of Dr. James to report on reconstruction matters. Mr. Cameron's sub-committee is actively engaged in classifying and preparing the necessary data for construction projects which can be put in hand without delay as soon as the war ends.

He has contributed several papers to the Proceedings and prepared for the semi-centennial number of *The Engineering Journal* the informative article on "Fifty Years of Public Works in Canada", which is one of its principal features.

An engineer of wide professional experience, versed in administration affairs and well known from coast to coast, our new president enters upon his year of office with the best wishes of all members of the Institute.

K. M. Cameron, M.Sc., M.E.I.C.

HONOURS FOR INSTITUTE MEMBERS

It is a pleasant duty to record, from time to time, the various honours and distinctions received by members of the Institute. In the February number of the *Journal* reference was made to those members who were honoured in the new year's honours list. Additional events of this kind have been announced recently, and it is a pleasure to record the awards of honorary doctorates to a past-president, a past member of council and the general secretary of the Institute.

In January, at the annual dinner of the Graduates Society of the Ecole Polytechnique, the degree of Doctor of Applied Science *honoris causa* was conferred by the University of Montreal upon Past-President Georges-Joseph Desbarats, C.M.G., M.E.I.C., and Colonel Arthur-Edouard Dubuc, D.S.O., M.E.I.C., both of whom have distinguished themselves in the public service. At the ceremony, they were presented for their degrees by Dr. Augustin Frigon, M.E.I.C., with the following citations:—

MONSIEUR GEORGES-J. DESBARATS:

Né à Québec, diplômé de la 3e promotion de l'Ecole Polytechnique, membre de l'Association des Anciens de l'Ecole depuis ses débuts, M. Georges Desbarats est, non seulement notre aîné à tous, mais aussi l'un de ceux qui ont fait le plus d'honneur à la profession d'ingénieur, au pays et à l'étranger. Sa compétence et ses talents se sont égalés à toutes les situations de premier plan qu'il a occupées au cours de sa carrière de cinquante-cinq années.

Membre du personnel au Ministère des Chemins de fer et Canaux, il collabore à la construction des canaux du Long-Sault à Carillon et de Sainte-Anne-de-Bellevue; en sa qualité d'assistant de l'ingénieur en chef, il dirige les travaux des canaux de Welland, du Sault Sainte-Marie et de Cornwall. Il construira en outre les ponts du canal de Lachine, et, enfin, collaborera à l'aménagement du canal des Galops. Entre temps, on lui aura confié l'inspection des chemins de fer de la Colombie britannique.

Au début de ce siècle, il fait un relevé hydrographique du fleuve Saint-Laurent, de Kingston à Québec. Puis il dirige les chantiers maritimes de Sorel. En 1908, Ottawa se l'attache et fait de lui, d'abord un sous-ministre de la Marine et des Pêcheries, puis du Service Naval, ensuite en 1922, un sous-ministre de la Défense Nationale, poste qu'il occupe jusqu'à sa retraite, en 1932.

Sa haute situation le désigna tout naturellement au Gouvernement, pour remplir certaines missions techniques, à l'étranger. A Londres, en 1913, il agit comme délégué plénipotentiaire du Canada à la Conférence Radiotélégraphique Internationale; à Gênes, en 1922, il représente le Canada à la Conférence Internationale Maritime de la Ligue des Nations; à Washington, en 1928, il est le chef de la délégation canadienne à la Conférence Internationale de l'Aviation Civile; à Anvers, en 1930, il représente encore notre pays à la Conférence Internationale de Navigation Aérienne. Rien d'étonnant si un tel voyageur est maintenant président de la Canadian Geographical Society . . .

Mais il est membre aussi de bien d'autres sociétés, notamment de l'Engineering Institute of Canada, dont il fut président; membre fondateur et membre d'honneur de l'Association des Diplômés de Polytechnique. Rappelons, pour finir, que Sa Majesté le Roi Georges V lui conférait, en 1915, les insignes de l'Ordre de Saint-Michel et de Saint-Georges.

Depuis cette date, M. Desbarats, on l'a vu, est loin d'avoir démerité. L'Ecole Polytechnique a voulu lui manifester sa respectueuse admiration. A sa demande, l'Université de Montréal est heureuse et fière de le proclamer aujourd'hui docteur ès-sciences appliquées "ad honorem."

LE COLONEL DUBUC:

Arthur-Edouard Dubuc est un Montréalais par sa naissance, par son éducation, reçue au Mont-Saint-Louis et à l'Ecole Polytechnique, et par les vingt-trois premières années de sa pratique d'ingénieur. Dès 1901, il entre au Ministère fédéral des Travaux publics en qualité d'ingénieur assistant et devient bientôt ingénieur de district; en 1924, il passe au Ministère des Chemins de fer et Canaux, d'abord comme surintendant, puis comme ingénieur en chef. Le pays tout entier lui est redevable de nombreux travaux de génie.

Sa haute compétence lui mérite, en 1936 la vice-présidence, puis le poste d'ingénieur en chef au Conseil des Ports nationaux, qui régit, comme on le sait, les ports de Halifax, de Saint-Jean, de Québec, de Montréal et de Vancouver.

Ingénieur distingué, M. Dubuc est encore un militaire d'égale valeur. Il a servi, au cours de la première Grand Guerre en qualité de capitaine, de major, de lieutenant-colonel et de commandant du glorieux 22e bataillon. Il était à Ypres et à Courcellette, à Vimy, à Amiens, à Arras pour ne signaler que quelques étapes de sa haute bravoure. Blessé trois fois sur le champ de bataille, nommé deux fois dans les dépêches, il fut décoré du Distinguished Service Order et de la Croix de la Légion d'honneur. Démobilisé, il sert encore au pays à la tête de la 11e brigade d'infanterie et s'occupe des Pensions et du Rétablissement des Soldats. Depuis 1935, il est aide-de-camp honoraire du Gouverneur général.

On pense bien qu'il fait partie des Associations professionnelles d'ingénieurs du Québec et de l'Ontario et que, dès 1914, il s'est inscrit à l'Association des Diplômés de Polytechnique, dont il a été, à son heure, vice-président et président.

Tant de mérites, civils et militaires, ont rejailli sur l'Alma Mater. Aussi, l'Université, qui veut aujourd'hui lui en exprimer sa gratitude, se rend-elle avec un vif plaisir à la requête de l'Ecole Polytechnique, en proclamant Arthur-Edouard Dubuc, docteur ès-sciences appliquées "ad honorem."

A translation follows:—

GEORGES-J. DESBARATS

Mr. Desbarats was born at Quebec. He is a member of the third graduating class of the Ecole Polytechnique (1879) and a member of the Alumni Association of the Ecole which he joined upon its foundation. Mr. Desbarats is not only our senior in years but also one of the most distinguished engineers, both in Canada and in foreign countries. His competency and his talents have been equal to all situations in the important positions he has occupied during his brilliant fifty-five year engineering career.

On the staff of the Federal Department of Railways and Canals, he worked on the construction of the Carillon Canal and the locks at Ste-Anne-de-Bellevue; as assistant to the chief engineer, he supervised the construction of the Welland, Sault Ste-Marie and Cornwall Canals. He also worked on the erection of the bridges over the Lachine Canal and on the construction of the Galops Rapids Canal. At one time he was inspector of railways for the Federal Government in British Columbia.

Early in the present century, he was engaged in hydrographic surveys on the St. Lawrence River, from Kingston to Quebec. Later he was in charge of the Government shipyard at Sorel. In 1908 he was called to Ottawa as Deputy Minister of the Department of Marine and Fisheries, later occupying the same position with the Department of Naval Service. In 1922, he became Deputy Minister of National Defence, a position which he occupied until he retired in 1932.

His high office designated him naturally as a member of technical missions outside of Canada. In London,

Dr. Georges J. Desbarats, M.E.I.C.

Dr. A. E. Dubuc, M.E.I.C.

Photo: Art. Roy, C.N.S.

Dr. L. Austin Wright, M.E.I.C.

in 1913, he was Canadian plenipotentiary at the International Wireless Conference. At Genoa, Italy, in 1922, he represented Canada at the Seamen's Conference of the League of Nations; in 1928, he was chief of the Canadian delegation to the International Conference on Civil Aviation, at Washington; at Antwerp, Belgium, in 1930, he represented his country at the International Conference on Aerial Navigation. No wonder that such a voyageur should now be president of the Canadian Geographical Society. He is also a member of several other societies, particularly of The Engineering Institute of Canada, of which he was president; he is a charter and honorary member of the Alumni Association of Polytechnique.

Finally, it should be recalled that His Majesty King George V conferred upon him, in 1915, the decoration of the Order of St. Michael and St. George. Since then, as has been shown, Mr. Desbarats has lived up to this honour.

The Ecole Polytechnique wishes to show him its admiration, and at its request the University of Montreal is happy and proud to proclaim him, to-day, Doctor of Applied Science "ad honorem."

COLONEL DUBUC

Arthur-Edouard Dubuc is a Montrealer by birth, by education and by engineering experience during the first twenty-three years of his professional career. He received his education at Mont Saint-Louis College and at the Ecole Polytechnique. In 1901, he entered the Dominion Department of Public Works as assistant engineer, soon becoming district engineer; in 1924, he transferred to the Department of Railways and Canals, first as superintendent, and later as chief engineer. To him belongs credit for many outstanding engineering works in Canada.

His competency was recognized, in 1936, when he was appointed vice-president and chief engineer of the National Harbours Board, which administers the harbours of Halifax, Saint John, Quebec, Montreal and Vancouver.

A distinguished engineer, Colonel Dubuc is also a gallant soldier. He served during the First Great War as captain, major, lieutenant-colonel and officer commanding the glorious 22nd Battalion. He was at Ypres, Courcellette, Vimy, Amiens and Arras, to mention only a few of the engagements. He was wounded three times, and twice mentioned in despatches. He received the decoration of the Distinguished Service Order and La Croix de la Légion d'Honneur. Although he is now demobilized, he continues to serve his country as officer in command of the 11th Infantry Brigade (R.A.), and continues his interest in pensions for, and re-establishment of, soldiers. Since 1935, he has been Honorary Aide-de-Camp to the Governor-General.

Colonel Dubuc is a member of the Associations of professional engineers of Quebec and Ontario, and

since 1914 has been a member of the Alumni Association of Polytechnique of which he was at one time vice-president and later president. (He has also been a member of The Engineering Institute of Canada since 1899.)

Such achievements in life, both civil and military, have reflected much credit upon his Alma Mater. The University of Montreal, desirous of expressing its gratitude, is particularly pleased to comply with the request from the Ecole Polytechnique in proclaiming Arthur-Edouard Dubuc, Doctor of Applied Science "ad honorem."

Those present at the last annual banquet of the Institute noted with pleasure the complimentary terms in which Dr. Elliott, president of Purdue University, referred to the value of the aid and information which United States officials had received from our general secretary, in his capacity as assistant director of National Selective Service in Ottawa. This co-operation, together with Mr. Wright's many contacts with sister societies in the United States on behalf of the Institute, no doubt led to the recognition of his achievements by one of the leading engineering schools in the United States, the Rose Polytechnic Institute, Terre-Haute, Indiana. He was not only invited to deliver the commencement address there on February 13th, but was also honoured with a degree of Doctor of Engineering. The subject he chose for his address was "Vocation or Profession?"

In presenting Mr. Wright for his degree, the Chairman of the Board of Management read the following citation:

LESLIE AUSTIN WRIGHT, MECHANICAL ENGINEER

You graduated from the University of Toronto and practiced your profession with signal success with municipalities, public services and private corporations.

By reason of your attainments and your successes in your profession, you were chosen for the high positions you now hold as General Secretary of The Engineering Institute of Canada and as Editor of *The Engineering Journal*.

Because of your accomplishments in these fields and your wide acquaintance and friendships with the engineering fraternity, you were chosen to organize the Wartime Bureau of Technical Personnel at Ottawa under the auspices of the Department of Labour.

You held the honourable and difficult post of Assistant Director of National Selective Service of the Dominion of Canada, discharging its duties with honour to yourself and with devotion to your country.

You have many devoted friends among engineers in this country, and Rose Polytechnic Institute is honoured in giving to you and in your acceptance from her, of an honorary degree.

I am happy to present you, the honoured son of our beloved sister nation on this continent, for the honorary degree of Doctor of Engineering.

To our three most recent doctors, our members will accord their hearty congratulations. R. J. D.

NEWLY ELECTED OFFICERS OF THE INSTITUTE

Wilfred Proctor Brereton, M.E.I.C., is the new vice-president of the Institute for the Western provinces. Born at Bethany, Ont., he received his primary education at the public and high schools of Port Hope, Ont., and studied engineering at the University of Toronto, where he graduated as a B.A.Sc. in 1903. Upon graduation he joined the engineering staff of Heyl & Patterson, Pittsburgh, Pa., where he worked until 1904. From 1906 to 1912 he was employed with Smith, Kerry and Chace, consulting engineers, Toronto, as assistant engineer on the construction of the hydro-electric plant for the city of Winnipeg and later as resident manager at Portland, Ore., on the construction of a hydro-electric power plant for the Mount Hood Railway and Power Company. Later he became Commissioner for the Winnipeg and St. Boniface Harbour Board.

In 1917 he was appointed city engineer at Winnipeg, Man., and has occupied that position ever since. Mr. Brereton was chairman of the Winnipeg Branch of the Institute in 1918 and 1919 and he was a councillor of the Institute in 1919, 1920 and 1921.

Lieut.-Colonel Le Roy Fraser Grant, M.E.I.C., was elected a vice-president of the Institute representing the province of Ontario at the annual meeting last month. Colonel Grant is General Staff Officer at Military District No. 3 Headquarters, Kingston.

W. P. Brereton, M.E.I.C.

Lt.-Col. L. F. Grant, M.E.I.C.

C. K. McLeod, M.E.I.C.

Born at Toronto, he attended the Royal Military College and Queen's University, Kingston, obtaining a diploma with honours from the former in 1905 and the degree of B.Sc. from the latter in 1925. In 1910 he became registered as a British Columbia Land Surveyor. From 1905 until 1909 he was engaged on railway work as draughtsman, levelman and resident engineer successively on the Grand Trunk Pacific Railway in British Columbia. He then became associated with the firm of F. S. Clements and later with that of Dutcher Maxwell and Company in Vancouver, B.C.

During four years he was with the Canadian Overseas Railway Construction Corps as captain for two years and later received the promotion to major, second in command of the 5th Battalion, Canadian Railway Troops. On his return to Canada he was engaged in surveying for three years and he was made instructor in engineering at the Royal Military College, in 1922, becoming associate professor the following year. In 1940 he was appointed to his present position.

In 1936-37 Colonel Grant was secretary-treasurer of the Kingston Branch and in 1938, 1939 and 1940, he was a councillor of the Institute.

Clement Kirkland McLeod, M.E.I.C., is the newly elected vice-president of the Institute for the province of Quebec. Mr. McLeod is managing director and chief engineer of Walter Kidde & Company of Canada Limited, Montreal, as well as engineering representative of the Permutit Company of Canada Limited for the provinces of Ontario, Quebec and the Maritimes.

Born in Montreal, he graduated from McGill University with the degree of B.Sc. in chemical engineering in 1913, and upon graduation became plant chemist with the Canada Cement Company for the next three years. From 1916 to 1919 he was engaged on the inspection of explosives with the Imperial Ministry of Munitions. In May, 1919, he was appointed chief chemist for the Dominion Glass Company and a year later became superintendent with Consumers Glass Company. In May, 1921, Mr. McLeod was with the Phoenix Bridge and Iron Works on design and sales of structural steel work. When this firm was taken over in October, 1923, by Canadian Vickers Limited, he occupied a similar position with the new organization. Since 1925, Mr. McLeod has represented the Permutit Company, Walter Kidde and Company and the American Hard Rubber Cement Company in eastern Canada, first as manager of the Chemical Engineering Equipment Company, then as a principal of Busfield McLeod Limited and in 1934 he entered into business under his own name representing the

same interests. He is an alderman for the City of Westmount.

Mr. McLeod is very well known to the membership of the Institute as a past secretary-treasurer of the Montreal Branch, which office he held for ten years. He was chairman of the Montreal Branch in 1939 and councillor of the Institute in 1940, 1941 and 1942. He is a son of the late Professor C. H. McLeod, who for twenty-five years was general secretary of the Institute.

Clarence Victor Christie, M.E.I.C., head of the department of electrical engineering at McGill University, Montreal, is the newly elected treasurer of the Institute. Born at Couva, Trinidad, B.W.I., he was educated at Dalhousie University, Halifax, where he received the degree of B.A. in 1902, and the following year was awarded the M.A. degree. In 1906 he graduated from McGill University with the degree of B.Sc.

Following graduation, he was appointed lecturer at McGill and in 1908 became assistant professor. In 1913 he was appointed associate professor of electrical engineering and in 1926 he succeeded the late Dr. L. A. Herdt, M.E.I.C.,

C. V. Christie, M.E.I.C.

C. E. Webb, M.E.I.C.

as Macdonald professor of electrical engineering and head of the department.

On many occasions, Professor Christie has acted as consulting engineer for Shawinigan Water & Power Company Limited and other firms and is recognized as an authority in his field. His text-book on electrical engineering has been widely used by students in universities both in Canada and the United States.

He has always taken an active interest in the work of engineering societies and in 1927 he was chairman of the Montreal Branch of the Institute. He was a councillor of the Institute in 1931, 1932 and 1933. Professor Christie was vice-president of the American Institute of Electrical Engineers in 1935-36.

Christopher Everest Webb, M.E.I.C., is the newly elected councillor of the Institute representing the Vancouver Branch. Mr. Webb is the district chief engineer for British Columbia of the Dominion Water and Power Bureau of the Department of Mines and Resources. He graduated from the University of Toronto in 1910 with the degree of B.A.Sc. and since 1913 he has been in the service of the Department. From 1913 to 1918 he was assistant to the assistant chief engineer and from 1918-25 he occupied the position of assistant chief engineer. In 1925 he was appointed to his present position.

In 1934 Mr. Webb received the degree of civil engineer from the University of Toronto. He was a member of the Council of Association of Professional Engineers of the Province of British Columbia in 1936 and in 1939 was elected president of the Association. In 1940 he was appointed a member of the board of arbitration established by the

International Joint Commission to enquire into damages suffered because of the diversion of Goat River, B.C., which formerly emptied into Kootenay Lake and now empties into Kootenay River above the lake. He is at present a member of the International Kootenay Lake Board of Control.

Mr. Webb was chairman of the Vancouver Branch of the Institute in 1940.

Edward Nelson, M.E.I.C., has been elected councillor of the Institute representing the Edmonton Branch. Born at Teddington, Middlesex, England, he was educated at Bristol, England, and came to Canada as a youngster. He later studied in Edmonton under Professor Muir Edwards of the University of Alberta, and, from 1913 to 1920, he was engaged in surveying work in the West. He joined the Department of the Interior of the Dominion in 1920 and did surveying work until 1924 when he entered the employ of Northwestern Utilities Limited at Edmonton, the company of which he is now chief engineer.

He was chairman of the Edmonton Branch of the Institute in 1940.

Alexander McIntosh Macgillivray, M.E.I.C., has been elected councillor of the Institute representing the Saskatchewan Branch. Born at Antigonish, N.S., he received his engineering education at St. Francis Xavier College, Antigonish. He joined the Canadian Northern Railway in 1900 and during several years was engaged on construction work in the maritime provinces.

He went to Manitoba in 1914, and in 1918 became division engineer for the Canadian Government Railway at Port

A. M. Macgillivray, M.E.I.C.

H. G. O'Leary, M.E.I.C.

Geo. E. Medlar, M.E.I.C.

Arthur, Ont. In 1919 he became district engineer with Canadian National Railways, at Saskatoon, Sask., a position which he still holds.

Mr. Macgillivray was active on the executive of the Saskatchewan Branch for several years.

Hugh Gordon O'Leary, M.E.I.C., was elected councillor of the Institute representing the Lakehead Branch at the annual meeting last month. Born at Lindsay, Ont., he studied engineering at the University of Toronto where he graduated with honours in 1904. Upon graduation he joined the Transcontinental Railway and he was engaged in surveying work until 1906 when he went with the Grand Trunk Pacific Railway Company where he held the position of resident engineer of the Lake Superior Branch from 1907 to 1909. In 1909, he returned to the Transcontinental Railway as division engineer. In 1927 he became superintendent with the Canadian National Railways at Fort William, Ont., a position which he still holds.

Mr. O'Leary was chairman of the Lakehead Branch of the Institute in 1940.

George Elmer Medlar, M.E.I.C., is the newly elected councillor of the Institute representing the Border Cities Branch. Born in Wentworth County, Ont., he was educated at the Hamilton public and high schools, later taking a correspondence course in engineering and surveying. In 1908 to 1918 he was engaged in surveying work in Saskatchewan and Alberta. In the early part of 1919 he was with the Hamilton Harbour Commission as assistant on surveys and reports and later became assistant on sewers, waterworks and power dam development surveys at Timmins,

J. A. Vance, M.E.I.C.

Ont. From 1920 to 1938 he was engineer in charge of field and office work with the Essex Border Utilities Commission at Windsor, Ont., and in 1938 he became office engineer with the Windsor Utilities Commission at Windsor, Ont., a position which he still holds.

Mr. Medlar acted as secretary-treasurer of the Border Cities Branch and he was chairman in 1941.

James Alfred Vance, M.E.I.C., engineer and contractor of Woodstock, Ont., was re-elected councillor of the Institute representing the London Branch at the annual meeting last month. He has been a councillor representing his Branch since 1933.

Born in the County of Oxford, Ont., he was educated at the University of Toronto. On the death of his father in 1914 he took over the contracting business and became responsible for the administration, engineering and construction of steel and concrete highway bridges. From 1919 the business grew to include the design and construction of factory buildings, sewers, dams and various concrete and steel structures. Mr. Vance is at present the proprietor and engineer of the firm of J. A. Vance, contractor, at Woodstock.

Mr. Vance has been active in Institute affairs for a great many years. Lately he has represented the Institute on the Engineers' Council for Professional Development Committee on Professional Recognition.

Harry Elmer Brandon, M.E.I.C., structural and mechanical engineer with the Hydro-Electric Power Commission of Ontario, has been elected councillor of the Institute representing the Toronto Branch. He was born at Can-

H. E. Brandon, M.E.I.C.

N. B. MacRostie, M.E.I.C.

A. Jackson, M.E.I.C.

E. V. Gage, M.E.I.C.

nington, Ont., and was educated at the University of Toronto where he was graduated in 1907. Upon graduation he went with the Manitoba Bridge and Iron Works at Winnipeg, and in 1910 joined the Vulcan Iron Works of Winnipeg. From 1911 to 1915 he was chief engineer with this firm, and from 1915 to 1919 he was overseas in active service. In 1919 he joined the Hydro-Electric Power Commission of Ontario as a structural and mechanical engineer and is still with the Commission.

Mr. Brandon was chairman of the Toronto Branch of the Institute in 1941.

Norman Barry MacRostie, M.E.I.C., has been elected a councillor of the Institute representing the Ottawa Branch. Born at Metcalfe, Ont., he was educated at Queen's University where he graduated in 1911. In 1912 he was in charge of field work as assistant to the inspector of surveys in Manitoba and Saskatchewan and in 1913 he was employed with J. B. McRae, consulting engineer, Ottawa, as inspector on construction of a dam at High Falls, Que. In 1913 he joined the engineering department of the City of Ottawa, first as assistant roadway engineer and later he became in charge of sidewalks as well as city surveyor. From 1916 to 1918 he was gauge examiner with the Imperial Munitions Board.

In the spring of 1918 he joined the Royal Canadian Engineers and went overseas. Upon his return to Canada in 1919 he became a member of the firm of Lewis and MacRostie, civil engineers and surveyors, Ottawa. Later he was associated with the firm of MacRostie and White. At present he is in practice on his own account.

Mr. MacRostie was chairman of the Ottawa Branch of the Institute in 1942.

Arthur Jackson, M.E.I.C., professor of engineering drawing at Queen's University, is the newly elected councillor of the Institute representing the Kingston Branch. Born at Hamilton, Ont., he received his primary education in the local schools and from 1908 to 1912 he served an apprenticeship with Hamilton Bridge Works Company at Hamilton, then went to Queen's University where he graduated in 1916 as a Bachelor of Science. He went overseas in the summer of 1916 and served with the Royal Canadian Engineers in France and Belgium until 1919. He joined the staff of Manitoba Bridge and Iron Works at Winnipeg upon his return to Canada in the summer of 1919. The following year, he joined the staff of Queen's University as an associate professor in engineering drawing, later becoming professor, a position which he still holds.

Professor Jackson has been active on the executive of the Kingston Branch for a great many years.

Edward Victor Gage, M.E.I.C., president of A. F. Byers Construction Company, Montreal, has been elected a councillor of the Institute representing the Montreal Branch. Born at Pearceston, Que., he received his engineering education at McGill University and graduated in civil engineering with the degree of B.Sc. in the class of 1915.

Upon graduation he joined the firm of the late A. F. Byers, M.E.I.C., engineer and contractor, and has been with the company ever since. Upon the death of Mr. Byers last year, Mr. Gage became president of A. F. Byers Construction Company, Limited.

He has been active in the Montreal Branch of the Institute for a great many years.

J. A. Lalonde, M.E.I.C.

H. J. Ward, M.E.I.C.

J. W. Ward, M.E.I.C.

John P. Mooney, M.E.I.C.

Chas. Scrymgeour, M.E.I.C.

Joseph Antonio Lalonde, M.E.I.C., was elected councillor of the Institute representing the Montreal Branch at the annual meeting last month. Born at Au Sable, Michigan, he was educated at the Ecole Polytechnique, Montreal, where he graduated in 1912. Upon graduation he spent a few months on railway work with the North Railway Company at Hudson Bay. In 1913 he joined the staff of the City of Outremont as assistant engineer. In 1920 he went with the City of Montreal as assistant superintendent of streets, a position which he left in 1924 to join the staff of Quinlan, Robertson and Janin, Montreal, as manager of the paving department. In addition to these duties he was chief engineer of A. Janin and Company from 1930 to 1939. At that time he became manager and chief engineer of the Quebec Paving Company, Montreal, and associated companies. Last year he accepted a position as production manager with Marine Industries Limited at Sorel, Que. He has been professor in municipal engineering at Ecole Polytechnique since 1926.

Mr. Lalonde was chairman of the Montreal Branch of the Institute in 1942.

Herbert James Ward, M.E.I.C., is the newly elected councillor of the Institute representing the St. Maurice Valley Branch. Born and educated in England, Mr. Ward joined the Shawinigan Water & Power Company Limited at Shawinigan Falls, Que., in 1911, and has been employed with the firm ever since. From 1915 he was assistant city engineer of Shawinigan Falls. Mr. Ward has been connected with the hydro-electric development in the Valley since the earliest days and he now holds the position of superintendent of property of the company at Shawinigan Falls.

Mr. Ward was chairman of the St. Maurice Valley Branch of the Institute in 1938.

John Wilmot Ward, M.E.I.C., has been elected councillor of the Institute representing the Saguenay Branch. Born at

Hagersville, Ont., he was educated at the University of Toronto where he graduated in 1921. From 1921 to 1923 he was service manager for Wagner Electric Corporation at Toronto, Ont. In 1923 he joined the staff of the Aluminum Company of Canada Limited at Toronto as assistant engineer. In 1926 he was transferred to Arvida, Que., as assistant engineer in the electrical department.

Mr. Ward was chairman of the Saguenay Branch of the Institute in 1940-41.

John Patrick Mooney, M.E.I.C., is the newly elected councillor of the Institute representing the Saint John Branch. Born at Saint John, N.B., he was educated at the University of New Brunswick where he received the degree of B.Sc. in 1916. Upon graduation he entered the employ of B. Mooney and Sons, general contractors at Saint John. In 1919 he became manager of the company still retaining this position when the firm name was later changed to Mooney Construction Company.

Mr. Mooney was chairman of the Saint John Branch of the Institute in 1940.

Charles Scrymgeour, M.E.I.C., refinery engineer with Imperial Oil Limited at Dartmouth, N.S., is the newly elected councillor of the Halifax Branch of the Institute. Born and educated at Liverpool, England, he served his apprenticeship with Jas. Buchanan & Sons, Ltd., engineers at Liverpool. During the last war he was employed in the manufacture of munitions for the same firm and later for the Austin Motor Company at Birmingham. He came to Canada in 1919 and joined the Acadia Sugar Refining Co. Ltd., at Woodside, N.S., as a draughtsman. In 1921 he went with Imperial Oil Refineries Limited at Dartmouth, N.S., becoming assistant refinery engineer in 1926. In 1929 he was appointed refinery engineer a position which he still holds.

Mr. Scrymgeour was chairman of the Halifax Branch of the Institute in 1940.

JANUARY JOURNALS REQUIRED

There has been an unusual demand for extra copies of the January, 1943, issue of *The Engineering Journal* and it would be appreciated if members who do not retain their copies would return them to Headquarters, at 2050 Mansfield Street, Montreal, Que.

INSTITUTE PRIZE WINNERS

Henry Girdlestone Acres, M.E.I.C., consulting engineer, H. G. Acres and Company, Niagara Falls, Ont., is one of the recipients for 1942 of the Julian C. Smith Medal awarded by the Institute "for achievement in the development of Canada."

The citation, read upon presentation of the medal to Dr. Acres at the annual banquet is as follows:

"A distinguished graduate of the University of Toronto where he was awarded a doctor's degree in 1924, Henry Girdlestone Acres began his association with power development with Canadian Niagara Power Company in 1903. In 1911 he became the chief hydraulic engineer. During the next twelve years he dealt with installations having a total capacity of over a million horsepower. In 1924 he began his consulting practice. His sphere of activity has included work in Quebec, New Brunswick, Alberta, Saskatchewan, Newfoundland, India and South America.

Dr. Acres has taken such a leading part in the development of our power resources that it would seem especially fitting for The Engineering Institute of Canada to recognize his achievements and professional eminence."

Robert Melville Smith, M.E.I.C., deputy minister of the Department of Highways for the province of Ontario, is one of the recipients for 1942 of the Julian C. Smith Medal awarded by the Institute "for achievement in the development of Canada." Mr. Smith could not be present at the annual banquet to receive his medal. The citation which accompanies the award reads as follows:

"The successful development of the admirable highway system of Ontario during the past twenty years has been in no small measure due to the supervisory work of Robert Melville Smith, first as chief engineer and then deputy minister of highways, and since 1935 as deputy minister of the combined Departments of Highways and Northern Development. In these capacities his administration has been far-sighted and economical. He has been called in as consultant on many important projects, among which may be mentioned the extensive programme of the Grand River Conservation Commission and the Alaska Highway.

Mr. Smith is a distinguished alumnus of Queen's University where he graduated in 1914. Since then his time has been devoted to the public service, in which he has gained a well-earned reputation as one of the leading Canadian authorities on highway problems. He has indeed 'rendered outstanding service in furthering the development of Canada'."

Dr. Stanley Dale Lash, M.E.I.C., has been awarded the Gzowski Medal of the Institute for 1942, for his paper, "The Analysis and Design of Rectangular Reinforced

Concrete Slabs Supported on Four Sides," published in the September 1941 issue of *The Engineering Journal*. Born at Sheffield, England, Dr. Lash is an honour graduate of the City and Guilds Engineering College, London, England, and a Ph.D. of the University of Birmingham. He came to Canada in 1929 as draughtsman with the Northern Electric Company of Montreal, and later was employed with the Dominion Reinforcing Steel Company, Limited, Montreal. In 1930, he went to Vancouver as a structural detailer with the British Columbia Electric Railway Company, Limited. From 1931 to 1933 he did post-graduate work at the University of Birmingham, and from 1933 to 1935 he worked as a research assistant with the Steel Structures Research Committee in England.

Returning to Canada in 1935, he was instructor in civil engineering at the University of British Columbia until 1938, when he joined the National Research Council at Ottawa as a junior engineer. Later Dr. Lash was acting secretary of the National Building Code project with the National Research Council. In 1941 he joined the teaching staff at Queen's University as a lecturer in civil engineering and last year he became assistant professor of civil engineering. Dr. Lash is a frequent contributor to *The Engineering Journal*.

John Henry Maude, M.E.I.C., chief designer of the Mining, Metals and Plastics Machinery Department of the Dominion Engineering Company, Montreal, is the recipient of the Duggan Medal and Prize of the Institute for 1942, for his paper on "The New Oil-Hydraulic Press in Munitions Manufacture" presented at the annual meeting of the Institute in 1942 and published in the February, 1942 issue of *The Engineering Journal*.

Born at Manchester, England, he was educated at the Manchester College of Technology, and served an apprenticeship with Sir W. G. Armstrong Whitworth at Manchester. From 1917 to 1924 he was employed as a draughtsman and designer for the general engineering department of Sir W. G. Armstrong Whitworth, and from 1924 to 1929 he was leading designer with Messrs. Vickers Armstrong, Manchester.

Mr. Maude came to Canada in 1929 as a mechanical engineer with Dominion Bridge Company Limited at Lachine, Que., later transferring to the Dominion Engineering Company Limited. He is the patentee and co-patentee of the numerous devices used on the presses manufactured by his company. Since the outbreak of war he has been particularly responsible for the design and development of the modern hydraulic presses used in the manufacture of shell cases.

H. G. Acres, M.E.I.C.

R. M. SMITH, M.E.I.C.

S. D. Lash, M.E.I.C.

J. H. Maude, M.E.I.C.

E. A. Allcut, M.E.I.C.

Paul Billingsley, M.C.I.M.M.

Edgar Alfred Allcut, M.E.I.C., professor of mechanical engineering at the University of Toronto, is the recipient of the Plummer Medal of the Institute for 1942, for his paper, "Producer Gas for Motor Transport" published in the April, 1942 issue of *The Engineering Journal*. Born at Birmingham, England, he was educated at the University of Birmingham where he received the degree of B.Sc. in engineering with honours in 1908 and the degree of M.Sc. in engineering in 1909. From 1908 to 1910 he was research scholar at the University of Birmingham. From 1910 to 1913 he was assistant engineer with the Humphrey Pump Company at Westminster, England, and in 1913 he became manager in the engineering and testing machine department of W. & T. Avery Limited, Birmingham. From 1917 to 1921 he was chief inspector of materials with the Austin Motor Company at Birmingham. Professor Allcut came to Canada in 1921 as associate professor of mechanical engineering at the University of Toronto, and in 1931 he became professor of mechanical engineering. In 1930 Professor Allcut was awarded the Herbert Akroyd Stuart prize of the Institution of Mechanical Engineers, London, England, for the best paper published in their Proceedings during the years 1927-28 and 1929, on the general subject of the origin and development of heavy oil engines. This was the first time that one of the Herbert Akroyd Stuart prizes had been awarded outside of Great Britain.

Professor Allcut is technical advisory editor of *Manufacturing and Industrial Engineering* a monthly publication from Toronto, and chairman of the sub-committee on Producer Gas of the National Research Council. He is also a member of the Institute's committees on Industrial Relations and International Relations.

Paul Billingsley, M.C.I.M.M., is the joint winner of the Leonard Medal of the Institute for 1942 for his paper written in co-operation with Mr. C. B. Hume on "Ore Deposits of Nickel Plate Mountain," published in the May 1941 issue of *The Canadian Mining and Metallurgical Bulletin*. Mr. Billingsley is a consulting geologist of Burton, Wash.

Chamberlain Bruce Hume, M.C.I.M.M., joint winner of the Leonard Medal of the Institute for 1942, was born at Revelstoke, B.C. He was educated at Mount Allison University, Sackville, N.B., and Nova Scotia Technical College, Halifax, where he received the degree of B.Sc. in mining engineering in 1930. From 1930 to 1932 he was engaged in highway construction work in British Columbia and he did prospecting work in the Caribou district, B.C. Since 1934 he has been with the Kelowna Exploration Company at Hedley, B.C., and is now chief engineer and resident geologist in charge of operations at the Nickel Plate mine.

Robert John Graham Schofield, Jr., E.I.C., has been awarded the John Galbraith Prize of the Institute for 1942. He received his early education in Winnipeg, Toronto and Montreal West. He entered McGill University in 1929 and graduated in 1935 with the degree of Bachelor of Engineering in chemical engineering. Upon graduation he went with Brunner Mond (Canada) Ltd., at Amherstburg, Ont. In 1936 he joined Canadian Cottons Limited, and spent two years in their Milltown, N.B. branch and was then transferred to their mill in Hamilton, Ont., where he is at present located.

C. B. Hume, M.C.I.M.M.

R. J. G. Schofield, Jr., E.I.C.

René Dansereau, S.E.I.C.

Paul O. Freeman, S.E.I.C.

René Dansereau, S.E.I.C., has been awarded the Ernest Mareau Prize of the Institute for 1942 for his paper on "Etude comparative de la construction par rivure et par soudure d'un pont-route en acier." Mr. Dansereau received his early education at Mont Saint-Louis College, Montreal and is a graduate of Ecole Polytechnique in the class of 1942. During vacations he worked for several firms of contractors as inspector and draughtsman and was with the Dominion Bridge Company, Limited, for a time.

Mr. Dansereau is now a Pilot Officer in the R.C.A.F. in training at Rivers, Man.

Paul O. Freeman, S.E.I.C., was awarded the Phelps Johnson Prize of the Institute for 1942 for his paper on "Cold Rivetting—Its Principles, Procedure and Advantages." He received his primary education at the Montreal West High School and is at present in his final year of civil engineering at McGill University. During college vacations he has been employed at the Angus Shops of the Canadian Pacific Railway Company, and with the Dominion Bridge Company.

MEETINGS OF COUNCIL

The Annual Meeting of the Council of the Institute was held at the Royal York Hotel, Toronto, on Wednesday, February 10th, 1943, convening at ten o'clock a.m.

Present: President C. R. Young (Toronto) in the chair; Past-Presidents T. H. Hogg (Toronto) and C. J. Mackenzie (Ottawa); Vice-Presidents deGaspé Beaubien (Montreal), K. M. Cameron (Ottawa), Hector Cimon (Quebec), J. L. Lang (Sault Ste. Marie), and G. G. Murdoch (Saint John); Councillors J. E. Armstrong (Montreal); J. M. Fleming (Port Arthur), E. D. Gray-Donald (Quebec), J. G. Hall (Montreal), R. E. Heartz (Montreal), W. G. Hunt (Montreal), E. M. Krebsner (Walkerville), N. MacNicol (Toronto), C. K. McLeod (Montreal), A. W. F. McQueen (Niagara Falls), A. E. Pickering (Sault Ste. Marie), G. M. Pitts (Montreal), H. R. Sills (Peterborough), J. A. Vance (London), and A. O. Wolff (Saint John); Vice-President Elect L. F. Grant (Kingston); Councillors-Elect H. E. Brandon (Toronto), E. V. Gage (Montreal), A. Jackson (Kingston), N. B. MacRostie (Ottawa), and H. J. Ward (St. Maurice Valley). Treasurer E. G. M. Cape (Montreal), Secretary-Emeritus R. J. Durley, General Secretary L. Austin Wright, and Assistant General Secretary Louis Trudel.

There were also present by invitation—Past-Presidents J. B. Challies (Montreal), J. M. R. Fairbairn (Peterborough), and O. O. Lefebvre (Montreal); Past-Vice-President H. E. T. Haultain (Toronto); Past-Councillor Huet Massue (Montreal); T. S. Glover, chairman, Hamilton Branch; R. S. Eadie, chairman, Montreal Branch; René Dupuis, chairman, and Paul Vincent, secretary, Quebec

Branch; J. T. Farmer (Montreal), chairman, Duggan Medal and Prize Committee; G. A. Gaherty (Montreal), chairman, Committee on Western Water Problems; S. R. Frost, member of Membership Committee; W. S. Wilson, chairman of the Toronto Branch and chairman of the Annual Meeting Committee.

After extending a cordial welcome to all councillors and guests, President Young asked each person to rise and introduce himself to the meeting.

President Young explained that this proposed "Canons of Ethics" had been prepared by a special committee of the Engineers' Council for Professional Development (E.C.P.D.), under the chairmanship of Dr. Dugald Jackson. The committee had realized that undoubtedly there would be some criticism regarding the length of the document, but it had felt that it would be very useful to young engineers if these principles of ethics were set forth in a little more detail than in the ordinary short codes. The committee was co-operating with the E.C.P.D. committee on Professional Training which is particularly concerned with the progress of young engineers in the post-graduate years. It was felt that such a document would serve a very useful purpose in pointing out to young engineers certain pitfalls which might not be revealed in a shorter code. If any organization wished to have a shorter code, an abstract could be prepared.

The proposed "Canons of Ethics" had been sent out to all members of Council with a request for comments, and the general secretary reported that replies had been received from seven members. These replies varied somewhat—some expressed approval, others made some comment, and one or two had made constructive suggestions. The general opinion appeared to be that the document was too long, although it was admitted that it might be necessary to include all the items in order to accomplish the desired result.

At the president's request, the general secretary gave a summary of the replies received and after some discussion, on the motion of Mr. Pitts, seconded by Mr. Gray-Donald, it was unanimously resolved that the president appoint a small committee to study the proposed "Canons of Ethics" and the replies received from councillors, and prepare a report for submission to Council.

Dr. Challies, chairman, of the Institute's Committee on Professional Interests, reported that in Manitoba the Council of the Association of Professional Engineers and the executive of the Winnipeg Branch of the Institute had approved a form of co-operative agreement, which was acceptable to the Committee on Professional Interests.

This was noted with satisfaction, and the hope was expressed that the agreement would be consummated at an early date. It was explained that at the moment the Council of the Association feels that as many of its members are overseas, a ballot to obtain approval of the agreement from the membership should not be taken until after the war. Following some discussion, on the motion of Mr. Vance, seconded by Mr. Wolff, it was unanimously resolved that Council should express to the Association its appreciation of the progress which has been made, and inform them that Council is prepared to send out the Institute ballot to members in Manitoba concurrently with a similar action by the Association, at any time acceptable to the Association and the Winnipeg branch.

President Young introduced the topic of affiliation with sister societies by explaining the sequence of events prior to the recent authorization by the Board of Direction of the American Institute of Electrical Engineers (A.I.E.E.) of a new section in the city of Montreal. He informed Council that he had gone to New York to discuss this matter with Mr. Osborne, the president of the A.I.E.E., with whom the situation was reviewed thoroughly and the Institute's policy and aspirations were explained in detail. In President Young's opinion, additional sections of American societies in Canada would be unfortunate inasmuch as they would

confuse and retard the efforts of the Institute to simplify and coordinate organized engineering in Canada. The president emphasized to Mr. Osborne the seriousness of this development, not only from the point of view of the Institute, but the whole profession, and suggested to him that the A.I.E.E. take no action with regard to the application for the section until the two societies had had an opportunity to survey the situation to see if some other amicable and equally advantageous arrangement might be evolved.

While at that time Mr. Osborne agreed that some co-operative basis of operation might be evolved which would work out to the mutual advantage of both organizations, President Young had received, a few days previous to this Council meeting, a letter from Mr. Osborne stating that the A.I.E.E. Board had unanimously decided to grant section status to the Montreal members. The letter from President Osborne and the brief acknowledgment of President Young were read to the meeting.

At the request of the president, Past-President J. B. Challies summarized recent developments referring to the viewpoint of several senior Montreal members of the A.I.E.E. who had approached him in the matter and expressed strong disapproval of the proposed section. He pointed out the difficulties which would face organized engineering in Canada if all the American societies decided to operate sections in various parts of Canada, particularly if these societies attempted to enter the Canadian universities and organize student chapters.

Mr. Challies stated that the recent action of the Board of the A.I.E.E. posed a problem for the E.I.C. which must be considered dispassionately from a long-term viewpoint, and in its broadest aspect. He thought the time had come when the Institute should consider the advisability of obtaining authority by an appropriate new by-law, similar to the by-law authorizing co-operative agreements with the provincial professional associations that would permit the Council to enter into co-operative agreements with British, American or Canadian professional engineering bodies, covering joint meetings; reciprocal membership privileges; availability at reduced cost of society publications, etc., etc., all for the purpose of promoting the best interests of the engineering profession in Canada.

Past-President Dean Mackenzie stated that he thought there was a great danger in the movement which had been started, particularly if it gets into the universities. He expressed the view that there was a definite value in membership in the American societies, but these values were principally in the publications. He agreed with Mr. Challies that the situation should be canvassed with dignity and consideration in order to find a satisfactory solution. Past-Presidents Fairbairn and Lefebvre were also of the opinion that the profession would suffer in a development of segregation and that everything should be done to avoid it. Past-President Lefebvre pointed out that the engineers are the only profession that allowed themselves to be divided in their societies.

It was the unanimous opinion of the members present at the meeting that an immediate survey be made of the Institute's relations with other engineering societies and that at the same time a study be made as to the best way for improving these relations in the future and possibly of codifying them through co-operative agreements similar in general setup to those that have been entered into between the Institute and the provincial professional associations.

A motion made by Vice-President Beaubien and seconded by Councillor Armstrong was unanimously agreed to—that the incoming president select a committee to advise Council as to what action would be appropriate under the circumstances and to do so with the least practicable delay.

Mr. Hall reviewed the work of the Membership Committee during the past year and commented briefly on the various items which had received consideration by the

committee, including branch affiliates, Institute affiliates, membership in provincial professional associations, branch recommendations with particular reference to the waiving of examinations, and the whole question of the method of dealing with applications. His committee had reported on the various items, and there was now before Council a report which included a proposed "Memorandum to branch executives—re qualifications for membership," together with a suggested form for the use of branch membership or executive committees in summarizing all available information regarding an applicant. A copy of this memorandum had been sent to all members of Council and councillors-elect with a request for comments.

Mr. Hall's committee would like to see this form used by the branch committees, and would also like to see some central committee appointed to study applications before they are presented to Council.

Colonel Cape expressed his appreciation of this very comprehensive report. In his opinion more information should be available to members of Council, including details of the examinations which have to be passed, and a list of the schools which are recognized by Council.

Mr. Gray-Donald pointed out that the requirements for the various classes of membership as described in the by-laws, were the minimum requirements in each case. He felt that Council was perhaps too lenient in admitting to corporate membership applicants who only just fulfil the requirements. Membership in the Institute was not "permission to practise," but such membership gave a definite standing in the profession which took a certain length of time to acquire.

Following some further discussion, on the motion of Mr. Hall, seconded by Mr. Armstrong, it was unanimously resolved that the report of the Membership Committee be approved, and that the proposed memorandum be sent out to all branch executives with a request that they operate under it for one year as a trial.

A letter was presented from the Toronto Branch advising that that branch had given consideration to the use on the Institute letterhead of the words "Incorporated 1887 as The Canadian Society of Civil Engineers." There appeared to be a feeling among certain engineers that the Institute is being operated mainly by and for the benefit of civil engineers rather than for the whole engineering profession. To counteract this, the Toronto Branch feels that unless there is some special reason for retaining those words on the letterhead, it would be desirable to omit them.

The general secretary reported that on receipt of this letter, he had consulted the Institute's counsel who had advised that it would be in order for the Institute to retain on its letterhead and other documents the words "Incorporated 1887" and, at the same time, eliminate the words "as The Canadian Society of Civil Engineers". The fact that the Canadian Society of Civil Engineers had changed its name to the Engineering Institute of Canada, did not in any way affect the date of its incorporation.

On the motion of Mr. MacRostie, seconded by Mr. Hertz, it was unanimously resolved that the words "as The Canadian Society of Civil Engineers" be deleted from the Institute letterhead and other documents.

The general secretary read the following letter which had just been received from the Assistant Dean and Secretary of the Faculty of Applied Science and Engineering at the University of Toronto:

"The report of the Committee on Industrial Relations of the Engineering Institute of Canada has been considered and studied for some time by the Committee on Policy of the Council of the Faculty of Applied Science and Engineering.

"The Council at its meeting of February 1, 1943, recorded in its minutes its sympathetic approval of the attention being devoted to Industrial Relations by the Engineering Institute of Canada, and directed that the Institute be advised of the importance with

which the Council views the work presently conducted in the Faculty in this field. The Council has appointed a committee to investigate the desirability and possibility of extending this work, and of initiating instruction in the general field of Industrial (or Administrative) Engineering."

Dr. Challies commented on the appointment of Robert E. Laidlaw, K.C., as judge on the Appellate Division of the Supreme Court of Ontario. He pointed out that Mr. Laidlaw had been graduated as a civil engineer from the University of Toronto in 1915. He had entered Osgoode Hall the following year, and was called to the bar of Ontario in 1919. He has had a distinguished career, and in association with Dean C. R. Young was co-author of the only text book in Canada on Engineering Law. Dr. Challies suggested that a letter from the president to his associate, congratulating him on his appointment, would be most appropriate. President Young was quite sure that Mr. Justice Laidlaw would be delighted to receive such an appreciation from the Council of the Institute. Although he had not practised engineering for a number of years, he was still keenly interested in engineers and engineering. He is a man of extraordinary capacity and one of the leading lawyers of the province. Accordingly, on the motion of Mr. Vance, a class-mate of Mr. Laidlaw, seconded by Mr. Hall, it was unanimously resolved that a letter congratulating him on his recent appointment, and expressing the good wishes of Council, be sent to Mr. Justice Laidlaw.

A number of applications were considered, and the following elections and transfers were effected:

The president announced that a meeting of the new Council, to which all retiring councillors are invited, would be held on Thursday, February 11th, at four o'clock p.m.

The Council rose at one fifteen p.m.

A meeting of the Council of the Institute was held at the Royal York Hotel, Toronto, on Thursday, February 11th, 1943, at four o'clock p.m.

Present: President K. M. Cameron in the chair; Past-President C. R. Young; Vice-Presidents Hector Cimon, L. F. Grant, J. L. Lang and G. G. Murdoch; Councillors J. E. Armstrong, H. E. Brandon, E. V. Gage, E. D. Gray-Donald, R. E. Hartz, W. G. Hunt, A. Jackson, N. B. MacRostie, A. E. Pickering, G. M. Pitts, H. R. Sills, J. A. Vance and H. J. Ward; Past-Councillor A. O. Wolff; Colonel E. G. M. Cape; H. F. Bennett, chairman of the Committee on the Young Engineer; R. S. Eadie, chairman of the Montreal Branch; Colonel George Beecroft, Military Advisor to the Wartime Bureau of Technical Personnel; Secretary-Emeritus R. J. Durley, General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel.

In opening the meeting Mr. Cameron thanked the councillors for attending, and expressed the hope that the Council would have a very profitable and constructive year.

On the motion of Mr. Vance, seconded by Mr. Cimon, it was unanimously resolved that L. Austin Wright be reappointed general secretary of the Institute.

On the motion of Mr. Gray-Donald, seconded by Colonel Grant, it was unanimously resolved that Professor C. V. Christie be appointed treasurer of the Institute.

Before reporting on the work of his committee on the Training and Welfare of the Young Engineer, Mr. Bennett,

as a member of Mr. Cameron's staff for many years, extended, on behalf of the staff of the Department of Public Works of Canada, congratulations to Mr. Cameron on his election to the presidency of The Engineering Institute of Canada. He expressed the hope that his efforts would be crowned with the same success that the Institute has had in recent years.

Although he had nothing of special importance to report regarding the work of this committee, Mr. Bennett stated that he was definitely pleased with the activities of the branches in the matter of student guidance. Student guidance committees had been appointed by all of the branches except three, namely, the Cape Breton Branch which was being looked after in that regard by the Committee of the Halifax Branch; the Moncton Branch which is represented on the main committee by Dean McKiel, and the Lethbridge Branch which is really the only branch not represented. Three active members from the Quebec Branch were in attendance at this annual general meeting: Through the courtesy of the Shawinigan Water and Power Company, the committee had been provided with a French translation of the booklet, "The Profession of Engineering in Canada." These have been distributed to French schools and the reaction has been very favourable—equally or more so than in the English schools. During the past year the committee has had many enquiries from individual students asking for additional information—a very definite evidence that the money and effort expended has been effective. In Mr. Bennett's opinion, it will continue to be so as the work of the student guidance committees is really just getting under way.

Regarding the matter of government aid to university students which had been brought up at the Council meeting in Niagara Falls in October, Mr. Bennett had discussed this with interested parties and there seemed to be no reason why engineering education should not be included in such an arrangement after the war. As the Wartime Bureau of Technical Personnel might be dissolved after the war, it was felt that the matter should be followed up by The Engineering Institute of Canada. Accordingly, his committee will keep in touch with any movement along this line and will have something to present to the government in the future.

Mr. Bennett then touched briefly on the committee's work among the junior engineers. A junior section had recently been formed in the Toronto Branch, and he has agreed to address the group in March or April. Mr. Bennett expressed the hope that the older engineers would make a special effort to help these younger engineers by getting them interested in branch activities. He suggested that something might be published in the nature of a personal message from the president of The Engineering Institute of Canada to be presented to young engineering graduates when entering the profession.

Dean Young stated that it had been suggested to him that the Institute would be rendering a very great service to the engineering profession in Canada if every applicant for admission to an engineering school could be furnished with a copy of the booklet "The Engineering Profession in Canada." In his opinion this suggestion should receive careful consideration, and he suggested that the Finance Committee be consulted with regard to the possibility of undertaking this additional expense. Mr. Bennett pointed out that his committee had about five thousand copies of the booklet on hand so that such a distribution would not involve any additional expense for this year at least. Following some discussion it was unanimously resolved that the suggestion be referred to Mr. Bennett's committee for the necessary action and for possible consultation with the Finance Committee should it be decided to continue such a programme into another year.

Mr. Cameron expressed appreciation of Mr. Bennett's remarks regarding himself. He had had occasion to be particularly proud of the engineers in the government service,

and especially his colleagues in his own department. He hoped the association would continue for many years.

The motion passed at the Annual Meeting of Council on the 10th was presented to this meeting for consideration. This motion stated that a committee to consider Institute policy relative to other professional engineering bodies, and in particular the American Institute of Electrical Engineers (A.I.E.E.), be selected by the incoming president.

Dean Young again outlined the developments leading up to the establishment of the A.I.E.E. section in Montreal and again emphasized the opinion of President Osborne of the A.I.E.E. that there might be established some affiliation between the members of both groups. A very full discussion followed in which Messrs. Young, Sills, Eadie, Armstrong, Gray-Donald, Hertz, Pitts and the president took part. Mr. Eadie spoke of the situation from the point of view of the Montreal Branch of the Institute, and indicated that the branch felt that the matter was one of national importance rather than local and therefore was inclined to wait for some guidance or leadership from Council before going into the situation locally. Finally, it was moved by Past-President Young, seconded by Councillor Armstrong, and unanimously agreed, that President Cameron be authorized to select an appropriate committee to examine the whole question of the Institute's relations with engineering bodies, and in particular the A.I.E.E., and to report to Council at the earliest opportunity regarding ways and means for evolving a programme and a policy for the Institute that will guarantee its position as the national engineering body, and that will best promote the general interest of the profession in Canada.

President Cameron briefly outlined some of the complaints which have come to the Institute with regard to rank and professional remuneration for engineers in the armed services. In the discussion which followed, many councillors participated and a special contribution was made by a friend of the Institute who was particularly well informed on these matters.

Council was sufficiently impressed with the seriousness of the situation that it was agreed that the president should name a committee to examine conditions, with particular reference to professional recognition and the establishment of a Corps similar to that working so effectively in the Imperial Army, known as the Royal Electrical and Mechanical Engineers (R.E.M.E.).

It was agreed that the recommendations of this committee would be taken up vigorously with the proper authorities in order to obtain for the members of the profession equality of treatment with other professions and at the same time increase the efficiency of those divisions of the forces which employ engineers professionally.

Councillor MacRostie drew the Council's attention to the fact that the government had set up, on behalf of the Treasury Board, an Advisory Committee to inquire into and report to the Board in respect of conditions of work and remuneration for employees in the Civil Service. Mr. MacRostie referred to the fact that many engineers in the government service are getting less pay than artisans. He thought the Council of the Institute should appoint a committee to study this whole question and, based on the committee's report, make a recommendation to the Advisory Committee referred to in Order-in-Council No. P.C. 2/584.

It was emphasized by different persons that some of the better qualified engineers were refusing to enter or were leaving the government service because of the inadequacy of the remuneration. The meeting thought this was putting a handicap on government operations and that a proper survey of the situation would indicate that it would be more economical if the government could retain a larger percentage of the highly trained engineers. On the motion of Mr. MacRostie, seconded by Mr. Vance, it was agreed that such a committee should be appointed.

On the motion of Mr. MacRostie, seconded by Mr. Murdoch, it was unanimously resolved that a hearty vote of thanks and an expression of appreciation be extended to the Toronto Branch and the Annual Meeting Committee for their hospitality during the Annual General Meeting.

On the motion of Mr. Vance, seconded by Mr. Armstrong, it was unanimously resolved that the thanks of Council be extended to the retiring president, the retiring councillors, and the retiring treasurer for their unselfish service. The Institute was greatly indebted to Dean Young for his excellent leadership during these trying times.

The Council rose at six fifteen p.m.

ELECTIONS AND TRANSFERS

At the meeting of Council held on February 10th, 1943, the following elections and transfers were effected:

Members

- Bjarnason**, Barney Sveinn, B.Sc. (Elec.), (Univ. of Man.), test engr., Radio Inspection and Test Dept., Research Enterprises, Ltd., Leaside, Ont.
- Finch**, Gordon Holbrook, B.Sc. (Elec.), (Univ. of Man.), sales engr., Canadian Westinghouse Co. Ltd., Ottawa, Ont.
- Frost**, John George, chief dftsmn., Power Corp. of Canada, Ltd., Montreal, Que.
- Hanlon**, John Edward, B.A.Sc., (Univ. of Toronto), 2053 Metcalfe St., Montreal, Que.
- Labrecque**, Henri, B.A.Sc., C.E., (Ecole Polytechnique), conslting engr., and professor, Ecole Polytechnique, Montreal, Que.
- MacKay**, Ernest, B.A.Sc., C.E., (Ecole Polytechnique), professor, Ecole Polytechnique, Montreal, Que.
- Robert**, René Antonio, B.A.Sc., C.E., (Ecole Polytechnique), asst., Physics Laboratory, Ecole Polytechnique, Montreal, Que.

Junior

- Boux**, John William, B.Sc. (Civil), (Univ. of Man.), staff engr., airport divn., Macdonald Bros. Aircraft, St. James, Man.

Affiliates

- Keane**, Edward Joseph, director and chief engr., Paul Curran Ltd. (Canada), Montreal, Que.
- Lawton**, Herbert Clarence, elect'l contractor, 68 Thorne Ave., Saint John, N.B.
- Mills**, Alfred Arthur, dftsmn. and plan surveyor, Inspection Branch, Quebec Provincial Government, Verdun, Que.
- Norton**, Alan Douglas, chief tool designer and methods supervisor, Canadian Car & Foundry Co. Ltd., Fort William, Ont.
- Reynolds**, Theodore, stationary enginemn examiner and asst. chief inspr. for boilers of the province of Quebec, Montreal, Que.
- Thomson**, Christian Aldrom, (Tri-State College), tech'l. supt., R. Campbell Brown & Co. Ltd., Montreal, Que.

Transferred from the class of Junior to that of Member

- Black**, William Steele, B.Eng. (Civil), (Univ. of Sask.), asst. engr., bldg. constr. dept., Trinidad Leaseholds Ltd., Pointe-à-Pierre, Trinidad, B.W.I.
- Esdaile**, Hector Milton, B.Eng., (McGill Univ.), supt. of service and erection, Combustion Engrg. Corp., Montreal, Que.
- Hutton**, John Robert, B.Sc. (Elec.), (N.S. Tech. Coll.), lamp engr., Canadian Westinghouse Co. Ltd., Hamilton, Ont.
- McKenzie**, Rolph Boynton, B.Sc. (Chem.), (Univ. of Alta.), manager, McKenzie Electric Co. Ltd., Lethbridge, Alta.
- Stirling**, L. Brodie, B.Sc. (Elec.), (McGill Univ.), asst. supt. of generating stations, Shawinigan Water & Power Co., Shawinigan Falls, Que.
- Stratton**, Leslie Robertson, B.Sc. (Civil), (Univ. of N.B.), res. engr. National Harbours Board, Ottawa, Ont.

Transferred from the class of Student to that of Member

- Carmichael**, James I., B.Sc. (Mech.), (Queen's Univ.), asst. chief inspr., Canadian Car & Foundry Co. Ltd., Fort William, Ont.
- Dunlop**, Robert John Forrest, B.Eng., (McGill Univ.), time study supervisor, Belding-Corticelli Ltd., Montreal, Que.
- Duranceau**, Charles Arthur, B.Eng., (McGill Univ.), civil engr. and manager, Chas. Duranceau Limitée, Montreal, Que.
- Haselton**, William Beverley, B.Sc., (Civil), (Univ. of N.B.), manager and operator, W. M. Haselton Granite Quarries, Beebe, Que.
- Pritchard**, Geoffrey Rowland, B.Sc. (Elec.), (Univ. of Man.), manager, western Ontario & Winnipeg district, Canadian Allis Chalmers, Ltd., and lighting service engr., Canadian General Electric Co. Ltd., Winnipeg, Man.
- Robert**, André, B.Sc. (Elec.), (Univ. of Sask.), system communication engr., Saguenay Transmission Co., Arvida, Que.

Transferred from the class of Student to that of Junior

Duquette, Roland Charles, B.Eng., (McGill Univ.), 753 St. Catherine Rd., Outremont, Que.

Exence, Alan Barr, B.A.Sc., (Univ. of Toronto), demonstrator in mech. engrg., University of Toronto, Toronto, Ont.

Gray, Laurence Frederick, B.A.Sc., (Elec.), (Univ. of B.C.), radio engr., transmitter development dept., Canadian Marconi Co., Montreal, Que.

Horwood, William Osmund, B.Eng. (Mech.), (McGill Univ.), design and dftng., Aluminum Co. of Canada, Ltd., Montreal, Que.

Kinghorn, William Wallace, B.Sc. (Civil), (Univ. of N.B.), aircraft instr., (A.I.D.), Canada Car & Foundry Co. Ltd., Amherst, N.S.

Kobylnyk, Demetrius Frederick, B.Sc. (Elec.), (Univ. of Alta.), junior engr., Calgary Power Co. Ltd., Calgary, Alta.

Macnabb, Thomas Creighton, Jr., B.Sc. (Civil), (Univ. of Man.), transitman, Laurentian Division, C.P.R., Montreal, Que.

Marchand, Fernand, B.A.Sc., C.E., (Ecole Polytechnique), electronics and development engrg., Canadian Westinghouse Co. Ltd., Hamilton, Ont.

Marshall, Welsford Allen, B.Sc. (Civil), (Queen's Univ.), Lieut., R.C.O.C., 7th Division, O.M.E. Workshops, Debert, N.S.

Mellor, Alfred Geoffrey, B.Eng., (McGill), engineer officer (P/O), R.C.A.F., Vulcan, Alta.

O'Donoghue, Gerald, B.A.Sc., C.E., (Ecole Polytechnique), engrg. dftsmn., Inspection Board of the United Kingdom and Canada, Washington, D.C.

Silverberg, David M., B.Sc. (Elec.), (Univ. of Man.), engrg. dftsmn., Dept. of Transport, Winnipeg, Man.

Trudeau, Marc R. B.A.Sc., C.E., (Ecole Polytechnique), asst., Hydraulic Lab., Ecole Polytechnique, Montreal, Que.

Students Admitted

Ashton, Hugh Williams, (Univ. of Toronto), 276 Durie St., Toronto, Ont.

Bateman, John Lincoln, (Univ. of Man.), 508 Carlaw Ave., Winnipeg, Man.

Black, John Sawyer, (Queen's Univ.), 334 Reid St., Peterborough, Ont.

Burgess, Basil Arthur, (McGill Univ.), 4334 Harvard Ave., Montreal.

Cordon, Frank Roderick, (Univ. of Man.), 251 Scotia St., Winnipeg, Man.

Cosman, Ernest, (Univ. of Man.), 329 Carlton St., Winnipeg, Man.

Davidson, Fred William, (Univ. of N.B.), Beaverbrook Res., Fredericton, N.B.

De Blois, Jules-Noël, (Inst. Michaud), Box. 89, Sherbrooke, Que.

Dyke, John Morley, (Univ. of Toronto), 88 Woodside Ave., Toronto, Ont.

Fowler, Chas. Allison Eugene, (McGill), 3437 Peel St., Montreal, Que.

Francis, James Scott, (Univ. of Man.), 188 Langside St., Winnipeg, Man.

Galloway, Harry Sydney, (McGill Univ.), 5199 Globert Ave., Montreal, Que.

Hardwick, Alfred Perry, B.Sc. (Elec.), (Univ. of Man.), 380 Rubidge St., Peterborough, Ont.

Hubbard, Frederick Wilmot, (Univ. of N.B.), Beaverbrook Res., Fredericton, N.B.

Legris, J. A. (Univ. of Toronto), 89 George St., Toronto, Ont.

Macdougall, Douglas Keith, (Univ. of N.B.), 59 Charlotte St., Fredericton, N.B.

Marshall, Herbert Ansley, (N.S. Tech. Coll.), Box 321, Dartmouth, N.S.

Muller, Richard Alfred, (Univ. of Toronto), 140 Glenrose Ave., Toronto, Ont.

Oxley, Loren Arthur, (Univ. of Toronto), 372 Bay St., Toronto, Ont.

Rispin, W. E. A. (Univ. of Toronto), Trinity College, Toronto, Ont.

Schwartz, Hyman, (Sir Geo. Williams College), 5230 Clarke St., Montreal, Que.

Scott, Ronald E. (Univ. of Toronto), 39 Classic Ave., Toronto, Ont.

Shane, Walter Roulston, (Univ. of Man.), 325 Baltimore Rd., Winnipeg, Man.

Shooner, Jacques, (Ecole Polytechnique), 3454 St. André St., Montreal, Que.

Smith, Claude Harry Mortimer, (Univ. of Toronto), 171 Alexandra St., Oshawa, Ont.

Stehling, Kurt, (Univ. of Toronto), 235 Borden St., Toronto, Ont.

Stonehewer, John, (McGill Univ.), 3578 Shuter St., Montreal, Que.

Telford, Robert Brown, (Univ. of Toronto), 11 Blythwood Crescent, Toronto, Ont.

Zimmerman, George Douglas, (Univ. of Toronto), 144 Glendale Ave., Toronto, Ont.

By virtue of the co-operative agreements between the Institute and the Associations of Professional Engineers of Alberta and Saskatchewan, the following elections and transfers have become effective:

Members

Byers, Willson Fitzgerald, B.A.Sc., (Univ. of B.C.), asst. instaln. engr., Northwestern Utilities, Ltd., Edmonton, Alta.

Cameron, Angus Johnstone, (Royal Tech. College, Glasgow), city engineer, Weyburn, Sask.

Marshall, James Lawrence, B.Sc., (Univ. of Man.), engineer-in-charge CBK, Watrous, Sask.

Transferred from the class of Student to that of Junior

D'Appolonia, Elio, B.Sc. (Civil), (Univ. of Alta.), instructor, Univ. of Alberta, Edmonton, Alta.

Ford, George, B.Sc., (Univ. of Alta.), sessional demonstrator in civil engrg., University of Alberta, Edmonton, Alta.

McManus, Ralph Norman, B.Sc. (Univ. of Alta.), sessional demonstrator in civil engrg., University of Alberta, Edmonton, Alta.

Students Admitted

Casault, Joseph McGill, (Univ. of Alta.), 10934-125 St., Edmonton, Alta.

Chan, Lloyd George, (Univ. of Sask.), soil mechanics lab., University of Saskatchewan, Saskatoon, Sask.

Hiller, Walter Andrew, (Univ. of Alta.), 9904-88th Ave., Edmonton, Alta.

Hispol, Richard H., (Univ. of Alta.), 10034-106th St., Edmonton, Alta.

Morrison, Lloyd Fletcher, (Univ. of Alta.), Cowley, Alta.

Poole, George E., (Univ. of Alta.), 11716-100th Ave., Edmonton, Alta.

Simpson, Jack Lloyd, (Univ. of Alta.), 9935-104th St., Edmonton, Alta.

Wilkins, Ernest Bertram, (Univ. of Alta.), 1407-4th Ave. S., Lethbridge, Alta.

Willson, Bruce Franklin, (Univ. of Alta.), 11134-87th Ave., Edmonton, Alta.

ANNUAL FEES

Members are reminded that a reduction of one dollar is allowed on their annual fees if paid on or before March 31st of the current year. The date of mailing, as shown by the postmark on the envelope, is taken as the date of payment. This gives equal opportunity to all members wherever they are residing.

Personals

News of the Personal Activities of members of the Institute, and visitors to Headquarters

Professor J. A. Van den Broek, M.E.I.C., was a visitor at Headquarters during the week of January 24th, last. Professor Van den Broek spent the week in Montreal, lecturing at the Ecole Polytechnique on the theory of limit design. Besides giving a series of lectures before the higher classes at the Ecole, the professor addressed an evening meeting of the Graduates Society at which members of the Institute had been invited. The exposé of his favourite subject which created such an interest at the Annual Meeting of the Institute last year, in Montreal, again provoked very lively discussion.

Harold J. A. Chambers, M.E.I.C., since 1940 chief engineer of the Hamilton Bridge Company Limited, was appointed, last month, general manager of the same company. One of the outstanding Canadian technical authorities in his field, Mr. Chambers' career in industry and public service includes executive posts with the Federal Department of

tration Board. The following year he was appointed inspecting engineer on rehabilitation of lines of the Toronto Transportation Commission, and in 1923 was appointed to the position which he holds.

In 1936 he was president of the Canadian Institute on Sewage and Sanitation.

J. B. Stirling, M.E.I.C., was re-elected president of the Canadian Construction Association at the Annual Meeting held in January.

Mr. Stirling is vice-president of E. G. M. Cape & Company, engineers and contractors, Montreal.

N. C. Cowie, M.E.I.C., is the newly elected chairman of the Sault Ste. Marie Branch. Born at Espanola, Ont., he was

H. J. A. Chambers, M.E.I.C.

T. S. Glover, M.E.I.C.

Lt.-Col. L. S. McGregor, S.E.I.C.

Public Works, to which he was loaned by Canadian Bridge Company, Windsor. He was concerned with the construction of public buildings for Halifax and Ottawa. Mr. Chambers joined Canadian Bridge shortly after his graduation with honours from the University of Toronto, Faculty of Applied Science, in 1924 and was designing engineer of the company when he came to Hamilton Bridge. He holds the degrees of B.A.Sc. and M.A.Sc.

George H. Ferguson, M.E.I.C., the newly elected chairman of the Ottawa Branch of the Institute is the Chief, Public Health Engineering Division of the Department of Pensions and National Health. Mr. Ferguson graduated at the University of Toronto with the degree of B.A.Sc. in 1906, and for the two succeeding years was engineer in charge of the layout of the buildings at the plant of the Dominion Radiator Company, Limited, Toronto. In 1908 Mr. Ferguson was employed as transitman on surveys in southern Alberta, and in 1909 was engineer-in-charge of the preliminary surveys for the Matabetchouan power development. Later in the same year he was appointed assistant to the hydraulic engineer of the Hydro-Electric Power Commission of Ontario, and in 1911 became hydraulic engineer to the National Conservation Commission. Mr. Ferguson secured a commission in the Royal Canadian Engineers, and served in France from 1915 to 1918, being awarded the Military Cross and promotion. At the conclusion of the war, he returned to his duties with the Conservation Commission but resigned in 1920 to accept a position as assistant to the chief traffic advisor of the Grand Trunk Railway Arbi-

educated at the University of Toronto where he received the degree of B.A.Sc. in 1931. Upon graduation, he joined the staff of the Great Lakes Power Company Limited, at Sault Ste. Marie where he is still employed as engineer.

T. S. Glover, M.E.I.C., was recently elected chairman of the Hamilton Branch of the Institute for 1943. Born in England, Mr. Glover was educated at the University of Toronto where he graduated in 1922. Following graduation, he was engaged with Messrs. Fraser Brace Limited as assistant engineer on water power development in Newfoundland. In 1924, he received the Colonial Office appointment of assistant engineer in the Department of Public Works in Nigeria. He returned from Nigeria in 1927 and the following year he accepted the position of assistant sales manager with Sawyer-Massey Limited at Hamilton, Ont. Later he joined the staff of Russell T. Kelley, Limited, Hamilton, and became manager of their industrial department. He is at present on leave of absence from the company and is regional representative of the Wartime Bureau of Technical Personnel in Hamilton.

Oliver A. Barwick, M.E.I.C., has now returned to Montreal where he is employed with United Shipyards Limited. Lately he had been located in Toronto where he was in charge of plant expansion in Ontario for Wartime Merchant Shipping, Limited.

A. L. Pierce, M.E.I.C., of C. D. Howe Company, Limited, consulting engineers of Port Arthur, is now located in Hamilton, Ont., with the same company.

W. H. S. Bird, M.E.I.C., who is a resident technical officer with the British Air Commission in the United States, has recently been transferred from Brewster Aeronautical Corporation, Hatboro, Pa., to the Curtiss Wright Corporation at Buffalo, N.Y. Before joining the British Air Commission he was chief draughtsman in the aviation division of Canadian Car and Foundry Co. Ltd., at Fort William, Ont.

H. S. Petford, M.E.I.C., is now manager of Frontenac Breweries Limited, Montreal. He occupied previously the position of superintendent.

Sub. Lieut. D. O. D. Ramsdale, M.E.I.C., has recently been posted for sea duty and is based at St. John's, Newfoundland. Before his enlistment a few months ago, Mr. Ramsdale was employed with the English Electric Company Limited at Toronto.

A. N. Budden, M.E.I.C., has left the Inspection Board of the United Kingdom and Canada and has joined the Army Engineering Design Branch of the Department of Munitions and Supply at Ottawa. Before the war Mr. Budden was connected with the Dominion Engineering Company Limited at Montreal.

Y. R. Anderson, M.E.I.C., has joined the firm of Ward-McKee Engineering Limited at Toronto.

Capt. W. L. Sheldon, M.E.I.C., is an ordnance mechanical engineer and is at present attached to the Inspection Board of the United Kingdom and Canada. He is inspecting officer of small arms ammunition in Quebec City.

Allan Tubby, M.E.I.C., is now located at Montreal with the works and buildings branch of the Royal Canadian Air Force. He resided previously at Ottawa.

Thomas Montgomery, M.E.I.C., has recently retired from the position of chief engineer of Imperial Oil Limited at Sarnia, Ont., after almost forty-six years of service. He joined the Company in 1897 as mechanical superintendent and was in charge of the engineering department at the Sarnia plant. In 1914 he had direct charge of the preparation of plans and also of the construction of the Company's refinery at Vancouver, B.C. He was appointed chief engineer of the Company in 1915 and in the same year was responsible for the construction of the Company's refineries at Regina, Sask., Montreal, Que., and Dartmouth, N.S. In addition to engineering and construction work at refineries, Mr. Montgomery has been responsible in his position for all construction work in the marketing department of the Company.

Mr. Montgomery has always shown a great interest in the Institute and two years ago he was presented with a pin in recognition of the fact that he was one of the oldest members of the Border Cities Branch.

G. L. Macpherson, M.E.I.C., is the new chief engineer of Imperial Oil Limited at Sarnia, Ont., succeeding Thomas Montgomery who has retired.

A. M. Mills, M.E.I.C., who was employed with the Department of Highways of Ontario, is now superintendent of W. H. Harvey & Son, road builders and general contractors at Dawson Creek, B.C.

M. N. McEwen, M.E.I.C., has enlisted in the Royal Canadian Engineers. Previously he was an instrumentman with the Department of Highways at Kenora, Ont.

Lieut. C. K. Hurst, R.C.N.V.R., M.E.I.C., has recently been promoted to this rank and posted to Halifax. Previous to his enlistment a year ago, he was on the hydraulic staff of the canals branch of the Department of Transport at Ottawa.

H. W. Burri, M.E.I.C., of Mathews Conveyor Company, Limited, Port Hope, Ont., was elected to the Council of the Town of Port Hope for 1943 and has also accepted the chairmanship of the Civic Administration Committee for the Royal Canadian Sea Cadet Corps which is being formed in Port Hope.

Frederic Alport, M.E.I.C., is at the present time consulting engineer to the Director of the Naval Service in the Department of National Defence at Ottawa. Up until a few weeks ago, Mr. Alport was located in Halifax where, since 1938, he had been employed with the Department of Public Works of Canada as senior assistant engineer.

R. K. Williams, M.E.I.C., of Toronto has been appointed Executive Assistant to the General Manager at the Victory Aircraft in Malton, Ont.

Flight-Lieutenant André Aird, Jr.E.I.C., has recently been promoted from the rank of Flying Officer. He is at present stationed at No. 9 Repair Depot with R.C.A.F. at St. John's, Quebec. He is a graduate from Ecole Polytechnique, in the class of 1938.

Sub-Lieutenant C. H. Vatcher, R.C.N.V.R., Jr.E.I.C., is at present located in Halifax, N.S. He left the employ of Canadian National Carbon Company, Toronto, last October, to join the R.C.N.V.R. Mr. Vatcher is a graduate of the University of Toronto in the class of 1939.

H. U. Ross, Jr.E.I.C., is at present employed as a Metallurgical engineer with the Frobisher Exploration Company Limited at Ottawa.

Sub-Lieutenant D. Lorne Lindsay, R.C.N.V.R., Jr.E.I.C., is a gun mounting officer with the Director of Naval Ordnance at Naval Service Headquarters, Ottawa.

Arthur G. Teskey, Jr.E.I.C., has been transferred from Winnipeg to the Regina office of Canadian Westinghouse Company Limited. He is a graduate of the University of Manitoba in the class of 1937 and has been with the company ever since.

Noel Campbell, Jr.E.I.C., has joined the R.C.N.V.R. as a Sub-Lieutenant. He was previously employed in the engineering department of the Ford Motor Company of Canada, at Windsor, Ont.

W. W. Ingram, Jr.E.I.C., is the newly elected chairman of the Junior Section of the Montreal Branch of the Institute. Born at Winnipeg, Man., in 1917, he was educated at the University of Manitoba where he graduated in electrical engineering in 1939. Upon graduation, he joined the staff of Phillips Electrical Works, at Brockville, Ont., as an inspector and electrical tester. A few months later he was transferred to the Montreal plant as assistant to the plant superintendent and in 1942 he was made foreman in the lead and impregnating departments. Mr. Ingram has been connected with the Junior Section for the past few years having acted in the capacities of councillor, secretary and vice-chairman.

Lieutenant-Colonel L. S. McGregor, S.E.I.C., has recently been appointed in command of the Royal Electrical and Mechanical Engineers of the 1st Canadian Corps troop in England. Details about the organization of this new corps in the British Army appear on page 147 of this issue.

Colonel McGregor graduated in mechanical engineering from McGill University in 1936. Upon graduation he returned to Canadian National Railways, Montreal, where he had been employed as a draughtsman and a machinist apprentice before entering the Engineering Faculty. After working for some time at Turcot Yard he was transferred to the Department of Economics and Research of the company as assistant engineer. He went overseas in May, 1940, and won his captaincy in April, 1941. In June, 1942, he was promoted to the rank of major in the headquarters staff of the Canadian Army overseas.

Joseph Van Damme, S.E.I.C., is at present employed with the National Research Council at Ottawa as a junior research engineer. He graduated from Queen's University as a B.Sc. in mechanical engineering in 1941 and after spending a year at Rensselaer Polytechnic Institute, Troy, N.Y., he obtained the degree of M.Ae. Eng. in 1942.

Sub-Lieutenant D. B. Sutherland, R.C.N.V.R., S.E.I.C., is at present stationed at H.M.C. Dockyard at Sydney, N.S. He was previously employed with Guysboro Mines at Goldenville, N.S.

Captain John J. Donovan, S.E.I.C., has recently been promoted from the rank of lieutenant. He is at present serving overseas with the British Ministry of Supply. A graduate of Queen's University, in the class of 1940, he had been employed with Canadian Ingersoll-Rand at Sherbrooke, Que., before his enlistment.

Alex. de F. Heron, S.E.I.C., has joined the Royal Canadian Corps of Signals and is at present stationed at the Officers' Training Centre, at Brockville, Ont.

Wilbur J. Cox, S.E.I.C., is at present employed as a junior research engineer in the Division of Mechanical Engineering at the National Research Council, at Ottawa. He graduated from the University of Saskatchewan in 1942.

R. J. Kenst, S.E.I.C., who for the past fifteen months has been in Columbia, S.A., doing oil exploration work for the Tropical Oil Company, is now employed with Ford Motor Company as an electrical engineer in the automotive department, at Windsor, Ont. He is a graduate in electrical engineering from McGill University, in the class of 1939.

VISITORS

Past President Sam G. Porter, M.E.I.C., Calgary, Alta., on February 3rd.

Euclide Paré, M.E.I.C., Hydraulic Service, Parliament Bldgs., Quebec, on February 4th.

J. B. Wilkinson, M.E.I.C., Hamilton, Ont., on February 4th.

R. W. Boyle, M.E.I.C., Director, Division of Physics and Electric Engineering, National Research Council, Ottawa, Ont., on February 4th.

W. F. M. Bryce, M.E.I.C., Sewer Engineer, City of Ottawa, Ottawa, Ont., on February 4th.

W. G. Swan, M.E.I.C., Consulting Engineer, Vancouver, B.C., on February 9th.

G. G. Murdoch, M.E.I.C., Consulting Engineer, Saint John, N.B., on February 13th.

2nd-Lieutenant R. R. Willis, M.E.I.C., Royal Canadian Engineers, Montreal, Que., on February 15th.

H. L. Johnston, M.E.I.C., Canadian Industries Limited, Windsor, Ont., on February 17th.

E. L. Ball, Jr., M.E.I.C., Field Engineer, Foundation Company of Canada, Arvida, Que., on February 17th.

F. E. M. Thrupp, M.E.I.C., Inspection Board, Ottawa, Ont., on February 18th.

Norman Eager, M.E.I.C., Assistant Sales Manager, Burlington Steel Company, Limited, Hamilton, Ont., on February 18th.

Professor R. F. Legget, M.E.I.C., Assistant Professor of Civil Engineering, University of Toronto, Toronto, Ont., on February 18th.

Stewart Troop, M.E.I.C., Consulting Mining Engineer, Manager Chibougamau Properties Limited and Cache Lake Chibougamau Lines Limited, St. Elie de Caxton, Que., on February 22nd.

K. R. Chestnut, M.E.I.C., Newfoundland Airport, Gander, Nfld., on February 25th.

Lieutenant Raymond LeBel, Jr., M.E.I.C., Royal Canadian Engineers, Petawawa, Ont., on February 25th.

W. R. McClelland, M.E.I.C., Bureau of Mines, Ottawa, Ont., on February 27th.

T. M. Moran, M.E.I.C., vice-president, Stevenson & Kellogg, Toronto, Ont., on March 1st.

J. Hugill, Jr., M.E.I.C., National Defence Headquarters, Ottawa, Ont., on March 1st.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Francis Charles Edward Burnett, M.E.I.C., died at his home in Montreal, on January 20th, 1943. Born on April 16th, 1878, at Galashiels, Scotland, he was educated at the Academy, Galashiels, and received his engineering training at the Heriot-Watt College, Edinburgh.

After serving his apprenticeship with Waverly Ironworks at Galashiels and with the Waverly Electric Company Limited, Edinburgh, he joined the staff of Siemens Brothers & Company Limited, London, England, as draughtsman. Three years later he went with Witting, Eborall & Company and acted as their resident engineer on a number of new power projects, including those for the Dublin Tramways, the Isle of Man and the Stalybridge Tramways and Electricity Joint Board. Later he joined Messrs. Kincaid, Watson, Manville and Dawson, consulting engineers, London, England. In 1907 Mr. Burnett came to Canada and acted successively as assistant to Mr. J. Kynoch, the chief engineer of the Canadian General Electric Company, and as power engineer for the Canada Cement Company, a position which he held for a number of years during which he was responsible for a large amount of development work.

From 1920 to 1929 he was engaged in iron foundry work on his own. In 1929 he built up a successful agency business in Canada, representing Messrs. George Ellison and other well known British firms. When the war placed many restrictions on the importing of British goods into Canada, he offered his services to Canadian Car & Foundry Company, of Montreal, where he was employed up to within a few days of his death.

Mr. Burnett joined the Institute as a Member in 1938.

Frederick Oxley Condon, M.E.I.C.

Frederick Oxley Condon, M.E.I.C., died suddenly at his home in Moncton, N.B., on January 12th, 1943. He was born at Moncton on July 21st, 1878, and was educated in the local schools. At the age of 15, he entered the service of the Intercolonial Railway, now part of the Canadian National Railways. From 1898 to 1912 he was employed as a draughtsman and later as assistant engineer in the maintenance department. In 1913 he became resident engineer on maintenance and construction at Moncton and later at Campbellton, N.B. He was appointed district engineer, at Moncton, in 1916, engineer of maintenance of way in 1923, principal assistant engineer in 1927, and chief engineer, Atlantic Region, C.N.R., in 1938. He retired from the Railway service on August 31, 1942.

In 1905 he married Jean Davidson Bruce. He is survived by his wife and three daughters, Margaret Elizabeth Bruce, Barbara Leslie Bruce, wife of Roscoe H. Allen, and Jose-

phine Bruce, wife of Warrant Officer Kenneth W. McLaren, R.C.A.F.

Mr. Condon joined the Institute as a Member in 1922. He was chairman and councillor for the Moncton Branch, and a former vice-president of the Institute. He was also a past-president of the Association of Professional Engineers of New Brunswick

William Kennedy, M.E.I.C., died at his home in Montreal on January 31st, 1943, after an illness of a few days.

Born near Prescott, Ont., on January 4th, 1848, Mr. Kennedy belonged to a large family many of whose members have long been leaders in engineering progress in Canada. In 1858, his father (the Senior William Kennedy) founded the well-known engineering works at Owen Sound which are still maintaining their reputations for hydraulic machinery of high quality. After working with the firm for some years, William Kennedy, Junior, came to Montreal in 1893 and established a consulting practice. During the following thirty years he planned and supervised the construction of a score of dams, waterworks, and hydro-electric power plants, from Nova Scotia to British Columbia. His work included consultation, advice, reports and valuation of many questions of water power and supply.

In 1886 he took part in the movement which led to the formation of the Canadian Society of Civil Engineers, and with his older brother—who later became Sir John Kennedy—joined that body on its establishment in February of the following year. His long and successful professional career ended with his retirement in 1925.

Mr. Kennedy had been made a Life Member of the Institute in 1930.

Dr. A. H. Harkness, M.E.I.C., passed away at Toronto, on February 28, 1943, in his 71st year, following a long period of uncertain health. While retaining his interest in engineering matters throughout, he had been forced to curtail his professional activities very considerably for the past two years.

Dr. Harkness graduated in architecture from the University of Toronto in 1895 and received the degree of Bachelor of Applied Science in 1897. Following some three years in an

architect's office, he joined the designing staff of the structural department of the Canada Foundry Company, Limited, Toronto, remaining with this Company for eight years and attaining the position of Assistant Chief Engineer of the department.

Special interest and experience in building prompted him to enter into private practice as a Consulting Structural Engineer in Toronto in 1910. This practice he continued until his death; since 1929, in partnership with Major-General C. S. L. Hertzberg, M.E.I.C., under the firm name of Harkness and Hertzberg. During its long existence his firm was responsible for the structural work of many of the outstanding buildings of Canada, such as the Canadian Bank of Commerce, the C.P.R. Building, the Canada Life Building, the Dominion Bank Building, the east block of the Parliament Buildings, and the Western Hospital, at Toronto; the Sun Life Building and the Canadian Bank of Commerce Building, at Montreal; the Canadian Bank of Commerce Building and the Confederation Life Building, at Winnipeg; the Dominion Parliament Buildings and the Civic Hospital, at Ottawa.

In 1935 Mr. Harkness was awarded the Sir John Kennedy Medal by The Engineering Institute of Canada in recognition of his outstanding merit in the engineering profession and in 1937 the honorary degree of Doctor of Engineering was conferred upon him by the University of Toronto.

Dr. Harkness was a Past Vice-President of the Engineering Institute of Canada and a Past President of the Association of Professional Engineers of Ontario. Always anxious to promote the fortunes of the engineering profession and particularly those of the younger men in it, he gave much time and thought to matters outside the normal responsibilities of his practice. A kindly reception always awaited anyone who sought his assistance.

In Toronto he was known in a very wide circle as an enthusiastic gardener, having one of the finest iris gardens in the district. Every year, hundreds of people were welcomed to view his extraordinary display of rare varieties. For more than twenty years he cultivated this interest to his great personal satisfaction and the delight of his friends.

Dr. Harkness is survived by his widow and four daughters, three of whom are married. C. R. YOUNG.

AN APPEAL FOR BACK NUMBERS OF THE JOURNAL

The *Journal* circulation extended, before the war, to several of the countries now occupied by the enemy. It consisted partly of paid subscriptions and partly of exchanges with other publications. Since the spring of 1940, the supply of engineering literature from these countries has ceased and we have likewise discontinued sending the *Journal*.

With a view to completing our file of foreign publications when the war is over, we have put aside, every month for the last three years, a number of copies of the *Journal* for exchange purposes, in the hope that foreign publishers are doing the same.

However, on account of urgent demands for the *Journal* in the last three years, we have had to part with some of those copies which we had laid aside.

In order to replenish our stock, we would be grateful to our members who could supply us with the following numbers:

1941	1942
JANUARY	JANUARY
MARCH	APRIL
MAY	MAY
JULY	AUGUST
AUGUST	

JANUARY, 1943

Parcels should be addressed to The Librarian, The Engineering Institute of Canada, 2050 Mansfield Street, Montreal, and may be sent collect.

BORDER CITIES BRANCH

W. R. STICKNEY, M.E.I.C. - *Secretary-Treasurer*

The monthly dinner meeting of the Border Cities Branch was held at the Prince Edward Hotel, Windsor, January 22, 1943, at 6.30 p.m., 30 members and guests were present.

After dinner, the Chairman, G. G. Henderson, called on C. G. R. Armstrong who introduced the speaker for the evening, Mr. T. Hudson Strickland, Superintendent of Filtration, Windsor Utilities Commission. Mr. Strickland's subject was "Water Purification" and his talk dealt chiefly with the methods of treatment used in the City of Windsor, and of the problems and complaints encountered from time to time.

The production of pure water is actually a manufacturing process. It must be treated or conditioned to the point where it meets the specifications of public health bureaus and medical boards. This may be easy or it may be complicated. Foreign bodies may have to be taken out to make it safe or the composition of the water may have to be altered chemically to make it suitable for industrial needs.

A study of the various methods of water treatment showed that individual countries usually developed their own methods of water purification independently of neighbouring countries. The English method is generally to find the source of pollution and eliminate this; the German method is to take impure water and make it safe and pure; the French method is to find a source of pure water, preferably in the mountains and pipe this to their cities; while in North America we usually find a combination of these European methods.

There are three main clauses in specifications for pure water, namely; safety, attractiveness, and chemical characteristics. The latter should be such that the water is reasonably free of minerals and salts, and soft enough for economical domestic and industrial use.

The clause relating to safety is simple but exacting—"It must be safe," that is, free of harmful bacteria. Samples of the water are taken and the bacterial content is measured. Chlorine or its compounds in the proper proportions are added to remove the bacteria. In the Windsor plant the water is treated twice with chlorine and as a result the city and surrounding district is practically free of typhoid fever.

Pure water must also be attractive, i.e., clear and sparkling and free of objectionable tastes and odours. In some communities where large areas are available, the dirt or turbidity is removed by allowing it to settle. Where this is not possible, chemicals such as aluminium sulphate is usually added to the water. This forms aluminum hydroxide, a flocculent substance which coagulates around the dirt particles and this floc is then filtered off. In Windsor, the problem is not to remove the quantity of dirt but rather the type of dirt, quite often a form of colloidal clay which is very difficult to remove, since it prevents the formation of floc by the action of the aluminum sulphate. This, then requires other chemicals to be added to the water.

The removal of tastes and odours is a more complicated process. These come from industrial waste waters, swamps, algae and plants, and vary greatly in intensity from day to day. Treatment which will remove taste and odour resulting from one of the above causes will often accentuate those resulting from another, so that a constant check on this type of pollution is required.

Most of the tastes and odours are removed by chloramine treatment; i.e., ammonium sulphate is added to the water after it has been treated with chlorine. This forms chloramine which is very effective in removing tastes and odours; but at times such impurities can only be removed by treatment with activated carbon, a finely divided form of carbon or charcoal. The gases and impurities are absorbed

Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

on the surfaces of carbon particles, which are then filtered off before the water enters the mains.

Mr. Strickland then related several amusing incidents about various complaints they had received from time to time.

After a discussion period in which several members told of similar experiences with water supplies and purification, H. L. Johnston moved a vote of thanks to the speaker.

The meeting adjourned on motion of E. M. Krebsler.

CALGARY BRANCH

K. W. MITCHELL, M.E.I.C. - *Secretary-Treasurer*
J. N. FORD, Jr., E.I.C. - *Branch News Editor*

A meeting of the Calgary Branch of The Engineering Institute of Canada was held in the Palliser Hotel on January 14th, 1943, at eight o'clock. The evening's programme was conducted by the affiliate members, who arranged for two speakers.

Mr. Saffran, head of the Service Department of the Institute of Technology and Art, gave a very interesting talk on **Synthetic Rubber**. Mr. Saffran pointed out that contrary to common knowledge, synthetic rubber is not chemically the same as pure rubber, although it performs the same functions. There are various types under process of manufacture to-day known as Thiokal, Neoprene, Batyl, Buna N. and Buna S. Manufacturing plants in the United States are now set up for production of over a million tons of these various forms of rubber in 1943. Most of these are unsuitable for use as tires due to poor resistance to abrasion, but they make excellent insulators. Neoprene, due to its excellent abrasive qualities and resistance to oil, is the best for tire manufacture. Mr. Saffran concluded by a series of slides showing steps in the manufacture of these synthetic rubbers.

Mr. Ainlay, Chief Instructor of wireless air gunners at the Provincial Institute of Technology, spoke on **Radio Development**. He outlined the extensive use of radio equipment in all forms of science. Mr. Ainlay pointed out that calculations have been made, by those who should know, with the conclusion that, if the war lasts for three or four more years, 60 to 70 per cent of the radios will be out of use due to lack of parts. The speaker also intimated that by 1950 television would be general but much more expensive due to the elaborate arrangements which would have to be made in conducting a television programme.

Mr. McEwen, the Branch Chairman, expressed the appreciation of the meeting for a very interesting evening's programme.

On February 12th, 1943, in the Palliser Hotel, Mr. W. Allen, Physicist at Western Canada High School, addressed a branch meeting on **Some Aspects of Modern Physics**.

Mr. Allen gave a complete history of the physicist's progress in the study of the atom from the early 19th century to the present day. In the early 19th century 92 elastic sphere atoms explained all elements. The Quattrid Planetary Theory replaced this belief by setting up the atom as a miniature solar system which explained the spectra, properties of elements and transmutation. The discovery of the positive electron by Anderson and the neutron by Chadwick later led to the use of artificial radio-activity by the medical profession. Through the invention of "Induction Acceleration" rays were made to pierce heavy armour plating and this is used extensively to discover flaws in ship building materials.

Present day physicists are prying into the science of "Wave Mechanics" which gave us the electron microscope and enabled us to see hitherto invisible germs. The speaker

pointed out that the physicist's production of the aeroplane locator saved Britain, just as the astrologer's golden cockerel saved the King in Rimsky-Korsakow's opera "Le Coq d'Or." Mr. Allen concluded his address by the remark that "it is hoped that the physicist receives his reward instead of being cast off like the astrologer in the opera. Adequate financial aid should continue to be awarded our physicists for the furtherance of pure science in our universities at the conclusion of the present conflict.

HALIFAX BRANCH

S. W. GRAY, M.E.I.C. - - *Secretary-Treasurer*
D. C. V. DUFF, M.E.I.C. - - *Branch News Editor*

A combined buffet supper, followed by a programme of entertainment at the Nova Scotian Hotel on the evening of January 28th, was attended by 250 members and invited guests.

This year, due to wartime conditions, it was impossible to hold the usual combined dinner and speaker, but the committee in charge deserve much credit for the well-arranged buffet supper and the mixed programme of entertainment which was presented. Each number on the programme received generous applause. Mr. Kenneth Dawson acted as Master of Ceremonies and handled the programme in a pleasing and capable manner.

Prof. A. E. Flynn, chairman of the branch, presented Dr. A. E. Cameron, newly elected president of the Association of Professional Engineers of Nova Scotia. Representatives of other societies present as guests of the branch were: G. G. Bowser, President of Nova Scotia Mining Society; H. A. Russell, President of Nova Scotia Architects Association; Dr. E. P. Lenton, Chairman of Maritime Section of Canadian Institute of Chemistry; Dr. E. Hess, President of Nova Scotia Institute of Science.

The appointment of Major R. L. Dunsmore, now Superintendent of the Dartmouth Refinery, to Ottawa, as Director of Naval Fuel Supplies with the rank of Acting Commander, was also announced by the chairman. This announcement received hearty applause. Commander Dunsmore has taken a keen interest in all activities of the Branch and his active participation will be missed.

Music for the evening was supplied by Harry Cochrane and his six-piece orchestra.

MONTREAL BRANCH

L. A. DUCHASTEL, M.E.I.C. - - *Secretary-Treasurer*
W. W. INGRAM, M.E.I.C. - - *Branch News Editor*

On Thursday, January 14th, the branch held its annual meeting. The annual statement and financial report were read and accepted. Mr. Lalonde, the branch chairman, then introduced Dean C. R. Young, president of the Institute who addressed the members.

Dean Young spoke first of the pleasure with which he had visited the various branches as president of the Institute. He then outlined the various committees of council and the great variety of work that they were doing. New committees had been set up to deal with the many problems created by the war. Of the new activities engaged in by the Institute due to war conditions, the Webster Lectures, had been the most notable.

In a more general approach, Dean Young drew attention to the great number of people trained to a technical level in war industries. This constituted a definite asset on the side of personnel. New methods and new procedures for the utilization of Canada's natural resources will have an immense backlog of demand when peace comes. New types and new forms of machinery and appliances will be required for civilian use. The manufacture of these items will take care of the vast amount of technical personnel now in war work. Many new processes and inventions such as multiple tooling of one piece of work, spinning molds, electronics in industry, new plastics and new alloys such as tinless bronze, resulting from war stimulus will carry over to peace activities.

The legal aspects of engineering are the province of the Corporation of Professional Engineers. The Institute's work emphasizes professional development.

As engineers we need to improve our humanistic outlook and look at our work as a layman would look at it. The era after this war will be the era of the common man. The engineer is the originator and creator of wealth due to his work, while the economist uses figures made possible by these works. It is the business of the engineer to give hard and constructive thought to the fields of endeavour, to think out the consequences of his schemes, projects, etc., and their contribution to the country.

On Thursday, January 21st, Dr. L. M. Pidgeon of the National Research Council spoke on **New Methods for the Production of Light Metals**, with particular reference to aluminum and magnesium. Sodium and potassium, which are high up in the electrochemical series, are too reactive for structural uses, while beryllium and silicon are too brittle.

The Canadian raw materials from which magnesium could be obtained commercially are brucite, magnesite, dolomite (which is incidentally a very pure mineral) serpentine and sea water. It is interesting to note that aluminum and magnesium were first isolated by thermic reduction methods and first produced commercially by electrolytic methods. The chemical purification of the raw materials is much easier for magnesium than aluminum. In the electrolytic cell for the production of magnesium the electrolyte is melted magnesium chloride. The preparation of the chloride for the cell is rather difficult due to the water of crystallization, which is very hard to remove without loss of HCl. One method of overcoming this difficulty is the direct manufacture of the anhydrous MgCl₂ from magnesium oxide, carbon and chlorine in an electric furnace. The molten chloride produced in this way is tapped off and taken to the electrolytic cells. This method involves the handling of large quantities of chlorine which is difficult in a metallurgical plant.

After fifty years of the commercial production of aluminum there has been very little change in the electrolytic method. In the production of magnesium, however, thermic methods are making their appearance. This is due to the following (a) magnesium boils at approximately 1100°C. compared with 2300°C. for aluminum, (b) magnesium does not react with carbon while aluminum does to form an aluminum carbide. The electrolytic method is also unfavourable due to the plating out of lower metals in the series iron silicon, etc.

One thermic method involves the reduction of magnesium oxide with carbon. This reaction takes place at 1900°C. giving carbon monoxide and gaseous magnesium. This reaction reverses on cooling to give the original substances. To prevent the reverse reaction, shock cooling by hydrogen jets on the gases escaping from the reduction chamber is used. This gives a mixture of magnesium in the form of a fine powder along with magnesium oxide and carbon as impurities. Crystalline magnesium, which is very easily melted, is obtained by a vacuum distillation of the above mixture. This process is being developed in California by H. J. Kaiser.

The process recently developed by Dr. Pidgeon makes use of a different reducing agent. In his method the magnesium oxide is reduced by means of silicon, giving an oxide of silicon, which is a solid, as a by-product and gaseous magnesium which is condensed under vacuum in the reduction chambers.

The magnesium now produced in Canada is used entirely for war purposes. It is used for flares and incendiary bombs in the pure form. It is also used in aeroplane castings. When alloyed with aluminum it is used extensively in aeroplane parts and light metal parts in numerous machines. Magnesium can be easily machined, can be acetylene welded under a flux and compared on a basis of weight is much stronger than steel and makes stiffer structures even than

aluminum. However, it corrodes rather readily and must have a protective coating.

On Thursday, January 28th, 1943, Mr. Devores of the U.S. Rubber Company gave a paper on **Structural Rubber for Vibrations and Shock**.

The use of rubber as a structural material is made possible by the use of special compounds developed for certain specific uses. The greatest uses of structural rubber are the reduction of the transmission of vibration, impact shock and noise. Noise may be reduced by any one or a combination of three methods (a) proper springs, (b) secure anchorage to large foundations, (c) counter vibrators. The most economical method is by the use of resilient supports or rubber springs.

Mr. Devores illustrated his paper with slides, motion pictures and practical demonstrations which brought out a number of important facts on the uses of the various types of mountings and materials used. The best structural rubbers are made from crude rubber as no synthetic compounds have yet been made with the necessary resiliency. In use the structural rubber usually is made to adhere to steel to form individual mounting units. In certain cases the units are much more efficient when operated under a lateral stress.

On Thursday, February 4th, 1943, Professor P. E. Nobbs, President of the Province of Quebec Association for the Protection of Fish and Game addressed a Branch Meeting on **Fishway Problems on the Quebec Rivers**.

In introducing the subject, the speaker referred to poaching, pollution and obstructions, such as dams, as the three enemies of fish life. Legitimate angling, he considered, rarely reduced stock seriously. He remarked (1) on the rivers in the farming country where the grandparents of the present inhabitants had plenty fish at their doors, (2) on the trout streams ruined by lumber dams, (3) on the salmon rivers which storage dams and industries had put out of business, and (4) on the commercial fisheries of the great rivers blocked by power developments. To much of this reduction of fish stock the answer was the fishway.

Among the many dams in the Province, at least 180 needed fishways, while 18 only were as yet so equipped. He attributed this to a certain prejudice against fishways, largely due to official recognition of an obsolete type, dating from 1874.

Practically all fish were migratory, more or less, for food, for breeding, or for both. Dams tended to cut off feeding grounds and spawning grounds and so stock perished. The climatic effects on certain types of fishway were then referred to as limiting factors on the design of fishways here and the comparative costs of concrete and wood construction were stated.

The three things to avoid in a fishway were stated to be undue speed of flow, turbulence and aeration. Ease and comfort for the fish were essential to success.

Nine recognized types of fishway were next described. Some of these were obsolete and some were not practical in this climate.

The speaker recommended that all fishway construction should be put in the hands of the Quebec Streams Commission, that fishways should become Government property and that they should be regulated as to flow by the game wardens. The ease with which a fishway could be converted into a fish-trap was commented on.

In conclusion Mr. Nobbs had something to say about storage dams in which water levels dropped in winter and to which fishways were rarely applicable. In such cases, other remedial works might well be insisted on to maintain fish stock as is the practice in Scotland.

The address was illustrated. Among the examples shown was a fishway 700 feet long to take fish up 68 feet at a waterfall on the English River at Comeau Bay. This fishway, recently constructed from Mr. Nobbs' design, was passing fish up a week after the water was turned on.

On Thursday, February 11th, Mr. Goddard of the Cana-

dian General Electric Co. Limited, presented a paper on the **History and Fundamentals of Resin Chemistry, and Fabrication Problems of Phenol Formaldehyde Plastics**.

The materials known as plastics can be forced into any desirable shape and will retain that shape under suitable conditions. They contain a synthetic or organic resin.

Plastics are composed essentially of the five elements: carbon, hydrogen, oxygen, nitrogen and chlorine. They may be divided into two groups thermosetting which solidify with heat and are then no longer meltable, and thermoplastic which melt on heating. Bakelite is prepared from phenol, formaldehyde and a catalyst. These are heated together after which the material is run out and cooled. In this stage it is a thermoplastic. After heating up to 350 deg. F. this material then becomes thermosetting.

Thermosetting plastics are moulded by compression, using a heated die. Thermoplastics are moulded by an injection process using a cold die. Plastics are available in many shapes also as rods, tubes, sheets, etc.

Plastics in war are used to relieve the shortage of metals, copper, steel, aluminum, and also for their strength and transparency. In aircraft they are used for making resin-bonded plywood.

On Thursday, February 18, Mr. K. M. Cameron, Chief Engineer of the Department of Public Works of the Dominion of Canada and President of the Institute, addressed the branch on **Post-War Reconstruction**. Mr. Cameron is Chairman of the Sub-Committee on Construction of the Federal Committee on Post-War Reconstruction.

In his paper, Mr. Cameron pointed out that during the last war no measures were taken for the reestablishment of the returning soldier until October, 1918. The scheme which was then developed was not very successful, and this, with the failure of the peoples of the democracies to apply sound economic principles, helped to produce the boom of 1929 and the depression of the thirties. The countries will have to align themselves on a world rather than a group basis. The present war has brought about a reversal of economic thinking, leading to the doctrine of full employment as advocated by Sir William Beveridge in England. For this purpose a reasonable standard of living and employment must be obtained, under which not more than eight per cent of the people unemployed. The post-war problems of the armed forces is being studied under a cabinet committee on Demobilization and Rehabilitation.

The Advisory Committee on Post-War Reconstruction, under the Chairmanship of Dr. James of McGill University, is a committee separate from the Government which reports to the government. It has set up various sub-committees as follows:

(a) Agriculture. This committee studies the western wheat problem, various rural problems, markets for agricultural products, and their use for proper nutrition.

(b) Development and Utilization of our Natural Resources, as Forestry, Waterpower, Mining, Fisheries. These matters are Provincial affairs and there is the need of research in mining and forestry.

(c) Post-War Employment Opportunities Committee dealing with vocational guidance, employment, regulations, old age pensions, ex-service men and unemployables.

(d) Committee on Special Problems of Employment which deals with the problems of women.

(e) Committee on Reconstruction. This committee advises the main committee on Post-war Reconstruction.

The question of the civil reestablishment of the munition workers and those in the armed forces is a large one. As yet industry has not shown much interest in post-war problems. Obviously we must have a plan and a post-war work programme. We should put the same endeavour into winning the peace as into winning the war. Post-war problems should not be dismissed merely because they are in the future and are very difficult.

NIAGARA PENINSULA BRANCH

J. H. INGS, M.E.I.C. - - *Secretary-Treasurer*
J. W. BROOKS, Jr., E.I.C. - *Branch News Editor*

The first dinner meeting of the current year was held on February 19th in the Blue Room of the General Brock Hotel, under the chairmanship of Mr. C. G. Cline. The Branch was privileged to hear a most excellent address on **Mathematics and the Engineer**, by Professor J. L. Synge, M.A., Sc.D., F.R.S.C., Professor of Applied Mathematics at the University of Toronto.

The speaker approached his subject with a brief synopsis of that invaluable engineering tool, the slide rule. The compilation of natural logarithms by James Napier in 1614, and their conversion to common logarithms by Briggs, were both necessary precedents to the invention of Gunter's Rule in 1632. This new instrument did not become popular with engineers for more than two centuries, for it was not until 1850 that Mannheim's slide rule was adopted by the French artillery, and English engineers followed suit in 1870. At this point the speaker introduced the rather disturbing thought that perhaps, to-day, there exist similar innovations which are not being used to full advantage by engineers, and as an example he cited the new Differential Analyzer, invented by Dr. Bush of the Massachusetts Institute of Technology.

Professor Synge went on to say that the multitude of formulæ found in engineering handbooks is the result of certain basic hypotheses, followed by mathematical theory and experimental proof, giving such illustrations as the area of a circle, the amplitude of a pendulum, and the deflection of a cantilever beam. He stressed the fact that every formula is set up under ideal, not practical, conditions, and added a word of warning to the effect that a formula must not be used beyond its range of applicability. For example, the old familiar πr^2 will not hold true for the area of a circle on a spherical surface.

The complex problems encountered in electrical, radio, and aeronautical engineering indicate that there is room for much more research in these fields, and the speaker suggested that this was a job for what he termed a "theoretical engineer"—that is, a man with engineering knowledge combined with a brilliant flare for mathematics. It was Professor Synge's opinion that Canadian engineers have been so busy with practical problems that research has suffered, and also that our so-called "education for the average man" results in rare talents being neglected. He therefore suggested that we import say half a dozen of these theoretical engineers to our universities, where they would be given every opportunity of doing research. A few brilliant students would be naturally attracted to these men and their methods, and hence the work would continue.

Vice-chairman George Griffiths introduced Professor Synge, and a vote of thanks was extended by Councillor A. W. F. McQueen.

OTTAWA BRANCH

A. A. SWINNERTON, M.E.I.C. - *Secretary-Treasurer*
R. C. PURSER, M.E.I.C. - *Branch News Editor*

At an evening meeting held on January 21st at the auditorium of the National Research Laboratories J. C. Cameron, associate professor and head of the Industrial Relations Section of Queen's University, gave an address on **The Engineer and Industrial Relations**. G. H. Ferguson, newly-elected chairman of the branch for the 1943 term presided. The address proper was followed by an extensive period of discussion participated in by many of the members, as well as the speaker of the evening.

With profits as the motive force to economic endeavour in industry and business, production technique has been given a great deal of attention, whereas the technique of human administration has received very little. But personnel science is now rapidly teaching us that industrial goodwill is the first requisite of productive enterprise.

"Personnel science is constructed on the basic belief that labour is not a commodity", the speaker stated. For the term 'labour', after all, refers to human beings with minds, personalities, self-respect, a desire for improvement and membership in a civilized community. Although labour may resemble a commodity in that, like other objects of exchange, it commands a price on the market still this fact does not reduce these human beings to the level of impersonal things. The energy and skill which are sold by the labourer are inseparable from his life and personality; they are essentially a part of himself. Thus when a man sells his labour power he must accompany what he sells and the conditions and methods of its use are of vital concern to him. His own immediate welfare, the welfare of his family, his future and consequently, the future of those who depend upon his economic efforts, his health, and his very life—all are involved in such a transaction.

In other ways, too, labour falls outside the category of a commodity. For instance it is not, like a commodity, a passive object. "Active and alert to new sources of satisfaction and happiness", as the speaker expressed it, "workers as human beings are naturally sensitive to new comforts, new pleasures and improved standards of living which education and acquisitive industry and business bring to their attention. Moreover, workers are as capable of resentment as they are of co-operation; hence, they will not accept willingly any attempt either to depress their established standards of living or to prevent progressive improvement in their ways of life".

Personnel managers know that the solution of problems in industrial relations, revolving as they invariably do about the human equation, are often most perplexing. The equation itself involves the relation of the worker to his job, his immediate supervisors, his company, his community and, in turn, their relations to him. In a democratic country, moreover, the worker is endowed with a large number of rights, privileges, and opportunities which he expects his boss to recognize and respect.

However, personnel science is constructed in part on the theory that it is quite possible to apply to the management of human relations certain rational principles and methods of procedure. One of the principal assumptions is that the basic interests of employers and employees are identical—this in spite of the fact that it is usually contended that "the employer desires to get as much work done as possible for as little pay as is necessary, whereas the worker desires to get as much pay as possible for as little work as is necessary".

Personnel science assumes that both parties would receive greater economic advantages if they would frankly recognize their mutual interests in efficient production, economic operation, profitable enterprise, and desirable standards of work, hours and pay. In other words, the substitution of industrial co-operation for industrial conflict would yield greater net returns for both capital and labour.

Professor Cameron briefly summarized some of the basic needs and desires of employees, employers, and "that heterogeneous mass commonly referred to as the public", maintaining that a knowledge of these is a necessary condition to a solution of labour problems.

The wage-earner, he said, wants security more than anything else. This would include protection against unjust and indiscriminate discharge, freedom from fear of unemployment, wages sufficient to ensure a decent standard of living for himself and dependents, a reasonable income in times of illness and accident, ample provision for the exigencies of old age, a decent burial, and a measure of economic protection for his family after his death. He also wants physical security in the way of protection against physical injury, occupational disease, and accidental death. He would like to have congenial and happy relationships in his work. And, finally, he wants some form of representation in the councils of industry.

"If industrial industry has taught any lesson", said Professor Cameron, "it is that workers want established channels of communication between themselves and the management. This involves the right to select their own representatives for joint conferences with the management concerning such vital matters as wages, hours, conditions of work, and dismissal".

The employer wants the greatest possible output at the least possible cost, recognition of and respect for his traditional rights and powers in the organization and management of his enterprise; freedom to develop new ideas, processes and equipment without interference from either labour unions or governments; sustained growth of his industries and businesses, and the unreserved co-operation of his employees.

The public wants an uninterrupted flow of goods and services at reasonable prices.

In concluding this portion of his address Professor Cameron stated that "any study of the problems of personnel relations must proceed primarily from the standpoint of management. This is because problems of procedure in handling human relations are essentially problems of managerial technique. To be complete the analysis must attempt to interpret to the worker the difficulties of management, and to management the difficulties of the worker. It must, moreover, take cognizance of the larger social interests which impinge at various points on equitable relations in industry and business.

"The economic organization of a country is a means to an end rather than an end in itself", he continued. "That end is dominantly social; it is the enrichment of human life through the satisfaction of wants and desires. From a social point of view, however, the achievement of that end through the exploitation of the workers is undesirable and, consequently, unjustifiable. Industry cannot be a vehicle of genuine social progress if its own advance is at the expense or sacrifice of those who are largely responsible for its success".

In elaborating further upon the general subject of democratic control of industry, Professor Cameron said: "modern organization urgently needs some form of joint control which will bring management and men closer together in the conduct of the business". Employee participation in the formulation and execution of the rules and regulations that govern their everyday employment conditions is essential to harmonious relations. But if the workers are to be given a voice, they must accept responsibility for making industry economical and efficient and for sustaining an active interest in its government.

But what the pay of the worker himself should be, he felt, "must remain primarily a matter of negotiation and expedient adjustment and compromise. Customary and prevailing wages, labour supply and demand, the value of services and standards of living—all deserve consideration, but none of these nor any other like principle can be accepted as determining what is 'just and fair'. The state may set a minimum wage to prevent employers from paying labour 'depressed' wages, but its attempts to fix the rewards of labour generally have proved (even in wartime) as unacceptable to working people as the wages that are dictated by employers. And Government wage fixing has (even in wartime) proved equally unacceptable to employers. For when the rewards of labour are determined, the rewards of management and of investors are also determined, and there are effects on the incomes of consumers. And in these controversies over the division of the income of industry, not only wages and earnings are involved, but also the sharing of economic authority."

PETERBOROUGH BRANCH

A. R. JONES, Jr.E.I.C. - *Secretary-Treasurer*
J. F. OSBORN, S.E.I.C. - *Branch News Editor*

The Junior section of the Peterborough Branch met at the Kawartha Club, January 15th, to organize for 1943. Mr. A. Hailey was elected Chairman, and Mr. D. Gardner

Secretary-Treasurer. Senior members were invited to the latter part of the meeting which consisted of an address by Mr. J. M. R. Fairbairn, former Chief Engineer of the C.P.R., on **Early Problems in Railway Engineering**.

The Kawartha Golf & Country Club was the scene of the Annual Party on Saturday, January 30th. This event is becoming a pleasant institution with the Branch and was attended by around 50 couples. Dinner was served in the early evening, followed by an entertainment and dancing. A new feature was introduced this year in the person of Mr. El. Jones, Master of Ceremonies and Funnyman, who devoted his great bulk to seeing that there would never be a dull moment. A magician of parts, Mr. T. Van Russell, was such a hit that after his performance he spent the evening demonstrating his skill to small groups of delighted spectators. Members of the Branch contributed their part to the entertainment also. Messrs. McHenry, Drynan, Wilson, Wright and Pope gave a nostalgic rendition of some of the old, and not-so-old ballads, including the Strip Polka, under an imitation street-light. It is felt that this party adds a desirable social element absent from the technical meetings.

On Thursday, February 4th, the Branch was addressed by Mr. C. F. Cline of the Norton Company, on **Engineering, of Abrasive Production**. Mr. Cline outlined the methods of production of the three chief abrasive products of the Norton Company, silicon carbide, aluminum oxide and boron carbide. All three involve the use of large quantities of electric power for heat in carrying out the chemical reactions, and in preparation of grinding wheels and other products. Silicon carbide is one of the early industrial abrasives, made from silica sand and coke and is particularly useful in grinding very hard material. Aluminum oxide is of great importance to-day, especially for use with mild steel, but it has various applications, ranging down to dentists' wheels. It is made from bauxite, the ore of aluminum. Boron carbide has the distinction of being the next hardest material to diamonds and has great future possibilities, as well as its present important application as an abrasive and refractory. Abrasives are an unobtrusive, but nonetheless important element of wartime manufacture, entering as they do into practically every fighting tool. Mr. G. C. Tollington thanked the speaker for his excellent paper.

SAGUENAY BRANCH

A. T. CAIRNCROSS, M.E.I.C. - *Secretary-Treasurer*
GEORGES ARCHAMBAULT, Jr.E.I.C. - *Branch News Editor*

On January 28th, 1943, at Arvida, the Saguenay Branch of the Institute held a joint meeting with the Women's Canadian Club of the Saguenay to hear Dr. Ivan H. Crowell, Director of Handicrafts, MacDonald College, speak on **Handicrafts**.

The Branch Chairman, Mr. R. H. Rimmer, presided. The meeting opened with the singing of "God Save the King," and then Mr. Rimmer called upon Dr. Helen Cairncross, President of the Women's Canadian Club, to introduce the speaker.

Dr. Cairncross said that Dr. Crowell was a manual training teacher before he took his Science Degree and later his Doctorate of Philosophy in Plant Pathology. After leaving university, Dr. Crowell kept up his interest in woodwork, and organized a handicraft club among his associates, from which sprang the Department he now leads.

Dr. Crowell outlined the known history of handicrafts in Canada, which is centred in Quebec and the Maritime Provinces. The early settlers did not consider good handwork a craft because most of the work done was for home improvement. Organized handicraft in Canada was probably founded at Quebec when Ursuline nuns from France opened a girls' school and taught gold and silver thread embroidery. The work of the school expanded, and in many Quebec Roman Catholic Churches are to be found

artistic treasures made by persons who came under its influence and worked in embroidery, birch bark, wood, porcupine, leather, and moose hair.

In the present generation handicraft is looked upon as an art that can be used to advantage in several ways. It takes first place as a hobby in providing the task worker with an outlet for using his hands and ingenuity. Handicraft provides a means of recreation which during times of depression often provides for self-support. In hospitals, handicraft taught by trained occupational therapists gives the injured new interests and a means of providing for themselves.

Immediately following the address, many questions were asked, and a motion was passed by the audience authorizing the Chairman to appoint a representative committee to investigate the possibility of forming a Handicraft Guild at Arvida.

Mrs. R. O. Kennedy moved a motion of thanks to Dr. Crowell, which was seconded by Mr. M. G. Saunders and Rev. M. W. Booth.

Dr. Crowell brought from MacDonald College a collection of handicraft articles made by the students. These were displayed together with handicrafts in wood, embroidery, weaving, painting, model railroading, pottery and book-binding done by local residents. The exhibition attracted much attention and indicated that talent was available for the proposed guild.

SASKATCHEWAN BRANCH

STEWART YOUNG, M.E.I.C. - *Secretary-Treasurer*

The regular monthly meeting of the Saskatchewan Branch was held jointly with the Association of Professional Engineers in the Hotel Kitchener, Regina, on Wednesday evening, January 22, 1943. The meeting, at which the attendance was 32, was preceded by a dinner.

Several musical numbers were rendered by Mr. Norman Ayres, accompanied by Miss Fleming; following which Mr. Charles Eder, Assistant Manufacturing Superintendent, Regina Industries, Ltd., addressed the meeting on **Industrial Relations**.

Pointing out that management-labour relations in all democratic countries had passed through a period of evolution, from fear being a control factor at the close of the last war, to co-operation, Mr. Eder proceeded to explain the several features of a well co-ordinated plan of co-operation which must include personal interest of the workman, proper instruction and fair wages, adequate equipment and proper material with fairness on the part of the foremen and those in authority. The address proved of more than usual interest and elicited numerous questions.

The meeting concluded with two sound films, one on Argentina and the second on the Icelandic population of Western Canada.

Due thanks were conveyed by the Chairman, A. P. Linton, to Mr. Eder for his excellent address and to Mr. Armstrong, Principal, Lakeview School for operating the projector. The films were on loan from the Visual Education Branch, Department of Education.

The Twenty-Sixth Annual Meeting of the Saskatchewan Branch was held in the Hotel Saskatchewan, Regina, at 4.00 p.m. on February 19th, 1943. The Chairman, A. P. Linton, presided.

Afterwards, those in attendance met for a social hour with the members of the Association of Professional Engineers and, at 6.30, all gathered for the joint annual dinner. The total attendance was 69. The newly elected Chairman and President of the Association, A. M. Macgillivray, presided. Following a programme of music and entertainment, Mr. G. N. Griffin, Principal, Normal School, Regina, addressed the meeting on **The Challenge of Democracy**.

Stating that the democratic way of life was an outgrowth of the teachings of Christianity, developed during

the last 150 years, Mr. Griffin proceeded to point out certain accompanying characteristics at variance with the ideals on which the system was based. Among these he mentioned rugged individualism as opposed to the principles of the brotherhood of man; competition in trade versus co-operation; the supplying of medical services on the basis of ability to pay rather than as a function of the state available to all. In concluding his address, Mr. Griffin stated that in the post-war world of free democratic nations, if we are to survive, there must be a changed attitude within each person from selfish individualism to the principles laid down nearly 2,000 years ago in Palestine.

During the course of the meeting an Institute pin was presented *in absentia*, to F/Lt. R. A. McLellan, the retiring Past Chairman.

SASKATOON SECTION

G. W. PARKINSON, M.E.I.C. - *Secretary-Treasurer*

The Saskatoon Section held four meetings during the past year. The dates of the meetings, speakers and topics are listed below:

Mar. 19th, 1942—**Urban Transportation—Past, Present and Future**, by G. D. Archibald.

April 8th, 1942—**Report of the Activities of the Engineering Institute of Canada**, by Dean C. R. Young.

Dec. 3rd, 1942—**Insulation**, by Dr. N. B. Hutcheon.

Feb. 12th, 1943—**Saskatchewan Soils**, by Dr. J. L. Mitchell.

The average attendance at these meetings was 42. Mr. A. M. Macgillivray has acted as President of the local section and the programmes were arranged by a committee composed of C. R. Forsberg, B. Chappell and the Secretary. The number of students attending the dinner meetings has been somewhat larger than usual. This is surprising when one considers the time required for academic work and military training.

SAULT STE. MARIE BRANCH

O. A. EVANS, Jr., E.I.C. - *Secretary-Treasurer*

N. C. COWIE, Jr., E.I.C. - *Branch News Editor*

The first regular meeting for the year 1943 was held in the Windsor Hotel on Friday, January 29, at 6.45 p.m., when twenty-seven members and guests sat down to dinner.

At the beginning of the dinner Chairman N. C. Cowie, requested the members to rise and drink a toast to the King.

At the conclusion of the dinner the members were entertained by a duet consisting of Mrs. Albert Cartmill, pianist, and Mrs. H. M. Jourdin, who played the guitar. A number of pieces were played and everyone enjoyed them. This was under the auspices of Paul Martin of the Entertainment Committee.

The minutes of the last regular meeting were then read and adopted on motion of A. M. Wilson and L. R. Brown. The following bills were passed on motion of J. L. Lang and A. E. Pickering, Cliffe Printing \$3.56 for 140 cards, Cliffe Printing \$8.64 for 150 membership cards and petty cash to Secretary \$5.00.

The Chairman, then, called upon A. E. Pickering to introduce the speaker of the evening, H. R. Sills of Peterborough, Ontario. Mr. A. E. Pickering said that H. R. Sills had a notable career in the electrical field, as a designer. He also told the members that the speaker had taken an active part in Institute affairs.

Mr. H. R. Sills had for his topic, **The Design and Construction of Synchronous Machine**. The following is a résumé of H. R. Sills' paper.

The paper sketched the electric and magnetic circuits of the synchronous machine and explained that such machines were characterized by possessing one direct circuit and one alternating current circuit and a common magnetic circuit.

TORONTO BRANCH

S. H. DEJONG, M.E.I.C. - *Secretary-Treasurer*
G. L. WHITE, A.E.I.C. - *Branch News Editor*

Synchronous machines must operate in synchronism or, in step with, the frequency of the alternating current voltage irrespective of load. Hence the name synchronous.

The simplicity of the magnetic circuit permits making synchronous machines to large sizes governed, so far, by the sizes of the connecting machines. The source of electric power in Canada is from synchronous generators driven by water wheels. Of the approximate 10,000,000 h.p. developed in Canada about two-thirds is developed by units of 40,000 h.p. or more, each. These large units occupy such a vital place in the power supply that they are worthy of a more than casual description and, as the design and construction of the small machines was a simplification of the large ones, a story of the large machines would be representative of the whole.

Synchronous machine design is in a continual state of development and modern machines are lighter and more compact than their predecessors of the same size were. There is a tendency for machines of any particular make to develop in accord with that tangible "way of thought" or "know how," that characterizes the men and products of individual manufacturers. The processes and structures illustrated are those characteristic of one manufacturer.

The characteristics of the basic materials of construction, the iron, the steel, the copper, are much the same as thirty years ago. Hence, the development is largely a matter of arrangement of the materials to best utilize their characteristics, and treatment to enhance the desirable characteristics and to eliminate the undesirable ones. The process of converting mechanical into electrical energy involves several intermediate steps and as the synchronous machine is, in abstract, an intricate inter linkage of five circuits, magnetic, electrical, mechanical, thermal and ventilation. The importance of the arrangement of these circuits to best utilize the potentialities of the material cannot be over emphasized. This was illustrated by series of slides showing process and arrangements used in the manufacture of the 40,000 K.V.A. generators for the St. Maurice Power Company at LaTuque. A certain historical background was added by showing slides portraying examples of construction as used 10 to 20 years previously. This was followed by several slides illustrating the diversity of forms in which the synchronous machine is used.

At the conclusion of the speech the members took a lively interest by asking the speaker many questions.

J. L. Lang moved a vote of thanks to the speaker and thanked him for his interesting speech. Chairman N. C. Cowie thanked the speaker on behalf of the Branch.

R. A. Campbell moved the adjournment.

ST. MAURICE VALLEY BRANCH

VIGGO JEPSON - *Chairman and Acting Secretary-Treasurer*

On Tuesday night, February 2nd, the Canadian General Electric Co. film "The Inside of Arc Welding" was shown to members of the Branch and other interested parties, by Mr. R. N. Fournier and Mr. R. McBrien of the Canadian General Electric Co. The meeting was held in the Auditorium of the Shawinigan Technical Institute, Shawinigan Falls, where the film was also shown to students of that Institution in the afternoon.

The meeting was presided over by the Branch Chairman, who introduced the representatives of The Canadian General Electric Co.

The introductory remarks were given by Mr. Fournier, who also delivered a short speech on the **Conservation of Welding Rods** during the intermission.

At the close of the meeting a hearty vote of thanks was extended to the Canadian General Electric Co., and, in particular, Messrs. Fournier and McBrien, by Mr. E. T. Buchanan.

The meeting was attended by 130 people.

War Industry Problems was the subject of a paper presented before the Toronto Branch of the Engineering Institute of Canada at Hart House, on January 7th, by T. M. Moran, Vice-President of Stevenson and Kellogg, Ltd., Management Engineers, and President of United Tool Engineering and Design, Ltd.

The meeting was opened by the Chairman of the Toronto Branch, Col. W. S. Wilson, who then turned the Chair over to Wills Maclachlan, Chairman of the Institute Committee on Industrial Relations.

In introducing the speaker, Mr. Maclachlan made reference to the many important industrial and Government jobs which Stevenson and Kellogg, Ltd., had undertaken and congratulated the Toronto Branch upon securing Mr. Moran to deal with a subject of such vast importance in war production.

Mr. Moran outlined in detail the problems that face industrial managers relative to organization, planning, production and personnel. Special emphasis was placed upon the human factor in industry and factual data was presented relating to the employment of women in industry and the implications of absenteeism. The speaker stated that these problems are best solved by industry as a whole, placing its shoulder to the wheel and adopting affirmative, horse-sense approach to the problem. There is no substitute for the understanding of the situation obtained in this manner and too often Government and external agencies are expected to supply the solution.

The speaker asserted that the engineer has a real place in industry and industrial management, and must realize more fully that he is very valuable in the field of management as well as in the field of technology. There should be more engineers working as foremen, superintendents and works managers—capacities in which their services are urgently required.

In conclusion Mr. Moran stated that industry must face the issue and organize itself on a sound fundamental basis. All operations must be centered around this fundamental industrial pattern. Management is a profession and as such demands adherence to its basic principles if an efficient war enterprise is to be the result.

The active discussion period which followed the address was an excellent indication of the interest taken in the subject by members of the Toronto Branch. During the discussion period further light was thrown upon the question of absenteeism, labour management committees for increasing production, and the appointment of someone in an organization to plan for the future.

The vote of thanks to Mr. Moran was moved by Dean C. R. Young, President of the Institute, who emphasized the importance of greater attention to human factors on the part of engineers.

The Toronto Branch was fortunate in having two special meetings in January which were of great interest to young engineers. The first of these was the Annual Student's Night of the Branch held in the Debates Room at Hart House on Thursday, January 21, 1943. The second was the Inaugural Meeting of the newly instituted Junior Section of the Toronto Branch, also held in the Debates Room at Hart House on Wednesday, January 27, 1943. Both these meetings constituted worthwhile contributions to the development of young engineers, in whose hands the future of the Engineering Institute of Canada and of the engineering profession generally rests.

About ninety young engineers attended the Inaugural Meeting of the new Junior Section of the Toronto Branch of the Engineering Institute of Canada. In discussion it was found that all the main branches of the profession and most

Canadian Universities were represented by those present. The gathering was called to order by Professor Robert Legget who explained briefly that the meeting was the culmination of a series of discussions amongst a small group who were concerned at the lack of any facilities in Toronto for the assembling of young men in all branches of the engineering profession to discuss their common problems and matters of general professional interest. Tribute was paid to the work done by the Junior Section of the A.S.M.E., and by the Junior Discussion Group of the A.I.E.E. in Toronto. Contact had been made with both these organizations in order that there should be no overlapping of activity, the aim being to supplement existing technical organizations and in no way to supplant them. Reference was made to earlier attempts to start a Junior Section in Toronto, and to the development of the corresponding Junior Section in Montreal.

The meeting was then turned over to Erwin E. Hart, as Chairman of the provisional committee, who outlined the aims and objects of the Section. He introduced Dean C. R. Young, President of the Institute, who expressed his pleasure at the start of the Junior Section. He explained the emphasis now being placed upon the place of the young engineer in professional circles, mentioning particularly the recent appointment of two young members of the Institute to one of the main committees of the E.C.P.D. Lt.-Col. W. S. Wilson, Chairman of the Toronto Branch, expressed corresponding pleasure at the inauguration of the Section on behalf of the Branch.

Professor Griffith Taylor, Professor of Geography at the University of Toronto, was guest speaker at the meeting, being introduced by J. VanWinkle, member of the provisional committee and Chairman of the Toronto Junior Section of the A.S.M.E. Professor Taylor spoke on **Geopolitics** with special reference to Canada. He traced the development of geographical studies in association with political objectives, paying special attention to the early work of Sir Halford Mackinder. Turning to Canada, Professor Taylor showed its importance in world politics from its geographical features and he discussed future possibilities for Canadian development stressing the importance, in his view, of the Alberta coal resources. An interesting and prolonged discussion followed the address, which was illustrated by many lantern slides, the speaker being finally thanked by R. Scott.

After a short interval, during which the senior guests retired, the meeting proceeded to discuss the future of the new Section after the Chairman had outlined the proposed constitution. Many suggestions were advanced, and it was finally decided to hold monthly meetings for the remainder of the winter season. It was generally agreed that this meeting provided the Section with a very useful start.

For the first time the Annual Student's Night was held as a joint meeting with the Engineering Society, University of Toronto. The speakers of the evening and the Executive of the Engineering Society were guests of the Toronto Branch at dinner in the Graduate Dining Room prior to the meeting.

The meeting was opened by Lt.-Col. W. S. Wilson, Chairman of the Toronto Branch, who immediately placed proceedings in the hands of Prof. R. F. Legget, Department of Civil Engineering, University of Toronto. Professor Legget introduced the judges, Messrs. J. T. Cawley, D. D. Stiles, Jr., and E. A. Cross, and the speakers in the Senior and Junior Competitions.

The speakers and their papers were as follows:

SENIOR COMPETITION

- John M. Dyke—**The Solid Fuel Combustion Engine**
 Ronald Scott—**Electronic Devices**
 R. B. Telford—**Deep Wells**

JUNIOR COMPETITION:

J. A. Legris—**The Place of the Engineer in the Post-War World**

W. E. A. Rispin—**Synthetic Rubber**

K. Stehling—**Underground Gasification of Coal**

In the Senior Competition the judging was for a draw between R. Scott and J. M. Dyke with first and second prizes divided between them; and third prize to R. B. Telford.

In the Junior Competition the first prize was awarded to W. E. A. Rispin, with second prize a draw between J. A. Legris and K. Stehling, who divided second and third prizes between them. Professor R. F. Legget who announced the judges' decision also announced the award of one year Student Membership and one year's subscription to *The Engineering Journal* to R. A. Muller and J. J. Hurley, who presented excellent papers but were eliminated from the competition.

Lt.-Col. W. S. Wilson presented the certificate for the Engineering Institute prize to J. M. Ham. During the interval while the judges were reaching their decision, two films—**The Wardens of Power** and **The Master Plan**—were shown through the courtesy of the Hydro Electric Power Commission of Ontario.

VANCOUVER BRANCH

P. B. STROYAN, M.E.I.C. - *Secretary-Treasurer*
 A. PEEBLES, M.E.I.C. - *Branch News Editor*

On Thursday, February 18th, at a meeting held in the Medical-Dental Building, presided by the Branch Chairman, Mr. W. N. Kelly, Mr. Gerald H. Heller, Personnel Supervisor, Dominion Bridge Co., Ordnance Plant, Vancouver, delivered an address on **Industrial Relations**.

Mr. Heller, who has had an interesting career as a journalist, spoke in general terms on his subject. He opened by relating some experiences and impressions gathered during an extensive journalistic tour of Central Europe in 1938, and in Japan the previous year. He visited Germany, Sweden, France, Italy and some of the smaller countries, at a time when war was in the making. In Germany especially, industry was working in high gear, its obvious purpose being maximum production of war materials and implements. Employees were regimented to a high degree, yet the psychological effects of this were not wholly ignored. Morale building propaganda was dispensed freely, and an industrial psychology was developed which, operating in conjunction with the new political training of the period, made their tremendous production effort possible.

In the democratic countries the same degree of civilian regimentation is not possible, but by an intelligent use of psychology in industrial relations, as great or greater production efficiency can be achieved. The rapid expansion of industry has necessitated a careful study of the effect on employees. As long as industrial growth was at a normal rate, employees worked their way into factories gradually and over a period of years were trained in factory methods, and environment. Now, large numbers of workers have been suddenly transferred from mines, farms, forests, offices, schools, and even from the kitchen, and placed in a new type of work where their movements are much more restricted, and they are forced to conform to the pattern of organization of the industrial plant. This change has given rise to certain difficulties for the individual employee which he cannot completely overcome by himself. Management is compelled to study and solve many problems which formerly were not considered one of its functions.

Some of these difficulties are problems of training unskilled persons while others pertain to the building up and protecting of morale. To mention some of the new phases of industrial management which deal with personnel the following are the most obvious. A large percentage of un-

skilled labour must be trained in a very short time. Transportation of employees must be arranged in many cases by the management. The employment of women where none were used before requires new regulations and new facilities for their use and comfort. In all cities housing is a present problem which reacts on working efficiency. Men are drafted into the armed forces on short notice and must be replaced by an untrained person. Plants must be protected against sabotage and the inquisitive outsider. Greater protection for employees is necessary because of crowded space, lesser skill on their part, and lack of experience of the world of machines. Recreational facilities must be provided in isolated plants, or where the community facilities are overtaxed. Absenteeism is serious in some cases and must be carefully handled. Meals must be provided for large numbers of persons. Certain outside activities such as appeal campaigns, also impinge upon the management.

The speaker expressed the view very emphatically that many of the above features of industrial relations will remain permanently. The old relationship between employer and employee, that of master and servant will never return, even during slack periods when there is no shortage of labour. Employees must be given a larger voice in some aspects of management, because they are relating their daily employment to life as a whole, and expect it to provide a reasonable amount of comfort and security. In developing such a broad attitude, management must frequently take the initiative, rather than the employees. This will avoid much of the bitterness which usually characterises any attempt on the employees' part to improve working conditions.

Considerable discussion followed the address, and a hearty vote of thanks was proposed by Mr. C. E. Webb. About twenty-five members were present.

SURVEYORS ELECT OFFICERS

At the 36th annual meeting of the Canadian Institute of Surveying held at Ottawa, on February 3rd, 1943, R. H. Field, M.E.I.C., was elected president for the year 1943-44. He succeeds C. H. Fullerton, Surveyor-General, National Research Council, Ottawa.

Other officers elected at the meeting are: H. E. Beresford, Winnipeg, first vice-president; R. D. Davidson, Ottawa, second vice-president; and W. L. McIlquham, Ottawa, secretary-treasurer. Councillors: B. H. Segre, M.E.I.C., W. B. Dingle and R. C. McDonald, all of Ottawa; George McMillan, Medicine Hat, Alta.; G. P. Tassie, Vernon, B.C.; W. Humphreys, Winnipeg, Man.; D. H. Hudson, Edmonton, N.B.; R. J. Milgate, Halifax, N.S.; J. W. Pierce, M.E.I.C., Peterborough, Ont.; H. E. Miller, Charlottetown, P.E.I.; A. C. Crépeau, Sherbrooke, Que.; W. M. Stewart, M.E.I.C., Saskatoon, Sask.

Library Notes

ADDITIONS TO THE LIBRARY TECHNICAL BOOKS

Foremanship and Safety:

C. M. MacMillan. N.Y., John Wiley and Sons, (c. 1943). 5½ x 7½ in. \$1.00.

Transients in Linear Systems:

Vol. 1—Lumped-constant systems. Murray F. Gardner and John L. Barnes. N.Y., John Wiley and Sons, 1942. 6 x 9 in. \$5.00.

A Start in Meteorology:

An introduction to the science of the weather. Armand N. Spitz. N.Y., Norman W. Henley, 1942. 5½ x 8 in. \$1.50.

Air Navigation for Beginners:

A ground school primer for the aerial navigator. Scott G. Lamb. N.Y., Norman W. Henley, 1942. 5½ x 8 in. \$1.50.

Alternating-Current Circuits:

Earle M. Morecock. N.Y., Harper and Bros., (c. 1942) (Rochester Technical Series). 6 x 9½ in. \$2.75.

Tool Design:

Cyril Donaldson and George H. LeCain. N.Y., Harper and Bros., (c. 1943) (Rochester Technical Series). 6 x 9½ in. \$3.75.

Photogrammetry:

3rd ed. H. Oakley Sharp. N.Y., John Wiley and Sons, (c. 1943). 8½ x 11 in. \$3.50.

Book notes, Additions to the Library of the Engineering Institute, Reviews of New Books and Publications

1942 Book of A.S.T.M. Standards:

Including tentative standards. Part 2: Nonmetallic materials — Constructional. American Society for Testing Materials, 1943.

Bibliography on Automatic Stations, 1930-1941:

American Institute of Electrical Engineers, December, 1942. 26 p. 50c. (E.I.C. members may obtain copies at Headquarters at 25c.)

Canadian Engineering Standards Association:

B63-1942: Specification for welded and seamless steel pipe.—B71-1942: Specification for standard dimensions of small rivets.

Water resources paper No. 83—Atlantic drainage, south of St. Lawrence river. (Continued on page 179)

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

February 27th, 1943

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the April meeting.

L. AUSTIN WRIGHT, General Secretary.

*The professional requirements are as follows:—

A **Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A **Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

ADAMSON—FRANCIS STANLEY, of 300 Waterloo St., Winnipeg, Man. Born at Nassagaya, Ont., April 7th, 1902; Educ.: B.Sc. (C.E.), Univ. of Man., 1926; R.P.E. of Man.; 1920 (summer), C.P.R.; 1923 (Sept.-Nov.), inspr., Winnipeg Electric Co.; 1924 (Jan.-Aug.), elec. consultant, Chicago Engineering Works; 1925 (May-Sept.), asst. field engr., Kelker, Deleuw & Co., Chicago; 1926 (June-Nov.), field engr. for same company i/c munic. work; 1926-32, designing engr., Concrete Steel Co., Akron and Youngstown, Ohio. Designing, detailing, estimating, office engr., and asst. sales mgr.; 1934-35, dftsmn., Cowin & Co. Ltd., Winnipeg; 1935-39, designing engr., Greater Winnipeg Sanitary District; 1939-42, asst. engr., i/c design and dftng. room, city engr's. dept., City of Winnipeg; June, 1942, to date, as above, also i/c sewer mtce., and chief bldg. and plumbing inspr.

MOORE—JOHN BEVERLY, of Cleveland, Ohio. Born at Chatham, Ont., Sept. 1st, 1918; Educ.: B.A.Sc. (Civil), Univ. of Toronto, 1940; 1937 (summers), dftsmn. and field material checker, S. C. Hadley Constrn. Co., Detroit; 1938-39 (summers), dftsmn. and checker, with Isaac Moore, Chatham, Ont.; 1940 (summer) detailer on struct'l. steel, Canadian Bridge Co., Walkerville, Ont.; with Arthur G. McKee & Co., Cleveland, Ohio, as follows: 1940-41, in Trinidad, B.W.I., as asst. civil engr. on the constrn. of a modern and new process refinery for the manufacture of 100 octane gasoline, later asst. to the general foreman supervising underground piping for oil and water drainage, also i/c misc. steel and rigging work, etc.; Oct., 1941, transferred to East Chicago, Indiana, as chief field engr. on constrn. of blast furnace for Inland Steel Co.; May, 1942, to date, designer and checker, engr. dept., Cleveland, Ohio. (St. 1940).

References: D. T. Alexander, C. R. Young, R. F. Legget, C. F. Morrison.

LIBRARY NOTES

(Continued from page 176)

Canada—Department of Mines and Resources—Mines and Geology Branch—Bureau of Mines:

Coal mines of Canada, January, 1943.

U.S. Bureau of Standards—Miscellaneous Publication M172:

Index to the reports of the national conference on weights and measures from the first (1905) to the thirty-first (1941) inclusive.

U.S. Bureau of Standards—Handbook H29:

Specifications, tolerances and regulations for commercial weights and measures and weighing and measuring devices. Supercedes handbook H22. Issued September 26, 1942.

U.S. Bureau of Standards—Building Materials and Structures:

Report BMS94—Water permeability and weathering resistance of stucco-faced, gunitite-faced and "knap concrete unit" walls.

University of Illinois Engineering Experiment Station:

Bulletin series No. 337—Tests of riveted and welded joints in low-alloy structural steels. A report of an investigation conducted by the Engineering Experiment Station of the University of Illinois and the American Bridge Company. No. 338—Influence charts for computation of stresses in elastic foundations. No. 339—Properties and applications of phase-shifted rectified sine waves. Circular series No. 45—Simplified procedure for selecting capacities of duct systems for gravity warm-air heating plants. No. 47—Save fuel for victory.

Purdue University—Engineering Bulletin:

Research series No. 86—A study of chert as a deleterious constituent in aggregates.

BOOK NOTES

ALTERNATING-CURRENT CIRCUITS (Rochester Technical Series)

By E. M. Morecock. Harper & Brothers, New York and London, 1942. 175 pp., diags., charts, tables, 9½ x 6 in., cloth, \$2.75.

This text is intended for use in technical institutes, junior colleges and industrial schools, and is based on a functional study of the essentials of a course in the subject. Problems and laboratory experiments are included. No knowledge of calculus is necessary.

AMERICA FLEDGES WINGS, the History of the Daniel Guggenheim Fund for the Promotion of Aeronautics

By R. M. Cleveland, with a foreword by R. A. Millikan. Pitman Publishing Corporation, New York and Chicago, 1942. 224 pp., illus., diags., charts, maps, tables, 9½ x 6 in., cloth, \$2.50.

The story of this fund and the great part it played in fostering the development of aeronautical achievement in America is told in detail in this interesting volume.

CHEMICAL-TECHNICAL DICTIONARY (German-English-French-Russian)

By A. W. Mayer, translated under the direction of B. N. Menshutkin and M. A. Bloch. 1st American ed. Chemical Publishing Co., Brooklyn, N.Y., 1942. 870 pp., 9 x 5½ in., cloth, \$8.00.

This is the first American edition of a well-known German dictionary. A comprehensive German vocabulary is given, with equivalents in English, French and Russian. Readers of German chemical literature will find the work very useful.

HEAT

By J. M. Cork. 2 ed. John Wiley & Sons, New York, 1942. 294 pp., diags., charts, tables, 9½ x 6 in., cloth, \$3.50.

This well-known text covers temperature and its measurement, specific heats, thermal

expansion, the transfer of heat, radiation, the first law of thermodynamics, the state of matter, elementary thermodynamics and the production of high and low temperatures. This edition has been revised to include references to recent advances in the subject of heat and has also been adapted to students with less preparation by increasing the amount of descriptive matter.

PRINCIPLES OF AERONAUTICAL RADIO ENGINEERING

By P. C. Sandretto. McGraw-Hill Book Co. New York and London, 1942. 414 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$3.50.

An engineering treatment is given of the peculiar problems that are involved in the use of radio in air transportation and of the means taken to solve them. The nine radio facilities used in modern air transport practice are considered in detail. The book is written chiefly from the point of view of commercial airline operation and assumes some preliminary knowledge of radio.

PRINCIPLES OF ELECTRONICS

By R. G. Kloeffler. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 175 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$2.50.

A short introductory book on electronics, intended for sophomore or junior students of electrical engineering, and to be followed by a mathematical treatment of the subject.

WELLS' MANUAL OF AIRCRAFT MATERIALS AND MANUFACTURING PROCESSES

By T. A. Wells. Harper & Brothers, New York and London, 1942. 212 pp., illus., diags., tables, 10½ x 7½ in., cloth, \$3.50.

The various materials and manufacturing processes used in airplane construction, and the characteristics, advantages and disadvantages of each are clearly and concisely set forth in this book.

Employment Service Bureau

NOTICE

Technical personnel should not reply to any of the advertisements for situations vacant unless—

1. They are registered with the War-time Bureau of Technical Personnel.
2. Their services are available.

A person's services are considered available only if he is—

- (a) unemployed;
- (b) engaged in work other than of an engineering or scientific nature;
- (c) has given notice as of a definite date; or
- (d) has permission from his present employer to negotiate for work elsewhere while still in the service of that employer.

Applicants will help to expedite negotiations by stating in their application whether or not they have complied with the above regulations.

SITUATIONS VACANT

MECHANICAL ENGINEER. Either capable of making mechanical repairs to power shovels, tractors, etc., or willing to learn. Apply to Box No. 2619-V.

EXPERIENCED (TRANSITMAN for railway engineering work. Apply to Box No. 2629-V.

CIVIL ENGINEER, must be capable of supervising plant and small town house construction. Apply to Box No. 2630-V.

SITUATIONS WANTED

CIVIL ENGINEER, 38, experienced in all types of building construction and in industrial layout work. Wants permanent or temporary position in charge of design or construction. Present location, Montreal. Apply to Box No. 576-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., 17 years experience as production manager and factory organizer in metal and various other industries, military exempt, available on short notice. Apply to Box No. 1730-W.

SURVEYING INSTRUMENTS FOR SALE

SIMPLE THEODOLITE, Stackpole and Bros.

Telescope, 10" long, 1 1/4" dia. O.S.

Compass, 5 1/4" dia.

Table, 7 1/4" dia.

Scale, 6 1/4" dia.

Height of C.C. of telescope above levelling table, 10 1/2".

Spirit levels, 3 1/4" long x 1/2" dia.

Levelling screws, 4.

Condition of instrument and lenses—excellent.

Complete with tripod and plumbob in wooden case.

TRANSIT, Watts.

Telescope, 7 1/2" long, 1" dia. O.S.

Horizontal scale, 3" dia.

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.

Vertical scale, 3 1/4" dia. O.S.

Compass, 2 1/4" dia.

Height of C.C. of telescope above levelling table, 7 1/2".

Levelling screws, 4.

Prism eyepiece and sun glass—1.

Extra eyepiece—1.

Scale reading lenses—2.

Spare frame in aluminum case.

Plumbob—1.

Complete in wooden case with tripod.

Condition of instrument and lenses—excellent.

TRANSIT, F. Barker & Sons, London.

Telescope, 9" long, 1 1/8" dia. O.S.

Horizontal scale, 4 1/2" dia.

Vertical scale, 4 1/4" dia.

Compass, 2 1/2" dia.

Height of C.C. of telescope above levelling table, 9 1/4".

Levelling screws, 4.

Levelling table part of the tripod.

Scale reading glasses—2.

Prism eyepiece and sun glass—1.

Plumbob—1.

Complete in leather-covered wooden box, with tripod.

Condition of instrument and lenses—excellent.

Y LEVEL, Watts (bright brass).

Telescope, 10 1/2" long, 1 1/4" dia. O.S.

Height of C.C. of telescope above levelling table, 5 1/2".

Levelling screws—4.

Base plate, 3 1/2" dia.

Complete in wooden case, with tripod.

Condition of instrument and lenses, good; one indexed lens appears to require cleaning.

SEXTANT, pocket type, brass case, complete in leather carrying case.

Screw-in type of telescope.

Condition of instrument, good.

SEXTANT, pocket-type, brass case, no telescope, no carrying case. Clamp-on type of telescope.

Condition good, except for missing telescope.

SURVEYOR ARROWS, one set (11), 1/8" sq. x 14" long. Condition, new.

STADIA ROD, 12 ft. (7 ft. closed). Condition, new.

LEVELLING ROD, 16 ft. (6 ft. closed). Condition, excellent.

PICKETS, iron-shod, 2-5 ft. Condition, good.

STEEL TAPE, 66 ft., 1/2", Chesterman, on reel. Condition, good.

STEEL TAPE, 66 ft., 3/8", on fibre reel. Condition, good.

STEEL TAPE, 100 ft., 1/4" on reel. Condition, good.

STEEL TAPE, 200 ft., 1/4" on reel. Condition very good.

STEEL TAPE, 100 ft., 3/8" (ft. and 10ths.). Leather case. Condition, very good.

MINER'S DIP COMPASS, W. S. Darley, in case. Like new.

SET OF 65 RAILROAD CURVES, in wooden case. Like new.

C.C. Moler-Line loss and voltage drop slide rule. Like new.

Full leather map-case, 5 1/2" dia. x 40" long. Condition, good.

Matthews Teleaheight Level, in leather case. Condition, good.

Offers will be considered. Apply to Box No. 48-S.

FOR SALE

Complete file of *Engineering News Record*, 1916 to date. All volumes 1916 to 1929, inclusive are bound in half-leather. Must be cleared before April 20th, at your own price. Apply to Box No. 46-S.

FOR SALE

PORTABLE TYPEWRITER, bought in 1938 and little used. Fitted with keyboard carrying mathematical symbols. In perfect condition. Original cost, \$65.00. Make your offer. Apply to Box 47-S.

ELECTRICAL OFFICERS FOR R.C.N.V.R.

A limited number of vacancies exist in the Royal Canadian Naval Volunteer Reserve for young graduates in electrical engineering possessing suitable personal qualities and engineering experience.

Applicants should complete an "Offer of Service" form, which may be obtained from the nearest R.C.N.V.R. Barracks, and should attach to it a detailed account of educational qualifications and engineering experience, together with copies of properly attested testimonials.

Successful applicants will be entered as Probationary Electrical Sub-Lieutenants or, in the case of exceptional qualifications, as Electrical Sub-Lieutenants. Their duties after a period of training will consist of electrical engineering work in connection with any of the following: Design and Manufacture; Ship Installations; Testing and Trials; and Base Maintenance. Applicants must be prepared to go to sea. Completed forms should be returned to the Deputy Secretary, Naval Board, Department of National Defence, Ottawa, Ont.

ARC WELDING ACCESSORIES

Canadian General Electric Company, Ltd., Toronto, Ont., have recently issued Catalogue CGEA-2704B, 28 pages and cover. Using the well-known "Joe McGee" character in the cover design, this catalogue lists over 100 arc-welding accessory items to meet the requirements of all ordinary welding work as well as many special applications. Head protectors, welding lenses and cover glasses, protective clothing, metal and carbon electrode holders, cable connectors, clamps and chippers, brushes and electrode carriers, "Glyptal" to prevent adhesion of weld spatter, are among the items featured.

CENTRIFUGAL PUMPS

Darling Brothers Ltd., Montreal, Que., have for distribution a 15-page bulletin, 46-C, describing the "Darling" Class D end suction centrifugal pumps for general industrial use. The centre spread gives typical sectional drawings of standard designs of this class of pump, indicating the particular application of each type. A general description of the principal parts is included, together with photographs of a number of installations representing a variety of applications. Rating tables, dimensional drawings and tables of dimensions and other hydraulic data are also included.

TRANSMITTING AND CONVEYING IDEAS

The February, 1943, issue of Transmitting and Conveying Ideas, published by Link-Belt Limited, Toronto, Ont., presents much of interest on the application of conveying and power transmission machinery with a view to solving the problems of modern industry. This issue describes the production of plywood and its many applications under present conditions. A number of plant photographs show the ingenious machines employed. Uniform paper machine speed through the use of P.I.V. gear, applied to the engine governor, is the subject of another article featuring the installation at the Abitibi Power & Paper Company's plant at Sault Ste. Marie.

PRESIDENT, ELECTRIC SERVICE LEAGUE

Mr. Norman Franks of Canadian General Electric Co. Ltd. has been elected president of the Electric Service League of Toronto. Mr. Franks is manager of the Toronto district office of C.G.E.

Mr. Norman Franks.

Late Mr. F. W. Blyth.

MR. F. W. BLYTH, DECEASED

Mr. F. W. Blyth, former district sales manager for Amalgamated Electric Corporation Ltd. at Montreal, died recently in Montreal. Born in Montreal and educated in Toronto, Mr. Blyth spent a number of years in Winnipeg and Toronto with Canadian Allis-Chalmers Limited until 1920, and later with Rose & O'Hearn, Toronto, and Northern Electric in Toronto and Renfrew Electric Products. He joined Amalgamated in 1929 and in 1932 became district sales manager for that company at Montreal, which position he occupied at the time of his death.

MR. G. L. KIRKPATRICK, DECEASED

Word has been received of the death of Mr. G. L. Kirkpatrick, for many years managing director of Bruce Peebles & Co. Ltd., Edinburgh. Mr. Kirkpatrick was a leading figure in the heavy electrical industry field in Britain and was largely responsible for the international reputation enjoyed by his company. Manufacturers of transformers and other electrical equipment since 1866, Bruce Peebles is a constituent company of Bepeco Canada Ltd., an amalgamation of four British companies with Canadian head offices in Montreal.

CONTACTOR RELAYS

Cansfield Electrical Works Ltd., Toronto, Ont., have issued bulletin No. B-2, describing their type J11 double pole, double throw contactors. This contains full information and specifications covering the contactor element only without mounting or enclosures and with the elements mounted in an enclosure for either indoor service, panel mounting or outdoor service. The double pole, double throw contacts are supplied as standard while single pole, normally open or normally closed circuits can be obtained by using appropriate terminals.

GRINDING WHEELS

Entitled "Boost Production on Your O.D. Grinding Jobs—Centerless and Cylindrical", Norton Co. of Canada Ltd., Hamilton, Ont., have issued a leaflet telling why the Norton "B-E" bond grinding wheel is stronger for faster production of traverse or plunge-cut jobs on steel and steel alloys. A list of "Norton" cylindrical and centerless grinding wheels for O.D. grinding, giving material and wheel marking, is included and the company states that a complete line of "Norton" wheels of hard, sharp Crystolon abrasive for the O.D. grinding of cast iron, brass, aluminum and non-metallic materials is available.

ELECTED PRESIDENT

Mr. A. L. Ainsworth, vice-president and general manager of John Inglis Company, Ltd., of Toronto, has been elected president of the Canadian Employee Chest, the organization which has consolidated the charity contributions of employees of many large companies.

INDUSTRIAL SWEEPING MACHINES

Moto-Mower Company, Detroit, Mich., have for distribution a bulletin featuring their "Moto-Sweeper", a new manually operated sweeper which collects all varieties of dirt, paper and trash in factories, warehouses, schools, parks, air fields, tennis courts, skating rinks, railroads, etc. This sweeper, which is pushed like a lawn mower, is thoroughly described and illustrated and specifications and advantages in efficiency, operation, economy and construction are given. This bulletin also illustrates two motorized units—the "Commander" Moto Sweeper which turns right or left under its own power by use of a clutch on each wheel of the tractor, controlled at the handle bar; and the "Fleetway" Moto-Sweeper equipped with a sprinkling system and brush, used for removing dirt or snow.

TABLES, CHARTS AND ENGINEERING DATA

Canadian SKF Company, Ltd., Toronto, Ont., have issued sheet No. 22 of a series of punched filing sheets of tables, charts and engineering data prepared by this company during the past two years. It contains a table of "U.S. Standard Thread Bolts and Nuts" and diagrams and data dealing with "Bearing Types and Their Application" which is continued from similar information on sheet No. 21. Any or all of these twenty-two sheets are available.

RECENT APPOINTMENT

Mr. M. F. Anderson has been appointed general manager of Naugatuck Chemicals Ltd., Elmira, Ont., and the Rubber Regenerating Division, Montreal, now known as the Chemical and Regenerating Division, Dominion Rubber Company, Ltd. Mr. Anderson continues as director of development with headquarters in Montreal. Mr. R. Bruce Marr remains as manager of the Naugatuck plant.

Mr. M. F. Anderson.

APPOINTED EXCLUSIVE DISTRIBUTORS

Tweco Products Company of Wichita, Kansas, has just announced the appointment of G. D. Peters & Company of Canada Limited as exclusive Canadian distributor for their extensive line of electrode holders, ground clamps, cable lugs, and cable connectors. Included in the range is the widely used "Red Head" ground clamp which is supplied in two sizes having capacities of 300 and 500 amperes, "Sol-Con" detachable type connectors, Tweco mechanical cable lugs of both open and hole type, and the new line of "Hol-Grip" fully insulated electrode holders. These are supplied in two sizes, the "Hol-Grip Jr." which weighs only eight ounces and has been especially developed for aircraft and sheet metal work, and the "Hol-Grip Sr." which has a capacity of 300 amperes. Also available is the "Type H Hol-Grip Sr." which features a quickly detachable cable connector and is of particular interest to shipyards and other large users.

DUST COLLECTOR

A 4-page leaflet, 34-C, prepared by Frontier Engineering & Manufacturing Ltd., Niagara Falls, Ont., outlines advantages of the type "V" unit dust collector—a high efficiency cyclone-type unit designed for use in single or multiple arrangement. A test unit equipped with fan and motor drive is illustrated and a performance table shows the wide range of collection efficiencies of various particle sizes.

JENKINS APPOINTMENT

On January 1st, 1943, Mr. Delmar K. Brundage became district sales executive for the province of Ontario excepting the Ottawa Valley and the territory west of Sault Ste. Marie, and will be in charge of the office of Jenkins Bros. Limited, at 204 Terminal Bldg., Toronto.

SAFETY VALVES

The James Morrison Brass Mfg. Company, Ltd., Toronto, Ont., have prepared a 24-page catalogue, No. 80-5, illustrating and describing the "Morrison" line of safety and relief valves of bronze, iron and steel, for steam, air, water, gas, oil, etc. Each is illustrated and described and accompanied by specifications. Four pages contain abstracted rules for safety valves from the A.S.M.E. Code for Power Boilers—1927.

REFRACATORIES

A 50-page catalogue just published by National Refractories Limited, Montreal, Que., illustrates, in colour, standard and special shapes in fireclay materials. In addition to much information of value regarding proper refractory practice, the catalogue gives many hints on the care and use of fire brick in its many industrial applications. Several pages of useful tabulated data are included.

THAWERS AND HEATERS

Bulletin No. 1038, 16 pages, by Hauck Manufacturing Company, Brooklyn, N.Y., covers the company's line of thawers and heaters designed for use wherever snow, ice or freeze-up are causing trouble or interfering with production. The wide variety of these units and their many applications are fully described.

ION EXCHANGERS

Bulletin No. 2508, four pages, by Permutit Company of Canada, Ltd., Montreal, Que. Stating that "Recent development of acid-regenerated cation exchangers and of suitable union exchangers has widened the fields in which ion exchange materials may be used. . .", this Company presents a brief historical summary of this development, describing cation exchangers, Permutit's union exchanger, and demineralizing, and lists applications in industrial process work.

Mr. H. M. Rowlette.

COMPANY HEADQUARTERS MOVED

It has been announced by Whiting Corporation, of Harvey, Ill., that the headquarters of its Canadian subsidiary, Whiting Corporation (Canada) Ltd., has been moved to 45 Richmond St., West Toronto, where its newly-elected vice-president and general manager, Mr. H. M. Rowlette, will be in active charge of the Canadian business. Serving with him as assistant general manager is Mr. Alex. Ritchie. Mr. H. T. Doran, New Birks Building, Montreal, and Mr. W. Bruce Campbell, Royal Bank Building, Winnipeg, will continue as sales representatives of the Canadian Company.

MOTION PICTURES

"Lights—Camera—Action" is the title of a 16-page booklet recently issued by Associated Screen News Ltd., Montreal, Que. This extremely interesting publication illustrates and describes the production of a motion picture from the planning stage onward and tells why motion pictures are important tools in the war effort. Their importance in public relations programmes, sales promotion, public relations, production and safety teaching in industry, etc., is dealt with, and under the heading "What Does a Motion Picture Cost?" the great number of variables which comprise the product of creative imagination are listed to show the many factors which will determine the cost varying from a few hundred dollars to thousands.

PLASTIC MATERIAL

Canadian Industries Limited, Plastics Division, Montreal, Que., have prepared a pocket size booklet containing complete information regarding the new "Dupont" plastic material designated as "Lucite" which is available in sheets, rods and tubes, and as a thermoplastic molding powder. The booklet gives physical, thermal, optical, electrical, chemical and working properties, together with information regarding compression molding.

VICKERS' FIRST CATALINA

Aircraft workers, R.C.A.F. officers and many distinguished guests were present recently at the christening of the first Consolidated PBV Flying Boat "Princess Alice" to be produced in Canada. The ceremony was performed by Lady Bowhill, wife of Air Chief Marshall Sir Frederick Bowhill, head of the R.A.F. Ferry Command. Ralph P. Bell, Director-General of Aircraft production for the Department of Munitions and Supply, speaking before the christening, traced the growth of aircraft production in Canada and praised the work of the Catalina Flying Boats as the "Watchdogs of the High Seas".

RECENT APPOINTMENT

It has just been announced that Mr. C. Jones has been appointed to the position of Montreal District sales manager for Amalgamated Electric Corporation Ltd. He joined the Toronto sales staff of the company in 1929 and moved to the Montreal District Office in 1932, and has served that territory to the present time, contacting electrical trade in Quebec and Eastern Ontario.

LATHE CHUCKS

A 20-page catalogue, No. 42, prepared by Williams Tool Corporation of Canada Ltd., Brantford, Ont., describes and illustrates this manufacturer's new line of 3-jaw self-centering, and 4-jaw independent, lathe chucks. Complete range of sizes and specifications are provided in the various tables. In addition to the lathe chucks there is information and illustrations regarding adapter plates, spindle noses, face plate jaws, boring mill jaws and a chart showing standard limits of accuracy adapted by the lathe chuck manufacturers.

THE WELD-IT

Volume No. 18 of The Weld-It by Commonwealth Electric Corporation Ltd., Welland, Ont., is devoted to the description of Taylor-Winfield standard type resistance welders. Details of various types of spot, projection, seam and butt-flash welders are given and accompanied by illustrations.

SHIPS' BADGES

A 16-page booklet being distributed by Gutta Percha & Rubber Ltd., Toronto, Ont., illustrates with colour plates 121 badges of fighting ships of H.M.R.N. Also shown are sleeve markings and shoulder straps indicating rank of Naval Officers and silhouettes of British Naval Vessels of the different classes.

NEW COMPANY FORMED

Mechanical Leather Products, Limited, Hamilton, Ont., a wholly Canadian owned and controlled company, has been incorporated to succeed Canadian Graton & Knight, Limited, in the manufacture of leather belting and allied industrial products, with Mr. W. H. Martin as manager. The Canadian Fairbanks-Morse Co. Ltd. will continue as national distributors for these products.

SCIENTIFIC METAL CLEANING

Canadian Hanson & Van Winkle Company, Ltd., Toronto, Ont., have published a 12-page bulletin describing the "Royalene" process of solvent degreasing and alkali cleaning. Full details of the process are included and the various machines are illustrated and described. A number of Canadian installations are also shown.

APPOINTED CANADIAN DISTRIBUTOR

Mr. O. Biedermann, well known in the electrical industry as manager of Oerlikon-Canada Limited, Montreal, has been appointed Canadian distributor for "Insl-X", the synthetic base coatings and electrical insulation compounds sold by the Insl-X Company, Inc., Brooklyn, N.Y.

It is claimed for "Insl-X" that, combining uniquely formulated synthetic materials, it gives the utmost in high dielectric strength, toughness and durability, resistance to moisture, oil, chemicals and light. It resembles paint and while it can be brushed, sprayed or dipped in application, it is much more chemically resistant. It finishes like a varnish but, being chemically inert, it is more resistant to decomposition. It dries quickly like lacquer, but it is tougher and more resistant to chemically active rays. "Insl-X" products are being employed in a wide variety of uses such as the insulation of tools, bus bars, coil sealing, flexible sealing and cable covering, radio and aircraft parts insulation.

POST-WAR RECONSTRUCTION

Proceedings of the session held during the Fifty-Seventh Annual General Professional Meeting of The Engineering Institute of Canada, at Toronto, Ont., on February 12th, 1943, under the auspices of the Institute Committee on Post-War Problems. Mr. Warren C. Miller, M.E.I.C., chairman of the Committee, presided.

INTRODUCTION

CHAIRMAN WARREN C. MILLER, M.E.I.C.¹

The late Lord Tweedsmuir used to tell the story of a party of tourists visiting a small village in his native land. They desired to pay their respects to the Laird. When they called at his home an elderly servant advised them that the great man was indisposed and regretted very much his inability to receive them. The visitors expressed sympathy and inquired the nature of his illness. "Ah", said the old man, "The Maister is a pairfect martyr tae the delirium tremens."

As we examine the various problems involved in post-war reconstruction, the matters that have to be rectified and the features that must be retained, we get the impression, finding so many things that are bad mixed with many that are good, that this old world, too, has for a decade or so, been suffering from economic and political delirium tremens. While many people think of reconstruction as an outcome of the war there is also justification for the assumption that the war is simply an incident in reconstruction. True, some of the problems to be faced would not have been met so soon if it had not been for the war, but they would have been before us inevitably. The war has simply hastened the occasion.

There are very few, I think, who look for a restoration of the world of 1939, or of 1929 or of 1914. We face a world after this war that will be as different from the world of 1939 or 1914 as they were from the world of 1900. He would indeed be blind who can still think that, after the cataclysmic happenings of the past few years, conditions on this planet, political, economic or spiritual can ever be the same again.

The building of this new world is our greatest problem after the winning of the war. I think that we all hope, as far as we may, consistent with our enlarging aims, that we shall be able to use the pattern of the old. This is something with which we are all concerned but in which we may tend to visualize what needs to be done in terms of our own experience. The exporter thinks of restored foreign trade. The business man looks for the removal of economic controls. The farmer wants increased prices for farm products with no increase in the prices of what he has to buy. The engineer visualizes the reconstruction of physical structures. The worker looks for the removal of rationing and wage ceilings. The bishop prays and works for an enlarged world vision of spiritual realities. These are all truly problems of the post-war world but they are all parts of the one problem, not separate questions.

The pattern of the programme devoted to post-war problems was this enlarged vision. It is an attempt to impress the idea that in addition to being engineers we are citizens of Canada, of the British Commonwealth, of the world. Engineers have a place in the pattern of reconstruction. We have a specialized knowledge of some phases. But we can bring to bear on other factors our established experience as solvers of difficult problems. This is the approach that we hope that the afternoon's programme will develop.

In regard to reconstruction in its wider aspects, the main Advisory Committee, under the chairmanship of Dr. F. Cyril James, has done admirable work in its appreciation of the situation that we face.

We regret very much that Dr. James or Mr. J. S. McLean, the vice-chairman of the committee, is not here to give us that picture. But we are fortunate, however, in having with us our own president, Mr. Cameron, who is chairman of the Sub-committee on Construction Projects of that Committee on Reconstruction.

¹City Engineer, St. Thomas, Ont.

K. M. CAMERON, M.E.I.C.²

After the last war the country had no definite plans for the future. The consequence, most of us know. As a result of the experience found in the last war, the Government, immediately on the outbreak of this war, set up its first planning committee, which was an inter-departmental Committee on Demobilization and Rehabilitation of members of the Armed Forces, including both men and women in the services. That committee is under the chairmanship of Brigadier-General H. F. McDonald, chairman of the Canadian Pensions Commission. It is advisedly inter-departmental because it has to do with the members of the various branches of the Armed Forces, and has done a masterly piece of work.

In December, 1940, a committee of the Cabinet was appointed to deal with matters relating to rehabilitation. In February, 1941, its functions were enlarged to include the general question of post-war reconstruction and to recommend the course of action which the government should take in respect to this subject.

Shortly after this, in order to advise that Cabinet Committee, there was established an Advisory Committee on Reconstruction of which Dr. James is chairman and which is a sister committee to that on Demobilization and Rehabilitation. That committee also is to advise the cabinet but reports on the matters particularly relating to the returned soldier. In other words, when a man is discharged while he is physically in a position to go to work, there must be a plan to give him something to do.

The Advisory Committee on Reconstruction, on the other hand, is to advise the Government on how people can be re-established who have been taken from their ordinary occupations to perform war duties.

More recently, there has been formed an Advisory Committee on Economic Policy, under the chairmanship of Dr. W. C. Clark, the Deputy Minister of Finance. That is also an inter-departmental committee, in that the members of that committee are the continuing heads in the Civil Service of those departments mostly concerned with the future and reconstruction.

As regards Dr. James' Committee, it is composed of men entirely separate from the government. Its members were chosen for their standing in the community, and they constitute a group who are bringing the very best they have in them to this problem.

That committee has a number of sub-committees including one on agricultural problems, and one on post-war employment, which relates largely to employment of labour. A third is on the development and utilization of the natural resources of the country, and the fourth one, on post-war construction projects, did me the honour to ask me to accept its chairmanship. A fifth, more recently formed sub-committee, allied very largely to and in fact initiated under my sub-committee, deals with housing and planning.

There is interrelation between a number of these sub-committees that is of interest to engineers. In the work of the sub-committee on development and utilization of natural resources, projects will have to be considered which involve construction. We have liaisons between our sub-committee and other sub-committees. Even in regard to the development of agriculture, there is opportunity of bringing forward construction projects which will assist in the development of our agricultural resources.

²Chief Engineer, Department of Public Works of Canada, Ottawa, Ont. President of The Engineering Institute of Canada, 1943.

POST-WAR PATTERN

H. G. COCHRANE, M.E.I.C.

Department of Munitions and Supply, Toronto, Ont.

SUMMARY—Three years after victory, assuming it comes in 1944, and with gross national production maintained at or near \$7 billions, 1,350,000 Canadian workers will probably be needed for capital goods production. Of this number, 900,000 should be engaged in constructing, supplying and equipping public works, buildings, housing, roads and like projects. For every dollar provided from public funds, private enterprise should be spending \$3.50. Between victory and this period of stabilization referred to, however, jobs will have to be found for around 1,000,000 displaced war workers and demobilized armed forces. Public works could be provided at Government expense sufficient to provide jobs for 550,000 or nearly 55 per cent of those to be cared for, for almost three years, either during the interim "tooling-up" period for peace, or later when the pent up demand for goods and services slackens. There is no time to lose in preparing a shelf of public works totalling to a value of \$3 billions, if we are not to be caught unprepared for peace as we were for war.

With the turn of the tide in the war in Europe, the publication of the Beveridge Report in Britain, and the Canada-U.S. post-war tariff agreements, interest in post-war affairs has greatly increased. This is a good sign, for emphatic expression of public opinion is necessary before government planning to the extent necessary can be expected, and although committees have been studying post-war problems for more than a year, Canada is considerably behind both Britain and the United States in preparing for peace. Should Hitler crack up unexpectedly during 1943, we would be caught unprepared for peace just as we were caught unprepared for war in 1939.

The kind of a post-war world we are going to live in is in our own hands. And while there are many problems to solve and many difficulties to surmount, there are also many things in our favour. To better fight our war, we have appraised all our resources, both human and material; we are learning the habits of saving instead of wasting; we have developed substitutes for scores of scarce materials; we have trained thousands of our man- and woman-power in technical and managerial skills; we have built up research organizations whose ability and imagination and accomplishments are equal to those of any nation.

We have also learned, through war, that various economic devices and controls may be made to serve us, to save us from sharp fluctuations in the business cycle. We need never fear for the future the runaway booms and the wretched depressions to the extent they reached in the past. We know now we can control them. Best of all, we are determined that never again will we go through another decade of unemployment and relief and indecision. If a wartime economy can guarantee every man a job who wants one, a peacetime economy can and will be framed to do likewise.

The keystone of the entire post-war structure is assurance backed by public opinion, by both the Government in power, and the Loyal Opposition, that national income and employment must and will be maintained at or near present wartime levels. With such assurance, private enterprise, confident of its markets, can boldly make their plans for production. Without it, indecision and chaos will result.

Post-war planning naturally divides into two parts; the first is the "short-term" planning, that which relates to domestic considerations over which we have full control, such as the conversion of war plants to peacetime uses, rehabilitation of our armed forces, education and training, preparation of a reserve shelf of public works to cushion the blow of a possible post-war depression, conservation of

natural resources, necessity of the retention or gradual relaxation of wartime controls, etc., and secondly, the "longer term" planning, for export markets and tariffs, rehabilitation of foreign countries, a post-war world police force, and the like, which must be considered jointly with other nations.

While full consideration of most of the latter may have to await some later date nearer victory, preliminary sketches for most of the items appearing in the first group should already be nearing the blueprint stage.

The making of a pattern for post-war production involves a study of available human resources, broken down by skills and location, of material resources and potential rate, of extraction, of plant capacities and suitable peacetime uses to which they may be put, of transportation, taxation, rate of demobilization, of built up backlogs of unfilled wants in durable goods, plant improvement, retooling and expansion as well as residential and commercial construction, and many other related items. A shelf of public works must be prepared and readied to be built at public expense as and when a drop in employment and national production threatens, as it may either during the tooling up period for peace, or when the pent up demand for goods and services slackens.

The various pieces of this pattern must be sketched and cut and tried and finally fitted together, so that in making the garment, material and time may not be wasted. Here it is only possible to draw some freehand sketches of how the garment will look on the model. Nevertheless, however rough, these should help us to visualize what our post-war years are going to be like.

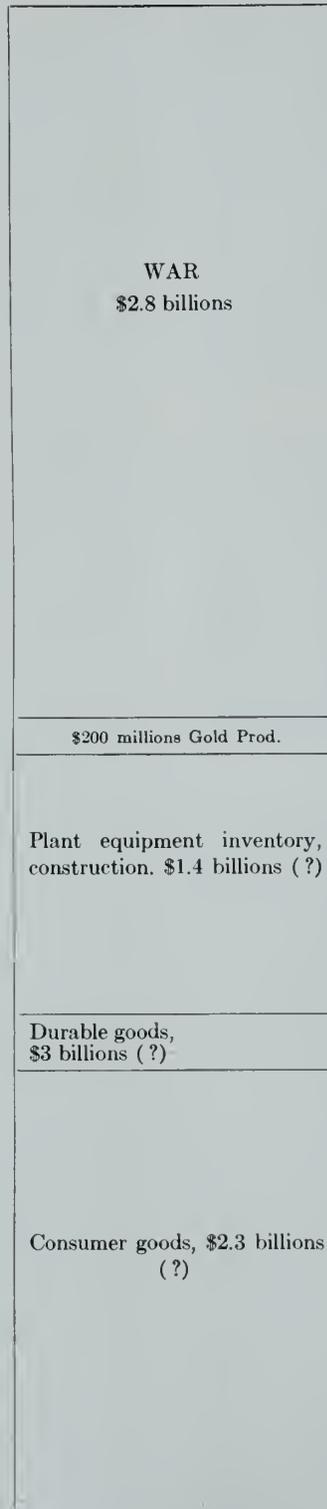

In the 1942 summer number of the *Harvard Business Review*, there was published an article by Messrs. Gustin and Holme, of the General Electric Company, entitled "An Approach to Post-War Planning." This article goes into considerable detail as to the methods used for determining post-war markets for the General Electric Company output. The first part, however, is devoted to an attempt to determine a pattern for post-war production for the entire United States.

The authors believe that the first step in planning post-war production should be to direct our efforts towards a post-war stabilized period, to determine what the ultimate objective should be. Thus, we are better equipped to face the immediate problem of conversion during the interim period between victory and the stabilized period two to three years later, from "all out," to the desired level of peacetime production.

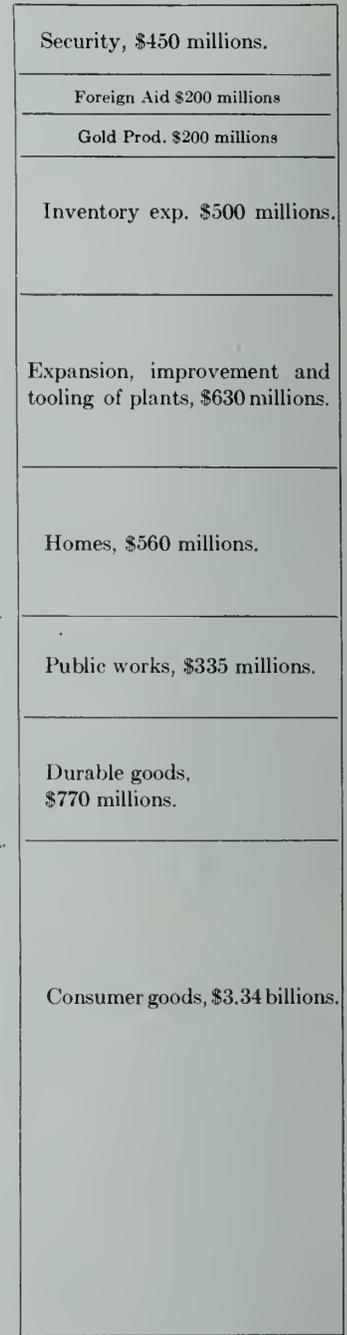

The authors determine that (1) in 1940 (a pre-war year), it required \$22 worth of capital goods production to generate buying power to support \$78 production of consumer's goods and services, (2) for 1943 (the peak war year), they estimate around \$45 capital goods production to support \$55 worth of consumer's goods, and (3) for a post-war year two years after victory, \$30 of capital goods production to support \$70 worth of consumer's goods.

The actual ratio for Canada for (1) a pre-war year, can only be estimated very roughly from statistics available, but it would appear to be nearer \$35 capital goods production supporting \$65 of consumer's goods production. The estimated Canadian ratio for (2) will not differ widely from that for the U.S.A. in the peak war year, probably because through war and "Lend-lease," the U.S. during

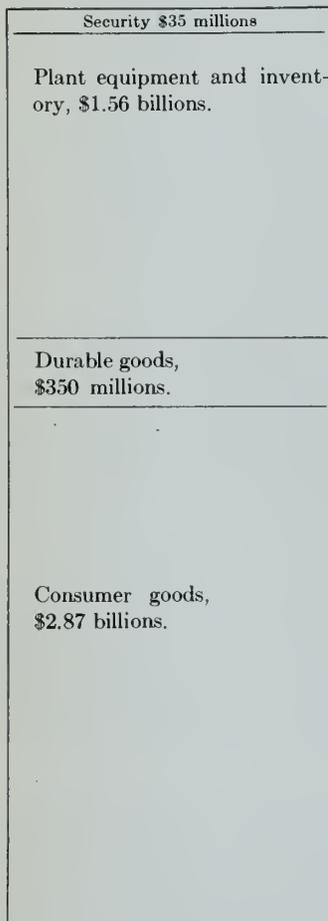

GROSS NATIONAL INCOME

**PATTERNS OF GROSS NATIONAL PRODUCTION
FOR A PRE-WAR, PEAK-WAR, AND POST-WAR YEAR**

the war becomes less self-sufficient and becomes proportionately as heavy an export nation as Canada is.

But it is difficult to visualize a ratio for a post-war year for Canada, similar to that suggested for the U.S.A. by the authors as in (3) above, namely \$30 capital goods to \$70 consumer's goods. Assuming expenditures on security and for help for undeveloped countries to the same proportion of total production as for the U.S., and a continuation of gold production on a pre-war scale, with a gross national output of \$7 billions and a maintenance of the \$35 capital goods to \$65 consumer's goods ratio which appears to be about standard for peace and war conditions so far, would call for expenditures per year, say three years after victory in Canada somewhat as follows:

TABLE I

	Millions of Dollars
Security, say.....	450
Help for other nations.....	200
Precious metals production.....	200
{ Inventory expansion.....	500
* { Replacement, expansion and tooling of plant.....	630
{ Homes.....	560
{ Public works.....	335
Durable goods.....	770
Consumer goods.....	3340
	<hr/>
	\$7000

*Using same proportions as assumed for U.S.A.

In June, 1941, there were 2,865,000 Canadian wage-earners. There was a 20 per cent increase from October, 1941 to date, making a present total of roughly 3,460,000. Adding the employment in the armed forces of say 750,000, gives 4,210,000 total.

Assuming a reduction of 10 per cent in this total for a post-war year two or three years after victory, as suggested by the authors for the United States, there would then be some 3,800,000 in employment or remaining in uniform by 1946-47, and producing \$7 billions worth of gross national production.

Capital goods production as listed above amounts to \$2.25 billions, the components thereof, assuming proportions similar to those used for the U.S.A., being \$335 millions for public works, \$560 millions for private construction of homes, perhaps \$105 millions of plant construction and expansion, \$525 millions of equipment machinery and tools, and the balance on inventory expansion and precious metals production. Dollar volume of construction contracts would then be around \$900 millions to one billion, machinery and equipment another \$700 million.

Resulting employment would be around 1,350,000 for capital goods production, while for construction and equipment only, an employment of 900,000 in the proportion of perhaps 320,000 on-site and 580,000 off-site. Mining and manufacturing account for another 500,000.

Thus roughly, one third of the potential output of the entire labour force would be devoted to the construction and equipment of permanent structures, factories, housing, roads, and the like.

It will also be observed that there are to be \$335 millions annually provided from the federal purse for public works, while \$1.2 billions, slightly over three times as much, would be financed and built by private enterprise.

Here then, in broad outline, is a pattern of post-war production and employment for Canada, say three years after victory, with national income maintained near war levels, and inflation averted through the retention of whatever wartime controls may be necessary.

During the intervening tooling up period between victory and stability, however, it will probably be necessary to devote a greater expenditure to public works. How many displaced war workers and returned soldiers will have to be

provided for? Here we must make some more broad assumptions.

First, let us assume victory by mid-1944, and another year to settle accounts with Japan, in which Canada's share is mostly naval and air support. Assume 950,000 war-workers in Canada, 200,000 of whom are women, assume 750,000 men in uniform, or a total of 1,700,000 whose efforts are to be ultimately directed from war to peace.

Assume 200,000, mostly navy and air force, are kept in uniform as Canada's contribution to world security, that 175,000 war workers are retired, and another 125,000 remain on war production. This leaves 1,200,000 for whom peacetime jobs must be found. Perhaps as many as 200,000 of these will be needed to supply sufficient additional consumer's goods and services so that our standard of living may be brought back to pre-war standard. This group would include farm help, doctors, nurses, taxi drivers, dietitians, tailors, manicurists, etc., leaving 1,000,000 to be immediately absorbed into peacetime employment on capital goods production.

How fast private enterprise will absorb them can only be guessed, but it is certainly going to be necessary to provide public funds for employing somewhere between this number of 1,000,000 and the 200,000 or so on-site and off-site workers to be ultimately engaged in producing \$335 millions worth of public works, for a year or so.

All of the above figures are approximations. They are based on assumptions which may turn out to be wrong. They are presented with a view to scaling the magnitude of our post-war employment problem, and to provoking discussion. It would seem idle to introduce refinements at this stage, which may later be upset by wrong assumptions or unforeseen developments.

Prior to this war, both volume of expenditure on producer's goods needed to achieve full employment, and *plant capacity* for full employment, were lacking. Canada has gone a long way towards correcting the latter, but it cannot be made effective until it is re-tooled for peace.

The enormous activity of wartime cannot be maintained through any automatic rise in living standards. There is needed a powerful economic and moral substitute for war, when it is over, to provide the impetus to keep the economic machine going. Stimulation may have to be artificial, but it must be expansion and must be expressed to a great extent in construction activity at first.

This indicates the need for having a planned programme of public works ready to take up the slack until private industry gets tooled up and ready to use them.

Since it is apparent that a stimulus will have to be given through the spending of public funds, for a time at least, it seems appropriate here to examine into what maximum amounts the Dominion could afford to spend, having in mind that some war expenditure will continue for security purposes and that there will be insistent demand for a Canadian equivalent of the Beveridge plan.

If we accept the authority of Mr. Alvin Hansen, eminent authority on economics, that national debt may be allowed to attain a figure equal to twice national income, without disastrous results, and if we assume national income to be maintained at or near \$7 billions a year, Canada's budgets for years 1942 to 1949, expressed in billions of dollars, might appear somewhat as shown in Table II.

This indicates that \$750 millions yearly (or about 35 per cent of expected yearly expenditure on construction and equipment, two or three years after victory) for a period of about 2½ years is about the maximum contribution from public funds that could be allotted for providing employment during the difficult interim period. It would make jobs for some 550,000. It emphasizes the urgent necessity of starting at once to prepare a shelf of public works to be resorted to,

All figures in billions of dollars.

as required, to provide employment. They should total to a value of at least \$3 billions, so there will be plenty to choose from.

A sub-committee of the Committee on Post-War Reconstruction, has already drafted a standard project questionnaire, based on ideas gleaned from contractors and engineers from all parts of Canada, ready for use the moment a central organization is set up to receive returns. As these replies come in, they will presumably be analyzed and reduced to common terms, inspected, and passed on or rejected, evaluated in terms of quantities of principal materials and man-hours of various skills, needs for equipment, power, fuel and transportation assessed, and scheduled for time. Summaries of these items can then be equated to known output and inventories, and a balance sheet of shortages and surpluses made.

From here on, the committees on conservation and conversion of war plants could take a hand. And here is where there is scope for vision and realism in seeing the need for, and the possibilities of providing substitute materials where scarcities exist or where savings can be made. Here our National Research Council should be invited to sit in.

New trends must be watched, such as the 60 per cent increase in aluminum production and its reduction in price to half the pre-war figure, the thousandfold increase in magnesium output, the new synthetic rubber, dozens of new plastics, powdered metallurgy, flexible and heat-toughened glass, high-octane gas, faster freight, gliders, transport planes and autogiros, and their influence on decentralization, "walkie-talkies," influence of the war on design, creosoted timber roof trusses, lower factors of safety, the possibilities of prefabrication when and as financing, building codes and union regulations are revamped to give it the scope it deserves.

Another tendency that must be taken into account is that neither this war's crop of ex-servicemen nor to-day's highly trained displaced war workers will take kindly to a pick and shovel. This will make for a greater measure of mechanization in all types of construction than heretofore.

The longer term prospects for employment following victory, however, after the first two or three years of readjustment are over, are tremendous. For one need only observe the current crowding in public places such as depots, movie theatres, restaurants, hotels, houses, apartments, railway trains, street-cars and buses, to realize the need for more of all of them if national income and employment is kept at or near current levels. Add to this the necessary resulting increase in services,—water, light, sewers, heating, telephones, pavements. Superimpose on these the further needs for 700,000 returned soldiers plus their families, let alone the immigration that must result from an influx of freedom-seeking war victims.

Power output has more than doubled in ten years, and

this with only 30 per cent more installed capacity. There are shortages in Ontario alone of 300,000 h.p., and the paper industry has been temporarily deprived of the capacity of 350,000 h.p. formerly used for steam generation, to serve war industries.

Rail freight has more than doubled since 1938, while rail passenger traffic is almost three times the pre-war figure, and this with actually less than pre-war equipment.

Urban transit has risen 70 per cent since 1939, with only a 7 per cent increase in seats.

Fuel consumption is up 50 per cent over 1939. More than half of our fuel needs are imported.

Enormous backlogs of unfilled wants have been building up. By the end of 1944, the very earliest that normal production is likely to be resumed, there should be backlogs of 500,000 autos and trucks, half a million radios, \$200 million worth of construction equipment and farm machinery, half a billion dollars worth of electrical and mining equipment, including the equipment needed for a million electrical horsepower. Add 1,000 locomotives, 2,000 passenger coaches, 20,000 freight cars, 3,000 buses for urban and interurban traffic. At present prices these total to a value of close to \$3 billions. But there are further tremendous pent up demands for residential and commercial buildings and the services that go with them. There is reportedly a deficit in the United States of 13 million homes. Prorated this means 1.2 millions for Canada. Yet 700,000 is probably nearer the truth, whose cost would be \$2.8 billions. And rounding the picture out with a sheer guess of another \$2.5 billions for services and commercial building, would give a backlog of unfilled wants of \$10½ billions.

Our post-war pattern of production here given calls for an increase in production of capital goods and consumer's durable goods, over "pre-war," of \$1.1 billion dollars annually. Thus with depreciation continuing about as before, it would take eight years to catch up with this \$8½ billions of unfilled wants. And thus far we are only thinking in terms of a population of 12 millions!

The cutting of this post-war pattern is not exclusively an Ottawa job. Canadian industry might well follow the example of our southern neighbour in forming a Canadian "Committee for Economic Development," chaired and directed by some of our top-flight industrialists and economists. Ottawa will have plenty on its hands after victory, with demobilization, peace treaties, social measures, immigration, untangling and improving Dominion-Provincial relations, and the like. Between Government and private enterprise there must be a compromise, or better, a partnership, steering a narrow course between bureaucracy and the "normalcy" of 1919.

Toronto—January 19th, 1943.

THE CONSTRUCTION INDUSTRY IN POST-WAR ECONOMY

O. J. FIRESTONE, Ph.D.

Advisory Committee on Reconstruction, Ottawa, Ont.

INTRODUCTION

You are concerned with many of the problems which have been examined and analyzed by the Advisory Committee on Reconstruction since early 1941. This Committee was set up, in the words of the Order-in-Council creating it, "to examine and discuss the general question of post-war reconstruction, and to make recommendation as to what Government facilities should be established to deal with this question."

I have been asked to inform you about important changes which have been made by the Government recently with regard to the study and the preparation of plans for dealing with post-war problems:

1. The Advisory Committee on Reconstruction which has been reporting hitherto to the Special Committee of the Cabinet on Demobilization and Rehabilitation, of which the Minister of Pensions and National Health was Chairman, now reports directly to the Prime Minister.

2. The Advisory Committee on Economic Policy, a committee of Government officials, hitherto concerned with war problems only, has been re-constituted and includes now post-war problems in its functions.

3. The Advisory Committee on Economic Policy and the Advisory Committee on Reconstruction are working in close co-operation in order to avoid duplication of effort and to insure that recommendations relating to post-war problems are put into the hands of the Government without delay.

After having offered you these explanations on the re-organization of Government Departments concerned with Post-War Planning, let us now turn to the topic of the day: "The Post-War Pattern of Canada." The views presented in the following are my own personal conclusions based on considerable research on the character of the construction industry in the Canadian economy.

FULL EMPLOYMENT

The paper delivered to-day by Mr. H. G. Cochrane on the "Post-War Pattern" has approached the problem of the role which construction industry might play in the Canadian post-war economy with courage and imagination.

The ablest economists in Great Britain, the United States and this country are very much concerned with the full employment concept. Full employment means the successful mobilization of all the productive resources (human and material) of a nation. In essence, the problem of full employment is a problem of the trade cycle. Not all forms of unemployment, it is true, are the products of cyclical depression. "Normal minimum" or the so-called "dynamic" unemployment is an inevitable concomitant of the mobility of labour; seasonal unemployment is as great in years of good trade as in years of bad; and the unemployment that arises from the decay of individual industries is another special case. But the two former could easily be cared for, and the third would be greatly alleviated if it were possible to avoid the much larger and more widespread unemployment that comes with trade depressions; and it is with these depressions that diagnosis and cure must chiefly concern themselves.* There is no doubt that it will take considerable forethought and planning in this country before a full employment scheme can reach the stage of realization in the post-war period. Mr. Cochrane has quite rightly stated that the construction industry could play an important role in the pattern of the Canadian post-war economy.

For over a year, the Committee on Reconstruction in Ottawa has given serious consideration to this problem. A

*See article on Full Employment in the *London Economist*, October 10, 1942.

study was undertaken for the purpose of determining, in the light of statistics and estimates available, the importance of the construction industry as a field of employment. This study deals with an analysis of the various definitions of the construction field, public and private construction and assesses the importance of construction in the Canadian economy. The components of the construction industry, its organization and the nature of the construction labour force are discussed. The supply of building labour, skilled, semi-skilled and unskilled with special reference to post-war needs, is assessed. Finally, the importance which the construction industry might obtain in the post-war period is analyzed. It is not contemplated to give to-day a summary of all the research work done in this field by the Committee on Reconstruction. It is intended to give only a few facts and some essential statistics which might assist us to see the role of construction in Canada in the proper perspective.

DESIRABILITY OF RELIANCE ON CANADIAN STATISTICS

It is important to consider the Canadian construction industry in the light of Canadian statistics and not to rely on estimates made in Great Britain or in the United States. The following two examples will illustrate how different conditions in the construction industry in Canada are from those in Great Britain and the United States.

(a) *Labour Supply*—The resources of skilled labour in this country and Great Britain differ markedly. Nearly all construction craftsmen in Great Britain are trained there. This

NATIONAL INCOME AND INCOME ORIGINATING IN CONSTRUCTION, CANADA AND UNITED STATES, 1929-1938

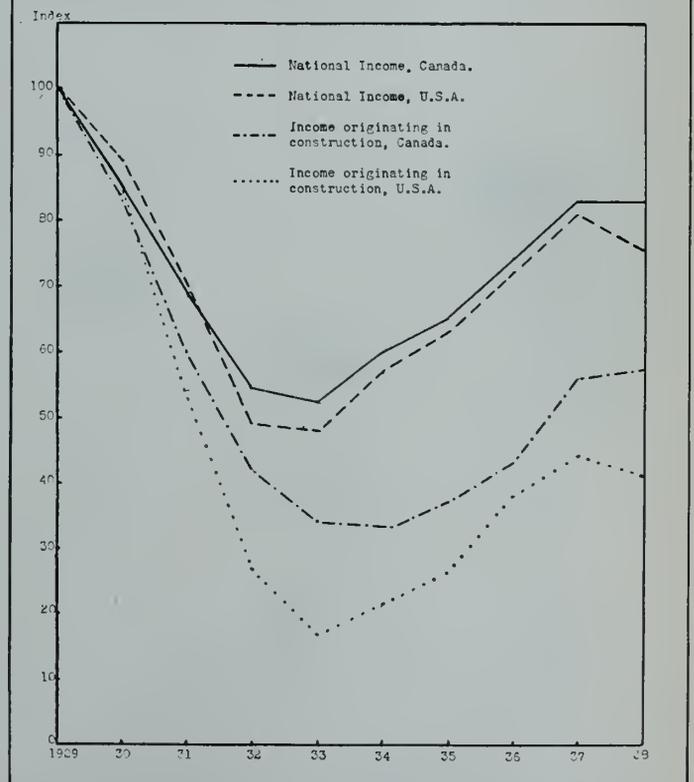

Fig. 1—Chart showing on a comparative basis annual changes in total national income and income originating in construction in Canada and United States. Base of Index: 1929=100.

country has depended to a great extent on immigration of skilled construction workers. You will be interested to hear that during 13½ years of operation of the Ontario Apprenticeship Act only 2,595 young men registered as apprentices. During seven years operation of the British Columbia Apprenticeship Act only 571 apprentices were registered. If you remember that the total number of persons in construction occupations is over 200,000, you will realize how important it is to consider the problem of training of construction craftsmen in a light different from the problem faced in Great Britain. The average person in a construction occupation in Canada is considerably older than his colleague in Great Britain. In England and Wales there are 5.2 adult construction craftsmen for every youth under 21 years of age. In Scotland there are 3.3 while in Canada there are 10 adults to each youth under 21 in the construction trade.

(b) *National Income*—Quite often American figures indicating the importance of the construction industry or possible backlogs of construction are used by adjusting them to Canadian conditions on a per capita basis. Statistics indicating conditions in the United States do not provide us with a true picture of Canadian conditions. Figure 1 shows the trend of the national income in Canada and the United States for the period 1929-1938. This chart shows that on

the whole, as far as unadjusted dollar values indicate, national income in the United States declined more rapidly in the depression in the thirties than the national income in Canada. Since 1934 the national income has been increasing in proportion at a greater pace in Canada than in the United States. This chart further shows that the trend of income originating in construction is similar to that of the total national income. It is of interest to note that income originating in construction reached a far lower point in the United States in 1933 (the index figure is 17) than in Canada in 1934 (the index figure is 33). This index gives only an approximate picture since it is based on preliminary estimates made by the Dominion Bureau of Statistics.

ROLE OF CONSTRUCTION INDUSTRY IN THE CANADIAN ECONOMY

Bearing the above qualifications in mind, the importance of the Canadian construction industry should be appraised in the light of Canadian statistics only. The Dominion Bureau of Statistics estimated that the gross value of construction in Canada amounted to 590.9 million dollars in 1929. This figure declined to 176.8 million dollars in 1934, but increased from 1935 onwards. The construction cycle reached its highest point in 1941 when gross value of construction amounted to approximately 640 million dollars. These statistics indicate that the construction industry undergoes fluctuations to a greater extent than any other industry in Canada.

For the purpose of comparison let us assess the importance of the construction industry among the nine main branches of production. Figure 2 shows that construction amounted to 8.8 per cent of the total gross value of production in 1929. It amounted to 6.1 per cent in 1933 and 6.5 per cent in 1938. The other main branches of production as shown in the chart are agriculture, forestry, fishing and trapping, mining, electricity, custom and repair, and manufacturing. The "commodity handling division," including transportation, communication and trade and the "facilitating division" including banking and finance, government activities and service excluding custom and repair are not considered. (See Table I.)

Some indication of the field of employment provided in the construction industry might be obtained from the 1941 Census, preliminary figures for which have just been released. There were approximately 4.2 million persons gainfully occupied in Canada in June, 1941 (men in the armed forces excluded). Of this number, approximately 220,000 persons were gainfully occupied in the construction industry. It appears that about 5.2 per cent of the total gainfully occupied were directly employed in the construction field. If allowance is made for employment in the construction material supplying and transporting industries, the percentage will probably rise to about 12 per cent or about ½ of the total population gaining its livelihood in Canada. This is the field of employment provided by construction in a good year. In this no consideration has been given to the secondary effects of construction expenditure which represent additional stimulus to our economic system. In a depression, employment in the construction industry and related industries might decrease to one-third or one-fourth of the level of employment in a prosperous year. It is obvious that provisions have to be made not only to provide employment in the post-war period for all those who have been working in the construction field but also for those men in the armed forces who have been working in the construction field previous to enlistment. Furthermore, a number of construction craftsmen have found work in war industries and they will also be looking for work.

EMPLOYMENT

It is possible to estimate broadly the volume of construction required in order to provide employment for those who are working in this field now and for those who will be released after the war from the armed forces and from war factories.

As far as can be ascertained, there were, in the armed forces on August 31, 1942, between 30,000 and 35,000 per-

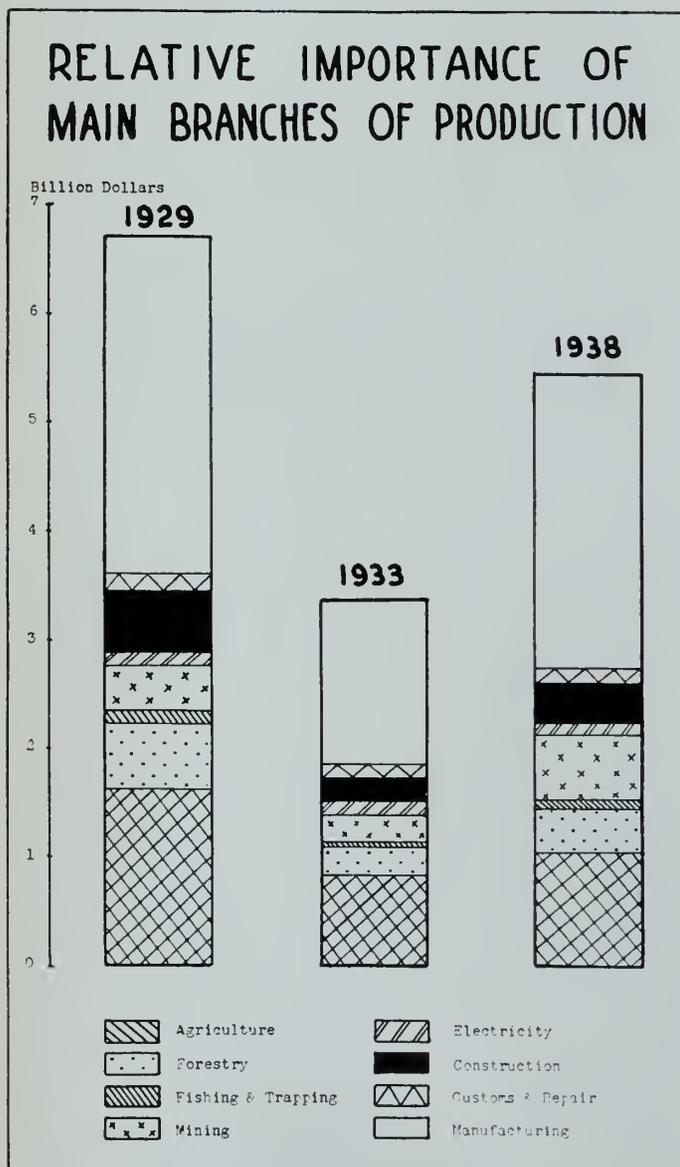

Fig. 2—Chart showing the gross value of production for the years 1929, 1933 and 1938. According to the classification used by the Dominion Bureau of Statistics "production" includes the industries specified above. The "commodity handling" and "facilitating" division of economic activity are excluded.

TABLE I

GROSS VALUE OF PRODUCTION IN NINE MAIN BRANCHES FOR THE YEARS 1929, 1933 AND 1938¹

Industry	1929		1933		1938	
	Million Dollars	Per Cent	Million Dollars	Per Cent	Million Dollars	Per Cent
Agriculture.....	1,631	24.3	805	23.8	1,063	19.6
Forestry.....	611	9.1	257	7.6	425	7.8
Fishing.....	71	1.1	36	1.1	53	1.0

Construction.....	591	8.8	208	6.1	353	6.5
Custom and Repair.....	145	2.2	113	3.3	146	2.7
Manufacturing...	3,166	47.1	1,575	46.5	2,595	47.7
Total Gross Value of Production..	6,714	100.0	3,387	100.0	5,440	100.00

¹Data taken from "Survey of Production in Canada, 1939," published by the Dominion Bureau of Statistics, pp. 16-17. "Production" includes, according to the classification used by the Dominion Bureau of Statistics, the industries specified above. Transportation, communications and trade described as the "commodity handling division" and banking and finance, government activities, and service excluding custom and repair described as "facilitating division" are not considered.

sons normally employed in construction work. It was further estimated that the ratio of skilled to unskilled workers employed in the construction industry was approximately 60 to 40 at that time. It means that employment for at least 50,000 to 58,000 men (including skilled) on the site would be required to provide employment for construction craftsmen released from the armed forces. An additional allowance will have to be made for those construction craftsmen working in war factories. This task of rehabilitation should be well within the capacity of the construction industry if this industry is given sufficient encouragement after the war.

One thing becomes obvious. We shall have to spend more than the 640 million dollars which were spent in 1941 on construction in order to provide employment for this additional group of men who will be looking for work in the construction field. It appears that an annual expenditure of one billion dollars would be the minimum required for this purpose. This is not to say that the whole expenditure needs to be Government expenditure. On the contrary, it can be expected that a great proportion of construction expenditure will come from private sources, provided adequate facilities for financing building after the war are made and encouragement to build given to the public as a whole. Another important part of construction expenditure might be inspired by the Dominion Government in assisting the provincial governments and the municipalities in large-scale building developments. Construction projects undertaken by the Dominion Government will only have to supplement the activity of private individuals and corporations and other public bodies in order to assure that sufficient employment will be provided in the construction industry.

Estimates of post-war demands for construction can only be very rough because technological changes, the duration of the war and a number of other factors, have an important bearing on the requirements of a sound economy in the post-war period. If you bear in mind that a construction expenditure of one billion dollars per year means work for at least 700,000 men on the site and off the site (estimate based on pre-war wage rates), you will be able to appraise the importance of such an expenditure for the Canadian post-war economy.

BACKLOG OF CONSTRUCTION

Based on American estimates, a backlog of construction has been suggested to exist in Canada exceeding five billion dollars. Let us analyze this estimate in the light of Canadian statistics. The Dominion Bureau of Statistics has prepared

a preliminary estimate indicating that the average gross value of construction per year during the period 1921 to 1930 amounted to 461 million dollars. Figure 3 illustrates the backlog of construction which has developed during the period 1931-1941 due to the depression of the early thirties and due to the fact that, since the outbreak of the war, the major proportion of construction activity was either directly or indirectly connected with the war effort. This figure shows also estimates of construction for war and civilian purposes. According to these estimates the total backlog amounts, for the period 1931-1941, to 2,126 million dollars. This backlog continues to increase the longer the war lasts. Furthermore, these estimates have made no allowance for the increase of population which Canada experienced since 1931. If this is done and the war ends in 1945, the backlog of construction will be around three billion dollars.

These statistics and estimates, which should only be taken as indicative of post-war requirements, make one thing clear. Canada will have to have a construction programme of a greater size than it had in the pre-war period. Such a programme can neither be planned nor be carried out without the active co-operation of the construction industry itself. Therefore, I was very happy to learn from Mr. Warren C. Miller, the Chairman of the "Committee on Post-War Construction Problems" of your Institute, that the Advisory Committee on Reconstruction can be assured of your co-operation in solving the numerous problems which are connected with the smooth operation of any large-scale construction programme after the war.

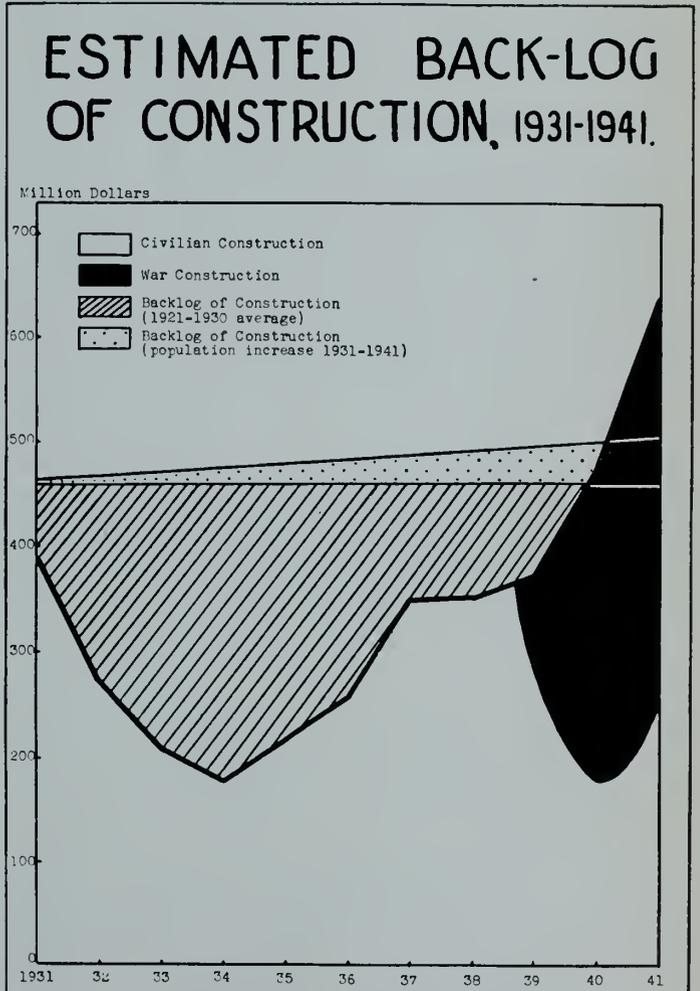

Fig. 3—Chart showing an estimate of a back-log of construction in Canada for the period 1931-1941. This estimate is based on the annual average gross value of construction (461 million dollars) during the period 1921-1930 as computed by the Dominion Bureau of Statistics (preliminary estimate). The estimate of civilian and war construction for the period September, 1939, to December, 1941, is based on a survey undertaken by the Department of Munitions and Supply, in August, 1942.

SOIL AND WATER CONSERVATION

PROFESSOR A. F. COVENTRY, B.A.

Department of Zoology, University of Toronto, Toronto, Ont.

Perhaps, at first glance, the subject of land reconstruction has little to do with the problems of a meeting such as this, but on reflection it would seem evident that unless the physical structure, the physical health of the land on which we live and on which our civilization depends is good, all our plans for reconstruction will have an unsafe basis.

Therefore, I very much appreciate the privilege of being invited to put before you a few statements on this subject, even if they are necessarily somewhat dogmatic.

My remarks will deal with a limited aspect of the subject. That is to say, some problems which concern agricultural Ontario. Similar agricultural problems, differing in detail but fundamentally the same in principle, are to be found in all other areas of the Dominion of Canada.

There is ample evidence in support of the facts presented. The evidence, as far as southern Ontario is concerned, has been collected and published recently by the Guelph Conference in a report dealing with the natural resources of the southern part of Ontario, an area of some 35,000 or 40,000 square miles.

They point out that the natural resources of southern agricultural Ontario are now in a depreciated condition as compared with their original productivity and activity, and they cannot restore themselves; unless active and careful measures are taken, conditions will get progressively worse.

Southern Ontario was originally forest country whose water system and soil system had developed under practically a continuous cover of trees. That cover is almost gone now. Precisely how much is left we do not know. There are scattered woodlots but many of them are in an ineffective condition, owing to lack of management or poor management. Some of the original cover had to be removed in the interests of agricultural development, but the fact has been disastrous to the water system of the area. All will agree that no country can prosper without fertile soil, and an adequate water supply. Many countries in the past have experienced this; when their natural resources were destroyed their civilization disappeared.

The water situation in Ontario can be summed up thus: floods in spring, drought in summer, fading wells and springs in fall and winter.

Now, that may sound like an exaggerated statement, but I can assure you the figures justify it. Eighty per cent or more of all our once permanent streams now dry up for a considerable part of a normal summer, and within the last five years, numerous springs have ceased to flow for the first time in the history of this province. It is now a matter of ordinary, unhappy experience among our farmers to have to carry water, often for miles, throughout a great part of many seasons.

Much of our water, too, is severely polluted, as any angler is only too well aware. Many of our harbours are being filled with silt and they can no longer take even motor boats.

Now the silt that has blocked the harbours is the fertile soil from the fields that were opened up when the forests were cleared away.

As a result of our exploitation, there are now spring floods which carry away large quantities of the fertile top soil on which the whole of our life depends. There is only about six inches or so of that fertile soil—seven in some places, three in others. It is a thin layer, in any case, and on that thin layer depends our agriculture. In other words, our soil is rapidly losing its fertility, its productivity. Without going into details, it is fair to say this loss of fertility which has taken place in Southern Ontario, and likewise in other parts of Canada has already given rise to a major economic problem.

One instance has been given me by an expert agricultural friend of mine, of an area in Ontario right in the middle of

agricultural country which was considered good, in which during the last few decades the soil has progressively become less and less fertile, and more and more lacking in essential elements through the washing away of the surface soil. That lack manifests itself now in inferior crops. The root crops show definite signs of imperfect nutrition. Correspondingly, stock fed on those crops show signs of malnutrition, and more recently, the children living in that area are showing the effects of the loss of the fertility of its soil.

The whole picture then is one of a degradation of our originally rich natural resources in terms of soil and water. In fact, in the 35,000 square miles that constitute southern agricultural Ontario, some 8,000 square miles are now fit for growing nothing but trees. It is not merely waste country but it is a danger to neighbouring land, because it does nothing to provide proper control of its streams as it did when covered by forest.

The cure for such conditions as these has been applied with great success in many places in the United States and that quite recently. The first steps include, of course, the obtaining of accurate information as to conditions, and that we have not got in southern Ontario and, indeed, in few parts of Canada. To get such information surveys must be made in the field, detailed surveys of areas of erosion, amount of stream flow, cutting of gulleys, what condition the woodlots are in, density of population, the social question whether a farmer trying to catch a living out of a piece of light, sandy soil with no fertility in it is a social asset or the reverse—all these problems and many others come immediately into the picture.

Then comes the matter of the natural resources of the area—wild animals, land and water game stock, forest, trees, soil, rivers, ponds; all these form an interlocking unit and cannot be dealt with piecemeal. The planning of the cure therefore must be of a comprehensive kind and on a large scale.

Such planning covers a wide range. It must consider soil chemistry, of course; the science of raising stock; the fertilization of the soil; the engineering control of water; reforestation. How much each comes into the problem as it affects any single area can only be decided when detailed and full information is available.

It is therefore evident that immediate action in collecting information and planning is essential if land reconstruction is to play any important part in the general post-war pattern. That it should play a part is clear, but we have as yet no figures which give us adequate information—just how many men, of the hundreds of thousands who will be wanting jobs, can be employed in this way.

The time element then is of first importance. Last summer a survey was conducted in the Ganeraska Valley, a joint survey by co-operation between the Dominion Government and the Government of the Province of Ontario. It collected information on the watershed of the River Ganeraska, which flows out at Port Hope from a basin of about one hundred square miles.

It has not yet been announced when the report with the results will be out. I understand at no very early date. We have an earlier report on King Township, about 120 square miles, which gives a good deal of information about the need of reconstruction in that area—a total of about 200 square miles. That is all the information that is available or partially available at the present moment, and at our present rate of survey it will take about 150 years to have the most important and critical parts of the province surveyed so that we can make plans. At our present rate of planting the areas that should be under trees, and which dominate a great deal of the water supply in Ontario as such, replanting would take about 800 years.

These are not pleasant statements, but I do not think they can be refuted. That is the situation.

My statements are based on the opinions of a score or more of men, all of whom have devoted much of their time in recent years to considering the problem of soil reconstruction. The figures have been approved by all of them. They can be found in the Guelph Conference report to which reference has been made.

In the United States, the principles of land conservation have been applied to the physical and social reconstruction of enormous tracts of land. The most famous of these is the

Tennessee Valley Administration Scheme. Some people say that southern Ontario is too big a thing to plan for—the Tennessee Valley is about 40,000 square miles. Southern Ontario is about 35,000 square miles. It is true that they do not present the same problem. One is a big river basin, the other a lot of small river basins, but the area is about the same.

But here we have not even begun, and unless we get a much greater speed into our attack on this problem there is no chance whatever that land reconstruction will play any important part in the general post-war pattern.

FORESTRY PROBLEMS IN RECONSTRUCTION

JOHN C. W. IRWIN, B.Sc.F.

Clarke Irwin and Company, Educational Publishers, Toronto, Ont.

It is not necessary before an audience such as this to record the contribution of the forest and forest products to the prosperity of Canada. To refresh memories, however, may I quote a few figures given before the Annual Meeting of the Canadian Society of Forest Engineers last month by J. D. B. Harrison, Chief, Division of Economics, Dominion Forest Service.

FOREST INDUSTRY—1940

Capital invested—\$1,110 million of which \$643 million is invested in the pulp and paper industry.	
Gross value of products, pulp and paper industry . . .	\$298 million
Sawmill industry	\$135 million
Net value of products of all wood-using industries . . .	\$458 million
In gross value of products, pulp and paper was second and sawmilling sixth, among the manufacturing industries.	

EMPLOYMENT

Woods operations	100,000	man years
Sawmilling	40,000	“ “
Pulp and paper	35,000	“ “
Miscellaneous wood-using	36,000	“ “
Paper-using (except printing trades)	13,000	“ “
Total	224,000	“ “

This represents subsistence for nearly a million people. Wages or salaries, 1940—\$240 million.

Sawmilling gave most employment, pulp and paper next. These two provided nearly 10 per cent of total industrial employment. In salaries and wages paid, pulp and paper stood first and sawmilling second.

In external trade “wood, wood products and paper” yielded a favourable balance of \$310 million in 1940, as compared with a deficit of \$199 million from trade in all other commodities, giving a net favourable balance for all commodities of \$111 million.

And finally one more set of figures also from Mr. Harrison’s paper.

Of the total area of the nine provinces of 2 million square miles, 760,000 square miles or 37 per cent is rated as productive forest land.

One would naturally suppose that the citizens of a country endowed with such blessings from the hand of a bountiful Creator would try to see to it for selfish reasons and for the sake of their children that such a resource as the forest was given at least a half decent chance at self-renewal, or even that forestry knowledge be used to improve the quality and quantity of the natural forest.

Such has been far from the case—if I may speak with moderation, I would say that our treatment of the forests of Canada represents the ultimate in callous stupidity, and a flagrant abuse and breach of trust on the part of our elected representatives, for which we the people must accept our share of responsibility.

This applies to all the major forested provinces of the Dominion, and although there is a little light on the horizon from Quebec and a gleam from New Brunswick the pall of politics still enshrouds. For various apparent reasons the public has not insisted on reform and as yet, speaking for Ontario, no Adam Beck of forestry has arisen. It is my considered opinion that the public is ready and eager for any reform, and that political leaders are lagging behind, loath

to part with such valuable, ready-made hand-outs for favours received or expected, that the undertaking of a serious forest policy would require.

As added background for what I have to say regarding forestry problems in reconstruction may I remind you that the forest is a living organism, subject to *improvement* by selection, betterment of soil and moisture conditions, and avoidance of overcrowding; subject to *deterioration* and destruction by the reverse and as are all living things, by disease and the depredation of natural enemies, particularly insects. The greatest enemy is the forest fire, however, some 90 per cent of which are man-caused and preventable. By leaving large amounts of slash in the woods, man is also responsible for the spread and intensity of many forest fires; his neglecting to remove the trees killed by insect infestations of epidemic proportions results in further dangerous fire hazards.

The handling of the forests so that they will continue to yield profitably forever is a highly technical and scientific business, requiring, I would suggest, for even average success, study and knowledge greater than that required for comparable success in agriculture. Just as different agricultural crops require different soil conditions, so in the growing of trees every variation of soil, slope and moisture content may present a different problem. Nature gives no guarantee that a second crop of trees as valuable or numerous as the present will grow in any particular area when the forest is cut, even if the area is not burned over, which it often is—again and again.

One other thing should be remembered, and it is often lost sight of by those who talk about unlimited supplies of wood—that is that wood is heavy and, therefore, transportation is a considerable factor in cost. Transportation requires roads in the woods, river improvements, railroad facilities, besides rolling stock of various kinds, all of which cost considerable money.

It follows, therefore, that the more wood that can be grown on an acre, the cheaper the unit price. That is why B.C. products can cross the continent to compete in Ontario markets. Our natural forests in Ontario produce from a quarter to one-half of what could be produced with any reasonable kind of forest management and silvicultural practice. The transportation problem explains also the numerous ghost lumber towns in Ontario—there was plenty of wood left in the province but it was too far from the mill. Ghost towns are still being added. Thessalon being the latest substantial one to come to my attention. The saw mill there recently closed down on account of shortage of supplies; let us hope something else will turn up for the town.

From the foregoing it is apparent that a sane forest policy is one under which as much timber as possible is cut from a given area while assuring another crop of trees as good or better than the original. The care necessary to assure the new crop naturally requires the expenditure of more time and money than would be necessary under a “cut out and get out” policy. Such extra expenditure could hardly be warranted if the area carefully logged on behalf of the

future, is likely to be ravaged by forest fire. Our forest fire record is a national scandal of which we all ought to be thoroughly ashamed.

Therefore, a condition of undertaking a programme of sane forest management is dependable protection from fire; the essential and urgently necessary work to improve fire protection services is therefore the first to be here considered in connection with forestry problems in reconstruction.

Fortunately, in this connection, there was presented at the Canadian Society of Forest Engineers meeting to which I referred, a very able paper by Mr. Peter McEwen, Regional Forester with headquarters in Sudbury, on the subject of Forest Fire Protection in Post-War Rehabilitation. Mr. McEwen gets down to details and cases for the Sudbury District which comprises some 20,000 square miles and which might be considered typical of the forested area under organized fire protection in Ontario, some 170,000 square miles. His figures, however, are in my opinion conservative, and deal only with bringing the Sudbury District up to a reasonable efficiency—making up for past omissions and neglect.

The kinds of work enumerated by Mr. McEwen are:

1. *Hazard Disposal*, which deals with—
 - (a) Safety Belts around Villages. 20,000 man-days
 - (b) Safety Belts along Roads and Railroads..... 200,000 “
 - (c) Broadcast burning..... 80,000 “

Total..... 300,000 man-days (without the winter burning)
- (d) Winter Burning..... 50,000 man-days per year while cutting continues.
2. *Transportation Improvement*. There is a direct relation between the time required to get to a fire and the damage done. If it takes a day or more to reach a fire, as it often does, the expense of fire-fighting is greatly increased and the hope of controlling it without rain lessened. Time is of the utmost importance. Transportation improvement includes:
 - (a) Streams, portages and lakes..... 200,000 man-days
 - (b) Roads (include trails) 640,000 “
3. *Communication Improvement*. Telephone System 40,000 man-days
4. *Detection Improvement*. Lookout towers and trails thereto..... 20,000 man-days

The totals under these four headings is 1,200,000 man-days, or based on a 200-day year would give employment to 3,000 men for two years.

Multiplying by eight to get an idea of useful work that needs to be done in the forested area of Ontario on *fire protection* alone, you have a total of 9,600,000 man-days or 24,000 men for 200 days per year for two years.

Much of the work outlined presupposes surveys and mapping, both ground and aerial, preliminary to its undertaking. No estimate of the men or time required for such surveying and mapping is given by Mr. McEwen. It would doubtless be considerable.

These labour figures have been given in terms of a two-year period, because such work might be considered stop-gap employment; there is no reason why a smaller number of men could not work for a much longer time and there would be a number of obvious advantages in such an arrangement.

Scientific forestry practice requires the maintenance of roads and permanent river improvements so that the mature crop, wherever it is, may be harvested when ready and also that fungus or insect-infected timber may be salvaged; the removal of such diseased timber, operates to stop the spread of the epidemic and is the only satisfactory way to deal with it, so far discovered.

The building of such a permanent transportation system could well be linked to the improvement of transportation in fire protection mentioned above and many of the roads would serve both. No estimate of time required for such construction is as yet available as far as I know except for very limited areas, but it will doubtless be forthcoming, and very considerable.

What has been said, deals with the possibilities of work in the forest to bring its facilities and organization to a

point where the fire protection system has a chance to cope with the danger, and the forest operator can, if required, do scientific logging without such a high initial charge for roads, stream improvements, etc., against his operation.

As has been suggested, the emphasis on the future timber crop while logging the present one, involves the expenditure of time and money, and although the amount will differ very greatly on different sites and types of forest, a fair estimate would be that the number of men required in woods operations, marking of trees, burning of slash, inspection, etc., would be 25 per cent more than at the present time—representing an investment in the present for the future—an investment, however, that should be repaid several times over by the improvement in quantity and quality of the new crop—if one can judge from European practice. As yet in Ontario (and this is generally true throughout Canada with the exception of the province of Quebec) we have no scientific forestry, if we disregard a few minor experimental cuttings.

That wood is used for many thousands of purposes is a fact few take time to consider. The war has brought it forcibly to our attention with the increasing scarcity of many other materials. The Germans have long appreciated it and have sacrificed their forests mercilessly for the basic material that helps them make up deficiencies in food, shelter, clothing, war essentials and motor fuel—in the hope, of course, that they will be able to rest their forests after they have acquired control of the rest of the world.

They have at least a well thought out plan. We, in Ontario, have had no plan worthy of the name, and those from other provinces will know to what degree this is true of theirs.

I might add that we have done comparatively little research into the multitudinous problems involved in keeping a forest productive although we have spent and are spending vast amounts on agricultural research.

If, after the war, a sane forest policy should be adopted in Ontario, we would find ourselves hamstrung for lack of trained technical foresters. Before the war, we had about twenty foresters in the employ of the provincial government of Northern Ontario, largely occupied with fire protection, or an average of one for each 8,000 square miles. The Government Forest Service of Ontario alone, with any rational forest plan, could use from 200 to 250 foresters without difficulty, the product of 25 average graduating classes of the Toronto Forest School. We have had no plan of training secondary personnel for ranger duty, cut inspectors, etc., and in this we are far behind the province of Quebec, which has had a ranger school for twenty years. The dearth of technical foresters and the low estate of the forestry profession can be attributed largely to the unenlightened course followed by our provincial authorities; only in the provinces of Quebec and New Brunswick has the value of four years specialized university training and forestry experience been recognized by legislation.

Proper forestry management will pay big dividends and protect the future of the vast investment in Canadian forest industries. It will increase the demand for woods labour and can maintain in perpetuity the many communities now dependent on the products of the forest. We must discontinue the ridiculous practice of taking money from forest revenue for the general funds of the provinces while the forest is deteriorating and being destroyed by fire, disease and waste. In Ontario the direct forest revenue thus taken is a small fraction of the total provincial revenue, but its application to the maintenance of the forest would make a tremendous difference.

This paper was to deal primarily with Forestry in relation to Post-War Reconstruction; I hope you will not mind my concluding it with an appeal for your sympathetic interest in the problems of those technical foresters and other conservationists who are striving to bring those responsible for the administration of the forests to some idea of their possibilities for the future of Canada.

Technical foresters and engineers of all kinds have much in common; I solicit your interest in this problem.

DISCUSSION

The Committee earnestly invites further discussion on the subject of post-war planning and reconstruction. Contributions will be welcome from members of the Institute and non-members as well. They should be addressed to Headquarters of the Institute, 2050 Mansfield Street, Montreal, Que.

G. MACL. PITTS, M.E.I.C.³

The reconstruction programme will require a great deal of co-operation, particularly the co-operation of the large element of educated and scientifically trained men that we have in this country.

Having the honour at the present time of being the president of the Royal Architectural Institute of Canada, I may say that in that body we have had to make some concise and exact studies with regard to the possibilities of the wartime period and the post-war period. We have tried to be realistic about this matter, and to reduce the idealism to a minimum, in order that practical results may be of the best.

In that Institute we have associated ourselves with other organizations, such as The Engineering Institute and the Canadian Construction Association, through the National Construction Council. We feel that no one organization can plan such a comprehensive scheme as will be required.

Our feeling at present is that we are away behind schedule. If there is to be a building programme ready to commence constructive work within the next two or three years, very definite plans should be well under way now.

In making these plans there is a tendency to depend too much on the government. It is easy, in time of war, to place the responsibility for a great many things upon the government which the government is not properly organized to carry out. If we continue to do so the government will be inclined to accept that theory and serious difficulties may arise.

We have in our Institute drafted a proposal which we are sending to the government, as to how we think a workable organization could and should be set up for the carrying out of the post-war reconstruction planning scheme. We appreciate the limitations which housing presents. A great many people think that the housing situation will be solved by simply building a large number of small houses to house our working men.

Now, there is nothing to indicate that a working man wants to own a house. In a great many cases he does not want a house because the economic set-up of his employment may make it necessary for him to move to some other community.

Another thing to be remembered is that the housing proposition is a very flexible one. In time of depression we found that people could double up at a surprising rate, and the necessity for housing could be very materially reduced.

As an Architectural Institute, we are carrying out a survey of all the work that has been on the board. Progress has been held up by the war itself, or by the restrictions that have been placed on materials and labour during the war, and although our returns are not yet complete, you would be surprised at the volume that we have at present before us as being work that can be carried out by the industry when the situation permits.

We find too that the government, in its anxiety to see that the greatest effort is put forth for the winning of the war, has imposed upon us a great many regulations, the actual effectiveness and efficiency of which in the prosecution of the war, we can not quite appreciate.

As far as the construction industry is concerned, we are terribly lacking in plans for communities where buildings can be carried out. There is no use trying to build before we know what we are going to build, where we are going to build, and how we are going to carry out the scheme. It is most desirable that the engineering profession, and those interested in town planning should cooperate with us, and we with them, to see that these difficulties are overcome.

³Maxwell and Pitts, Architects, Montreal, Que.

As far as reconstruction problems are concerned, none of us are selfish in our approach. We are trying to plan for our fellow Canadians, and see that they will live in the future under the very best conditions that our technical knowledge and our humanitarian point of view can possibly develop. We are not in this for profit, we are in it to make a country worth living in. Let us not depend too much on the government, but let us do something for ourselves.

FRANCIS HANKIN, AFFILIATE E.I.C.⁴

Mr. Cochrane has done well in drawing public attention to the general nature of the post-war problem of ensuring full employment. His adaptation of the General Electric analysis of post-war possibilities and needs to Canadian conditions is valuable, though some people may not accept all the items he includes under "capital goods production", and may feel that the proportion of the total national production he allots to capital goods of 35 per cent is a little high. But differences of this sort do not detract from the worth of what he has done in stressing the importance of capital goods and consumers' durable goods in our economy.

If past experience is a guide, they will together form not less than one-third of our national income. Like construction in the United States which dropped from nine billions in 1925 to one and a third billions in 1933, they will be subject to great fluctuations in volume and, therefore, will cause from time to time considerable unemployment unless we bring their production under better social control than we have hitherto done. To accomplish this, we should do the following things:

1. We should even out and stabilize our total annual expenditures for capital goods required both by public bodies and private enterprises.

2. We should adopt measures that will maintain the purchase of consumers' durable goods, such as radios, automobiles, etc., at a high and constant level. We need not worry very much about expenditures for food, clothing, and other essentials of life because, if the considerable fluctuations in the other areas of production are brought within reasonable bounds, such expenditures will automatically be constant and at a high level.

Accomplishment of these purposes requires the co-operation of all individuals and organizations in the community, and, among the latter, the state must be included. What form should the effort take, and how can it be brought about?

First, we should examine the action we may expect from government at its various levels, federal, provincial and municipal. Clearly, each authority should plan its public works with the dual object of providing useful service, and of affording employment when it is needed. Each should prepare as many projects as possible to the blueprint and specification stage so that the most appropriate may be launched promptly when needed. Where possible, they shall be used as "fill-ins" when private enterprise is stagnant. In financing them, our governments should follow the Swedish plan of budgeting public works separately from current operations. And we should pay for them out of loans during depressions; and out of taxes during prosperity.

Through its power of taxation, government can do much to maintain purchasing power for consumers' goods which depends upon the receipt by each citizen of a sufficient share of the national income. Adequate social insurance which, in the words of Mr. Churchill, "brings the magic of averages to the rescue of millions" is an important con-

⁴President, Francis Hankin and Company, Limited, Montreal. This discussion was not presented at the meeting, but contributed in writing afterwards.

tributor to that purchasing power and, therefore, to prosperity. Remove the fear of disaster from accident, sickness, unemployment, and death, and nine-tenths of the population will not find it necessary to save for a rainy day. Instead, they will spend nearly all their income on consumers' goods, and thus keep the wheels of industry moving regularly, reducing thereby the cost of insurance itself. If proof is wanted, see what unemployment benefits, and even the dole did to maintain purchasing power in England after the last war.

Through taxation of excess profits of monopolistic enterprises, government can induce big business to keep prices low or wages high so that purchasing power will be maintained at an adequate standard. Graduated taxation also is used to remedy inequities in income distribution.

Government can do many other things as well that will help to maintain prosperity and full employment. Education, for example, fits a man to produce better, and good health keeps him constantly at his bench or in his office.

What can business and other organizations do? Private enterprise must find some way to controlling its capital expenditures on the principle advocated above for public works. Possibly, concerted effort by employers working through their trade associations will be needed to do this. Government also may take a hand, as it has already done, by remitting taxation on capital expenditures during depression, and by offering financial aid similar to that available from the R.F.C. (Reconstruction Finance Corporation) in the United States. The final responsibility, however, rests on the shoulders of private enterprise itself. If it is to survive, it must find ways and means of eliminating violent employment fluctuations in capital goods industries. It must level out its demand, and it must also be ready to venture into new fields of effort which will require new buildings and new equipment.

But the most important responsibility of private enterprise is to ensure the distribution of the greatest volume of the things it is in a position to produce. The instruments for doing this are prices and wages. Prices must be low enough to call forth the greatest volume of purchases, or alternatively, wages must be high enough to enable the recipients to buy all that comes on the market. Through trade associations, which may have to be subject to government supervision, industry should pursue a policy of striving for the greatest possible distribution. Only by doing so can unemployment be avoided, and the possibility of state capitalism forestalled.

The foregoing suggests that full employment demands the collaboration of all the interests concerned with it. How can it be brought about? Mr. Cochrane mentions the Committee for Economic Development organized in the United States and financed by business men. It proposes to cooperate with agencies of government and "to stimulate and work with local community groups and business men, learning from them as it goes along". This Committee may do good work, but I think it will be hampered in its efforts because, apparently, it will work from the top down. I prefer the method proposed by the Canadian Chamber of Commerce which suggests that local committees on recon-

struction "should be comprised of nominees from various bodies in which the following might be included:

The Board of Trade or Chamber of Commerce of the city.
The Junior Board of Trade or Chamber of Commerce if such exists.

Co-operative societies, if such exist in properly organized form.

Citizens' committees on Rehabilitation.

Labour organizations, such as Trades and Labour Council, the Canadian Congress of Labour, and the Catholic Unions.

Farmers' organizations, if they exist.

Construction organizations such as the Architects' Association, The Engineering Institute of Canada, Canadian Construction Association or Builders' Exchange.

Canadian Manufacturers' Association.

The university or senior teachers' association.

The Canadian Medical Association.

Social service organizations.

Major trade associations.

Any already established community committees on such matters as public works, slum clearance, town planning, etc.

Other women's organizations.

Though boards of trade may inaugurate the committees and make available to them their secretarial facilities, I think it is of the greatest importance that neither they nor any other organization should dominate them. The committees must be truly communal, and, therefore, the members should not be chosen by the boards of trade but nominated by the organizations interested in reconstruction.

It has been suggested that an organization of organizations might engender fascist tendencies. There will be no danger of such a development providing the committees avoid entanglement with government. It is their business to prod government and to criticize it. They should cooperate with government but not be tied to it. Only if they preserve their independence and freedom will the committees be free from politics and command the confidence of the community they serve.

What can they do? Through their own or *ad hoc* sub-committees of experts, they can ensure the preparation of a shelf of public works for their community; can assist small local industries to plan for change-over and expansion for peace-time work; can educate producers, workers, and public to the importance of proper price and wage policies; can plan for appropriate educational and health facilities; and can help to create an informed public opinion which will decide wisely on the matter of social insurance.

This will be true communal work from which the individual will benefit and in which he can participate, for, after all, powerful organizations and associations, and also the state itself are composed only of individuals like ourselves. There is need that each one of us, working through our appropriate organizations, shall apply his intelligence and his energy to the problem of providing full employment and a decent standard of living for everybody when war ceases so that we may this time win the peace that ensues and make it permanent and prosperous.

THE TRAINING AND EDUCATION OF ENGINEERS

S. D. LASH, PH.D., M.E.I.C., ASSOC. M.INST.C.E.

Assistant Professor of Civil Engineering, Queen's University, Kingston, Ont.

It is reasonable to expect that, in the post-war period, careful consideration will be given to the whole subject of engineering training, and it is probably well for us to start thinking about it now. In support of this view attention is directed to the presidential address to the Institution of Civil Engineers delivered last year by Professor C. E. Inglis^② and to the recent address by the president of The Engineering Institute reported in *The Engineering Journal*^③. It is the purpose of these notes to emphasize some of the principles outlined in the above addresses and to suggest application to conditions in our universities.

In order to plan engineering training it is necessary to decide what sort of people we want engineers to be, and how, if at all, such people can be trained. Remembering that the engineer is the man "who directs the great sources of power in nature for the use and convenience of man" and remembering also that the term engineer originally meant "one who contrives, designs, plans or invents" (1702) it is suggested that the primary function of engineers are the planning, designing, constructing and maintenance of structures and machines of all descriptions.

Successful planning of engineering projects requires a breadth of outlook which engineers (and others) often lack. In the development of American railroads, for example, immense sums of money were wasted through improper planning and what is even more important, improperly motivated planning. In the post-war period, many engineering projects will have to be examined, not only for technical soundness, but also for economic soundness, social soundness and for the aesthetic satisfactions that they may be expected to bring. The making of such studies is a proper task for the engineer and the engineers who make them must be men of broad general education with a predominantly scientific outlook. In a recent broadcast, Professor Inglis^② said: "Those who plan and carry out vast engineering works must be men who possess forward-looking minds, coupled with great resolution and powers of leadership, just the type of leaders we want in these days and in the days of post-war construction." To broad general education must be added specialized knowledge in one or more fields. Specialization gives rise to the most difficult problems in the engineering education. To what extent should the universities attempt to impart specialized knowledge, to what extent should they attempt to teach subjects of a general cultural nature and in what way should such subjects be approached? Some attempt must be made to answer these questions.

It is widely recognized that the training of engineers cannot be entirely accomplished by universities. However competent the teaching or however well planned the courses, practical experience will always be an essential part of an engineer's training; moreover, an engineer continues to learn things throughout his professional life. The young engineer has ample opportunities after graduation of obtaining detailed technical knowledge of the fields in which he is interested. As Professor Inglis^② has put it "A beginner in an electrical firm will get little credit for his knowledge of electricity, for in that particular direction he will be surrounded by others far more knowledgeable. But if, perchance, a problem involving stress calculations comes along, which he alone is capable of solving, seen against a black background of ignorance he will gain credit out of proportion to his merits."

In the past, men with engineering training have frequently been engaged in work of a predominantly non-technical nature. Sir Clement Hindley^④ has estimated "that in carrying through an engineering project probably 75 per cent of the directing engineers' time, energy, and

brain power are absorbed in overcoming human difficulties and the remaining 25 per cent in solving material and physical problems." The better paid positions are often executive rather than technical. For men in such positions, highly specialized knowledge such as is commonly imparted at a university is valueless, but a scientific outlook is of inestimable value. By a scientific outlook is meant "a critical, logical attitude, and a wholesome respect for correct reasoning, precise definitions, and clear grasp of underlying assumptions."^⑤

University courses consist at present of an intensive diet of technical subjects leavened with a few other subjects which students feel to be largely unnecessary. The effect of this intensive diet is to produce mental indigestion of the worst kind. An average student may regurgitate sufficient information at examination times in order to get a degree but only an exceptional student can be expected to assimilate such an excess of mental food. Forty years ago it was recognized that courses were too crowded—they are probably still more crowded now and as a consequence there is very little time left for thinking. The average graduate finds, say ten years after graduation, not only that he has forgotten most of the material he studied so intensively for examination purposes; he will find that he has forgotten that he ever knew it. Probably the only reason that university training has worked as well as it has, is that it serves as a sort of intelligence test, picking out those who are bright and rejecting those who are dull.

In most Canadian universities, an engineering course consists of two years spent largely on fundamental subjects such as mathematics, physics and chemistry followed by two years of more or less specialized study in some branch of engineering. This system was apparently introduced into American colleges from France during the 19th Century. On paper it looks like a logical system but in practice there are disadvantages. Perhaps the most serious of these is the division of outlook produced in the students' minds. The fundamental sciences are regarded only as prerequisites to engineering studies and are not closely related to them. Another drawback is that, in mathematics for example, too much material is presented in too short a time. In the opinion of the author it is unreasonable to expect the average student to assimilate the elements of co-ordinate geometry, differential and integral calculus, differential equations, spherical trigonometry and various other topics within two years.

The need appears to be for more extensive and more varied fundamental courses together with a considerable reduction in the time spent on specialized work. It is the latter suggestion which will probably arouse the greatest doubts in many minds. But unless courses are lengthened this is what we must do. Consider, for example, the field of structural engineering. It is common for undergraduate students to study all, or many, of the following topics: arch design, moment distribution, rigid frame analysis, strain energy, virtual work, photoelasticity, wind stresses in tall buildings, continuous trusses, suspension bridges, and so forth. These subjects are all interesting and some are important, but it is maintained that practically none are essential in undergraduate training. Only in exceptional times is the young engineer called upon to design the more complicated types of structure. The average employer expects the graduate to be able to proportion simple beams, columns, connections and perhaps, trusses. It is only after gaining experience in the design of such simple structures that an engineer is qualified to tackle more complex problems. A structural engineer should know what a suspension bridge looks like and he should understand the

general structural principles involved in supporting the loads, but only one man in a hundred will ever design such a bridge. The bridge designer can study the exact methods of design which have been used in previous bridges and in a week, at the most, learn as much about the subject as he could have done in any undergraduate course. In subsequent weeks he will, of course, learn far more.

Matters such as those listed above are more suitable for study by graduates and the universities might well offer a variety of short intensive summer courses, perhaps lasting not more than three weeks, on such subjects. Many engineers would welcome an opportunity of studying recent theoretical developments in their own particular field.

The pruning of courses must be carried out thoroughly if a new healthy growth is to be encouraged. Such new growth will be characterized by a renewed interest in fundamental subjects such as mathematics, together with an interest in subjects which are comparatively new to the curriculum but which are nevertheless of wide interest to engineers, subjects such as regional and town planning aesthetics, management, traffic control.

It seems almost essential to introduce some further element of specialization during the final year at college. Whilst this may appear contrary to some of the preceding arguments it nevertheless appears a necessary consequence of the general advance of engineering science. Moreover, the student taking a civil engineering course, for example, usually has a fairly clear idea as to whether he wishes his future work to be in the field of structural engineering or that of municipal engineering. Similarly the student studying electrical engineering will know whether he is interested chiefly in radio or in the design of heavy electrical machinery. Thus, further use can be made of elective courses in the final year. For those who do not wish to specialize at all, it is suggested that a course in general engineering be offered.

We are now perhaps able to answer in a little more detail the question asked at the beginning of this discussion. What sort of people do we want engineers to be? It appears that engineers need to have:—

1. An understanding of scientific methods of thought.
2. A broad grasp of the basic principles underlying the design and construction of structures.
3. An understanding of the economic structure of society.
4. A specialized technical knowledge in some particular field of engineering.
5. The ability to express ideas clearly and concisely.
6. An appreciation of culture.

With the above ideals in mind let us attempt to construct an ideal curriculum. Consider first the general engineering course. The four years might be spent somewhat as follows:

First Year

English—*Writing* of laboratory and engineering reports and essays. *Reading* books on the history of engineering developments, descriptions of engineering works, biographies of engineers, recent papers of a general non-technical nature in engineering and allied fields.

French or German—Acquire a reading knowledge of the language.

Mathematics—Basis of mathematical reasoning, logic, number systems, equations, series, plane co-ordinate geometry, trigonometry, very elementary calculus (“Calculus made easy”), introduction to ideas of mathematical philosophy.

Physiology—Elementary human physiology, the body as a machine and the necessary conditions for its efficient operation.

Psychology—Elementary human psychology, emphasis on basic psychological conditions for well adjusted living, methods of learning.

Shopwork—Carpentry, machine shop, blacksmith shop.

To gain practical knowledge of the properties of materials and of the way in which they are worked.

Second Year

Mathematics—Co-ordinate geometry, functions, elementary calculus, moments of inertia, kinematics, accelerated motion, statics, hydraulics.

Physics—Elementary heat, sound, light, magnetism and electricity.

Chemistry—Chemical properties of common engineering materials. Chemistry of common industrial processes. Introduction of general ideas of modern chemistry.

Properties of Materials—Physical properties of common engineering materials. Laboratory testing.

Drafting—Systems of projection, lettering, structural and machine drawing, descriptive geometry.

Social Science—Introduction to principles of economics, money credit, business cycles, government control, historical development of capitalist and socialist society.

Surveying—Principles and practice of elementary plane surveying.

Third Year

Mathematics—More advanced calculus, partial differentiation, elementary differential equations, damped oscillations, solutions of equations, curve tracing, dynamics, hydraulics.

Electrical Engineering—Fundamental principles of electrical engineering, including electronics.

Structural Engineering—Statics, simple framed structures, stress and strain, beams, columns, shafts, elementary structural design. Principles involved in structures of various types.

Mechanical Engineering—Power plants, including internal combustion engines, machines, heating and ventilating, thermodynamics, hydraulic machinery. Selection of machinery.

Aesthetics—Aesthetics of engineering structures, architectural design.

Social Science—Economic structure of Canada, Dominion-Provincial relations.

Fourth Year

Mathematics—Differential equations, vectors, probability and statistics, philosophy of mathematics.

Municipal Engineering—Town planning, zoning, street layout, traffic control, highway construction, water supply, sewage treatment.

Transportation—Air, rail, road, water—history, economics, operation, location, construction of airports, railways, highways, docks and harbours.

Social Science—Industrial relations. Business and works administration. Social effects of engineering methods.

Construction—Brief description of construction methods.

Production—Technique of mass production. Industrial design for mass production.

For a specialized degree the first three years would be substantially the same as for the general degree but greater specialization would be permitted in the final year. For example a degree course in structural engineering might have a final year as follows:—

Mathematics }
Social Science } As for general course.

Theory of Structures—Continuous and restrained beams, trusses.

Structural Design—Elementary structural design in wood, reinforced concrete and steel.

Structural Laboratory—More advanced testing of materials, testing of structural models, photoelasticity.

Structural Engineering—Principles involved in design of building, bridges, retaining walls, tanks, towers and other structures.

Foundations—Soil mechanics, proportioning of foundations for buildings, bridges and other structures.

The above outlines are only intended to convey an idea of the sort of topics to be discussed in an engineering course. There are doubtless serious omissions and possibly the pruning process has not been carried far enough.

It may be objected that undue attention is given to mathematics in the above programme of studies. Mathematics has been given the most prominent position for a number of reasons. Firstly, it is obviously of fundamental importance—more so than any other subject. Secondly, to form a link between the work of different years. Thirdly, subjects such as mechanics and hydraulics are regarded as branches of mathematics rather than as separate subjects. Fourthly, it is planned to introduce mathematics gradually as required for engineering studies. It is desirable that as much as possible of the mathematics instruction be given by men with engineering training and experience, so that the subject may be constantly related to practice.

In all subjects it is hoped that the present trend toward increasing laboratory instruction, problem periods, and seminars will continue with an accompanying decrease in formal lectures. In subjects such as structural engineering, students could well be encouraged to build actual structures on a suitable scale under field conditions subsequently loading them and measuring actual stresses. In this way an appreciation of construction problems and of the errors involved in ordinary design assumptions can be obtained. Dachau deserves to be remembered not for its notorious concentration camp but for the 'Bauhaus' established by Dr. Gropius[Ⓢ]. At the Bauhaus, students were taught the fundamentals of architecture not only in the drawing office but also in the work-shops and by actually working on carefully planned and directed building projects.

It cannot be too strongly emphasized that there is no fundamental conflict between theory and practice. One of the pioneers of engineering education, Professor Rankine[Ⓢ], put the matter thus:—

"At length during the Renaissance the truth began to be appreciated that sound theory in physical science consists simply of facts, and the deductions of common sense from them, reduced to a systematic form. The science of motion was founded by Galileo and perfected by Newton. Then it was established that celestial and terrestrial mechanics are branches of one science; that they depend upon one and the same system of clear and simple first principles; and that those very laws which regulate the motion and stability of bodies on earth, govern also the revolutions of the stars and extend their dominion through the immensity of space. Thus it came to be established that no material objects however small, no force however feeble, no phenomenon however familiar is insignificant or beneath the attention of the philosopher; that the processes of the work shop, the labours of the artisan, are full of instruction to the man of science; that the scientific study of practical mechanics is well worthy of the attention of the most accomplished mathematician. Then the notion that scientific men are unfit for business began to disappear. It was not court favour or high connection which caused Newton to be appointed Master of the Mint but a knowledge that Newton's skill both theoretical and practical rendered him the fittest man in all Britain to direct the execution of a great reform of the coinage."

FISHWAY PROBLEMS ON QUEBEC RIVERS

PERCY E. NOBBS, M.A., F.R.I.B.A.

President, Province of Quebec Association for the Protection of Fish and Game

Paper presented before the Montreal Branch of The Engineering Institute of Canada on February 4th, 1913

A. INTRODUCTION

The diminution of the inland fisheries of Quebec is due to three main causes: (i) poaching, (ii) pollution and (iii) obstructions. Very few species can be fished out, but the brook-trout unfortunately is one of these. The answers to poaching and pollution are not here under consideration; the answer to obstructions, whether natural falls or man-made dams, is the fishway, which is our present concern.

Consider the rivers in our farming country; half their length is barren of useful species. Perch, for example, have totally disappeared during the period between the wars from long stretches of river where they once were plentiful, in waters which are neither polluted nor much poached, but are much dammed. The fathers and grandfathers of the present 'habitant' farmers in many a long Quebec valley caught and salted all the fish they needed, where to-day they have recourse to sardines and salt cod on Fridays.

Consider our trout waters increasingly invaded by lumbering and water storage operations. The fishway and the spawning sanctuary are more economical answers to this than the hatchery, the proper functions of which are to re-establish stock where greatly depleted and to plant stock in virgin waters, not to maintain stock against legitimate angling.

Consider our salmon rivers with respect to sea netting and the food market. In a hundred years these waters have been reduced by 75 per cent. But what remains of them could be doubled in length and productivity by easing the passage at natural falls. Besides this, there are a number of rivers, once producing salmon, on which lumbering has now ceased, or will soon cease, and where permanent industrial dams are established. These could be restored as salmon rivers to the great profit of the inhabitants of this fair province.

And lastly, consider the commercial fisheries of our great rivers. An adequate fishway at the Montreal Island Power dam and passage at the Carillon Canal dam would soon recreate the shad fisheries all the way up to Ottawa. The harnessing of the St. Lawrence between Lake St. Francis and Lake St. Louis threatens the valuable sturgeon fisheries (which could be further developed) and the still more valuable eel fisheries, to say nothing of the carp and doré and half a dozen other existing fisheries that provide a livelihood for hundreds of families and very desirable supplies to our markets.

In all this, the engineer can make his contribution. River management is a practical science. As in farming, scientific research is a basic necessity; but, as in farming, common sense and energy and an ability to count the cost and to estimate the profits is what matters most.

The fishway engineer has to understand his fish as well as his water. The mathematical formulæ involved are neither abstruse nor recondite. There is a good deal of romance in harnessing a river with a dam, for a river can be a very wild thing on occasion; and there is a good deal of sport in getting fish to do what one wants in the matter of ascending a fishway—as much as in getting them to take the fly and come to the bank. And when fish, through their use of a fishway, are fruitful and multiply, there is a satisfaction such as no dead fish, however fine a trophy of one's skill, can rival.

B. GENERAL CONSIDERATIONS

The earliest recorded fishway legislation appears to be that of Alexander II of Scotland (c. 1225) which provided for

room for a pig to turn around in, as an opening in all dams on salmon rivers. Haliburton (in Sam Slick) records a heavy daily fine imposed upon a dam-owner at Liverpool, Nova Scotia, in 1853, for not keeping the fishway open. Present fishway legislation in the province of Quebec provides for fishways in all dams "unless" and "unless", etc., with the result that there are (in 1942) very few fishways in the province, as the following table shows.

Dams in the province of Quebec, about	450
Dams needing fishways, about	180
Ineffective fishways on dams	18
Effective fishways on dams	12
Waterfalls needing fishways	110
Fishways at waterfalls	1
Projected fishways studied	10
Fishways unknown to the author, possibly	10

That is to say, in a province twenty times the size of Scotland, with ten times Scotland's river mileage in its accessible parts, there are only about a dozen effective modern fishways known to the author.

Probably the main reason for this state of affairs is that drawings for the type of fishway originally designed by Mr. Cail of Newcastle, England, about 1874, got into the hands of the authorities in various eastern states and provinces and became standard practice. Now this type of fishway is easy and cheap to build and works quite well, if only about half a dozen steps are required. Its defects will be explained later. The apathy of the authorities and the hostility on the part of most dam-owners and of some engineers with respect to fishways may be attributed to the fact that a long obsolete type continued to receive official endorsement in the eastern states and provinces for half a century after better types of fishway had come into general use elsewhere.

The waste of water, that is to say, the use of more water than is necessary for the passage of fish, during far more months than is necessary in the year, has also very naturally increased the general prejudice against fishways.

MIGRATORY FISH AND DAMS

All the fish about which the author knows anything are more or less migratory, either in relation to seasonal search for food or seasonal movement to spawning grounds, or both. Every dam, therefore, causes diminution of stock, yet some few dams are very useful in diminishing an undesired species in favour of a desirable one. But, in this connection, we should not assume that suckers are undesirable in trout lakes. True, suckers eat trout eggs; but trout eat young suckers and this produces that balance which results in good sized and even very large trout. The author knows of no lake which can be rated a good trout fishery, producing lots of 2-lb. four-year-old fish and a fair stock of 6 to 8-lb. fish, to which the suckers do not have access. He knows of scores of lakes (and there are thousands in the province) full of 3-oz. four-year-old trout where suckers are absent; and several lakes exist which once held an abundance of 2 to 6-lb. trout where the construction of a dam has ruined the fishery and resulted in starving millions of old small trout. There are, of course, other contributing factors, but this is a matter worthy of biological study which might cause a revision of opinion on the sucker question in relation to fishways. However, there still remain some dams without fishways which are best as they are, serving as they do to keep German carp, bass and pike out of trout waters above.

There is many a long reach of river in Quebec which could support a large stock of some desirable species which cannot do so, solely because a dam prevents access from the reach in question to some suitable spawning and nursery stream above. There is in southwestern Quebec, as revealed by the 1941 river survey (conducted by the Province of Quebec Association for the Protection of Fish and Game in co-operation with the Department of Game and Fisheries), a matter of 400 miles of such barren or unused river reaches.

CLIMATIC FACTORS IN DESIGN

The climatic eccentricities of our province exercise certain limiting factors on the design and construction of our fishways. The spring floods are apt to be tremendous affairs if the snow melts quickly; they usually bring ice down with them, sometimes in enormous masses. Furthermore, our severe frosts render it necessary to drain our fishways for the winter. Concrete is not a material easy to use, far from highways, at the back of beyond where most of our fishways must be. Moreover, once broken up by frost and ice and undercutting, the repair of concrete is difficult and expensive. The cost of concrete fishway work can never be less than \$300 per foot of rise, while the cost of wooden fishway work need rarely be more than \$30 by the same measure; and repair or alteration of woodwork is easy and cheap. Moreover, we are poor, when all is said and done. Most fishways in this province, for a long time to come, must therefore be in wood construction, which necessarily involves some annual maintenance work and inspection for defects.

These things being so, it follows that only certain forms of pool and steps, readily constructable in wood, can usually be used in the designs for fishways in Quebec; and only forms not too readily destructible by ice and frost, whichever material is employed. Many effective and some economical types of fishway recently evolved by designers in other countries are thus barred out, so far as this province is concerned; and some refinements of streamlined form, appropriate enough to concrete construction, have no place in a wooden flume fishway. Some fishways recently constructed in this province which have met with the approval of fish of certain kinds will be fully described further on.

Within the fishway proper there are three things to avoid. The first of these is undue velocity, both over the fishway as a whole and at the points of rapid flow if such there be; the second is turbulence, the enemy of rest and comfort for fish; and the third is aeration which deprives the water of that solidity which is as necessary for the tail of a fish to drive against as for the paddle of a canoe. All three are interconnected; all three are fatally easy to bring about by feeble design or slight errors in execution, and any one of them produces inefficiency. The longer the fishway, the more important it becomes to eliminate each and all of them. Observe that turbulence and aeration are unqualified while it is "undue" velocity that is to be avoided, for there must of necessity be a velocity suited to the kind of fish and the circumstances of the case.

C. TYPES OF FISHWAY

(a) THE DIAGONAL BAULK FISHWAY

This is one of the cheapest and most efficient types of fishway (see Fig. 1a). It can only be formed in the case of a dam with an even moderate slope from the crest to the foot of the apron and consists of a baulk, set at an appropriate angle so as to form a channel up the dam at a low gradient. There must be a notch in the crest of the dam at the head of the baulk for the easy passage of fish at the top. Unfortunately neither a baulk nor its attachments can stand ice cakes sliding down, besides which very few dams in this province have suitable faces. This type may be regarded as inapplicable here.

(b) THE DISHED CHANNEL FISHWAY

In the rare case of a dam with a low enough gradient for fish to ascend, the provision of a channel to give adequate depth at all times is a simple device. Such a channel, how-

ever, cannot be readily closed and uses a lot of water (Fig. 1b). It cannot be recommended for use here.

(c) THE DENIL FLUME FISHWAY

This consists of a simple flume with a corrugated baffled floor and sides to dissipate the energy of the flow and reduce the speed of the current passing through (Fig. 1c). In cases where flow varies, the flume has to be made deep; and most rivers vary in level from day to day. Recent experiments* have shown that certain kinds of coarse fish prefer this type of fishway. If in wood construction the complicated floor required would necessitate protection and drainage in winter to prevent ice forming in the fishway. This type could be used here in cases where concrete flooring for the flume is possible.

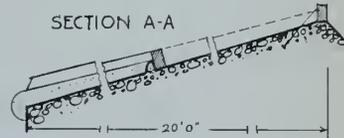

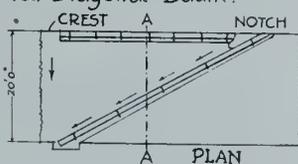

(d) THE ALTERNATE OBSTACLE FISHWAY

For fishways of this general type many kinds of baffles on the sides have been tried. These slow the flow appropriately, but most of them provoke a variable surging flow and a stream of mixed velocities in which only small fish could find rest. Such fishway flumes cannot be recommended for long ascents, unless interrupted by frequent large resting pools. Furthermore the baffles, when pointing upstream as they usually do, give lodgment for debris (Fig. 1d). This type is of very doubtful application in this province, but is suitable for small fish such as alewives.

(e) THE PAIRED OBSTACLE FISHWAY

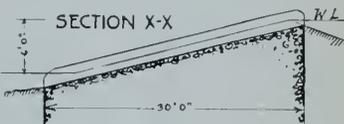

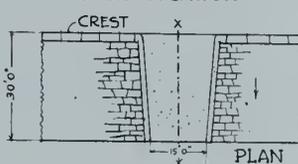

Such fishways only differ from the last type considered in that the baffles are not staggered (see Fig. 1e). They are

(a) Diagonal Baulk.

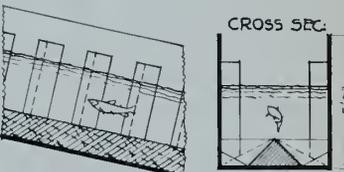

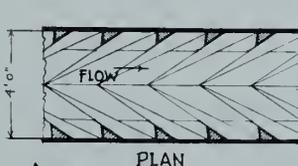

After Frye-Tennant.

(b) Dish Channel.

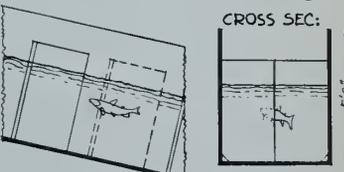

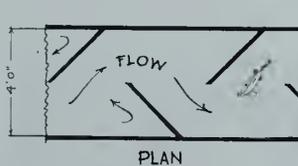

After Frye-Tennant.

(c) The Denil Flume.

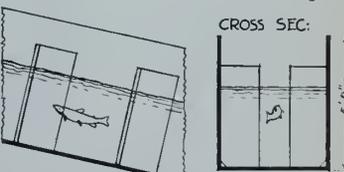

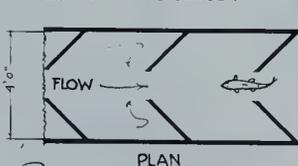

After McLeod & Nemenyi.

(d) Alternate Obstacles.

After McLeod & Nemenyi.

(e) Paired Obstacles.

After McLeod & Nemenyi.

Fig. 1 — Types of fishway, a, b, c, d, e.

* A. M. McLeod and Paul Nemenyi, London, Eng., and University of Iowa, U.S.A.

simple and economical to construct and do not provoke surging. With a resting pool after every 8 or 10 pairs of obstacles or baffles and for short fishways with a small rise they are workable but they are wasteful of water compared to certain other types. They are, however, practical for a rise up to 6 or 8 ft.

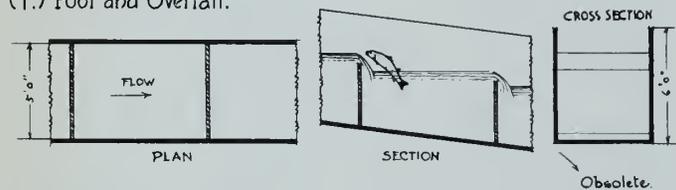

(f) THE POOL AND OVERFALL FISHWAY

The flume of suitable gradient interrupted by cross walls, or weirs, is an old device. When little water is coming over, the fish are expected to jump from pool to pool, and when there is a rush of water over the cross walls they are expected to take rest and refuge below them (see Fig. 2f). Such fishways use too much water. This type must be regarded as obsolete.

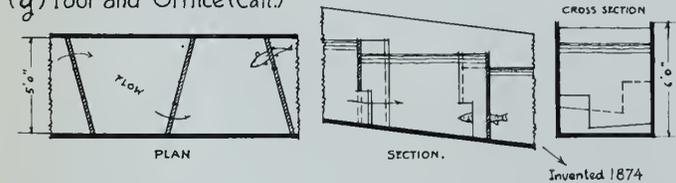

(g) THE "CAIL" OR POOL AND ORIFICE FISHWAY

Most of the fishways of this and our other provinces are of the Cail Type, illustrated in Fig. 2g, consisting of a flume with cross walls having submerged orifices at the bottom of each and staggered as to position. Such a fishway works well enough for a four to six step affair. The flow necessarily accelerates from top to bottom and this is met by diminishing each orifice in succession. In a long series the lower orifices give rise to small high velocity jets passing as much water as the top one does. The result in the lower pools is much aeration and turbulence, two things to be as much avoided as high velocity. Also the pools fill up with trash which blocks the orifices. No more Cail fishways should be built in this province for more than a 4-ft. rise.

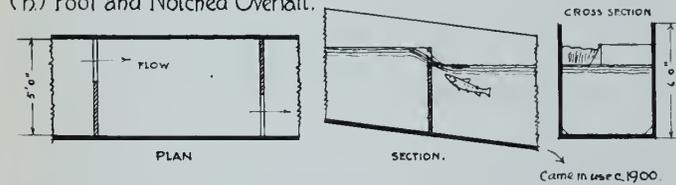

(f.) Pool and Overfall.

(g) Pool and Orifice (Cail.)

(h) Pool and Notched Overfall.

(j) Fish-Lock.

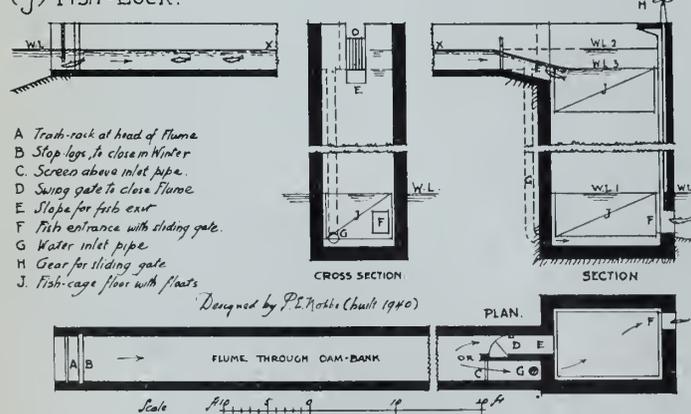

Fig. 2 — Types of fishways, f, g, h, i.

(h) THE POOL AND NOTCHED OVERFALL FISHWAY

This is the basic type for many successful fishways built between 1914 and 1942, in the British Isles. The cross walls are notched at alternate ends giving a series of easy flows from pool to pool and economizing water (Fig. 2h). When properly proportioned there is no acceleration, each pool receiving and delivering the same flow owing to what may be called its own internal dissipation of energy. Various recent improvements have been made in the design of the notches. The modern notch is a slide rather than a step. The earliest fishway of the type (but without slides) in this province was designed by Mr. Hocken of the Department of Fisheries at Ottawa for concrete construction at St-Ours on the Richelieu about forty years ago. It is working to-day and many sorts of fish continue to use it. This type appears to be pre-eminently appropriate for adaptation to most fishway problems in Quebec.

(j) FISH LOCKS

Automatic fish-locks have been designed and patented and fish-locks operated by hand are quite feasible. There is no doubt that they are very economical of water. One constructed at Ile Juliet, Beauharnois Dam No. 1, is operated by hand and contains, before raising the level, 500 cubic feet of water, being 8 by 12 ft. in area (Fig. 2j). This accommodates about 350 3-lb. fish at most; it takes twenty minutes to fill up and pass the fish on, and about half an hour for a fair "haul" of the fish present outside to enter. But to cope with the vast number of fish subsequently found to be present outside, an area at least ten times as great would be required and to attract large fish the flow might have to be increased. Besides economy of water there is great economy of construction on the scale carried out. There would, however, be no economy of structural cost, or water, over an ordinary fishway in a case where 3,000 to 4,000 fish had to be passed every hour. This type thus has its very definite limitations of application.

D. THE DESIGN OF A POOL AND NOTCHED OVERFALL FISHWAY FOR WOOD CONSTRUCTION

THE FISH ENTRANCE

Unless fish come naturally to the foot of a fishway, or can be induced to do so by alterations to the river bed, there is, of course, no way of getting them to come in and begin the ascent. The determination of the position of a fishway is often largely conditioned by the nature of the dam to be surmounted and the uses made of it. This may mean that the point below the dam to which fish would naturally come cannot be used for the fishway. It then becomes a matter of making a better place (and possibly ruining the good natural place) so that fish will come to the neighbourhood of the entrance. That is an operation of what is called "river improvement work".

The actual fishway entrance needs a sharp flow. As there may be only five cubic feet of water per second passing down the fishway, this means a narrow opening, as the depth at the fish entrance will be anything from two to four feet. An opening 16 to 20 inches in width will let anything but a 100-lb. sturgeon through. A fish entrance 18 by 36 inches (or 4½ sq. ft.) passing five cubic feet a second gives a flow of a little over a foot a second which is the least velocity advisable. This mild small stream must deliver into a heavy stream and this can be obtained by constructing a by-pass or by arranging that a sluice gate adjoining the fish entrance should be the last to be closed in case of low water. With the water very low, fish would, of course, not be in any mood to run (see Fig. 3c).

THE FISH EXIT

Passing to the other end where the water comes in and the fish go out, we have the following problems. Salmon will need an orifice at the head to be 18 by 18 inches and, if there is a gate, they will need at least 12 inches of water

over the sill. At the water intake there must, first of all, be a trash rack, preferably adjustable as to levels, to extend 12 inches below the water level which, of course, is usually variable; and then stop logs to close the fishway off all winter. Next comes the head gate to adjust flow and after that anything from one to three cross walls with submerged orifices for the passage of fish under variations of the water levels above. Lastly there must be an overflow for adjustment of water levels in the fishway. All these elements come above the highest notch (see Fig. 3a).

WATER LEVELS

The first thing to establish is the normal high and low water levels above and below the dam, or waterfall, and their variations. Next, one must determine the levels at those times of the year when fish will not run. That leaves the "working" levels, which usually do not have a range of more than 3 feet above and 1½ feet below the obstruction. The floor of the flume at the head and at the foot can now be fixed at, say, 3 feet below for trout, etc.

THE BOTTOM STEP

The bottom step (which will consist of a traverse or cross wall with a notch in it and a slide in the notch like the rest) should be fully awash at "working" low water level below, to make sure that fish can get over it easily. In the case of a dam reached by the tide one may take half tide as "working" low water. One would not put in a lot of steps down to low tide level, because fish would not try to move at low tide; but it would not do to let them in only at high tide because they are apt to move for an hour or two before or after that. And so, with the seasonal floods and operational levels.

THE SCALE OF LEVELS

With the level of the lowest cross wall's top and its notch so established, it is a simple matter to decide how many steps are needed to reach the "working" high water level above. Higher levels above are kept out by the control gate and over-flow; and for "working" low level above, the orifices in the cross walls at the top provide adjustment. The height of the steps is, within limits, determined by the length of fishway there may be room for, or the amount of money available; in other words, by the grade. For salmon, 15 inches is not uncommon and 18 inches is sometimes used, but the author prefers 12 inches for salmon, 8 inches for trout and 6 inches for all other fish. With that settled, one can set up a scale of the number of steps with their water levels and a scale of feet beside it (see Fig. 3d).

GRADE OF FLUME

Of course, the shorter the fishway the easier it is to find a place for it and the cheaper it is to build. There is a prevailing idea that one ought to be able to get fish up a 1 in 4 slope and one can do this with a Denil fishway if the height to be surmounted is only 6 to 8 feet. The idea at the back of the Cail, the Denil and all the many baffled flume types is to so disturb the water that it must go slow. But all this disturbance produces states of turbulence and aeration which fish do not like, and, in extreme cases, cannot swim in, possibly because they become "drunk" with too much oxygen, and certainly because foam is not solid enough to grip. As a consequence of all this, many fishways have been failures and confidence in all types of fishways gets shaken in many quarters. Given an invitingly contrived fish-entrance, fish should be able to move up quickly without undue struggle. The fact that a fresh salmon with a good take off out of water 15 feet deep can jump 11 feet and bury his nose in the head of a fall, and get over the crest, has nothing whatever to do with fishway design. Gravid fish in cold water from 2 feet to 4 feet deep cannot be expected to do gymnastics. To get sure results with salmonoid fish, the grade should not exceed 1 in 10. For a short fishway for trout 1 in 8 will do at a pinch; but 1 in 12 is better than 1 in 10 for salmon, giving more length-room in the pools.

For non-salmonoid fish in general, a grade of not less than 1 in 12 is recommended. The small black sucker is the gamest fish that swims and can move for quite a long time against water running 15 feet per second. In such water a salmon could only make a few yards and then fail. It follows from the above that with steps 12 inches high the pools would in general be from 10 to 12 feet long. In a fishway for coarse fish with steps 6 inches high the pools should be at least 6 feet long.

WIDTH AND DEPTH OF FLUME

The cost for length should never be pinched. Of course the longer and wider and deeper the pools are, up to 8 by 16 ft. and 5 ft. deep, the better; but for wide deep pools the costs mount up, especially in wood construction. A salmon fishway flume need not be more than 5 feet wide with pools 3 feet deep at the upper end and 4 feet deep at the lower end (average depth 3 ft. 6 in.). For trout, 3 ft. 6 in. of width and 2 ft. 6 in. of average depth is quite sufficient.

NOTCH SLIDES

Mr. J. Rook (the English fishway designer) was probably the first to introduce streamlined notches with slides in place of mere square openings in the cross-walls. The slides usually have a grade of 1 in 2. For salmon a 2 ft. wide notch is advisable, as deep as the rise from pool to pool, say 12 inches; for trout 1 ft. 6 in. by 8 in. will do. It will thus be seen that the flow through a fishway need have a sectional area of not more than two square feet for salmon and about one square foot for trout. The pool and notch

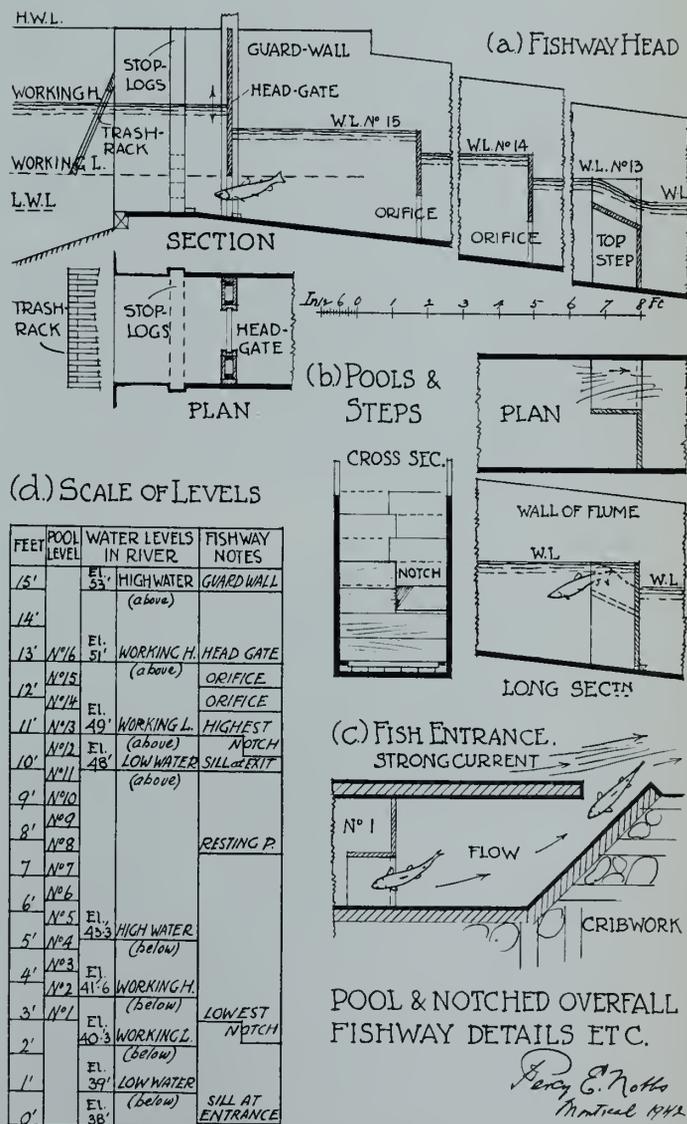

Fig. 3 — Details, pool and notch overfall fishway.

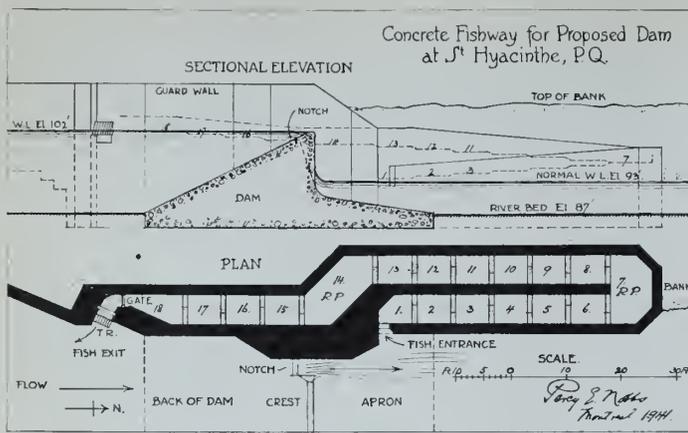

Fig. 4 — Proposed fishway at St-Hyacinthe, Que.

overfall type of fishway thus requires less water than any other type. Allowing for three months' operation in the year this is a moderate consumption. Compensation for leakage in the flume can readily be made by slightly narrowing the lower notches in the case of a long fishway, so as to keep all pools equally full (see Fig. 3b).

TURNING POOLS

When a fishway has to be over 100 feet long it should be interrupted with a larger resting pool. In practice, fishways of such length and over usually have to double back and forth like flights of stairs from a landing. The turning pool thus comes out from twice to three times the area of the pools in the flights and serves as a resting place (Fig. 6). This resting is not necessarily a matter of fatigue. A fish will not charge up a set of steps in the eye of the sun; even with the sun across the flight a fish may refuse the notches on the sunny side. These turning pools count as steps; it is well to make them a foot deeper than the outgoing flume and to give each a drain plug. With weep-holes at the floor in the cross walls of the flight above, each flight with its turning pool below becomes a separate drainage unit.

A flight of seven steps works well between turning pools. The number must be uneven so as to get the notches leading in and out of the turning pools at the ends of the broad sides, not close together at the centres. This may be regarded as the basic pattern for a long fishway, and a fishway may be considered long if the rise is in the neighbourhood of 20 ft. For a very long fishway, 70 ft. of rise, let us say, two or three really big resting pools, with natural bottoms if possible, and capable of harbouring 40 or 50 salmon in comfort, are desirable (see Fig. 4).

SHORE AND CENTRAL LOCATIONS

Most fishways occur on the shore at the side of a dam and it is important that the river bed below the dam at its other end should not be too inviting. There is some evidence that salmon will work back and forth below a dam to find a way up, if there is one; but this may take weeks and expose them meantime to poachers. When a fishway is not at the shore, a long crib with a hollow centre for the fishway is necessary. This arrangement is useless if the crib extends below the foot of the apron of the dam. The entrance to the fishway should be at the foot of the apron or within it, and the fishway with the cribwork on each side of it should extend up into the pool above the dam. Fish may nose back and forth below a dam to find an opening, but once they get their noses to a dam apron they cannot be expected to turn round or drop back to seek an opening lower downstream (see Fig. 5).

A fishway is converted into a fish-trap by the simple processes of breaking out the lowest cross wall or blocking the flow at the head. (Examples: at Windmill Dam, Richelieu River; and Penman's Dam, Yamaska River). A fishway must therefore be securely enclosed with a lock-up access gate and the stream below the fish entrance should

be strewn with concrete blocks with iron spikes in them against netting. The Nova Scotia law prohibiting angling within 100 feet of the foot of a dam or fishway has much to be said for it. The angler may have a gaff, or else a spear nearby.

E. PRESENT PROCEDURE AND IMPROVED LEGISLATION

CONSTRUCTION DIFFICULTIES

When the fishway designer has produced a plan that meets with the approval of the appropriate authorities in the Department of Game and Fisheries, the plan goes to the dam-owner. In the case of small owners the plans have to be in pretty full detail, while in the case of large concerns employing their own engineers the plans given omit structural details such as reinforcement of concrete or the framing of supporting staging for wood construction. The designer, if anything is to be achieved, must visit the site and explain matters to the builder. Most fishways are in out-of-the-way places and the construction foremen usually have no fishway experience. Fishways are tricky things and very small errors in construction disarrange the flow. The result when the designer inspects the fishway on its alleged completion usually involves some rectifications, great or small. One present difficulty is to provide inspection during construction. The Quebec Streams Commission (with its engineers stationed or moving about, as some of them do, all over the province) could provide this service economically. Visits to the site and inspections by an independent expert may easily, in the case of a small fishway, cost quite as much as the construction.

MAINTENANCE DIFFICULTIES

With our fishways of necessity mostly of wood construction, annual inspection and maintenance is essential. Flood damage, or a leak from decay, not only tends to grow if neglected, but usually puts a fishway out of commission at once. Annual inspection and attention to see that repairs are promptly made is costly. Here again the Streams Commission could be of great service at far less cost than sending the designer round all his fishways in the province. The Department of Game and Fisheries, Quebec, has no engineers or builders on its permanent staff.

When a fishway is completed instructions should be given as to the flow desired and the annual dates between which such flow should be maintained for the fish concerned. As things are, these instructions get lost or the servant of the dam-owner who knows about them gets moved. Thus a fishway may waste a lot of water to no purpose. Both the charge and management of fishways should be in the hands of the fish and game wardens who are in touch with the Departmental officials.

OWNERSHIP OF FISHWAYS

The present legislation could be greatly improved by providing (1) that the dams must have a suitable site and

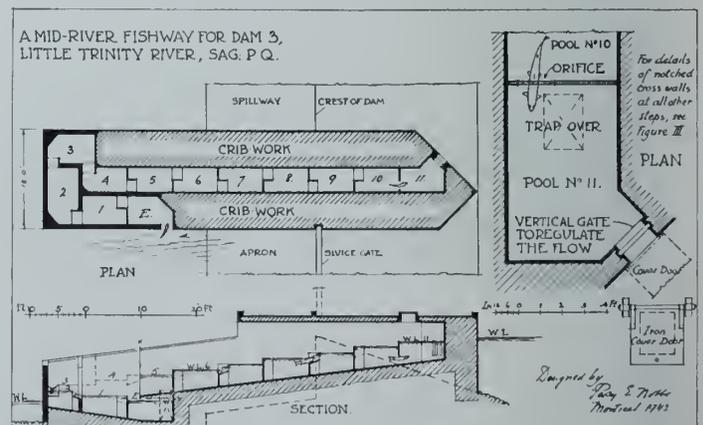

Fig. 5 — Trinity River fishway, Dam No. 3.

opening for a fishway provided by the owner; and (2) that the Department of Game and Fisheries would construct, maintain and operate such fishways as it might consider necessary. If this change were made the construction and maintenance could very properly be handed over to the Streams Commission while the operation would be in the hands of the game wardens.

The conversion of a fishway into a fish-trap is a five-minute job and this very prevalent offence would be less practised if the fishways were Government property and the game wardens had charge of them and responsibility for their enclosures.

F. STORAGE AND HYDRO-ELECTRIC DAMS

STORAGE DAMS

A very clear distinction must be made as between storage dams and dams at which power is generated. In the first case great areas are inundated, producing a pollution from decaying vegetable matter which may take half a century to pass away and the storage is usually for winter use and derived from the spring flood which ceases to occur below the dam and may be greatly reduced over the river below. Thus the pond above a storage dam may be full all summer and be all but empty in February; and this "pond" may be a lake 50 to 100 square miles in area. But, in some cases, usually small affairs, the storage may be for summer use of the water. Thus, if there is any question of a fishway in connection with a storage dam, the flow in the river throughout the year has to be taken into consideration.

If the dam in question is operated for lumbering in the spring, a great many fish will wash out and the object of the fishway may be the return of these fish to the waters above. In that case the designer of the fishway is only concerned with spring levels. Or, in the case of storage for summer use there may be no spring wash out of fish but there may be the autumn run to take into consideration.

Where a storage dam exists for winter use of the water, there is apt to be a complete upset of the fish life above and a fishway to facilitate the ascent of fish from below may be quite useless. Mr. W. L. Calderwood, the Scottish expert, in the January, 1942, number of the *Salmon and Trout Magazine*, writes an illuminating article on the compensating work involved in such cases. The principle accepted in Great Britain which he enunciates is a sound one. In such a case no fishway is required, but whatever river improvements works, such as opening up new spawning streams, the construction of new spawning grounds, etc., will tend to maintain the stock of fish in the river system in question, may be called for instead.

DISCUSSION

VERNON E. JOHNSON¹

Having some experience in the location of fish within the province, I have no hesitation in approving the intent of Mr. Nobb's paper—that is to promote better and more accessible sport fishing, commercial fishing for the moment being a separate issue. The pulp and paper industry recognizes the necessity of promoting better possibilities for sport and pan fish, but it is necessary to determine whether or not fishways are required. Where shall they be built? Who will pay the cost and who will look after their maintenance?

It is quite certain that trout and salmon will, to some extent, use fishways. Most of the logging and pulpwood operations are confined to waters carrying these species. However in some cases bass, pike, and doré inhabit the driveable streams and lakes where logs or pulpwood are handled. I have no convincing examples that these fish will use fishways if provided. On the other hand, coarse fish such as suckers will use a fishway more readily even

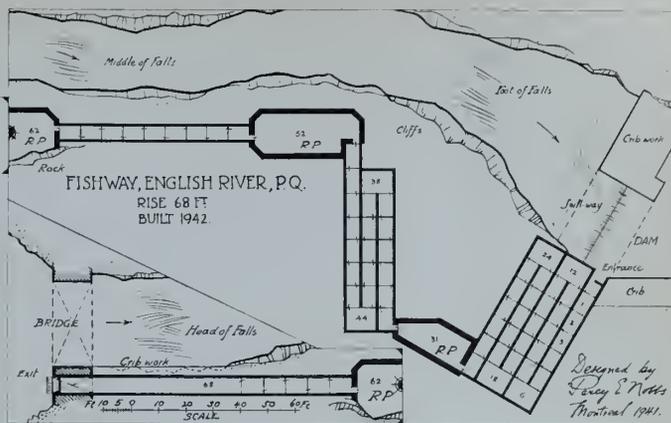

Fig. 6 — The English River fishway, 68 feet.

HYDRO-ELECTRIC POWER DAMS

In the case of a dam with a hydro-electric plant upon it, the water levels above and below naturally vary very little, being under control. The barrier is in most such cases long, but the fish-holding water is usually immediately below the power house in question. The best position for the fishway is then likely to be a very difficult matter to arrange after the power house is built and in operation. A case in point may be cited at the Montreal Island Power Company's plant. There a fishway leading from shallow quiet water, and of the Cail type, has proved quite useless and the only practical solution is a fishway through the structure, which happens in this case to be possible.

LONG DAMS ON GREAT RIVERS

Very long dams on great rivers present many difficulties. Sites for fishways at the shore ends are preferable because most fish in large rivers work upstream near the shore, particularly sturgeon. But in such dams there is constant adjustment of the great gates causing not only variations in water levels, which are difficult enough to deal with, but also sudden variations of terrific currents and the back eddies they set up, so that fish at a given point may be headed one way one day and in the opposite direction the next. The problem of contriving suitable conditions outside the fish entrance under these difficulties is outside the control of the designer. Fishways in a central position within a double pier may offer the best solution in such cases, but they would involve greater expense than shore-based fishways.

than trout. Is it necessary that industry be burdened with costs for such an uncertain result?

I will not comment on the structural design of Mr. Nobb's fishways, he is critical of a sample which I have—a model of one that produces reasonable results.

Before we commit any one to legislation or expenditures, it appears that continued study must be made to show that fishways are required—first, in specific cases, then a more general installation based on sound results.

There are three types of dams referred to:

1. Logging dams—usually of a temporary nature though often maintained for periods up to ten or twenty years.
2. Power dams—such as those on the Saguenay, St. Maurice, or Gatineau.
3. Storage dams—administered and controlled by the Quebec Streams Commission.

There is no doubt that fishways in logging dams can be provided—but the majority of these dams are opened during the summer and fall, or even during the spring driving

period for the passing of logs, and therefore water levels fluctuate rapidly.

In the case of large power dams such as those on the St. Maurice or the Gatineau, it does not seem possible to construct a fishway that would be economical or used by the fish. When the gates are open a fishway could not be used and the cost of building and maintenance would run into a heavy expenditure. The storage dams are in much the same class, except that they are closed for greater portions of the year—more frequently opened in winter.

In any case, why does a fish want to get on the other side of the dam? If we want more fish above the dam perhaps stocking with suitable species can answer the problem in many cases at a greatly reduced expenditure.

There are exceptions where large quantities of fish accumulate at the foot of dams—and are taken by fishermen at will until depleted. There are cases where sport fishing is ruined by power dams—such as the ouananiche at Lake St. John. If this type of fishing is lost, we might have to substitute red trout or land-locked salmon in the quiet waters above the dam.

The industry feels that administration of the forest assets, including fish and game, can best be handled by one authority. If we do not co-operate it is easy to get an autocratic rule which does not fit with the present field staffs of the industry. There is, to-day, among forest operators a more tolerant attitude toward sportsmen, for whom the forest roads and camps now provide greater facilities of access. We, however, must face the risk and danger of more fires if more people are in the woods. We have shown to the government our willingness to co-operate by using fire rangers as game wardens. In some instances, the forest industries have built up, protected and maintained both good hunting and fishing within controlled areas. These demonstrations show that similar results can be had in other areas if properly studied and developed.

In some cases there has been a great increase in numbers and size of fish where dams have been created, due to the formation of more feeding and spawning grounds.

If it is demonstrated that fishways are necessary, industry will readily co-operate in a plan for wider use of our national assets. Water can be used for both fish and industry if properly planned. There is no criticism of the suggestion that the forest industries when building dams should provide a place for a fishway—but our present attitude is that some other agency should pay the cost of fishway construction and maintenance.

O. O. LEFEBVRE, M.E.I.C.²

Dr. Lefebvre remarked that he was not entirely in agreement with Mr. Nobbs as regards the injury to fish life caused by large storage dams. In his experience there was often an increase in fish in the waters above such dams, and while in such cases to build a fishway would be a waste of money, he questioned the necessity of the river improvement works of which the author had spoken.

In regard to the water needed by a fishway, it must be remembered that in addition to the water passing down the fishway itself, a considerable additional flow had to be provided to make a stream past the fishway entrance so that the fish might find their way in. In the case of a large fishway like the \$5,000,000 installation at the Bonneville dam on the Columbia River, in the United States, which passes 25,000 fish per hour the total water needed was some 6,500 cu. ft. per sec.

Dr. Lefebvre had in the past been somewhat averse to fishways but his views had been modified by recent information. He now thought that more rivers in the province—specially salmon rivers—should have fishways, particularly where natural obstacles now exist.

J. A. McCRORY, M.E.I.C.³

Engineers in the province of Quebec are not antagonistic to the provision of fishways in the dams with which they are concerned, but it must be acknowledged that they have been apathetic. One reason for this is the lack of agreement on the part of the experts as to the design of fishways that will be acceptable to the fish themselves. This is shown by the large proportion of ineffective fishways in the total number of fishways in the province as given in the tabulation on page 202 of the *Journal*. Another reason is the practical difficulties that would be encountered in the provision of acceptable fishways in the large structures with which engineers are usually concerned. A third reason is that most of these large structures have been located on rivers which have never been frequented by valuable fish species. It is possible that the reason for this condition is the existence near the mouths of these rivers of impassable natural barriers such as Shawinigan falls on the St. Maurice, the tremendous series of falls and rapids in the short reach of the Saguenay between Lake St. John and the mouth of the Shipshaw, Montmorency falls on the Montmorency river and the Seven falls on the Ste. Anne de Beaupré.

The provision of fishways in the large power and storage dams, as Professor Nobbs has pointed out, would have been an expensive and very difficult matter and the problematical benefits derived would hardly have justified the expense. It seems to the writer that one of the most difficult problems involved would be the arrangement of a workable exit at the upper end of the fishway. The pond levels in most of the large storage reservoirs vary considerably from year to year and even in the case of many of our power dams there is a large variation in the forebay levels brought about by varying operating conditions.

Professor Nobbs has confined his discussion of the subject to the consideration of timber crib dams of comparatively low head. Most dams of this type in the province of Quebec have been built for logging operations. When used for this purpose the dams are opened and the ponds emptied shortly after the spring flood to assist in flushing the winter's accumulation of logs downstream. The dams then remain open throughout the summer and fall. During the years when logging is not carried on along the streams served by these dams, their operation is sometimes taken over by the power companies to augment the storage along the river. In this case the cycle of operations is different, introducing an entirely different fishway problem.

The amount of water required to operate the type of fishway recommended by Professor Nobbs is given in the paper as 5 cu. ft. per sec. This is the theoretical discharge through a notch with free fall 12 in. deep by about 18 in. wide. Over a period of three months, which is given as the normal period during which fishways should be operated, this discharge will amount to approximately 40 million cu. ft., not a great amount. However, one company that I know of operates 25 such dams ranging in head from 5 to 16 ft. If each of these dams were equipped with a fishway operated for a period of three months the total discharge would be considerable. As the period of operation of the fishways would probably not coincide with the period during which withdrawal from storage for production of power would be required this water would be wasted. On the St. Maurice alone this would amount to a loss in power output of 7,000,000 kwh. or a reduction in capacity of approximately 4,100 hp. When one applies the same reasoning to all of the river systems in the province which are important for power production it would seem that some more economical means of fish propagation might be devised.

Professor Nobbs points out that "the diminution of inland fisheries of Quebec is due to three main causes (1) poaching, (2) pollution, (3) obstructions." It would be interesting to know which of these three is the most responsible for this condition. So far as the fishing with which most of us are

³Vice-President and chief engineer, Shawinigan Engineering Company, Montreal, Que.

²Vice-President, Quebec Streams Commission, Montreal, Que.

familiar, namely trout fishing, is concerned I am inclined to believe that poaching is the villain in the piece. However in the case of the commercially valuable species of fish, the protection of which, after all, is the only consideration on which any great expenditure for fishways can be justified, it is possible that the other two causes may enter to a greater extent.

M. V. SAUER, M.E.I.C.,⁴ and L. H. BURPEE, M.E.I.C.⁵

Mr. Nobbs has done an excellent job in preparing this paper on fishway problems, and it is our hope that it may be the means of interesting many other people in this important subject. The following remarks deal with some features of the fishway constructed at the Ile Juillet dam in the St. Lawrence river, which Mr. Nobbs has referred to and which is indicated on his Fig. 2(j). The Order-in-Council approving the design of the dam stipulated that a fishway must be provided, and Mr. Nobbs was appointed by the provincial government to supervise the layout of the fishway. It was built during 1940-41, and during the past year a close record was kept of the operating results. Through the co-operation of the Quebec Association for the Protection of Fish and Game, the services of Dr. V. D. Vladykov were made available for carrying out these observations.

There is no doubt that on a large river it is difficult to maintain suitable approach conditions for the fish below the dam. In this case there are 14 large sluice gates and the range of flows is such that there may be from two to ten gates open throughout a normal season. The head at the dam may vary from about 6 to 15 ft. with the consequent variations in velocity. The fishway is located near the south abutment of the dam, and in such a position that fish working up against the current along the south shore are most likely to find the entrance. Results proved that the arrangement of open gates needed to be kept in mind for the maintenance of proper currents.

Some of the results of Dr. Vladykov's observations are as follows:

1. The season of migration of fish in the St. Lawrence river extends for about four months from April to July (inclusive).

2. The important species of fish found in this part of the St. Lawrence river are sturgeon, maskinongé, doré, small-mouth and rock bass, various kinds of suckers, and eels.

3. Only a very few doré passed through the fishway during its first season of operation, but this is probably due to the fact that it was not put into operation until the middle of May, after the spawning season for doré.

4. Maskinongé and sturgeon were seen in considerable numbers near the entrance to the fishway, but did not enter. This may be due to inadequate size of opening (18 by 18 in.), or to insufficient flow of water to attract them.

5. The other fish passed up the fishway in large numbers, about 33,000 having been counted last season, but even this number appears to be a very small proportion of the fish observed immediately below the dam looking for a way to get up.

6. Light conditions played an important part in the way the fish acted. Fish entered the well readily when the sun shone down into the well, or at night when a light was arranged to shine towards the entrance door. Except for the eels, they did not enter the well at night without the light, and did not enter as readily in day-time until the sun was well up. On the other hand, fish came out of the well into the flume quickly when the flume was wholly or substantially shaded, but would not come out into the flume when it was all in sunshine.

7. With best light conditions and with suitable currents to attract the fish to the entrance, as many as 300 fish entered the well in 15 minutes.

In a general way it can be said, then, that this type of

fishway worked well from a mechanical and hydraulic point of view. It was relatively inexpensive to build, but requires a man to operate it for a four month's period each year. It is operated with a very small amount of water, but that feature is of little importance in the case of the St. Lawrence. Various types of fish entered the well in large numbers and passed easily through the flume. By the knowledge gained in the first season of operation, it is expected that very much larger numbers of fish can be passed up the fishway in future years. The relative economic advantage of the lock type over the stepped type increases with the height of the dam.

In concluding these remarks about the Ile Juillet fishway, we should like to say that the success of this particular fishway is due to painstaking efforts of Mr. Nobbs in the care with which he designed it, and in the great amount of time which he gave to the experimental operation of it during the past season.

THE AUTHOR

Mr. Nobbs, in reply, remarked that in making a study of fishway problems he had been animated quite as much by the interests of the pot fishermen and the inland commercial fishermen as by the sporting interest. He was a little tired of hearing that no fishways should be built for the commoner fish till we knew more about how to make them. The only way to learn was by trial and failure and Mr. Hocken's old fishway at St-Ours had been a success for such fish till the head of the dam was raised subsequently.

Mr. McCrory had asked which did most damage to fisheries—poaching, obstructions or pollution? On the whole, pollution was our worst enemy of fish life because it affected all kinds of fish where it occurred.

As to lumber dams in operation for ten years, fishways were hardly to be considered, but such dams should be opened up when done with. The cribwork and apron usually remained as an obstruction. The fishway policy should be directed chiefly to the rivers where lumbering had now ceased or would soon cease, and where permanent dams for local industries had been established. Many rivers in this category could be restored for salmon and many others could be saved, or restored, as general fisheries for the good of the local population, by the construction of fishways. On those rivers, where lumbering is a thing of the past, very few of the dams were for water storage with variable levels, so the problem was usually simple—the lip of the dam fixing the upper water levels.

R. N. COKE, M.E.I.C.⁶

In thanking the speaker, Mr. Coke observed that many of the fishways, which under the existing law had in the past been constructed in this province, were mere tokens to comply with the law. No one had expected fish to use them and the fish had not used them. He had been greatly interested in seeing fish go up certain of the fishways referred to by Mr. Nobbs in his paper.

BIBLIOGRAPHY

The bibliography of fishways runs to some 167 useful works according to Mr. Paul Nemenyi and there are a considerable number of others which one may regard as more or less obsolete. The author has found the following very short list of use:

1. *Salmon Passes* (No. I and No. II) by W. L. Calderwood, Fishery Board for Scotland, 1926.
2. *Fish Passes* (The Buckland Lectures for 1937) by T. E. Pryce-Tennant, Edward Arnold & Co., London.
3. *An Investigation of Fishways*, by A. M. McLeod and Paul Nemenyi, University of Iowa (Bulletin 24) 1939-40.
4. *An Annotated Bibliography of Fishways*, by Paul Nemenyi, University of Iowa (Bulletin 23), 1939-40.
5. *Fish Pass Making* (a review of the report of the Civil Engineers' Committee) by W. L. Calderwood, *The Salmon and Trout Magazine* No. 106, (Sept., 1942), Fishmongers Hall, London.

HANDLING LARGE CAPACITY TRANSFORMERS

HERBERT L. WAGNER, M.E.I.C.

Assistant Engineer, Hydro-Electric Power Commission of Ontario, Toronto, Ont.

During the past twenty-five years, electric power transformers have greatly increased in capacity and weight. The ultimate size of these transformers is, to a large extent, controlled by the shipping facilities of the railway companies. These companies have, concurrently with the growth in individual transformer capacity, improved their road beds, increased the carrying capacity of their rolling stock, and developed new centre-depressed cars as shown in Fig. 2, with the result that in Canada to-day, they are able to carry transformers having a shipping weight of 135 tons. Such transformers when in service with their full equipment (including oil in place of the nitrogen gas used in shipment) weigh in the neighbourhood of 200 tons. Transformers that have an ultimate weight much in excess of this would have to be shipped in parts and assembled at their destination.

Owing to the loss of capacity in the event of one of these large transformer banks being out of service, it is necessary, in case of failure, to resort to a speedier method of handling than the slow and cumbersome method often employed in moving smaller transformers. This applies particularly where transformers may have to be shipped back to the maker for repairs.

In moving smaller transformers, a method frequently used is to lay timber tracks and move the transformer on rollers. This method is neither practical nor sufficiently expeditious for larger transformers, which are therefore moved on their own wheels, the railway siding, where possible, being extended to the transformer foundation, permitting the transformer to be wheeled directly from the railway car to its permanent position. Where it is impossible to extend the siding to the transformer foundation, an auxiliary track is installed, extending between the railway siding and the foundation, the transformer being carried over this track on a special transfer truck.

The accompanying series of photographs shows a heavy transformer being received by the Hydro-Electric Power Commission of Ontario at one of its transformer stations. At this station an interesting problem presented itself. The nature of the site is such that it not only prevents the railway siding from being extended to the transformer

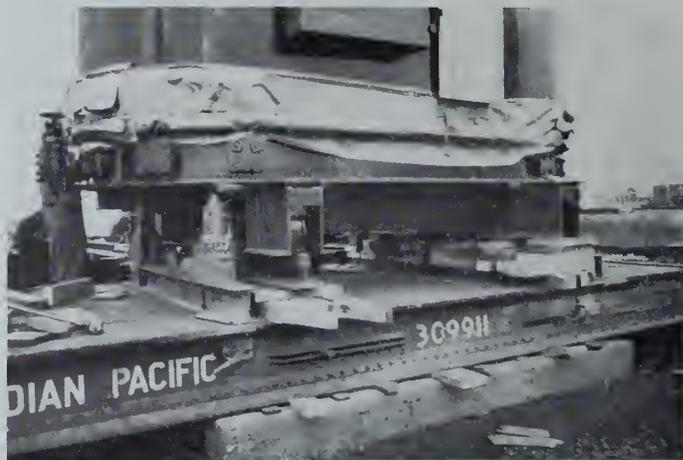

Fig. 2—Rail placed under wheels at one side of the transformer.

foundation, but the auxiliary track between the railway siding and the foundation has a right-angle track intersection. To cope with this condition a transfer truck was designed having two sets of wheels, one set for each direction of track.

To begin with, the body of the centre-depressed car is raised to its unloaded height and supported on timbers. This relieves the springs from the weight of the transformer, and prevents the body of the car from tilting as the transformer is removed from the car. The method of jacking up the transformer is such as to permit rails to be placed under the transformer wheels.

Figure 2 shows a rail placed under the wheels on one side of the transformer. The jacks are supported on steel beams which transmit the weight of the transformer to the car girders.

Figure 3 shows the transformer after it has been moved on its own wheels from the car to the transfer truck.

Figure 4 shows the loaded transfer truck at the auxiliary track intersection and in the process of being changed from one track to the other. The position of one set of truck wheels (consisting of four wheels) is fixed relative to the frame of the truck. The other set of truck wheels can be lowered, after raising the truck, to run on the right angle track. The truck when travelling on the movable set of wheels is therefore two inches higher than when travelling on the fixed set of wheels, this difference in height permitting the flange of the fixed wheels to clear the railway track when the transfer truck is moved from the intersection.

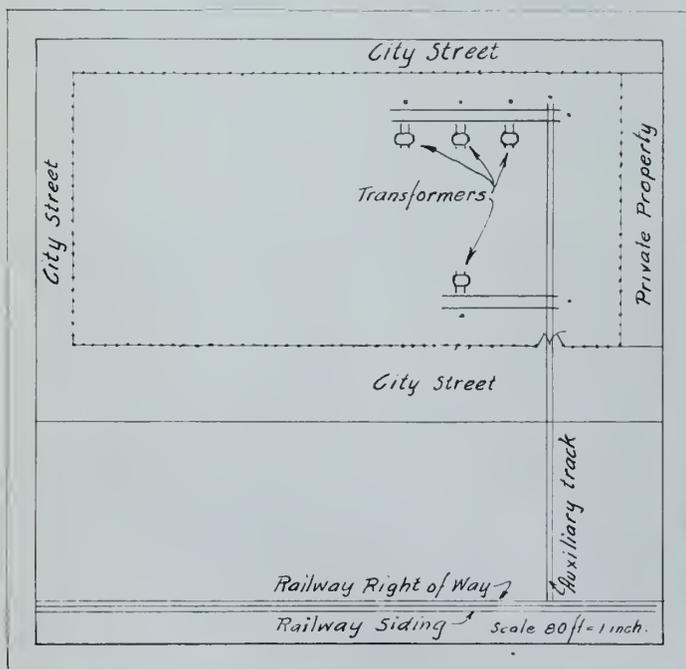

Fig. 1—Diagram showing the site.

Fig. 3—Transformer on transfer truck.

Fig. 4—Changing wheels on transformer truck.

The movable wheels are each individually mounted in separate frames. When these wheels are carrying load, their frames are connected to the truck frame by means of two pins. To raise a wheel (resulting in the lowering of the truck), one pin is withdrawn, and the frame containing the wheel is rotated about the remaining pin. The frame of each movable wheel is equipped with a screw jack to facilitate the raising and lowering of the wheel and to hold the wheels in the raised position. To change from the fixed to the movable wheels, the truck is jacked up, the movable wheels are lowered, and their frames pinned. First one side of the truck is jacked up and the wheels changed, then the opposite side. In Fig. 4 the rear side of the truck has still to be raised, and the wheels lowered. This can be detected

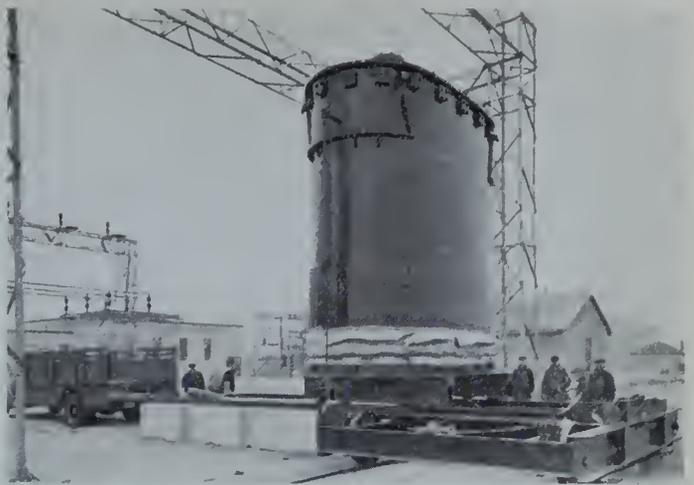

Fig. 5—Pulling transformer onto its foundation.

by examining the rear right hand wheel on the truck as shown in the figure. (Note the angle of the wheel frame with respect to the horizontal).

Figure 5 shows the transformer being moved from the truck to its foundation.

In its permanent position, the transformer is supported on steel stools which raise it so that the wheels clear the rails by about one-eighth of an inch. This precaution is taken because it has been the experience of the Commission that, when transformers remain stationary for long periods of time on their wheels, the bearings seize, making it difficult to put the transformers in motion when the occasion arises to move them.

Abstracts of Current Literature

AN ARMY MARCHES ON ITS ENGINEERING

If Napoléon were taken to a modern battlefield he would revise his famous dictum that an army marches on its stomach. To-day it marches on the skill and ingenuity of its engineers.

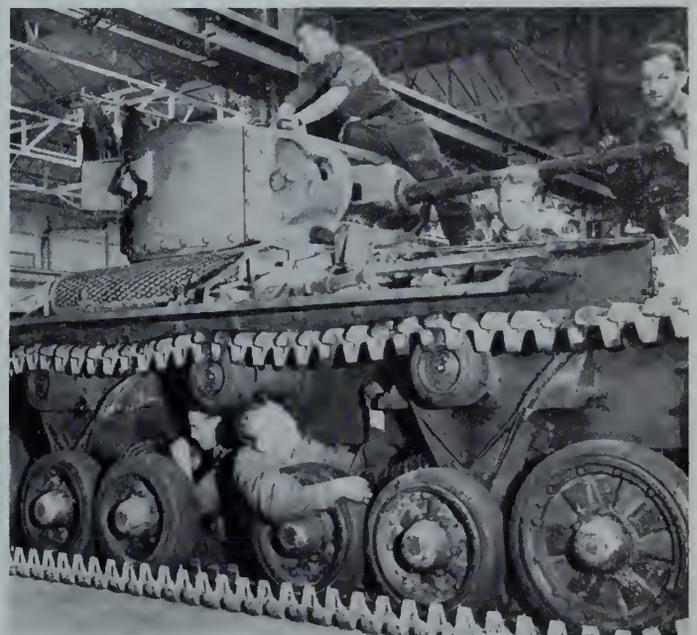

In peace-time, Britain was world-famous for the durability and meticulous accuracy of her engineering products. She was therefore fortunate when war broke out in having a pool of highly-trained technical men ready to hand. They became instructors of eager and intelligent young men who now form one of the vital elements in a mobile and resourceful army.

It is a tradition in the Royal Engineers that nothing can stop them. They will build a bridge in a matter of minutes; not a flimsy structure capable only of carrying troops but sturdy enough to take the heaviest equipment used in modern warfare—tanks, big guns, tractors. They will cut a road through ground that is broken by trenches or shell holes in the time it takes to smoke a cigarette. They will make raft ferries under fire capable of taking line transport, such as anti-tank guns and tanks, across a river. They will lay a minefield under the enemy's nose or—most perilous job of all—crawl on their stomachs through the enemy's minefields and discover and dig up his mines.

Recently a new engineering corps has been added to the British Army, or rather it is new only in name, for its personnel were drawn from existing units; it is the corps of Royal Electrical and Mechanical Engineers. These men are the front line armourers of the army, a hospital service for inanimate objects. The unofficial motto of the R.E.M.E. is, "Anything that the Army can break we can mend."

Abstracts of articles appearing in the current technical periodicals

The operations of this repair corps cover all the weapons and equipment that an army carries. They will mend a derelict tank or put a new leg on a messroom chair. They

A rush overhaul job on a big tank, in one of the largest R.E.M.E. workshops.

will instal guns on merchant ships or solder a leaking saucepan. They will overhaul a typewriter or dig a tank out of a shell hole.

The Engineers of the British Army have proved their ingenuity in battlefields in three continents. Their skill in improvisation helped materially to rob Hitler of a decisive victory at Dunkerque. Their genius for overcoming obstacles enabled the British Army in 1941 to travel 1,840 kilometres through East African mountain, desert and jungle in the record time of 50 days, with the resultant loss to Mussolini of a vast empire and an army of half a million men. It is the Engineers of the British Army who have encased the shores of Britain in fortifications which Hitler has not dared to assault. In the desert of North Africa, engineers have dug wells and supplied a large British Army with filtered and sterilized water. In Persia, British Army Engineers have built and maintained new roads and railways, which are now carrying an ever increasing quantity of war material to the Russian Army.

It must not be thought that the Engineers can wield nothing more lethal than a spanner. They are all trained fighters. They can use a rifle as effectively as the ordinary infantryman. They have had courses in unarmed combat. They will, when necessary, leave the lathe to take part in a bayonet charge, or cross a river by a bridge of their own making and wipe out the hostile machine-gun nests that tried in vain to stop the construction.

So important are the technicians in a modern army that it is estimated that one man in every 12 in Britain's land forces is a sapper. Wars are won nowadays by the brains behind machines. In that particular form of brain capacity, Britain has excelled for centuries.

THE ROLLS-ROYCE "MERLIN 61" SUPER-CHARGED FIGHTER ENGINE

From *The Engineer* (LONDON), DECEMBER 18, 1942

Last week we accepted the invitation of Rolls-Royce, Ltd., to inspect an example of the firm's new "Merlin 61" supercharged aero-engine, which is being fitted by the Royal Air Force to the improved "Spitfire" now operating with Fighter Command. By using a double-stage supercharger, with a water-cooled passage between the first and second stages of the supercharger and a cooler between the supercharger outlet and the induction pipe to the rear cylinder, it is found possible with the new engine to develop double the power output as compared with that of the "Merlin III" the first engine to be fitted to the "Spitfire" fighters. When operating at a height of 40,000 ft., the charge of air and fuel is now raised by the supercharger to six times the pressure of the surrounding atmosphere. Accompanying this article we reproduce a diagrammatic drawing giving a section through the supercharger and illustrating the arrangement of the cooling system.

Engine Particulars

Number of cylinders.....	Twelve in two banks of six
Cylinder bore.....	5.40 in.
Piston stroke.....	6.00 in.
Compression ratio.....	6.0 to 1
Total capacity.....	1647 cubic inches, or 27 litres
Cooling medium.....	Water under pressure, with 30 per cent "Glycol"
Net weight of dry engine (estimated).....	1600 lb. plus 2¾ per cent

Reduction Gear

Type of gear.....	Direct spur
Ratio.....	0.42 to 1
Direction of rotation....	Airscrew, right-hand; engine, left-hand

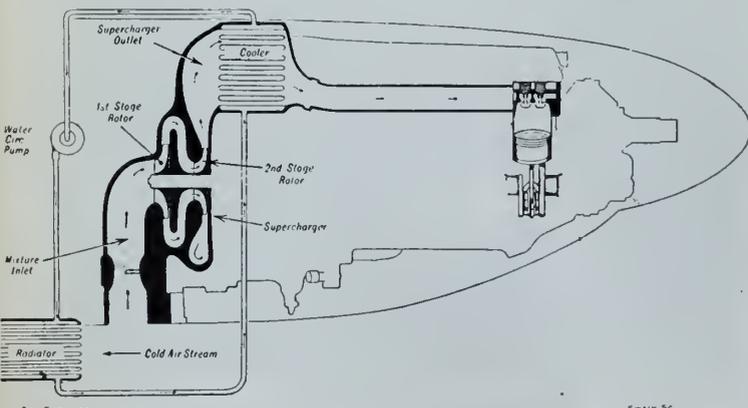

PROGRESS IN FIGHTER ENGINE DESIGN

It may be recalled that at the beginning of the war and during the Battle of Britain every R.A.F. first-line fighter aircraft was fitted with the Rolls-Royce "Merlin III" engine, and the complete defeat of the Luftwaffe in August and September, 1940, definitely established the technical superiority of British machines. The superiority was not obtained by chance, but every move of the enemy had been anticipated and a definite counter-move worked out. Early in the war, German aircraft resorted to low-flying tactics, and in order to counter this, Rolls-Royce immediately increased the sea-level power of the "Merlin" engine by 40 per cent by raising the supercharger pressure. This move so improved the performance of the "Spitfire" at low altitude that German aircraft were forced to fly higher, and throughout the Battle of Britain there was a noticeable tendency for the German "ME. 109's" to go higher and higher into the stratosphere, in order to try to escape from our fighters. It seemed at this stage that the German aircraft had an advantage owing to their smaller dimensions and lighter weight, but fortunately Rolls-Royce had ready for production a new supercharger, giving more power at high altitudes, and were able to introduce the "Merlin 45" and "Merlin XX" engines into the "Spitfire" and "Hurricane" classes of fighter, respectively, thereby enabling our fighters to maintain their superiority.

These increases in engine power output were achieved without any radical change to the aircraft, and the flow of fighters from our factories was not affected in the slightest by the modifications made. A continuous supply of improved fighters to the R.A.F. was maintained, as the basic engine remained unaltered, excepting that new supercharger had to be manufactured in large quantities. The war demands that the performance of all types of military aircraft, and particularly that of fighter aircraft, shall continually improve. Ranking above the need for more and more aircraft of all types is the over-riding necessity that our aircraft shall have technical superiority over those of the enemy. It soon became apparent that in the "Spitfire" we had a supreme aircraft from the aerodynamic and military points of view, and all that was required to keep this machine on the top of the list was a steady improvement in the performance of the "Merlin" engine with which it was fitted. An advantage to the R.A.F. was that any improvement thus obtained could be immediately applied to existing aircraft and could be put into service with the minimum of time. With these facts in mind, Rolls-Royce, Ltd., has continually striven to increase the power output of the "Merlin" engine by improvement to the supercharger and carburetor, a logical development being the "Merlin 61," with two-stage supercharger and cooler.

The advantages of the system may be effectively reviewed by comparing the aero-engines which power the various first-line aircraft to the nations engaged in the war. German engines, without exception, are fitted with a single-stage supercharger, designed to maintain ground level pressure in the engine induction system up to a height of 20,000 ft.

Rolls-Royce engines, equipped with a single-stage super-

Diagrammatic arrangement of supercharger.

chargers designed to maintain the same pressure up to 30,000 ft., and with supercharger rotors running at speeds up to 28,000 ft., have been made, and the increase in altitude thereby gained has been the main means of our achieving technical superiority so far. Certain American engines are equipped with turbo-superchargers, which also maintain sea-level pressure up to 30,000 ft. Although this system is excellent when applied to bomber aircraft, there are, however, technical reasons which make it less suitable for fighter aircraft. Finally, the two-stage supercharger maintains the desired pressure up to 40,000 ft., and stands out above all others as the most successful means of obtaining high power and high altitudes. At 40,000 ft. the charge is compressed to a pressure of six times the surrounding atmospheric pressure, the power of the original "Merlin III" engine being doubled, while at a height of 20,000 ft. the output of the new engine is 50 per cent larger than that of the original "Merlin III."

SUPERCHARGER DESIGN AND ARRANGEMENT

It will be seen from the accompanying drawing that the two-speed, two-stage supercharger has two rotors mounted on a common shaft, the arrangement being two superchargers in series. The mixture of air and petrol drawn through the carburettor is compressed by the first-stage supercharger, and it then passes through a cooled passage to the inlet of the second-stage supercharger, in which its pressure is again raised. After passing through a cooler, which is supplied from an air-cooled radiator, the mixture is delivered to the main induction pipe, which feeds the twelve cylinders, grouped in vee formation in two banks of six. The cooling of the mixture as it is delivered from the outlet of the second stage is effected in the square, box-like structure containing the cooler elements, which is mounted between the rear of the cylinder blocks and the supercharger casing. As previously mentioned, in addition to the main cooler there is a water-jacketed passage between the two-supercharger stages, which contributes to the cooling of the charge. The supercharger cooling system is entirely separate from that of the engine, and the radiator for cooling the circulating fluid and dissipating the heat abstracted from the compressed charge can be placed in any convenient position in the aircraft.

In the "Spitfire" it is mounted under the wing of the machine in a duct which also contains one of the main engine cooling radiators. The other engine cooling radiator is placed in a similar position on the opposite wing, and alongside it is arranged the engine oil cooler. An advantage of the liquid cooling system is that it can be made considerably smaller than if the heat exchange was made direct with the atmosphere. By this means a short induction system is retained, the space taken up being small, while the view of the pilot is unimpaired.

The results obtained from the improved "Spitfire" powered with the new engine we have described have, we learn, more than fulfilled the hopes and expectations of all who have helped in the work. Every aspect of this wonderful fighter aircraft has been tremendously improved by the introduction of the "Merlin 61." This outstanding development of an already fine engine should do much to counteract the tendency there is in this country to belittle the qualities of our military equipment and to exaggerate the good points of our adversaries' equipment. The completion and entry into service of the "Merlin 61" is a proof, if such were needed, that we are in no way lagging behind either in the matter of technical development or in the speed with which new ideas are put into service. The advent of the new "Focke-Wulf 190" on the battle front, with its 1600 H.P. air-cooled supercharged engine caused some uninformed persons to believe that the Germans had stolen a march on us in the high-performance fighter class of aircraft, but, as enemy fighter losses continually show, the improved "Spitfire" with its new "Merlin 61" engine was there to surpass it.

And so, in the war emergency, it was finally decided to turn to synthetic rubber as the nation's best bet—at least for the short-time pull—and most of us agreed that it was a practical solution.

And the daily tumult died away, when those who had sincerely believed that certain vegetable, or plant sources of emergency rubber were the best bet, found that they had not won, and got behind the synthetic plan that was adopted and helped push. Whereupon, the old argument slid off the front pages of the newspapers.

No one should run away with the idea, however, that we have heard the last about rubber from plant sources. Quietly it is receiving most careful attention. As soon as the decision to go for synthetic rubber for the immediate need was made, it became possible for a large corps of scientists and technologists to begin a study of plant sources of rubber, unhampered by urgencies and other expediencies. Thus we shall hear from time to time of the quiet, calm research that is proceeding.

Goodrich, for example, is specializing in the careful study of three rubber-producing plants that seem at present to look best to its scientists—the well-known goldenrod, the Russian dandelion, called kok-sagyz (pronounced, according to the Russian-American Chamber of Commerce, "kuk sag-iz"), and a twining vine heretofore little publicized, called *Cryptostegia*. This is a perennial which grows wild in Mexico (but has no relation to guayule, which also grows wild in Mexico) and contains rubber latex in all its parts. The tips can be harvested 30 times a year. We may hear more of these hopes.

Then, if ways can be found to handle this weed, it is believed that the same ways will enable us to handle others that grow wild in every fence corner—dandelions, dogbanes, wild lettuce, and others—all of which yield some rubber.

On common fence-corner plants, the New York State College of Agriculture, at Cornell University, has been doing outstanding research, between 1,500 and 2,000 species having already been tested there. A method of testing a given plant or weed in five minutes was developed. A thin section of leaf, stem, or root is cut by means of a razor, placed on a microscope slide, stained with a dye dissolved in solvents, and examined. The stain renders rubber and accompanying resins visible. If the test gives promise, the plant is later analyzed quantitatively in the laboratory. (A very crude, though simple, field test is to rub out a leaf between the fingers. If the milky latex coagulates into a cohesive ball, there probably is some rubber in the plant. How much rubber is, of course, the next question.) Cornell also grew the Russian kok-sagyz last summer and gained a better production than the average Russian yield, but this plant remains on the doubtful list.

So ineluctable are the basics of economic law that, when the war is over, our permanent source of rubber will be the one which can produce it most cheaply—unless, of course, some artificial obstruction is permitted to interfere with the pure logic of economic law. If synthetic rubber from petroleum, or limestone, or other source; or, if synthetic rubber from one weed, or plant, or another; or if even the old *Hevea* rubber tree, proves to be one cent or even one mill per pound less expensive, then that will be our future rubber source.

It has been said, for example, and rightly, that in normal times the rubber industry would have had to buy its plantation rubber from the opposite side of this planet, even if the suburbs of Akron, Ohio, had been a forest of rubber trees—the decisive factor would have been labour costs.

In the meantime, while we let the facts decide on our future source of rubber, the rubber chemists who are now holding the fort with their work on synthetic deserve the nation's thanks. There is pretty solid ground for the assertion that they are right now saving our future skins.—A.G.I.

From Month to Month

THE STATUS OF PROFESSIONAL PERSONNEL IN THE SERVICES

Discrimination shown in the treatment of persons of equal attainment and status has long been a criticism aimed at the armed forces. Examples exist in great numbers, particularly where the various engineering services are concerned. This discrimination includes rank, special pay, authority and competence. For example, in one service a medical doctor right out of college with no more experience than his internship or a dentist direct from college, receives \$7.50 per day whereas, under similar circumstances, an engineer with equivalent training and experience receives \$4.25 per day. The doctor gets a rank higher than the engineer plus \$1.50 per day as professional pay, thus building up the \$3.25 advantage he holds over his professional brother.

Shortly after the beginning of the war, the Institute approached the Department of National Defence to see if something could be done about this, but after an elapse of one year and two months a reply was received to the effect that "this matter has been considered by the Military Members of Defence Council and the conclusion arrived at was that no action can be taken to increase the pay of Engineer Officers." Other considerations besides pay were included in the Institute's brief but pay was the only one upon which any answer was received.

Complaints of the same discriminations and in some instances of an elaboration of them, continue to come to the Institute, both from members and non-members. Consequently, Council has set up a committee, as announced in the *March Journal*, to investigate the various situations, and to recommend any action that should be taken in an endeavour to eliminate these anomalies.

Persons should not dismiss this complaint with the simple thought that now is not the time to worry an already over-worked and overworked administration. It is not just a matter of fair treatment for the engineers. It goes much farther because these discriminations are having a serious effect on enlistment in the engineering services. It was reported to the writer that recently in one month out of approximately twelve hundred candidates for commissions, many of them engineers, only three offered for ordnance mechanical engineers, while, at the same time, there was a need for two hundred and fifty in that service.

In none of the fields in which the engineers are complaining is the solution easy to find. Inquiries reveal many complicated and involved situations that have been built up over long years of use and custom. It will not be easy to adjust or correct conditions, but the committee hopes to assemble the facts and present them clearly and emphatically in the belief that a clear understanding will lead eventually—if not now—to a more equitable treatment of the engineer.

The terms of reference for the new committee and certain other information from the minutes of the first meeting are reproduced herewith. It is proposed to keep the membership of the Institute informed of the committee's work and progress as events transpire.

TERMS OF REFERENCE

(a) Consideration of rank given engineers on enlistment as compared to that given other professions.

(b) Consideration of professional allowance as given to other professions.

(c) Consideration of the status of officers on the Stores side of the Ordnance Corps, as compared to officers on the Engineering side. This would involve the question of promotions and authorities.

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

(d) Consideration of the frequent appointment of non-technical persons to technical positions.

(e) Study and recommendations as to the advisability of the Canadian Corps following the British Army procedure in establishing the Royal Electrical and Mechanical Engineers (R.E.M.E.) to replace the engineering branch of the Ordnance Corps.

After proper information has been gathered and conclusions reached, the committee is to recommend to Council the procedure which it believes should be taken.

PRESIDENT'S VISIT TO THE MARITIMES

President Cameron is planning to visit the branches of the Institute in the maritime provinces, in April. A regional meeting of the Council will be held in Saint John, N.B., on Saturday, April 17th, at the Admiral Beatty Hotel, at 10 a.m.

The custom of inviting past councillors and other past officers of the Institute to attend such meetings has been continued, as their knowledge of local affairs is of great assistance to Council.

The president will be accompanied on his tour by the general secretary and, it is expected, by officers of other branches. Members from all parts of the country who may find themselves on the route of the presidential party will be welcome at branch meetings. The itinerary follows:

Montreal	Lv.	7.30 p.m.	Tuesday	Apr. 13	C.N.R.
Moncton	Arr.	3.15 p.m.	Wednesday	Apr. 14	C.N.R.
			Meeting with Moncton Branch, Wednesday Evening.		
Moncton	Lv.	4.45 a.m.	Thursday	Apr. 15	C.N.R.
Saint John	Arr.	8.40 a.m.	Thursday	Apr. 15	C.N.R.
			Thursday—Visit to University of New Brunswick, at Fredericton.		
			Friday evening—April 16th—Meeting with Branch.		
			Saturday—April 17th—10.00 a.m. Meeting of Council, Admiral Beatty Hotel.		
Saint John	Lv.	11.10 a.m.	Sunday	Apr. 18	C.N.R.
Halifax	Arr.	9.40 p.m.	Sunday	Apr. 18	C.N.R.
			Monday evening—April 19th—Meeting with Branch.		
			Monday or Tuesday—Visit to Nova Scotia Technical College.		
Halifax	Lv.	7.50 p.m.	Tuesday	Apr. 20	C.N.R.
Sydney	Arr.	9.30 a.m.	Wednesday	Apr. 21	C.N.R.
			Wednesday evening—Meeting with the Branch.		
Sydney	Lv.	7.15 a.m.	Thursday	Apr. 22	C.N.R.
Truro	Arr.	4.40 p.m.	Thursday	Apr. 22	C.N.R.
Truro	Lv.	5.35 p.m.	Thursday	Apr. 22	C.N.R.
Montreal	Arr.	7.30 p.m.	Friday	Apr. 23	C.N.R.

TWENTY-FIFTH ANNIVERSARY

The May number of *The Engineering Journal* will mark the twenty-fifth anniversary of the first appearance of this publication. Although the Institute was founded in 1887, the publications up to 1918 consisted of proceedings and transactions. In view of war conditions, it is not proposed to make any great celebration of this event, but it is felt that it should not pass unnoticed.

The anniversary number will include a series of short articles dealing with the history of various industries in which engineers are concerned, over this period of twenty-five years. It will also contain communications from prominent members of the Institute and from sister societies. An interesting feature will be extracts from the original number of the *Journal*, and comparisons of Institute activities at that time with the present.

Examination of the original number indicates that the first editor, Fraser S. Keith, had a splendid conception of the possibilities of such a publication. It is a compliment to him, and must afford him considerable satisfaction to see that so much of the spirit and form of the original publication has been retained until the present day.

The history of the *Journal* indicates the usefulness of a monthly organ for the Institute. For twenty-five years it has presented to a professional audience the best papers on current engineering and scientific topics, and has distributed between branches the news of activities of all branches from coast to coast. Twenty-five years of this type of service is something of which to be proud. The May number will emphasize this fact to all readers.

SUSPENSION BRIDGES UNDER INVESTIGATION

After the failure of the Tacoma bridge the need for a comprehensive investigation of the design of long-span suspension bridges, particularly with respect to the effects of aerodynamic forces, was apparent. A group of engineers in the United States, concerned with this problem, approached the Public Roads Administration with the suggestion that a programme of investigation be initiated by the Administration.

This proposal was accepted, and representatives of interested organizations were invited to serve on a committee known as the Advisory Committee on the Investigation of Long-Span Suspension Bridges. The work of this group is to prepare a comprehensive programme of investigation work that may be undertaken.

The Engineering Institute has been invited to participate, and at the March meeting of Council Mr. P. L. Pratley, who was recommended by the Administration, was appointed as the Institute's representative on the Advisory Committee.

Other organizations represented include—

Agricultural and Mechanical College of Texas.
American Association of State Highway Officials.
American Institute of Steel Construction.
American Society of Civil Engineers.
California Institute of Technology.
Highway Research Board.
John A. Roebling's Sons Company.
National Bureau of Standards.
Mackinac Straits Bridge Authority.
Port of New York Authority.
Public Roads Administration.
Princeton University.
San Francisco-Oakland Bay Bridge Division.
Triborough Bridge Authority.
Washington Toll Bridge Authority.
Yale University.
Golden Gate Bridge and Highway District.

Those members of the Institute whose activities are along structural lines, will be particularly interested in this work. The *Journal* hopes to present from time to time to all members, news of the findings of this committee.

WARTIME BUREAU OF TECHNICAL PERSONNEL

From a recent report prepared by the Bureau some interesting figures have been made available. The Bureau has completed two years of service, and the report shows the importance of its work. It is difficult to give in figures anything like a real picture of what has been accomplished, but to anyone who has had experience in professional personnel work the following statistics will tell a story. For instance "known placements" will be well below actual placements, because most people have not reported back to the Bureau. If this figure was added the number of persons who on advice of the Bureau decided not to change position, the total would be very high.

The portion of the tabulation reproduced here covers only the ten months between April, 1942, and January, 1943. The year preceding this was given over largely to organizing, circulating questionnaires, tabulating, classifying, preparation of legislation, and so on.

Inquiries received for personnel.....	907
Known Placements—Civilian.....	781
Active Service.....	113
—	894
Permits issued.....	3,327
Interviews.....	8,821
Records of technical personnel referred to employers.	6,919
Questionnaires (blank) sent to technical personnel...	11,498
Questionnaires (completed) received.....	12,048
Total of questionnaires on file from technical personnel.....	27,000

BROADCASTS ON POST-WAR PROBLEMS

Members will be interested to know that the chairman of the Institute Committee on Post-War Problems, Warren C. Miller, city engineer of St. Thomas, Ontario, has been selected as one of a group of advisers to the Canadian Broadcasting Corporation, in relationship to a series of broadcasts being given under the title, "Of Things to Come—Inquiry on the Post-War World."

These broadcasts can be heard on Sunday afternoons from 5.03 to 5.30 p.m., and are in the form of round-table discussions.

If any members have suggestions to make, Mr. Miller will be glad to have them sent direct to him. These might take the form of suggested topics for discussion or names of persons who might be invited to participate.

MEETING OF E.C.P.D. COMMITTEE

One of the most active branches of the Engineers' Council for Professional Development is its Committee on Professional Training, whose function is "to develop plans for the further personal and professional development of young engineering graduates and also those without formal scholastic training."

This committee follows the practice of holding meetings every second month, the last one being convened on the evening of February 25 at AIEE Headquarters in the Engineering Societies Building, New York City. Members of both senior and junior committees attended, the seniors under the chairmanship of Everett S. Lee, AIEE, and the juniors under F. J. Van Antwerpen, AICChE. One of the EIC representatives on the junior committee, Mr. J. W. Brooks, Jr., E.I.C., of Niagara Falls, was present.

The first item of business concerned the Reading List for Junior Engineers, compiled by ECPD for the guidance of young graduates. The list includes books on natural science, economics and sociology, history, fine arts, and religion and philosophy. As later events proved, the religion and philosophy section contained a few texts which some of the Roman Catholic universities found objectionable, and these institutions proposed substitute books.

The matter had been referred to the junior committee, and Mr. Van Antwerpen presented several recommendations from his committee. After considerable discussion, it was decided that the junior committee would handle the

problem under the heading "The Evaluation of Reading Material." In other words, one of the tasks of the junior committee is to keep in close touch with the reading list at all times, revising it from time to time as required to maintain it at the optimum of usefulness.

The next item involved the proposed Manual for Junior Engineers. Perhaps listing the tentative chapter headings is the best way of illustrating the proposed scope of the booklet:

1. Heritage of the Engineer.
2. Engineering Student.
3. Engineering Graduate.
4. Engineer in his Practice.
5. Engineer in Continued Education.
6. Engineer in Civic Affairs.
7. Engineer in his Professional Society Life.
8. Engineer and his License.
9. Detours.
10. Engineer and the Second Mile.

After a general discussion on the manual as to length, cost, and possible authors, the meeting was adjourned.

THE JAMES WATT INTERNATIONAL MEDAL

It will be remembered that this medal is awarded every two years by the Institution of Mechanical Engineers (Great Britain) to some one who has won distinction in mechanical engineering; a large number of national technical societies are asked to suggest names, and these suggestions are given consideration by the Institution.

A. G. M. Michell, F.R.S.

The most recent award of this, the highest honour in the gift of the Institution, was made to Anthony George Maldon Michell, F.R.S., of Melbourne, Australia, a choice which had the support of the Institution of Engineers, Australia, as well as of The Engineering Institute of Canada and of the South African Institution of Engineers. A formal presentation ceremony took place in London, on January 22nd, at which The Engineering Institute was represented by Major General C. S. L. Hertzberg, Chief Engineer of the First Canadian Army, in place of General McNaughton who was unavoidably absent.

Unfortunately Mr. Michell could not be present, but to make up for this, the B.B.C. arranged for a broadcast, beamed to Australia, so that he could at least listen to the proceedings. The citation was delivered by Professor Andrew Robertson. In the absence of Mr. Michell, the medal was handed by the president of the Institution to the Rt. Hon. S. M. Bruce, P.C., C.H., High Commissioner for the Commonwealth of Australia, who accepted it on behalf of Mr. Michell, and expressed the gratitude of the Institution of Engineers, Australia, and the engineering profession of that commonwealth, for the mark of high distinction which had thus been conferred on one of their members.

In his citation, Dr. Robertson sketched the career of the recipient of the medal, mentioning that after his early education in England, Mr. Michell returned to Australia and graduated with distinction at the University of Melbourne, where his elder brother John later became professor of mathematics. After various engagements as surveyor and assistant engineer, Anthony entered a firm specializing in hydraulic engineering, and with his partner, invented and developed a successful regenerative centrifugal pump. In 1903 he commenced consulting practice on his own account, dealing mainly with power plant and hydro-electric installations. Turning his attention to the theory of lubrication, in 1905 he published a paper for which he became justly famous. It dealt with an important development of the classical researches of Beauchamp Tower and Osborne Reynolds on the phenomena of lubrication in terms of the theory of the viscous flow of liquids. Starting from the fact that relatively moving parts whose surfaces are fully lubricated are separated by a film of lubricant which is not of uniform thickness, Michell investigated the case of an inclined rectangular sliding surface of finite size and succeeded in evaluating the leakage at the sides, a feature which had not been dealt with previously.

Having solved this mathematical problem, Michell invented the tilting pad for use as a rubbing surface, thus providing a bearing surface which could adjust itself automatically to the inclination appropriate to the load and speed. When applied to thrust blocks—formerly the most troublesome kind of bearings to operate and maintain—this idea proved to be a great practical advance. In fact, the success of the Michell bearing has had a marked effect on the design and development of all high speed bearings, including journal bearings for certain duties, particularly in marine steam turbines and other modern high speed machinery. In 1917 he began the development of a crankless engine, which has had considerable success.

His inventive genius and his mathematical achievements earned for him the unusual honour of being elected a Fellow of the Royal Society in the same year, 1934, as that in which his name was proposed.

Notwithstanding his celebrity, Michell is a man of retiring nature who finds his chief recreation in the pursuits of country life.

FOURTH VICTORY LOAN

A billion dollars used to be a lot of money, but within one's mind, if not within one's pocket, great changes have taken place. Large figures have ceased to awe us, even when they represent the national debt in which we are prime participators, but we must not be blasé about the Fourth Victory Loan which has slightly over a billion dollars as its objective.

To collect this amount of money by voluntary methods is a colossal task. One of the drawbacks of a democratic form of government is the privilege it gives us of being as inefficient, thoughtless and selfish as we wish. Theoretically one would think that all a free government would need to do to raise money necessary to the national welfare would be to announce that the money was needed. Free citizens—theoretically—would walk up to the altar of their temporary sacrifice and make their maximum contribution (at 3% interest).

But it does not work that way. Instead, an army of thirty thousand workers has to be assembled and trained for the sole purpose of approaching the free citizen and urging upon him that he should invest a small part of his income or savings in the cause of protecting not only the income and savings themselves, but his very life, his property, and his civilization.

Doubtless human nature will not change in time to help with this emergency and therefore we must be ready for the Victory Loan canvasser when he calls. Let us appreciate the size and seriousness of his task and give him our support quickly and gladly. Let us pull together enthusiastically that we may continue to live freely.

The Fourth Victory Loan opens April twenty-sixth. It is planned to raise over five hundred millions from private subscribers which, based on previous statistics, indicates that thousands of new subscribers will have to be found, and old subscribers will not only have to repeat but will be required to amplify their effort.

The War Finance Publicity Committee has circulated some figures on the costs of war equipment. Many of them are reproduced herewith. It is interesting to see just what your subscription will buy, as well as some of the reasons why war is so expensive.

Miscellaneous

303 rifle and machine gun ammunition	3½cents
Steel helmet	2.50
Hospital bed	35.00
Tank periscope	250.00
Sighting telescope	125.00
Silk or nylon parachute	225.00
Anti-aircraft searchlight	18,000.00
Protective gas mask	7.75
Haversack	2.05
No. 4 rifle and bayonet	65.00
Soldier's water bottle	.60
Soldier's clasp knife	1.05
Soldier's emergency medical kit	.80
Complete personal kit for one soldier, including clothing rifle and bayonet, anti-gas equipment, etc	200.00

Aircraft—(Complete)

Elementary trainer	12,000.00
Single-engined advanced trainer	30,000.00
Twin-engined advanced trainer	50,000.00
Bombing and gunnery trainer	75,000.00
Single-engined transport	40,000.00
Fighter	35,000.00 to 50,000.00
Dive bomber	50,000.00 to 75,000.00
Amphibian patrol bomber	200,000.00
Four-engined long range bomber	400,00 to 500,000.00

Ammunition

25-pdr. shell	13.00
40-mm. A.A. shell	6.00
3 7" A.A. shell	22.00
4" naval shell	30.00
4 5" Howitzer shell	20.00

Army guns

25-pounder (complete)	30,000.00
40mm. Bofors (complete)	30,000.00
3 7" A.A.	50,000.00
2-pounder tank	1,200.00
2-pounder anti-tank with carriage	4,000.00
6-pounder tank	2,500.00
6-pounder anti-tank with carriage	5,500.00

Small arms

(Complete fighting equipment with accessories and spares).	
Sten sub-machine carbine	40.00
Bren gun	375.00
Browning aircraft	250.00

Automotive Equipment—(Complete units)

Reconnaissance car	6,000.00
Armoured car	12,000.00
Scout car	4,000.00
Field artillery tractor	3,000.00
Field ambulance	3,500.00
Workshop lorry	7,500.00
Universal carrier	3,000.00
Derrick truck	3,000.00
Dental lorry	4,000.00
Crash tender	6,500.00
Compressor trailer	7,500.00
Snowmobile	5,000.00
Snow fighter	25,000.00

Ships

10,000-ton cargo	1,750,000.00
Corvette	950,000.00
Minesweeper	700,000.00
Wooden minesweeper	175,000.00
Trawler	500,000.00
Fairmile patrol boat	125,000.00
Motor torpedo boat	200,000.00
Whaler	1,350.00
Collapsible assault boat	225.00
Ram tank (30 tons)	90,000.00
2" trench mortar bomb	2.00
500-pd. aerial bomb	50.00
Depth charge	90.00
Anti-tank mine	5.00
Hand grenade	2.00

Navy guns

12-pounder	3,500.00
12-pounder mounting	5,000.00
4"	20,000.00
4" single mounting	25,000.00
4" twin mounting	50,000.00
2-pounder	4,000.00
2-pounder single mtg.	7,500.00
2-pounder multiple mounting	50,000.00
2" trench mortar	175.00
2" bomb thrower	125.00
3" trench mortar	563.00
4" smoke discharger	40.00

ENGINEERING GRADUATE APPOINTED TO BENCH

Members of the engineering profession are naturally highly pleased at the appointment of Robert Everett Laidlaw, K.C., an honour graduate in civil engineering, of the University of Toronto, of the class of 1915, as a Judge of the Appellate Division of the Supreme Court of Ontario. So far as is known, this is the highest judicial appointment that a graduate engineer has ever received in Canada.

Mr. Justice Laidlaw was born at Durham, Ontario, in 1892 and received his early schooling at the Durham Public School and the Owen Sound Collegiate. Following graduation in engineering he was employed for a time on railway valuation. Out of this work, which lay on the borderline between engineering and law, he developed an interest in the law which was so consuming that he abandoned a remunerative position to enter Osgoode Hall and to serve under articles at a small fraction of the salary that he had previously enjoyed.

His course at Osgoode Hall was one of distinction. In the first and second years he won cash prizes given by the Law Society of Upper Canada and in his third year he received the Silver Medal and the Christopher Robinson Memorial Scholarship. In addition, he won the gold medal for public speaking.

Called to the Bar in 1919, he became associated with the prominent legal firm of McCarthy & McCarthy and during that association was entrusted with many important legal tasks. For example, he was Crown counsel in the investigation of the disastrous Haileybury fire, which had involved a loss of approximately \$6,000,000.

In 1923, he joined the legal staff of the Central Region of the Canadian National Railways as solicitor and was appointed assistant regional counsel in 1927. He became a King's Counsel in 1935.

During his long service with the Canadian National Railways, Mr. Justice Laidlaw had an extensive, responsible and highly successful experience in the practice of law in the courts, including the Supreme Court of Canada. He was an outstanding counsel, always courteous to the Court and to his opponents, while, at the same time, insistent and indefatigable in the ferreting out of the truth.

For twenty-one years Mr. Justice Laidlaw, as he now is, was special lecturer in engineering law in the Faculty of Applied Science and Engineering of the University of Toronto. His classes were amongst the most popular in the Faculty, a circumstance that was due not only to rich experience and a capacity for clear expression, but as well to the fact that he thoroughly enjoyed lecturing to groups of interested and questioning students. Growing out of this work, he published (in 1937) in association with Dean Young, the volume "Engineering Law," of which considerable use has been made in the universities of Canada.

With a sound knowledge of engineering and with a long and highly successful career as a member of the Bar, Mr. Justice Laidlaw brings to his new duties a training and experience of unusual breadth, a judicial mind, and a demonstrated capacity for hard and effective work. His friends are confident that he will bring great distinction to the Bench.

C. R. YOUNG.

LAVAL AT WORK

With the slogan, "The Faculty at Work," the Faculty of Science of Laval University, Quebec, inaugurated on April 6th the practice of opening its laboratories and lecture rooms to the inspection of the public for an entire day. Nearly three thousand persons testified to the propriety of such an innovation and visited the buildings on the Boulevard de l'Entente.

In the afternoon, about a thousand boys from high schools and classical colleges witnessed the experiments carried out by the students in the laboratories as part of their regular schedule. The usual fireworks in the physics laboratory and black magic tricks in the chemical laboratories were staged for the amazement of the younger visitors. Before leaving the buildings, each boy was provided with informative literature, with which was a copy of the booklet published by the Institute on "The Profession of Engineering in Canada."

To the more mature persons who crowded the buildings at night—including many engineers to whom boisterous manifestations of Nature's laws are no secret—the inspection disclosed the thoroughness of the training given in the youngest of our Canadian engineering schools. More strikingly than the physical organization, which is most modern and complete, did the eagerness and self-expression displayed by the students testify to the excellency of the instruction dispensed at Laval.

Laval University has been giving degrees in medicine, law, theology and arts for nearly a century but only in recent years has extended its activities to the field of pure and applied science. It was in 1937 that the Faculty of Science was established as such. Previously, instruction in science was given in the Faculty of Arts. Courses in surveying were started in 1907 and the School of Forestry was established in 1910. In 1920, the School of Chemistry was founded and soon became a very active centre of studies and research.

With the establishment of the Faculty of Science, the School of Chemistry was incorporated with the faculty and expanded into a department of chemical engineering. Shortly afterwards, a department of mining and metallurgical engineering was opened and the first degrees were granted in 1941. Last September, a department of electrical engineering was inaugurated and full instruction is now given in this field.

The engineering courses offered at the faculty are very similar to those in other Canadian universities. The first two years are devoted largely to the fundamental sciences and students branch off to specialized fields in the third year. After successful completion of the fourth year, the degree of bachelor of applied science is given, with mention of the specialized branch in which the student graduated.

The dean of the faculty is Dr. Adrien Pouliot, M.E.I.C. Dr. Paul E. Gagnon, M.E.I.C., is director of the department of chemical engineering and of the School of Graduates. The department of mining and metallurgical engineering is headed by Mr. Gérard Letendre, and Mr. René Dupuis, M.E.I.C., is the director of the new department of electrical engineering. Mr. Dupuis is chairman of the Quebec Branch of The Engineering Institute for 1943.

All engineers of Canada will join in extending wishes of success to Laval in its new field of endeavour, confident that the high standards of the profession will be well maintained.

CORRESPONDENCE

Mining Building,
University of Toronto,
Toronto, Ont., February 25th, 1943

The Honourable Mr. Justice R. E. Laidlaw,
Osgoode Hall, Toronto, Ont.

Dear Mr. Justice,

At the last meeting of the Council of the Engineering Institute of Canada during my term of office as President, I was asked to convey to you the warm congratulations of

the Institute on your elevation to the Bench. It is with the utmost heartiness that I do so, both for the Council and for the membership generally.

We are very conscious of the high honour that has been accorded one who trained in the engineering profession and had made a promising start in it. It is seldom that one of our members receives so great a distinction in a profession other than his original one. We believe that the prestige of the engineering profession will, along with that of the law, be strengthened and enhanced by your appointment.

With best personal regards, I am

Yours sincerely,

(Signed) C. R. YOUNG,

Immediate Past President.

Osgoode Hall,

Toronto, Ont., February 27th, 1943.

My dear Dean Young,

At your convenience will you please convey to the Council of the Engineering Institute of Canada an expression of my gratitude for the congratulations and good wishes extended to me in your courtesy of February 15th.

I am justly proud of my qualifications as an engineer, and fully conscious of the great part my training in that profession has formed in my practice of law. I know too that the knowledge of practical science and engineering will better fit me in my present vocation to determine and apply the principles of justice. It is, therefore, with a feeling of deep personal interest and sincerity that I express the hope that from time to time I might find opportunities to emphasize the distinction of the engineering profession and the high place in public esteem to which engineers are properly entitled.

I send you my kindest personal regards.

Yours sincerely,

(Signed) R. E. LAIDLAW.

MEETING OF COUNCIL

A meeting of the Council of the Institute was held at Headquarters on Saturday, March 13th, 1943, at ten o'clock a.m.

Present: President K. M. Cameron in the chair; Vice-President C. K. McLeod; Councillors J. E. Armstrong, H. E. Brandon, E. V. Gage, R. E. Heartz, W. G. Hunt, N. B. MacRostie, G. M. Pitts, and H. J. Ward; Treasurer V. C. Christie; Secretary Emeritus R. J. Durley, General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel.

The president reminded Council that at the February meeting in Toronto it had been decided that a committee should be selected by the president to examine the whole question of the Institute's relations with engineering bodies and in particular the American Institute of Electrical Engineers, and to report to Council at the earliest opportunity.

Following Council's instructions, President Cameron had asked Dr. Challies if his Committee on Professional Interests, which has had wide experience in matters of this kind in its negotiations with the provincial professional associations, would undertake this task. Dr. Challies had accepted on behalf of his committee, but as he had been out of town, and had only just returned, no report was available for this meeting.

Professor Christie, the Institute's Treasurer, had been in close touch with A.I.E.E. activities in Canada over a long period, and the president asked him if he would express his views on the present situation.

Professor Christie gave an interesting outline of A.I.E.E. activities in Montreal during the past fifteen years and encouraged co-operation with the Engineering Institute.

The general secretary pointed out that while such an attitude on the part of the Montreal Branch would undoubtedly be helpful as far as the local section was concerned, recent correspondence and interviews between Presi-

dent Osborne of the A.I.E.E. and Past-President Young had indicated that the matter should now be studied from the point of view of national co-operation.

President Cameron stated that this and other points brought out in the discussion would be taken into consideration by the Committee, which it was expected would have a report ready for the next meeting of Council.

President Cameron reported that Mr. F. H. Peters, of Ottawa, had accepted the chairmanship of a committee to study the proposed Canons of Ethics for Engineers. Certain names have been suggested to Mr. Peters, and subject to his approval and the acceptance of the members concerned, it was unanimously resolved that the committee be appointed as follows:

F. H. Peters.....	Ottawa, Chairman
H. F. Bennett.....	London
R. J. Durley.....	Montreal
E. P. Fetherstonhaugh.....	Winnipeg
I. S. Patterson.....	Ottawa
Kenneth Reid.....	Victoria
Dr. F. H. Sexton.....	Halifax
G. St-Jacques.....	Quebec

President Cameron reported that following the last meeting of Council, at his request, Professor D. S. Ellis, of Kingston, had accepted the chairmanship of a committee to examine conditions affecting engineers in the active services with particular reference to professional recognition and the establishment of a corps similar to that now working so effectively in the Imperial Army, known as the Royal Electrical and Mechanical Engineers (R.E.M.E.).

As a progress report, the general secretary read the minutes of the first meeting of this committee, which are as follows:

"Minutes of a meeting of the Committee on the Engineer in the Services, held at the home of Professor D. S. Ellis at Kingston on March 11th, 1943.

Present: Professor D. S. Ellis, Chairman, Col. D. M. Jemmett, Lieut.-Col. L. F. Grant, and the General Secretary.

It was agreed that the Committee should be known as the Committee on the Engineer in the Services.

The chairman selected the following persons to act on the committee: Col. D. M. Jemmett, Professor of Electrical Engineering, Queen's University, Kingston; Major H. W. Tate, Toronto Transportation Commission, Toronto; Major E. Gray-Donald, Quebec Power Company, Quebec, P.Q.

The secretary was instructed to communicate with certain individuals in Montreal to see if they would be free to act.

Terms of Reference: It was agreed that the terms of reference of the committee would include the following:

- Consideration of rank given engineers as compared to other professions.
- Consideration of professional allowance as given to doctors and other persons.
- Consideration of relationships between officers on the Stores side of the Ordnance Corps, as compared to officers on the Engineering side. This would involve the question of promotions and authorities.
- Consideration of appointment of non-technical persons to technical positions.
- Study and recommendations as to the advisability of the Canadian Corps following the British army procedure in establishing the Royal Electrical and Mechanical Engineers (R.E.M.E.).

After proper information has been gathered and conclusions reached, the committee is to recommend to Council the procedures which it believes should be taken in order to bring the recommendations to the attention of the proper authorities.

The general secretary was instructed to gather the necessary information relative to the practices in the British army and in the Canadian army. It was recommended that after this information had been assembled and distributed to members of the committee, a meeting be held at some

central point so that a full discussion of the information might be possible. From such discussion a brief should be prepared and referred to the Council of the Institute with certain recommendations as to the next steps to be taken.

The general secretary was instructed to communicate with Lieut.-General A. G. L. McNaughton, informing him of the purposes of the committee, in order to make certain that the programme outlined did not run contrary to any of his plans or wishes.

It was the opinion of the meeting that after a strong brief had been prepared, arrangements should be made for a delegation to wait on the Minister of National Defence, in order to be certain that the recommendations were brought to his attention and given full consideration.

It was agreed that all suitable material dealing with the R.E.M.E.'s should be printed from time to time in *The Engineering Journal*, so that members of the Institute might become aware of the new development."

The general secretary explained that Colonel Grant was leaving almost immediately on a special mission to the Old Country. While there he would gather certain information for the use of the committee.

On the motion of Mr. Pitts, seconded by Mr. Heartz, it was unanimously resolved that the terms of reference be approved, and that the minutes be accepted as a progress report.

President Cameron reported that following the last meeting of Council he had asked Councillor MacRostie, of Ottawa, to accept the chairmanship of a committee to make representations on behalf of the members of the engineering profession in the Civil Service to the Advisory Committee of the Treasury Board which had recently been set up to inquire into and report on conditions of work and remuneration of employees in the Civil Service.

Mr. MacRostie had accepted the appointment, and a committee had been set up consisting of Mr. deGaspé Beaubien, of Montreal, the general secretary, and the president, ex-officio.

As immediate action was necessary in order to make representations to a meeting of the Advisory Committee being held in Ottawa on March 5th, the Institute committee had met in Ottawa and had spent three days gathering information and preparing a brief, which had been duly presented. The Institute Committee, accompanied by Mr. L. E. Westman, representing Mr. Dobson, President of the Dominion Council, had been very well received by the Advisory Committee.

A copy of the brief, and the accompanying graph, was submitted for the information of Council. The general secretary explained how the information had been secured, and how the various averages had been determined. The complete report was published in *March Journal* for the information of all members of the Institute, and reprints have been sent to the branch executive committees.

In accepting the report, President Cameron thanked Mr. MacRostie and his committee for the very valuable presentation, which, in his opinion, was one of the most effective documents on this subject which had been prepared.

Mr. Armstrong, chairman of the Institute Committee on Civil Defence, reminded Council of the joint submission relative to certain aspects of civil defence, presented to the Prime Minister in November last over the signatures of the presidents of the Royal Architectural Institute, the Canadian Construction Association and The Engineering Institute. No action had yet been taken by the government on this submission, and, following further conferences between the three presidents, it had been decided to seek an interview with the Hon. C. D. Howe, Minister of Munitions and Supply, whose Department would be most interested in the submission. It was expected that such a meeting could be arranged at an early date, following which the committee would report further to Council.

The committee was keeping in close touch with the branch committees. Mr. Armstrong had been particularly interested

in two recent newspaper clippings, one about an enemy plane over Sydney, Australia, and another regarding the protection of our own east coast. He had been in communication with the branch committees regarding these two items, and hoped to circulate shortly certain information which would be of assistance to the committee chairmen in organizing their territories. Some of the branches were well organized, particularly the London branch area. In others, as far as the E.I.C. was concerned, little had been done, but his committee would see that information continued to reach the committee chairmen with a view to improving the situation.

Reports were received on the following matters which had been referred to the Committee on Post-War Problems for consideration.

Construction Council of Canada—At the November meeting of Council it had been decided that the Institute would be ready to co-operate with the National Construction Council by appointing representatives to regional committees which the Council proposed to set up in twenty of the more important cities in Canada to study and make recommendations on post-war projects. On instructions from the President the matter had been referred to the Institute's Committee on Post-war Problems for an expression of opinion before any definite action was taken.

The general secretary read a letter from Mr. Miller, chairman of the committee, which indicated that while approving of the Institute supporting the general proposal, he felt that the Institute should not be committed to any recommendations that would be made on social problems that concerned construction. In his opinion these should be a matter for an individual member and not for an organization.

Mr. Miller approved of the suggestion that representatives of his committee would make suitable representatives on the proposed regional committees, and following some discussion it was unanimously resolved that the Institute support the National Construction Council in this matter, and that Mr. Miller be asked to name the Institute's representatives on the various regional committees.

Industrial Democracy and Its Survival—At Council's request Mr. Miller had read Mr. Ackerman's paper on "Industrial Democracy and its Survival" and did not recommend any additional publicity for this paper, as suggested by a resolution of the Montreal Branch which had been referred to this committee.

From the discussion which followed, it appeared that the consensus of opinion was that Mr. Ackerman's paper was of an economical rather than an engineering nature, and as the government has recently set up a committee to study this question, it was unanimously decided to suggest to the Montreal Branch that no action should be taken by the Institute regarding publicity for this paper until the parliamentary committee had made its report.

C.B.C. Broadcasts—The general secretary read the following letter from Mr. Miller:

"I would like to call attention to a series of broadcasts each Sunday afternoon at 5.03 p.m. lasting for half an hour. They are round table talks on the subject of 'Of things to come—Inquiry on the Post-War World.' By virtue of his position, the Chairman of your Post-War Problems Committee has been asked to act as an Honorary Consultant to this programme along with representatives of a number of other organizations.

"Any members having any comments on any of these programmes already given or those to follow may clear them through your Chairman. Several of the programmes will deal with construction problems and I would be glad to pass along any suggestions as to matters that might be discussed for the consideration of the director of the series."

Council unanimously approved of Mr. Miller's acceptance of the position of honorary consultant and suggested that any members having any comments to make on these broadcasts should communicate with Mr. Miller as soon as possible.

Beveridge Report—Mr. Miller reported that two members of his committee had undertaken to study the Beveridge report and advise on any matters therein that would, in their opinion, be pertinent to the work of his committee.

The general secretary informed the meeting that on seeing in the papers that Sir William Beveridge was planning to visit Canada, he had cabled offering him the facilities and co-operation of the Institute. No reply had yet been received.

It was noted that the financial statement for the first two months of the year had been examined and approved.

On the recommendation of the Finance Committee it was agreed that the general secretary should make a survey of a section of the membership in order to determine, if possible, the cost to the Institute of making Life Membership automatic. It was intimated that under such circumstances a longer period of corporate membership, namely thirty-five instead of thirty years as at present, and an age of seventy instead of sixty-five, might be appropriate.

Following the practice established two years ago, it was unanimously resolved, on the recommendation of the Finance Committee, that the annual fees of members resident in the United Kingdom and other combatant areas be remitted for the year 1943.

A letter had been received from the Public Roads Administration of the Federal Works Agency, Washington, inviting the Institute to appoint a representative to an Advisory Committee on the Investigation of Long-Span Suspension Bridges, which has recently been established. The committee had suggested that on account of his professional attainments and his interests in the problems concerned, Mr. P. L. Pratley would make a valuable addition to the membership. On the recommendation of the Finance Committee it was unanimously resolved that Mr. Pratley be nominated as the Institute's representative on the committee and that some aid be provided in meeting travelling expenses.

The general secretary made a brief report on the operations of the Wartime Bureau of Technical Personnel, basing his remarks on a recently issued review of the history of the Bureau. It was the opinion of Council that a digest of this material be printed in the *Journal*. It was agreed that the general secretary should communicate with the Bureau to suggest that the general secretary of each of the three constituent organizations should be invited to any future meetings of the Advisory Board of the Bureau.

The general secretary referred to the suggestion contained in National Selective Service legislation that the Bureau might be taken over entirely by the Department of Labour. The Bureau was steadily working in closer co-operation with the Department, and it might readily appear to be a logical development, particularly for the post-war period, to have the Bureau as a complete government agency.

A letter had been received from the Canadian Engineering Standards Association asking the Institute to nominate a representative to a committee recently established to investigate the use of sawdust and shavings for insulation purposes and to draft an appropriate specification. On the motion of Mr. Pitts, seconded by Mr. Ward, it was unanimously resolved that Mr. H. E. Brandon be nominated as the Institute's representative on this committee.

A number of applications were considered and the following elections and transfers were effected:

The Council rose at one twenty p.m.

ELECTIONS AND TRANSFERS

At the meeting of Council held on March 13th, 1943, the following elections and transfers were effected:

Members

- Aubert, Marcel A.**, B. A. Sc., C.E. (Ecole Polytechnique), civil engr. Aluminum Co. of Canada, Montreal, and Professor at Montreal Technical School.
- Blais, Robert**, B.A.Sc., C.E. (Ecole Polytechnique), superintending engr., Chief Engr.'s Branch, Dept. of Public Works, Ottawa, Ont.
- Duquette, Roland R.**, B.A.Sc., C.E. (Ecole Polytechnique), supervising engr., McDougall & Friedman, Montreal, Que.
- Gardner, Cyril James**, M.Sc. (London), mgr., Production Planning Dept., Hamilton Bridge Co., Hamilton, Ont.
- Jane, Robert Stephen**, B.Sc. (Univ. of B.C.), M.Sc., Ph.D. (McGill), Director, Electro-Metallurgical Research Dept., Shawinigan Water & Power Co. Ltd., Montreal.
- Janelle, Waldeck Alexis**, B.A.Sc., C.E. (Ecole Polytechnique), Laboratory technician, Aluminum Co. of Canada, Ltd., Shipshaw, Que.
- Lace, George Sutton**, engr. officer, Aircraft Production Branch Dept. of Munitions & Supply, Winnipeg, Man.
- MacDonald, Charles Donald**, B.Eng. (N.S. Tech. Coll.), asst. prof. of Engineering and Plant Supt., Mount Allison University, Sackville, N.B.
- Moffatt, Edward Hopkins**, S.B. (Harvard), research engr., Canadian Car & Foundry Co. Ltd., Montreal, Que.
- Noakes, Frank**, B.Sc. (Univ. of Alta.), M.S., and Ph.D. (Iowa State College), lecturer, Dept. of Elec'l. Engrg., University of Toronto, Toronto, Ont.
- Tylee, Arthur Kellam**, B.Sc. (Mass. Inst. of Tech.), supervisor (overhaul and repair div'n), Aircraft Branch, Dept. of Munitions & Supply, Ottawa, Ont.
- Weaver, Howard Lewis**, chief dftsmn., Standard Steel Construction Co., Welland, Ont.

Juniors

- Duncan, Allan S. E.**, B.Sc. (Queen's Univ.), plant mgr., Oxygen Co. of Canada, Ltd., Montreal, Que.
- Gardner, Donald**, B.Sc. (Univ. of Alta.), student engr., Canadian General Electric Co. Ltd., Peterborough, Ont.
- McKenna, Joseph Victor**, B.A.Sc. (Univ. of Toronto), junior layout man and engr., General Motors of Canada, Oshawa, Ont.
- Parrish, Vernon McLeod**, B.A.Sc. (Univ. of Toronto), sales-service engr., Bailey Meter Co. Ltd., Winnipeg, Man.
- Woermke, Orville R.**, B.Sc. (Queen's Univ.), plant designing engr., Electric Reduction Co. of Canada, Ltd., Buckingham, Que.

Affiliates

- Winterburn, Fred**, electrical supt., Howard Smith Paper Mills, Ltd., Cornwall, Ont.

Transferred from the class of Junior to that of Member

- Boutillier, Andrew Pringle**, B.Eng. (N.S. Tech. Coll.), A/Major, R.C.E., chief Works Officer and O.C., 3rd Fortress Company, R.C.E., Sydney, N.S.
- Hayes, Herman Rutherford**, B.Sc. (Univ. of Alta.), gen'l supervisor of standards, Burns & Co. Ltd., Calgary, Alta.
- Hood, George Leslie**, B.Sc. (Univ. of Man.), asst. meter and relay engr., Hydro Electric Power Commission of Ontario, North Bay, Ont.
- Jones, Arthur R.**, B.Sc. (Univ. of Alta.), asst. induction motor engr., Canadian General Electric Co., Peterborough, Ont.
- Stanfield, John Yorston**, B.Sc. (N.S. Tech. Coll.), Major, 15th H.A.A. Battery, R.C.A., Canadian Army, Labrador.
- Thurston, Arthur Monroe**, B.Eng. (McGill Univ.), plant mgr., Dominion Electric Protection Co., Montreal, Que.
- White, Walter Edmund**, B.A.Sc., B.E., B.A.Sc., (Univ. of Toronto), test engr., Radio Division, Research Enterprises Ltd., Toronto, Ont.

Transferred from the class of Student to that of Member

- Cannolly, John Lawrence**, B.Eng. (N.S. Tech. Coll.), asst. plant supt. Demerara Bauxite Co. Ltd., McKenzie, British Guiana.
- Morin, Alphonse G.**, B.A.Sc., C.E., (Ecole Polytechnique), res. engr., Quebec Roads Department, St-Cyrille de Wendover, Quebec.

Transferred from the class of Student to that of Junior

- Bourbonnais, George Valois**, B.Eng. (McGill Univ.), Captain, R.C.E., 2nd i/c B. Company, 3rd Battalion, Canadian Army Overseas.
- McArthur, Donald Smith**, B.Sc., M.Sc., (Univ. of Sask.), junior research engr., National Research Council, Ottawa, Ont.

Olafson, Magnus Joseph, B.Sc. (Univ. of Sask.), asst. machine tool engr., Modern Tool Works, Toronto, Ont.

- Richardson, George Wm.**, B.Eng., (McGill Univ.), chassis engr., Dept. of Automotive Engineering, Ford Motor Co. of Canada, Windsor, Ont.
- Ring, Alfred Jackson**, B.Sc. (Univ. of N.B.), foreman, Defence Industries, Ltd., Montreal, Que.
- Weldon, George Horace**, B.Sc. (Univ. of Man.), supervisor, Defence Industries, Ltd., Winnipeg, Man.
- Zweig, Irving Israel**, B.Sc. (Sir George Williams Coll.), senior research asst., National Research Council, Ottawa, Ont.

Transferred from the class of Student to that of Affiliate

- Little, Harry**, sales mgr. and director, R. & M. Bearings Canada, Ltd., Montreal, and director of Aircraft Bearings Ltd., Toronto, Ont.

Students Admitted

- Backer, George Ernest**, (McGill Univ.), 21 Second Ave., Grand'Mère, Que.
- Berry, Arthur Herbert**, (McGill Univ.), 610 Green St., St. Lambert, Que.
- Bloom, Charles Abe**, (McGill Univ.), 6116 Durocher Ave., Outremont, Que.
- Brooks, Douglas Austin**, (Univ. of Toronto), 89 Charles St. W., Toronto, Ont.
- Crawford, George Byron**, (Univ. of Toronto), Box 390, Bowmanville, Ont.
- Curzon, David Macklem**, (Univ. of Toronto), 46 Elora St., Guelph, Ont.
- Dahl, Henry Lewis**, (Univ. of Man.), 555 Wellington Cresc., Winnipeg, Man.
- D'Angelo, Joseph A.** (Univ. of Man.), 901 Riverwood Ave., Fort Garry, Man.
- Davis, Gordon Thurlow**, (Univ. of Man.), 612 Alverstone St., Winnipeg, Man.
- Eisenhauer, Daniel Andrew**, (Dalhousie), Lunenburg, N.S.
- Gold, Manuel Theodore**, (McGill Univ.), 67 Maplewood Ave., Outremont, Que.
- Hannon, Matthew Stuart**, (Univ. of Toronto), 465 Avenue Rd., Toronto, Ont.
- Kuster, Norman Walter**, (Matric. Prov. of Sask.), senior dftsmn., Tool Design Section, Canadian Car & Foundry Co., Fort William, Ont.
- Kuzyk, William John**, (Matric. Prov. of Alta.), senior dftsmn., tool and jig, Canadian Car & Foundry Co. Ltd., Fort William, Ont.
- Morehouse, Rupert Henry**, (Univ. of N.B.), 645 Union St., Fredericton, N.B.
- Onasick, Peter**, (Univ. of Toronto), 85 Gorevale Ave., Toronto, Ont.
- Peckover, Frederick Lionel**, (Univ. of Toronto), 233 Ellis Ave., Toronto, Ont.
- Pellegrind, Antonio John Joseph**, (Univ. of N.B.), 560 Needham St., Fredericton, N.B.
- Rogers, John Douglas**, (Univ. of N.B.), Box 185, St. Stephen, N.B.
- Stanners, James Ellwood**, (Univ. of Toronto), 566 Spadina Ave., Toronto, Ont.

By virtue of the co-operative agreements between the Institute and the Associations of Professional Engineers, the following elections have become effective:

Students

- Alberta**
- Campbell, Donald Kilgour**, (Univ. of Alta.), 11138-87 Ave., Edmonton, Alta.
- Hannah, M. Russell**, (Univ. of Alta.), Sub-Lieut., R.C.N.V.R., Fleet Mail Office, Halifax, N.S.

Members

New Brunswick:

- Hill, Major E. S.**, res. engr. on constrn., Civil Aviation Divn., Dept. of Transport, Princeton, B.C. (Home—St. Stephen, N.B.).
- MacLatchey, C. W.**, Works' & Buildings Branch, R.C.A.F., North Sydney, N.S. (Home—Moncton, N.B.).

Nova Scotia:

- Draper, Charles Frederick**, M.A., B.A.I., (Trinity College, Dublin), engr. of constrn., Foundation Maritime Ltd., Halifax, N.S.

Saskatchewan:

- Stewart, EaSl**, B.Sc., (Univ. of Sask.), chemist, Sewage Disposal Works, City Engineer's Dept., Regina, Sask.

News of the Personal Activities of members of the Institute, and visitors to Headquarters

C. C. Lindsay, M.E.I.C., of Montreal, has recently been made Honorary Lieutenant-Colonel of a Royal Canadian Engineers unit. He is a veteran of the last war during which he won the Military Cross and the Belgium Croix de Guerre. He served overseas from 1915 to 1919, first with the Sixth Field Company, Royal Canadian Engineers, and then with Second Indian Field Squadron before being attached to the 202nd Field Company of the Royal Engineers. While in the field he was promoted to acting major and was later confirmed to his rank.

In civilian life, Colonel Lindsay is a consulting civil engineer and Quebec land surveyor. He is vice-president of the Corporation of Professional Engineers of Quebec, vice-chairman of the Montreal Branch of the Institute, a director of the Corporation of Quebec Land Surveyors, a director of the Canadian Institute of Surveying and a member of the Montreal Tramways Commission.

chairman of the Junior Section of the Montreal Branch of the Institute, in 1937.

Kenneth Reid, M.E.I.C., is the newly elected chairman of the Victoria Branch of the Institute. Born at Victoria, B.C., he studied engineering at McGill University, Montreal, where he obtained his degree of B.Sc. in electrical engineering, in 1926. Upon graduation he joined the staff of the Canadian General Electric Company Limited, at Peterborough, and, in 1928, he accepted a position as assistant engineer with British Columbia Electric Railway Company at Vancouver. In 1930-31, he was assistant chief electrician with Consolidated Mining and Smelting Company Limited at Trail, B.C. He joined the Light Depart-

Kenneth Reid, M.E.I.C.

J. H. Fregeau, M.E.I.C.

P. N. Gross, M.E.I.C.

A. W. Ahern, M.E.I.C., is now with the Northeastern Paper Products Limited at Quebec. A graduate of McGill University in the class of 1922, he had been connected with The James Ruddick Engineering and Construction Company, at Quebec, since 1924, as vice-president of the company.

C. B. Fisher, M.E.I.C., of Northern Electric Company, Montreal, has been on loan to the British Ministry of Supply Mission in Washington and Detroit, since May, 1942. As of March 1st, 1943, he was loaned from the British Ministry of Supply Mission to Eicor Incorporated of Chicago, where he occupies the position of vice-president. Born at Wresville, Alta., he was educated at the University of Alberta and later went to the University of Toronto where he received the degree of B.A.Sc., in 1930. He did post-graduate work at McGill University, Montreal, and obtained the degree of M.Eng., in 1933. He joined the staff of the Northern Electric Company of Montreal in 1931 as a development engineer in the special products division. Later he became engineer in charge of the radio receiver engineering department.

C. E. Frost, M.E.I.C., has recently been commissioned as a Flying Officer in the R.C.A.F. and, after a period of training, has been posted at the Directorate of Signals at R.C.A.F. Headquarters, Ottawa. Before enlisting, F/O Frost was on the engineering staff of the Bell Telephone Company of Canada, at Montreal. A graduate of McGill in the class of 1931, he was on the staff of the National Harbours Board, Montreal, as an assistant engineer until he joined the Bell Telephone Company in 1937. He was

ment of the City of Victoria, as assistant engineer, in 1934.

J. H. Fregeau, M.E.I.C., was elected chairman of the St. Maurice Valley Branch of the Institute at the annual meeting held last month at Shawinigan Falls. Born at Beebe Plain, Que., he received his education at McGill University. Upon his graduation, in 1910, he joined the staff of the Shawinigan Water and Power Company and has always remained with the firm. From 1911 to 1914 he was in-charge of the electrical installations at various stations. From 1915 to 1923 he was in charge of the construction of transmission lines. In 1923, he was transferred to Trois-Rivières as superintendent and, in 1927, he became divisional manager, a position which he still holds. Since 1939, Mr. Fregeau has also been manager of the St. Maurice Transport Company.

Mr. Fregeau was a councillor of the Institute representing the St. Maurice Valley Branch in 1941-1942.

P. N. Gross, M.E.I.C., has been elected vice-president and general manager of Anglin-Norcross Corporation Limited of Montreal.

Born at Worcester, Mass., in 1901, he received his engineering education at McGill University, Montreal, where he graduated as a B.Sc. in 1926. Upon his graduation he joined the engineering staff of Anglin-Norcross Limited at Toronto. In 1929 he was appointed Ontario manager of Anglin-Norcross Limited and later became vice-president and manager of Anglin-Norcross Ontario Limited. He joined the Royal Canadian Engineers at Toronto in 1940 and proceeded overseas in 1941. He returned recently to Canada with the rank of Captain.

Edward C. Hay, M.E.I.C., has recently accepted an appointment with the Army Engineering Design Branch of the Department of Munitions and Supply, Ottawa. He was previously sales engineer in charge of the Regina Office of Canadian Westinghouse Company Limited. A graduate of the University of British Columbia, in 1930, Mr. Hay had been with the Westinghouse Company since graduation. From 1933 to 1936 he was in Hamilton and in 1936 went to Toronto where he stayed until 1938 when he received his Regina appointment.

A. J. Lawrence, E.D., B.Sc., M.E.I.C., who has been granted leave of absence for the duration of the war by the Northern Electric Company, Limited, has been appointed head of the Production Control Department of Allied War Supplies Corporation, Montreal. During the last war, Mr. Lawrence did inspection work on ammunitions for the Imperial Ministry of Munitions.

J. G. McGregor, M.E.I.C., is the newly elected chairman of the Calgary Branch of the Institute. Born in Scotland, in 1905, he received his education at the University of

W. Taylor-Bailey, M.E.I.C., vice-president and general manager of the Dominion Bridge Company Limited, Montreal, was recently elected to the board of directors of Robert Mitchell Company Limited, Montreal.

Maurice Gérin, M.E.I.C., departmental manager, Canadian Fairbanks Morse Company, Montreal, has been appointed a director of the Corporation of the Ecole Polytechnique of Montreal. Mr. Gérin graduated from the Ecole Polytechnique, in 1920, and obtained his degree of M.Sc. in mechanical engineering from the Massachusetts Institute of Technology in 1921. He has been with Fairbanks-Morse since 1922.

J. T. Dymont, M.E.I.C., assistant superintendent, engineering, Trans-Canada Air Lines, has been elected chairman of the Winnipeg Branch of the Institute. Born at Barrie, Ont., he received his engineering education at the University of Toronto where he graduated in 1929. After a few months spent in the airplane division of the Ford Engineering Laboratories at Dearborn, Mich., he joined the staff of the Aero Division of the Department of National Defence,

J. G. McGregor, M.E.I.C.

J. T. Dymont, M.E.I.C.

Roland A. Lemieux, M.E.I.C.

Alberta where he graduated in 1929. Upon graduation, he joined Canadian Utilities Limited at Calgary and in 1931 he became district superintendent at Vegreville. He now occupies the position of assistant manager at Calgary.

A. M. Macgillivray, M.E.I.C., the newly elected chairman of the Saskatchewan Branch of the Institute, holds a unique distinction. In addition to being chairman of the Branch, he is councillor of the Institute for the Branch, president of the Association of Professional Engineers of Saskatchewan and representative of the Association on the Dominion Council of Professional Engineers. Mr. Macgillivray is district engineer for Canadian National Railways at Saskatoon.

F/O Jacques Price, M.E.I.C., is now works and buildings engineer officer at No. 1 "Y" Depot, R.C.A.F., at Halifax, N.S. Before joining up, F/O Price was engaged in airport construction with the Department of Transport and later with the Department of National Defence. He studied engineering at the University of Toronto.

R. H. Stevens, M.E.I.C., waterworks engineer for the city of Edmonton, Alta., is now assistant waterworks engineer, No. 2 Western Command, R.C.A.F., and is stationed at Comox, B.C.

J. W. Ward, M.E.I.C., has recently been transferred from Arvida to the Beauharnois plant of the Aluminum Company of Canada Limited where he now occupies the position of electrical superintendent. Mr. Ward is a councillor of the Institute representing the Saguenay Branch.

Ottawa, in 1930. In 1937 he transferred to the aeronautical division of the Department of Transport as aeronautical engineer and in 1938 he accepted a position in the same capacity with Trans-Canada Airlines in Winnipeg. Later he became chief engineer.

D. G. Geiger, M.E.I.C., transmission engineer, western area, Bell Telephone Company of Canada, Toronto, was recently appointed a member of the national committee on communication of the American Institute of Electrical Engineers.

Sarto Plamondon, M.E.I.C., has recently been admitted as a Junior Member of the American Society of Heating and Ventilating Engineers. He is the engineer in charge of the Division of Industrial Hygiene of the Department of Health of the Province of Quebec.

Squadron Leader W. J. Inglis, M.E.I.C., is now construction officer at R.C.A.F. Headquarters, Ottawa. Before enlisting in April, 1940, he was a designer with Bloedel, Stewart & Welch, Limited, Vancouver. After graduation at the University of British Columbia, in 1934, he was employed with British Columbia Electric Railway of Vancouver, until October, 1935, when he joined the staff of Hamilton Bridge Company (Western) Limited, Vancouver. From August, 1937, to May, 1938, he was in England where he acquired valuable experience in the design and construction of industrial plants with Sir Alexander Gibb and Partners and later with the British Air Ministry.

Roland A. Lemieux, M.E.I.C., has been appointed recently city manager and engineer at Arvida, Que. He had

VISITORS TO HEADQUARTERS

H. Balmforth, M.E.I.C., Burnaby, B.C., on March 4th.

Lt.-Commander Sydney Phillips, M.E.I.C., H.M.C.S. Fort Ramsay, Gaspé, Que., on March 5th.

Sarto Plamondon, M.E.I.C., Ministry of Health, Quebec, Que., on March 13th.

Major H. A. Gauvin, M.E.I.C., Supt., A. Bélanger, Limited, Montmagny, Que., on March 13th.

H. J. Ward, M.E.I.C., superintendent of property, Shawinigan Water & Power Company, Shawinigan Falls, Que., on March 13th.

Squadron Leader W. L. Inglis, Jr.E.I.C. Works and Buildings Branch, R.C.A.F., Ottawa, Ont., on March 10th.

F/O. C. E. Frost, M.E.I.C., Royal Canadian Air Force Headquarters, Ottawa, Ont., on March 16th.

C. D. McAllister, M.E.I.C., Department of Public Works, Saint John, N.B., on March 15th.

F. W. Gray, M.E.I.C., Asst. General Manager, Dominion Steel and Coal Corporation, Sydney, N.S., on March 16th.

Victor Meek, M.E.I.C., controller, Dominion Water and Power Bureau, Department of Mines and Resources, Ottawa, Ont., on March 18th.

H. O. Windler, Anglo-Newfoundland Development Company, Grand Falls, Nfld., on March 19th.

C. F. Morrison, M.E.I.C., assistant professor of civil engineering, University of Toronto, Toronto, Ont., on March 18th.

G. Ericksen, M.E.I.C., assistant engineer, City Engineer Department, Port Arthur, Ont., on March 25th.

C. O. Whitman, M.E.I.C., field engineer, Beauharnois Light, Heat and Power Company, Valleyfield, Que., on March 27th.

John Grieve, M.E.I.C., promotion manager, Imperial Varnish & Colour Company Limited, Toronto, Ont., on March 27th.

Don Ross, M.E.I.C., Foundation Company of Canada Limited, Shipshaw, Que., on March 31st.

F/O. B. P. Seull, M.E.I.C., Maple Creek, Sask., on April 1st.

Capt. J. F. Rutherford, M.E.I.C., R.C.C.S., Camp Borden, Ont., on April 3rd.

COMING MEETINGS

Eastern Photoelasticity Conference and Symposium on Experimental Stress Analysis—The Seventeenth Semi-Annual Meeting. To be held on May 13, 14 and 15, 1943 at the Rackham Memorial Bldg., 100 Farnsworth St. Detroit Michigan. Secretary: Lee R. Baker, Chrysler Institute of Engineering, Highland Park, Michigan.

American Society of Mechanical Engineers—1943 Semi-Annual Meeting, Los Angeles, California, June 12-14. Secretary: C. E. Davies, 29th West, 39th Street, New York, N.Y.

American Water Works Association—Annual Meeting, to be known as A.W.W.A. Conference on War-Winning Waterworks Operations, at the Carter and Statler Hotels, Cleveland, Ohio, June 14-17. Secretary: Harry E. Jordan, 22 East 40th Street, New York, N.Y.

occupied the position of city engineer and secretary-treasurer of the municipality of Sillery, Que., since 1941. Previously he was engaged as assistant to the district No. 1 engineer in the Department of Roads of the Province of Quebec. Mr. Lemieux graduated from Ecole Polytechnique in 1937.

Paul-Emile L'Heureux, Jr.E.I.C., who for the last few years had been assistant division engineer of the Department of Highways of Quebec, at Sherbrooke, has been transferred recently to Beauceville, Que. He is a graduate of the Ecole Polytechnique in the class of 1936.

Gerald N. Martin, Jr.E.I.C., who has been on loan to the Aluminum Company of Canada Limited, Montreal, for the past two years, has now returned to the Dominion Bridge Company Limited, Lachine, Que.

J. R. Tregget, Jr.E.I.C., is on leave from the Coca-Cola Limited, Montreal, and has joined the R.C.A.F.

G. G. Wanless, Jr.E.I.C., who joined the staff of the National Research Council, at Ottawa, last year, has recently been transferred to the St. Clair Processing Corporation, at Sarnia, Ont.

Lieutenant R. Bennett, S.E.I.C., is with the Signals Production Branch in the Department of Munitions and Supply, at Ottawa. He is a graduate in electrical engineering from McGill University in the class of 1942.

Percy Codd, S.E.I.C., has joined the R.C.A.F. and is at present training as aircrew at Belleville, Ont. A graduate of the University of Saskatchewan, in chemical engineering, he was employed with the Defence Industries Limited, Valleyfield, Que., before enlisting.

Flying Officer T. A. Harvey, S.E.I.C., is now stationed at R.C.A.F. Headquarters, Ottawa, in the office of the director of aeronautical engineering. He had been stationed previously at Macdonald, Man. He is a graduate of McGill University in the class of 1941.

Sub-Lieutenant G. R. Minty, S.E.I.C., is at present stationed in Halifax. He graduated from the University of Saskatchewan in the class of 1941.

Lieutenant E. A. Olafson, S.E.I.C., is now serving with the Royal Canadian Ordnance Corps overseas. He is a graduate of the University of Saskatchewan in the class of 1941.

Sub-Lieutenant William Tkacz, S.E.I.C., has joined the R.C.N.V.R. last February and is at present training at Halifax. He was previously employed with the Ottawa Car and Aircraft Limited, at Ottawa.

Lieutenant J. A. Webster, S.E.I.C., is with the Royal Canadian Corps of Signals and is stationed at Ottawa.

Leon Wigdor, S.E.I.C., has been employed with Defence Industries Limited, Valleyfield, Que., since April, 1941, when he graduated from McGill University.

Sub-Lieutenant D. O. D. Ramsdale, S.E.I.C., who was among the recent naval graduates from King's College, Halifax, passed with the highest marks ever made at the college.

Engineers Should Buy War Bonds

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

John Logie Allison, M.E.I.C., died at Montreal, on February 10th, 1943. He was born at Toronto, Ont., on October 17th, 1860, and was educated at the School of Practical Science, Toronto. From 1885 to 1889 he was employed on construction work at the Welland Canal. Later he was employed at the Soulanges Canal, for several years.

Mr. Allison had varied experience in civil engineering work during his professional career and he was employed on several large construction projects, successively with W. I. Bishop Limited, Montreal, and H. J. Acres Limited, at Montreal. He had retired from active practice several years ago.

Mr. Allison joined the Institute as an Associate Member in 1887 and he was transferred to Member in 1895.

John Lyle Harrington, M.E.I.C., died on May 20th, 1942. Born at Lawrence, Kansas, U.S.A., on December 7th, 1868, he was educated at the University of Kansas where he graduated in 1895. During two summer vacations and from June, 1895, to March, 1896, he worked with the late J. A. L. Waddell, consulting engineer of Kansas. He then held various positions as follows: March to August, 1896, in the drafting room of the Elmira Bridge Company, at Elmira, N.Y.; August, 1896, to July, 1897, with the Pencoyd Iron Works at Philadelphia, Pa., in charge of work in the drafting room; July, 1897, to January, 1898, with the Keystone Bridge Works of the Carnegie Steel Company at Pittsburgh, Pa., in charge of preparation of general and detail plans for numerous bridges, including various bridges and viaducts for the Union Railroad approach to the Pittsburgh and Lake Erie Railroad bridge over the Ohio River; January to September, 1898, with the Cambria Steel Company at Johnstown, Pa., first as assistant superintendent, Structural Department, designing the structural shops, then in charge of engineering, and later in charge of the shop and structural material yards; September, 1898, to March, 1899, with the Bucyrus Company at South Milwaukee, Wis., as assistant chief engineer and assistant superintendent; March to December, 1899, with the Northwestern Elevated Railroad Company in Chicago, Ill., as assistant to the chief engineer, in charge of preparation of shop plans and of inspection of fabrication of steelwork at the shops of the Elmira Bridge Company and Union Bridge Company; December, 1899, to November, 1900, with the Berlin Iron Bridge Company at East Berlin, Conn., as designer; November, 1900, to November, 1901, with the Baltimore and Ohio Railroad Company at Baltimore, Md., as assistant engineer of bridges and buildings; November, 1901, to January, 1905, with the C. W. Hunt Company in New York, N.Y., first in charge of preparation of details, drawings of structural work and of general contract plans for bidding purposes, and later as executive engineer in charge of estimating, contracting, etc.; and January, 1905, to January, 1907, with the Locomotive and Machine Company at Montreal, Que. (a subsidiary of the American Locomotive Company), as chief engineer and general manager, having charge of the building and then the operation of its plant.

In 1907 he entered private practice as a partner in the firm of Waddell and Harrington, consulting engineers, Baltimore. From 1914 to 1928 he was senior partner in the firm of Harrington, Howard and Ash and after 1928 senior

partner in the firm of Harrington and Cortelyou, all specializing in the field of bridge engineering.

During his 35 years of consulting practice, Mr. Harrington was associated with the design and construction of several bridges in the United States, Canada and countries abroad. It is interesting to recall that his firm was associated with the construction of the bridge on the Don river at Rostov, Russia. His most outstanding contribution to bridge engineering was in the development of the vertical lift type of movable span. This is witnessed by the numerous patents for the firm's designs and the construction of twenty-seven lift spans.

In August, 1932, Mr. Harrington was called to Washington by President Herbert Hoover, to become a member of the Engineers Advisory Board of the Reconstruction Finance Corporation. He remained with the R.F.C. as chief engineer until 1934.

Mr. Harrington received from McGill University, in Montreal, the degree of Bachelor of Science in 1906 and that of Master of Science in 1908. In 1930 he received the honorary degree of Doctor of Engineering from Case School of Applied Science in Cleveland, Ohio.

Mr. Harrington joined the Institute in 1905 as a Member.

Chester Waters Larner, M.E.I.C., died at his home in Philadelphia, Pa., on June 11th, 1942. Born at Elizabeth, N.J., on March 31st, 1881, he was educated at the Baltimore Polytechnic Institute where he graduated in 1887. From 1900 to 1902 he was instructor at the University of Chicago. In 1902 and 1903 he worked as a designer with the New Jersey Bridge Company and from 1903 to 1906 he occupied the same position with I. P. Morris Company, Philadelphia. After having been employed for a few months as a mechanical engineer with International Steam Pump Company at New York, he joined the staff of Wellman-Seaver-Morgan Company of Cleveland, Ohio, as hydraulic engineer, in 1907, and remained in the same position until 1917.

In 1918 he became president of the Larner Johnson Valve and Engineering Company at Philadelphia serving in that capacity until 1922 when he became president of the Larner Engineering Company, a position he occupied at the time of his death. In 1927 he also became president of the Larner Machine Company.

Mr. Larner was the co-inventor of the Larner-Johnson valve. At one time, he was consulting engineer to the Baldwin Locomotive Works, and during the last war he served on the Naval Construction Board of the United States.

Mr. Larner joined the Institute as a Member in 1913.

Nathan Deane Paine, M.E.I.C., died at his home in Montreal on March 7th, 1943. Born at Berlin, N.H., on April 19th, 1892, he was educated at the University of New Hampshire where he graduated in electrical engineering, in 1913. Upon graduation, he joined the staff of Northern Ohio Traction and Light Company at Akron, Ohio.

In 1916, Mr. Paine came to Canada to join the staff of Price Brothers & Company Limited at Kenogami, Que., as electrical foreman. In 1922 he became superintendent of electrical operation and in 1925 he was made general electrical superintendent.

A few months ago, Mr. Paine had left Price Brothers to take a position with the Aluminum Company at Montreal where he was employed at the time of his death.

Mr. Paine joined the Institute as an Associate Member in 1927, and he became a Member in 1937.

HALIFAX BRANCH

S. W. GRAY, M.E.I.C. - - *Secretary-Treasurer*
D. C. V. DUFF, M.E.I.C. - *Branch News Editor*

The regular monthly joint dinner meeting of the Engineering Institute of Canada, Halifax Branch, and the Association of Professional Engineers of Nova Scotia was held in the Halifax Hotel on Thursday, February 25, 1943. Professor A. E. Flynn, Chairman of the Branch, presided.

The guest speaker for the evening was Mr. H. W. Lea, Director of the Wartime Bureau of Technical Personnel, Ottawa. He was accompanied by Colonel S. W. Beercoft, military advisor to the Bureau.

In his address, Mr. Lea explained how the bureau was organized in 1941. From this beginning in 1941 to date, the total registration of technically trained men had increased to more than 27,000. Mr. Lea stated that they did not expect the register figure to exceed 30,000 maximum, at any future date.

The body of Mr. Lea's address was given to the discussion of the Bureau's purpose, the Policy of Bureau, and its method of operation. The field of operations, he explained, includes all pure and applied science graduates and the field, from time to time, is being enlarged to encompass other groups of technically trained men.

Mr. Lea referred to students now in science courses in Canadian universities and pointed out that, in the event of an "emergency", these students could be called for military service and "the universities go out of business overnight." He stated that such a condition is not very probable, since the demand for technically trained men is steadily increasing and the medically fit students now take military training and have signified their intent to become technical service officers on completion of their courses.

Mr. Lea, after his address, answered several questions and in one instance when questioned "are there sufficient trained men available", replied that the Bureau carries a constant file of from 700 to 800 unfilled applications for trained personnel. These are ultimately filled but often the firm which makes the application must wait six months or more to obtain a man.

A vote of thanks was extended to Mr. Lea for his interesting address and it was evident by the applause that every member present appreciated the opportunity to hear about the regulation and control of all technical personnel throughout the Dominion.

HAMILTON BRANCH

W. E. BROWN, M.E.I.C. - *Secretary-Treasurer*
L. C. SENTANCE, M.E.I.C. - *Branch News Editor*

Monday, March 1st, was the occasion of the regular branch meeting; T. S. Glover, chairman of the branch, presided.

The speaker of the evening, E. R. Rowzee, Factory Manager of the Canadian Synthetic Rubber Company, dealt in a masterly fashion with numerous aspects of the pertinent subject, **Synthetic Rubber**.

As an effective introduction to the main topic, Mr. Rowzee outlined the history of the development of natural rubber.

Historical mention of rubber begins with Columbus, who brought the first natural rubber to Europe. It was not until 1839, however, that an obscure chemist, named Goodyear, discovered the process of vulcanization, and, thereby, made possible full utilization of this versatile material.

Rubber originally came exclusively from Brazil, and in an effort to maintain this monopoly, the Government placed an embargo on the export of seeds. An enterprising Englishman managed, however, to smuggle a ship load of seed out of the country. This seed was sprouted in England,

Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

and seedlings later transported to, and planted in, the Far East.

Intensive cultivation and cross-breeding raised the maximum yield of plantation rubber from 500 pounds per acre per year in 1910 to approximately 1,500 pounds per acre per year in 1939. Such production soon forced the Brazilian rubber off the market, and when the Eastern plantations fell into the hands of the Japanese, between 1,300,000 and 1,400,000 tons of the world's 1,500,000-ton yearly production was lost to the United Nations.

To replace this lost production, a gigantic industry, unique in history, has come into being. This billion dollar industry, synthetic rubber, started barely two years ago, is already beginning to produce.

The search for a satisfactory synthetic rubber began many years ago. Early destructive distillation had shown that Isoprene was the parent hydro-carbon from which rubber came by synthesis in the rubber tree. The first real step toward synthesis of rubber was taken in 1880, with the discovery that Isoprene could be produced from turpentine. The rubber-like material produced from Isoprene was, however, only a laboratory curiosity, and it has remained so, as no cheap source of isoprene has been found.

In the early 1900's, the advent of the motor car caused the price of rubber to skyrocket, and thereby provided incentive for the search for a suitable synthetic. First patents were issued in 1910, and named Isoprene, or Butadiene as the base, with metallic sodium as a catalyst.

No exploitation of these discoveries took place, and it was not until 1916 that rubber was produced in Germany from dimethyl Butadiene. By 1918 Germany had produced 4,000 tons of this rubber, but the two grades available proved either too hard, or too soft, for the majority of applications.

Interest lagged after the war, and it was not until 1925 that the present investigational work had its beginning.

In the United States, economics have dictated the use of Butanes and Butylenes, cheap by-products of the petroleum industry, as the major contributors of Butadiene. Additional Butadiene will be produced from grain.

In discussing Canada's part in the synthetic rubber programme, the speaker indicated that the Polymer Corporation project is probably the most complete now under construction. Five separate units are coordinated under one head to manufacture the basic ingredients, in addition to the actual synthetic rubber.

Mr. Rowzee ventured the opinion that synthetic rubbers will eventually replace natural rubbers to a large extent. Even at this time, the synthetic rubbers accomplish many tasks which are beyond the capabilities of natural rubber, and the present tremendous stimulation of research will undoubtedly produce even better and cheaper synthetic rubbers.

At the present time, the most expensive synthetics, specially rubbers, such as Buna N and Neoprene, are used for gasoline hoses, gaskets, and self-sealing gasoline tanks, which would be out of the question with natural rubber. Buna S, the general purpose rubber, is the chief source of tires. Butyl rubber has been found excellent for footwear, wire insulation, and in the manufacture of mechanical rubber goods.

At the conclusion of his talk, Mr. Rowzee answered many questions, during an animated half-hour discussion period.

Mr. H. A. Cooch extended the thanks of the gathering to the speaker for his excellent address.

Upon adjournment, the eighty members and guests retired to the anteroom for the customary refreshments.

MONTREAL BRANCH SOCIAL EVENING

O. Biedermann and W. W. Timmins at a not too serious moment.

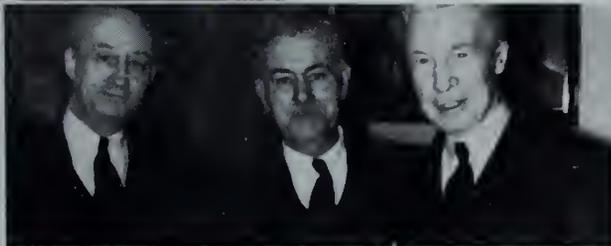

Branch Secretary L. A. Duchastel and Chairman R. S. Eadie pose with Professor G. J. Dodd.

W. G. Mitchell, G. O. Vogan and H. M. Scott.

M. S. Macgillivray listens closely to A. G. Moore.

G. MacL. Pitts, H. T. Doran and George R. MacLeod.

A group of students chatting with Professor Gaudefroy—left to right: J. Sansfaçon, B. Baribeau, H. Audet, P-E. Salvas, H. Gaudefroy, F. Boulva and L. Scharry.

P. E. Poitras, C. E. Gelin, R. Matte, W. E. Lauriault and E. Prévost.

KINGSTON BRANCH

R. A. Low, M.E.I.C. - Secretary-Treasurer

A special joint meeting of the Kingston Branch, E.I.C., the Ontario Association of Professional Engineers, and the Engineering Society of Queen's University was held in Convocation Hall, Queen's University on February 3rd to hear Prof. J. A. Van den Broek of the University of Michigan speak on **Theory of Limit Design**.

The meeting was under the chairmanship of K. M. Winslow and a capacity audience welcomed Prof. Van den Broek. The speaker was introduced by Dr. S. D. Lash who outlined the highlights of Prof. Van den Broek's career in an interesting manner.

Prof. Van den Broek outlined his theory of limit design. In 1942 he was awarded the Norman Medal from the American Society of Civil Engineers for this paper, and which has been presented in *The Engineering Journal*

An interesting discussion followed the lecture with student members showing keen interest in this new approach to design.

The speaker was thanked on behalf of the three societies by Prof. C. V. Armour.

C. V. Armour, M.E.I.C.

The regular February meeting of the Kingston Branch of the Institute was held on February 24th in Convocation Hall, Queen's University, with K. M. Winslow in the chair introducing the guest speaker, Dr. P. M. Haenni, Director of Research, Aluminum Laboratories Ltd.

Dr. Haenni surveyed the development of aluminum as a construction metal. He showed that this development was due principally to the discovery of suitable alloys and the introduction of methods of protection against corrosion.

The large increase in production during recent years was almost entirely due to the demands of the aircraft industry led by Germany in pre-war years. Along with the increase in production there has been a substantial reduction in cost of aluminum which is selling now at the lowest price in its history. In allied countries, all aluminum production is now devoted to military purposes. Dr. Haenni pointed out that, curiously, this is not the case in Germany since aluminum has been widely used there as a substitute for other non-ferrous metals. He also pointed out that in Germany it has been found necessary to utilize clay as a raw material in place of bauxite although the process of manufacture from clay is much more expensive.

The appreciation of the meeting was expressed by Col. L. F. Grant.

The March meeting of the Kingston Branch, E.I.C., under the chairmanship of K. M. Winslow, was held on March 11th in Convocation Hall, Queen's University, and took the form of a joint meeting with the Engineering Society of Queen's University. The guest speaker of the evening was Mr. Huet Massue of the Shawinigan Water and Power Co., Montreal.

Left to Right—R. A. Low, D. S. Ellis, J. D. Lee, Huet Massue, J. R. Carter, K. M. Winslow, S. D. Lash, Major J. P. Carrière, D. M. Jemmett.

The speaker was welcomed and introduced by Prof. R. A. Low, who pointed out that Mr. Massue was not only an engineer, but an ambassador of goodwill from our sister province, Quebec. He suggested that the programme committee might well arrange a series of similar meetings for branches throughout Canada whereby French and English engineers could fraternize and discuss their common problems.

Mr. Massue spoke on the **Heating of Dwellings with Coal, Gas, Oil and Electricity** and presented a composite picture of the economics of domestic heating, showing average plant installation and operating costs for the various methods and showed estimated power requirements for various Ontario and Quebec cities. Should the use of electricity become general for domestic heating, he emphasized the tremendous investment for plant that would have to be made before it could be put into general use.

The speaker was thanked in French by Mr. P. J. Bourgeois, Sc. '44, on behalf of the Engineering Society of Queen's University and Prof. D. M. Jemmett on behalf of the Kingston Branch.

Dr. L. Austin Wright, the general secretary, spoke briefly on the extensive programme of activities facing the Institute, and clarified the existing situation of the engineering students regarding National Selective Service.

Mr. Massue and Dr. Wright were guests at a courtesy dinner at the LaSalle Hotel given by the executive of the Kingston Branch prior to the meeting.

Left to Right—S. N. Graham, R. Hay, D. M. Jemmett, H. Stewart, W. A. Wolfe, S. D. Lash.

OTTAWA BRANCH

A. A. SWINNERTON, M.E.I.C. - Secretary-Treasurer
R. C. PURSER, M.E.I.C. - Branch News Editor

In honour of Mr. K. M. Cameron of Ottawa, Chief Engineer of the Department of Public Works and newly-elected President of the Engineering Institute of Canada, the Ottawa Branch of the Institute held a luncheon Thursday noon, March 18, at the Chateau Laurier. In the absence through illness of G. H. Ferguson, chairman of the local Branch, N. B. MacRostie, immediate past chairman, presided. Head table guests included the general secretary of the Institute, L. Austin Wright of Montreal; past presidents Dr. C. Camsell and G. J. Desbarats, both of Ottawa; Gordon Pitts of Montreal, president of the Royal Architectural Institute of Canada; W. P. Dobson of Toronto,

Left to Right: Councillor N. B. MacRostie, the Hon. Mr. Fournier, Deputy Minister E. P. Murphy, Past President G. J. Desbarats.

president of the Dominion Council of Professional Engineers, Commander C. P. Edwards of Ottawa; Hon. Alphonse Fournier, Minister of the Department of Public Works, E. P. Murphy, Deputy Minister, and others.

The luncheon was of an informal nature. The new president was introduced by the chairman. Mr. Cameron then spoke briefly emphasizing the part played by engineers in Canadian life and particularly in the Dominion Government service, with reference also to the cordial relations existing between the Canadian Institute and engineering organizations of United States.

Hon. Mr. Fournier then spoke, suggesting that engineers should take an important part in any post-war reconstruction plans. He also remarked upon the lack in public life generally of engineers and suggested that the country itself would be better off and the public in general would benefit if more of them for instance "were in the House of Commons."

E. P. Murphy, Deputy Minister, also spoke commenting upon the honour which his department had received in having one of its senior officers attain to the high office of President of the Institute.

Left to Right: G. MacL. Pitts, Past President Charles Camsell, President K. M. Cameron, N. B. MacRostie and the Honourable Mr. Fournier.

SAINT JOHN BRANCH

G. W. GRIFFIN, M.E.I.C. - *Secretary-Treasurer*

The Saint John Branch held a special meeting in the Admiral Beatty Hotel at 8 p.m. on March 19th. The subject of the meeting was the showing of a sound film in colours produced by the General Electric Co., entitled **The Inside of Arc Welding**. Members brought friends whom they thought would be interested, resulting in an attendance of 67. Notable among the gathering were welders from the Saint John Drydock and Shipbuilding Co., and the Cana-

dian Pacific Railway Co. The film proved most interesting to all and many favourable comments were heard regarding it.

Mr. A. O. Wolff, vice-chairman of the Branch, presided in the absence of Mr. D. R. Smith, Chairman.

ST. MAURICE VALLEY BRANCH

V. JEPSEN, M.E.I.C. - *Acting Secretary-Treasurer*

The annual meeting of the St. Maurice Valley Branch of the Institute was held on March 18th, 1943, at the Cascade Inn, Shawinigan Falls, under the chairmanship of the retiring chairman, Viggo Jepsen, with an attendance of twenty-four.

Regrets were expressed that such a small number were present. This, however, was no doubt largely due to unfavourable weather conditions in the days just previous to the meeting. In opening the meeting the chairman mentioned that he had a little trouble in keeping secretaries during the past year. The first appointee, Jack Sweeney, was a very promising and a very able secretary but joined up last fall with the R.C.A.F. and shortly after Eric Wheatley took over the duties of secretary-treasurer he was called by McGill University to help them to turn out more engineers.

The minutes from the previous year's annual meeting of April 22nd, 1942, were read by C. G. de Tonnancourt and adopted on the motion of Mr. H. G. Timmis and seconded by Mr. Stirling.

The chairman read the report of the branch meetings, as well as the membership reports. There had been five meetings apart from the annual meeting and the membership had increased to seventy-nine from sixty-two a year ago.

The chairman then explained that Headquarters have asked that a committee be set up in each of the four towns in our district and to be known as the Student Guidance Committee. Some of these committees had a little difficulty in getting started, but the Shawinigan Falls sub-committee had done excellent work and in the absence of its chairman, Dr. Healey, Mr. Dorion gave a short report on the activities there.

The other committee, as asked for by the Headquarters, was the Committee on Engineering Features of Civil Defence. This committee, which consisted of the two members from our branch who attended the Webster Lectures, Messrs. Wyman and Foster, together with Councillor Fregeau and Branch Chairman Jepsen. It had not started to function as yet and consequently no report was available, but hopes were expressed that work would soon be started.

The chairman also mentioned that Mr. Eaton of Shawinigan Falls had been appointed to represent the branch on the Institute Nominating Committee and that Mr. Fregeau had acted in a similar capacity on the committee of Provincial Professional Interests.

At the conclusion of the report from the committees the Chairman thanked all committee members for the work they had performed during the year.

Of new business, it was strongly suggested that the incoming executive set up a small committee to revise the branch by-laws which dates back as far as 1926. It was felt that these by-laws would be a great help to the executives if brought up to date.

The scrutineer's report was read and adopted on a motion by Mr. Timmis and seconded by Mr. Buchanan.

The new chairman was then introduced. Mr. Fregeau thanked the members of the Branch for having done him the honour of electing him chairman and introduced the other members of the executive committee for 1943.

Mr. Fregeau then asked Mr. Jepsen to introduce the guest speaker.

Mr. C. S. Kane, M.E.I.C., P.E.Q., Sales Manager for Dominion Bridge Co. Ltd., and president for the Canadian Institute of Steel Construction, in his talk stated that the public in general and even engineers as well as big industrial firms were inclined to sit back and say that the question

of post-war planning and reconstruction was up to the Government. He pointed out the fallacy of such sayings and emphasized that especially engineers should lead the way and point out to the government what plans could be made ahead of the actual winning of the war in order that the peace may also be won.

Mr. Kane went on to explain some of the points in his 19-point programme plan for post-war reconstruction, a copy of which was issued to everybody present.

A lively discussion took place at the close of the address and Mr. Kane was thanked very ably by the incoming vice-chairman, Mr. R. Dorion.

SASKATCHEWAN BRANCH

STEWART YOUNG, M.E.I.C. - *Acting Secretary-Treasurer*

The Saskatchewan Branch met jointly with the Association of Professional Engineers in the Kitchener Hotel, Regina, on Thursday evening, March 18, 1943. The meeting was preceded by a dinner at 6.30 p.m. The attendance was 30.

A paper on **The Effect of Aerial Bombing**, prepared by Dean I. F. Morrison, Professor of Applied Mechanics, University of Alberta, and illustrated by lantern slides, was read by D. A. R. McCannel in the absence of Professor Morrison who was unable to attend.

The paper, after describing the nature of various types of bombing, dealt briefly with the relative merits of different kinds of shelter—100 per cent no protection in the open, standing up, to almost 100 per cent protection underground. It also explained the theory of explosion. A hearty vote of thanks was accorded Professor Morrison for the very excellent paper and to D. A. R. McCannel for its presentation, on motion of W. O. Longworthy.

In concluding the meeting the Chairman, A. M. Macgilivray, expressed appreciation of the work of the retiring committee in charge of meetings under the leadership of F. C. Dempsey. The new committee will be under the direction of F. E. Estlin.

SAULT STE-MARIE

O. A. EVANS, M.E.I.C. - *Secretary-Treasurer*

The second regular meeting of the Branch for the year 1943 was held in the Grill Room of the Windsor Hotel, on Friday, February 26th, 1943. Forty-seven members and guests sat down to dinner at 6.45 p.m.

Before the dinner commenced, Chairman N. C. Cowie asked the members to rise and drink a toast to the king.

The chairman then called upon D. C. Holgate to introduce the speaker of the evening, D. C. Tennant, of the Dominion Bridge Company, Toronto, Ontario. In his address Mr. Holgate thanked the members for their kindness in allowing the structural class to participate in the meeting, and in introducing the speaker said that Mr. Tennant had a noteworthy career in the structural field and the Branch was fortunate in having a speaker of his calibre to address them.

Mr. D. C. Tennant, Engineer of the Ontario Division of the Dominion Bridge Company, spoke on **Steel Erection at the Algoma Plant**.

To begin with Mr. Tennant showed slides and gave an account of the moving of the travelling Coal Bridge and this has already appeared in the pages of *The Engineering Journal*. Continuing he dealt with the assembling of all necessary erection equipment including small tools and derrick parts from Toronto, other derrick parts and the high erection tower from Montreal, and locomotive cranes and smaller items from the Sault Structural Steel Company. He stressed the fact that most of the 109 foot tower and the derrick used in erecting the Blast Furnace and adjacent high structures such as Stoves, Dust Catcher, Stack, Elevator Shell and Skip Bridge—about 2,000 tons in all—had been taken from Dominion Bridge Company erection stock and had been used many times on different jobs with necessary adaptations.

Some special erection problems were noted such as the setting of derricks or travelers on adjacent high buildings or on top of the steel framing for a new roof where, on account of congestion of routine yard traffic, it would have been impossible to find room for the derrick on the ground. He summed up by pointing out that the successful design and operation of erection equipment depended on foresight and common sense on the part of the designer and a combination of caution, resource and co-operation on the part of the erection forces, than whom there are no finer group of men anywhere.

A few statistics were also given about the 200-ton crane to be installed in No. 2 Openhearth Building. It will be the heaviest crane in Canada although there are some others with greater lifting capacity.

At the conclusion of the address C. Stenbol and L. R. Brown moved a vote of thanks. J. O. Fitzgibbons moved that the meeting be adjourned.

PETERBOROUGH BRANCH

A. R. JONES, JR., E.I.C. - *Secretary-Treasurer*
J. F. OSBORN, S.E.I.C. - *Branch News Editor*

On February 18th, Mr. R. E. Hayes, Engineer, of the General Supply Company presented a paper before the local branch entitled **Earth Moving Takes Wings**.

Mr. Hayes enlarged on this arresting title by explaining how the technique of moving large masses of earth has speeded up in recent years. Specialized machines have been designed to meet the needs of to-day's vast construction projects. Airports with mile and a half long runways, urgent highway and power projects, each call for a different treatment on an unprecedented scale.

A large versatile machine called the Tourneau-Pull, a combined carrier and excavator came in for particular attention. Other machines of a more familiar type were mentioned and their use outlined. An unusually good talking picture accompanied the paper, illustrating the function of machinery on construction jobs.

The March 4th meeting was addressed by Mr. Wills Maclachlan, Chairman of the Committee on Industrial Relations of the E.I.C. and head of Employee Relations Department, Hydro Electric Power Commission of Ontario. Mr. Maclachlan spoke on **Employee Industrial Relations**.

Mr. Maclachlan stressed the necessity of mutual respect and confidence on the part of employer and employee. He pointed out that the right man can only be selected for a position after analyzing the job and the man's qualifications. Psychological and health examinations can be of great value.

The importance of making a man familiar with his work his surroundings and the general policy of the organization by which he is employed was stressed as was the necessity of adequate training. Wage schedules and the effect on these of various services rendered to the employees such as pensions, sick benefits, insurance, savings schemes, should be carefully explained to a new man. Mr. Maclachlan said that the policy of "equal pay for equal value of work" was now very generally accepted as being a fundamental of Industrial Relations. Great strides are being made toward giving human relations the attention they merit, and this is a process which is bound to continue and accelerate after the war.

Mr. Maclachlan's paper comes at a time when there is particular interest in this topic and was received with close attention by the audience.

TORONTO BRANCH

S. H. DE JONG, M.E.I.C. - *Secretary-Treasurer*
G. L. WHITE, AFFIL.E.I.C. - *Branch News Editor*

At the meeting of the Toronto Branch of the Engineering Institute of Canada, at Hart House, on Thursday, March 4th, Mr. E. L. Durkee, Bethlehem Steel Co., spoke on the **Rainbow Bridge**. The speaker was introduced by Dean C. R. Young, Faculty of Applied Science and Engineering,

University of Toronto, who acted as Chairman for the meeting.

In introducing the speaker, Dean Young referred to some of the many engineering achievements in which Mr. Durkee has played an important part. These include the Greater Extensions to the Tata Iron and Steel Company's plant in Tatanagar, India, involving the erection of 31,500 tons of steel mill building; the Outerbridge Crossing between Perth Amboy, N.J., and Tottenville, Staten Island, N.Y., a 750-ft. cantilever span and approaches built for the Port of New York Authority; the Cooper River Bridge in Charleston, S.C., which at the time of building was the fifth longest cantilever span in the world; an all-steel ocean pier 1,530 feet long built for the United Fruit Company, in Panama, in 1935; the Baton Rouge Bridge over the Mississippi River; and most recently, the Rainbow Bridge at Niagara Falls.

The Rainbow Bridge replaces the Falls View or Honeymoon Bridge which was destroyed by an ice jam in January, 1938. In view of what had happened to its predecessor, one of the first considerations in building the Rainbow Bridge was to provide for footings farther back and higher above the river in order to prevent any re-occurrence of the Falls View catastrophe.

The Rainbow Bridge is the longest fixed or hingeless arch span in the world, with a length of 950 feet between abutments. The roadway has a length of 1,200 feet between the vertical walls of the Niagara Gorge. In describing the construction of the bridge, with the aid of slides and excellent motion pictures, Mr. Durkee gave much interesting information on the nature of the design and the construction methods employed.

Successful erection of the arch ribs depended to a great degree on their accurate fabrication in the shops. As sections

of the rib were produced in the steel shop, they were assembled three or four at a time, and the form of this assembly was carefully checked to ensure that it would give a proper rise to the section of the arch into which it would be incorporated. The erection of the arch, of course, involved its support from each side of the river until a junction could be effected at the centre. The cables supporting the arch passed over the top of steel bents at the edge of the Gorge and back to suitable anchorage. The cables used were bridge strands which had been employed in the construction of the Golden Gate Bridge and the ill-fated Tacoma Bridge.

Most of the steel used for temporary structures during erection was eventually incorporated into the bridge. One of the most exacting jobs during construction was the adjustment of the cables supporting the arch. An arrangement was used in which two steel plates were mated to three other plates with properly spaced bolt holes. A set of split falls enabled the men to take the weight off the matched plates while any necessary adjustment was made.

The speaker described the method used in shifting the point of cable support outward as the arch progressed. As each part of the arch proceeded toward the middle of the river, modifications were necessary in the methods of getting steel sections to their proper locations.

Where the arches met at the centre, provision had been made for an 11 in. joint to be made by a fabricated keystone piece. The accuracy of the design, production of sections, and erection were shown by the fact that two sections of the arch met with a difference of only about one inch in their horizontal plane.

The completed bridge shows very simple and beautiful lines in keeping with the setting in which it is placed. From the point of view of safety, it is interesting to note that this dangerous piece of work was completed with no fatalities and no serious accidents.

News of Other Societies

ASSOCIATION OF PROFESSIONAL ENGINEERS OF NEW BRUNSWICK

Professor E. O. Turner, M.E.I.C., professor of civil engineering at the University of New Brunswick, Fredericton, was elected president of the Association of Professional Engineers of New Brunswick at the annual meeting held in the Admiral Beatty Hotel, at Saint John, on January 29th. Born at Harvard, Mass., U.S.A., in 1883, Professor Turner received his engineering education at the Massachusetts Institute of Technology where he graduated in 1914. In 1915 and 1916, he was engaged as a resident engineer with the Massachusetts Highway Commission and from 1916 to 1917 he was instructor of highway engineering at Polytechnic Institute of Brooklyn. In 1917, he enlisted and served as a Second-Lieutenant, Air Service, in the U.S. Army. In 1919 he became professor of civil engineering in charge of that department at the University of New Brunswick.

J. T. Turnbull, M.E.I.C., district highway engineer, Department of Public Works of New Brunswick, of Saint John, is the new vice-president of the Association.

ASSOCIATION OF PROFESSIONAL ENGINEERS OF ALBERTA

At the annual meeting of the Association held on March 20th, 1943, at Edmonton, Vernon Pearson, M.E.I.C., mechanical superintendent, Department of Public Works of Alberta, was elected president.

Born and educated in England, Mr. Pearson came to Canada in 1910 and was employed with Lethbridge Iron Works until 1914 when he became in charge of electrification of the Canmore Coal Company property at Canmore.

Items of interest regarding activities of other engineering societies or associations

In October, 1917, he became assistant chief engineer and a year later was appointed chief engineer. From 1919 to 1923, Mr. Pearson was superintendent of public utilities for the town of Macleod, Alta. In June, 1923, he was appointed

Vernon Pearson, M.E.I.C.

mechanical superintendent of the provincial government of Alberta. He resigned in 1928 to become manager of the Edmonton branch of Electrical Engineers Limited. From 1931 to 1934, Mr. Pearson was in private practice under the

firm name of Vernon Pearson Company. In 1930, he accepted the appointment of chief engineer and building superintendent of the Royal Alexandra Hospital at Edmonton, a position which he occupied until 1937 when he was appointed to the office which he now holds.

The other officers elected at the same meeting are: Vice-president, J. Garrett, M.E.I.C., general manager, Northwestern Utilities Limited, Edmonton; Councillors, N. W. Macpherson, M.E.I.C., highway commissioner, Department of Public Works, Edmonton; Professor J. W. Porteous, JR. E.I.C., department of electrical engineering, University of Alberta, Edmonton; A. Higgins, M.E.I.C., general mining engineer, Institute of Technology, Calgary, Alta.; J. S. Irwin, M.E.I.C., consulting petroleum geologist, Calgary, Alta.

The remaining councillors to act for one year are: A. Griffin, M.E.I.C., assistant manager, department of natural resources, C.P.R., Calgary, Alta.; P. M. Sauder, director of water resources, provincial government, Edmonton, Alta.; J. McMillan, M.E.I.C., purchasing agent, Calgary Power Company, Calgary, Alta.; E. H. Hunt, M.E.I.C., manager, exploration department, McColl-Frontenac Oil Company, Limited, Calgary, Alta.

QUEBEC CORPORATION HOLDS ITS ANNUAL MEETING

A. O. Dufresne, M.E.I.C., a mining engineer of great distinction, now deputy-minister of the Department of Mines of Quebec, was elected president of the Corporation of Professional Engineers of Quebec, at the annual meeting held on March 27th, at the headquarters of the Engineering Institute in Montreal.

Born at Montreal, Mr. Dufresne entered the Ecole Polytechnique in 1907 and graduated in mining engineering in 1911. He did post-graduate work at McGill University and obtained a degree of Master of Science from this

A. O. Dufresne, M.E.I.C.

institution in 1913. During the early years of his career he was engaged in geological surveys and prospecting work. He later built up a successful practice as a mining engineer, specializing in inspection work, geological examinations

and reports on mining properties. In 1929, he was called to head the Quebec Bureau of Mines as director. In 1941, Mr. Dufresne became deputy-minister of the Department of Mines, Province of Quebec.

The other officers elected at the same meeting are C. C. Lindsay, M.E.I.C., consulting engineer and land surveyor of Montreal, vice-president; A. D. Ross, M.E.I.C., manager of Canadian Comstock Company, Montreal, secretary-treasurer. The councillors for the current year are: J. A. McCrory, M.E.I.C., vice-president and chief engineer, Shawinigan Engineering Company, Montreal; Adhémar Laframboise, M.E.I.C., chief engineer, Eastern Canada Steel and Iron Works Limited, Quebec; J. O. Martineau, M.E.I.C., assistant chief engineer, Department of Highways, Quebec; P. E. Poitras, M.E.I.C., mechanical engineer, Steel Company of Canada, Montreal, E. A. Ryan, M.E.I.C., consulting engineer, Montreal.

The report from the Membership Committee showed that the efforts made to induce engineers to join the Corporation were very successful and the indications are that the results should be even more gratifying during the current year.

In his valedictory address, President McCrory stressed the importance of looking at the act establishing the Corporation with a real professional attitude. The purpose of this act was not so much to force engineers to join the Corporation as to assure the public that engineering work be carried on in the province only by those who are properly qualified.

A.I.E.E. NOMINATIONS

The National Nominating Committee of the American Institute of Electrical Engineers, consisting of members from various parts of the country, has nominated the following official ticket of candidates for the offices becoming vacant August 1, 1943:

For President:

Nevin E. Funk, Vice-President in Charge of Engineering, Philadelphia Electric Co., Philadelphia, Pa.

For Vice-Presidents:

(Middle Eastern District)—W. E. Wickenden, President, Case School of Applied Science, Cleveland, Ohio.

(Southern District)—C. W. Ricker, Professor and Head of School of Electrical Engineering, Tulane University, New Orleans, La.

(North Central District)—L. A. Bingham, Assistant Professor of Electrical Engineering, University of Nebraska, Lincoln, Neb.

(Pacific District)—J. M. Gaylord, Chief Electrical Engineer, Metropolitan Water District of Southern California, Los Angeles, Calif.

(Canada District)—W. J. Gilson, General Manager, Eastern Power Devices, Ltd., Toronto, Ont., Canada.

For Directors:

C. M. Laffoon, Engineering Manager, A.C. Generator Engrg. Dept., Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.

C. W. Mier, Engineer, Southwestern Bell Telephone Co., Dallas, Texas.

S. H. Mortensen, Chief Electrical Engineer, Allis-Chalmers Mfg. Co., Milwaukee, Wis.

For National Treasurer:

W. I. Slichter, Professor Emeritus of Electrical Engineering, Columbia University, New York, N.Y.

These official candidates, together with any independent nominees that may be proposed later in the manner specified by the Constitution and By-laws, will be voted upon by the membership at the coming election this spring.

Book notes, Additions to the Library of the Engineering Institute, Reviews of New Books and Publications

BOOK NOTES

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet the books are not in the Institute Library, but inquiries will be welcomed at headquarters or may be sent direct to the publishers.

A.S.T.M. STANDARDS ON PAINT, VARNISH, LACQUER, AND RELATED PRODUCTS

Prepared by Committee D-1 on Paint, Varnish, Lacquer, and Related Products; Specifications, Methods of Testing, Definitions of Terms. Dec., 1942. American Society for Testing Materials, Phila., Pa., 1943. 408 pp., illus., diags., charts, tables, 9 x 6 in., paper, \$2.25.

This compilation of standards contains in their latest form more than 120 specifications, tests and definitions relating to paint, varnish, lacquer and their constituents. A number of specifications and tests are new.

APPLIED KINEMATICS for Students and Mechanical Designers

By J. H. Billings, 2 ed. D. Van Nostrand Co., New York, 1943. 320 pp., illus., diags., charts, tables, 9 1/2 x 6 in., cloth, \$3.25.

The principles governing motion and the design of machine elements are presented. As far as possible, simple graphical methods are used. The illustrative material and problems are related to engineering practice. Special attention is given to acceleration.

(THE) ARMY ENGINEERS IN REVIEW

By B. W. Leyson. E. P. Dutton & Co., New York, 1943. 202 pp., illus., maps, charts, diags., 8 1/2 x 5 1/2 in., cloth, \$2.50.

This book describes the work of the Corps of Engineers of the U.S. Army in peace and in war. It also gives something of its history and tell how it is organized and trained. Young men interested in joining the Corps will find information on the training required and the fields of work.

BIBLIOGRAPHY OF THE LITERATURE RELATING TO CONSTITUTIONAL DIAGRAMMS OF ALLOYS (Institute of Metals Monograph and Report Series No. 2)

Compiled by J. L. Haughton. Institute of Metals, 4 Grosvenor Gardens, London, S.W.1, 1942. 163 pp., 8 1/2 x 5 1/2 in., stiff linen, 3s. 6d. net.

This valuable bibliography contains over six thousand references to publications on the constitution of alloys, arranged by alloys. In addition to the original publications, reference is also made to abstracts that appeared in "Metallurgical Abstracts".

ECONOMICAL MINERAL DEPOSITS

By A. M. Bateman. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 898 pp., illus., diags., charts, maps, tables, 9 1/2 x 6 in., cloth, \$6.50.

This work is intended primarily as an elementary textbook, but because of its comprehensiveness it will also be useful as a reference book to all those interested in the mineral industry. Part 1, on general principles and processes, describes the formation of mineral deposits and their kinds, and describes briefly the methods of prospecting, exploring and developing them, as well as methods of mining, milling and smelting. Parts 2 and 3 respectively discuss the deposits of metallic and non-metallic minerals. The value of the book is increased by numerous brief lists of carefully selected references.

ELEMENTARY MATHEMATICS

By H. Levy. Ronald Press Co., New York 1942. 216 pp., illus., diags., charts, tables, 8 x 5 in., cloth, \$1.50.

This is an interesting British text intended primarily to assist students of aeronautics in obtaining a solid foundation for further study. The explanations are clear and simple, and the range covered is a wide one, extending from whole numbers and fractions to the use of vectors, functions, etc. Students of science generally will find the book helpful.

ELEMENTS OF SUPERVISION

By W. R. Spriegel and E. Schulz. John Wiley & Sons, New York; Chapman & Hall, London, England, 1942. 273 pp., diags., tables, 9 1/2 x 6 in., cloth, \$2.25.

Present rapid industrial expansion has created a shortage of trained supervisors and a need for texts which describe the functions of supervisors and methods for training them. The present book meets this need by giving an account of the duties of the position, the problems involved and the ways of meeting them, and of practical methods of training.

ENGINEERING MECHANICS

By G. N. Cox. D. Van Nostrand Co., New York, 1943. 301 pp., diags., charts, tables, 9 1/2 x 6 in., cloth, \$3.00.

In preparing this textbook, the author has endeavoured to co-ordinate the desires of our engineering teachers as expressed in the surveys conducted by the Society for the Promotion of Engineering Education. The book is intended for undergraduate students majoring in engineering, and calls for a working knowledge of physics and the calculus.

(THE) FEDERAL POWER COMMISSION AND STATE UTILITY REGULATION

By R. D. Baum. American Council on Public Affairs, Washington, D.C., 1942. 301 pp., 9 x 6 in., paper, \$3.00; cloth, \$3.75.

This is a careful study of the relations with the states of the Federal Power Commission. The disputes as to jurisdiction that have arisen, the experience of the Commission in controlling water power, accounting, rates, etc., and the efforts for collaboration are discussed. There is a bibliography.

FOREMANSHIP AND SAFETY

By C. M. MacMillan. John Wiley & Sons, New York; Chapman & Hall, London 1943. 101 pp., illus., tables, 8 x 5 1/2 in., stiff paper, \$1.00.

This little book explains, in clear, simple language, the safety problems that confront the foreman and the way they should be handled. All important phases of everyday industrial accident prevention are discussed.

FREQUENCY MODULATION

By A. Hund. McGraw-Hill Book Co., New York and London, 1942. 375 pp., diags., charts, tables, 9 1/2 x 6 in., cloth, \$4.00.

This book is designed to meet the need for an engineering treatment of all phases of frequency modulation from the basic principles to the design of commercial apparatus. The treatment is a critical one, and the text is complete in itself. The book will be of use to the expert as well as to the student.

GAS WARFARE, the Chemical Weapon, Its Use and Protection Against It

By A. H. Waitt. Duell, Sloan & Pearce, New York, 1942. 327 pp., illus., diags., tables, 8 1/2 x 5 1/2 in., cloth, \$2.75.

A thorough, readable book of usefulness to both civilian and soldier. The nature of the gases used, their use in battle and methods of protection and first aid are covered. The tactics of chemical warfare are discussed in some detail.

(A) GUIDE TO CATHODE RAY PATTERNS

By M. Bly. John Wiley & Sons, New York; Chapman & Hall, London, 1943. 39 pp., diags., paper, loose-leaf binder, \$1.50.

This collection of cathode-ray patterns summarizes in convenient form the types encountered in the usual course of laboratory and test-bench work. Over one hundred forms are shown. These have been collected from many sources and brought together for ready reference.

HANDBOOK FOR PROSPECTORS AND OPERATORS OF SMALL MINES

By M. W. von Bernwitz, revised by H. C. Chellson. 4th ed. McGraw-Hill Book Co., New York and London, 1943. 547 pp., illus., diags., charts, tables, 7½ x 5 in., cloth, \$4.00.

This well-known work has again been revised and brought up to date. New tests have been added as well as new chapters on crystals, on ore dressing and treatment and weights and measures, calculations, etc. Details of the United States Mining Law are given. Especially, the data useful to the small-mine owner have been enlarged.

HANDBOOK OF BRICK MASONRY CONSTRUCTION

By J. A. Mulligan. McGraw-Hill Book Co., New York and London, 1942. 526 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$5.00.

The materials used in bricklaying and brick masonry construction are discussed in a practical way and more comprehensively than in any other book. Much information is provided on strength of masonry, on estimating brickwork, on special types and shapes and on tests. Such topics as underpinning with brickwork, boiler settings, fireplaces and chimneys, paving, swimming pools and timber arches are given special notice.

(THE) HYPERGEOMETRIC AND LEGENDRE FUNCTIONS WITH APPLICATIONS TO INTEGRAL EQUATIONS OF POTENTIAL THEORY

By C. Snow. U.S. Bureau of Standards, Washington, D.C., 1942. 319 pp., photo-offset of longhand, diags., 11 x 9½ in., paper, \$2.00.

This work has been compiled for workers in applied mathematics and is intermediate between tables of the numerical values of these functions and a treatise on their pure theory. The linear and quadratic transformations and analytic continuations of the ordinary hypergeometric function are derived and written out at length with special space devoted to the associated Legendre functions, and to a smaller extent Heun's generalization of the hypergeometric function. Many applications to potential theory are developed.

MACHINE DESIGN

By P. H. Hyland and J. B. Kommers. 3rd ed. McGraw-Hill Book Co., New York and London, 1943. 562 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$4.50.

This is a carefully illustrated college textbook covering the elements of machine design and containing numerous problems. This edition has been revised throughout, new material replacing old wherever necessary.

MANUAL OF SHIP CONSTRUCTION

By G. C. Manning, D. Van Nostrand Co., New York, 1942. 319 pp., illus., diags., charts, tables, 9 x 5½ in., cloth, \$2.75.

The purpose of this book is to explain the fundamental principles of naval architecture

to operating officers in the merchant marine and to cadets preparing for that service. The subject is treated as simply as possible, with emphasis upon the portions of most interest to the officer.

METALLOGRAPHY

By C. H. Desch. 5th ed. Longmans, Green & Co., London, New York and Toronto, 1942. 408 pp., illus., diags., charts, tables, 9 x 5½ in., cloth, \$8.00.

The new edition of this popular textbook is a reprint of the fourth edition with an appendix which calls attention to certain work done during recent years. The book affords a good introduction to the subject and is especially useful because of its ample references to the literature of metallography.

NOXIOUS GASES and the Principles of Respiration Influencing Their Action (American Chemical Society Monograph Series No. 35)

By Y. Henderson and H. W. Haggard. 2 rev. ed. Reinhold Publishing Corp., New York, 1943. 294 pp., diags., charts, tables, 9½ x 6 in., cloth, \$3.50.

In this work two experienced physiologists review the poisonous gases and vapors and discuss their effects and the methods of treatment. The book is designed for chemists, engineers and others engaged in industry, and covers all the noxious gases that occur in industry. The functions of respiration are considered, as well as methods of protection against poisoning.

PHOTOGRAMMETRY

By H. O. Sharp. 3rd ed. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1943. 129 pp., illus., diags., charts, tables, 11½ x 8½ in., cloth, \$3.50.

This book provides an exposition of the fundamental principles involved in both terrestrial and aerial photographic surveying, together with a discussion of the application of these principles to map making. The work is intended for use as a text and for office reference. The cameras, instruments and methods which have proved satisfactory are described. The analytical solution of photogrammetric problems is discussed as is the use of the photograph in land surveying. Map reproduction is treated in some detail.

PLASTICS, Problems and Processes

By D. E. Mansperger and C. W. Pepper. 2 ed., edited by W. H. Varnum. International Textbook Co., Scranton, Pa., 1942. 350 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$3.00.

This manual is intended for students of industrial art, home craftsmen and others interested in working plastics on a small scale. The materials available, tools needed and methods of working are described, and designs and instructions given for many useful or ornamental articles. Lists of suppliers of materials and equipment are given. The information is practical and well presented.

(THE) PRINCIPLES OF METALLOGRAPHIC LABORATORY PRACTICE

By G. L. Kehl. 2 ed. McGraw-Hill Book Co., New York and London, 1943. 453 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$4.00.

This textbook presents the principles of physical metallurgy which underlie effective laboratory practice, and is intended to bridge the gap between theoretical physical metallurgy and its practical application in the laboratory. The new edition follows the plan of the previous one, but has been revised to include recent advances.

QUESTIONS AND ANSWERS FOR MARINE ENGINEERS, Book III —AUXILIARIES

By G. L. Kehl. 2 ed. McGraw-Hill Book Co., New York and London, 1943. 139 pp., diags., tables, 8 x 5 in., paper, \$1.00.

This little manual contains material selected from the Questions and Answers department of "Marine Engineering and Shipping Review". The questions refer to practical difficulties encountered in operating pumps, condensers, refrigerating equipment, evaporators and other auxiliary equipment of ships.

RAILWAY ENGINEERING AND MAINTENANCE CYCLOPEDIA, 5th ed. 1942

Edited by E. T. Howson and others. Simmons-Boardman Publishing Corp., Chicago, Ill., and New York, N.Y., 1,224 pp., illus., diags., charts, maps, tables, 12 x 8 in., fabrikoid, \$5.00.

The Encyclopedia is designed to cover thoroughly the best practice of American railways with regard to the materials, devices and products used in the construction and maintenance of the fixed properties. Sections are devoted to Track, Bridges, Water Service, Signals and General Topics. Each technical discussion is supplemented by material prepared by manufacturers, discussing their products in detail. The new edition has been thoroughly revised and partly rewritten.

SHIP STRUCTURE AND BLUEPRINT READING

By H. L. Heed. Cornell Maritime Press, New York, 1942. 258 pp., illus., diags., charts, tables, 7½ x 5 in., cloth, \$2.50.

Blueprint reading is presented here solely from the point of view of men engaged in building ships. The shapes and structures which the prints represent are described in detail. A glossary of shipbuilding terms is given.

STRATIGRAPHY OF THE EASTERN AND CENTRAL UNITED STATES

By C. Schuchert. John Wiley & Sons, New York, 1943. 1,013 pp., illus., diags., charts, maps, tables, 9 x 6 in., cloth, \$15.00.

The main object of the late Dr. Schuchert's monumental work on the historical geology of North America is to present the data upon which are built a series of Raps depicting the ancient geographies, and to throw light upon the causes that change the relative levels of land and sea. In this, the second volume of the work, the author discusses the stratigraphy of thirty eastern and central States, including Texas. An enormous mass of data is organized systematically, with references to sources, forming a reference work of permanent usefulness.

STRUCTURAL GEOLOGY

By M. P. Billings. Prentice-Hall, New York, 1942. 473 pp., illus., diags., charts, maps, tables, 9½ x 6 in., cloth, \$4.50.

This is an elementary textbook, confined to the study of relatively local structural units, in which the emphasis is on principles, methods and technique. The structure of specific local areas is not discussed, except to illustrate principles. Laboratory exercises and problems are provided.

TABLE OF ARC TAN X

Prepared by the Federal Works Agency, Work Projects Administration for the City of New York, as a Report of Official Project No. 165-2-97-22, Mathematical Tables Project.

A. N. Lowan, Technical Director; conducted under the sponsorship and for sale by the National Bureau of Standards, Washington, D.C., 1942. 169 pp., tables, 11 x 8 in., cloth, \$2.00.

This table of the inverse tangent is claimed to be the most comprehensive yet published. The angle is given in radians, and the function is calculated to twelve decimals, calculated over the range of x from 0 to 10,000.

TELEVISION STANDARDS AND PRACTICE, Selected Papers from the Proceedings of the National Television System Committee and Its Panels

Edited by D. G. Fink. McGraw-Hill Book Co., New York and London, 1943. 405 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$5.00.

This volume has been compiled from the Proceedings of the National Television System Committee, on which are based the standards for television broadcasting in use in this country. The papers chosen for the present book are those that directly underlie the official standards. They comprise a symposium on the engineering problems of the television engineer and the radio industry.

(THE) THEORY AND PRACTICE OF HEAT ENGINES

By D. A. Wrangham. The Macmillan Co., New York; University Press, Cambridge, England, 1942. 756 pp., illus., diags., charts, tables, 10 x 7 in., cloth, \$10.50.

This is a general textbook, which provides an introduction to the various sections of this large subject. Air compressors and motors, reciprocating steam engines, steam condensers, steam turbines, gas, gasoline and oil engines, steam boilers, refrigeration, combustion, etc., are discussed with the aid of excellent diagrams.

(THE) THEORY OF THE PHOTOGRAPHIC PROCESS

By C. E. K. Mees. Macmillan Co., New York, 1942. 1,124 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$12.00.

During the last fifty years a fund of knowledge of the photographic process has been built up, which is scattered through many journals. The present volume is a general handbook of the subject, which provides a guide to the literature and a summary of its conclusions. The author has had the assistance of many specialists. There are bibliographies with each chapter.

TOOL DESIGN (Rochester Technical Series)

By C. Donaldson and G. H. LeCain. Harper & Brothers, New York and London, 1943. 443 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$3.75.

This textbook presents the general methods of tool design in a practical way, with many applications of the principles to practical problems. The design of punches, dies, gages, jigs, fixtures and cams is discussed, as well as the tooling of automatic screw machines and turret lathes.

TOOL DESIGN AND TOOL ENGINEERING

By J. G. Jergens. John G. Jergens, 4280 E. 119 St., Cleveland, Ohio, 1942. 106 pp., diags., tables, 11½ x 9 in., paper, \$2.00.

A collection of articles, drawings and tables of interest to tool designers and engineers. Includes many examples of clamps, cams, tools, fixtures, etc.

TRANSIENTS IN LINEAR SYSTEMS, Studied by the Laplace Transformation. Vol. 1. Lumped-Constant Systems

By M. F. Gardner and J. L. Barnes. John Wiley & Sons, New York; Chapman & Hall, London, 1942. 389 pp., diags., charts, tables, 9½ x 6 in., cloth, \$5.00.

This exposition of the subject is intended primarily for graduate students of electrical and mechanical engineering, but can also be used for graduate work in mathematical physics and applied mathematics. Volume one deals with lumped-constant systems. The book contains an extensive bibliography.

ULTRA-HIGH-FREQUENCY TECHNIQUES

By J. G. Brainerd, G. Koehler, H. J. Reich and L. F. Woodruff. D. Van Nostrand Co., New York, 1943. Ninth printing, 570 pp., diags., charts, tables, 9½ x 6 in., cloth, \$4.50.

This textbook was compiled to meet the demand for engineers and physicists with training in ultra-high-frequency work aroused by the war. It is based on a syllabus of the course now being given in various colleges, and represents the minimum basis for technical work in its field. In addition to the text, there is an excellent bibliography.

WEATHER SCIENCE, an Illustrated Outline of

By C. W. Barber. Pitman Publishing Corp., New York and Chicago, 1943. 248 pp., illus., diags., charts, tables, maps, 9½ x 6 in., cloth, \$2.50.

This concise textbook presents the course in meteorology, developed at the U.S. Naval Air Station at Lakehurst for training Naval Air Cadets. The subject is clearly presented, with profuse use of visual aids and with many questions.

PSYCHOLOGY FOR BUSINESS AND INDUSTRY

By H. Moore. 2 ed. McGraw-Hill Book Co., New York and London, 1942. 526 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$4.00.

This text is devoted especially to those aspects of psychology which have been shown to be of value in the business and industrial worlds. The practical personnel problems of testing applicants for positions, appraising employees, training, promotion, accidents, fatigue, etc., are discussed, together with the psychological factors in selling. The new edition has been carefully revised.

QUESTIONS AND ANSWERS FOR MARINE ENGINEERS, Book II—Engines

Compiled by H. C. Dinger. Marine Engineering and Shipping Review, Simmons-Boardman Publishing Corp., New York, 1942. 186 pp., diags., charts, tables, 8 x 5½ in., paper, \$1.00.

This book, containing a collection of questions and answers which have appeared in "Marine Engineering and Shipping Review", is the second of a series dealing with practical problems that confront marine engineers. This volume is concerned with steam engines, both reciprocating and turbine. The information deals with practically every situation.

READING AS A VISUAL TASK

By M. Luckiesh and F. K. Moss. D. Van Nostrand Co., New York, 1942. 428 pp., illus., diags., charts, tables, 8½ x 5½ in., cloth, \$5.00.

Describes the work of the authors in endeavouring to make a scientific analysis of the visual task of reading. The criteria of readability which have been developed, and the devices and techniques which can be used to measure readability are discussed, and certain conclusions drawn. The book is a pioneer effort in a relatively unexplored field. There is a bibliography.

SCIENCE IN PROGRESS

By H. Shapley, E. Hubble, H. A. Bethe, V. K. Zworykin, P. W. Bridgman, L. S. Marks, J. Franck, J. G. Kirkwood, P. H. Long and H. Mark; edited by G. A. Baisell. 3rd series. Yale University Press, New Haven, Conn.; Humphrey Milford, Oxford University Press, London, 1942. 322 pp., illus., diags., charts, tables, 9½ x 6 in., cloth, \$3.00.

Contains ten lectures by distinguished scientists who discuss the results of recent research work in various scientific fields. The subjects considered in this volume include: galaxies, the expanding universe, energy production in the stars, image formation by electrons, recent work in high pressures, power generation, photosynthesis, the structure of liquids, sulfanilamide and synthetic rubber.

The SCIENCE OF MECHANICS

By E. Mach, translated from the German by T. J. McCormack. Open Court Publishing Co., La Salle, Ill., and London, 1942. 635 pp., illus., diags., tables, 8 x 5½ in., cloth, \$3.50.

The new edition of this classic makes available again a work that has been out of print for more than a decade. It has been revised according to the ninth German edition, and the alterations and additions formerly printed as appendices and in a supplementary volume have been incorporated in the text, with great improvement in readability.

STRESSES IN FRAMED STRUCTURES

Edited by G. A. Hool and W. S. Kinne, revised by R. R. Zipprott and G. C. Ernst. 2 ed. McGraw-Hill Book Co., New York and London, 1942. 642 pp., diags., charts, tables, 9½ x 6 in., cloth, \$5.00.

The first edition of this reference book on the stresses in framed structures appeared twenty years ago and has been widely used. The present edition has been thoroughly revised to correspond with modern practice. The book covers the principles of statics, reactions, moments and shears in beams and trusses, influence lines, methods of computing stresses in roof and bridge trusses, determination of stresses in lateral trusses and portal bracing, etc.

STRUCTURAL PETROLOGY OF DEFORMED ROCKS

By H. W. Fairbairn. Addison-Wesley Press, Kendall Square Bldg., Cambridge, Mass., 1942. 143 pp., illus., diags., charts, tables, 11 x 9 in., paper, spiral binding, \$5.00.

The subject of structural petrology has aroused increasing interest during the last decade, and this book is a welcome addition to the small number available. The author presents an up-to-date account of knowledge in this field, with some attempt at interpretation of the facts. The book is intended for experienced geologists and petrographers, not for beginners. There is a full bibliography.

TOWN PLANNING AND ROAD TRAFFIC

By H. A. Tripp, foreword by P. Abercrombie. Edward Arnold & Co., London; Longmans, Green & Co., New York, 1942. 118 pp., diags., charts, 9 x 5½ in., cloth, \$3.25.

The author, who is Assistant Commissioner of Police at Scotland Yard, has attempted to "review in outline the whole field of traffic direction, its supervision and control, the making and enforcement of traffic law, and the relevant problems of public opinion and psychology, and of town and country planning."

DIFFERENTIAL EQUATIONS

By R. P. Agnew. McGraw-Hill Book Co., New York and London, 1942. 341 pp., diags., charts, tables, 9½ x 6 in., cloth, \$3.00.

Offers a first course in the subject for those with a working knowledge of algebra, trigonometry and elementary calculus. Is intended to give a mastery of the techniques by which differential equations are obtained and solved, and by which the solutions are applied.

PROCEEDINGS OF THE FIRST SOUTHERN CALIFORNIA MANAGEMENT CONFERENCE

"Manning and Managing Our Arsenal," held at California Institute of Technology, Pasadena, (apply), May 2, 1942. 49 pp., tables, 11½ x 9 in., paper, \$1.00.

The papers here presented under the general theme of "Manning and Managing Our Arsenal" discuss such fundamental subjects as inventory and production control, the training of workers, and foremanship. In addition, attention is given to current problems of production, co-operative subcontracting, retooling for war work, and women in war industries.

(Continued on page 237)

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

FOR ADMISSION

April 1st, 1943

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the May meeting.

L. AUSTIN WRIGHT, General Secretary.

*The professional requirements are as follows:—

A Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

BEEDHAM—GEORGE HERBERT, of 29 Clowes Ave., Leaside, Ont. Born at Sheffield, England, Sept. 21st, 1894; Educ.: 1908-12, evening classes, dept. of applied science, Sheffield Univ., 1909-13, ap'ticeship in engrg., B. M. Renton Co., Sheffield. Course in metallurgy (lectures only), Ont. Chapter, Amer. Soc. for Metals; 1915-17, journeyman fitter and turner i/c forge repairs, Thos. Firth & Sons, Sheffield; 1917-19, engine room artificer, destroyers and submarines, Royal Navy; 1919-20, tool designer, Lincoln Machine Tool Co., Pawtucket, R.I.; with J. & J. Taylor, safe works, Toronto, as follows: 1913-15 and 1919 (Apr.-Aug.), dftsman., 1920-29, senior dftsman., design work on numerous bank vault jobs, also safes for radium protection, etc., 1929-36, chief dftsman and vault engr., 1936-37, vault engr., doing technical engr. in South Africa, Australia, New Zealand, setting up exhibits, etc., 1937-39, design and engrg. on new prison at Hull, Que., etc.; 1939 to date, mech. engr., Lablaw Groceries Co., Toronto, i/c all mech. equipment in 114 stores and large warehouse and mfg. depts., power plant, refrigeration and air conditioning plant, etc.

FOR TRANSFER FROM STUDENT

CLEVELAND—COURTNEY ERNEST, of Vancouver, B.C. Born at Vancouver, Feb. 22, 1910; Educ.: B.A.Sc., Univ. of B.C., 1934; M.Sc., 1938, Ph.D., 1940, McGill University; R.P.E. of British Columbia; Summers—1926-27, rodman, Hydro Electric Power and Railroad service; 1929, assayer, Premier Gold Mines, Ltd., 1930, concrete inspr. Burrard St. Bridge, 1931-34, geological mapping, Geological Survey of Canada; 1934-41, with Bralorne Mines, Ltd., B.C., as follows: 1934-35, surveyor's helper, 1935-38, mine geologist, 1938-39 (summers) and 1940-41, examination engineer; 1941-42, development engr., Canbrae Expl. Co.; 1942-43, development engr., and at present geologist and engr. at Takla Mercury Mine (Bralorne Mines Ltd.). Also in full charge of camp constrn. and diamond drill programme. (St. 1937).

References: E. A. Cleveland, W. H. Powell, F. G. Smith, J. N. Finlayson, J. B. Challies.

HOAR—CHARLES RICHARD, of 12210-109 A Ave., Edmonton. Born at Woodleigh, N. Devon, England, Dec. 25, 1917; Educ.: B.Sc. (Elec.) Univ. of Alta., 1940; 1940-41, junior engr., Calgary Power Co. Ltd.; at present senior A.I.D. Inspector, Br. Commonwealth Air Training Scheme, Edmonton. (St. 1940).

References: E. G. Cullwick, H. B. LeBourveau, W. E. Cornish, H. Randle, T. D. Stanley.

OSBORNE—JOHN FOLLETT, of 554 Reid St., Peterborough. Born at Montmartre, Sask., Aug. 21, 1914; Educ.: B.Sc. (Elec.), Univ. of Man., 1936; R.P.E. Ontario; with Canadian General Electric Co., Peterborough, as follows: 1937-38, test dept., 1938-40, foreman, test dept., 1939-43, asst. engr., Industrial Control Engrg. Dept. (St. 1936).

References: J. Cameron, W. T. Fanjoy, D. V. Canning, A. L. Malby, R. L. Dobbin.

ROSS—OAKLAND KENNETH, of 204 Cote St. Antoine Rd., Montreal. Born at Montreal, Sept. 29, 1911; Educ.: B.Eng. (Mech.), McGill Univ., 1934. With Continental Can Co., Montreal, as follows: 1934-35, general foreman, 1935-38, asst. factory mgr., 1938 to date, factory mgr. (St. 1934).

References: E. A. Hankin, P. B. French, A. R. Roberts, E. Brown, R. DeL. French, C. M. McKergow.

LIBRARY NOTES

(Continued from page 235)

REFRACTORIES

By F. H. Norton, 2 ed. McGraw-Hill Book Co., New York and London, 1942. 798 pp., illus., diagrs., charts, tables, maps, 9½ x 6 in., cloth, \$7.50.

Since the publication of this treatise, ten years ago, much new information has accumulated, and has called for complete revision. To this edition there have also been added a chapter on Fundamental concepts of matter in the solid state and five chapters on the selection and use of refractories in furnace construction in various industries. The work provides a good account of the fundamental processes involved in manufacturing and using refractories, and of the process in current use in the United States.

REPORT OF THE COMMITTEE ON SEDIMENTATION 1940-41, with charts for the Determination of Detrital Minerals.

National Research Council, Division of Geology and Geography, Washington, D.C., March, 1942. 110 pp., Charts, tables 11 x 8½ in., paper, \$1.00 (separate copies of Charts, 50c.).

This pamphlet includes the general report of the chairman, and also ten supplementary reports upon special investigations in the field of sedimentation. Among these are "Tables for the determination of detrital minerals," prepared by R. Dana Russell.

SIMPLIFIED DEFINITIONS AND NOMENCLATURE FOR AERONAUTICS, 1942 illustrated edition, a Modern Aeronautical Dictionary

By L. Thorpe. Aviation Press, San Francisco, Calif., no pagination, alphabetical arrangement, illus., diagrs., charts, tables, 9½ x 7 in., paper, \$2.00.

This glossary of aeronautical terms contains about fifteen hundred definitions and explanations of words and phrases, accompanied by numerous drawings illustrating them. It is based on the nomenclature report of the National Advisory Committee for Aeronautics, supplemented by terms from other sources.

THE STONE THAT BURNS, the Story of the American Sulphur Industry

By W. Haynes. D. Van Nostrand Co., New York, 1942. 345 pp., illus., diagrs., maps, tables, 8½ x 5½ in., cloth, \$3.75.

The story of the American sulphur industry is told at length, beginning with the first unsuccessful attempts to mine it in Louisiana. The growth of the industry following the successful introduction of the Frasch process is carried up to the present time, with some remarks on its future. The book is well documented and includes considerable statistical material.

TABLE OF SINE AND COSINE INTEGRALS from 10 to 100

Prepared by the Federal Works Agency, Work Projects Administration for the City of New York, conducted under the sponsorship of and for sale by the National Bureau of Standards, Washington, D.C., 1942. 185 pp., charts, tables, 11 x 8 in., cloth, \$2.00.

This volume supplements the two previous volumes of "Sine, cosine and exponential integrals" by providing sine and cosine integrals, calculated to ten decimal places, for the range of x between 10 and 100, at intervals of 0.01. These integrals are encountered in many branches of physics and electrical engineering, and the volume is expected to meet the needs of workers in these fields.

Employment Service Bureau

NOTICE

Technical personnel should not reply to any of the advertisements for situations vacant unless—

1. They are registered with the War-time Bureau of Technical Personnel.
2. Their services are available.

A person's services are considered available only if he is—

- (a) unemployed;
- (b) engaged in work other than of an engineering or scientific nature;
- (c) has given notice as of a definite date; or
- (d) has permission from his present employer to negotiate for work elsewhere while still in the service of that employer.

Applicants will help to expedite negotiations by stating in their application whether or not they have complied with the above regulations.

SITUATIONS VACANT

MECHANICAL ENGINEER. Either capable of making mechanical repairs to power shovels, tractors, etc., or willing to learn. Tropical assignment. Apply to Box No. 2619-V.

EXPERIENCED TRANSITMAN for railway engineering work. Apply to Box No. 2629-V.

CIVIL ENGINEER, must be capable of supervising plant and small town house construction. Tropical assignment. Apply to Box No. 2630-V.

SITUATIONS WANTED

CIVIL ENGINEER, 38, experienced in all types of building construction and in industrial layout work. Wants permanent or temporary position in charge of design or construction. Present location, Montreal. Apply to Box No. 576-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., 17 years experience as production manager and factory organizer in metal and various other industries, military exempt, available on short notice. Apply to Box No. 1730-W.

SURVEYING INSTRUMENTS FOR SALE

SIMPLE THEODOLITE, Stackpole and Bros. Telescope, 10" long, 1 1/4" dia. O.S.
Compass, 5 1/4" dia.
Table, 7 1/4" dia.

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.

Scale, 6 1/4" dia.
Height of C.C. of telescope above levelling table, 10 1/2".
Spirit levels, 3 1/4" long x 1/2" dia.
Levelling screws, 4.
Condition of instrument and lenses—excellent.
Complete with tripod and plumbob in wooden case.

Y LEVEL, Watts (bright brass).
Telescope, 10 1/2" long, 1 1/4" dia. O.S.
Height of C.C. of telescope above levelling table, 5 1/2".
Levelling screws—4.
Base plate, 3 1/2" dia.
Complete in wooden case, with tripod.
Condition of instrument and lenses, good; one indexed lens appears to require cleaning.

SURVEYOR ARROWS, one set (11), 1 1/8" sq. x 14" long. Condition, new.

STADIA ROD, 12 ft. (7 ft. closed). Condition, new.

LEVELLING ROD, 16 ft. (6 ft. closed). Condition, excellent.

PICKETS, iron-shod, 2-5 ft. Condition, good.

STEEL TAPE, 66 ft., 3/8", Chesterman, on reel. Condition, good.

STEEL TAPE, 66 ft., 5/8", on fibre reel. Condition, good.

STEEL TAPE, 100 ft., 1/4" on reel. Condition, good.

STEEL TAPE, 200 ft., 1/4" on reel. Condition very good.

STEEL TAPE, 100 ft., 3/8" (ft. and 10ths.). Leather case. Condition, very good.

MINER'S DIP COMPASS, W. S. Darley, in case. Like new.

SET OF 65 RAILROAD CURVES, in wooden case. Like new.

C.C. Moler-Line loss and voltage drop slide rule. Like new.

Full leather map-case, 5 1/2" dia. x 40" long. Condition, good.

Matthews Teleaheight Level, in leather case. Condition, good.

Offers will be considered. Apply to Box No. 48-S.

REQUIRED IMMEDIATELY

Chemical, Civil, Mechanical
and
Metallurgical Engineers
For Production Supervision

DOMESTIC AND FOREIGN ASSIGNMENTS ESSENTIAL WAR WORK

Apply to Box No. 2622-V
The Employment Service Bureau
The Engineering Institute of Canada,
2050 Mansfield Street,
Montreal, Que.

FOR SALE

Transits, theodolites, compasses, levels, clinometers, hand-levels, pickets, tapes, rods (10', 15' and 20' slab), other accessories. Draughting boards and instruments; planimeters, electric-motored erasers, plan-binders, scales, etc. Apply to Ralph Kendall, M.E.I.C., 93 Maynard Street, Halifax, N.S. Telephone 4-2849.

FOR SALE

Thacher Calculating Rule in mahogany case, good condition. Apply to Box No. 49-S.

ELECTRICAL OFFICERS FOR R.C.N.V.R.

A limited number of vacancies exist in the Royal Canadian Naval Volunteer Reserve for young graduates in electrical engineering possessing suitable personal qualities and engineering experience.

Applicants should complete an "Offer of Service" form, which may be obtained from the nearest R.C.N.V.R. Barracks, and should attach to it a detailed account of educational qualifications and engineering experience, together with copies of properly attested testimonials.

Successful applicants will be entered as Probationary Electrical Sub-Lieutenants or, in the case of exceptional qualifications, as Electrical Sub-Lieutenants. Their duties after a period of training will consist of electrical engineering work in connection with any of the following: Design and Manufacture; Ship Installations; Testing and Trials; and Base Maintenance. Applicants must be prepared to go to sea. Completed forms should be returned to the Deputy Secretary, Naval Board, Department of National Defence, Ottawa, Ont.

It's Good Engineering to Buy War Bonds!

THE ENGINEERING JOURNAL

“To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public.”

ANNIVERSARY

A FOREWORD BY THE PRESIDENT

TWENTY-FIVE years is a long time in the life of a person or an institution, and yet it seems but a short time since *The Engineering Journal* made its first appearance. In May nineteen hundred and eighteen, with the inauguration of the *Journal*, the Institute took a long step forward—a step that has been well justified by the contribution made not only to the Institute but to the profession of engineering in Canada. With this number the *Journal* starts out on its next cycle of service.

There is a great responsibility in circulating to the public, printed word of any kind. The Institute accepted this responsibility twenty-five years ago, and has steadily maintained standards of quality and progress that have been fitting to a professional society; that have brought knowledge and gratification to the membership. The *Journal* has been the chief repository for the story of engineering progress and accomplishment throughout Canada.

The early ambition of the founders of this Institute, that all engineers in civilian occupations should be given a chance to join together in one society, has been a sound one. No one speaks more approvingly of this feature of the Institute than do members of the profession in the United States. On every occasion they express their admiration of our set-up and continually admonish us to remain “free of the curse of extensive segregation by specialization.” The *Journal* has had an important part in maintaining this broad policy, and will continue to aid the cause of the entire profession rather than any one section of it.

I am sure that in acknowledging the attainments of the *Journal* I am speaking for all members of the Institute. Some persons have more opportunity to read the *Journal* than have others; not all members are able to contribute papers, but I do believe the membership generally appreciate the good work done by the *Journal* in establishing itself in a difficult field, and in steadily reaching new levels of attainment in numbers of papers published, circulation, advertising and reader interest.

It is appropriate that for such an occasion there should be a review of events in those fields where the engineer has taken a prominent part in the development of technique and the shaping of policy. The following pages tell in brief but interesting form the story of twenty-five years progress in Canadian industry and science. They also bring greetings from prominent members, officials and sister societies.

For the future it is impossible to prophesy, but we may face it with the hope that good shall conquer evil, and that shortly man's fertile mind may be relieved from the accomplishment of destruction and restored to the contemplation of the way of enduring peace and prosperity, with freedom. In all this *The Engineering Journal* will continue to take its share of responsibility and will maintain its interest in the welfare of the country and of the profession.

K. M. CAMERON, *President.*

MESSAGES

W. L. MACKENZIE KING
Prime Minister of Canada

ON THE occasion of the 25th anniversary of *The Engineering Journal*, in May of this year, I should like to extend my warmest congratulations and best wishes both to *The Engineering Journal* itself, and through it, to the officers and members of The Engineering Institute of Canada.

I should like to express appreciation of the value of the many contributions made by members of the engineering profession in building up our country and improving its industrial life, both in peace and in war. I should also like to acknowledge with thanks the helpful manner in which The Engineering Institute, through its various special committees, has co-operated with government agencies in dealing with such important matters as Civil Defence, Industrial Relations and Post-War problems.

The engineering profession is in an exceptional position to aid in the nation's war effort. It is gratifying to know that the engineers of Canada are fully cognizant of the value of their highly specialized skills, and are so zealously devoting their endeavours towards victory.

★

LIEUT.-GENERAL A. G. L. McNAUGHTON
G. O. C.-in-C. First Canadian Army

I WELCOME this opportunity of sending a short acknowledgment of the 25th Anniversary of *The Engineering Journal*.

In this war of highly-mechanized, fast-moving armoured forces, engineering plays a greater part than ever before. Ours is a citizen army in which the vast majority of officers are civilians and, in the technical arms, it is their engineering experience in civil life that has enabled them to handle their very diversified military jobs efficiently.

Highly trained and experienced engineers are required for commissions, not only in the R.C.E., but also in the R.C.A., the R.C.C.S., the R.C.O.C., and the R.C.A.S.C. Such men are to be found in The Engineering Institute and in the provincial associations. I thank you for your past help and in supplying this demand and bespeak even greater efforts for the future.

Looking back 25 years to the birth of your *Journal*, brings us to the spring of 1918, the fourth year of the last war. This, your 25th Anniversary, is the spring of the fourth year of this war. May 1943 also end, as did 1918, with the unconditional surrender of the enemy.

THE AMERICAN SOCIETY OF CIVIL
ENGINEERS

George T. Seabury, *Secretary*

UPON INSTRUCTION by the Board of Direction of the American Society of Civil Engineers, I am to extend to the officers and members of The Engineering Institute of Canada congratulations upon the birthday of one of the important activities of the Institute.

Your *Engineering Journal* has a secure place in the field of technical literature. This it has attained through adherence to the high ideals of your organization. Mere extent of service is perhaps not so important as its quality. Nevertheless, it must be a sincere satisfaction to you to contemplate the completion of a full quarter century.

Our best wish for the *Journal* at this anniversary is that it may continue to add to its scope and usefulness. May the spirit that prompted its initiation twenty-five years ago and that has guided it continually since then continue to burn brightly and to produce increasing results of value to the engineers of Canada—and incidentally, to those of the United States.

These good wishes to your Council, and to the entire membership of the Institute express the sentiments of our Society through its Board of Direction. Again our congratulations upon this significant event in the life of *The Engineering Journal*.

★

THE AMERICAN SOCIETY OF MECHANICAL
ENGINEERS

Harold V. Coes, *President*

ON BEHALF of The American Society of Mechanical Engineers may I take this opportunity of congratulating The Engineering Institute of Canada on the twenty-fifth anniversary of *The Engineering Journal*. The Engineering Institute of Canada serves the entire engineering profession of the Dominion and hence the task of holding together the widely diversified interests of engineers falls heavily upon *The Engineering Journal*.

The American Society of Mechanical Engineers has taken great satisfaction in the much closer ties which have developed between it and The Engineering Institute of Canada during the last few years. We look forward to greater co-operation when the ending of the war should make it possible for the engineers of the two countries to devote their energies to reconstruction and peaceful developments.

MILITARY ENGINEERING

MAJOR-GENERAL C. S. L. HERTZBERG, M.E.I.C.
Chief Engineer, First Canadian Army, Overseas.

GENERAL

Before attempting a detailed discussion of the effect the past twenty-five years have had on the activities of engineers in war, consideration should be given, very briefly, to the factors that have brought about the resulting changes.

The year 1916 saw the advent of tanks and, by 1918, the range and carrying capacity of the aeroplane had increased enormously. The possibilities and advantages of complete mechanization were becoming evident. In Germany, during the ensuing 21 years, plans and preparations were made to wage war to the utmost on the lines that were indicated in 1918—the dawn of mechanized, scientific war of a ruthlessness never before dreamed of. The war in Spain provided the opportunity of testing the effectiveness of the new technique.

Mechanization has resulted in an enormous increase in the speed, density and loads of vehicles.

Long range air bombing necessitates road and bridge maintenance in areas far removed from the actual battle.

Improvement in artillery, with the increased range and armour-piercing performance of projectiles, has led to heavier armour and so to heavier bridges over which the armour must pass.

These new offensive weapons have been developed by engineers and their fellow scientists and, to the engineer also falls the task of producing their antidotes.

BRIDGING

In Europe during the last war, except for the rare occasions when armies measured a day's advance in miles rather than in yards, bridging equipment was kept in storage in the back areas. Existing bridges on lines of communication were not likely to be destroyed by aerial bombardment, and enemy sappers, with explosives, could not be landed in gliders or dropped by parachute to deal with them. To-day, in a country where rivers abound, bridging equipment capable of carrying the heaviest military loads must be available, on wheels, well up in an advancing column. In addition to this, an adequate supply of equipment must be kept on hand to repair or rebuild bridges that may be destroyed by long range aerial bombing.

As operational bridges cannot be lifted and re-used further forward until after rear formations have had time to replace them by more permanent structures, a never-ending flow of equipment must be maintained from the base to the van of the army. Sappers must be available, all along the line, to use this equipment to enable the army to advance and to maintain the supply routes that make the advance possible.

In the last war, existing civilian bridges were nearly always strong enough to carry the heaviest military loads. To-day this is not the case and it is an engineer's responsibility to investigate—either from existing records or from

A new type bridge is under construction in Sussex. This is the first time the "derrick and preventor" method of launching has been carried out. Two double truss girders, each weighing 27 tons, and 140 ft. in length form the main part of the bridge. A derrick is erected to pull, by winch, the girders across the river. A cable and winch is secured to the opposite end to prevent the girder toppling when past point of balance. The first girder almost across. This is the most critical stage of the operation.

reconnaissance—the capacities of all existing bridges in the theatre of operations.

ROADS

Road construction and maintenance have been effected in the same way. The surprising way in which English roads have stood up to the severest military traffic may prove to be misleading when we operate in other countries. Existing road surfaces must be maintained and, in some cases, widened.

Enemy action, both from aerial bombs and deliberately placed demolitions, cause extensive damage at far distant points, and sapper parties, with the most modern equipment, must be available to make repairs. The pick and shovel have given place to bull-dozers, auto-patrol graders, and other modern mechanical equipment.

The rapid building of temporary road diversions

presents many problems. Approaches to military bridges, as well as roads to by-pass obstacles, may be required to carry thousands of heavy vehicles, both tracked and wheeled, over soft ground. Continuous maintenance is required on such roads and materials must be readily available.

The provision of tracks across beaches for assault landings, such as that at Dieppe, must be made by sappers, under heavy fire, after they have cleared the beach obstacles.

AIR LANDING FIELDS

Air support is essential to the operation of armies, and the rapid construction of landing fields must follow closely in the wake of an advance. Maps and aerial photographs provide an indication of where suitable fields may be expected, but the sites must be carefully reconnoitred by sappers moving with the foremost formations. As soon as a site has been chosen, the sappers move forward with plant and material to prepare the field for use.

The site may be an abandoned enemy air field, in which case it will probably have been so demolished that a virgin site is preferable. In any case, the sappers must be prepared to do a considerable amount of grading and removal of trees before they can start preparing the surface. This work must be done in a matter of days—sometimes hours—if the advance is to go forward on schedule.

DEMOLITIONS

Since the last war, great strides have been made in explosives and in the technique of demolishing obstacles of all kinds. All sappers must be trained to decide on the most efficient type of charge and to calculate the amount required for each demolition. They must also be skilled in placing the charges and in connecting them up for firing.

Obstacles may consist of extensive mine fields, concrete road blocks, wire entanglements, concrete pill boxes, etc., all of which are well covered by enemy fire. The removal of each type of obstacle requires a particular kind of demolition.

BOMB DISPOSAL

Delay-action aerial bombs have provided engineers with the difficult and dangerous job of removing them or of rendering them innocuous *in situ*. These are dropped from great heights and some are extremely heavy. They penetrate to great depths and, as they follow a curved path through the soil, they are very difficult to locate. The time of delay cannot be foretold and work on them must be as rapid as possible. A minimum number of men, consistent with speed, are exposed to the danger of detonation. Much work has been done on methods of locating such bombs and of making them harmless.

GENERAL

I have dealt only with a part of the work done by the Corps of Royal Canadian Engineers and have said nothing of the field survey unit; the tunnelling companies who have done such good work at Gibraltar and throughout this island from Land's End to John o'Groats and even further north in the Shetland Islands; the construction of permanent workshops, hospitals, airfields, roads and many other structures. Nor have I mentioned water supply, the lighting of the different headquarters in the field, the construction of docks, the demolition and repair of industrial plants and

A huge cement-mixing plant is part of the equipment of the army engineers for erecting defence structures.

Minefields, sometimes of great depth and generously provided with booby-traps, must be carefully reconnoitred before it is possible to clear a path through them.

In beach-landing operations, engineers must clear a path through beach-mines, wire and, in most cases, heavy reinforced concrete walls, before vehicles can be landed. They must also prepare tracks across the beach for all types of transport.

All such work requires a high standard of courage and skill, and the maximum amount of protection possible must be provided to bring the engineers and their equipment forward.

FIELD DEFENCES

In the last war, field defences consisted of long lines of infantry trenches with occasional strong-points in rear. These were protected against infantry by wire entanglements. Against modern armies such lines are useless. This was demonstrated when the first slow moving tanks successfully cruised across the enemy trenches at Courcellette in 1916.

The "tempo" of a modern battle and the ability of modern armour to penetrate far behind the enemy lines calls not for linear defence, but for strongly defended localities so placed that the enemy can be dealt with in locations and under conditions most favourable to us. As the enemy armour may have penetrated well into our area before it is convenient to destroy him, our defended localities must be capable of withstanding attack from any direction.

All arms are trained to provide their own local defences but their construction will usually be supervised by sappers, and the engineers are responsible for the charting of mine fields and for advising the commander on their disposition.

A bull-dozer tractor, levelling out rough ground.

countless other activities that are undertaken by engineers during active operations.

Engineering in the army has kept pace with the profession in civil life. In fact, the average military engineer officer is nothing more—or less—than a civilian engineer, trained as a soldier and engaged in the application of engineering knowledge to war. To our brothers in civil life we look for assistance in the development of ideas and the production of the weapons and equipment so necessary to win the war.

CANADA AND THE TOOLS OF WAR

C. D. HOWE, HON. M.E.I.C.
Minister of Munitions and Supply, Ottawa.

Few nations have had less experience than Canada in making armaments and weapons of war. Until the present conflict came upon us the craft was unknown, the tradition non-existent.

Even in 1914-18 we established no munitions industry of major consequence. We made explosives, we manufactured shells, we turned out army rifles, we equipped our troops with boots and uniforms. But for twenty years thereafter our industrial resources were tuned to the arts and crafts of peace; we made nothing more deadly than commercial explosives, hunting knives, and sportsmen's ammunition. The armaments business was left to the great European specialists—to Vickers, Skoda, Schneider-Creusot, and Krupp, with their huge plants, their trained workmen, their own secrets and traditions developed by years of experience in making tools of war.

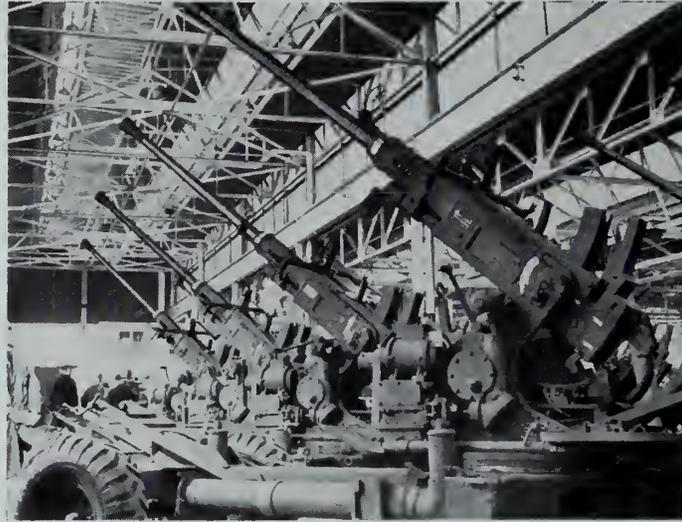

It can be said, therefore, that when we turned to the production of weapons at the outbreak of the present conflict we started from scratch. The lack of an established armaments industry was a handicap. Great Britain, France, Russia, and Germany had strong foundations upon which to build and expand. We had to depend on conversion, improvisation, and building from the grass roots. And after Dunkerque, when swift replacement of Britain's lost equipment was necessary and when there was even a possibility that Canada might be a last-ditch arsenal of democracy, we were suddenly called upon for munitions output on a scale regarded as improbable if not impossible.

But, from some aspects, the lack of an established armaments industry was no handicap. There were no shackles of tradition. We were able to adapt the best tools and the best production methods of the New World to concentration on the most modern types of equipment. It was some time before our aircraft plants—busy turning out trainer planes for the Combined Training Establishment—had expanded to the stage where they could contribute substantially to the making of combat craft. But, when that stage was reached, the industry was capable of producing the latest and best.

We are now producing service planes which, in their respective fields, are unsurpassed by any other type of aircraft.

The production of weapons of war follows an established pattern: a better offensive weapon is countered by a better defensive weapon. An improvement in defence demands an improvement in offense. The result is a rapid obsolescence of equipment. The armoured tank gave birth to the anti-tank gun and the land mine technique. The anti-tank gun and the land mine resulted in improved designs and stronger armament for tanks. Stronger tanks meant bigger anti-tank guns, more devastating mines. This contest has been going on since man first waged war, and in time of war it accelerates so rapidly that the secret and invincible weapon of to-day is the obsolete and discarded weapon of to-morrow.

In this race, we have been fortunate in being able to build new plants, equipped with new machines, manned by workers trained in new techniques. These plants, safe from

Bofors 40mm. anti-aircraft guns. An Ontario factory turns these out by the dozen.

enemy attack, are close to supplies of power and raw materials. They are fed by components and parts made in established industrial factories converted to wartime output. Under forced draught, as it were, we have managed to turn this country into an arsenal producing close to ten million dollars worth of war equipment every day. These weapons and supplies cover a wide range, from anti-aircraft guns to training rifles, from corvettes to dinghys, from 25-pounder artillery to bomb-throwers, from aerial bombs to grenades, from Ram tanks to motorcycles.

Because of our lack of tradition and experience in

the making of the tools of war we have few standards with which to compare the quality and quantity of our output, although they are being created quickly even in the span of the present war, so constant is the pressure for improvement. In the last war we produced shells, which were shipped overseas to be filled. Our shell programme in the present war goes a good deal farther. We not only produce a greater variety of shells, ranging in size from the small 37 mm. armour piercing shot to the heavy shells, but they are filled with Canadian-made explosives and are shipped together with their cartridge cases and components as completely filled rounds of ammunition.

This means that our ammunition industry is immensely greater than in 1914-18. It involved the establishment of a number of major filling plants and scores of smaller plants in all parts of Canada, for the manufacture of propellant and explosive charges required for gun ammunition of all kinds, as well as for depth charges, land mines, aerial bombs, smokes bombs, fuses, primers, and small arms ammunition. This huge industry, employing 50,000 people, was created at a cost of \$150 million. Our chemical and explosive plants alone cover an area equivalent to the area of the city of Montreal. In safety and sufficiency they are equal to the best in the world. Production techniques are such that untrained workers can soon become adept at tasks in an industry where the novice was once regarded as a potential danger.

While there have been many difficulties in converting this nation's industrial capacity to a war production programme of the vastness upon which we are now engaged, there have been pleasant surprises. Gun steel was never previously made in this country. Armour plate had never been made in Canada. High quality alloy steel, so vital to many types of modern weapons, had not been made in sufficient quantity "to fill one's hat," in the words of one steel expert. The fact that our steel industry has successfully increased production of basic open hearth steel and is producing great quantities of steels indispensable to a wide range of weapons and armaments is one of the major reasons for our ability to produce tools of war on our present scale.

There were two factors mitigating against production of heavy guns. Lack of gun steel capacity and a complete lack of industrial experience in the manufacture of these complicated weapons. A modern anti-aircraft gun will consist of as many as four thousand separate parts, all machined

and assembled with extreme tolerance down to a ten-thousandth of an inch. Some parts demand precision work of the accuracy that goes into the making of a fine watch.

In spite of lack of experience, lack of skilled labour, incomplete drawings and specifications, Canadian manufacturers undertook the task—revolutionary to this country—of making heavy guns. The steel industry made gun steel. Industrial plants once devoted to peacetime products accepted contracts for parts. And just recently our 15,000th heavy gun was turned over to the army ordnance authorities—a Bofors anti-aircraft gun of the most complex type, completely mounted, equipped with instruments for remote fire control, ready for action, made by Canadian hands in Canadian factories.

We are making field guns and naval guns, tank and anti-tank guns of the most modern types but we are particularly proud of the fact that Canadian workmen have mastered this art so quickly and so well that we are delivering the British 3.7 anti-aircraft gun, which fires a 28-pounder shell eight miles in the air at the rate of 15 shells a minute. One part of this gun is so meticulously finished that it requires three months of machining. This type of weapon, of course, was unknown in the last war. It is a miracle of engineering design, being equipped with instruments which automatically locate the target, set the fuse, aim and fire the gun.

In the instrument field, not only in the manufacture of intricate fire control apparatus for artillery but in the production of communications equipment vitally essential to modern land, air and sea warfare, we have established an industry which keeps apace with the latest in scientific discovery. Indeed it often sets the pace.

In twenty-five years, radio has revolutionized communication methods. Paralleling the revolution in transportation that has taken place in the same period it has helped shrink the world in size. Naturally it has had a pronounced effect on methods of warfare. Fast tanks and automotive transport, swift combat aircraft and naval combat craft have added speed and mobility to modern attack far beyond anything imaginable in the last war, but these advantages might be nullified if it were not for corresponding advances in the science of communication.

It is possible now to shift forces swiftly, to marshal defences rapidly, to launch combined attacks with great speed and accuracy of timing by organization based on two-way radio communication. Delays in conveying information can be fatal in battle at any time; modern battles are fought at such speed that instant communication between various elements of aerial, naval, or land forces is of first importance. In the manufacture of this equipment Canada has become a major source of supply. This year we will build \$250,000,000 worth of communications equipment for the United Nations.

The great, obvious difference between the present war and the conflict of 1914-18 is that mechanization has made this a war of movement as against the stabilized type of trench warfare. Transport has become of greater importance than ever before. Here we had a solid foundation upon which to build and expand. Our contribution in this respect has been heavy.

Even in peacetime, the introduction of a new passenger car model demands weeks of planning, redesign, and retooling. In abandoning commercial output, our automotive factories took on the task of making no less than 115 types of automotive transport never before made in this country.

A good deal of planning and foresight went into this. From 1933 to the outbreak of the war, collaboration had

been in progress between the automotive industry and Canadian and British army authorities. Primary development in army design came from the British authorities who recognized that the ordinary commercial vehicle would be unsuitable for duty in the event of another war, owing to its poor cross-country performance. Army design benefited the automotive industry when the time came for conversion; on the other hand, mass production techniques, the resourcefulness and experience of the automotive men have been of inestimable value to the army in turning those designs into sturdy, reliable, economically built vehicles equal to the best in the world.

A fundamental difference between wartime and peacetime automotive production is that front wheel action drive is considered a necessity for military requirements. Improvements based on lessons learned under service conditions are constantly being incorporated. Two of our automotive companies have technical staffs in Cairo, acting as liaison officers between military authorities in the Middle East and production officials in Canada.

Essentially, there are no new weapons. There are only improvements and variations of the old. But the *Mosquito* bomber, made of plywood, capable of great speed and manoeuvrability, is a technical miracle compared to the "stick and string" training planes we made in the last war. The Sten carbine is a handier infantry weapon than anything our soldiers had in the last war, just as our No. 4 rifle is lighter and more accurate and our Bren machine guns and Browning aircraft machine guns are more reliable and have far more devastating fire power than the machine guns of twenty-five years ago. The Ram tank is a swifter, more mobile, heavier armoured, more deadly tank than anything in service at the beginning of the present war. Our twenty-five pounder field gun is one of the most effective pieces of artillery in the world and our naval guns and anti-aircraft guns are models of accuracy, power, and precision. Our Canadian-built army trucks will bring troops and supplies into action more rapidly and in greater numbers than ever before in military history. Our armoured cars and universal carriers enable battles to be fought at speeds undreamed of in other wars. Our communications equipment knits fighting forces together to a degree never before realized. Our corvettes are equipped with devices that rob the submarine of secrecy of approach. We are not only making a far greater variety of weapons than ever thought possible in this country. We are making them in quantities and of qualities equal to the best on earth, for we have never permitted the second-rate or the expedient as a standard.

The obstacles that stood in the way of Canadian industry's conversion to modern war production have been numerous. The making of modern tools of war is a highly specialized division of industrial science, not to be easily or quickly mastered. With neither tradition nor experience in these crafts, however, Canadian industry has met the challenge. The problems have been complicated by shortages of raw materials, by the complex difficulties of adjusting civilian economy to a war basis, by the manpower adjustments inevitable to any programme of enlisting armed forces and producing not only weapons to equip those forces but the forces of our Allies. Industry has shown remarkable ingenuity and resource in solving its problems of production and supply. The Canadian people have adjusted their lives from peacetime to wartime standards with a free willingness that is the best augury of democracy's ability to beat the Axis in the very field where it deemed itself supreme.

NATIONAL SCIENTIFIC RESEARCH

C. J. MACKENZIE, M.E.I.C.

Acting President, National Research Council, Ottawa

Pasteur once said that chance favours those who are prepared. Research development in Canada during the last quarter-century provided a degree of preparedness for the present conflict far in advance of that which this Dominion possessed in 1914.

Science, technical mechanics and engineering have become such great and fundamental factors in the present world-wide struggle, that it is difficult to realize their implications and to appreciate the value of the work done by the relatively few scientists and engineers who, in the years from 1916 onwards, quietly developed the machines and equipment which to-day are contributing so largely to the success of our arms in the field.

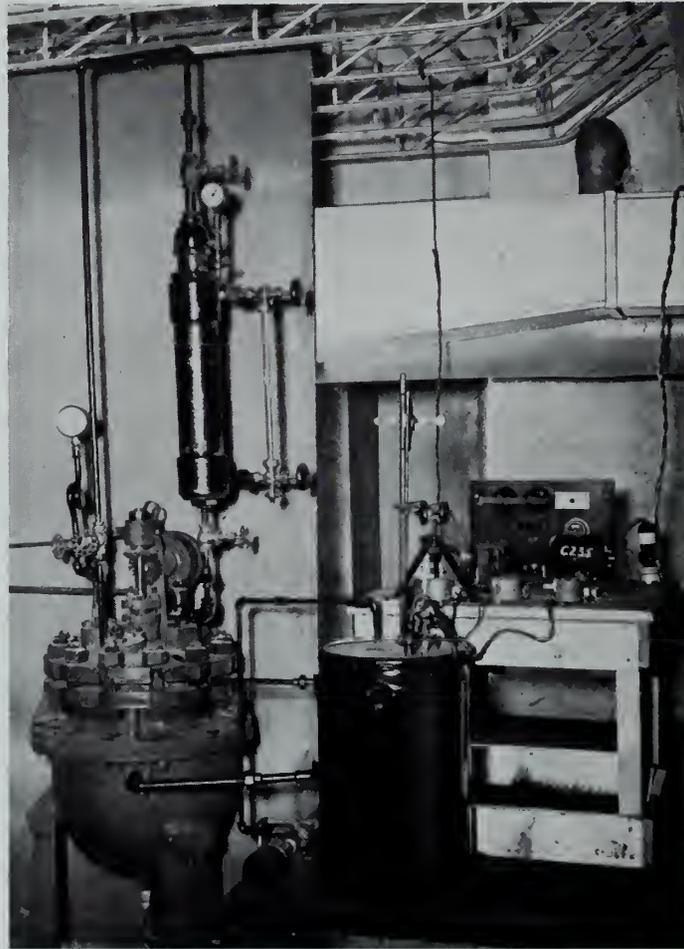

It was under the stress of World War I, that the call went out throughout the British Empire for highly qualified research men. It was then discovered that there were more trained scientists in a few of the great German industries than could be found in the whole British Empire. However, if the British are slow to change and to adopt new ideas which disturb traditional procedure, it is equally true that once awakened to the necessity for action, Great Britain moves effectively and very surely.

The Committee of the Privy Council for Scientific and Industrial Research was created in Great Britain in 1915 to enlarge and organize the scientific resources of the country. This was the first time in the national history that an organized attempt had been made to equip scientific research in an adequate manner. It was clearly realized that such action was essential if the industrial fabric of the Empire were to be built up and maintained on a sound basis.

Under the Committee of the Privy Council, the Government of Great Britain appointed an Advisory Council for Scientific and Industrial Research. Furthermore, a dispatch was sent to each of the Dominions requesting them to establish similar organizations for the purpose of developing scientific and industrial research within their own borders.

The Government of Canada, acting on this suggestion from the Government of Great Britain, established, late in 1916, the Honorary Advisory Council for Scientific and Industrial Research, now known under the short title—"National Research Council."

One of the first activities of the Council was to take, in 1917, a research inventory of Canada. This inventory disclosed two outstanding facts: first, that industrial research was at that time practically non-existent in Canada, and secondly, that the supply of research men, with such post-graduate training as to enable them to undertake independent investigation, was entirely inadequate to permit of

Experimental apparatus in the National Research Council rubber laboratory for making Buna S synthetic rubber by copolymerization of butadiene and styrene.

any general application of scientific research to Canadian industrial problems.

Pending the provision of such laboratory facilities as would make it possible to serve Canadian industry on an adequate scale, the National Research Council directed its activities along three main lines:

(a) The co-ordination of research and the organization of co-operative investigations through competent and representative Committees;

(b) The postgraduate training, through scholarships, of students selected for their aptitude in scientific research;

(c) The encouragement of graduate research through financial grants to heads of science departments in Canadian universities.

This programme was and is a matter of some importance because in the absence of similar offers at home many graduates continue to be attracted to institutions in other countries where scholarships are available. Too often it happens, as a consequence, that those who leave Canada under foreign scholarships find profitable appointments elsewhere with industrial concerns whose products may even

be competitive with those produced in this Dominion. The fallacy of training men in Canadian institutions and then allowing them to be absorbed by foreign industries while Canadian manufacturers lag behind for lack of scientific guidance should not need to be emphasized, but before the war, it is feared that many persons failed to realize the national value of these postgraduate scholarships and regarded them only as evidence of paternalism on the part of a benevolent government organization.

Efficiency of industry is a matter of vital concern to everyone. A national research organization should seek to promote this efficiency in every way; to assist in turning every national resource and facility to account; to improve processes and to cheapen products so as to better the competitive position of its country in the markets of the world, and particularly to be ready to suggest new articles of manufacture when the fashion for the old diminishes or they stand in danger of being displaced. It is to these activities in aid of Canadian industry that the National Research Council is dedicated.

During the last half century or so the industries of the world have been modified and built up on the basis of scientific knowledge. The mechanical industries derive from Newton's laws of motion; the electrical industries are based on the early scientific work of Henry, Faraday, Maxwell, Ampère, and down the years through Kelvin, Edison and a multitude of others; aviation is the outgrowth of hydrodynamics and aerodynamics; the chemical and metal-

lurgical industries make use of knowledge accumulated since the days of the alchemists.

Most of this fundamental information, which has made modern industry possible, was built up slowly in the universities of the world. It was not acquired for any utilitarian purpose, it came as a by-product in the search for truth. This form of research has in consequence come to be called "pure science," and it continues to hold a most important place in the scheme of things as they are.

Until towards the end of the last century only a relatively small fraction of the fundamental knowledge that had been acquired and stored up by the universities had been assimilated by industry and new knowledge was accumulating perhaps faster than it could be applied.

In this period, industry sought to exploit existing stores of information and often succeeded, but even for this task trained minds were needed. A demand arose for men who could understand the facts and apply them to every-day problems, and experience showed that men who had been trained in the universities in the fundamentals of mathematics, chemistry, physics, etc., were particularly useful. First, in the larger manufacturing establishments and later extending in ever-widening circles, there began to grow up organizations for what was called "applied research."

Discharging retort of magnesium furnace in pilot plant of the National Research Council.

Applied research was something that most business men of that day could understand. It was immensely profitable. In contrast "pure research" was deemed academic and the men who engaged in it were thought of as people who were not practical. Business was quite content to leave to the universities the pursuit of knowledge for its own sake.

At the beginning of this century, some forward-looking leaders of industry recognized that industrial application had nearly overtaken the capacity of the universities to produce new facts to work on, and out of this idea "industrial research" was born.

The development of the National Research Council in the era of peace between the first Great War and the present conflict followed a line of slow but definite progress. The Research Council Act was passed in 1924. Laboratories were established in temporary quarters and construction of the present spacious National Research Building was commenced in 1930. The buildings were completed and occupied in 1932.

Immediately prior to the war, additional provision for laboratory space was made through the purchase of a site just outside of Ottawa. Plans were laid for a group of buildings but the advent of the war made it necessary to limit construction to those which would be wholly used for war purposes. The aeronautical laboratories with their shop

equipment, the hydrodynamic laboratory and the explosives laboratory are now installed.

The demands of the war have made it necessary greatly to increase staff as well as laboratory accommodation. Radio field stations have been constructed and every available inch of space in existing laboratories has been utilized. University facilities have been used to advantage for the conduct of special investigations of a kind that can be decentralized.

Appointment of the National Research Council as the official research station of the Navy, Army and Air Force opened up new avenues of service and brought, to the Council, the advice of the operational staffs in respect of scientific problems presented for solution.

The enormous advantages of this arrangement, both to the laboratories and to the Armed Services, need not be stressed. The co-ordination of effort thus made possible has greatly accelerated both the study of problems in the laboratories and the application of the results in the field.

This procedure is in line with the generally accepted policy that the scientific method must pervade all stages of production and of the use of the product; the scientific worker must live with the maker and the user. He is an essential "third party," understanding the points of view of both.

It is the moral responsibility of the scientific workers to see to it, by all means in their power, that those responsible for the formulation of policy give full weight to the scientific and technical factors involved. The extent to which policy must be based on scientific and technical considerations tends to increase rather than otherwise.

In the twenty-odd years between the end of the last and the beginning of the present war, Canada had built up, from almost nothing, creditable scientific research facilities. In 1919, the total expenditure on research in Government departments, in universities and in industry amounted to not more than \$500,000 while in 1939 the peacetime budget of the National Research Council alone was about \$1,000,000 and probably as much more was spent in the research laboratories of the Departments of Mines and Resources, Agriculture, and Pensions and National Health, and in the universities. In addition, industry probably was spending something like \$20,000,000 a year and the number of scientific research workers available had increased in comparable proportions.

On the other hand, the budget of the Department of National Defence had been cut so drastically in the post-war period that no moneys were available in Canada for development of new weapons and devices or for other strictly military research, and the relatively small amount of scientific work that it was financially possible to do was carried out by the National Research Council in co-operation with Service officers and departments. This co-operation became more intimate when Lieutenant-General A. G. L. McNaughton became president of the National Research Council in 1935.

The outbreak of the war intensified the need for scientific work on war problems, and, since then, the co-operation between the National Research Council and Services has developed steadily in a most effective and cordial manner. To-day, the Council's work is almost entirely on war projects; the staff of less than 300 in 1939 has grown to over 1,200; the direct war budget has increased in like proportion. Expenditures on equipment designed and projects directed by the Council's scientific staff now amount to many millions of dollars annually.

The fundamental problem facing Canada, to-day, is the simple and obvious task of providing equipment superior to that of the enemy and in adequate quantities for the military personnel trained in its tactical use. For the first time this Dominion has been called upon to produce complicated scientific equipment on a mass production basis, for use in the war.

When the ordinary man on the street thinks of mass production, he probably visualizes production on assembly lines with the machines or equipment coming off at a continuous and rapid rate. He probably does not realize that before such production is possible several other time-consuming phases have preceded it. There is the research phase when the equipment or the machine must be conceived in its general outline, its detailed features worked out scientifically, the various components tested and often even special materials developed. Then the laboratory model must be placed in the hands of development and designing engineers whose job it is to work out not a tailored article, but one that is capable of being manufactured by mass production methods. After this is done, the factory layout must be made, the necessary machines and tools obtained and a plant constructed to carry out the process. Not until all these steps have been taken can we obtain equipment in mass quantities. It has generally been assumed that, in peacetime, these steps take at least three years. Moreover, in peacetime, changes in models from year to year are kept to a minimum in order to ensure adequate production.

What of war? In war, the problem is met from a different, and for us on this continent, a doubly different, angle owing to the fact that up until the outbreak of war there were few if any scientists and engineers in industrial organizations who had ever thought in terms of weapons of war and who, consequently, had done no thinking or active work on the research and development phase.

In order to produce materials in mass quantities, it is necessary to go through the various phases. The research phase is the period during which the prototype is being worked out. The length of this period is unpredictable but on the work in this stage will depend whether our equipment will be inferior, or equal, or superior to that of the enemy, and all this takes time.

When the prototype has been produced, the factory specifications for its manufacture have to be worked out, the necessary plant layout has to be designed and buildings erected or remodelled, staff must be assembled and trained and the necessary tooling-up process completed before construction can be commenced. And then, when the finished product becomes available, its tactical use depends on a long and arduous training of the military personnel for

Apparatus for measuring permeability of fabrics by poison gases.

whom it was developed. Mass production even in peacetime bristles with difficulties.

In war problems, all mass production becomes aggravated; war is not a static affair, it is rapidly moving; changes come quickly and war is not only a contest between armies in the field but a contest based on the industrial resources of the countries involved. The enemy is constantly changing his equipment and improving and devising new instruments and we must do likewise or else we will perish.

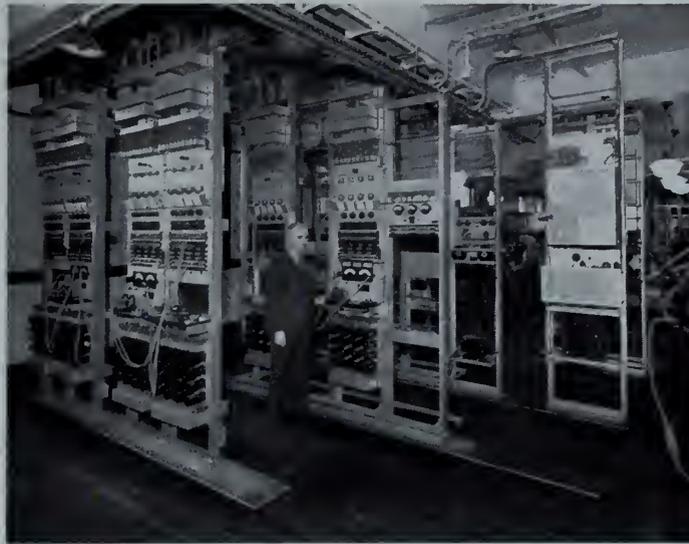

The situation now is that we must keep our production at top speed from existing designs and, at the same time, we must push forward development work on these designs in order continuously to improve our weapons and machines of war. War more than any other of man's activities puts a premium on being in the lead.

In this endeavour, the scientist and the engineer work hand in hand. The National Research Council, through its laboratory facilities and personnel, through co-operation with government departments, and by correlation of research in the universities, and through its close affiliation with the Armed Services as their official research establishment, is playing a not unimportant part in the application of science to the Nation's war needs.

TELEGRAPH COMMUNICATIONS

L. A. W. EAST

Chief Engineer, Department of Communications, Canadian Pacific Railway Company, Montreal

Modern carrier telegraph equipment.

Like its younger brothers telephony and radio, telegraph communication brought forth many improvements and underwent much expansion in the period following the last world war. From its first use in Canada in 1846 until this period, telegraph transmission had been limited almost exclusively to single wire ground return circuits employing direct current and, for the most part, Morse signals. Manual relaying of messages was general and uninterrupted transcontinental service was difficult to maintain, frequently being impossible during periods of aurora borealis. However, with the introduction of carrier systems and improvements in telegraph equipment during the twenties, these difficulties were rapidly overcome. Much of this improvement may be attributed to developments in magnetic materials and metal alloys, particularly in mechanical parts. In 1918, automatic telegraph equipment was practically limited to a multiplex system enabling simultaneous transmission of four messages in each direction over one wire, and relatively few teletypewriter machines located in central offices. To-day, thousands of teletypewriter machines, usually called teletypes, located in branch and individual subscribers' offices provide speedy and direct communication at sixty words per minute throughout Canada. Contrasted to the equipment of twenty-five years ago, these modern machines can be operated for months at a time without other maintenance than occasional oiling of mechanical parts. Manual retyping and relaying of messages can now be eliminated by the modern reperforator, whereby received signals are recorded on punched tape by means of which the same signals can be automatically retransmitted as required. A printer reperforator is also available which prints the letters as well as recording the signal impulses on tape.

CARRIER CURRENT SYSTEMS

The development of carrier telephone and telegraph systems may be considered as having its inception in the application of the vacuum tube and electric wave filter for the generation, detection and selection of alternating currents. The first carrier telegraph systems were installed in Canada in 1927. These provided ten telegraph and one long distance telephone channel on one pair of copper wires, using frequencies up to about 11 kc. Due to convenient association of carrier telephone and telegraph systems, the utility of a single pair of wires was soon increased. In the latest carrier telegraph systems now in operation in Canada, some 42 telegraph and a long distance telephone or broadcast transmission circuit are derived from a single pair of wires. This permits 42 messages to be transmitted simultaneously in each direction at 60 words per minute.

A system having still higher message capacity has already been developed commercially. Using carrier frequencies up to about 140 kc., it provides 15 carrier telephone channels on each of which 14 voice frequency carrier telegraph channels may be superimposed. However, at present, service requirements in Canada are being adequately and economically provided by the 30 kc. systems. The advantages

and economy of carrier over physical operation on trunk circuits are well established. Incorporating many vacuum tube and circuit inventions, tremendous improvements have been made in the stability and efficiency of over-all circuit performance and reduction of operating maintenance. One or two tubes now perform the functions previously requiring six or eight tubes. Application of the negative feed-back circuit has made possible highly stabilized repeaters whose over-all amplification may be held practically constant over wide ranges of power supply voltages. Much simplicity and economy of operation have been made possible by use of the copper oxide

varistor for modulation and demodulation purposes in place of vacuum tubes. In general, the per channel cost of carrier telegraph operation has been reduced because of these developments.

OUTSIDE PLANT

In sharp contrast to the relatively simple construction of 1918, involved engineering of practically all details of line construction is now required to enable simultaneous operation of a multiplicity of carrier telegraph, telephone and broadcast services without interference. Precise arrangement of wires in pairs and location of poles are matters of extreme importance. High efficiency loaded cables have replaced the simple rubber insulated types of earlier days. Wide application of improvements in protection against inductive interference and electrical hazards have contributed greatly to the reliability of service despite the growth in power lines throughout the country. Developments in wood preservatives and treatment of poles, galvanizing of hardware parts, glass insulation capable of withstanding extreme temperature changes, low resistance compression type wire joints and many others have greatly improved the life, efficiency and maintenance required in outside plant.

BROADCAST NETWORKS AND SPECIALIZED FACILITIES

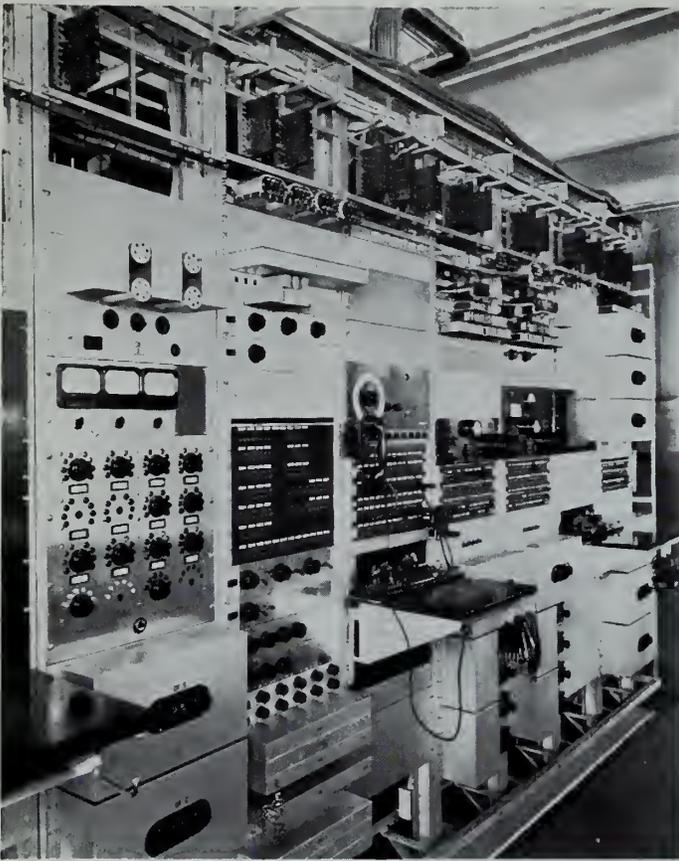

Since 1932 the two major telegraph systems in Canada have been providing coast-to-coast programme network facilities for the Canadian Broadcasting Corporation. Some 10,000 circuit miles are operated on a regular schedule of sixteen hours per day. This network links all of the principal broadcasting stations throughout Canada. Quick switching of programme pickups between points thousands of miles apart is, to-day, a matter of ordinary routine. Private long distance telephone facilities are operated for the two transcontinental railway systems. Long distance telephone lines are also furnished to the various telephone systems. A large section of the trans-Canada telephone system is operated over lines of one of the major telegraph companies.

LEASED TELEGRAPH AND TELETYPE FACILITIES

In addition to public telegraph service, the Canadian telegraph systems furnish many leased wire facilities for varied services. An elaborate teletype network linking most of the airports throughout Canada and operating twenty-four hours per day is maintained for the Meteorological

POST-WAR DEVELOPMENTS

In the light of developments at the outbreak of war many new innovations may be anticipated. For use when general service may require it, automatic teletype switching equipment has been perfected whereby teletype subscribers at local or distant points may be inter-connected quickly. Means have also been developed whereby a single telegraph channel may be shared simultaneously by a number of subscribers when service requirements permit, and, it is not economically feasible for any one subscriber to lease an exclusive channel. Automatic telegraph means, employing facsimile transmission, has been developed practically. With this it is only necessary for the subscriber to drop a hand or typewritten message into a slot and push a button. The message is automatically transmitted to the central telegraph office there to be retransmitted to the distant point. A facsimile reproduction of the original message is produced and released at the receiving subscriber's machine. Facsimile and telephoto equipment has been developed to transmit graphic and pictorial material. During the occasion of the Royal Visit to Canada of the King and Queen in 1939, some 250 to 300 pictures were transmitted for the various news agencies by portable equipment using programme transmission facilities of the telegraph companies. The feasibility of operating some 240 telephone channels simultaneously over two pairs of concentric conductors contained within a single lead sheathed cable has already been demonstrated. Considering that some 14 telegraph channels can be superimposed on each of these voice frequency channels, some idea of the present state of the art, insofar as the number of messages which can be handled over a single metallic

Programme transmission equipment.

Branch of the Department of Transport. Nationwide teletype networks are also furnished for the exclusive use of the principal news gathering agencies. Transcontinental land line facilities are operated in conjunction with the transoceanic cable and wireless companies in the chain of Empire communications. Improvements in repeater and automatic equipment in recent years have greatly reduced the amount of manual relaying on such circuits.

WARTIME OPERATIONS

At the outbreak of war, telegraph communications in Canada were eminently better equipped than in 1914 to meet the needs of the armed services and various governmental departments. Many private teletype circuits have been furnished on short notice for the Department of Munitions and Supply, and the Department of Transport. Extensive facilities for the Army, Navy and Air Force in connection with defence communications have also been provided. With new equipment extremely difficult, if not impossible, to obtain, these have been furnished for the most part by transfer of carrier and other equipment from one point to another. Many improvisations have been effected in the re-use of old equipment parts and salvaged materials. Use of additional copper wire has been avoided except where carrier systems are not feasible or not obtainable. Emergency cars containing portable repeater and terminal equipment have been set up and held in readiness in the event of damage in coastal areas. A number of long distance telephone facilities have been made available to the telephone systems to take care of increased traffic in highly industrialized areas.

Modern telegraph operating room.

circuit, can be obtained. Employing conventional multiplex equipment this number is at once doubled so that some 6,720 teletype circuits could be operated over a single pair of such coaxial conductors. The electronic and photographic principles of television suggest even greater possibilities. Perhaps it may not be too much to suppose that, when technical development can again be turned to peacetime pursuits, recorded messages may be transmitted instantly.

TELEPHONE COMMUNICATIONS

PEACETIME RESEARCH MEETS WARTIME CRISIS IN TELEPHONY

H. G. OWEN

Bell Telephone Company of Canada, Montreal

Continuous improvement through unremitting research—that is the story of telephone development since *The Engineering Journal* made its first appearance 25 years ago, and it is this research which explains the readiness with which the telephone system has met the tremendous wartime expansion of the past four years.

In 1918, as in 1943, all the resources of telephone science were being concentrated upon war problems. Bell System engineers were busy devising methods of ensuring secrecy in military communications, circuits for firing mines by remote control, and electrical ears for detecting enemy gun emplacements, submarines, and airplanes from afar. Telephone manufacturers

were turning out shock-proof field telephones and gas masks equipped with telephones for the land forces, helmets equipped with telephones for the air force, radio sets for the tank corps, and electrical stethoscopes and probes for the medical corps.

With the armistice, all this activity was directed upon the problems of telephone expansion created by the boom of the 1920's. The fruits of this intensive study can be most readily seen in a comparison of telephone service in 1918 with that in 1943, and in a brief review of its by-products which have appeared in almost every field of modern science.

First, consider the telephone set itself. In 1918, the most modern type was the desk stand set. The telephone user of 1943 is still familiar with the outward appearance of this instrument, and may become increasingly so as wartime shortages compel the reconditioning and re-use of all telephones in stock.

Despite this outward similarity, there is no comparison between the desk stand set of 1918 and that of 1943. The modern transmitter is eight times more efficient over a wider range of tones than that of 1918. The modern receiver unit weighs only three ounces, compared with ten for that of the old desk stand, yet its efficiency is even greater. Finally, the circuit of the modern set is specially designed to reduce the effect of room noise picked up by the transmitter and reproduced by the receiver of the same set.

In 1918, there were no dial exchanges in the Bell System. The Bell Telephone Company of Canada opened its first dial exchange in Toronto in 1924. Beginning in 1933, dial service was also extended to small-town exchanges, and at the present time, 72 per cent of all the company's telephones are dial-operated.

In 1918, a caller often had time to go out and play a game of golf between the times of asking for a long distance connection and obtaining it. By 1939, the average time for establishing an out-of-town connection had been reduced to 78 seconds. Under war conditions, that figure has risen again slightly, to 102 seconds, but 90 per cent of all long distance calls are still completed while the caller remains at the telephone.

The latest method of providing storm-proof long distance telephone facilities is by burying cable directly in the ground by means of special plough drawn by powerful tractors. This type of cable is being laid in 1943 to link Ottawa, Montreal and Toronto.

In 1918, the Bell of Canada had no inter-city cables and no carrier systems in service. The company's first long cable was erected between Toronto and Hamilton in 1924, and the first carrier systems were installed in 1928. The use of cable ensures greater protection from storms than open-wire lines afford, while carrier permits several conversations to be carried on over the same wire circuit at the same time. The conversations no more interfere with one another than a broadcast from one radio station interferes with a programme from another station which is operating at a different point on your radio dial.

The loading coil of to-day is one sixth the size of the 1918 coil, yet the use of

the permalloy core instead of the old iron one renders the coil far more efficient. The modern telephone repeater lasts ten times as long as the vacuum tube of 1918, and gives many times greater amplification for the same amount of current. The effect of these developments is indicated by the world-wide extension of the service during this period.

In 1918, long distance service of The Bell Telephone Company was available only to other communities in the provinces of Ontario and Quebec, and those in the United States within the radius of a thousand miles. It was not until the following year that regular commercial service was established to the Maritimes and not until 1920 that a Canadian telephone user could call anywhere in Canada and the United States. Even then, service between the Maritimes and Quebec, between Ontario and the Prairies, and between the Prairies and British Columbia was provided only over lines in the United States.

It was not until 1932 that the Trans-Canada Telephone System was officially inaugurated. It is jointly owned and operated by the seven major telephone systems of the Dominion. These systems include the Maritime Telegraph and Telephone Company in Nova Scotia, the New Brunswick Telephone Company, the Bell Telephone Company of Canada in Quebec and Ontario, a government system in each of the three Prairie Provinces, and the British Columbia Telephone Company.

Transatlantic radio-telephone service was introduced in 1927. From then on, overseas connections were extended year by year until at the beginning of the war, any Canadian telephone user could reach any important country in the world except the U.S.S.R. or New Zealand, and could also speak with passengers on ships at sea.

Meanwhile, many by-products had come from telephone research. Bell Telephone Laboratories improved the electrical stethophone, the artificial larynx for those whose vocal cords have been removed, and a variety of aids for the hard-of-hearing. They evolved orthophonic recording, sound motion pictures, magnetic tape recording, and the reproduction of recorded music in auditory perspective, as exemplified in Walt Disney's *Fantasia*. They contributed

to the development of two-way radio-telephone for planes in flight, and other devices to promote air safety, and to teletype, telephoto, and television.

Then came the war. As a result of this 25 years of development, the telephone companies and the telephone researchers were ready. With little change in standard practices, they swung easily in the new direction required by the war effort.

First, consider the effect of war upon ordinary telephone service. Between 1939 and 1943, Ottawa, heart of the nation's war effort, has actually doubled its telephone requirements. Twice as big as in 1939 are the government's private branch exchange, which is large enough in itself to serve a small city; the Ottawa-Hull telephone exchange building; and the volume of long distance calls from the capital. Calls between Ottawa and Toronto have increased fourfold since the outbreak of war.

To ensure storm-proof service between the capital and the two largest cities in the Dominion, new cables, ploughed directly into the ground by means of a special tractor-drawn plough, are under construction from Ottawa to Montreal and Toronto. Many circuits in the Montreal-Ottawa section were made available on an emergency basis following the year-end sleet storm.

Additional circuits to the Maritimes and the Prairies have involved the erection of two entire new lines, poles and wires, from Montreal to Edmundston, New Brunswick, and from Ottawa to North Bay. Direct circuits have had to be provided from Ottawa to Halifax, Winnipeg, and Washington.

These are only the major projects. All over the two provinces served by The Bell Telephone Company, military, naval, and air force centres, government, industrial, and war service organizations have called for telephones, public telephones, teletypewriters, private branch exchanges, and other installations of many different kinds—some involving unusual engineering problems.

The part the Trans-Canada Telephone System is playing in the nation's war effort is revealed by the rapid increase in the number of messages handled since the outbreak of war. The annual calling volume has leapt from 87,000 in 1939 to 121,000 in 1940, 200,000 in 1941, and 276,000 in 1942.

In 1940, the longest direct circuit in the British Empire was placed in service between Toronto and Vancouver, a distance of over 3,000 miles. With the direct circuit opened between Halifax and Toronto in 1941, connections can be established from Halifax to Vancouver with but a single switch—at Toronto.

Despite these undeniable wartime requirements, the telephone industry must still effect economies in its use of vital materials. The Northern Electric Company makes 90 per cent of all telephone equipment manufactured in Canada. Over 80 per cent of this great plant is now directly devoted to war production. The manufacture of new telephone equipment is confined to high-priority jobs only.

In such new installations as are still required, a number of substitutions have been adopted for telephone materials which are also war materials. It is estimated that the Dominion's telephone systems are saving enough aluminum annually by such substitutions to build more than 16 fighters or half as many bombers.

Here is a specific example of how the company has been able to fall back upon peacetime researches to meet a wartime crisis.

When the wires in a telephone cable have been spliced, the bunched joints are enclosed in a lead sleeve with a short length of lead sheath at each end, and a wiped solder joint is made to seal the sleeve to the sheath. Since the seizure of Malaya, source of 80 per cent of the world's tin, the metals controller has successively limited the proportion of tin used in solder from 40 per cent to 38 per cent, then to 30 per cent, and finally to 20 per cent. From studies made

by Bell Telephone Laboratories long before a war emergency was ever thought of, solder formulae had to be selected which contained the requisite proportion of tin, but compensated for the reduction in the tin content by the addition of other metals such as cadmium or bismuth. With the introduction of each new type of solder, the entire cable-splicing force had to be trained in its use.

Not only did the company reduce the tin content of its solder, but it also introduced the "Victory Joint," which effected a 50 per cent saving in the amount of wiping solder used in 1942.

There is another metal telephone companies are even more anxious to save. That is copper. A machine gun in action for four minutes uses as much copper as a mile and a half of telephone wire. The average 10,000-ton merchant vessel requires nearly enough copper to erect a telephone circuit from Montreal to London, Ontario.

Copper is being saved by the installation wherever possible of carrier systems instead of the erection of new wires. Through a more intensive use of carrier than ever before, applied to one long distance line alone, The Bell Telephone Company obtained several badly-needed circuits which would otherwise have required the erection of 500 tons of copper wire in 1942. The new Ottawa-Montreal-Toronto cable is designed for the ultimate provision of 20 12-channel carrier systems, in addition to the regular wire circuits.

Eventually, it may be necessary to get along with substitutes which cannot altogether replace the materials which were evolved only after years of research. For example, to economize the use of nickel, iron has replaced a nickel alloy in the core of the telephone ringer magnet. Iron-core ringers are less satisfactory, especially when they are located at the end of long lines, where only a small amount of current may reach them.

It is possible that further restrictions in civilian telephone service may be necessary before the final victory is won. Some companies are trying to console their customers for present wants by promises of future miracles. Traditionally conservative, the telephone system prefers to state merely that the policy of seeking constant improvement will be pursued even more diligently than in the past.

The plastic telephone set is already with us, and coloured plastic housings were under study when the war began. A limited number of combined, or bell-in-base sets released before 1940 indicates a trend toward more compact, streamlined design.

Dial operation is being extended to long distance service, so that an operator in Montreal can dial a number in Toronto directly, without having to pass on the number to the Toronto operator, this speeding up inter-city connections. Although the prospect of nation-wide dial service is very far distant indeed, it opens up immense possibilities to the imagination.

Coaxial cable, that "wire in a tube" which permits the transmission of frequency bands a million cycles wide, and methods of reducing the band of frequencies required for a single voice channel without distorting the speech, may permit an almost limitless multiplication of inter-city-telephone circuits in the future. The American Telephone and Telegraph Company is considering the feasibility of laying a transatlantic coaxial cable after the war to supplement the existing radio channels. It would involve the use of repeater tubes designed to operate unattended for more than 20 years on the bed of the ocean.

Since the coaxial cable is also capable of accommodating the very wide range of frequencies required for television, it is possible that the post-war telephone user will not only talk to his girl in London, but also see her—and all over the same wire!

Thus, at the conclusion of our review of 25 years in the history of telephony, we find ourselves upon the threshold of another 25 years packed with staggering potentialities.

RADIO COMMUNICATIONS

GORDON W. OLIVE

Chief Engineer, Canadian Broadcasting Corporation, Montreal

Perhaps the outstanding advance, to date, in the art of conducting warfare in World War II is in radio communication. It is significant that, through the use of radio location, the secret weapon which Britain had perfected prior to the outbreak of the Second World War, R.A.F. fighter planes were used to best advantage to repel the Luftwaffe and eventually control the air and win the air battle of Britain in 1940.

Twenty-five years ago, radio was referred to as wireless communication but, with the conclusion of the First World War, and with all wartime bans on radio operation removed, vacuum tube oscillators, developed for wartime use, rapidly replaced so-called spark transmitters. With the advent of the vacuum tube, the first practical use of radio communication was made for voice transmission.

INTERNATIONAL PROBLEMS AND CONVENTIONS

The international problems, insofar as radio communication is concerned, are governed by two major factors: (1) radio waves spread out everywhere stopping at no boundaries and are capable of great mutual interference; (2) the number of radio communication channels is definitely and severely limited. The implications of these facts are far-reaching and led to the post-war International Radio Convention at Washington in 1927. This conference was attended by 79 nations of the world and resulted in the adoption of what is known as the "International Radio Telegraph Convention and General Regulations Annexed Thereto."

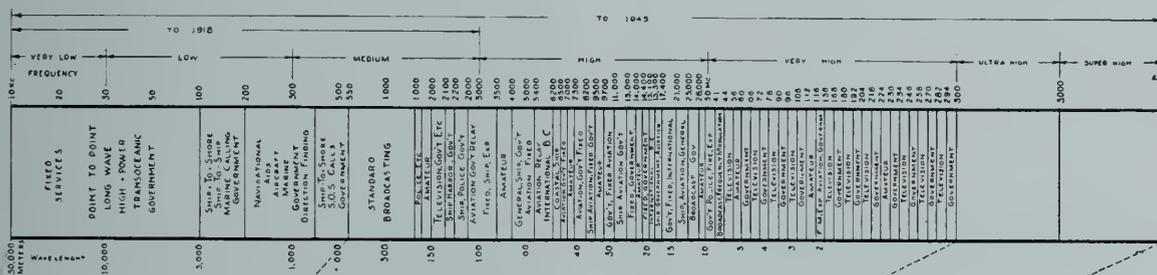

It may be said that radio, more than any other business, depends for its efficiency on co-operation between people at great distances and such co-operation can best be promoted by understanding, conferences and friendships such as are only possible by frequent international gatherings. Hence, in 1932, a second World Convention on Radio Communications took place at Madrid and, in 1938, at Cairo in Egypt. At the Madrid Conference, the International Radio Con-

vention Regulations were completely revised. These conventions are arranged through the Bureau of International Telecommunications' Union at Berne, Switzerland.

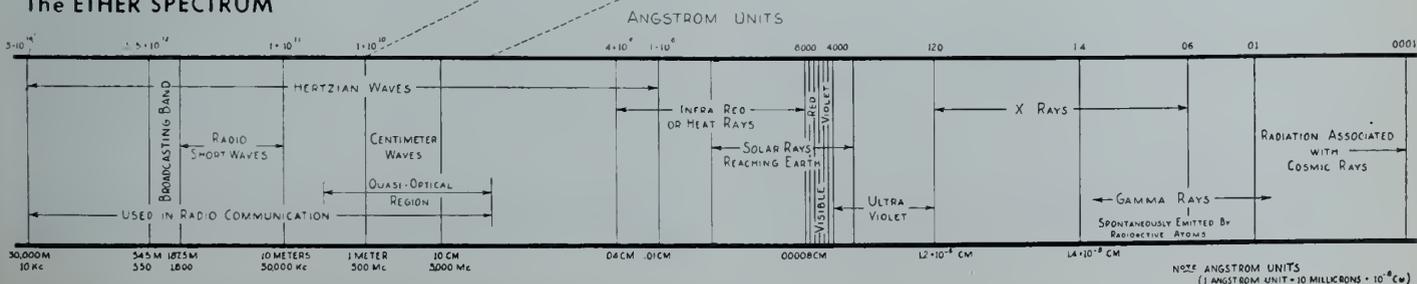

In order to keep up to date with the technical progress that was being made in radio, the 1927 International Convention provided for the establishment of a technical committee known as the International Technical Consulting Committee on Radio Communications, or the C.C.I.R. (Comité Consultatif International des Radiocommunications), to meet every two years to consider technical recommendations which would be consistent with technical progress made since the holding of the last world conference. This committee, which was organized following the Washington Conference in 1927, held its first meeting at the invitation of the Netherlands Government at The Hague in September, 1929. Fifty-two countries of the world were represented and the groundwork was laid for technical progress in radio communications on an international basis. A second meeting of the C.C.I.R. took place at Copenhagen in Denmark, in 1931, and meetings have been held since at regular intervals. The location and date of all International Radio Conventions of importance since the advent of "wireless" are as follows:—

Berlin	(1st Administrative)	1906
London	(2nd Administrative)	1912
Paris	(Technical)	June-August 1921
Geneva	(European Broadcasting)	1927
Washington	(3rd Administrative)	Sept.-Nov. 1927
Ottawa	(North American)	1929
The Hague	(1st C.C.I.R.)	Sept.-Oct. 1929
Prague	(2nd European Broadcasting)	1929
Copenhagen	(2nd C.C.I.R.)	May-June 1931
Madrid	(4th Administrative)	Oct.-Dec. 1932
Ottawa	(2nd North American)	May 1934
Lisbon	(3rd C.C.I.R.)	Sept.-Oct. 1934
Havana	(Technical)	March 1937
Bucharest	(4th C.C.I.R.)	May-June 1937
Havana	(Inter-American)	Nov.-Dec. 1937
Cairo	(5th Administrative)	Jan.-April 1938
Santiago de Chile	(2nd Inter-American)	January 1940

The RADIO SPECTRUM

The ETHER SPECTRUM

It will be observed that of the 17 international meetings on radio from 1906, all but two of these have taken place since 1921.

The London Conference of 1912 was the effective international document until the Washington Convention of 1927. The long interval between these conventions was, of course, due to the First World War but the London Convention remained internationally effective during the whole period from 1912 to 1927.

CANADA AND GREAT BRITAIN

The history of radio communication in Canada is really the history of the development from the time of Marconi, for Canadians were keenly aware of the successful attempt to span the Atlantic made in 1901 between Poldhu in Cornwall, England, and St. John's, Newfoundland.

Quoting from a periodical of that time, we find the following prophetic comment in connection with Marconi's triumph:

"When gas was introduced into the House of Parliament in London, members of the Parliament touched the pipes gingerly and marvelled that they were not hot.

"When Morse sent his first telegraph message over the wire between Washington and Baltimore, people thought it incredible and were almost convinced that the final wonder was come.

"The people of to-day are looking on an achievement as wonderful and perhaps as epoch-making as the discovery of gas or the discovery that electricity could be sent through wires for communication at a distance.

"Marconi has proved electrical telegraphy not impossible without wires. This apparently cuts the practice of telegraphy from all its earthly bounds. The imagination can hardly conceive of the possibilities in store."

One of the earliest experimenters in radio communication was Sir Ernest Rutherford. In the year 1902, Ernest Rutherford, then a professor of physics at McGill University, Montreal, carried out successfully the transmission of signals by wireless to a moving train on the Grand Trunk Railway system between Montreal and Toronto. Nothing was done to adapt the science to transportation uses at that time. However, it seemed fitting that in the year 1923, the Canadian National Railways, of which the Grand Trunk was an important component, broadcast on December 31st of that year what was probably the first commercial network radio programme in the world, employing a radio network made up of Station CHYC owned by the Northern Electric Company in Montreal and Station OA in Ottawa, owned by the Ottawa Radio Association, using transmission facilities of the Bell Telephone Company of Canada.

Radio communication is a very wide field for it covers not only that which the layman is perhaps most familiar with—broadcasting for entertainment purposes—but also all other forms of electrical communication without the use of inter-connecting wires. During the past twenty-five years, radio communication has been supervised in Canada by the Radio Branch, Department of Marine and, in more recent years, by the same branch under a new Minister, i.e., the Department of Transport. In the United States, the same function is carried out by the Federal Communications Commission except that this body, since 1934, has supervised for the Government the operation of all communication facilities, radio and land line.

The Postmaster-General is the licensing authority for all radio transmitting and receiving stations in Great Britain and Northern Ireland. The principal services operated by the British Post Office may be classified under the following headings:

- Ship-to-shore radio telegraphy.
- Long-wave radio service.
- Point-to-point radio telegraphy.
- Point-to-point radio telephone services.
- Radio telephone to ships.

In addition to these services, as the statutory authority for the control of radio telegraphy in Great Britain, the British Post Office has a close interest in broadcasting, the control and issue of licenses for radio transmitting and receiving, the investigation of complaints of interferences, etc. The B.B.C. like the Canadian Broadcasting Corporation with respect to the Radio Branch, Department of Transport, is separate from the Post Office and is governed by a Board appointed by the Government, and derives its revenue from broadcast license fees collected by the Post Office and from the sale of its B.B.C. periodicals.

In Canada, the Department of Transport, Radio Branch, besides acting as the controlling and licensing authority on behalf of the Government over radio communication, itself operates coastal and inland radio stations for direction finding and point-to-point communication. Other organizations in the Dominion which it licenses to operate radio facilities, both transmitting and receiving, are the C.B.C. and private broadcasting stations, the Canadian Marconi Company, (which established a beam service from Canada to England in 1926 and to Australia in 1928), the various branches of the military forces, the municipal and provincial police and the Royal Canadian Mounted Police, the various transportation companies, railway, air and water, the radio broadcasting listeners and, in peace time, the radio amateurs. To accommodate all these radio communication services, the radio spectrum, i.e., the frequency bands from 10 kc. to 3000 megacycles or from 30,000 metres to 10 cm. is now divided as indicated in the figure on page 255.

It will be observed that the part of the ether spectrum occupied by the radio spectrum is indicated and then the radio spectrum is divided into the main division extending to-day from 10 kc. to 3000 megacycles in frequency or from 30,000 meters to 10 cm. in wavelength. Comparison is also made with the allocation some twenty-five years ago before the advent of voice or music transmission, when practically little commercial use was made of the high frequency end of the radio spectrum.

RADIO BROADCASTING IN CANADA

Perhaps if we trace the development of radio broadcasting in Canada from its modest beginning, we might best indicate the developments in the art generally during the past twenty-five years. The important date to remember in connection with the development of radio broadcasting in Canada, besides the ones already mentioned, is the year 1929 when the Aird Commission had been appointed by the Government of Canada to look into the problem and to recommend how best the development and operation of radio broadcasting should take place in the Dominion. The report of this commission offered the first real attempt at a comprehensive plan to establish radio broadcasting communication on a national basis. It was not until the year 1932 that it was found possible, however, to follow up the recommendations of the Aird Commission by appointing a House of Commons Radio Committee to make recommendations to Parliament, and following the unanimous report of that committee, national control and operation of radio broadcasting were organized in 1933. Later, in 1936, based on the first experience with national ownership, further changes were made in the set-up and the Canadian Broadcasting Corporation came into existence on November 2nd of that year. An important change that took place on that date was the creation of a Board of Governors of the C.B.C. as distinct from management and operations. The board dealt with matters of policy affecting radio broadcasting generally in Canada and management dealt with the particular administration and operational problems of the C.B.C. An increase in the license fees also helped considerably to obtain the additional revenue required for expansion.

THE ROYAL VISIT

Perhaps the most comprehensive test in the use of radio broadcasting facilities to cover an event of world-wide interest was the job assigned to the C.B.C. to cover the

Royal Visit in Canada in May and June, 1939. Many months before Their Majesties were due to arrive at Quebec city and to commence their six weeks' tour of Canada and the United States, preparations were going on so that adequate equipment and facilities would be available when required for all the thirty-three broadcasts that were scheduled to completely cover the historic event. The highlight of the Royal Visit was on Empire Day from Winnipeg, when the whole of the British Empire was linked up with that city for two-way broadcasting in the exchange of greetings around the world. This important event in the history of Canadian radio communication required the co-ordination and the use of the facilities of all the major communication companies of the Dominion and of the British and colonial broadcasting systems. In Canada, facilities of the Bell Telephone Company of Canada, Canadian National Telegraphs and Canadian Pacific Communications and of the Canadian Marconi Company were all employed, and the fact that the complete two-hour programme was carried throughout the world without a hitch was due to the excellent co-operation of all these organizations working with the C.B.C. and also through the excellent co-operation of the British Broadcasting Corporation, without whose valuable help the event would not have been possible. The B.B.C.'s high-powered shortwave transmitters, which had been developed from the modest beginning in 1932, were brought to the peak of efficiency for this event and guaranteed the satisfactory transmission and reception of the programme to all parts of the Empire.

With the intensive development and excellent provision of equipment that was made necessary for the Royal Visit broadcasts, the C.B.C. found itself in a splendid position to carry on its increased responsibilities at the outbreak of the Second World War, September 3rd, 1939. At that time two-thirds of the total power of broadcasting stations in Canada were owned outright by the Corporation and it was operating over forty hours of network broadcasting per day supplying programmes from its principal studios in Montreal, Toronto, Winnipeg, Vancouver and Halifax, and from the B.B.C. through the C.B.C.-owned shortwave receiving station in Ottawa and from the American networks.

WARTIME OPERATIONS OF THE C.B.C.

The wartime technical plans of the C.B.C. include the following major items:—

1. Conservation of equipment by every means possible to prolong the life of such items as vacuum tubes, condensers, transformers, moving parts, etc.

2. Provision of standby antenna and power supply units at vital points to ensure continuity of service.

3. Replacement of technical personnel required for wartime duties elsewhere by training of other temporary personnel not eligible for military service.

4. Help to other organizations such as the Department of Transport, Radio Branch, civilian emergency committees, Free French Forces, etc., in carrying out important wartime assignments.

5. Protection to vital C.B.C. plants against sabotage by provision of protective fences, floodlights, fire protection and the use of armed guards.

Of the actual work to assist in the war effort, apart from the normal technical operations, perhaps the most interesting is the assistance that was given to the Fighting French Forces in the establishment of vital communications overseas. Members of the C.B.C. Engineering Division spent considerable time abroad on initial plans of an important undertaking and the C.B.C. Engineering Division in Montreal was able to render vital assistance in the preparation of engineering plans including actual layout, mechanical and electrical drafting.

Because of its interest in radio interference matters generally, the C.B.C. has been assisting other Government departments in investigating interference with radio reception on tanks and other armoured vehicles as used by the

Canadian Army. To protect the broadcasting network in areas that were considered vital and hazardous, radio links were established using frequency modulation transmission so as to by-pass physical circuits which might, in an emergency, not be available to the C.B.C. to carry on its operations. This work is proceeding.

POST-WAR RADIO COMMUNICATIONS

What of the post-war years, when the effect of wartime necessity and secrecy will have been removed and radio communication will once again be mainly concerned with peace time pursuits and civilian needs? Perhaps the greatest change that we can foresee will be brought about by the introduction of frequency modulation transmission for point-to-point radio communication to replace wire lines and, through the use of the same medium, for broadcast entertainment purposes in urban centres.

One of the great difficulties to-day in the use of the medium wave broadcasting channels is that to accommodate all the broadcasting transmitters needed to give service, only 10 kc. separation can be permitted between stations. With the use of frequency modulation transmission for broadcast entertainment purposes, there immediately are opened up new channels in the ultra-high frequency bands which are necessary to accommodate the wide bands required for frequency modulation transmission (i.e., the bands between 30 and 300 megacycles). The very nature of radio transmission on these radio frequencies is such that an optical path is the limit of transmission, i.e., you can transmit as far as the horizon. For instance, a 1 kw. FM transmitter operating in the 40 megacycle band and with an antenna height of about 300 ft., might transmit 70 miles if the surrounding terrain is suitable. Inherent with FM transmission, is high fidelity response and practically no noise or interference. This medium, therefore, offers excellent radio broadcast reception in urban centres of population while, at the same time, the present broadcast band may be employed wholly for the use of high-powered broadcast transmitters of 50 kw. power or greater, each channel separated by 20 kc. instead of 10 kc. as at present to permit high fidelity reception in rural as well as in urban centres. As far as the listener is concerned in the post-war years the radio receiver might be of the push-button type capable of receiving equally well the present amplitude-modulated transmission in the medium-wave broadcast band and the new frequency-modulated transmission in the ultra-high shortwave band. The listener would simply push a button to get a particular station and would not be unduly concerned with just how the transmission was being directed to his receiving set.

With such high fidelity reception there would then be the need for improvement in network transmission. Physical programme circuits linking up broadcast centres across the Dominion would have to be capable of much wider band transmission than at present and in some locations it might be found more economical to operate radio point-to-point links through the use of FM instead of the physical circuits commonly employed to-day. The next step after the introduction of FM transmission would be the use of television applied at first on an experimental basis. In a country like Canada, of great distances and limited population, the one factor in delaying the introduction of television to the whole population will be that of cost. Of the wartime developments and improvements in radio communication, we can only know with certainty that with the coming of victory for the United Nations' cause, will also come the benefits to peaceful pursuits of such important applications as radio location and other radio communication devices now employed by our fighting forces.

One wartime radio communication development for Canada which can be mentioned here is the establishment of a high-powered international shortwave broadcasting centre at Sackville, N.B. It is expected that this new development will be operating sometime in 1944 to carry the radio voice of Canada to the far corners of the world.

WARTIME TRAFFIC

N. B. WALTON

*Executive Vice-President, in charge of Operation, Maintenance and Construction,
Canadian National Railways, Montreal*

While not primarily designed as strategic lines, the routes of the Canadian National Railways system are admirably located to serve the war effort of Canada and the United Nations and they have been doing so since September, 1939. Possessing 23,600 miles of road, the largest rail mileage in North America, serving all deep water ports in Canada, with international connections and many miles of track reaching a score of important industrial centres in the United States, the Canadian National Railways are well located to answer the demands of wartime emergency.

The latest type of hospital car in service on Canadian railways can accommodate twenty-eight bed cases.

Eastern lines now within the system did a big transport job beginning in August 1914, and continuing until the last of Canadian overseas troops had been returned to the Dominion in 1919. From September 1939 to this date these lines have given similar service on much larger scale. During 1914-1918, from interior points to the seaboard, these

eastern lines carried on 1,191 special trains and by regular trains, 813,998 military passengers. These totals have been greatly exceeded—more than twofold—during the forty-three months of the present war.

To illustrate the war task imposed on the system these figures will serve: in 1938, the pre-war year, 10,289,000 passengers of all categories were carried; in 1942, the total had risen to 30,363,000.

Military passenger traffic is vitally important, and in addition armies need munitions and supplies and civilians in war zones require food. Canada has an imperative duty to manufacture, produce and transport supplies and food. As an example of the growth of wartime freight traffic these figures are presented: in 1938, Canadian National Railways carried 40,577,666 tons of freight; in 1942, the total freight transported amounted to 71,545,000 tons, which constituted an all-time record.

To deal with such an immense tonnage, large fleets of locomotives and freight cars are essential. It may appear surprising to learn that in 1943 the Canadian National Railways have in operation fewer locomotives and less freight cars than in 1938 when a smaller volume of freight was transported. In 1943, the company has in use approximately 2,500 locomotives of all classifications and just over 90,000 freight cars. In 1938, the system employed an additional hundred locomotives and approximately 2,000 more freight cars. The answer to the problem is to be found in the increasing daily mileage made by cars and locomotives in 1943, in the greater tonnage of the average freight train, and in the larger tonnage of freight loaded into the average car. By stepping up the locomotive maintenance programme, the equivalent of 264 additional locomotives was obtained. Similarly, an increase in the serviceability ratio

improved the freight car situation by 3,900 units.

The additional passenger traffic was handled by increasing the number of trains, the length of trains, the daily mileage made by cars, and the passenger car load.

In passenger traffic, a new service has been established requiring the daily transportation to and from war plants of well over 20,000 workers, actually an industrial commutation service. To obtain equipment for these special trains a considerable number of units were salvaged and redesigned by mechanical engineers of the Canadian National. By removing the conventional seats and preparing a new interior plan with seating along the sides and a row down the middle, the capacity of these cars was increased to 126 passengers. Some of the units to be reconditioned for this purpose include the mountain observation cars formerly employed between Jasper and Kamloops to allow

passengers on the transcontinental main line a clearer view of the Rockies. These cars are in service every day rolling to and from important war plants in Quebec and Ontario.

By far the greater part of present day passenger traffic is due to war work. Quite apart from the large number of military passengers travelling daily, a considerable number of civilians move on business directly concerned with the country's war effort. This includes movements of large groups of workers being sent to special war projects under construction or for the additional manning of plants already in operation. In this connection large numbers of men, military and civilian, employed during the construction of the Alaska-Canada highway were moved from distant centres over the Canadian National Railways. During the same period a very heavy tonnage of machinery and material required for construction work also moved over the National Railways.

Much of the freight handled by the system every day is rather of the "secret and confidential" character and may not be particularized. However, there is no special secret in the fact that the company does handle a great deal of interesting war material including tanks, planes, shells, and even light craft built inland and designed for coastal service. Travellers who use important main lines have seen stacks of cases at yards and close observers note that the character of these great piles changes frequently. These are goods assembled along the railway awaiting the gathering of ships for a convoy. When the ships are ready, thousands of tons of these goods begin their journey to the seaboard to be laden on ships for the ocean crossing.

During the pre-war years the roadbed and bridge structures of the system were maintained at a satisfactory standard, and in 1939, when it became evident that a crisis was

approaching in Europe, measures were taken to strengthen and expand those sections of the line which experience in 1914-1918 had indicated would be called on to sustain heavier movements. Considerable stretches of passing tracks were lengthened, greatly speeding up movements over lines east of Montreal, and additions were made to yards in Quebec and the Maritimes, signal systems were enlarged, and, at the same time, a large tonnage of heavy rail was relaid in the important traffic areas of Ontario and Quebec. Shop facilities were increased at eastern points, coal docks enlarged and later a system of lighters was established at an eastern port to assist in the quick transfer of cargo between land and ships.

After the outbreak of war, it was necessary to provide spurs and sidings to accommodate war plants and Royal Canadian Air Force fields and stations. To the first quarter of 1943, such additions have required the construction of well over 200 miles of track.

For security reasons it is not permissible to give details of this special work which has a direct bearing on the nation's war effort. To the close of 1941, expenditure on this account amounted to approximately \$10,000,000 and since then that sum has been substantially increased.

To deal with the traffic situation imposed by the war, it was necessary for the Canadian National system to design and provide a considerable number of units of special equipment for military passengers. Probably, the most widely known of these special types is the commissary kitchen car used in special troop trains. In the new order of things, quantities of food are carried in these cars and cooked therein, but meals are served to the men of the armed forces in the cars to which they have been assigned. Orderlies come from the troop cars and carry the food to their fellow soldiers, one kitchen car being capable of serving 600 individuals at each meal. Some of the cooking is done by taking steam from the trainline. A type of steamer installed on these kitchen cars can cook at one time all the potatoes required by a train load of troops.

A new type of dining car was also developed for use where smaller numbers of men are travelling. This is a "long table" diner, with two tables running the length of the dining-room, permitting waiters to serve from the centre of the car. These tables seat 54 men, instead of the regular diner capacity of 30 to 36.

War conditions which added considerably to the volume of passenger traffic on many lines, led to the production of a new style of café car, popularly called a coffee-shop on wheels. This car has its kitchen in the centre with a dining room at each end, patrons being seated on settees at the sides of the car, 40 being accommodated at one sitting. The coffee-shop specializes in "plate" meals so that a larger number of passengers may be served in less time than when the standard diner is in use.

For entirely different service, the company has co-operated with the Department of National Defence in the design and fitting out of hospital cars. The first unit of this character was placed in service in July 1940, after inspection by the Royal Canadian Army Medical Corps. In this car, berths were removed to be replaced by hospital cots so that serious cases could be handled conveniently. This type of car was planned to form the medical centre of a train carrying casualties from seaboard to inland points.

In November 1941, the Medical Department of the Canadian National Railways again co-operated with the Royal Canadian Army Medical Corps to design a slightly different type of hospital car accommodating twenty-eight bed cases.

As direct contributions to the country's war effort, two special responsibilities were accepted by the Canadian National Railways. One was the establishment of a plant for the manufacture of munitions; the other the enlargement of an existing dry dock and shipyard to allow for the construction of the type of cargo ships needed for the United Nations sea transport.

The manufacturing plant was organized as National

Railways Munitions Limited, a Crown plant operated by the subsidiary company for the manufacture of naval guns and field artillery mounts. A complete new structure was erected on railway property at Montreal, the location being selected to make full use of existing facilities for drainage, steam, water and power, and, at the same time, take advantage of the protection afforded by the enclosures already built for other railway structures. The shop measures 505 by 513 ft. and is laid out in eight longitudinal bays, varying in width from 61 to 66 ft. the design following closely the neighbouring locomotive erection shops. Foundations and walls to a height of 5 ft. above the ground are of reinforced concrete with brick walls above. The frame is of structural steel and the roof of laminated timber construction. Ample light is provided from wall windows, skylights and monitor sash. Glass in the walls measures 33,000 sq. ft., or 25 per cent of the total, the skylight glass measures 64,000 sq. ft., nearly 25 per cent of the total roof area. As the shop will ultimately be used as a car repair shop, the design is in accordance with railway requirements.

The first contract undertaken at the National Railways Munitions plant was for naval guns and when that order was completed the plant received another important order for a naval gun of larger calibre.

Another contract awarded to the plant was for the manufacture of field artillery mounts and at present the workers are busy with guns and mounts.

When the enterprise was started, none of the mechanical staff of the railway had any experience in the classes of work which had been undertaken. A nucleus of trained machinists was obtained from the National Railways locomotive shops at Montreal and Stratford. In turn, they imparted their knowledge to newcomers and in time a complete working staff of one thousand individuals was in active service. A large proportion of these workers are women trained on the premises for the special tasks at which they are employed.

The other unusual enterprise undertaken by the Canadian National Railways was a shipbuilding contract. Long before the outbreak of war, the company operated a drydock on the Pacific Coast and, when war came, the plant immediately gained in national importance. The first work undertaken was the repair and equipment of naval vessels. Then the construction of minesweepers was commenced and, after that, the yard had developed to such an extent that ways were erected to build cargo ships up to 10,000 tons. To date a large amount of tonnage has been launched and is now in service. The Canadian National is the only railway in North America which operates a shipbuilding yard.

Every day finds 100,000 freight cars on the line, those of the Canadian National system and cars which have reached the lines from other railway connections. To keep the freight and passenger trains moving on the Canadian National system requires the services of 94,000 workers—equivalent to six army divisions.

During this winter, Canadian railroaders have been called on to work under unusual conditions, the winter of 1942-1943 being exceptionally severe. For two and a half months, from mid-December to the close of February, the operating forces have faced everything that a so-called "old-fashioned" Canadian winter represents, excessive cold, heavy snow, rain, sleet and high winds. One item alone would paralyze operation if not promptly dealt with, that was the crashing of more than 1,500 poles in the Central Region of the Canadian National with the consequent disruption of thousands of miles of dispatching and commercial wires. Rain and sleet coated poles and wires and high winds came along to finish the job bringing sub-zero temperatures at the same time. That emergency was met. During that same period the snowfall was heavier than for many years previous. This will be appreciated when it is noted that on the Canadian National system, snow plow miles in January 1942 totalled 61,585, and in January 1943 rose to 185,467 miles, an increase of over 200 per cent.

RAILWAY TRANSPORTATION

J. E. ARMSTRONG, M.E.I.C.

Chief Engineer, Canadian Pacific Railway Company, Montreal

The railways of Canada are of relatively recent origin, the oldest having been built little more than 100 years ago. Natural waterways were the original arteries of commerce, and highways were initially tributary or supplementary to them. The first railways were merely advantageous substitutes for highways, and, like the first highways, were tributary or supplementary to waterways.

The "Company of the Proprietors of the Champlain and St. Lawrence Railroad" was incorporated under the statutes of Lower Canada in 1832 to build a railway from Dorchester (now St. Johns, Que.) on the Richelieu river to a point on the St. Lawrence river opposite the city of Montreal. This railway line, some sixteen miles in length, was the first in Canada, and was opened for traffic in 1836, essentially as a portage link in the water route between New York and the St. Lawrence river.

The locomotive first used on this line, although a primitive engine, was adequate for its purpose.

The Engineering Journal commenced publication in 1918, only 82 years after the opening of the Champlain and St. Lawrence Railroad. At that time Canada was in the midst of a World War, and the railways of Canada had advanced far beyond the stage of being ancillary to waterways. They were the major arteries of transportation, and transportation was a vital element in Canada's war effort. Their development prior to the turn of the century had been gradual but persistent, and after the turn of the century had been very rapid.

The Grand Trunk Railway Company of Canada was incorporated in 1852 to build a line from Toronto to Montreal. Prior to 1867, railways had been built in Nova Scotia and New Brunswick under colonial government auspices, but under the British North America Act the Dominion Government acquired all of these lines and assumed responsibility for their extension into an Intercolonial Railway System. The Canadian Pacific Railway Company was incorporated in 1881 to implement the undertaking of the Dominion Government to build a railway connecting the seaboard of British Columbia with the railways of Canada, this being one of the conditions under which British Columbia, in 1871, had agreed to become a part of Canada. The Canadian Northern Railway was incorporated in 1899 as an amalgamation of the Winnipeg Great Northern Railway Company and the Lake Manitoba Railway and Canal Company. From its inception each of these railways continued to grow by construction and by acquisition of other lines.

In 1900, the railways of Canada may be said in broad terms to have consisted of the government-owned Intercolonial Railway, principally in the Maritime Provinces, the privately-owned Grand Trunk Railway in eastern Canada, the privately-owned Canadian Northern Railway in western Canada, and the privately-owned transcontinental Canadian Pacific Railway.

With the turn of the century the success of the Canadian Pacific Railway inspired the other two privately-owned railways each to endeavour to develop itself into a transcontinental railway. Toward this end the Grand Trunk

Fig. 1. Large freight locomotive of 1939

Railway undertook the construction of the Grand Trunk Pacific Railway from Winnipeg to the Pacific Coast, and the Grand Trunk Pacific Railway undertook to lease from the Government the Transcontinental Railway which at the same time was being built by the Government between Moncton and Winnipeg. The development of the Canadian Northern Railway took the form of extensions both to the Pacific Coast and eastward.

The decade of railway construction, which was brought to a close by the depression immediately preceding the war of 1914-18, was a drain upon the finances of the railways which participated in it. This drain, followed by the many months of light traffic and reduced earnings during the pre-war depression and the early part of the war, placed the Canadian Northern Railway and the Grand Trunk Railway in a precarious financial position.

Commencing in 1916, railway traffic arising out of the war developed very rapidly. By 1918, the railways of Canada were handling a record-breaking business which overtaxed their separate capacities, and their operation was being directed, in effect as a single entity, by the Canadian Railway War Board, which had been created to deal with this situation. In 1918, they had a total of approximately 38,900 miles of line and gross operating revenues of over \$330,000,000.

In the period between 1836 and 1918, great strides had been made in all matters having to do with railways. 1918 and the immediately preceding and following years were critical ones in Canadian railway history. In 1917, the Canadian Northern had found itself unable to carry on and was taken over by the Dominion Government, which by so doing sought to protect its financial commitments in that railway. The Grand Trunk Pacific Railway had found itself unable to carry out its undertaking to lease the National Transcontinental Railway, and the Dominion Government retained control of that railway. In 1919, the Grand Trunk Pacific Railway notified the Dominion Government that it would be unable to carry on, and in the same year the Grand Trunk Railway, for the same reasons, came to an agreement with the Dominion Government for its acquisition of their property. The Dominion Government decided against permitting these railways to pass into receivership, and as an alternative took over the operation of the Grand Trunk Pacific Railway in 1919, and of the Grand Trunk Railway in 1920. Subsequently, their purchase was completed on terms determined by arbitration.

In 1919, the Canadian National Railway Company was incorporated to operate and manage a national system of railways, including the Canadian Government Railways and the Canadian Northern Railway. In 1923, the Grand Trunk Railway and its subsidiary the Grand Trunk Pacific Railway were amalgamated in the Canadian National Railways. It may therefore be broadly stated that five years after the close of the war of 1914-18 there remained in Canada one privately-owned transcontinental railway, the Canadian Pacific Railway, and one government-owned transcontinental railway, the Canadian National Railways.

Fig. 2. Freight locomotive of 1918

The post-war depression was followed by the boom days of the so-called New Era during which railway improvements and extensions were again accelerated. During this period the extensions were chiefly branch lines to act as feeders for the existing transcontinental lines. Extensive development ended soon after the close of the New Era in 1929, but intensive development was uninterrupted. In 1928, the record year up to that time, the Canadian railways had approximately 40,700 miles of line, and gross operating revenues of almost \$564,000,000.

For the Canadian railways the depression which followed the New Era reached its nadir in 1933, at which time they had a total of just under 42,500 miles of line, and gross operating revenues of slightly over \$270,000,000. This precipitous decline of more than 50 per cent in revenue from the peak of five years before reduced the revenues to a point substantially below that of 1918. The recovery was slow and somewhat intermittent.

The ten depression years from 1930 to 1939, concurrent with drought conditions in western Canada, severely affected the railways, but throughout that period they maintained and improved their properties and services, and discovered means of doing so for less expenditure of dollars and man-hours than ever before. Had they been unable to accomplish this the record of Canada's war effort during the present war would not have been possible.

In 1939, which may be regarded as the most recent year in which the railways were not affected by war traffic, they

had approximately 42,700 miles of line, and their gross operating revenues had recovered to just over \$367,000,000, only slightly more than they had been in 1918, and still very much less than they had been in 1928.

The large freight locomotive of 1918, shown in Fig. 2 was a little over 71 ft. long, weighed approximately 438,000 lb., and could exert a tractive effort of 54,000 lb. The large freight locomotive of 1939, shown in Fig. 1 was a little over 98 ft. long, weighed approximately 750,000 lb., and could exert a tractive effort of 77,200 lb. without the help of the booster, and with the booster in operation could exert a tractive effort of 89,200 lb. This improvement in motive power is symbolic of the general improvement of the Canadian railways during that interval of 21 years.

Since 1939, the railways have been progressively more and more restricted in the use of manpower and materials. Locomotives of any new type have been unobtainable, and the few locomotives of existing types which could be purchased have been barely sufficient in number to compensate for retirements. Similar restrictions have operated in regard to all railway materials so that it has been necessary for the railways to carry the enormous increase in traffic due to the war with little if any increase in facilities. By intensive use of existing facilities they have done so in a manner generally satisfactory to their patrons.

During 1942, with slightly less than 42,600 miles of line, the gross operating revenues of the railways of Canada, with December earnings estimated, amounted to over \$650,000,000.

Gross operating revenue as an index of the volume of service rendered is to some substantial extent misleading because of the fact that both passenger fares and freight rates were lower in 1942 than in either 1918 or 1928. While gross earnings indicate an increase in railway business of approximately 100 per cent between 1918 and 1942, and approximately 15 per cent between 1928 and 1942, the actual increase in services rendered by the railways were substantially more than these percentages indicate.

An industry which, after ten years of most serious depression, and without substantial increase in fixed property or equipment, is able to handle in three years an increase of approximately 80 per cent in traffic, and in the third year handle over 15 per cent more than in its previous record year, which came toward the end of a period of prosperity, cannot be regarded as an industry which was unprepared for eventualities when the present war commenced in 1939.

URBAN TRANSPORTATION

A. DUPERRON, M.E.I.C.

Assistant General Manager, Montreal Tramways Company
President, Canadian Transit Association

In 1937, the author had the privilege of writing an article on urban transportation for the special number of *The Engineering Journal* published on the occasion of the semicentennial anniversary of the Institute. This article covered the development of the industry during the past 50 years. The present article, for the issue commemorating the 25th anniversary of the foundation of *The Engineering Journal* deals with the progress of the last twenty-five years. Discussion will be confined to the general principles of urban transportation, with special reference to wartime conditions. For additional information, the reader may refer to the article published in 1937.

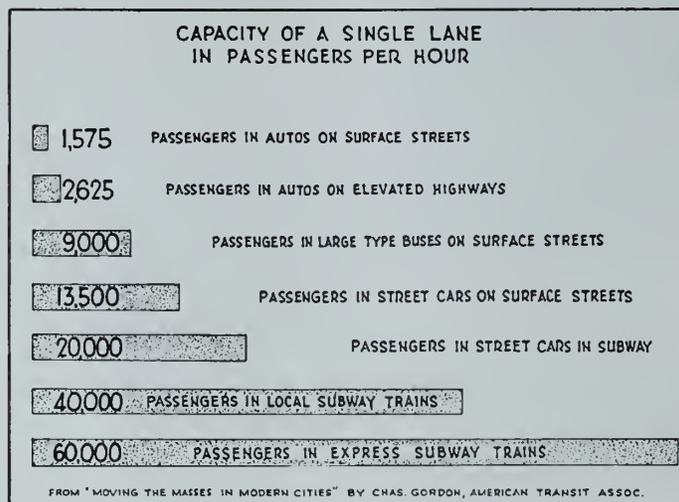

In 1918, there existed but one method of urban surface transportation: the electric railway. To serve municipalities of relatively small population, or outlying districts of large cities where density of traffic was low, many miles of track-work and electric lines had to be installed, entailing large capital investment and high cost of maintenance for a relatively small amount of traffic. There was therefore a need for a system which would not require the spending of large sums of money in places where the number of passengers did not economically warrant such an expense. The autobus and trolley bus have since filled this very important need.

To-day, three different modes of urban transportation are available on surface lines: the street car, the trolley bus and the autobus. Each has a definite place, depending upon the density of traffic and local conditions.

In large cities the street railways are still the backbone of transportation. Due to their large carrying capacity, street cars can move more passengers with less street occupancy than any other type of vehicles. To replace one street car it is necessary to use $1\frac{1}{2}$ autobuses of the larger type or two of medium capacity. In main arteries of large cities, tramways are operated on headways as low as 25 seconds. Most of these streets can accommodate only four lanes of traffic, two in each direction, and are now taxed to capacity. The remedy to the acute problem of traffic cannot be found, as is sometimes proposed, in the substitution of buses for street cars, because the former take up much more of the street space which is already too small.

One thing has not changed during the last twenty-five years: the width of existing streets in the central districts of large cities. Most streets were built over fifty years ago, when transportation was furnished by horse-drawn vehicles. It is not necessary to describe the conditions of to-day's traffic, as they are well known to every one. Cities have grown to giant proportions, but the old streets have still to be used.

It is interesting to note that on the American Continent, in all cities having a population of 500,000 and over, 70 per cent of the passengers are carried by street cars. In fact, in all of its large cities where there is no subway, e.g., Chicago, Los Angeles, Montreal, Toronto, Cleveland, Baltimore, Pittsburgh, St. Louis, the proportion of passengers carried by street cars varies from 75 to 90 per cent. New York is often cited as an example of successful replacement of street cars by buses, but it must be noted

that 66 per cent of the passengers are carried by the subway system. If New York did not have subways, there could be no question of carrying its people in buses only.

There is a special difficulty which public transportation companies have to face in Canada, and that is conditions in winter. It is a well established fact that, during heavy snow storms, street railway service is not interrupted, when autobuses often have to suspend operation. This is due to the fact that transit companies, with their plows and sweepers moving on

rails, keep the tracks free of snow. There are also days in winter when, on account of rain, the streets become so slippery that autobuses cannot operate. Due consideration has to be given to these facts in deciding upon the different modes of transportation serving large cities.

Apart from the above, one must also take the economic point of view. Evidently, the density of traffic must be high enough to justify the capital cost of the construction and maintenance of tracks, trolley lines, feeders and substations for street cars. When this condition is not fulfilled, as a general rule, trolley buses or autobuses should be used.

Modern trolley buses were first used in Canada in 1937. The body and chassis of a trolley bus is that of an ordinary gasoline bus, but the vehicle is driven by an electric motor taking its current from a positive trolley wire like that of a street car. As there are no rails to serve as a return conductor, there must be a second trolley wire, and consequently trolley buses are equipped with two trolley poles. Such a bus can move freely right and left to a distance of about 12 ft. each side of the trolley wires, and on streets of ordinary width it can, therefore, move as freely as an ordinary gasoline bus and draw to the curb to load and unload passengers.

These vehicles are economical when headways are sufficiently short to distribute the cost of the trolley line, feeders and substations over a large number of bus miles. They have their place for medium traffic in streets where there is no objection to the erection of poles and trolley wires. The disadvantage of the trolley bus is that its route cannot be altered. In this respect, the gasoline bus has a decided advantage.

Certainly the most important change in urban transportation during the past twenty-five years has been the use of gasoline and Diesel engine buses.

The first autobuses appeared in 1920, but it was not until 1925 that the development of this vehicle had reached a point where it could be used with real advantage. Its growth has been both rapid and remarkable. At first, the motor was placed in the front as in automobiles. As the capacity of the buses increased, the engine became quite large and it was realized that the space it occupied was wasted as far as floor area was concerned. A radical change was then effected when the body and chassis were built integral as one unit, and the engine located underneath the floor or transversely at the rear of the bus. Buses of larger carrying capacity could then be built and the street occupancy per passenger reduced accordingly. It has been found, however,

that for economic and structural reasons, the size of buses is limited to approximately 40-seat capacity.

The great advantage of autobus service is that it only requires the purchase of the vehicle and the construction of the garage for storage and repairs. However, the average life of an autobus is much shorter than that of a street car and its maintenance and operation more costly.

As mentioned previously, autobuses are used where the density of traffic does not justify the capital expense required by tramways. In large cities, they are used as feeder lines to the main tramway system. They are especially suitable for use in less populated sections, in residential areas and in newly developed districts.

A well-balanced surface transportation system in a large city therefore includes street cars and trolley buses or autobuses, each fulfilling its proper function, due weight being given to climatic and topographical conditions. Complete change-over from street cars to buses cannot usually be made at one time without causing a waste of money; on the contrary, it should be gradual and spread over a number of years. Each route so changed should be the subject of a special economic study.

During the last fifteen years, many small and medium sized cities have entirely substituted buses for street cars where the population and local conditions did not justify the continuance of street car service. In a number of these cases, tramway tracks and street cars had not been properly maintained and the property was in such a state that the change had to be made in one operation. It is not possible to state a definite figure of population below which a tramway service cannot be justified economically. Each city has its own special problems in this respect.

RAPID TRANSIT

It may be of interest to say a few words about rapid transit. When a city has become so large that surface transportation can no longer meet the needs of the population, it becomes necessary to resort to some form of rapid transit, which in the central district usually takes the form of subways. The construction of subways, however, is so expensive that it cannot be financed by private enterprise alone, because the fare required to meet the fixed charges on capital investment plus the cost of operation would be so high as to be prohibitive. I do not know of any subway that pays its cost of operation and fixed charges with the fares collected, so the deficit has to be met by general taxation. It would be totally unfair to place the full burden of the cost of underground rapid transit on the passengers alone. By putting mass transportation underground, the streets are relieved for the balance of traffic, thereby benefitting the public as a whole. Subways provide additional street space without widening the streets in areas where land values and existing structures prevent street widening.

On the North American continent only New York, Chicago, Philadelphia and Boston have subways. In Chicago, in spite of its four million population, the first subway was built only recently, (its operation was commenced in March of this year), and it was built partly with money loaned by the Government.

In Canada, there are as yet no subways, although studies have been made for Montreal and Toronto. Can they be built as post-war works? It would be very desirable, for the congestion of traffic in the central districts of these two large cities has reached a point where relief is urgently needed.

FARES

If we examine the fares in force since 1918, it is seen that they increased from 1918 to 1922 but since then have remained practically at the same level. Street car transportation is therefore one of the few commodities which has not become more expensive during the last twenty years. This is in spite of the fact that the cost of labour, material and equipment of all sorts has considerably increased. It must also be noted that during the last twenty-five years, large cities have grown very rapidly and their

population has moved toward the outlying districts; many suburban municipalities have also been developed. Transit passengers to-day must travel far greater distances to go to and from their work than they did before, with the result that the cost of transportation per person has risen.

WARTIME TRANSPORTATION

To-day, transit companies have to face tremendous difficulties due to wartime conditions. War started in 1939, following a very severe business depression. The industrial war effort of our country, taking into account its population, is surpassed by none. As mass transportation is a true barometer of the trend of business activities, the number of passengers has increased accordingly. The following table shows the number of revenue passengers carried in typical Canadian cities in 1939 and in 1942:

	1939	1942	Percentage of Increase
Vancouver, B.C.....	62,048,000	89,355,000	44%
Hamilton, Ont.....	15,565,000	29,675,000	91%
London, Ont.....	8,909,000	14,750,000	65%
Montreal, P.Q.....	208,928,000	319,398,000	53%
Halifax, N.S.....	9,627,000	24,396,000	153%
Ottawa, Ont.....	21,138,000	42,294,000	100%
Quebec, P.Q.....	16,980,000	28,936,000	70%
Toronto, Ont.....	154,090,000	238,992,000	55%
Winnipeg, Man.....	41,640,000	61,696,000	48%

The following methods are available to meet these abnormal increases:

1. By adding to the rolling equipment.
2. By increasing the speed of operation.
3. By staggering the hours of work.

With regard to additional rolling stock, orders for street cars and buses were placed by transit companies immediately following the outbreak of war. Most of such equipment had to be obtained from the United States and paid for in American funds. The Canadian Government at that time had great difficulty in maintaining the exchange at a reasonable level and was very reluctant to transfer large sums of money to the United States. The result was that only a limited amount of equipment was obtained.

Conditions became worse when the United States declared war, as the number of transit vehicles manufactured was gradually reduced until now it is practically nil. The few buses and street cars now built are under the exclusive control of the United States Government, which allots the vehicles as it sees fit. The few vehicles Canadian companies can get from the United States Government are obtained through the Transit Controller for Canada, who, in turn, distributes them as he deems advisable.

A limited number of small buses manufactured in Canada were also obtained. While helping to relieve the situation, these cannot solve the problem.

One unforeseen development of the war was the shortage of rubber and gasoline. In compliance with a request of the Transit Controller, the use of autobus equipment was reduced to strictly essential services. Few changes were made during rush hours as all pieces of equipment were required at that time, but, outside of these hours, a number of bus lines operating within walking distance of street car lines were discontinued. In certain cases, abandoned street car lines, replaced before the war by bus lines, were resumed. It was fortunate that the bulk of passengers in large cities could be carried by street cars.

The speed of service was also increased. With a fixed number of vehicles, more people can be carried if these vehicles move faster. Numerous stops for loading and unloading passengers were abolished, and this policy is still being extended. Also, men were stationed at heavy transfer points to hasten the loading of passengers. Strict enforcement of no-parking regulations on main arteries of traffic was also applied. City authorities and transit companies were in many instances fortunate in having the support of newspapers, social clubs and public bodies, who urged the strict observance of traffic by-laws.

In addition to these measures, further steps were needed

(Continued on page 316)

AIR TRANSPORTATION

J. A. WILSON, M.E.I.C.

Director of Air Services, Department of Transport, Ottawa.

The story of the gradual development of aviation in Canada from the earliest days to the end of 1936 was recorded in the special number of *The Engineering Journal* published in June, 1937, to celebrate the semi-centennial anniversary of the Institute. It is fitting that this story should be continued and brought up to date in this issue of the *Journal* which marks the celebration of its twenty-fifth anniversary. Progress in all phases of aeronautical activity was rapid but on normal lines during 1937, 1938 and 1939. The outbreak of war forced an immense expansion in every field; training, manufacturing, aerodrome and building construction, air transport operations, radio and other communications, meteorology, alike shared the new impetus. Aviation will emerge from the war immensely strengthened in all respects and at its conclusion Canada will be the fourth ranking air power in the world.

A new chapter in the development of air transport opened towards the close of 1936 with the coming into force of the Department of Transport Act (November 2, 1936). This Act brought together, for the first time under one Minister of the Crown, all services in Canada having jurisdiction over transportation and communications. As air transportation develops, its dependence on radio aids to air navigation and meteorology increases each year. Under the new Department of Transport an "Air Services Branch" was formed to unite, under one Director, these three closely allied activities. Since its formation, the Air Services Branch has very fortunately remained under the able and energetic direction of the Honourable C. D. Howe, M.E.I.C., to whose vision and foresight Canada owes much of its progress in aviation, during his tenure of office, first as Minister of Transport and then as Minister of Munitions and Supply, retaining jurisdiction over the Air Services Branch.

AIR LEGISLATION

Mr. Howe introduced, and passed through Parliament, the Department of Transport Act in the session of 1936, the Trans-Canada Air Lines Act in 1937, and the Transport Act 1938. These three Acts have placed air transport on a firm foundation for all time. The first provides a suitable organization in the Department of Transport for the administration of all phases of civil aeronautics. The second creates a national instrument for the operation of main line air transport services in Canada and international main line connections to other countries. The third provides, through the Board of Transport Commissioners, an independent judicial body to deal with air route licensing including adjudication on necessity and convenience, tariffs and other related matters, leaving regulation of the technical and safety factors to the Air Services Branch.

CONSTRUCTION OF THE TRANS-CANADA AIRWAY

In 1937, the tempo of construction on the airway, which had been proceeding intermittently for ten years, was stepped up and measures were taken to hasten its completion from

Administration building at the new Montreal Airport,
Dorval, Que.

Toronto and Montreal, through the rough and unsettled terrain of northern Ontario were being pressed so that a regular service connecting for the first time eastern and western Canada by air might be possible. Training and familiarization flights over this section commenced on September 7th, 1938. These were followed by mail and express services and finally on April 1st, 1939, the passenger service over the whole system west of Montreal was placed in regular operation.

On the section east of Montreal, the time-table was: January 1st, 1940, air mail service established between Montreal and Moncton; passenger service, February 15th, 1940. This service was extended to Halifax on April 16th, 1941, and to St. John's, Newfoundland, on May 1st, 1942.

This construction programme involved the enlargement, paving and lighting of all the principal airports. There are now 19 principal airports at which regular stops are made, 24 intermediate fields with ranges, and 42 emergency fields on the airway. Almost all of these are now in active use as part of the Joint Air Training Plan or for other defence purposes.

CONSTRUCTION OF THE NORTHWEST AIRWAY

The possibilities of an airway connecting with the Trans-Canada system at Edmonton to give access to all parts of northwestern Canada and Alaska had long been realized. In 1935, a survey to determine the best route was made. The route over valleys of the Peace, Liard and Yukon rivers offered the best solution and, in 1937, a contract was let for a weekly airmail service, on skis in winter and floats in summer, from Edmonton to Whitehorse, Y.T., via Fort St. John, Fort Nelson and Lower Post so as to gain further knowledge of flying conditions at all seasons of the year. The results were so favourable that an airway survey of the route was authorized in the spring of 1939 to locate aerodromes and radio range sites at intervals of one hundred miles according to standard airway practice. The construction of an airway based on these surveys was recommended by the Joint Canadian-United States Board on Defence in November 1940. This recommendation was accepted and the Canadian Government authorized the Department of Transport to proceed with the construction on February 8th, 1941. Construction was far enough advanced by Sep-

coast to coast by providing, for the first time, funds adequate for a project of this magnitude. By the end of January 1938, the construction of the aerodromes between Winnipeg and Vancouver, radio ranges, field lighting and installation of other necessary facilities was sufficiently advanced to permit Trans-Canada Air Lines to begin their training programme. Regular air mail services were inaugurated over this section on March 6th, 1938, and, on April 1st, the complete services for mail, passengers and express were started.

Meanwhile the completion of the airway facilities on the long section of the airway between Winnipeg,

tember 1, 1941, to permit of its being flown in daylight and good visibility, and by the end of 1941 the main bases and radio ranges were completed up to standard requirements. Since the entry of the United States into the war, this route has become of vital importance to the war effort of the United Nations, and its facilities have been greatly augmented. It gives direct access from the airway systems of Canada and of the United States by the shortest route through northern British Columbia and the Yukon to Fairbanks in the heart of Alaska. Its importance in the post-war period as the shortest route between the North American Continent and the Orient and Asia can readily be seen.

AERODROME CONSTRUCTION FOR THE COMMONWEALTH TRAINING PLAN

A detailed account of the co-operation between the Departments of National Defence for Air and Transport and the results of the first year's work on this programme will be found in *The Engineering Journal*, November 1940 issue. The Air Services Branch has continued and extended its work for the Department of National Defence for Air and is now authorized to construct on its behalf all aerodromes and allied facilities required, not only for the Air Training Plan but for all defence purposes. This has meant a great increase in work and responsibility. These activities are now Dominion wide (and include Newfoundland and Labrador as well). The projects number more than 200 and the cost of the programme now exceeds \$150,000,000 and still increases. The Air Services Branch is responsible not only for the planning and construction of these aerodromes but for the selection of suitable sites, their purchase and survey, power and water supplies, radio range stations where necessary, telephone and teletype installations, highway connections, and all related work.

AIRPORT AND AIRWAY CONTROL SYSTEMS

Increasing congestion on major airports due to war activities has made necessary the installations, in 1940, of a system for the efficient control of all air traffic within a radius of 20 miles of the principal airports. This was followed in 1942 by a similar demand for "airway" traffic control, to ensure the safety of the numerous aircraft en route over the system especially under conditions of poor visibility and at night. This links up with a similar control system in force in the United States. These control systems have necessitated the formation of a school for the training of traffic control officers and assistants for both classes of work. This school trains not only the civil staff but members of the R.C.A.F., including the Women's Division, as well. Fully manned airport traffic control towers, giving service 24 hours a day, are now installed at all major airports and the necessary land line phone connections are now being installed to give direct through connections between the airway traffic centres, with connections as necessary across the international boundary.

RADIO AIDS TO AIR NAVIGATION

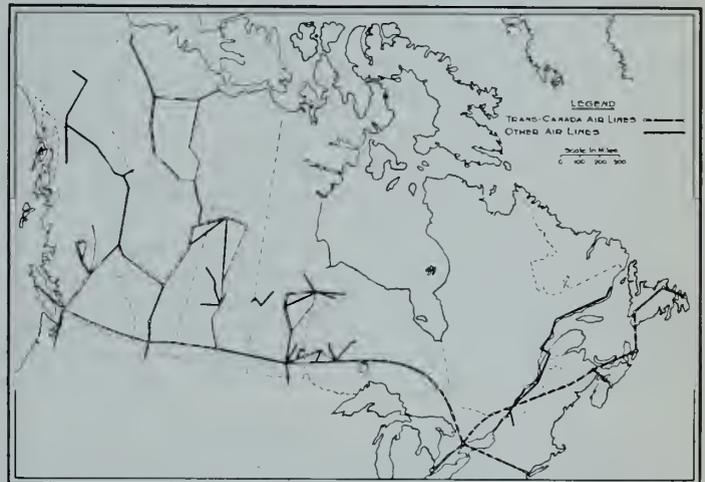

The importance of radio in the operation of air transport services increases continually. The air administrations of Canada and the United States have followed a common policy in this, as in other airway facilities, such as airport planning, zoning, lighting, control systems, etc., so that there may be as far as is physically possible one system universally used throughout North America.

A chain of radio range stations now guides pilots from coast to coast. These stations are spaced at intervals of approximately 100 miles along the airway and give pilots a true indication of the proper course at all times and, in addition, a means by which he can bring his aircraft down through an overcast ceiling to a safe landing on an airport. For added safety, marker beacons and cone of silence markers have been added where necessary to afford the pilot additional assurance of his exact location on his course relative to an adjacent airport or radio range when he is

flying "on instruments" in conditions of poor visibility. There are now 48 range stations on the trans-continental system and 15 serving other airways, while 17 more are projected.

All range stations are also weather observing stations and are interconnected by teletype. Each range transmits for the information of pilots the weather conditions at his station and the same information from other adjacent stations at 60 minute intervals. The major airline operators all have their own radio communication stations at the principal airports with frequencies allotted for their special use. Itinerant aircraft are also allotted special frequencies which are guarded at the main airports by Department of Transport operators. Congestion of the radio services had forced the introduction of land line connections for the transmission of weather, traffic and administration messages. In some districts, however, it has not been possible to extend these land lines and the whole burden of communications for all purposes rests on the radio service. Under such circumstances, the Department provides communication sets on long and short wave for intercommunication between airports, radio ranges and aircraft.

Airport traffic control is exercised by radio-phone. Special sets are installed in all control towers for this purpose to enable the control operator to communicate direct with the pilot. On the other hand, airway traffic is controlled by landline interphone between stations and the necessary

Map showing the routes of T.C.A. and other air lines.

information is relayed to pilots through the airport control radio. The modern airway communication set up is a complicated but closely integrated system using radio and land lines, voice and key each in its most efficient field.

METEOROLOGICAL SERVICES

Flying has revolutionized meteorological science. New methods of forecasting have been introduced and the collection and dissemination of weather information has been speeded up to a remarkable degree. Weather recognizes no political or physical frontiers. The ebb and flow of the atmosphere is world wide and the modern meteorologist must of necessity have a world outlook. Under existing war conditions, the free interchange of meteorological information has been greatly restricted. Canada fortunately is not so adversely affected as many other countries since weather reports are still available from all points on the North American Continent, the Aleutian and Arctic Islands, and for trans-Atlantic operations from Greenland, Iceland and the British Isles, which, together with a few reports from ships at sea on the Atlantic Ocean, provide a very large area from which regular reports are received. The prompt collection and dissemination of meteorological data over such a wide area requires skillful organization. Radio, teletype, phone and telegraph are all used in the work.

Scheduled airline operations call for a most intensive

weather organization capable of accurate forecasting of the weather for all points on the airway system. Hourly sequence reports, giving the temperature, pressure, humidity, ceiling, visibility, wind strength and direction, are made by all main airports and radio range stations. These are made available to all aircraft operators. In addition, regular forecasts are issued at six-hour intervals by seven forecasting stations based on observations not only on the airways but from numerous stations established all over the Dominion. Many of these are quite inaccessible and stores, food and replacement personnel can only be supplied once a year. In such locations the weather reports must of necessity be made by radio.

To cope with war-time responsibilities, the Meteorological Service has trained a very large number of men and women for special work. These duties range all the way from those of highly trained physicists for forecasting work to the relatively simple duties of weather observing. This war work has included the organization of special forecast centres on both coasts for the Air Force and the Navy; the manning of all Air Force stations with a specially trained meteorological staff; the preparation of all text books on meteorology for the Joint Air Training Plan and the supply of personnel qualified to lecture on this subject; the establishment of radiosonde stations for the measurement of the pressure, temperature and humidity of the upper atmosphere up to very great heights which greatly improve the accuracy of forecasting.

The establishment of the R.C.A.F., R.A.F., and U.S.A. A.F. Ferry Commands has thrown extra burdens on this staff which is wholly responsible for all Canadian and trans-Atlantic forecasts. The staff has increased from 195 on September 30th, 1939, to 672 on January 31st, 1943, and the appropriations from three quarters of a million dollars in the fiscal year 1939-40 to nearly three million dollars in 1943-44.

The Meteorological Service of Canada is second to none and its rapid expansion to meet war-time requirements was only possible because its directing staff realized in advance the demands which would be made on it and took measures to meet the situation by training a number of scientists for its special requirements.

COMMERCIAL FLYING

The accompanying table illustrates clearly the steady growth of commercial air operations which still continue. Air mails increased from 1,450,473 lb. in 1937 to 5,415,117 in 1942, with a corresponding growth of revenue not only to the air operator but to the Post Office Department as well. Commercial freight fell from 24,317,610 to 12,224,028 lb. This decrease shows the lessening of mining and prospecting activity in northern Canada due to the war. This

was the mainstay of many "bush" operators in peace time. It has been more than compensated for by the immense increase in freighting by air for military services, for which figures cannot yet be released. Passenger traffic rose from 141,158 to 235,860 and aircraft mileage from 10,755,524 to 12,986,590. The figures for licensed personnel show a corresponding increase; pilots, 1937, 1157; 1942, 1276; air engineers, 1937, 595; 1942, 944. The largest factor in this steady growth is Trans-Canada Air Lines.

TRANS-CANADA AIR LINES

The national system began its commercial operations in September, 1937, over the Vancouver-Seattle route, 122 miles long. About the same time it initiated its staff training programme. In January, 1938, T.C.A. had 71 employees and owned five Lockheed "Electra" planes, each carrying 10 passengers, pilot and co-pilot. At the close of 1942, the employees numbered 1,662. The company owns 12 Lockheed "14" and 12 "Lodestar" planes, each fitted with two 1200 hp. Pratt & Whitney "Twin-row Wasp" engines, which fly 22,670 miles a day or 8,250,000 miles a year.

The war has affected T.C.A.'s operations in many directions. Some of its most experienced employees have been released for military service and deferralment has only been requested from the National Selective Service Board for such employees as are essential to maintain the safe operation of the air line. To-day more than 30 per cent of the employees are women who are employed in many capacities.

The release of experienced personnel and the continued expansion of the company's operations has necessitated a large training programme for new entries. Classes for the training of pilots, dispatchers, stewardesses, radio operators, passenger agents and shop workers of all classes are in continuous operation. A large pilot training programme has been carried out for the R.C.A.F.; for the Department of Munitions and Supply a new engine and propeller overhaul plant has been built and is now operating on a three-shift basis; the instrument shop is working 24 hours a day chiefly on R.C.A.F. work; the company's facilities across Canada have been extensively used for the servicing of military aircraft; at Montreal about 300 skilled mechanics are continuously employed on maintenance and overhaul of the trans-Atlantic aircraft operated by British Overseas Airways Corporation; T.C.A. flight crews have been assigned to B.O.A.C. for overseas work; radio coverage, dispatch and station service are furnished to the R.C.A.F. Communications Squadron by arrangement with the Department of National Defence for Air; the company's engineering and flight staffs have given much assistance to the National Research Council and the R.C.A.F. in the study of icing conditions; in fact the war work of T.C.A. has covered the whole field of aircraft operation and maintenance from coast to coast.

STATISTICS FOR COMMERCIAL FLYING

Year	Reg'd Aircraft	Licensed Air Engineers	Licensed Pilots				Aircraft mileage	No. of passengers carried	Lbs. of freight carried	Lbs. of mail carried
			Private	Commercial	Ltd. commercial	Transport				
1936	559	380	65	42	7,100,401	22,947,105
1937	604	595	635	320	129	73	10,755,524	141,158	24,317,610	1,450,473

CANADIAN PACIFIC AIR LINES

The consolidation of the many independent commercial operators chiefly engaged in servicing the mining industry in northern Canada has been proceeding gradually for the past two years. The Canadian Pacific Air Lines now controls the operation of Canadian Airways Limited, Arrow Airways Limited, Ginger Coote Airways, Prairie Airways, Mackenzie Air Service, Yukon Southern Air Transport Limited, Dominion Skyways Limited, Quebec Airways, Wings Limited, Starratt Airways and Transportation Com-

pany. The traffic statistics of all of these companies are embodied in the tables showing the total traffic for the years 1937-1942. The component companies of C.P.A. in 1942 flew approximately 5,300,000 miles, carried 60,000 passengers and 10,000,000 lb. of freight, express and mail. Their employees number 7,000. Ninety per cent of the company's business is now for war purposes—in the northwest for the important developments in these remote districts arising out of the joint defence programmes of Canada and the United States for the defence of northwestern Canada and Alaska; in the northeast in connection with the construction of plants for war industries and aerodromes. "Bush" services have been maintained in all important areas but the decline in gold mining has materially reduced this activity. This decline has been compensated for by the increased war-time search for essential war minerals.

To meet the increasing traffic, more efficient and larger twin-engined aircraft have been placed in operation on several routes replacing the former ski-float operations. Up to date air navigation facilities, including aerodromes, radio ranges, improved weather and communication services and lighting are also being installed so as to permit of all weather, night and day operation. Every effort is being made to bring such services up to main line standards as rapidly as possible.

The majority of the component operating companies had made contracts with the Department of National Defence for Air in 1940 for the operation of schools under the Combined Training Plan. C.P.A. now operates on a non-profit basis one elementary and six air observers schools under such contracts. The company also manages five aircraft and engine repair plants under contract with the Department of Munitions and Supply.

The Aerial Survey Division has been actively engaged throughout the period under review and, during 1942, 12,000 negatives were handled.

Although many of the principal operating companies have been absorbed by C.P.A., there still remain independent organizations in this field. Typical of these are Maritime

Central Air Lines who operate a mail, passenger and express service between Moncton, Saint John, Summerside and Charlottetown, P.E.I.; the M & C Aviation Company who operate a licensed airmail, passenger and express service from Prince Albert to northern Saskatchewan points and, in addition, an engine and overhaul shop under contract with the Department of Munitions and Supply; Leavens Bros., who hold the contract for the winter airmail service to Pelee Island, operate charter services and an air observers school under contract with the Department of National Defence for Air; Northern Airways who operate a mail, passenger and express service under license between Carcross, Y.T., and Atlin, B.C., and charter services from these points; Austin Bros., who operate a charter service in northern Ontario.

The flying school operators who were fully employed up to the end of 1941 have been forced out of business in many cases since then owing to the restriction of the use of gasoline to essential war purposes, shortage of man-power and the concentration of flying training in the hands of the R.C.A.F. through the Combined Training Plan.

THE FLYING CLUBS

The Flying Clubs started in 1928 with the assistance of the Government to meet the urgent need for pilot training facilities and municipal airports, continued their activities on a constantly increasing scale till 1940.

In June 1939, the Department of National Defence entered into contracts with eight of the strongest clubs for the elementary training of a number of pilots for the R.C.A.F. On the outbreak of war this system was extended to cover all clubs.

In 1940, that Department entered into contracts with elementary training school companies sponsored and organized by the Flying Clubs for the elementary flying instruction of all pupils under the Commonwealth Air Training Plan. This system was subsequently extended to cover elementary flying training for the Royal Air Force schools in Canada. Nineteen such schools are now in operation. In most cases the normal work of the clubs close down with the opening of their sponsored school but in one or two of the larger cities the club activities were carried on to meet the need for pilots for the civil schools, ferry commands, and air operating companies.

In 1942, even these activities ceased with the need for the conservation of gasoline, man-power and equipment and the concentration of training activities for all services in the Combined Training Plan under the direction of the Department of National Defence for Air.

The Canadian Flying Clubs Association has continued to play a useful part in the co-ordination of these activities.

FLYING CLUBS STATISTICS

MINERAL INDUSTRIES

DR. CHARLES CAMSELL, C.M.G., M.E.I.C.

Deputy Minister of Mines and Resources, Ottawa.

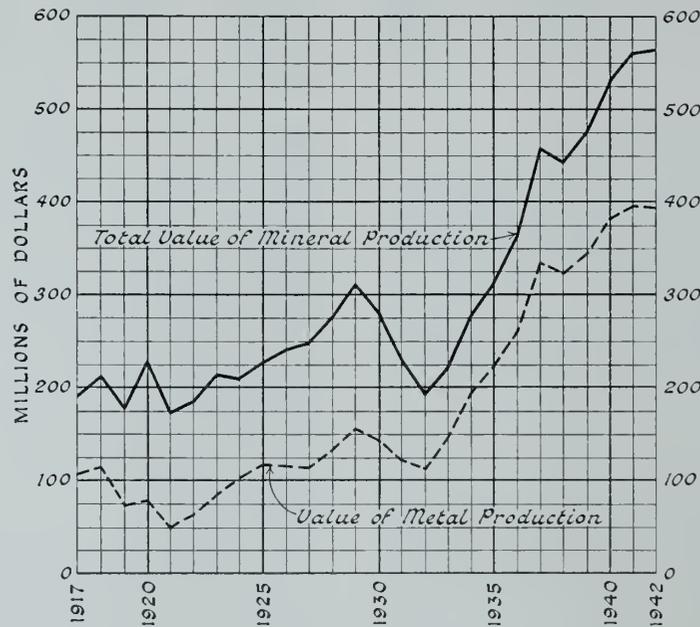

The headway that Canada has made in the production of metals and minerals in the past quarter of a century is shown to excellent advantage in the accompanying chart. Commencing with 1917 when the total output reached a value of \$190,000,000, it gives in broad outline the production history of the industry over a twenty-five-year period, ending with 1942, when the output reached a record total value of \$564,000,000. This represents an increase in per capita production from \$23 in 1917 to \$49 in 1942, the comparable figures for the United States, the leading producer of minerals, being approximately \$49 and \$57.

In the same period, metal production in Canada increased from an annual value of \$106,000,000 to a value of \$392,762,000.

The headway can be traced to many factors. It can be traced in part to the wide range of metals and minerals found in the Dominion and to the fact that supplies of most of them are large; to the expansion of other industries, primary and manufacturing, which opened up new markets for the products of the mines, and the growth of which in turn depended largely upon mining; to the availability of cheap hydro-electric energy throughout the country, to the widening use of metals and minerals in industry; and perhaps most important, to the skill and toil of the prospector, the work of the engineer, metallurgist, and geologist, and to the vision and venturesome instincts of men who were prepared to take risks in the belief that the industry had a real future.

A comparison of the status of the industry in 1917 with its present position is necessary to a full appreciation of the progress that has been made. Commencing with the metals, the most impressive comparison is in the production of gold. Output of this metal in 1917 reached a value of \$15,273,000 and it came chiefly from a few large mines in the Porcupine and Kirkland Lake areas of Ontario. These mines are still among the leading Canadian producers of the metal but the list now comprises more than one-hundred and forty properties in scattered areas across the Dominion, the total gold output from which in 1942 was valued at \$186,000,000, a record of \$206,000,000 having been established in 1941. In 1917, the value of gold output was little more than a third of the value of coal output. In 1942, it was appreciably greater than the total for the fuels and the non-metallic minerals and it was \$18,500,000 greater than the total for copper, nickel, lead, and zinc. The price of gold in the meantime, of course, had advanced from \$20.67 an ounce to the present level of \$38.50 an ounce.

Considering the metals as a group, a comparison of exceptional interest is in the distribution of output. In 1917, approximately 85 per cent of the output of metals came from Ontario, British Columbia, and Yukon. There was only a small production from the mines of Quebec, and Manitoba and there was no production of metals from

Saskatchewan and the Northwest Territories. Last year, Quebec reported a metal production valued at \$61,500,000 and approximately 95 per cent of the output was obtained from deposits in the northwestern part of the province, all of which were discovered since 1917. About the same percentage of the output for Manitoba and all of the output from Saskatchewan was obtained from deposits that were brought into production since 1917. Metal output in the two provinces last year reached a total value of \$28,000,000 and that from the Northwest Territories, chiefly radium and gold from deposits discovered since 1930, a value of \$5,200,000.

In 1917 as at present, Canada was the leading producer of nickel, but its output of copper, lead, and zinc in that year was relatively small. Most of the larger base metal deposits from which production is being obtained at present were discovered prior to 1917, the chief exception being the copper-gold deposits at Noranda in Quebec, but the huge orebodies had only been partly explored. A few years later, however, an expansion programme was undertaken chiefly with the object of coordinating all stages of operation, from the mining of the ores to the marketing of the finished products. The programme comprised the underground exploration and development of the deposits and the erection of modern smelting units and of huge refining plants. These plants include two copper refineries, one of which is the largest in the British Empire, two zinc refineries, a lead refinery, and a nickel refinery. With these facilities available, all but a small part of the output is refined within the country, whereas in 1917 most of it was exported for refining. The vast programme and extensions to plants that have since been made placed Canada in the forefront as a producer and exporter of non-ferrous base metals. The value of the facilities under present conditions requires no comment.

Other comparisons could be made in reference to the metals but they would only serve to further emphasize the many changes that have taken place since 1917. These changes, in the main, have been featured by marked increases in the production of most of the metals; by the discovery and successful development of gold deposits in areas the possibilities of which were largely unknown in 1917; by the addition from time to time of new metals to the list, recent examples being antimony, mercury, tin, and magnesium metal; and particularly by the greater realization on the part of Canadians of the importance of the industry in the economy of the country as a result of the progress that it has made.

In the case of the fuels, the production of crude petroleum affords the best comparison. Canada's output of this fuel in 1917 amounted to 214,000 barrels, 95 per cent of which came from wells in southwestern Ontario, the annual output from which has shown little change. In 1942, however, 96 per cent of the record output of 10,364,000 barrels came from wells in Alberta, chiefly from the Turner Valley field

and that field is also the source of about 70 per cent of Canada's output of natural gas. Crude oil is also obtained from wells in New Brunswick and in the Norman field west of Great Bear lake in the Northwest Territories. Nova Scotia, Alberta and British Columbia continue to be the chief Canadian sources of coal output. Coal production in Canada last year reached a record total of 18,226,000 tons, but this was only 4,000,000 tons higher than in 1917. The Dominion has large supplies of coal but in 1942 as in 1917 it imported a large percentage of its requirements owing to the fact that the important coal fields are hundreds of miles distant from the principal consuming centres.

In 1917, the production of non-metallic minerals, including the clay products and other structural materials, reached a value of \$34,512,000 and in 1942 it amounted to \$81,139,000. In both years, asbestos and cement were the chief contributors to the output, but the value of output of both minerals in 1942 was more than double that of 1917. Most of the minerals produced in important quantities in 1917 are still being produced but there have been several additions to the list, chief among which are nepheline syenite, rock wool, sodium sulphate, muscovite mica, high grade magnesia, magnetitic dolomite, and peat moss. These additional minerals have a total value of several million dollars a year. Muscovite mica was first produced in important quantities in Canada in 1942 and the output was obtained from deposits discovered in the Mattawa area, Ontario, late in 1941. High grade magnesia was also added to the list in 1942, the source of supply being brucitic limestone deposits in the Wakefield area, Quebec. Peat moss had been produced in small quantities for years, but when supplies from Europe to Canada and the United States were cut off as a result of the war, interest in the Canada deposits was revived and production at present is several times greater than in 1939, with prospects of a further substantial increase.

With some exceptions, chiefly asbestos, gypsum, and barytes, Canada's output of the non-metallic minerals is marketed within the country and, accordingly, production is governed by domestic demand and frequently by localized demand. Transportation costs are an important factor in the marketing of many of them, and that together with a relatively small population, hampers the development of deposits too far distant from the populated areas and industrial centres.

Progress in the development of the non-metallic minerals has been steady rather than colourful. Most of the operations are on a much larger scale than in 1917, but there have been few changes in the principal sources of output. Minerals of domestic origin, however, are being used much more extensively than in 1917 when a large part of the requirements were imported. Until about fifteen years ago, for instance, most of the requirements of limestone for building purposes were imported, but investigations showed that the Canadian stones were of high quality and for the past several years Canadian quarries have been supplying most of the domestic demand.

By provinces and territories the net result of the expansion outlined above is shown in Table I which also supplements the information given in the chart.

As stated elsewhere, the progress the industry has made can be credited largely to the work of the engineer, metallurgist, and geologist. So many illustrations come to mind that it is difficult to select those that are typical. In his reconnaissance work, the geologist broadly outlines the areas favourable for the occurrence of deposits and in his detailed investigations, he acquires knowledge of their mode of occurrence, which provides a key to the exploration and discovery of further deposits in the area. He works in close relation with the prospector and he frequently makes discoveries in the course of his work. It was a geologist of the Department of Mines and Resources, for instance, who discovered the mercury deposits in the Pinchi Lake area, British Columbia, a few years ago. From these deposits Canada is now producing sufficient mercury to meet its own needs and to supply a large part of the Allied needs. Another of the Department's geologists was the co-discoverer of the large bodies of chromite found in the Bird River area in Manitoba during the summer of 1942. Test work is underway on sample shipments from the deposits.

In mining, the work of the engineer overlaps to some extent that of the geologist, and he is often a combination of geologist, engineer, economist, cost accountant, and operator. He develops methods for the mining of the ore; plans, and usually supervises, exploration and development programmes; attends to the maintenance of production; is in charge of surveying and related work, which forms an important part of mine operation; and is frequently called upon to make appraisals of properties for possible future development.

The metallurgist is interested chiefly in the treatment of the ores for the extraction of the metals. In Canada, his work has largely made possible the successful development of the huge base metal deposits now in operation. Before the copper-nickel deposits of the Sudbury area could be developed, for instance, it was necessary to find a suitable means of separating the nickel from the copper. The copper-zinc deposits of the Flin Flon area in Manitoba were discovered in 1915, but were not brought into production until 1927. Much of this time was required in developing suitable methods for the extraction of the metals. Several of Canada's metallic ores are of a complex nature and are difficult to treat and it is mainly the skilful work of the metallurgist that has enabled the successful development of such ores.

The mineral technologist has made his chief contribution to the industry's headway in his work on the metallic minerals. He is interested in the resources of the minerals, their economic characteristics, and mining, marketing, and uses, and in problems of processing in the manufacture of mineral products, particularly ceramic products. The additions of rock wool and high grade magnesia, referred to above, to the list of minerals produced in Canada, are directly the result of surveys and investigations carried out by Dominion Government mineral technologists. Their special knowledge and that of privately employed technologists are being used to particular advantage in meeting the non-metallic mineral requirements of the war industries.

This progress in mining during the past twenty-five years
(Continued on page 274)

CHEMICAL INDUSTRY

H. McLEOD, A.C.I.C.

Statistician, Dominion Bureau of Statistics, Ottawa.

The story of the chemical industry in Canada closely parallels the story of industry as a whole. Prior to the last war, Canada was mainly an agricultural country, but in the years which have since elapsed she has become a nation in which manufacturing has assumed the major rôle in its economic life, and she has come to occupy a prominent place in the world markets for manufactured goods. As is well known, there have been periods of serious decline in business operations, but over the quarter of a century there has been an upward trend that has been remarkable. In 1915, the gross value of manufactures in Canada was \$1½ billions; in 1940, when the country was again in the first year of war, the total was \$4½ billions, a threefold advance in the 25 years. The mining industry experienced a similar expansion in which aggregate output value rose from \$189 millions in 1917 to \$564 millions in 1942.

As a result of this growth in manufacturing and mining, there arose a highly diversified demand for chemicals and chemical products, offering opportunities which were quickly exploited by a well-founded chemical industry. As volume developed, the manufacture of new items, many of which were previously imported, was undertaken; new plants were built and existing facilities were expanded. From about \$28 millions in 1920, when detailed records first became available, the output of heavy and fine chemicals of all kinds rose to \$75 millions in 1941. The following chronology gives in brief form the more important developments during this period.

1919—Soda ash made by Brunner, Mond Canada, Ltd., Amherstburg, Ont.

1921-22—Liquid chlorine made by Canadian Salt Co. Ltd., Sandwich, Ont.

1923—Acetylene black made by Canadian Electro Products Co. Ltd., Shawinigan Falls, Que.

1924—Phosphoric acid made by the Electric Reduction Co. Ltd., Buckingham, Que.

1925—Sulphuric acid first made from smelter gases in new plant at smelter of the Mond Nickel Co. Ltd., Coniston, Ont.

Insulin made at Connaught Laboratories, Toronto, Ont.

1927—Butyl acetate and ethyl acetate made by Shawinigan Chemicals Ltd., Shawinigan Falls, Que.

1929—Vinyl acetate made by Shawinigan Chemicals Ltd., Shawinigan Falls, Que.

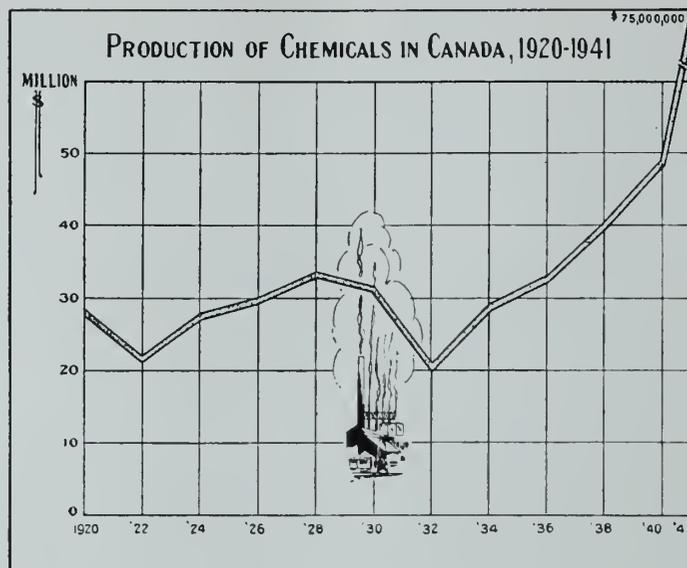

1930—Pentasil acetate made by Shawinigan Chemicals Ltd., Shawinigan Falls, Que.

Synthetic ammonia made by Canadian Industries Ltd., Windsor, Ont.

New sulphuric acid plant of Canadian Industries Ltd. at Copper Cliff, Ont. commenced operations utilizing smelter gases from smelter of the International Nickel Co. of Canada Ltd.

Nitre cake made by Canadian Industries Ltd. at Copper Cliff, Ont.

Iron oxides made by the Northern Pigment Co., New Toronto, Ont.

Synthetic nitric acid made by Canadian Industries Ltd. at Beloeil, Que.

Superphosphate and fertilizer mixing plants of Canadian Industries Ltd. at Beloeil, Que. and Hamilton, Ont., commenced operations.

The Mallinckrodt Chemical Co. started to manufacture fine chemicals in Canada.

Merck & Co. Ltd., Montreal, Que. started to manufacture fine chemicals in Canada.

1931—Synthetic ammonium sulphate, synthetic ammonium phosphate, and triple superphosphate made by the Consolidated

Mining and Smelting Co. of Canada Ltd., at Trail, B.C.

1932—Sodium silicate made by the American Cyanamid Company, Niagara Falls, Ont.

Liquid sulphur dioxide made by Canadian Industries Limited, Hamilton, Ont.

Sodium chlorate plant rebuilt by the Electric Reduction Co. Ltd., Buckingham, Que.

Phenol, cresol, and other tar derivatives made by the Dominion Tar and Chemical Co. Ltd., Toronto, Ont.

Nitrous oxide made by Cheney Chemicals Ltd., Toronto, Ont.

1933—Aeid calcium phosphate made by the Electric Reduction Co. Ltd., Buckingham, Que.

Sulphur dichloride and sulphur monochloride made by Canadian Industries Ltd. at Windsor, Ont.

Sodium silicate plant of National Silicates Ltd., New Toronto, Ont. commenced operations.

Vinyl acetate resins made by Shawinigan Chemicals Ltd., Shawinigan Falls, Que.

Zinc oxide made by the Zinc Oxide Company of Canada Ltd., Montreal, Que.

1934—Calcium chloride made by the Brunner, Mond Canada, Ltd., Amherstburg, Ont.

Ferric chloride made by Canadian Industries Ltd., Windsor, Ont.

Caustic soda-chlorine works of Canadian Industries Ltd. at Cornwall, Ont., commenced operations.

Radium salts and uranium salts made by the Eldorado Gold Mines Ltd., Port Hope, Ont.

1935—Liquid hydrogen peroxide made by Canadian Industries Ltd. at Shawinigan Falls, Que.

Disodium and trisodium phosphate made by the Electric Reduction Company of Canada Ltd., Buckingham, Que.

1936—Acetone made by Shawinigan Chemicals Ltd.

Aeid sodium pyrophosphate made by Electric Reduction Co. of Canada Ltd.

Elemental sulphur produced commercially by Consolidated Mining & Smelting Co. of Canada Ltd., Trail, B.C.

Acetic anhydride made by Shawinigan Chemicals Ltd.

1937—Perchloroethylene and trichloroethylene made by Canadian Industries Ltd., at Shawinigan Falls, Que.

Vanillin made by Howard Smith Chemicals Ltd., Cornwall, Ont.

1938—Lactic acid made by Beamish Sugar Refineries Ltd. at Toronto, Ont.

Stearic acid made by W. C. Hardesty Ltd. at Toronto.

Metallic naphthenates made by Nuodex Products of Canada Ltd. at Toronto.

Aluminum fluoride made by Aluminum Co. of Canada at Arvida.

1939—Caustic soda-chlorine works of Canadian Industries Ltd. at Shawinigan Falls came into production.

Tetrasodium pyrophosphate made by Electric Reduction Co. Ltd.

1940—Ammonium chloride, zinc chloride and sodium sulphite made by Canadian Industries Ltd. at Hamilton.

Calcium phosphide and acid sodium orthophosphate made by Electric Reduction Co. Ltd.

1941-42—Potassium chlorate, potassium perchlorate, barium chlorate, ammonium perchlorate made by Electric Reduction Co. Ltd.

Sodium thiosulphate and sodium metabisulphite made by Canadian Industries Ltd. at Hamilton.

Carbon bisulphide made by Cornwall Chemicals Ltd., Cornwall, Ont.

Nickel formate made by Catalytic Chemical Corp. Ltd. at Toronto.

Phthalic anhydride and dibutyl phthalate made by Dominion Tar & Chemical Co. Ltd. at Toronto.

Huge new plants for manufacture of sulphuric acid, ammonium nitrate and special war chemicals.

Probably no phase of Canada's war effort has shown such spectacular expansion as the explosives and chemicals programme. Before the war the explosives industry was occupied almost entirely on commercial requirements, and the chemicals industry was in no position to feed a large-scale munitions output. In October 1939, the Chemicals and Explosives Branch of the Department of Munitions and Supply was set up to expand explosives production and to place the chemical industry on a parallel course of development. Since that time, in every part of the country great plants have mushroomed up. Capital expenditure for new factories in this field has amounted to more than \$100 millions and recent announcements indicate a further expansion by the addition of 10 new plants which, when completed, will make 38 projects in all within this special programme. Now operating are 28 units, of which 15 are classed as major undertakings. Three of these are making explosives, three are mammoth shell-filling plants, one is a large fuse-filling plant and the others make chemicals of various kinds. Of the 13 smaller projects, eight are making chemicals, one makes fuse powders and four are making or filling smoke bombs. Three of the new units under construction are for large-scale alkylation of petroleum fractions for high-octane aviation gasoline. Over 60,000 employees are working in these establishments. Another huge wartime programme is in connection with synthetic rubber for which plants are now in course of construction.

Space does not permit detailed reference to developments in the chemical process industries and in the manufacture

of allied chemical products, but the following tabulation will serve to indicate the growth in some of the more important fields during the period under review.

	Gross production in millions of \$	
	1919	1941
Pulp and paper.....	140.0	334.8
Distilled liquors.....	1.3	22.9
Breweries.....	20.1	63.3
Rubber goods.....	36.6	119.1
Sugar refining.....	102.6	62.4
Leather tanning.....	46.9	33.6
Glass.....	7.1	14.6
Artificial abrasives.....	3.0	20.7
Coke and gas.....	24.4	50.8
Petroleum refining.....	43.3	155.4
Non-ferrous smelting and refining..	51.6	379.3
Soaps.....	17.4	23.2
Paints.....	19.5	40.2
Fertilizers.....	2.5	15.2
Medicinals and pharmaceuticals....	13.9	35.5

In the refining of metals and reduction of ores there has been a tremendous expansion. During the last war, the problem of ore treatment at Trail, B.C. had been solved and the electrolytic refining of zinc had started in 1916, while at Port Colborne, Ont., the first refined nickel was made in Canada in 1918. Since then, the operations at these works have been greatly increased. In 1926, the aluminum reduction works at Arvida, Que., now expanded to one of the largest in the world, started operations. In 1927, the Noranda smelter commenced shipments. In 1928, metallic cadmium was first produced in Canada at Trail, B.C. In 1930, production of refined zinc was started at Flin Flon, Man.; the copper refinery at Copper Cliff, Ont. began operations; and bismuth was first made at Trail, B.C. In 1931, Canada's second copper refinery was started at Montreal, and selenium was produced for the first time at Copper Cliff. In 1933, the refinery at Port Hope, Ont. started to produce radium and uranium salts. In 1935, tellurium was first produced at Montreal. In 1940, cerium was made at Shawinigan Falls, and in the fall of 1942, the magnesium plant at Haley's Station, Ont., came into production.

The above brief outline of material progress is, of course, only a small part of the story. Mention should be made also of the ever-broadening interest in chemistry, of the increasing attention to chemical research, of the growing body of technical personnel, and of technical knowledge which has resulted in more efficient use of materials and resources. The speed and efficiency with which the present huge wartime undertakings have been brought into operation is ample evidence of the skill and versatility which has been attained by the industry of to-day.

PULP AND PAPER

E. HOWARD SMITH

President, Canadian Pulp and Paper Association

AND

PAUL KELLOGG, M.E.I.C.

Acting President, Newsprint Association of Canada

The period between the end of the last war and the beginning of the present conflict witnessed an expansion in the production of pulp and paper which made it Canada's greatest peacetime manufacturing industry. Its rôle since 1939 has been no less outstanding. Prior to the Hyde Park Agreement, when dollar balances lost some of their former lustre, the quarter billion dollars of foreign exchange which the pulp and paper industry provides to Canada was invaluable for the purchase of materials and munitions abroad and is still an important factor in the Canadian economic picture. Since 1941, the industry has been a giant reservoir for horsepower and manpower which the nation has sorely needed. It has made other important contributions as well.

It has been rightly said that "no industry is either completely essential or completely non-essential in a wartime economy: it is its production for the war effort which counts." Judged by this standard, the pulp and paper industry has a high degree of essentiality.

Since it is agreed that the maintenance of a free press is essential in this hemisphere, it seems worth remembering that seven out of every ten papers read between Alaska and Cape Horn are printed on Canadian newsprint.

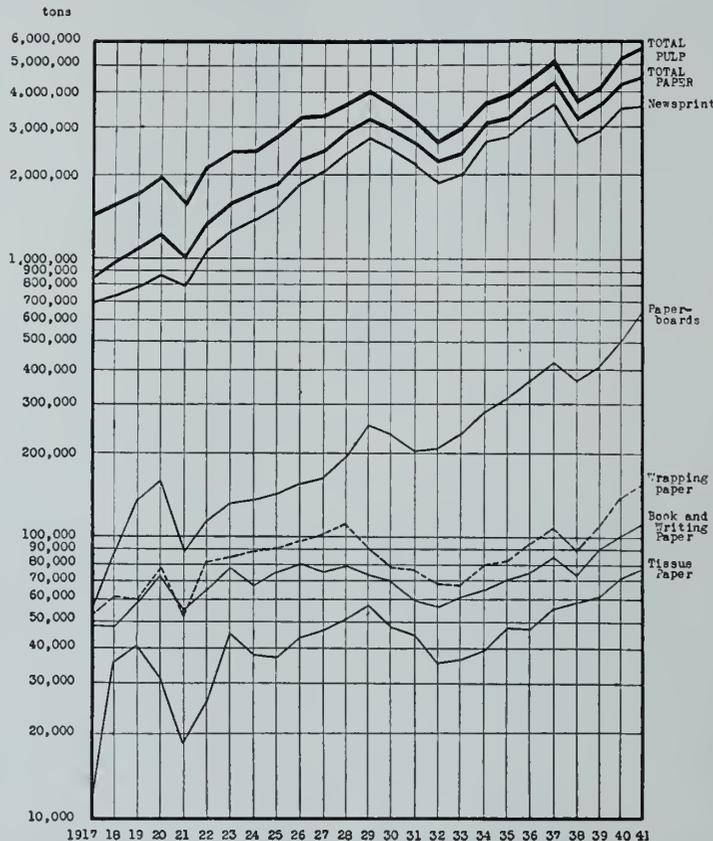

If it is important that food and munitions be not only produced but delivered to the fighting forces, then the board and wrapping used in their packaging can hardly be regarded as non-essential. If food must be packed for the civilian population and the products of the industry can suitably replace tin, these products, it seems reasonable to assume, are fulfilling a wartime function.

If ships and planes and guns are weapons of war, the thousands of square feet of blueprint paper on which they first take shape are perhaps as essential as nuts and bolts.

If the rationing of food and gasoline is necessary to win the war, the millions of pounds of paper required to print the ration books and application forms are no less necessary. If bonds must be sold, they must be printed on paper. No suitable substitute has yet been evolved.

If housing the armed forces is vital, the wallboard which goes into their construction is no less vital. If explosives are essential, the woodpulp which now replaces cotton linters in the manufacture of explosives has an equal degree of essentiality.

Maps, the "orders of the day," sanitary drinking cups, paper towels—the list might be extended almost indefinitely and include, to some extent at least, every product which

Variations in pulp and paper production in Canada. (This chart is drawn on a logarithmic scale and shows comparative trends in volume which may differ greatly in actual values. It should be noted that direct comparisons of volumes cannot be made on this scale by measuring proportional vertical distances).

the industry or converters produce. To those who give the question a moment's thought, it must seem immediately obvious that, without paper, the country could not function, the war effort would bog down.

If this great peacetime industry is an asset to Canada at war, it may be worthwhile briefly reviewing its development, particularly since 1918.

The growth of the pulp and paper industry in Canada was due to a favourable combination of many factors. These included abundant forests, river routes, water-power, mills, machines and men, and proximity to substantial markets.

THE FORESTS

More than one-fifth of the total land area of Canada is covered with productive forests—an area roughly equal to the combined areas of the British Isles, France, Spain, Portugal, the Netherlands, Denmark and Sweden. Quebec, Ontario and the Maritimes together account for 80 per cent of the total accessible stand,

British Columbia for 9 per cent and the Prairie Provinces for 11 per cent.

THE RIVERS

Accessibility of forests does not mean more proximity as the crow flies. Accessibility is measured in terms of getting the logs out. On the whole, Canada is fortunate in having usable rivers in conjunction with her forest resources to make these resources accessible. While the greater part of the Dominion drains into Hudson Bay and the Arctic Ocean, in eastern Canada where our forest resources are greatest, the Great Lakes and St. Lawrence drainage basin dominates, and the chief rivers with their network of tributaries interlace the forested areas making them accessible for utilization.

WATER POWER

To run a pulp and paper mill requires vast sources of energy or power but the bulk of the forests are concentrated in "the acute fuel zone" where native coal is not conveniently or economically available. Here again Canada has been singularly fortunate in having that other source of energy abundantly available in this zone—water power converted into electricity.

With this combination of natural resources plus vision, brains and capital, and a vast nearby market, the development of the pulp and paper industry in Canada was almost inevitable.

MILLS

The mills of the Canadian industry have been built in most instances at points where there is available water or electric power in abundance. The same situation usually provides the means whereby adequate supplies may be delivered to the mills and also a means of shipping the products by water or railways.

Other mills which do not use wood as a raw material, are conveniently located at water or rail centres closer to their markets.

MEN AND MACHINES

The development of men and machines has proved an important factor in the phenomenal growth of the paper industry in the past 25 years. The formation of the Technical Section of the Canadian Pulp and Paper Association has been closely associated with this growth. Through the regular services of this association, technical men and operators of the industry are given many opportunities of increasing their own individual worth to the industry and to their own companies. It is impossible to estimate the increase in the value to the industry of members of the Technical Section, who have written papers, taken part in discussions, served on committees, or given of their own time and energy, often at considerable sacrifice and usually with the full understanding, co-operation and support of their companies. Chemists and engineers have become more and more active in the affairs of the industry, serving on both operational and managerial staffs.

Engineering developments have contributed to a large extent to the increased production that has been accomplished in most Canadian mills. Dealing with a few of these developments we have the improvements that have taken place in the machinery available for manufacturing ground-wood pulp. The newer types of grinders produce many times the tonnages of the older machines, with an accompanying saving in horsepower expended. Wastes from the groundwood process have been considerably reduced by the improvement in the types of refiners which make it possible to reduce coarse material, previously rejected, to acceptable stock. Techniques have been developed whereby the quality of pulps produced by the sulphite and sulphate processes has been improved. Bleaching processes have been improved and others discovered which have produced new pulps with a very high degree of purity. Recovery procedures applicable to some of the pulping processes have enabled us to recover the chemicals originally used in the process and also to reclaim to some extent the chemicals and heat which heretofore had been exhausted to the atmosphere. These processes which reduce wastes have contributed to a great extent in the economic development of the industry. Research toward the solution of the utilization of the potential value of more of our waste products will have far-reaching effects on the future of the industry and the nation.

Increased production of newsprint has been the industry's biggest gain during the years 1913 to 1943. This has been accomplished by the designing and installation of new high-speed newsprint machines, capable of running up to 1,500 ft. per minute. Coupled with this, we have the accomplishment of our designers and engineers, whereby machines installed to run at speeds from 600 to 900 ft. per minute are now operating at speeds of from 1,000 to 1,200 ft. per minute.

Research work carried out at the Pulp and Paper Research Institute of Canada has also been a contributing factor in the development of both men and machines. The men trained in the research post-graduate departments of our Canadian universities, and those trained at the Institute are scattered throughout the industry, many in positions of importance. The Institute has also provided many tests and machines whereby with increased tempo of production we are able to carry on adequate control testing of our products. Besides all this, there is an unrecorded service that is being continually rendered by the Research Institute.

This service consists of consultations that take place between mill men and members of the Institute staff. There is no way of measuring the help that has been given to puzzled manufacturers and operators, not only in paper making, but also to a considerable extent in paper using and in connection with the development of machinery for mills.

1918-1939

The growth of the industry from 1918 has been phenomenal. In the boom years following the last war, gross output jumped to a peak of over \$232,000,000 in 1920. This was followed by a drop in 1921 which was general throughout the industrial field. From 1922 to 1929, there were steady annual increases in total value of production culminating in 1929 in a total of roughly \$244,000,000 which exceeded for the first time the abnormally high total of 1920. There were annual reductions during the next four years to \$123,000,000 in 1933 followed by successive increases to \$226,000,000 in 1937. In 1938, gross output dropped to \$184,000,000 but rose again to \$208,000,000 in 1939. (*The trend in each division of the industry is shown graphically in the accompanying chart for the period covering 1917-1941.*)

At the outbreak of war four years ago, pulp and paper was rightly regarded as "Canada's greatest manufacturing industry."

In 1939 there was an investment in mills alone of roughly \$600,000,000 or more than three times that of its closest competitor.

Counting only those working in the mills, it outranked the nine other leading Canadian manufacturing industries in salaries and wages paid out (\$44,737,000) and was second only to sawmills in the number of workers employed (31,016). An additional 100,000 men or more were employed in the woods operations.

It consumed 40 per cent of the total electric power employed by all manufacturing industries.

Its annual bill for transportation was approximately \$60,000,000 and it was a large buyer of goods and services from other Canadian industries.

It was acknowledged by the Dominion Bureau of Statistics to be the greatest single factor in sustaining the balance of trade.

Whole communities depended on the industry. It affected the livelihood of half a million people.

A dark spot on the history of the industry has been its failure to provide an equitable return on their capital to those who have invested in it—a failure due to the inability of the industry to operate at an adequate percentage of capacity coupled with a low price level. For years, the bulk of the thousands of investors who supplied the money to build the industry had little or no return on their investment.

To fill in the 1939 outline, it may be worthwhile looking at the division of the industry's products. The most important single product from a tonnage and dollar point of view was and is newsprint, but books, writing paper, wrapping paper, wallpaper, roofing papers, wallboard, tissue papers—all are pulp and paper products. In addition, the industry was producing pulps used for other than paper products—for rayon, cellophane, explosives and plastics (a field that seems destined to show a wide expansion).

On a volume basis the individual items broke down roughly as follows:

1939

Newsprint.....	64.5%
Pulp made for export.....	20.5
Paper boards.....	9.2
Wrapping paper.....	2.6
Book and writing paper.....	1.9
Tissue paper.....	.6
Other paper.....	.7

On a tonnage and dollar basis, this was broken down as follows:

1939	tons	\$
Newsprint.....	2,900,000	121,000,000
All other paper and board.	700,000	50,000,000
Pulp made for export.....	700,000	30,000,000

CANADA IN THE WORLD PICTURE

Prior to the war, Canada faced intensive competition in supplying world markets with pulp and paper. The chief competition came from the Scandinavian group—Norway, Sweden and Finland. This was particularly true in the case of pulp. In newsprint production, Canada had developed to a far more dominating position than she held in pulp. In the pre-war years of 1937-39, Canada accounted for 35 to 40 per cent of total world production of newsprint. As early as 1913, Canada led the world with exports of 256,661 tons of newsprint. By 1938, her exports were more than nine times that quantity and she contributed to the total almost twice as much as the other 11 leading export countries combined.

Our chief market for newsprint and pulp is, of course, the United States—a market which, prior to the war, absorbed about 82 per cent of our pulp exports and 77 per cent of our newsprint shipments.

With the outbreak of the war, the world market in pulp and newsprint changed radically. Exports from the Scandinavian group to countries not dominated by Germany were drastically reduced, thus leaving virtually only the North American producers—Canada, Newfoundland and the United States—to supply the rest of the world.

In 1940, new production records were created by the Canadian industry, and tonnage and dollar value exceeded 1929 for the first time. In 1941 these records were again surpassed.

It has already been pointed out that, in the early stages of the war, the quarter billion dollars of foreign exchange produced by the industry was of paramount importance to Canada but that, with the Hyde Park Agreement, the importance of this quarter billion was somewhat shaded.

Coincident with this, the nation faced a power shortage and was also gravely threatened with lack of manpower.

Here again the industry demonstrated its value to the nation. In the Lake St. John area, in the St. Maurice valley, along the St. Lawrence and in eastern Ontario, power originally developed for the industry's mills was in part diverted for the manufacture of aluminum and other vital war materials. Production of the pulp and paper mills affected was allocated to mills where there was no power shortage and a plan of compensation worked out. An overall reduction of the output of the industry also went into effect.

What further reduction in the industry's operations, if any, will take place is problematical. Wood supply, transportation, manpower, shortage of essential chemicals and other materials may be determining factors. That many of the products of the industry have, however, a high degree of essentiality in a wartime economy is beyond question.

WARTIME MACHINE SHOP BOARD

No sketch of the industry's wartime operations would be complete without mention of a field in which it blazed the trail—wider sub-contracting.

When it became apparent that there was in Canada a shortage of machine tools and a dearth of technically trained men and skilled mechanical labour, the industry created a Wartime Machine Shop Board. Under this Board it embarked on a programme of first, training men; secondly, upgrading or thinning out its staffs to make men available for war industries and, thirdly, the making in its own machine shops of machine parts. The activities of the Board have shown continuous expansion and, among the diversified list of product being made, are parts for corvettes, mine sweepers and cargo vessels; parts for the manufacture of ordnance and other items.

In the past twenty-five years, the industry has played a dominant rôle in the economic development of the country. To-day it is making a worthwhile contribution to the war effort. When peace returns, it may logically be expected to play its part in the rehabilitation of our sailors, soldiers and airmen, and resume its enviable place as "Canada's greatest manufacturing industry."

MINERAL INDUSTRIES

(Continued from page 269)

has obviously been of tremendous value to the country. It has provided new fields of employment for tens of thousands of Canadians and a direct or indirect means of support for hundreds of thousands of others. It has provided new outlets throughout the Dominion for the products of other industries; its operations have paved the way for the opening up of large sections of the country that would otherwise have probably received little attention; it has helped to forge an economic link between the industrial east and the agricultural west; and it has helped to place Canada in a high position among the exporting countries of the world.

Perhaps the best evidence of the benefits that have been derived from the industry's progress is found in Quebec. Most of the northwestern section of that province was largely a wilderness twenty-five years ago. As a direct result of the discovery and development of metal deposits, prosperous mining communities with populations ranging from a few hundred to several thousand have been built up. Roads and railroads have been built to service the properties and a large part of the revenue of the province is now de-

rived from a formerly unproductive region. The production of metals from this region has thus greatly strengthened the economy of the province, and has made possible a scheme of colonization which has opened up many hundreds of square miles to settlement.

Canada has accordingly shown a threefold increase in the value of its mineral production in twenty-five years. This is an impressive record, but it is an achievement of the past. Whether or not corresponding headway will be made in the next quarter of a century is largely a matter of conjecture. Much will depend upon the possibilities of the large areas throughout the Dominion that have as yet received comparatively little mineral development attention. Much will depend also upon the course of international developments following the war, more particularly in reference to the effect these developments may have on world markets for metals. Canada has reached or at least is approaching a stage of maturity in the development of its mineral resources. Thus there will be a continued and increasing need for a well-planned development of these resources. Even then the headway may not be as colourful as in the past, but it is likely to be steady and prolonged.

AUTOMOTIVE INDUSTRY

T. R. ELLIOTT

General Motors of Canada Limited, Oshawa, Ont.

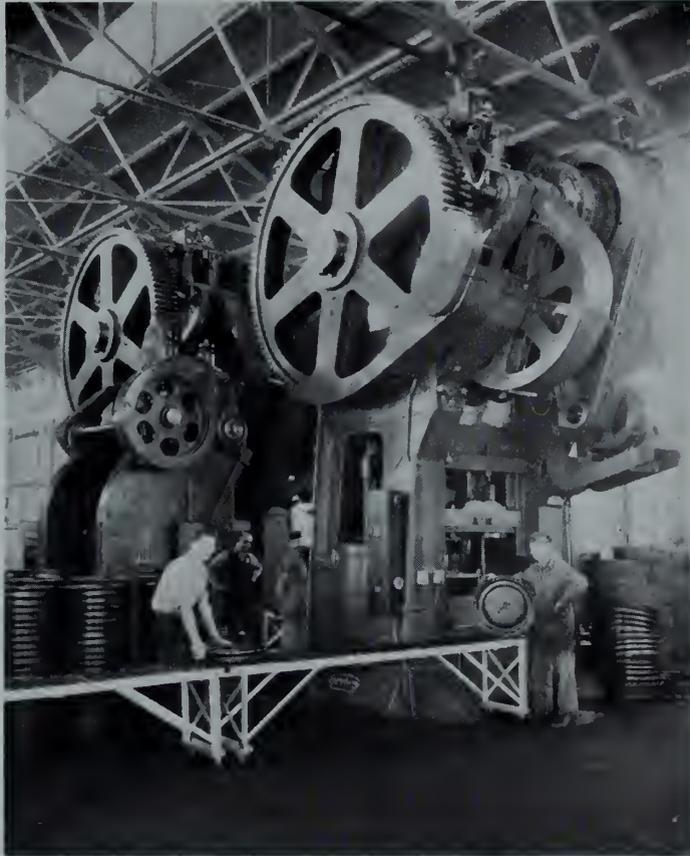

A review of the Canadian automotive industry over the past quarter of a century reveals that in the two decades following 1918 the industry laid the groundwork for a superlatively effective participation in the war. If those twenty years had been consciously devoted to training for war production the effect on Canada's all-out effort could scarcely have been better. Among the first to be called upon by the Government to fabricate war goods in quantity, the automobile companies went into production ahead of schedule on assignment after assignment.

Normally efficient in building motor cars and trucks, the industry was immediately singled out to build many war products of an unfamiliar nature and some they had never heard of. The individual companies met the challenge with characteristic vigour, summoned executives, production men and skilled engineers around the table and tackled the job. Technical secrets were shared with one-time competitors, machine tools and other facilities were exchanged, production short-cuts were passed along to others and the war job got rolling.

Automotive engineers worked with the British Army technicians, with the Admiralty and with Ottawa to devise ways to put the required machines of war into mass production, to avert shortages of critical material, and then, when products had been turned out, to improve their performance under battle conditions. The extraordinary variety of war goods for which the motor car industry assumed responsibility is in itself a tribute. A partial list includes:

- Aircraft fuselages and other aircraft components
- Field guns, gun parts, gun sights and gun carriages
- Machine guns
- Shell components and fuses
- Tank components
- Fire control instruments
- Universal carriers, reconnaissance cars and other combat vehicles
- Machine tools
- Naval gun mountings
- Transport and service vehicles, such as field workshops, dental clinics, power generating outfits, water purification units, laundries, etc.

All of which would indicate that the automobile industry in this country had a special appropriateness in wartime production. The key to the riddle lies simply in the development which took place in the industry during the 20 years prior to the outbreak of hostilities. The development included advancements in technology, in engineering, and in methods of manufacture to such an extent that the

Giant press, first of its kind in Canada, stamps out 2,000 finished wheels a day for military vehicles.

whole commercial and industrial life of Canada felt the impact. The discovery by the automobile companies that manufacturing costs could be reduced by mass production, carefully planned and well organized, soon had its effect on Canadian industry in general, with the result that changes were wrought in the Dominion's social life and in the status of Canadian products in the markets of the world. The motor car industry led in the reduction of labour effort and in the improvement of quality in product. It led in the payment of higher wages and in the reduction of hours per working week.

While all this was going on, with consequent influence upon the whole fabric of the Dominion, the industry remained by its very nature one of the most competitive in the world. Steady improvement in the design of the industry's product was essential. And prices were whittled with a regularity which was born of compulsion.

Efficiency had always been developed so that Canadian-made automobiles might be sold in Canada at the minimum advance over American prices. So well was this done that prices in Canada were lower than in any other automobile-producing country in the world, except the United States. It is recalled that before the war the Singer 4-cylinder car, weighing 2,465 lb., had a retail price of approximately \$1,400.00; the Austin 14-horse-power—weighing 2,632 lb.—\$1,250.00; the Morris 14 horse-power, weighing 2,912 lb.—\$1,240.00; whereas the corresponding retail price of the Canadian Chevrolet, a six-cylinder, 29 horse-power car weighing over 3,000 lb., was \$1,000.00. The car buyer in the United Kingdom, with higher motor car production than ours, paid 70 per cent more for a comparable car than the buyer in the United States, while the Canadian buyer paid only 24 per cent more. In Germany, also with a big production, the price comparison was 200 per cent higher than the United States; in France 116 per cent higher.

There was one additional factor in the industry's development through this period that is not as well understood, and it had an important bearing on the ability to tackle the wartime job when the time came. That factor was the policy of the Canadian automotive industry as a whole of paying a premium for Canadian materials, where necessary to do so, in order to establish Canadian production sources of required materials. It was because of that policy that the percentage of Canadian content in Canadian cars consistently grew right up until the outbreak of war.

A single example might be cited. Body hardware and miscellaneous die-cast parts were for years imported because there were no die-casting industries in Canada equipped to handle Canadian requirements. The result was that a new

industry was created in Canada, using Canadian zinc, supplying all the motor car companies' needs and, in addition, building up an increased demand throughout the industry generally for Canadian produced zinc.

When it is realized that there are 5,000 important parts in an automobile and that most of them have to be fabricated by "contributing" companies it can be understood that the policy of the motor car industry in developing and supporting the factories of these companies across Canada has a substantial effect upon the Dominion's economic life. The number of contributing industries from which the motor car companies draw material is estimated at 600, and in the years immediately preceding the war the annual purchases from these companies across Canada by the motor car companies amounted to some \$85,000,000. The effect upon employment and purchasing power can be imagined.

The requirements of war, because of all this background, found the Canadian automobile industry ready to accelerate its war production from day to day, to such a degree that in 1942, while the principal motor car factories employed directly only four per cent of the workers, they turned out 20 per cent of the whole war production total of the Dominion. This record is proof not only that the industry in a short time had been able to subordinate all normal interests to the needs of the nation at war and that the period of "change over" had been short and efficient but also that an outstanding job had been done in utilizing to productive advantage the skills, facilities and production capacities of those hundreds of auxiliary concerns now known in the war's terminology as "sub-contractors" but which the motor car industry had helped to develop in the first place as suppliers.

This, then, was the first contributing factor to the Dominion's surprisingly ambitious arms programme when war came. The point to be emphasized is that it was "normal practice" with the automotive industry to assign responsibility to "sub-contractors" and thereby build up production men all over Canada with initiative and resourcefulness. It was little wonder when munitions jobs had to be tackled that the key men chosen to direct these enterprises were drawn from the automotive industry's well-developed reservoir; and little wonder that these production men turned out a good job. It was no miracle; it was mass production. And mass production is just mass brains applied to a specific task.

The next development in the arms programme in which the industry figured was the creation of a new modern type of munitions industry. The emphasis remained on quality production but new visions of what the word "quantity" meant began to be entertained. The products were new to the makers. Most personnel had never seen these guns and shells in the modern version. That, to some extent was an advantage. Engineers and production men were not handicapped by old techniques. What if this or that gun part always had been forged? If it could be made better by casting or stamping that is the way they did it. What if tank parts always had been rivetted? Wouldn't welding be better? And in that spirit, bringing fresh viewpoints to the job, automotive engineers saw that existing practice could be improved on. Collaborating with ordnance officials

they introduced innovations in manufacturing method which permitted astounding savings in time and money.

Typical example of production skill was early on record in the case of a passenger car producer who got an anti-aircraft gun of foreign design into production seven months after the order was received, cut four months from the time required by the original gun company and 80 days from the time required by a leading British armament maker. The motor car company suggested that the barrel could be broached instead of processed by traditional methods. This cut the manufacturing time for this part to 15 minutes from three and one half hours.

A better known instance is the case of an automotive company in Canada which applied the technique of cost cutting and material saving to the mass production of shell fuses. Substitutions were made for critical materials, procedure was simplified, inspection was streamlined and machining reduced. Originally the fuses were machined out of bar brass and more than half of the brass for each unit was machined off and returned as scrap. To-day the fuses are being made of a zinc alloy by a die-casting method which is fast and accurate. The substitution of zinc alloy for brass resulted in a saving of 3,633,000 lb. per month of brass and in its place only 1,042,500 lb. per month of a much less critical metal, zinc, is used. The cost of the fuses to the Government was reduced by approximately 70 per cent.

Another plant of the same company applied the same technique to a project for the manufacture of naval gun mounts. Engineers in tooling for the job felt that a considerable amount of critical metal could be saved by making the mount of structural steel instead of the cast steel called for. The plan was approved and the structural steel stand was turned out at a cost of \$275.00 compared with \$504.00 for the cast steel model. In addition—180,000 lb. of critical steel was saved on the small initial order.

Accent is still on saving but emphasis is also placed on quality, and the products of automotive factories are rigidly tested. To check performance in the field, Canadian automobile companies first launched training programmes for men in uniform and thousands of officers and other ranks have been called to the factories and taught the proper techniques for obtaining peak performance of military vehicles in the field. These "war colleges" have been a big factor in obtaining full usefulness of the mechanized armies of the United Nations.

Going a step further the companies have sent a considerable contingent of their best service technicians to the actual battle fronts, there to check and report on performance of war products so that no chance might be overlooked of making them still better.

Summarizing wartime development of the automobile industry in Canada, it would certainly appear that management and engineering have contributed significantly to the great objective; they have supplied their ingenuity, they have sent streams of war material down the roaring assembly lines and, at the same time, have reduced the cost of the stream. And they have done the job in co-operation with a decentralized industry throughout Canada in a way which marks that far-flung industry for a new and even more important assignment in the days that are to come.

AIRCRAFT MANUFACTURE

RALPH P. BELL

Director-General, Aircraft Production Branch, Department of Munitions and Supply, Ottawa.

The first heavier-than-air machine flown in the British Empire was the *Silver Dart*. Its initial flight was off the ice on the Bras d'Or lakes near Baddeck, Nova Scotia, on the twenty-third of February, 1909. The pilot was J. A. D. McCurdy.

Seventeen months prior to this, on October 1, 1907, at Halifax, Nova Scotia, Doctor Alexander Graham Bell, the inventor of the telephone, in association with J. A. D. McCurdy, F. W. ("Casey") Baldwin, Thomas Selfridge, and Glen H. Curtiss, formed what was known as the Aerial Experiment Association.

While the legal origin of this organization took place in Halifax, McCurdy states that all the discussions leading to its creation had previously been completed in Baddeck.

The idea on which this organization was based originated with Mrs. Alexander Graham Bell, who provided the money with which to finance it. Without her vision and her financial sacrifice—for the funds she contributed represented practically all her financial worth—the spectacular results from which those participating have received undying fame and credit would probably never have been realized.

The youth of the industry is emphasized by the fact that McCurdy is still in the forefront, occupying as he does the position of Supervisor of the Purchasing Division of the Aircraft Production Branch of the Department of Munitions and Supply in Canada.

While Doctor and Mrs. Bell and their associates are usually referred to as the pioneers in this field as far as Canada is concerned, a tremendous amount of basic research work in the science of aerodynamics, which is the foundation on which the whole structure rests, had been done prior to 1907 by Wallace Rupert Turnbull.

It is an odd and interesting coincidence that Turnbull did his work in another rural community in the maritime provinces—in the village of Rothesay, New Brunswick—and that Turnbull, himself, is also a Canadian and a native of the Maritimes.

Actually, Turnbull's activities date from 1902 and include such basic work as the first wind tunnel in Canada and the invention of an electrically-controlled variable-pitch constant-speed propeller. Propellers based on Turnbull's patents are now being built in enormous quantities by the Curtiss Wright Company in the United States, and also by the Bristol Aeroplane Company, Limited, Bristol, England.

Writing at this time, Turnbull said: "Just as soon as the mechanical engineer can command at his designing table full data concerning the lift, drag, and centre of pressure of

W.I.B. Photo
The Mosquito—fastest bomber in the world to-day—built by The de Havilland Aircraft of Canada, Limited.

aeroplanes, the thrust and efficiency of different forms of aeroplane propellers, the strength and suitability of materials, and the complete elements entering into the stability of the aeroplane, just so soon, and not before, can we reasonably expect the problem of aero-navigation to be really solved."

As some one subsequently said: "That was certainly calling his shots for the next twenty-five years."

In 1916, at Toronto, Ontario, McCurdy established Curtiss Airplane and Motors, Limited, the first organization in Canada to build aircraft on a commercial scale. That company and its successor, Canadian Aeroplanes, Limited—formed by the Imperial Munitions Board—built just short of 3,000 planes during the last war, a remarkable performance for those days.

Aircraft manufacture ceased in Canada with the close of the last war and was not revived until 1923 when Canadian Vickers, Limited, began the production of eight single-engined amphi-

bians for the Canadian Air Board.

In November, 1934, Noorduynd commenced the design of the *Norseman* in Montreal; and the first *Norseman* flew on November 7, 1935.

For the four years preceding the outbreak of the present war, Canada's aircraft industry employed on an average less than 1,000 persons, occupied a total floor area of approximately 500,000 sq. ft., and produced on an average less than forty planes a year.

To-day, Canada's aircraft industry employs over 90,000 men and women, occupies well in excess of 10,000,000 sq. ft. of floor space, produces ten times as many aircraft in a month as it formerly produced in a year, and has a well-balanced long-range programme based on the following nine types, each of which stands at the very top of its field in world competition:

TRAINERS:

Fairchild PT-26 low wing monoplane—known in Canada as the *Cornell*—the most modern primary trainer in the world.

North American AT-16 low wing monoplane—known in Canada as the *Harvard*—universally recognized as the greatest single-engined advanced trainer in the world.

Avro Anson, the Canadian versions of which are now five in number—the two latest, Mark V and Mark VI respectively, are scheduled to come into production during 1943 and will have moulded plywood fuselages—is the outstanding twin-engined trainer in the world.

Canadian *Bolingbroke*, a twin-engined medium bomber of long range that has been adapted for advanced bombing

Noorduyn Norseman, the only wholly Canadian designed aircraft.

and gunnery training, is not only a topnotch machine for training purposes but still remains a valuable active combat type.

COMBAT TYPES:

Coastal reconnaissance bomber, PBV-1A, famous the world over as the *Catalina*—designated by the R.C.A.F. as the *Canso*—unchallenged in its field and class it stands out as one of the great aircraft of the war for use on ocean patrols.

Dive bomber, Curtiss SB2C-1, or *Hell Diver*—the Canadian versions of which are designated SBW-1 and SBF-1—the latest and most powerful dive bomber in the world.

High speed bomber, DH-98—or as it is more familiarly known the *Mosquito*.—This latest and most famous aircraft of a long line from the boards of the De Havilland design group has already established itself as one of the deadliest and most effective weapons of the whole allied armoury. It is the fastest bomber in the world to-day and one that will write sky history in this war.

Four-engined long range bomber, the *Lancaster*, the fastest, the most manoeuvrable, and the one capable of carrying the largest and heaviest bomb load in its field, this great battleship of the air is Canada's most ambitious undertaking in the aircraft field.

TRANSPORT:

Noorduyn *Norseman*—or as it is designated in the United States, the C-64—the only wholly Canadian-designed aircraft in the programme; easily the greatest and most adaptable single-engine transport in the world, equally efficient and manoeuvrable on wheels, skis, or floats, known the world over to airmen who fly the remote places of the earth, the *Norseman* is a proven champion in its field.

Seven of these types of aircraft are already in production and two come into production within the next few months.

The Hawker *Hurricane*, a single-seat, interceptor fighter is still in large-scale production in Canada under the designation *Hurricane II*, but is scheduled to "fade out" early in 1943.

Canada's aircraft industry is now capable not only of providing all the planes required for the gigantic British Commonwealth Air Training Plan, which is probably

Canada's greatest single contribution to the whole war effort, but in addition is contributing substantially to the Allied cause in various parts of the world in both combat and transport types.

Simultaneously with the production of these aircraft, factory facilities from coast to coast with a total of over 10,000,000 sq. ft. of floor space have been built and equipped and over 90,000 employees, 90 per cent of whom never worked on aircraft in their lives before, have been recruited and trained.

Thirty-five years ago, an effort of imagination in a woman's mind resulted in five visionary men experimenting in a small wooden workshop on a Cape Breton hillside, laboriously building something they hoped might fly—today, we have an industry stretching from coast to coast, employing almost a hundred thousand persons, and turning out thousands of aircraft per year from primary trainers to the largest bombers.

As the skill of the individual worker increases, production is steadily rising and costs are as steadily falling.

Here is one of Canada's great new industries and one of the few arising out of the war for which a commercial post-war future can reasonably be visualized, for aircraft

The Canso, coastal reconnaissance bomber.

is one of the few items of wartime manufacture for which there will be a world-wide peacetime demand.

Canada has the basic raw materials. Canada has the modern facilities. Canada has the skilled workmen and workwomen.

Two things are required:

- (a) the adoption of a policy calculated to firmly and permanently establish Canada's aircraft industry on the foundation already created;
- (b) the constructive imagination and leadership necessary to guide the industry through the immediate post-war period.

Canada stands at the keystone of the arch of aerial world transportation. As one of the first four trading nations of the world, it is imperative that Canada's post-war transportation and communication services encircle the globe in competition with those of its friendly rivals, and that Canadian-built aircraft be found wherever aircraft fly.

Intelligent, courageous, and inspired leadership can make Canada's aircraft industry one of the greatest industrial assets of the Nation.

STEEL

DESMOND KILLIKELLY

Chief Inspector, Steel Company of Canada, Limited, Montreal.

The growth of the steel industry of Canada to its present high standard of value, in our economic field of industrial endeavour, is one of the greatest achievements that history will record of our country's material development. From its early inception, dating back to the French regime in Canada, there is woven into its history a wealth of romance and legend, marking the vicissitudes of its struggles and its ultimate successful establishment. Its very failures in the early years of its efforts may be regarded as monuments in our history which express the faith and determination of Canadian enterprise in its battles against adversity, eloquent of that daring and courage which are characteristic of nation builders.

The past twenty-five years which mark the first quarter-century of *The Engineering Journal*, have witnessed an almost phenomenal expansion of plant and increase in output in the steel industry, and in none of the arts and sciences

in Canada, has any industrial development contributed more largely and effectively towards the advancement of the professions than has the steel industry to the engineering profession in all its various branches. Wonders have been wrought in the results obtained by new applications of alloying materials in new combinations. In the field of research, chemists and metallurgists strive for new and better products in probing for the solution of steel problems. It is a constant quest of the unknown, for the potentialities of steel appear to be limitless. To the civil and mechanical engineer, new qualities are being constantly revealed of its strengths, uses and workabilities. To this realm of progress and economic achievement, Canada has made a notable contribution.

A few men of vision and courage, engaged in the primary production of iron and steel, maintained faith in its future against the heavy odds of competition from the larger steel industries of the United States and other highly industrialized countries. Faced with the dual handicap of a restricted domestic market and of foreign competition having relatively easy access to that market, the success of the steel industry in Canada is in large measure due to the foresight and wisdom of those who have directed its fortunes.

During the two years of 1927 and 1928 Canada actually showed a more rapid increase in steel production than the United States, due to a larger construction programme, which, in rate of increase in construction, was five times as rapid in Canada as in the United States during those two years. The lean years which followed the economic debacle of 1929, resulting in world-wide depression in trade, did

Canada's largest blast furnace. This stack has a daily capacity of 980 net tons of pig iron.

1736 "Les Forges de St. Maurice" were established and carried on their operations until as late as 1883. A special incident of historical interest was the treasonable act of one Pellisier, one of the lessees of the plant, who aided the Americans in their invasion of Canada in 1775 by casting shot and shell at "Les Forges" to be used by them in their siege of Quebec.

In the World War of 1914-18, Canada again called upon her iron and steel industry for the implements of war. The response was prompt and of an invaluable character in all the varied requisites of war's insatiable demands for steel. Again the call came in 1939 and the readiness and response have constituted a magnificent contribution to Canada's war effort, the extent of which has been made possible largely through the primary producing industry of iron and steel within Canada. Indeed, if that basic industry ever needed proof of its economic and security value to Canada, the current war has amply provided it. It was not upon existing plant facilities alone that this task fell. Tuned as they were to the production of materials for domestic purposes, and of a limited demand, there were now costly adjustments to be made to meet an extraordinary condition and the still greater task of plant expansion for increased capacity. Expanding an existing iron and steel industry to meet the sudden and imperative exigencies of war is not a simple or easy undertaking. Before planning plant extension and increased capacity, there are many factors to be considered which are of great primary importance. Provision must first be made to assure an adequate supply of raw materials; that iron ore and limestone can be quickly secured and brought together for the production of pig iron; that

not lessen the value and capabilities of the steel industry in Canadian economy. In the years immediately preceding the outbreak of war in 1939, when heavy demands were being made upon the steel industries of Europe for the production of war material, Canada's steel industry, by reason of the happier and more peaceful atmosphere of its geographical position, was available for the production of a fair share of the world's needs in consumable steel goods for peaceful uses.

It is a strange fact of history that war was literally the parent of the steel industry of Canada. It was for the defence of Canada, over two centuries ago, that Talon, then the Intendant of New France, was ordered by the government in Paris to organize and carry out a search for iron ore, and to investigate the possibilities of establishing a forge to smelt the ore.

Deposits of iron ore were discovered on the banks of the St. Maurice river in the province of Quebec, and by

coal in sufficient quantity and quality can be obtained for conversion into coke; that the necessary increase in labour for operational services will be available.

The time element for the extension of plant to provide increased capacity is of no lesser importance. There are things which require considerable time for completion despite all human desire or effort.

The erection of a modern blast furnace requires at least a year under normal conditions and with increased pig iron production a heavy strain is put upon existing open hearth capacity for converting the iron into steel. Rolling mill facilities and capacity are the next factors of importance in meeting war requirements, and the suitability of existing mills for the manufacture of the various classes of finished and semi-finished steel products thus demanded, depends upon the type or section of product required. Such a condition arose at an early stage of the present war, when Canada embarked on the important project of shipbuilding. Fortunately, the advent of war found the construction of a new plate mill well under way at Hamilton; a dismantled plate mill at Sydney was quickly rebuilt and put into operation and a new blooming mill was added to the steel plant at Sault Ste. Marie.

In 1939 there were ten blast furnaces in existence in all Canada for the production of pig iron, two of which, however, had not been in operation for several years. The eight operating furnaces had, at the end of 1939, a daily capacity totalling 4,125 gross tons with a total production for the year of 846,419 net tons. By the end of December, 1942, two more blast furnaces had been built; one at the plant of the Steel Company of Canada, Ltd., at Hamilton (at present the largest blast furnace in the Dominion), and the other at the plant of Canadian Furnace Limited at Port Colborne, Ont., bringing a total of twelve blast furnaces into operation and the production of pig iron rose to 1,975,015 net tons. In the production of steel ingots and castings, during the past twenty-five years, the records are impressive in reflecting periods of prosperity and depression in Canada. In the closing year of the first World War (1918), Canada's production of steel ingots and castings reached the then record tonnage of 1,672,954 long tons of 2,240 lb. each. The first million-ton year of steel production in Canada had been reached in 1913 and from that year onward to 1934 there were fluctuations below and above the million-ton mark indicating the cycles of trade. It has been truly said that the steel industry is a "sensitive barometer of capital goods activity," and that "when capital goods are selling in satisfactory volume in normal years of peace, the steel business is good. When it is not good, you may be sure there is a lessened demand for capital goods."

In 1932, a year of trade depression, the production in Canada of pig iron and of steel ingots and castings fell to the low level of 144,130 and 339,346 long tons respectively. By 1935, however, production of steel ingots and castings had again risen over a million tons per annum and has not since fallen below a million tons.

The demands of war have greatly accelerated steel production of all grades in Canada and with the vastly increased development of Canada's water powers, in the generating of electric energy, the introduction of the electric process of steel production became possible and its employment has steadily increased. What may be regarded as the principal values of this process of steel manufacture are its special adaptability for the production of some of the finer grades of steel, and under the pressure of wartime emergencies, it provides an important additional capacity for the production of all grades of steel. Great as is its contribution to the war effort, it is nevertheless a fair classification to place the electric furnace process, where operated as a single industry, in the category of a secondary producer of steel, dependent, as it is, upon a supply of steel scrap, or the pig iron produced by the primary iron and steel industry, as its raw material.

For the year 1939, Canada's total production of steel

ingots by the open hearth process was 1,410,339 net tons. The electric furnace process added 79,718 net tons of steel ingots while steel castings amounted to 60,997 tons; a total steel production of 1,551,054 net tons. The production for the year 1942 rose to 2,624,280 net tons of open hearth steel ingots; 318,641 net tons of electric furnace steel ingots, and 178,440 net tons of steel castings; a total steel production of 3,121,361 net tons, an increase over the year 1939 of 1,570,307 net tons.

At the present time, there are only three companies in Canada engaged in the production of iron and its products from the ore to the manufacture of semi-finished and finished articles. As primary producers they constitute the core of Canada's steel industry. Taking their raw materials from the earth, assembling them at the blast furnaces and mills, and, after several metallurgical and mechanical operations, shipping the resulting products to their destined uses, this integrated character of steel producing operations involves an extremely high capital investment in relation to the sales value of its products. Investment in mines, land, buildings and equipment calls for tremendous capital outlays, while obsolescence, as a vital factor in the life and progress of the industry, and the eternal quest for new and better products, constantly create the need for progressive developments and modernization of plants. Some realization of this may be gathered from the fact that, before the current war, there were already roughly 4,000 distinct types of steel required by the various steel consuming industries; the term "tailor-made steel" being aptly applied to the modern products. The American Iron and Steel Institute is authority for the statement that 57 of the 92 known chemical elements are used in steel mills, directly or indirectly, in the production of steel. The engineering activities of our Dominion have been demanding alloy steels of a highly specialized nature in increasing variety, but no one country in the world possesses, in its native resources, all the elements required for the manufacture of these high-grade steels, so that steel making may be said to have developed an international flavour of an interdependent character. However, under the exigencies of war, much has been done, and is being done, to simplify and reduce the number of special steels hitherto considered necessary for various uses. This has had the desired effect of accelerating and increasing production to a marked degree.

In the wake of the primary iron and steel producers follow the large number of secondary steel industries, scattered through the Dominion, which occupy a most important position in the life and progress of the steel industry of Canada. They are legion in their variety of productive enterprises. Foundries, finishing mills, bridge and other structural assembling plants, automobile and aeroplane factories, shops for the construction of railway rolling stock, machinery, boilers, Diesel engines and a multitude of others requiring steel in some form as their raw material, adding greatness to Canada's industry and progress through years of peace. War has transformed countless numbers of these factories into the production of instruments of war, expanding capacity in many cases, while numerous new enterprises have been created for similar purposes.

Industrial development in Canada has generally followed a geographical pattern tending to concentrate in well-defined districts, the location of which has been determined by the proximity to raw materials, or by the facilities and economic values of assembling and distributing centres. Largely because of the latter fact there has been built up an industrial East. But as Canada grows in population and development of her rich natural resources, actual and potential, we may expect to see a wider extension of industrial activity which will include the western provinces now occupied almost entirely in agricultural pursuits. Already, in the province of Manitoba there is a growing secondary steel industry, which, though long established, has been little known as to its activities and value. Many expansions and additions to

(Continued on page 321)

STEAM POWER

J. G. HALL, M.E.I.C.

Assistant to the vice-president, Combustion Engineering Corporation, Toronto.

Although the story of steam plant design in Canada during the past twenty-five years does not have such romantic appeal as that of the radio, aeroplane, etc., it is not without interest. Owing to the abundance of hydro-electric power in most of our industrial areas, the steam plant in the public utility field has occupied a secondary position, except in some parts of the Prairie Provinces and the Maritimes. However, in recent years it has been realized more and more that new hydro-electric power in future may not continue to be cheap, that steam and hydro in many cases can supplement each other efficiently and that a combination involving by-product power and process steam is worthy of serious study.

In 1918 the average boiler unit was small with insufficient setting height and over-all efficiency low, as compared with present standards. In a few places in the Middle West and the Maritimes there were moderately large steam plants in the public utility field, but the capacity per boiler unit rarely exceeded 20,000 lb. of steam per hour, while in other parts of the country they were almost entirely used for standby purposes.

About 1920 the introduction of pulverized fuel firing in boiler practice in the United States created a new interest in steam generation. It was something radically different and gave every indication of being more efficient than prevailing methods. In addition to higher capacities and efficiencies which were being obtained, it appeared to be particularly suitable for burning the wide range of available Canadian coals. Also, about that time the pulp and paper industry began its spectacular expansion. And in the next decade many large pulverized-fuel fired plants were installed. This naturally gave stoker manufacturers the incentive to redesign their equipment to meet competition with the result that each method of firing merited consideration in power plant studies. Manufacturers of only one type of firing equipment, as well as those men whose experience had been limited to particular methods, endeavoured for several years to perpetuate their own ideas. To-day, however, it is realized by independent-thinking steam plant engineers that no one method occupies an exclusive field, but that each installation must be considered on its merits. A study of all factors, such as characteristics of fuels available, suitable steam plant heat balances, etc., must be made before the best method of firing can be chosen. In other words, over-all economic efficiency and not merely thermal efficiency should be the deciding factor.

During the depression years following 1930 the number of plants installed decreased, but gradually business conditions improved until 1939, when the war caused such an unusual demand that statisticians were forced to discard their carefully prepared curves showing anticipated increases.

The above chart shows the total capacity installed each year from 1924 to 1942, inclusive, of all steam generat-

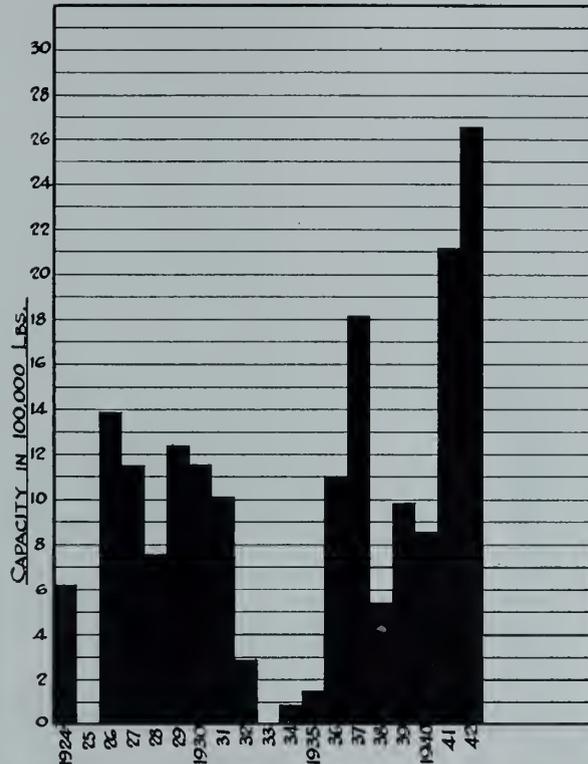

Chart showing the total capacity of all steam generating units (over 50,000 lb. per hour) installed each year from 1924 to 1942.

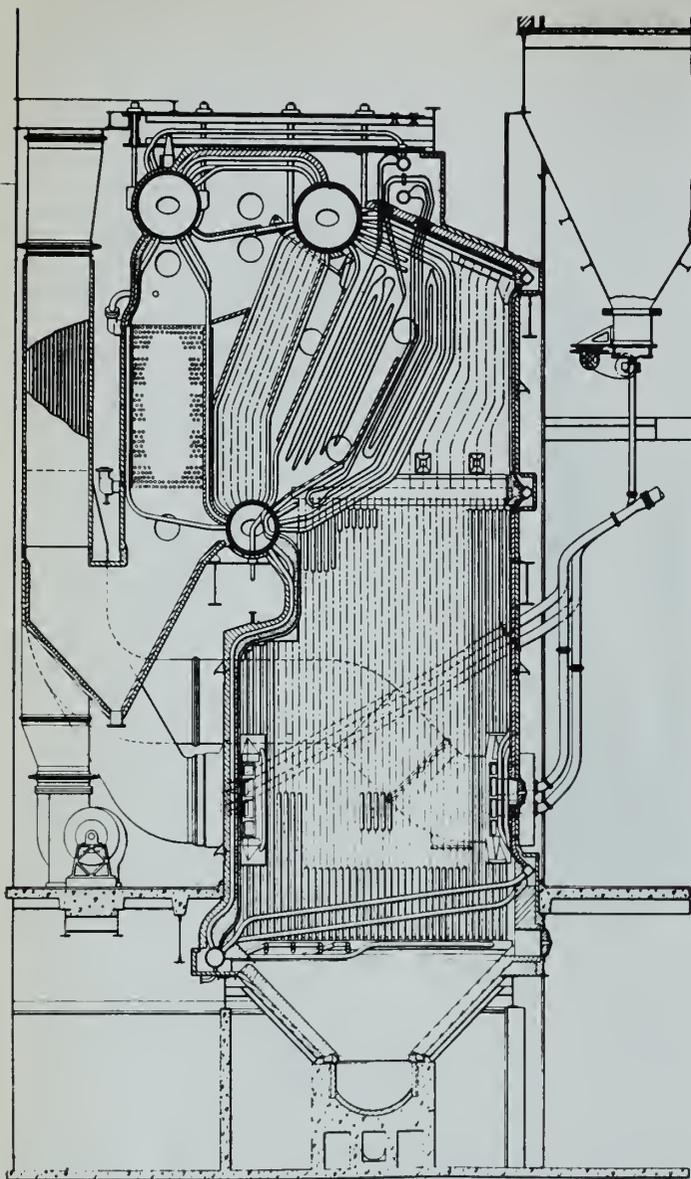

ing units with a capacity of over 50,000 lb. of steam per hour each. This illustrates very clearly the effects of the pulp and paper industry boom, the depression years and the war.

Most people look upon the modern pulverized-coal fired steam generator as something which first saw light about 1922, but actually the basis of our present design was recognized prior to 1912. About that time five units of British design, known as "Bettington boilers for atomized fuels," were installed in Nova Scotia and New Brunswick and tests showed results which were considered outstanding. This type of generator consisted in general of a boiler built around the furnace, burning coal pulverized in a hammer-mill as required, and using pre-heated air for combustion. While it is true that the original details have been greatly improved since that time, due credit for the essentials of our modern design should be given to the two Bettington brothers, as well as to those who financed them

and to the companies which had sufficient foresight and confidence to install units so radically different from the then standard practice.

For many years, engineers concentrated on higher capacity per unit, increased pressure and temperature and better thermal efficiency, but later began to realize the relative importance of reliability. If stand-by units could be reduced or eliminated, capital charges would be lower, hence a reduction in boiler outage became very important in power plant studies. To-day many plants report units with a record of more than 97 per cent availability over a period of several years. One utility plant in the United States has recently taken a unit off the line for inspection after an operating period of approximately eleven months. Of the 8,147 hours in that period, it was in operation a total of 8,067 hours, or 99 per cent of all the available time. It may be assumed that this phase of boiler-room layout will receive more and more attention by designers.

One of the main factors in the success of our modern design is the use of water cooling in the furnace. This is a direct result of the development of pulverized fuel firing. The early experiments in Milwaukee and elsewhere, headed by such men as John Anderson, John Blizard, Henry Kreisinger and others, showed that with increased heat releases and higher temperatures, standard refractory furnace designs were inadequate. Air-cooled walls were tried out and are still used for some conditions, but further improvement seemed imperative. Water cooling of the ashpit was tried with success, then a portion of each side wall was added, the idea being held by some engineers that there was a limit to the area that could be watercooled, which, if exceeded, would cause unstable ignition and incomplete combustion. To-day, however, furnaces are built without any refractory limitations. In the figure on the next page it will be noted that very little, if any, refractory material is directly exposed to flame temperatures.

Sectional elevation of a modern steam generator.

Water cooling is also applied to stoker-fired installations and has assisted in obtaining higher average operating efficiencies, lower maintenance and decreased outage. When new units are installed it is a relatively simple matter to include furnace wall cooling, and many designs, even in the smaller sizes, include it as an integral part of the installation. In existing plants, although water cooling shows very definite advantages and has resulted in increasing the useful life of many boilers which would otherwise have been discarded, there is a limit to which it can be employed without unjustifiable capital expenditure. Furnace water cooling is of particular advantage when coals are burned which have low ash fusion temperatures or those which contain high percentages of metal oxides. By the adoption of water-cooled furnaces large deposits of Canadian coals formerly considered unsuitable have been made available for high capacity and high efficiency plants.

A development of particular interest to western Canada is the increased use of the lignites found in Saskatchewan, Alberta and, to a limited extent, in British Columbia. These vary widely in moisture content, the deposits in Saskatchewan having 30 to 35 per cent, while those in Alberta and British Columbia range downwards to the point where they merge into the sub-bituminous class. Owing to the low heating value per pound and consequent high freight cost, their economical use is, generally speaking, limited to the four western provinces.

In addition to high moisture content, many of them have

severe clinkering characteristics, hence underfeed stokers have a limited application, except in very small boilers. Spreader and travelling grate types are favoured, the latter particularly for large units and where heat recovery by means of air preheaters can be used to advantage. Smaller water-cooled areas are generally used when the Saskatchewan lignites are burned, although some plants report good success with large percentages of the furnace so protected. This latter applies more particularly at high capacities and with preheated air.

The early experiments with pulverized lignite gave valuable data. When it was pulverized and allowed to stand for a day or more in bins, it arched over, causing irregular feeding, so that the storage system is seldom used and direct firing has become standard in all recent Canadian installations. The high moisture content also reduces the pulverizer capacity and, as nearly twice as much must be burned for the same steam output due to the low heating value, over-size mills are required. The decrease in capacity has been partly offset by drying in the mills with highly preheated air or gas.

Two utility plants in Saskatchewan report good results with pulverized lignite; one metallurgical plant in British Columbia, after trying pulverizers and stokers, decided in favour of the former when plant extensions became necessary. It is thus apparent that the choice of equipment cannot properly be made until all factors have been carefully studied.

In 1918, a plant operating at 200 lb. gauge pressure and a total temperature of 550 deg. F. was considered a high pressure installation in this country. In 1926, a pressure of 600 lb. and a total temperature of 700 deg. F. were used, while in 1937 one firm installed units of 900 lb. design pressure and a total temperature of 820 deg. F. This pressure has not as yet been exceeded, although a total temperature of 850 deg. F. has been reported by a different company.

It is interesting to note that the metallurgist has been called upon to play an important part in this phase of steam plant work. In 1930, engineers were prepared to design plants using higher pressures and temperatures than were then in use, but were limited by the metals available. During the depression period, materials were developed which would withstand the conditions in prime movers and steam generating units, arising from higher pressures and temperatures. In recent years, in the United States, units having a pressure of 2,500 lb. gauge and 950 deg. F. total temperature have been installed. Owing to the increased available energy in the high pressure and temperature areas of the Mollier chart, it would appear reasonable to assume that pressures approaching the critical point, as well as temperatures far beyond those in present practice, will be given careful consideration when found to be economically justified.

Larger units, increased use of water-cooled surfaces exposed to radiant heat, higher heat releases, pressures, etc., have created radical changes in boiler room auxiliaries. The reciprocating feed pump has been replaced by single-stage or multiple-stage centrifugal types. Piping has had to be redesigned to suit the new conditions, including extensive application of welding, and there is now more general and intelligent use of instruments and controls. Possibly the most important change has been in feed water equipment. The old boiler compound "cure-all" method has been replaced by scientific analyses and treatment. Methods satisfactory for units operating at pressures of 200 lb. and with low heat transfer rates were found to be unsuitable and even dangerous for modern conditions. As a result, the feed water chemist now plays a very important role in steam plant design and operation.

It will be noted that reference has been frequently made to "steam generators" rather than to "boilers." The reason is that to-day we consider the unit as a whole rather than its individual parts, such as boiler, furnace, firing equip-

ment, etc. In 1918, there were two general classes of boilers in use; viz. fire tube and water tube with straight tubes. Many of both classes are still in use but, in the water tube type, bent tubes have largely replaced straight tubes. Two, three or four drums are included in various designs, although two or three drums are most common due to simplicity and cost. Welded drums are becoming standard with many manufacturers and will doubtless increase as greater welding and x-ray facilities are made available. For low pressure heating, the welded steel-encased type is most common although, where some moderately high pressure steam is required or may be necessary at a later date, the horizontal return tube type is popular.

As mentioned previously, Canada is favoured with large amounts of hydro-electric power so that steam turbines are not used to the same extent as in other countries. Space will not permit of a detailed account of turbine practice in this country, but a few notes should be of interest. In 1918, a 5,000 kw. steam turbo-generator was considered a large unit and it was not until 1926 that a 10,000 kw. 3,600 r.p.m. machine was installed in Edmonton. This was followed in 1929 by a 15,000 kw. unit in Regina. To-day the largest in service has a capacity of 25,000 kw.

The detailed study of power plant heat balances has brought into prominence the different kinds of steam turbines now available. In addition to the straight condensing and back pressure types so widely used for many years, there are now the automatic controlled bleeder condensing, bleeder back pressure and mixed pressure bleeder types. These can be used singly or in combination, depending on the nature of the particular conditions. Standard designs are available from all recognized manufacturers and are being given careful consideration in industrial areas, even where water power is or may later be available.

At the outbreak of war, Canada was forced to change from peacetime to wartime effort almost overnight and very soon the effect on the country's steam plants became apparent. Utility companies, instead of endeavouring to sell electric power for the generation of steam at any price which would tempt firms to shut down their boilers, now began to invoke the cancellation clauses in their contracts. In 1939, the capacity of electric steam generators exceeded a million and one-quarter kilowatts, while at the beginning of 1943, after about $3\frac{1}{2}$ years of war, a negligible fraction of that amount was being used in isolated cases and at highly restricted off-peak periods.

In addition to the limits of shops to turn out steam generating and allied equipment, there was the problem of finding designers and draughtsmen. Where possible, plans were made to use existing designs, either in their entirety or with slight modifications. One company with many plants from coast to coast has installed 72 units each of approximately 25,000 lb. of steam per hour rated capacity since 1939. The uniformity of design was carried out, not only in the boilers and firing equipment, but also in piping, pumps, feed-water treatment, coal-handling equipment, buildings, etc. The value of this general policy became more evident as plant additions were required. By placing orders for one or more duplicate units, engineering time was eliminated and often several months were saved in delivery, installation and starting up.

An unexpected effect of the war was the necessity for changing a large number of boilers from oil to coal firing. As the submarine menace increased in 1941, the problem of crude oil transportation became acute and, in addition, larger quantities of fuel oil were required for ships both in the Navy and Merchant Marine.

Prior to July 1942, a number of large boilers had changed to coal firing, resulting in a saving of oil at the rate of 26 million gallons per year. At that time, the Government ordered all installations burning more than 10,000 gals. per year to convert. This involved approximately 4,100 actual boiler plants or 15,500 boilers. Of these, more than 7,000 were equipped with stokers; the remainder were hand fired, using either forced or natural draft.

The work which began in July was completed by December 31st, with the exception of 39 plants where the change-over was well advanced. This involved a cost of five million dollars, and effected an additional saving of 100 million gals. of fuel oil per year.

In view of the short time available and the scarcity of both materials and man-power, this is a remarkable record and an indication of what can be done by proper co-operation of Government and industry.

The question is often asked as to what the steam plant of the future will be like and if steam will continue to hold its place in the heat and power fields. In the field of straight power generation it is, of course, thermally very inefficient, due to the large latent heat loss in the exhaust. This is quite apparent when it is realized that even in the very efficient utility plants in the United States less than 30 per cent of the heat energy in the fuel is actually made available as electric power at the bus-bar. The mercury vapour unit is reported to be past the experimental stage, but so far only a few installations have been made. Also, like most binary-fluid designs, it can only maintain its high efficiency when used in conjunction with steam. It would appear, therefore, that steam will maintain its position until some new medium has been discovered and developed to the point where it is better from the standpoint of over-all economic efficiency, including first cost, operating cost, reliability, maintenance, safety, etc.

As mentioned previously, if Canada should continue to develop industrially, further hydro-electric developments capable of delivering cheap power will be found to be limited and even now relay steam plants are being used in conjunction with hydro to provide for low water periods. There is every indication that hydro and steam plant designers and operators will be called upon to work in close co-operation.

Another important field which the steam plant will be called upon to serve is in the utilization of by-product power by the use of process steam. In this way there is little or no latent heat loss and considerable savings are possible. The combination is, of course, generally restricted to conditions where there is a reasonable balance between steam and power loads, or where steam demand is the governing factor.

Grateful acknowledgment is hereby tendered to Mr. George Sancton of Fraser & Chalmers Limited for details of the Bettington boiler and to the Canadian Steel Boiler Institute for data required for the capacity chart.

WATER POWER DEVELOPMENT

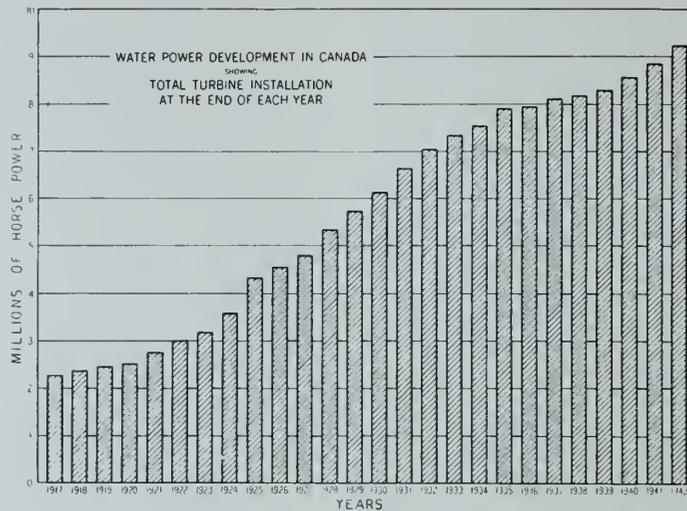

VICTOR MEEK, M.E.I.C.

Controller and Chief Engineer, Dominion Water and Power Bureau, Surveys and Engineering Branch,
Department of Mines and Resources, Ottawa

In the twenty-five years which have elapsed since the founding of *The Engineering Journal*, in May, 1918, no single factor is of more fundamental significance in Canada's progress during this period than the great increase that has taken place in water-power development. This increase of 6,938,000 hp. amounts to more than three times the total installed capacity of 2,287,000 hp. at the beginning of 1918 and has brought the total, at the end of 1942, to 9,226,000 hp.

The period under review had its beginning in the last year of the First World War when an acute power shortage in southern Ontario led to the undertaking of the great Chippawa-Queenston power project on the Niagara river by the Hydro-Electric Power Commission of Ontario. Although this development did not come into operation until the end of 1921, too late for use in World War I, it marked the commencement of an era of large-scale water-power development which was to extend throughout the Dominion and which was to provide the low-cost energy necessary not only for the establishment and expansion of extensive peace-time industries but also for the tremendous production of war materials and equipment for the use of the United Nations in the present world conflict.

The peace-time interval from 1919 to 1939 witnessed a large and widespread growth in Canadian industry. The most notable enterprise was undoubtedly the expansion of the pulp and paper industry to an extent where it led all other manufacturing industries in capital investment, in wages paid, and in the net value of production, and was the greatest factor in maintaining Canada's favourable balance of trade. This industry is dependent upon an abundance of wood and ample supplies of low-cost power and, before the war, was consuming more than 50 per cent of all power sold for industrial purposes, by central electric stations in Canada, in addition to the production from water-power developments directly owned and operated by the mills themselves, having an installed capacity of almost 650,000 hp. Although the pulp and paper industry provided the most spectacular growth in the peace-time interval, particularly in point of power utilization, the whole industrial base expanded to such an extent as to bring Canada to a position of first rate industrial importance amongst world nations. Contributing greatly to this programme of expansion was the growth in the mining, smelting and refining of base and precious metals, the growth of automotive, steel, machinery manufacturing, textile, food processing and packing, and many other industries. Power production kept pace with this industrial expansion both by the construction of new developments and by the systematic extension of existing facilities. Indeed, in the period of business depression following 1930, these new developments provided a surplus of power-generating capacity, a surplus, however, which was to be of the utmost importance in the war years to come. In addition to the greatly increased demands for power by industry in this peace-time interval, a tremendous growth took place in the use of electric energy for domestic and commercial purposes. Extension of transmission and distri-

bution facilities, introduction of radio, electric refrigeration, air conditioning, and numerous electrically-driven labour-saving devices together with improvements in lighting and heating appliances combined to bring about this great increase. By the end of the period, electric service was virtually universal in urban communities and had been greatly extended into rural areas in many parts of the country.

For almost four years, Canada has again been involved in a great world war, and the enormous part that

this country has been able to take in providing the materials and equipment so urgently required by the armed forces of the United Nations, in almost every theatre of the war, is attributable to the broad expansion which had previously taken place in industrial, and in power-producing and distributing facilities. At the outbreak of the war the power situation was peculiarly favourable. During the immediately preceding years, construction had proceeded on several hydro-electric power projects and, owing to the lag brought about by the industrial depression, power demands, particularly for firm power, were considerably less than power capacity. As a result, substantial supplies of power were immediately available for war production purposes and further large amounts, which were being sold as secondary power for raising process steam in pulp and paper mills, could be diverted to primary war use with relatively little delay. Such supplies were soon earmarked for war purposes but as the war progressed it was evident that additional capacity would be required and new construction was undertaken and prosecuted with such vigour that, during the war period up to the end of 1942, hydro-electric installations were brought into operation totalling more than 1,000,000 hp. Further construction is proceeding which should add as much more within the next twelve to eighteen months. During the war period, also, extensive additions and interconnections have been made to transmission systems, daylight saving is in force the year round throughout Canada, restrictions have been imposed in the use of power for certain non-war purposes and other measures have been taken to make available the maximum amount of power for war production. It is difficult to make a definite estimate of the total power being used for war purposes but it should be safe to say that more than one-third of Canada's hydro-electric capacity is now in war service, supplying power for the production of aluminum, copper, nickel, lead, zinc, and other war metals, and for the manufacture of ships, planes, tanks, guns, motor vehicles, and the host of other things required in this country's vast war programme.

REVIEW OF OUTSTANDING DEVELOPMENTS (1918-1943)

As already stated, the water-power capacity installed in Canada during the twenty-five years (1918-1943) totalled 6,938,000 hp. Every province was represented in this great programme of development as is shown in Table I.

TABLE I—TOTAL TURBINE INSTALLATION BY PROVINCES
(1918-1943)

Province	Hp. installed (1918-1943)	Per cent of total
British Columbia.....	495,394	7.2
Alberta.....	61,875	0.9
Saskatchewan.....	90,805	1.3
Manitoba.....	342,075	4.9
Ontario.....	1,728,440	24.9
Quebec.....	3,982,774	57.4
New Brunswick.....	117,096	1.7
Nova Scotia.....	109,666	1.6
Prince Edward Island.....	628	—
Yukon and Northwest Terri- tories.....	9,700	0.1
Total.....	6,938,453	100.0

This indicates that Quebec had by far the greatest share of water-power development and Ontario and Quebec combined, where much of the country's heavy industry is concentrated, were credited with more than 82 per cent of the total installation. Substantial developments, however, were made in all the provinces with the exception of Prince Edward Island which, owing to its size and topography, has limited water-power resources.

It is also of interest to record the development year by year during the period under review. This is done in Table II and shows very substantial increases for every year from 1921 to 1935. Heavy installations continued through the depression years from 1930 to 1935. These were offset, however, by very much smaller installations in the recovery period until the outbreak of the war when the greatly increased power demand brought about further large additions in the last three years.

It is not possible, in a brief article, to describe in detail the many developments undertaken during the past twenty-five years, but reference will be made to a number of the larger ones in the various provinces.

BRITISH COLUMBIA—To meet steadily increasing power demands in Vancouver and the lower coastal mainland area, the British Columbia Power Corporation enlarged its Stave Falls station on Stave river by 36,000 hp., constructed the Ruskin station on the same river with an installed capacity of 94,000 hp. together with the Alouette station on Stave lake of 12,500 hp. The corporation also increased the capacity of its plant on Jordan river on Vancouver Island by 20,000 hp. for the supply of Victoria and vicinity.

In the West Kootenay area, the West Kootenay Power and Light Company built new plants at Corra Linn and South Slocan on the Kootenay river and reconstructed or added to its plants at Upper and Lower Bonnington Falls on the same river. This new construction added 242,000 hp. to the company's generating capacity which serves chiefly the large power requirements of the Consolidated Mining and Smelting Company of Canada.

The East Kootenay Power Company constructed two hydro-electric plants totalling 22,200 hp. on the Bull and Elk rivers to supply mining needs in the East Kootenay district.

The Powell River Company, operating pulp and paper mills on the mainland coast at Powell river, added 25,860 hp. to its power installation on Powell river and constructed a 24,800 hp. plant on Lois river. Pacific Mills Limited, another pulp and paper enterprise on the coast, increased its power-generating capacity by 6,300 hp.

In the Prince Rupert area, the Northern British Columbia Power Corporation constructed a plant of 4,380 hp. on Falls river and, to serve an area centering on Vernon, the West Canadian Hydro-Electric Corporation installed 7,600 hp. in a plant at Shuswap Falls on Shuswap river.

ALBERTA—In Alberta, the Calgary Power Company constructed two new hydro-electric developments during the period, both in the Bow River basin. The Ghost develop-

ment on the Bow of 36,000 hp. was brought into operation in 1929 and the Lake Minnewanka—Cascade River development of 23,000 hp. in 1942. The company also greatly extended its transmission system to embrace most of Alberta from Edmonton south to the international boundary.

SASKATCHEWAN—All hydro-electric development in Saskatchewan took place during the period. The Churchill River Power Company brought its Island Falls development on Churchill river into operation in 1930 with an installation of 42,000 hp. and, by additions in 1937 and 1939, enlarged the development to 87,500 hp. Power is transmitted to Flin Flon and Sherridon for the operations of the Hudson Bay Mining and Smelting Company and Sherritt Gordon Mines respectively. In 1939, the Consolidated Mining and Smelting Company of Canada completed a plant of 3,300 hp. at Wellington lake on Charlot river for gold-mining operations at Goldfields, Saskatchewan.

MANITOBA—With the exception of a 1,900 hp. development completed by Gods Lake Gold Mining Company in 1935 on Island Lake river in northeastern Manitoba, all other waterpower development during the period was made on the Winnipeg river. The City of Winnipeg hydro-electric system completed its Pointe-du-Bois station by adding 65,400 hp. and a new plant was constructed at Slave Falls with an installation of 48,000 hp. Power is transmitted for distribution in the city of Winnipeg. Two plants controlled by the Winnipeg Electric Company were built on the Winnipeg river; one at Great Falls with an installed capacity of 168,000 hp. and the other at Seven Sisters Falls where an initial installation of 60,000 hp. has been made. Power is transmitted to Winnipeg and vicinity, also to the Manitoba Paper Company's mill at Pine Falls, to the central Manitoba mining area and to Kenora in Ontario.

The Manitoba Power Commission, established in 1919, purchases power from the Winnipeg Electric Company and serves 151 municipalities throughout southern Manitoba by means of a network of 1,825 miles of transmission and distribution lines constructed and extended during the past twenty-four years.

ONTARIO—During the past twenty-five years, the developments carried out by the Hydro-Electric Power Commission of Ontario far surpassed all others in the province. In this period, new plants constructed by the Commission or acquired by purchase totalled more than 1,300,000 hp. representing almost 75 per cent of the Commission's total generating capacity. In addition, the Commission purchases under contract 835,000 hp. from companies generating power in the province of Quebec. The great Chippawa-Queenston development of 560,000 hp. on the Niagara river was the largest of the Commission's construction undertakings but other large developments included Chats Falls on the Ottawa river (112,000 hp.), Cameron Falls (75,000 hp.) and Alexander Landing (54,000 hp.) both on the Nipigon river, Barrett Chute (56,000 hp.) on the Mada-waska river, and the Canyon plant on the Abitibi river (330,000 hp.), the latter completed and operated for the Ontario Government. Among smaller developments, five were built on Muskoka waters (28,550 hp.), three on the Trent river (21,400 hp.), two on the South river (3,100 hp.), one on the Mississippi river (3,720 hp.), and on the English and Albany rivers in the Patricia district developments totalling 20,400 hp. were made and are operated for the Ontario Government. Additional installations made in older plants and plants acquired by purchase totalled 50,000 hp. During this period, the Commission vastly extended its network of transmission and distribution lines, bringing electric service to virtually all parts of the province and supplying some 900 urban and rural municipalities.

In addition to the developments undertaken by the Hydro-Electric Power Commission, several privately-owned power organizations and a number of industrial companies added substantially to Ontario's water-power development. Serving Sault Ste. Marie, the Great Lakes Power Company built three plants on the Montreal and Michipicoten rivers

TABLE II—CANADIAN WATER POWER DEVELOPMENT
TURBINE INSTALLATION BY PROVINCES (1918-1943) IN HORSE-POWER

1929	5,000	36,000			48,350	208,312	45,500	34,768			377,930
1930	71,000		42,000		136,000	122,700	21,050	5,100			397,850
1931	25,200			79,000	57,150	382,200		2,225			541,325
1932	57,800	1,065			62,900	256,990		168			378,923
1933	3,810				147,000	136,000					286,810
1934	115				650	210,000		4,200			214,965
1935	780			1,900	204,400	150,000				5,000	362,080
1936	425				1,750	30,000		4,300			36,475
1937	1,050		19,000	12,500	15,475	116,366		2,770			167,161
1938	18,041	400		15,600	5,579	31,377	334	7,180	178		78,021
1939			29,800		13,840	53,700		1,100			98,440
1940	50,750				796	236,180		7,500			295,226
1941					19,900	236,000				4,700	260,600
1942	3,800	23,000			66,900	282,600		4,500			380,800
Total	792,563	94,997	90,835	420,925	2,684,395	4,839,543	133,347	143,717	2,617	22,899	9,225,838

totalling 62,000 hp. and added 7,200 hp. to its plant at Sault Ste. Marie. The Canada Northern Power Corporation, supplying power in the Porcupine and Kirkland Lake mining areas, increased its generating capacity on the Montreal and Mattagami rivers by 31,200 hp. The Keewatin Power Company installed 30,875 hp. on the Winnipeg river at Kenora. Among pulp and paper companies, the Abitibi Power and Paper Company added 81,650 hp. to its generating capacity chiefly at two plants on the Abitibi river, the Spruce Falls Company built plants totalling 58,750 hp. on the Mattagami and Kapuskasing rivers, and the Minnesota and Ontario Paper Company constructed three plants on the Seine river totalling 36,500 hp. The International Nickel Company increased its generating capacity by 28,200 hp. on the Spanish river and numerous lesser installations were made by other power and industrial organizations.

QUEBEC—The great increase in water-power development of 3,982,000 hp. in Quebec during the past twenty-five years was accounted for very largely by the activities of a few large privately-owned public utility organizations. The Shawinigan Water and Power Company and its subsidiaries or associates, serving a large area in central Quebec increased its generating facilities by 742,500 hp., chiefly on the St. Maurice river. New plants on that river were constructed at La Gabelle (172,000 hp.), Rapide Blanc (160,000 hp.), and La Tuque (178,000 hp.), and additions were made at Shawinigan Falls (129,000 hp.), and Grand'Mère (77,000 hp.). Other new construction included a 22,000 hp. plant at St. Narcisse on Batiscan river, 4,500 hp. at St. Raphael on du Sud river, and 4,000 hp. at St. Alban on the Ste. Anne-de-la-Pérade river. Large extensions were also made to the company's widespread transmission and distribution systems.

Montreal Light, Heat and Power Consolidated and companies now under its control, viz. Beauharnois Light, Heat and Power Company and Montreal Island Power Company, accounted for 823,400 hp. in new installations. The great development of 689,000 hp. at Beauharnois on the St. Lawrence river was the outstanding achievement; the Cedars development on the St. Lawrence was increased by

89,400 hp. and a plant on Rivière des Prairies at St. Vincent-de-Paul was constructed with an installed capacity of 45,000 hp.

Serving the Eastern Townships area south of the St. Lawrence, the Southern Canada Power Company constructed two developments on the St. François river, one at Drummondville (18,400 hp.) and the other at Hemming Falls (33,600 hp.); a smaller plant of 2,000 hp. was built at Burroughs Falls on Nigger river.

The period witnessed the establishment of four new power organizations of large magnitude: three in the Ottawa River valley, Gatineau Power Company, Maclaren-Quebec Power Company, and Ottawa Valley Power Company; and two in the Saguenay River district, Saguenay Power Company and Aluminum Power Company.

Gatineau Power Company constructed three large plants on the Gatineau river at Paugan Falls (238,000 hp.), Chelsea (170,000 hp.), and Farmers (96,000 hp.), and a smaller one of 2,500 hp. at Corbeau Rapids. The company also acquired by purchase a number of other plants which were either installed or extended during the period including two on the Ottawa river, Bryson (51,400 hp.) and Hull (22,500 hp.), one on Gordon creek at Kipawa (24,000 hp.) and others on the Rouge, Nord, and Ouareau rivers where installations totalling 7,765 hp. were made. An extensive transmission system was constructed throughout the territory covered by the company's operations.

The Maclaren-Quebec Power Company completed two large developments on the Lièvre river, one at High Falls (120,000 hp.) and the other at Masson (136,000 hp.).

Ottawa Valley Power Company joined with the Hydro-Electric Power Commission of Ontario in constructing the Chats Falls development on the Ottawa river; the company undertaking the works in Quebec province and installing 112,000 hp. The output from this installation is sold to the Commission for distribution in Ontario.

Saguenay Power Company, supplying chiefly the aluminum industry and pulp and paper mills in the Saguenay River and Quebec districts, constructed a large development of 540,000 hp. at Isle Maligne on the Saguenay river at the

outlet of Lake St. John. A plant of 3,500 hp. built during the period at Garneau Falls on Chicoutimi river was also acquired by the company.

The Aluminum Power Company, serving the aluminum industry, completed a permanent installation of 280,000 hp. at Chute-à-Caron on the Saguenay river and installed temporarily 110,000 hp. at the same site. A major development is also under construction at the present time at Shipshaw on the Saguenay which will have an installed capacity, when completed, of 1,020,000 hp.; 170,000 hp. of this capacity was installed and in operation at the end of 1942 and it is expected that the full development, including the transfer of the temporary units from Chute-à-Caron to Shipshaw, will be completed by the end of 1943.

To supply the mining industry in northwestern Quebec, the Canada Northern Power Corporation constructed a 40,000 hp. development on Quinze river and the Province of Quebec one of 48,000 hp. at Rapid No. 7 on the Upper Ottawa river.

The City of Sherbrooke, supplying its own needs, built a new plant of 5,800 hp. at Westbury on the St. François river and reconstructed a plant on the same river at Weedon adding 4,300 hp.

Serving the lower south shore district of the St. Lawrence and also the town of Campbellton in northern New Brunswick, the Lower St. Lawrence Power Company built a plant of 9,600 hp. on the Métis river.

Among pulp and paper companies developing power for their own needs, Price Brothers constructed a plant of 17,600 hp. at Chute-aux-Galets on the Shipshaw river, one of 11,000 hp. on Chicoutimi river and added 5,300 hp. to other existing plants. North Shore Paper Company built a plant of 70,000 hp. on the Outardes river to supply its mills at Baie Comeau. Smaller installations were made by other companies.

No account of the major power programme in Quebec would be complete without a reference to the highly important work carried out by the Quebec Streams Commission in the construction and operation of storage dams for the regulation of stream flow. The Commission now controls 21 reservoirs on the St. Maurice, St. François, Gatineau, Lièvre, Nord, Ste. Anne-de-Beaupré, and Métis rivers and on Lake Kenogami. Virtually all of these reservoirs have been created during the past twenty-five years, the most notable of which have been the Gouin reservoir on the St. Maurice river (5,000,000 acre-feet), Baskatong and Cabonga reservoirs on the Gatineau river (3,165,000 acre-feet), Cedar Rapids reservoir on the Lièvre river (500,000 acre-feet), Lake St. François and Lake Aylmer reservoirs on St. François river (340,500 acre-feet), and Lake Kenogami reservoir (312,000 acre-feet). Other reservoirs not under the control of the Commission have been created by private power interests, the outstanding ones being those on Lake St. John (3,850,000 acre-feet) and on the Peribonka river (5,440,000 acre-feet) for the regulation of the Saguenay river.

NEW BRUNSWICK—The outstanding water-power developments in New Brunswick during the past twenty-five years were undertaken by the New Brunswick Electric Power Commission, the Gatineau Power Company, and the Bathurst Company.

The New Brunswick Electric Power Commission, established in 1920, serves power to most urban and a number of rural communities in the province over 2,290 miles of transmission and distribution lines leading from two power plants constructed by the Commission; one a hydro-electric plant on the Musquash river (11,100 hp.) and the other a fuel-electric plant on Grand lake (25,000 hp.) The Commission also purchases a small amount of power from other sources.

At Grand Falls on the St. John river, the Gatineau Power Company completed a hydro-electric development of 80,000 hp. and transmission lines leading to Dalhousie and Ed-

mundston; power being used chiefly for the operation of pulp and paper mills in those communities.

The Bathurst Company constructed a hydro-electric plant of 14,500 hp. at Grand Falls on the Nipisiguit river for the operation of its pulp and paper mills at Bathurst.

Lesser installations were made by the Maine and New Brunswick Electrical Power Company on Aroostook river (5,100 hp.) and the Municipality of Edmundston on Green river (1,050 hp.).

NOVA SCOTIA—The past twenty-five years have witnessed a four-fold increase in water-power development in Nova Scotia largely through the operations of the Nova Scotia Power Commission and the Avon River Power Company.

The Nova Scotia Power Commission, established in 1919, has constructed 14 hydro-electric developments totalling 76,350 hp. and 1,400 miles of transmission and distribution lines serving communities and industries throughout the province. The larger developments are five on the Mersey river (39,600 hp.), three on Indian and North East rivers (15,700 hp.), two on East River Sheet Harbour (16,140 hp.), and one on Tusket river (3,000 hp.).

The Avon River Power Company, serving power to Halifax and communities in the Annapolis valley, constructed three plants on Black river (16,500 hp.), two on Avon river (6,200 hp.) and other smaller plants, giving the company a total generating capacity of 24,825 hp.

The Minas Basin Pulp and Paper Company built two hydro-electric plants on the Ste. Croix river totalling 6,970 hp. for the operation of its pulp mill at Hantsport. A number of other lesser plants were constructed by industries and municipalities during the period.

YUKON AND NORTHWEST TERRITORIES—In the Yukon, the only new water-power development was the addition of a 5,000 hp. unit in the hydro-electric plant of the Yukon Consolidated Gold Corporation on the North Fork of the Klondike river. Power is used principally for the operation of gold dredges in the Klondike district and for the supply of Dawson city.

The first hydro-electric development in the Northwest Territories was constructed by the Consolidated Mining and Smelting Company on the Yellowknife river (4,700 hp.) to supply gold-mining properties in the Yellowknife area to the north of Great Slave lake.

CURRENT AND FUTURE DEVELOPMENT

Under the urge of war demands, construction is currently proceeding on several projects which will add another 1,000,000 hp. to the Dominion's total. These include the completion of the outstanding Shipshaw development on the Saguenay river by the Aluminum Power Company (740,000 hp.); the addition of units at Rapide Blanc (40,000 hp.) and La Tuque (44,500 hp.) plants of the Shawinigan Water and Power system; the completion of a 65,000 hp. development at DeCew Falls in the Niagara area by the Hydro-Electric Power Commission of Ontario; and the construction of a 130,000-hp. development at Brilliant on the Kootenay river in British Columbia by the Consolidated Mining and Smelting Company of Canada. A development in early prospect is one of 300,000 hp. at Des Joachims on the Ottawa river by the Hydro-Electric Power Commission of Ontario.

When the war is over, large quantities of power now being used for war production will be available for other purposes. At that time, however, there will have accumulated, undoubtedly, an enormous demand for goods and equipment brought about by wartime destruction, rationing and curtailment. Canada's industries with large supplies of low-cost hydro-electric power available should be in an unrivalled position to take a great share in this work of reconstruction and rehabilitation. Looking further to the future there are very large reserves of power still undeveloped throughout the Dominion which will be of fundamental importance in fashioning the development of other natural resources in the years to come.

ELECTRICAL EQUIPMENT

D. C. DURLAND

President, Canadian General Electric Company, Limited, Toronto.

Canada's electrical industry during the past 25 years has experienced a phenomenal growth. A few facts and figures exemplify the rapid progress that has been made. The annual per capita consumption of electricity has increased from 660 kw.h. in 1918 to 3100 in 1942 to give Canadians the distinction of being the world's largest per capita users of electricity. The output of central stations increased from 5.5 billion kw.h. to 37.1 billions in 1942 or an increase of 6.7 times.

What are some of the factors that have brought about this rapid growth in the use of electricity? The principal one is the large proportion of Canada's electricity produced by hydraulic power. Canada is fortunate in having many water power sites that not only lent themselves to relatively low cost development but also were fairly close to established centres of population and to sources of raw materials. Canada has a progressive central station industry with the foresight and courage to embark on large scale hydro-electric projects and the ingenuity to carry them to completion. The Dominion also has an efficient electrical manufacturing industry with research, engineering and manufacturing facilities for the constant improvement of equipment as well as for the development and manufacture of new products to meet the growing demands of Canadian industry. These factors combine to make available large amounts of low cost electricity which is freely utilized in industry, municipalities and homes.

In 1941, the electrical apparatus and supplies industry had 211 plants, 33,086 employees, and a selling value of products of \$177,902,626. In 1918, this industry had only 68 plants, 8,863 employees and a selling value of products of \$30,045,399.

Since our immediate interest is with the advances in equipment during the past quarter century, let us review some of these developments. The sequence in which they are named does not in any way indicate their relative importance in the Canadian electrical scene.

FABRICATION BY ARC WELDING

One of the greatest advances in electrical apparatus was the transition from cast to fabricated steel construction. Although successful results were obtained by electrically welding together steel parts as far back as 1918, there was for several years a reluctance to adopt this method of manufacture for electrical machinery. In 1925, the first all-welded tanks for large transformers were built in Canada. In 1927, the first all-fabricated vertical waterwheel-driven generator was built. Fabricated-steel construction has the advantages of greater strength, lighter weight and gives the engineer an opportunity to build-in higher efficiency and better functional design. To-day, practically all electrical apparatus is fabricated by welding. Last year, for the first time, steel spiral casings for large hydraulic turbines were completely arc welded. A continuous improvement in welding electrodes and arc welding machines has been largely responsible for the success of the process.

Portable anti-aircraft searchlights are being built by Canadian electrical manufacturers.

factory thrust bearing, which carries the total weight of the rotating parts as well as the thrust of the water, has been responsible for making large vertical waterwheel-driven generator installations practical. The single thrust bearing on each of the 75,000-kva. units mentioned above carries a total load of 562 tons.

In 1940, the first station designed for generators with a completely enclosed re-circulating cooling system was built. This system keeps out dust, flies, and fuzz from trees and thereby reduces maintenance costs. It also reduces the fire hazard and provides greater security for continuous operation, as the units do not have to be shut down for periodic cleaning.

ELECTRIC STEAM GENERATORS

Another unique piece of electrical apparatus—the electric steam generator—was introduced to serve the pulp and paper industry. These generators make process steam from surplus or off-peak power.

Between 1920 and 1939, over 1,500,000 kw. in electric steam generators were installed in Canada. In 1937, these consumed over 25 per cent of the central stations output. When the growth of war industries threatened a power shortage, power was diverted from steam generators to operate machines in war plants. To-day the power utilized by electric steam generators is only six per cent of central station output and is still decreasing.

TRANSFORMERS

In no piece of electrical apparatus has the increased knowledge of electrical phenomena, gained since the last war, been more successfully applied than in the transformer. Trouble-free transformers of greatly increased capacity have been built for operation at voltages as high as 230,000 with little or no increase in physical dimensions.

Since the year 1900, there has been a steady development and improvement of silicon steel for transformer cores. Step by step the quality of transformers has been improved until hysteresis losses in transformers have been reduced from $1\frac{3}{4}$ watts per lb. in 1903 to $\frac{1}{2}$ watt in 1943.

In the shielded-winding transformers, developed in 1926, high concentrations of voltage stress inside the winding due to lightning are prevented by the scientific use of electrostatic shields. Electrostatic shields external to the windings and connected to the line terminals control the stress distribution.

In 1932, transformers using a new liquid cooling and

GENERATORS

Keeping pace with the development of larger water power sites, generators have steadily increased in size. The 75,000-kva. generators currently being installed at the Shipshaw station, represent the largest generators in electrical output ever built in Canada. The vertical-shaft generator has largely displaced the horizontal type. The vertical-type generator lends itself admirably to large hydraulic installations where the water wheels can be readily installed at a level to give the best economy and efficiency. The development of a satis-

insulating material were introduced to Canada. This material, in addition to the desirable characteristics of mineral oil, has the property of being non-inflammable and non-explosive. This liquid when used in transformers eliminates the necessity of expensive fireproof vaults and permits the economical installations of transformers indoors close to the centres of load. When used in capacitors it permits smaller, lighter weight, fireproof and more reliable units.

SWITCHGEAR

Since 1918, there has been a continuous improvement in switchboards. Deadfront steel panels replaced marble, slate, and more recently ebony asbestos. To-day, switchgear is factory-assembled and is received on the site complete, ready to connect to the main circuits. Metalclad switchgear, the latest development, is not only factory assembled but the complete metal enclosure adds to the safety, efficiency and appearance of the equipment. Ingenious mechanisms have been developed to permit the quick removal of a circuit breaker for overhaul and the insertion of a "spare."

The increase in the size and power of modern systems has thrown greater burdens on circuit breakers and has resulted in the development of breakers with greater interrupting capacity. The oil-blast principle of arc extinction has made these higher ratings possible, without any appreciable increase in physical size. In recent years there has been a definite trend towards the use of air circuit breakers, and for voltages of 550 and less they are now used almost exclusively.

LIGHTNING ARRESTERS

Entirely superseding the oxide film and similar types of lightning arresters in vogue between 1918 and 1930 is the new "Thyrite" type arrester. This arrester utilizes a ceramic material which has the remarkable characteristic of being substantially an insulator at the lower voltages and becoming an excellent conductor at the higher voltages encountered from surges and impulse conditions.

POWER FACTOR CORRECTION

For many years low power factor was more or less disregarded, probably because of excess system capacity and also because of the small amount of inductive equipment in service. The greatly increased use in recent years of inductive equipment—induction motors, transformers and induction furnaces—coupled with heavy circuit loading, called for the serious consideration of power factor correction. The magnetizing current of such inductive equipment can readily be either partly or entirely neutralized by the use of suitable corrective equipment—either capacitors, or synchronous machines operating at a leading power factor.

TRANSPORTATION EQUIPMENT

In 1938 a revolutionary advanced design of electric street car was placed in operation in Canada. These new cars are faster, quieter, and more comfortable than their predecessors. In 1936, trolley coaches were placed in operation in Montreal. These vehicles give the comfort and flexibility of a modern bus, but because they take their power from overhead power lines, have lower operating costs, are quieter, and can maintain faster schedules. In the field of industrial haulage many diesel-electric locomotives have been placed in service during the past few years. These locomotives are unusually economical to operate.

MOTORS

For years the motor was nothing more than a device for supplying rotational power to the plant line shafting. The chief consideration was that the motor be of sufficient horsepower to turn the shafting or other driven member. Speeds were only a matter of selecting pulleys of a size to give the desired result. The electric motor of to-day is a highly specialized tool, designed to meet the exacting requirement of modern industry, in which motors with special characteristics as to power requirement, torque, speed and surrounding conditions are specified. In modern

plants the use of individual motors, mounted on the machines they drive, has practically eliminated overhead shafting and belts.

The squirrel-cage induction motor, with its simplicity, robustness, and versatility, is the type most frequently used in industry to-day. The following three types are in general use—(1) The normal torque for full voltage starting. (2) The high torque, low starting current. (3) The high slip, high torque motor.

The use of standard NEMA frame dimensions by all the leading manufacturers brings to the user the advantages of interchangeability in respect to mounting dimensions between motors of the same ratings but of different makes.

Depending on the surrounding conditions, the following types of induction motors are available. (1) Standard protected type. (2) Splash proof. (3) Totally enclosed fan-cooled. (4) Totally enclosed. (5) Explosion proof.

The modern synchronous motor with its high efficiency and high starting and pull-in torque is no longer regarded as a special machine but is considered for many drives for which induction motors may have been employed in the past, especially where low speeds are involved or where some degree of power factor improvement is desired.

USE OF MOTOR POWER

In 1917, each of the 606,523 employees in manufacturing industries in Canada had at his disposal only 2.7 hp. For each of the 658,114 employees in manufacturing industries in 1939 there were available 6.2 hp. of electric motors and 1.5 hp. of other power producers. To-day, there are probably 6 million hp. in electric motors at work in Canadian plants as contrasted with 1.3 million hp. in 1923.

MOTOR CONTROL

Although a succession of improvements contributed to safety, accessibility and longer life of control equipment there are a few developments worthy of special mention. For instance, temperature overload protection, in which a temperature relay heater conforms to the heating characteristics of the motor, permits the motor to stay on the line until the danger point is approached. This eliminates many unwarranted outages from service. The introduction of improved automatic control has been in a large measure responsible for bringing the synchronous motor out of the special class and rendering it suitable for operation by ordinary plant operators. The sequence control of machine tool operations and industrial processes of all kinds can be taken care of automatically by timing devices incorporating telechron motors or electronic tubes, which operate in conjunction with other relays and suitable control equipment.

Recent years have seen the electrical industry applying old principles in new ways and developing entirely new, highly specialized devices to aid other industries in the solution of their production problems. Ward-Leonard control illustrates the former trend. This system, invented in 1891 by Mr. Ward Leonard, has been used for flexibility, wide speed range and smooth acceleration on large drives, but not until lately has it been used extensively in the smaller sizes. Electrical manufacturers now supply the motor-generator set, the D-C motor and the various control equipment as a "packaged" unit in ratings up to 50 hp.

ELECTRONIC EQUIPMENT

Electronic equipment dates back to the last war when radio was introduced. The radio tube is the best known member of the electronic family. To-day, rapid strides are being made with frequency modulation to replace amplitude modulation used in the ordinary radio. The former eliminates static and fading, two of the worst features of the latter type. During the past few years intensive development has taken place in television equipment, in which electronic tubes play an important part.

In recent years, a galaxy of electronic tubes has been developed, the best known of which is the photo-electric

cell which has the unique characteristic of becoming a conductor in the presence of light. This tube is used in motion picture projectors, counting and sorting machines, door openers, street lighting systems and in many other applications. Electronic tubes are used for such purposes as control of theatre lighting. They also make possible the modern seam-welding machines, widely used for fabricating airplane parts and the bodies of military vehicles. Electronic tubes permit large currents to flow for very short periods, such as a fraction of a cycle, to give a succession of welds on thin metals that resemble the stitching on a piece of cloth.

Electronic tubes are widely used as rectifiers—every radio set uses one. This same principle is now widely used for power rectifiers using steel tanks instead of glass tubes. Canada's first power rectifier went into operation in 1927. Since that time, hundreds of rectifiers have been installed, principally in the aluminum industry where this apparatus is employed to convert alternating to direct-current for the aluminum pot-lines.

LAMPS AND LIGHTING EQUIPMENT

In 1918, the gas-filled incandescent lamp developed in 1913 was still the lamp in common use. It was not until 1926 that the now familiar inside frosted lamp with its increased diffusion, glare reduction, and softening of shadow effect came on the scene. Incandescent lamps have been continually improved in light output and quality. This combined with substantial price reductions gives the user an average of well over four times as much light for his lamp dollar, as he obtained a quarter of a century ago.

One of the more recent developments has been gaseous discharge lamps. In 1933, a sodium lamp and a high intensity mercury-vapour lamp were developed. These sources produced light at the highest efficiencies ever achieved, the sodium at sixty lumens per watt and the mercury at forty lumens per watt. However, because of the characteristic colour of the light emitted by these sources—orange-yellow for the sodium and yellow-green for the mercury—their use is limited to certain locations where the colour of the light is not a factor but where high efficiency is of definite value. A more recent development is the 1000 watt water-cooled mercury vapour lamp. This lamp is only 3½ in. long and is used where an intense point of light is required.

The most remarkable development since Edison's first practical incandescent lamp is the fluorescent lamp introduced in 1938. This lamp not only makes available a relatively cool source of white light but also gives from two to three times as much light as an incandescent lamp of the same wattage. Highly efficient fluorescent lamps when used in war factories contribute greatly to better lighting and increased production.

During the past 25 years, many new uses for artificial light have been developed. These include highway and airport lighting; sports and protective floodlighting, automobile headlights and traffic control as well as the improved lighting of industrial, commercial, and home interiors. Comparative lamp sales best illustrate the growth of lighting during the past 25 years. It is estimated that in 1918 only 8,000,000 lamps (6,400,000 large style and 1,600,000 miniature) were sold in Canada. It is estimated that last year 68,500,000 lamps (39,000,000 large style and 29,500,000 miniature) were placed in service.

Lighting practice since 1918 has been the subject of intensive research, both from the qualitative and quantitative needs of our eyes. This research has demonstrated the benefits of raising the level of illumination in our war factories from approximately 10 foot-candles in 1918 to from 50 to 200 foot-candles in 1943. The studies carried on during the past 25 years by the lighting industry have contributed greatly to the production records established by industry.

X-RAYS IN INDUSTRY

Within the past few years, X-rays have invaded the industrial field for the examination of large castings and

welds on boilers and pressure tanks, for possible flaws. Detection of flaws with X-rays, during the early stages of manufacture, saves considerable time and money. Modern industrial X-ray equipment operates at one million volts.

INSULATING MATERIALS

Great strides have been made in the development of better insulating materials. The introduction of a dense plastic bonded material that can be formed into collars and cylinders was a distinct advance. Practically all power transformers now built in Canada utilize cylinders of this type to separate the high and low voltage windings.

Improvements and new developments in electrical insulations have resulted in such benefits as better space factors, more dependable operation over longer periods and under more adverse conditions of service. The most outstanding improvements have been in insulating varnishes, particularly in the field of synthetics, such as the alkyds and the phenolics. Synthetics have also been successfully applied to tubing and sheet insulating materials.

Wire insulation has been greatly improved. For instance, tellurium compounded rubber introduced in 1932 gives to trailing cable a jacket which it is almost impossible to destroy by abrasion or rough usage. A new magnet wire introduced to the Canadian market in 1940 insulated with a synthetic resin of the vinyl acetate type is tougher and more flexible than the conventional enamel coatings. This wire is now used almost exclusively for winding motors, small generators and coils. The restrictions on the use of rubber as a result of the present war have greatly stimulated the use of synthetic rubber coverings. For instance, one typical insulation resembles rubber but has the added desirable characteristics of being non-combustible and resistant to moisture, acids, alkalies and oils. It is being used for aircraft cables, tank wiring, field communication cable, admiralty cable, machine tool wiring, switchboard wiring and battery and coil leads.

ELECTRIC HEATING EQUIPMENT

The first major application of electric heat in industry was in 1917, when it was applied for heat-treating gun barrels. Since then its use in industry has shown great growth. To-day, electric heat is widely used in elevator-type furnaces, conveyor belt furnaces, small box-type furnaces for tool rooms, salt baths for treating aluminum, pot type furnaces for cyanide or lead hardening; industrial ovens for core baking, paint drying and dehydrating and in air heaters, strip heaters, immersion heaters, cartridge type heaters, soldering irons, melting pots and other small devices. One of the most important developments was the utilization of inert gas atmospheres in electric furnaces for bright annealing and copper brazing. Another recent industrial heating application is the infra-red oven in which heat is produced by special incandescent lamps that emit a large proportion of infra-red rays. Drying is done in these ovens in from one-tenth to one-fifth of the time required by other methods.

DOMESTIC APPLIANCES

Prior to 1919, the use of electric appliances in the home was meagre indeed. Light was almost the only domestic use of electricity. There were several reasons for this; (1) electric appliances were expensive and had not reached a high state of development; (2) houses were, in the main, not adequately wired for the extra loads; (3) the public generally was not familiar with the economies, labour saving, and conveniences that electric appliances for the home could provide. A "standard wiring" evolved in 1922 did much to improve wiring systems. Electrical manufacturers have continuously improved their products and developed new appliances for the home. The result was a tremendous growth in the use of appliances until their manufacture was restricted by the war. It is interesting to note that the annual domestic consumption of electricity is steadily increasing and, in 1940, showed an increase of

(Continued on page 327)

PUBLIC WORKS

F. G. GOODSPEED, M.E.I.C.

Superintending Engineer, Department of Public Works of Canada, Ottawa

The past quarter of a century, commencing in the last year of the First World War, and finishing in the fourth year of the Second World War, has included a period of great prosperity for Canada, and also a period of extreme depression and unemployment. Each of these conditions, war and peace, prosperity and depression, have had their influence on the construction of public works.

In 1914-15, the expenditures of the Department of Public Works had risen to approximately thirty million dollars per year. By 1918, during the war, these expenditures had dropped to approximately fourteen million dollars per year, governmental expenditures being concentrated during that time on the war effort. Between 1918 and 1929, ordinary departmental expenditures did not exceed twenty million dollars annually, although in the first three years after the war considerable sums were expended from war appropriations for the construction of military hospitals, etc., making the total expenditure for each of those years from twenty million to twenty-two million dollars.

In the years of depression and unemployment which followed, expenditures increased to a maximum of approximately thirty-one million dollars in 1935-36 when a sum of nearly eighteen million dollars was expended on special works carried out under the Public Works Construction Act for the relief of unemployment.

At the outbreak of war in 1939, all Public Works contracts were cancelled, and since that time, the ordinary work of the Department has been limited generally to the maintenance of existing structures and buildings, no large departmental works having been constructed. However, very considerable work has been carried out by both the Chief Architect's and Chief Engineer's Branches of the Department in the construction of buildings and works for the Department of National Defence and for the Department of Munitions and Supply, which works were financed from war appropriations. The actual construction work carried out by the Department during these years, including work done under war appropriation, has been practically equal to that of the peace time era.

The construction and maintenance work of the Department of Public Works has been carried out under the three branches of the Department: the Chief Architect's Branch supervising the construction and maintenance of public buildings; the Chief Engineer's Branch in charge of the construction and maintenance of engineering works such as docks, wharves, breakwaters, bridges, the carrying out of dredging, etc.; and the Government Telegraphs Branch in charge of the construction and maintenance of Government telegraph and cable lines.

About 1880, the Dominion Government embarked on a policy of providing telegraph service to outlying areas and a considerable mileage of line was constructed in eastern Canada and in the then Northwest Territories. In 1918, the total mileage of wire amounted to 11,711 miles. This has been reduced since that date to 11,513 miles, partly by the sale and abandonment of lines in settled areas to private telephone or telegraph companies. In 1928, 2,092½ miles of line were sold to the B. C. Telephone Company. During the period since 1918, the service has continued to be used extensively; lines exist in every province of Canada except Manitoba, and in the Yukon Territory and Newfoundland. In 1942, an income of \$224,468.00 was received from some 474,311 messages. The service has been of immense benefit in outlying areas, particularly to the fur and mining industries, to fisheries, and in the enforcement of law and order. The telegraph lines which followed the coast and the submarine cables leading to adjacent islands, largely to serve lighthouses in peace time, now form a vital network available for defence purposes. A limited telephone service is

also provided. Since 1930, this branch of the Department has been under the direction of F. G. Sims, General Superintendent of Telegraphs.

Under the direction of C. D. Sutherland, Chief Architect, practically all Dominion public buildings across Canada are erected and maintained by the Architect's Branch. This work is well known to the public. Post offices, customs and federal buildings, armouries and military hospitals form part of the list. While Ottawa is justly proud of the Confederation and Justice Buildings, and the National Research Buildings on Sussex Street and the Montreal Road, the list of notable buildings constructed within twenty-five years by the Department, outside Ottawa, includes Postal Station "A" in Toronto, the Post Office in Hamilton and the Federal Building in Winnipeg.

To undertake to describe the major works carried out by the Chief Engineer's Branch of the Department during the past twenty-five years would be impossible in the limited space available, but a few of these works may be mentioned.

Between 1918 and 1926, three graving docks capable of accommodating the largest vessels afloat were completed in Canada. The Champlain dry dock at Lévis, Quebec, had been started in 1911 but the project was ultimately completed in 1921. In 1920, the new Esquimalt graving dock was commenced and carried through to completion in 1926. Both of these works were constructed, and are owned and operated, by the Department of Public Works. In 1923, the Saint John graving dock, constructed on the east coast of Saint John, New Brunswick, was completed by the St. John Dry Dock and Shipbuilding Company under the Dry Dock Subsidies Act. This provided Canada with docks of approximately the same dimensions, with lengths varying from 1150 to 1164 ft. 6 ins., widths varying from 125 to 131 ft. and providing a depth of 40 ft. over the entrance sill, located on each coast and on the St. Lawrence river. At Esquimalt, one of the dry docks operated by the Public Works Department, travelling cranes from five to fifty tons capacity, and a one-hundred ton stationary derrick are provided by the Department to be used by con-

The Champlain dry dock at Lévis, Que.

The new graving dock at Esquimalt, B.C.

tractors on ship repairs, on a rental basis. At Champlain dry dock these facilities must be provided by the contractors.

On the Pacific Coast, extensive development and improvements have been carried out on the Fraser river, which in peace time carries a very great volume of shipping. By the construction of jetties, the protection of banks with rock and extensive dredging, the flow of the river has been concentrated in a fairly direct channel through the sand bars existing between New Westminster and the Gulf of Georgia. The depth of water available for vessels at low water has been increased from sixteen feet in 1918 to twenty-one feet in 1942. Assembly wharves for shipment of lumber were constructed at Nanaimo and Port Alberni, and harbour improvements carried out at Victoria. In the Prairie provinces a large reinforced concrete seed-cleaning plant designed by C. D. Howe and Company was erected at Moose Jaw, and extensive dyking has been carried out on the Assiniboine and Roseau rivers for protection against flooding.

During the years of depression, considerable sums of money were provided for the relief of unemployment, and construction work not customarily undertaken by the Public Works Department was carried out. While the Dominion of Canada, through the Department, assists in the construction of international and interprovincial bridges, it is not customary to construct highway bridges, which come within the jurisdiction of provincial governments. However, in 1932-37, highway bridges were constructed over the Red river at Selkirk, Manitoba, over the South Saskatchewan river at Outlook and over the North Saskatchewan river at Borden, Saskatchewan. These bridges, when completed, were turned over to the provincial governments for maintenance and operation. International bridges were constructed at Edmundston and Clair over the St. John river and at Vanceboro over the St. Croix river in New Brunswick in conjunction with the United States Government. An interprovincial bridge was constructed over the Ottawa river at Hawkesbury. Extensive bank protection and drainage work was also carried out from special funds provided for the relief of unemployment.

In the province of Ontario the construction of rock mound breakwaters and extensive dredging at Port Arthur and Fort William, the construction of a terminal elevator

at Prescott, harbour improvements at Toronto, and the construction of Burlington bridge, were major works carried out. Harbour developments which should also be mentioned in the province of Ontario are those at Midland, Collingwood, Goderich, Windsor, Leamington, Port Stanley and Hamilton.

In Quebec, the construction of Fryer's Island dam in connection with improvements on the Richelieu river, the construction of Queen's wharf at Quebec, and harbour developments at Sorel, Matane and Rimouski, together with the construction of piers at Havre St. Pierre and Baie Comeau, may be mentioned.

In the maritime provinces, terminals have been built for the Wood Islands-Caribou ferry between Prince Edward Island and Nova Scotia, and harbour developments at Pictou and Brooklyn. Much of the development of Courtenay bay and St. John harbour was also carried out by this Department before being taken over by the National Harbours Board.

Changes have occurred during the last quarter of a century in the kinds of material used in the construction of wharves, breakwaters, etc. While timber, rock and concrete are used most extensively, the treatment of timber with creosote as protection against sea-borers—the teredo and the limnoria—has come into very wide use, as well as the treatment of superstructures for preservation against decay. Previous to 1920, little treated material had been used, although some treated southern pine had been imported from the United States. At that time, the Canada Creosoting Company had plants at Trenton, at Transcona in Manitoba, and had just completed one at North Vancouver. In the early twenties, however, a number of plants for the creosoting of timber were constructed across Canada, and the use of creosoted B. C. fir, pine and hardwood has continually increased until, at the present time, creosoted material is used in practically all timber structures built along the coast. Creosoting timber for protection from sea worms is invaluable, and the treatment of timber superstructures, where used, against decay is becoming more and more common.

About 1930, the use of steel sheet piling for wharf construction was introduced in Canada through an agency of the British Steel Piling Company, Limited, of England, and a number of structures were built of Larssen piling. In 1934, the Algoma Steel Company commenced the manufacture of steel sheet piling and subsequently numerous wharves were constructed of this material, particularly on the east coast and the Great Lakes. On the west coast, where large sizes of timber and long lengths of piling have been plentiful, pile wharves have been adhered to almost entirely. Due to the prevalence of teredo, creosoting of piles is very necessary on this coast. Practically no cribwork or steel sheet pile work has been used in British Columbia. Since the outbreak of war in 1939, little steel sheet piling has been available for use in Canada, due to the requirements for steel in war industries. Lack of steel has also reduced the quantity of reinforced concrete used.

In 1918, the Department owned and operated a very considerable dredging fleet employed on both the Atlantic and Pacific coasts, the Great Lakes and in the interior waters of the Prairie provinces and British Columbia. Subsequent to 1918 a great portion of this fleet was disposed of and more dredging has been carried out by private contract. A part of the fleet of dredges is still maintained and operated by the Department, affording valuable information as to the actual cost of dredging, which serves as a check on contract rates.

Supervision of the construction of private structures, insofar as they may interfere with navigation, is controlled by the Department through the operation of the Navigable Waters Protection Act, which requires the approval of the Governor General in Council for any structures built in or on a navigable waterway. On the submission of the plan

ENGINEERS IN THE CONSTRUCTION INDUSTRY

J. B. STIRLING, M.E.I.C.

*Vice-President, E. G. M. Cape and Company, Contractors, Montreal,
President, Canadian Construction Association*

It will be remembered that, before the last war, most of the engineers engaged in or by the construction industry were then employed as field engineers or instrument men. Even these were few in number. The professional engineers, architects, engineers of public works, railway district or resident engineers, besides making the designs, did practically all their own layout work, and only rarely did the construction forces carry engineers on their staffs.

At that time, university courses in engineering had not long been established, and the numbers of engineering graduates in the country were small, but nevertheless, despite the fact that a considerable amount of engineering construction had been carried out in recent years, the engineer had not yet demonstrated to the construction industry that there was a wide field of usefulness for him in the construction organization. Moreover, the engineer or architect, whether employed by the government or by a private client, had not made the demands upon the construction industry that are now made in relation to the industry's responsibility for quality, correctness and records of work—demands which, to be met, required the employment of engineers.

During those pre-war years there was, however, an interesting development. A few engineers who had been employed on construction—chiefly on supervision—decided to enter the construction field themselves. Some of these men, possessing the proper balance between technical skill and the commercial instinct, and being endowed with the necessary resourcefulness, integrity, optimism and perseverance, combined with robust health, made an unqualified success of their ventures. They earned the respect and confidence of their fellow-engineers who were engaged in strictly professional work, and had to supervise the execution of their contracts. Others, unfortunately in the majority, found the going not to their liking, and returned to activities to which their talents were better adapted.

Thus it is seen that in the first decade of this century the engineer's place in the construction industry was a comparatively unimportant one. To-day it can be said that the industry is dominated by engineers—that is, the engineer, with few exceptions again, is actually the owner or operating head of the majority of construction companies carrying out the important projects throughout the country. In the membership lists of The Engineering Institute of Canada and of the Canadian Construction Association there are many names common to both; their number is increasing yearly. Such membership in The Engineering Institute is, moreover, not confined to the principals of such construction companies, but is held also by other categories of contractors' personnel, such as superintendents, field engineers and draughtsmen. In some of the larger companies, encouragement has been given—and will be given more freely in the

Grain storage elevators and flour mill on the Welland Canal, near Port Colborne, Ont.

future—to the employment of younger engineers as foremen, timekeepers or material checkers, for the mutual advantage of both the company and the man concerned. There are to-day some very excellent superintendents who as young engineers were far sighted enough to forget, temporarily at least, the “professional” attitude, and give a few years to learning the construction business at first hand.

This successful invasion of the construction industry by engineers has followed the considerable changes which have occurred not only in that industry, but also in industry at large. Some of the changes in the construction industry may be mentioned here:

1. Construction has become much more competitive. In proportion to the amount of work offered, there has been a notable increase in the number of construction companies and individuals engaged in the business. This severe competition has resulted in very low profits, and there is, without question, a greater “casualty list” in that business than in most others. To survive, the contractor must bring to his tendering and operation of work the best skill and judgment that he can obtain.

2. New construction methods demand, for their proper execution, personnel which understands the reason for and the importance of doing work in the manner planned and specified.

3. Engineers in charge of the design and supervision of projects have a somewhat changed attitude towards the execution of the work. To-day it is fairly common practice, for example, to give a contractor a bench mark and a base line, after which, in many cases, the balance of the engineering work on the project is the contractor's job, if not responsibility. This work is of course subject to the supervising engineer's checking, which, if the contractor has the engineer's confidence, is not very elaborate. This procedure extends to other features in the work, so that in the main the resident engineer's duties, apart from his usual duties as supervisor, have become largely a matter of checking the figures of the contractor's engineer as far as actual “instrument work” is concerned. In general, this manner of carrying out work is working out well, and while it means at times a sizeable engineering staff in the contractor's organization, the results in the end appear to be satisfactory to both the supervising engineers and to the contractors.

4. Construction on many projects has, for reasons best known to owners, been commenced prior to the completion of plans and specifications. Thus, it frequently becomes necessary for owners and their supervising engineers to discuss details of the proposed work with the contractors—details of methods, sequences, schedules, etc. Sometimes, alternative methods must be planned and the benefit of the

LUMBER INDUSTRY

W. J. LECLAIR, M.E.I.C., M.C.S.F.E.
Secretary-manager, Canadian Lumbermen's Association, Ottawa.

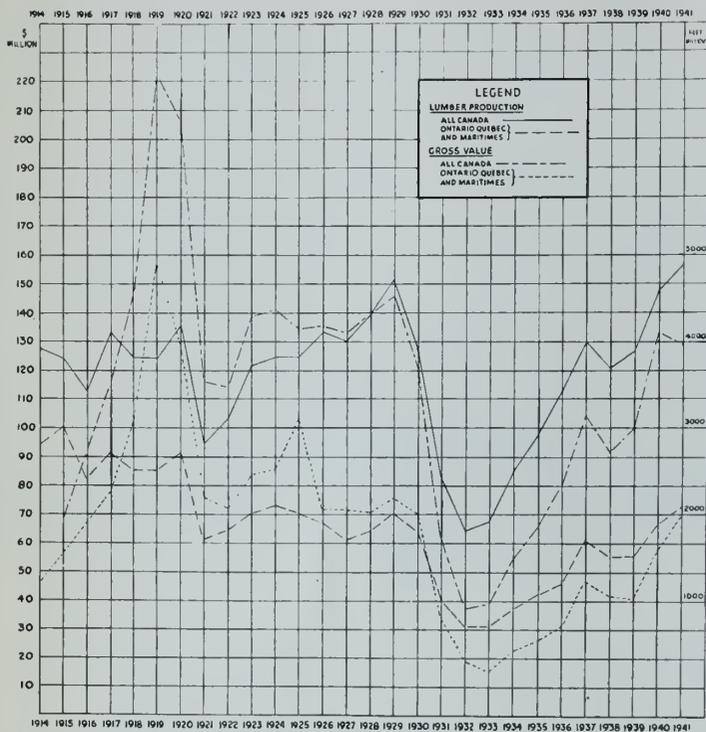

Fig. 1—Trends in the lumber industry during the past quarter century.

The Canadian lumber industry welcomes this opportunity of assisting in the marking of a very important anniversary to the engineering profession in Canada. It is peculiarly fitting that lumbering should do so because, traditionally, engineering and lumbering have had much in common and, economically, they are mutually dependent. Wood probably was the first material of construction. References are made in Babylonian lore to its use over 4,000 years ago, and we are all familiar with the Scriptural record of its prominence in the construction of Solomon's temple. Among the respected "Fathers of Engineering," none hold more eminent place than the millwrights Rennie and Telford. In Canada, from earliest times the lumber industry has availed itself of the services of the surveyor and engineer and, in turn, engineering has accepted many thousands of miles of highway locations originally chosen by lumbermen as forest trails and logging roads. The earnings of early Canadian lumbermen provided the capital nucleus for a great part of our railway construction, our hydro-electric development and our more recent pulp and paper and plywood manufacture. With the imminent development of the field of plastics, lumbering already is being most prominently identified.

ENGINEERING IN LUMBERING

From the engineering interest point of view, the past twenty-five years have shown a steady development in mechanization in lumbering. From very necessity, brought about by the large size of trees in British Columbia, a high degree of mechanization was early introduced on the West Coast. In the East, however, the traditional methods of logging were continued until about coincident with the general financial collapse of 1929. In the year 1928, the author strongly urged in an address in Montreal the building of truck roads in logging operations and the greater use of the truck. Such ideas, even at that time, were decidedly novel. Now good truck roads are the order of the day and

the use of trucks is considered indispensable in logging operations if one is to judge from demands for priorities for automotive equipment and tires.

The construction of conservation dams on many of our large rivers and the resultant development of comparatively large artificial lakes introduced new problems in the transportation of logs. Diesel-powered towing equipment has obtained fairly general use. The old steam-powered paddle-wheel alligator or winch-boat is still in evidence in some places, but it has been largely replaced by designs equipped with screw propeller, and specially designed Diesel tugs are in general evidence. Log chutes through power dams and fish ladders on log-driving dams are further recent developments. The floating of square timber in cribs and rafts was practically discontinued before the advent of the quarter century with which we are dealing and it is now only a matter of fond memory. The British Admiralty, with characteristic immutability, still places an occasional order for "Waney Pine," but delivery to shipside is now made by rail.

WARTIME LUMBER DEMANDS

It can be stated quite conservatively that the Canadian lumber industry has been a very material factor in the survival of democracy in the present titanic struggle with the Axis powers. Britain was always a large wood-consuming country. She produced comparatively little lumber herself and depended on imports as indicated in Table I.

Europe was the principal source of her supply, with Canada and the United States materially contributing. The outbreak of war cut off supplies from Europe completely and the enforcement of U.S.A. neutrality legislation prevented the entry of U.S.A. shipping into the war zone. In consequence, Canada became immediately Britain's principal source of timber. Coincidentally, Canada's own tremendous development of a war industry and her assumption of responsibility for the training of Empire airmen, in addition to provision for the immediate establishment of large Canadian naval, army and air forces, made quite unprecedented demands upon her lumber supplies.

A veritable miracle of assembly and delivery of lumber was achieved in Canada during the first two years of war. The succeeding production effort was only slightly less miraculous when one considers the handicaps of depleted manpower, the anaesthetizing effects of price fixing and excess profits confiscation by Government. The lumber trade had been particularly hard hit by the depression which preceded the war, and the fixing of a standard profit on the basis of a four-year depression period worked real

hardship and may work ultimate injustice. The competition of Government contractors and munitions industries for labour has resulted in greatly advanced wage scales to the accompaniment of decreased individual worker efficiency due to the replacement of young, physically fit and experienced men with older and inexperienced men and women. Actually, the trade attained an all-time high last year in the matter of production despite handicaps.

Engineers generally are thoroughly familiar with the great quantities of lumber which have gone into construction. They may not be as acquainted with the importance of lumber in equally essential fields. Of most spectacular interest is the tendency to an ever increased production of wooden aeroplanes. The record breaking Mosquito bomber is an all-wood plane and the new Anson construction programme is predicated on practically all-wood construction. As a result of this development in aerial warfare, three Canadian lumber species have attained pre-eminence. Yellow birch veneer and straight-grained lumber have become items of supreme importance and, to ensure their supply, a Crown company known as Veneer Log Supply Limited under the presidency of S. J. Staniforth has been set up with headquarters in Montreal. A similar Government agency known as Aero Timber Products Limited has been set up to handle the production and collection of Sitka spruce. A third development is still in comparative infancy—red pine lumber and veneer is about to replace an imported species.

The construction of wooden ships is attaining ever greater prominence with the famous *Fairmile* and the motor torpedo boat (M.T.B.) claiming most publicity. The outbreak of war saw a share of army motor transport bodies made of wood and later there was a deflection to steel. Now all such bodies in Canadian and U.S.A. production are made of wood and, to meet the abnormal requirements, greatly altered specifications have been adopted by the authorities.

ECONOMIC TRENDS

A study of the curves in Fig. 1 tells the story of lumber production in Canada during the past quarter century. It is interesting to note that there was a much smaller extra

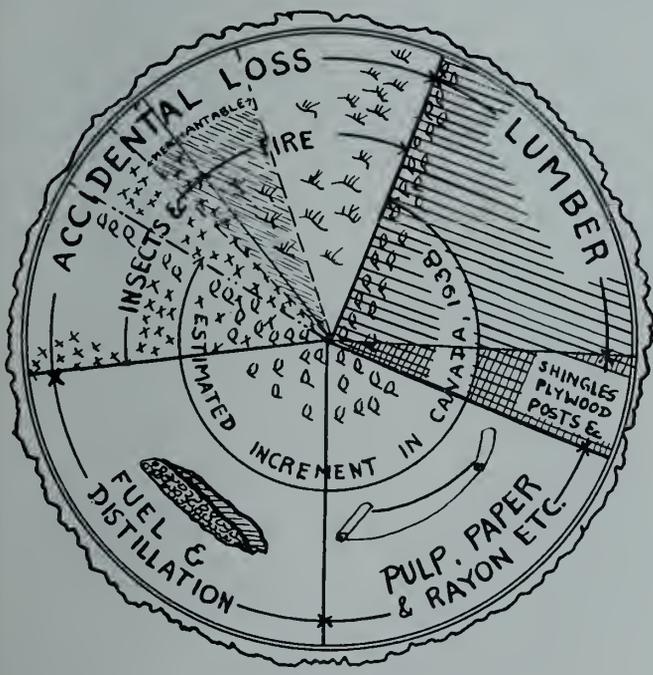

Fig. 2

demand for lumber in World War I than in World War II. Equally interesting is the fact that lumber values did not start to climb until the first war was almost over and reached final dizzy heights only a year after it was over. Economists will no doubt draw comfort from the fact that these statistics prove conclusively that inflation has been prevented insofar as the lumber trade is concerned.
