It is otherwise with the American continent, however, where in Canada, and particularly in the West Indies, our resources are considerable. Of the Eastern Canadian fields, in New Brunswick, Quebec, and Ontario, the latter is the most important oil-producing centre. Here the fields are located on what is known as the Cincinnati anticline, a fold extending northwards from Tennessee through Western Ohio to the Province of Ontario, and on which in the States some of the richest oilfields of Ohio and Indiana are situated. The most important fields in the Province are those of Petrolia and Oil Springs in Lambton County, where oil occurs in the Onondaga Limestone series of Devonian age. It is accompanied by large quantities of natural gas, of which the most productive is the Essex-Kent field. In New-Brunswick a great deal of boring has been carried out for oil and gas which has only met with indifferent results, though the oil, when met with, has been found to be of a high grade. The fluctuations in output are largely due to the selection of poor sites for boring, and to lack of penetration to sufficient depth. The exploitation of oil in this province is an example of the dangers attending promiscuous boring for petroleum without regard for anything more than doubtful surface indications. In Albert County, oilshale deposits have been investigated which have yielded up to fifty gallons of oil per ton on distillation: these deposits have been surveyed in several areas within this region, with promising results. In Quebec, on the other hand, the results of exploration have proved unsatisfactory, both for oil and gas. One field (that of Gaspé) has yielded oil, but only in small amount, and the possibility of extensive supply is remote. The "Geological Survey" definitely advised against any further drilling within the province (1915), though this opinion has not met with general credence. In Nova Scotia, Prince Edward Island, and Newfoundland, bituminous shale deposits occur which have of late received attention; those of Nova Scotia are said to be as important as those of Scotland, and richer in hydrocarbon content. The Western Canadian fields embrace certain regions in the Yukon and Northwest Territories, Alberta, Manitoba, Saskatchewan, and British Columbia, of which the Province of Alberta and the Mackenzie Territory seem to offer the best chances of future success. Prospecting in these areas has in the past been rather of a speculative nature, but with the increased data to hand furnished by the admirable work of the Canadian Geological Surveys, coupled with the experience already gained from some of the more promising ventures, future operations should meet with a considerable amount of success.

The oil potentialities of the West Indies have long been regarded as favourable, and of the five islands which have recently received attention in this respect, Trinidad and Barbados have both justified the initial work carried out. The Barbados petroleum deposits are much less important than those of Trinidad at the

present juncture; they are mainly confined to the Scotland region of the island, where the oil is associated with Miocene sandstone and shale. The curious desiccated tar product "Manjak" occurs here, which has been mined considerably in the past. The Trinidad oilfields have been much more systematically developed than those of Barbados, and operations are proceeding on an ever-increasing scale. Petroleum indications are mostly confined to the southern part of the island, where the well-known fields of Tabaquite, Guayaguayare, and Barrackpore, yielding very high-grade products, are located. A great deal of prospecting yet remains to be carried out before all the resources of this island are tapped, and, with the increased facilities of transport and the installation of further pipeline systems, rapid development may confidently be expected.

There remain for our consideration the countries of New Zealand and Australia. In New Zealand there are three principal districts from which oil seepages have been known, the most important being that of Moturoa, near New Plymouth, in North Island. From this source small quantities of oil have been obtained intermittently, while the other two fields at Waitangi Hill and Kotuku are at present insignificant, and some doubt exists as to whether these localities will ever yield a commercial supply. The oil shales of the Orepuki region are generally known, but attempts to work them profitably have so far proved abortive. Borings near Greymouth, on the west coast of South Island, have met with little success, though the area between this and Brunnei inland will probably pay further prospecting. In Australia oil has been reported from many places on many occasions, but so far no results of commercial importance have been forthcoming. Dr. Wade has investigated certain supposed oil-bearing areas in South Australia, but concluded that the prospects were not encouraging. West Australia and Victoria have shown small oil seepages in several parts, but nothing has been discovered which would warrant extensive prospecting. In New South Wales, Queensland, and Tasmania, there are oil-shale deposits which have been worked on a large scale, and it must be admitted that the petroleum prospects of the continent, as a whole, seem to be largely centred in these occurrences.

This brings our brief survey of the British and Colonial oil resources to a close. It is significant, at all events from a geophysical point of view, that our most productive fields (and, at the same time, those which offer the best possibilities of successful development in the future) are confined to the zone between latitudes 0 deg., and 30 deg. N.; and from what has already been said, it will be apparent that to the West Indies, India, and possibly the East Indies, we have to look for future resources. While we may not hope to discover fields of anything like the magnitude of those of the United States, there are at least equal chances that our own fields, and others as yet unknown, will yield to the prospector supplies of oil which, together with that obtainable from extraneous sources, would be sufficient to carry us through for many a long year. We must not forget that there are enormous possibilities of development in other parts of the world—such as Mexico, the Gulf States, South America (particularly on the north coast), Russia, and possibly Japan. The ultimate location of a productive field in any one of these regions would be quite sufficient to postpone a critical situation, if such were likely to arise. Each new well drilled, each new area sur-

veyed, providing the essential principles of the science be kept in view throughout, brings the chance of further supply nearer. And each addition to the world's market must tend to alleviate any suggestion of famine that may be made. At present there is no oil famine, and in the writer's opinion there is not likely to be one for several generations. Every day, almost, a new wonder is proclaimed from the realms of experimental science, and synthetical productions are ever taking the place of natural resources. The question of substitutes for petroleum as a fuel is engaging the attention of experts all the world over, and if past success is any indication of the future, we cannot justifiably regard the prospects of their work other than with complete optimism. Economy in use of existing supplies, careful prospecting on scientific lines, greater development of the world's oil-shale deposits, and the use of substitutes for petroleum wherever possible, are arguments which collectively must tell in the long-run. We have not yet exhausted Nature's resources of coal, water, or oil; we may not see a generation's supply ahead, but that does not prevent us from continuing the search.

**Coal Prices**

Toronto, Aug. 25.—Very little coal is coming through, although dealers report a keen demand for steam-sized coal in the Eastern States. Prices remain unchanged from those of last week, namely mine run, \$14.25 to \$14.50 f.o.b Toronto; smokeless coal, \$14.50 to \$15.00; hard coal \$8.00 to \$11.50 gross tons at mines, American funds.

Toronto, Sept. 2.—Stocks of coal are low and, according to the dealers here no one wants to buy any coal in the present unsettled state of the market. The Great Lake district and the New England States are getting most of the coal and very little is coming through Ontario points. According to dealers there is practically no market for coal and last week's quotations prevail with an additional 75 cents on bituminous and \$1.25 on hard coal, due to the increased freight rates.

The advance in railway rates will cause an increase of \$1.10 per ton in the delivered price of anthracite at Winnipeg after 1st September. This will make the retail cost of anthracite \$22.60 per ton.

In Montreal dealers report inability to obtain consignments of coal from the bituminous mines at less than \$10.50 per gross ton, American funds. Freight rates, as increased September first, add an additional \$5.25 per ton. Bituminous coal is selling at \$18.00 per ton delivered in cellars in Montreal. Anthracite is selling at the same price.

**SECOND ANNUAL WESTERN MEETING OF THE CANADIAN INSTITUTE OF MINING AND METALLURGY.**

**Winnipeg, October 25th, 2th and 627th.**

The Second Annual Western Meeting of the C. I. M. & M. is to be held at the Hotel Fort Garry, Winnipeg, on October 25th, 26th and 27th.

The Secretary of the Local Committee is Mr. W. W. Berridge, and all members who desire hotel accomodation are requested to let Mr. Berridge know at once.

It is understood the Local Committee has succeeded in interesting local bodies and enterprises to a very considerable extent in the forthcoming meeting.

So far only a sketch of the programme is possible, but it is understood the Institute will be the guests of

the Manitoba Government, the City of Winnipeg and the Winnipeg Board of Trade at luncheons on the three days of the meeting. Special attention is to be paid in the papers to the coal trade in the West and the possibilities of an iron and steel industry in Western Canada.

**TORONTO MINING STOCKS.**

Toronto, Sept. 2.—The mining market during the past week has been dull with practically no speculating buying going on. The ups and downs of the market were caused by investment orders but generally speaking the market declined somewhat although not to any great extent. Silver reached 99 1-4 and this brought in a small selling of some stocks. Nipissing Consolidated was strong from 9.75 to 10.75, due to a declaration of a five per cent. bonus. It was also stated that Nipissing had acquired some oil properties and it remains to be seen what effect this will have on the stock. In many cases shareholders do not like to see the companies going out of their regular lines.

Following are the average quotations for gold, silver and miscellaneous stocks on the Standard Stock Exchange, Toronto, for week ending August 28th, 1920.

	High	Low	Last

### ASBESTOS FIBRE OF CANADIAN ORIGIN SUPPLIED TO JAPAN BY UNITED STATES EXPORTERS.

At the recent meeting of the Canadian Manufacturers' Association held in Vancouver, Mr. A. E. Bryan, Canadian Trade Commissioner, had prepared for presentation to the delegates a comprehensive account of possible trade openings for Canadian goods in Japan, but owing to lack of time Mr. Bryan was unable to deliver his remarks in full.

With regard to asbestos, after detailing the figures of United States' exports of asbestos fibre to Japan, Mr. Bryan said:

Where do you suppose the United States is getting all the asbestos she sells to Japan? Canada prides herself on the assertion that she supplies 85 per cent of the total world's output. From investigations made I find that nearly all this asbestos is purchased from brokers in New York. That is, American firms are handling the sales of our natural products, and are thus taking the cream of the profits for themselves. Gentlemen, it is time we became a little more independent of our southern neighbours. Let us be up and doing! We should handle our own natural products from the time that it is taken from its natural state until it is landed in the various foreign markets of the world. We must have our own export houses, good substantial firms with their own branches in all overseas countries where our goods can be sold. These offices must be manned by good live Canadians who are full of pep and tenacity and who will push their lines against keen competitors. Why should we be dependent on foreign commission houses for the sale of our products abroad? Just before coming away I wrote to seventeen of the largest users of asbestos in Japan. As a result of enquiries made, I found out that in nearly every case they were buying "American Asbestos"—they did not realise that what they were using originated in Canada. But in nearly every case they asked me to have Canadian shippers write to them sending prices and samples. They were all keen to buy from Canada direct.

This asbestos is used in Japan for making all kinds of asbestos products—slates, shingles, corrugated plates, yarns, clothes, packing, jointings, rope, in fact just about everything in the asbestos line. There is a fair demand for imported manufactures, such as mill-board, cement, etc., but by far the greatest market is for fibre.

The Government encourages this industry, and is encourages almost all industries in Japan. No asbestos goods of foreign manufacture can be sold to Government factories, arsenals, shipyards, railways, etc., which are of course the largest users. They always specify home manufactured goods.

### OIL IN MACKENZIE RIVER BASIN.

The discovery of oil at Fort Norman is considered to be an event of importance. The oil is said to be of good quality and the significant feature of the discovery is that there are hundreds of square miles of the country in which the oil formation occurs. Mr. Chas. Camsell, Deputy Minister of Mines, regards the discovery as one of the most notable events in recent mineral exploration work. Mr. Camsell knows the country well and he is well pleased to learn that its resources are being explored with such good results.

### BELCHER ISLAND IRON ORES.

In the Engineering and Mining Journal August 28 number, Mr. E. S. Moore, who examined iron ore deposits of Belcher Islands in 1916 says that: "The maximum thickness of the iron formation is 275 feet, but the great bulk of the formation is hard, highly siliceous jasper with bands of slate or greywacke, the whole averaging less than 30 per cent. iron. One band 35 feet thick, measured in the best portion of the formation and carefully sampled, averaged 30.1 per cent. iron, with 37.97 per cent. silica, 0.039 per cent. phosphorous, and a trace of sulphur. There are considerable bodies of this low grade material close to tidewater. The highest grade sample taken and analyzed ran 50.7 per cent. iron..... There has been much discussion as to whether the iron deposits of the Belchers are of economic value. It is my opinion that they are so lean, and the climate conditions are so unfavorable, that they cannot be worked at present. Electric smelting, with power developed on the falls on the numerous rivers entering the east coast of Hudson Bay might be employed, but even then the conditions do not seem promising."

Some of those who have examined the Belcher Island iron ore deposits during the past few years, are much more favorably impressed with them than Dr. Moore. No report of the recent examinations is, however, available for publication.—R.E.H.

### SALT MINING AT MALAGASH, NOVA SCOTIA.

Mr. Cavanagh, who is in charge of the unique Canadian rock-salt mine at Malagash, Nova Scotia, recently passed through Montreal. He states that the product of the mine is finding a wide distribution, and is well spoken of by all users. The deposit, which pitches vertically, has an undetermined width, but drilling has disclosed that it is at least over 300 feet. The centre of the vein contains salt of great whiteness and excellent quality.

The potash-bearing streak which was noticed at a point not distant from the surface showed evident signs of leaching by surface waters and replacement by earthy substances, but there is much reason to hope that when a point is reached in the vein, that has not been subjected to surface conditions, potash may be found in greater purity of concentration.

The discovery of this salt deposit was accidental, having occurred through the sinking of a well for water. It promises to prove of great economic importance in Nova Scotia. About twenty tons of salt daily is now being produced, and is finding a ready market.

### TORONTO NOTES.

The appointment of a Commission to enquire into the administration of the provincial mining resources of Ontario, which was announced some time ago, has not yet been made. It is thought that the enquiry will not commence until the timber probe is over. Judges Riddell and Latchford will probably have charge of it.

The Height of Land Mining Syndicate, Limited, has been granted incorporation by Ontario letters patent. The syndicate is empowered to engage in a general mining business and carries a capitalization of fifty thousand dollars. The head office is in Toronto and the following are the provisional directors: John Callahan, Frank Regan, Edward Murphy, Glen Sullivan and Loretto Dugan.

## Northern Ontario Letter

### THE GOLD MINES

#### The Porcupine District

While no official confirmation has been given by the management of the Hollinger Mine of the report that a diamond drill has shown the presence of gold-bearing ore at a depth of 2,500 feet, evidence is accumulating that the Porcupine gold-bearing rocks are very deep, and that operations up to the present time can only be regarded as preliminary development. Favorable reports regarding the extent of the Hollinger deposit justify optimism regarding other mines in that area, namely the McIntyre Porcupine, the Dome Mines, Porcupine V. N. T., North Crown and Schumacher.

In producing upwards of 37 million dollars, the Hollinger mine has only been extensively developed to a depth of 425 feet. From that depth to the 800 ft. level a moderate amount of development has been done, while the 800 ft. level to the deepest workings at a depth of 1,250 feet only a very limited amount of work has been done. As a result of the work so far done, nearly eighty million dollars in gold has been brought into sight, the reserves now being upwards of forty million. From these facts, and taking into account the likelihood of these enormous bodies extending to great depth, perhaps deeper than it may be found possible to mine, the size of the Hollinger Consolidated mine stirs the imagination.

On the McIntyre-Porcupine which is carrying on the greater part of its operations at its lower levels, ranging from 800 to 1,375 feet in depth, gold values have actually been found to increase, and is another factor which adds to the potentialities of the future of all other producing mines in this field. With such official data forming the basis of calculation, the most conservative mining men are found to be numbered among these who believe the Porcupine field, together with the other gold-bearing sections of Northern Ontario is destined to be a close rival of the world-renowned Rand, of South Africa.

The plan outlined a few weeks ago in these columns, relative to the exploration of a large number of mining claims situated in the township of Mountjoy, and lying just a short distance west from the Hollinger mine, is progressing satisfactorily, and the work in progress. This is perhaps the most interesting exploration scheme under way at the present time in the Porcupine gold area. The work is financed by English interests, and is being supervised by Ernest Loring, of Haileybury. Two diamond-drilling machines have been engaged and are in operation. The area to be explored is made up entirely of level country, commonly referred to as sand plains. The bedrock lies considerable distance below the surface, and the present scheme is to determine the nature of the rock formation and to also explore for possible deposits of ore. Already some favorable information has been secured, the first hole having entered a formation of porphyry and schist, showing resemblance to the formation of the producing area of Porcupine. The work is being done on the theory that the gold-bearing formations of Porcupine extend farther west than the territory being developed in the proven area.

#### The Kirkland Lake District.

The producing mines of the Kirkland Lake district are increasing their output. This includes the Lake

Shore, Kirkland Lake Gold and the Teck-Hughes. In the meantime, the Wright-Hargreaves is making rapid progress in the work of installing its big new mill, while the Tough-Oakes is also likely to join the producing list before the end of the current year.

The Lake Shore production is now running at the rate of close to \$17,000 every twenty-four hours, and is treating an average of sixty tons of ore daily. Mill heads have recently averaged around \$28 to the ton, and the mine is easily maintaining the right to lay claims to being the highest-grade producing gold-mine in Canada.

Development work on the 200 ft. level of the Argonaut Gold Mines has been sufficiently favorable as to encourage the operators to decide to continue the work to a depth of 500 feet. This work will be commenced at once. It is learned that provided this work proves to be as satisfactory as in that section now developed, the company will be prepared to instal a large mill. The plan followed heretofore has been to operate the small test mill now on the property and in this way test the ore coming from development work as well as produce sufficient gold to offset the cost of current work.

On the Wood-Kirkland property, in the township of Lebel, work is going ahead at a satisfactory rate. The first test pit has reached a depth of 25 feet, and the mineralization is said to continue heavy. A small steam plant is being taken in, and will furnish power for operations pending the installation of a large mining plant.

At the Bidgood property the main shaft is down 300 feet and crosscutting toward the main vein is underway at that point. A large amount of crosscutting and drifting will be carried on at this level.

#### The Outlying Fields

According to official advice, the Lightning River Gold Mines will soon issue a report on its property situated in the township of Egan, lying to the west of the Porcupine district. The report will also deal with the water power which this company owns.

The final cash payment for the Murray-Mogridge property is due but at the time of writing it has been announced whether or not it will be made. Rumors have been current that an extension might be requested, while it is understood the vendors are not prepared to grant such an extension. It is believed, however, in view of the fact that a large amount of stock has been sold, that the purchasers will find some way of arranging for the payment or for a compromise.

The Sesekinika Lake Mining Syndicate has been organized for the purpose of exploring and developing a large number of mining claims situated in the Sesekinika Lake and Bourke's gold areas. Eight of these claims are located on an island in Sesekinika Lake, while eight are situated at the corner of the three townships, Benoit, Melba and Maisonville. Camps are to be erected on both groups, a force of men already being on the ground.

### THE SILVER MINES

#### The Cobalt Field

Much added prosperity comes to the silver producing mines of Northern Ontario as a result of the higher price of silver as shown during the past week or so. It is obvious that the higher quotations are due to purchases under the Pittman Act completely absorbing

the output of the United States, and that not only does this relieve the market of the American output, but makes it necessary for the parts of the United States to go into the already depleted world market for requirements.

The present price of close to a dollar an ounce compares with a low of 80 cents an ounce on June 18th and an average of only 90.95 for the whole of June.

At the time of writing, the mines of Cobalt are able to market their silver at around a dollar an ounce in New York, and receive the benefit of a premium of about 12 per cent. on New York funds. Thus, in a market which offers about \$1.12 an ounce to these Canadian producers, the hoarding which has gone on for several months appears to have been justified.

While the hoarding commenced at a time when silver had declined to around \$1.25 an ounce from a high of \$1.37, the slump was so rapid as to make it quite difficult to market silver, and in all probability had the product of the mines been sold "at market", the value received would not have exceeded that of the present.

In this connection, leading producing mines like the Nipissing are now in a position to work off their hoarded supply of the white metal on a market stabilized by steady demand, and it is believed the present strong market will be of long duration, with not a little likelihood of another upward move.

Continued favorable developments are reported on the Lumsden property, an encouraging amount of high grade ore having recently been opened up. It is perhaps too early to estimate the likelihood of steady production but developments hold out promise of such being achieved.

Arrangements have been made to diamond drill the the Crown Reserve mine for the purpose of securing detailed data relative to the diabase sill on the property. A contract for 5,000 feet of drilling has been let, and it is understood this work will be commenced very shortly, the drilling to be carried in from the fifth level.

A uniform output is reported from the McKinley-Darrah, from 55,000 to 60,000 ounces of silver being produced every thirty days. While costs have advanced several points above the average for last year, the recent increase in the price of silver removes the danger of net profits falling below dividend requirements at the present rate of 3 per cent. quarterly.

On the Beaver Consolidated, as well as the Temiskaming mine, it is learned the present rate of output is quite satisfactory. As regards the Temiskaming Mining Company, a matter of considerable importance has to be dealt with at a very early date. It has to do with the proposal by the company's president, J. P. Bickell, that the Temiskaming Mining Company join the McIntyre-Porcupine Mines in taking over important coal lands in Alberta. The proposal is believed likely to receive favorable consideration due to the possibility of the plan offering an opportunity for the Temiskaming to use its treasury surplus of approximately a million dollars. As regards this, of course, opinion among the shareholders is so far divided, some of those vitally involved believing it would be the better part of wisdom to reward the shareholders by at least a moderate rate of dividend disbursements, rather than entering too extensively

into the coal business. However, until such time as a full report is available, outlining the proposed scheme in detail with estimates of expenditure, etc., it will not be possible to weigh the merit or de-merit of criticism or commendation so far offered.

### The Gowganda District

Mining enterprise in the Gowganda field still suffers from quite unsatisfactory transportation facilities. The Canadian Light Railway Company does not appear to be certain of carrying its proposed construction scheme through, although in the mean time the Ontario Government, following a hasty decision, discontinued the construction of a macadam road. The present uncertainty surround the projected light narrow-gauge railway seems to justify the very pointed criticism which has been directed at the Ontario Government in connection with its lack of intelligent action in regard to the Gowganda transportation problem.

A scheme is on foot to finance the construction of a power plant at Indian Chutes on the Montreal River. The project is being promoted by Hugh Sutherland, of the brokerage firm of F. C. Sutherland & Company of Toronto. A recent meeting was held, at which were Sutcliffe and Neelands, surveyors who are interested in the ownership as well as being engineers engaged in laying out the development scheme, as well as Hugh Sutherland.

From available information, while the financing of the scheme is still more or less uncertain, there are at least fair prospects of all arrangements being ultimately successfully made. It is believed the Gowganda field as well as Fort Matachewan would furnish a demand for the full 5,000 h.p., which the engineers estimate could be developed.

### SILICA PRODUCTS COMPANY TO OPERATE IN CAPE BRETON ISLAND.

For some years a proposal has been mooted to develop the large areas of silica rock which exist in the neighbourhood of Orangedale and Whycomagh, Cape Breton Island, and it is understood that Canadian letters of incorporation are being sought for a company to be known as the Empire Silica Company. The promoter of the enterprise is Major Burton of New York who is said to have associated with him a number of reputable United States capitalists.

The new company proposes to employ in full operation some one thousand workmen, and contemplates the manufacture of firebrick, cement and lime products.

### Railway Branch Suggested for Frontenac Co. Felspar Mines, Ontario

A proposal is mooted to extend the Canadian National Railway from Westport, Ont. into the township of Bedford, Frontenac County, for the benefit of the felspar mines.

Beer, Sondheimer & Co., Inc., has taken legal steps to change the name of the firm to "International Minerals and Metals Corporation. The circular announcing this change states: "The active business management of the corporation and its relationship to its affiliated and subsidiary companies has in no way been affected and will continue as heretofore."

## DOMINION STEEL CORPORATION CREATES OFFICE OF SUPERINTENDENT OF INDUSTRIAL RELATIONS.

The Dominion Steel Corporation have appointed Mr. Angus W. Macdonald as Superintendent of Industrial Relations, having charge of the work of this department as it effects all the operations of the Corporation in Cape Breton, Springhill, Newfoundland and other points.

Mr. A. W. Macdonald has had a unique training for this responsible position. He has been continuously in the service of the Dominion companies since the formation of the Coal Company in 1893, having previously worked for the predecessors of the Dominion Coal Company. Since 1900, with an interval during which he was Superintendent of the Black Diamond Coal Company at Lethbridge, Alt., Mr. Macdonald has been the Employment Agent of the Dominion companies, and has been required to visit Europe on several occasions in connection with the recruiting of labor.

The new department will have three divisions, namely, the work of employment, employees service and safety and first aid work.

The employment division will be charged with the development of sources of labor supply, the selection and placing of workmen, and supervision of the "turnover" of labor, with a view to retaining every employee possible and reducing discharges and notices to quit to a minimum.

A. W. MACDONALD,  
Supt. of Industrial Relations, Dominion Steel Corporation.

The employees' service division will have charge of housing plans, sick benefit and pension schemes and general social welfare of employees. The plans of this division contemplate district nurses, hospitals, garden plots, Company's farm, employees' clubs, athletic, musical and dramatic societies, employees magazine, boarding camps, cafeterias, restaurants and the accomodation for single-men boarders.

The safety first division will endeavor to organize safety committees and first-aid work, the compilation of accident statistics, communal sanitation and cleanliness, water supplies, and educational bulletin service.

The assistants which the new Superintendent of Industrial Relations has been assigned are all men of competence and long experience.

There is a widespread and pressing necessity for just such activities as are contemplated in the programme of organization of the Steel Corporation's new department. Many sporadic attempts at improvement of living conditions and the environment of the colliery towns and steel districts have been made, but they have never been co-ordinated, and their continuity has been affected by changes in control and management, periods of trade depression, and, to a large extent, by non-realization of the necessity for a department of corporate industrial activity that is not, as is sometimes supposed, philanthropy or paternalism, but just ordinary common sense and good business.

It is not to be expected that all the various activities contemplated will at once assume full shape, as the new Superintendent will have to overcome a good

## FOR SALE

- 1—20 x 42 Jenckes First Motion, Double Drum Mine Hoist, Friction Drums 72 x 30, Corliss Twin Engine complete with 1200' 1 1/4" Cable.
- 1—14 x 20 Jenckes Geared Double Drum Mine Hoist, Friction Drums 72 x 48 with special Reduction Gears and extra 6" Shaft for Electric Drive.  
(Note. Was operated at times with 150 H.P. Motor since removed.)  
1200' 1" Cable on Drums.
- 1—36 x 24 Jenckes Jaw Crusher, Bolted Pitman, Manganese Jaw Plates.
- 1—300 H.P. C.G.E. Variable Speed, Slip Ring Motor, 2000V., 3 phase, 60 cycle, 300 R.P.M., Type 1, Complete with outboard bearing, Resistance Frames and 60 x 24 C.I. Sheave for Rope Drive, Starter, etc.
- 2—300 H.P. Westinghouse Type 'C' Constant Speed Motors, 2000V., 490 R.P.M. complete with Starters, outboard bearings, 36 x 24 C. I. Pulleys and adjustable sliding Bases.
- 1—Briquetting Mill complete, rated capacity 5 tons per hour, manufactured by The Henry S. Mould Company, Pittsburg, Pa.
- 1—24" S. & A. Type A.C. Troughing Belt Conveyor. Distance C. to C. Head and Tail Pulleys 102'.
- 1—24" Link Belt Company's Troughing Belt Conveyor, C. to C. Pulleys 116'.
- 4—Standard Gauge Slag Cars, capacity of Bowl 225 cubic feet.
- 1—5 1-2 x 8" C.B. B.V. Canada Foundry Vertical Triplex Plunger Pump, Direct Geared to 25 H.P. C.G.E. 550V. Motor.

We have a large assortment of Mine Cars and Steam Pumps and miscellaneous equipment, and will gladly send booklet on request.

# SAFETY MINE CAGES

MADE TO FIT YOUR SHAFT

We build these Cages to suit you and your workmen. They are Safe, Strong and Reliable.

We guarantee the Safety Device of our Mine Cages to be quick and positive in its action. It can be relied on to work and to hold the cage safely at any time in case of accident. The springs are strong, the dogs are properly designed and adjusted, and the whole device is made amply strong for any emergency.

If you do your part by keeping the timbers in proper condition, and the bearings lubricated and reasonably free from rust, the Safety Device will do its work every time.

We supply these Cages with either one or two sets of doors for inlet or exit, to suit your shaft.

Rails are also laid in the floor, if required, for convenience in handling the cars.

The top doors permit the carrying of long timbers, or the escape of the men in case of accident.

The hand rails are properly placed to safeguard the passengers in the quick ascent or descent.

HAVE YOU SEEN A COPY OF OUR NEW MINING CATALOGUE?  
If not, drop us a card, and one will be sent at once.

deal of inertia and incredulity, and he may not inconceivably meet actual opposition, but in appointing Mr. Macdonald to a position that will be in its initial stages an experimental one, the Corporation have acted very wisely, as Mr. Macdonald possesses just those qualifications of patient persistence and ability to impress his views upon others, combined with a unique complete knowledge of the labor situation in the Corporation's works and mines, that will make success probable, given sincere backing by the operating heads.

The paper on "Labor Turnover of Industrial Plants" read by Mr. Macdonald before the Mining Society of Nova Scotia, which appeared in our issue of May 21st, was a convincing presentation of the loss that occurs through unnecessary changes in working personnel, and a strong plea for its minimization.

### MANUFACTURING IN WESTERN CANADA.

The western provinces of Canada are generally considered as forming a purely agricultural area, and in the occurrences of new land settlement, increased cultivation and bumper yields, the progress of this region in industry and manufacture is often lost sight of. Nevertheless, the west is making phenomenal strides in manufacture and each week sees recorded the establishment of new industrial concerns in the progressive towns of the western provinces.

#### Remarkable Extension.

An indication of the progress which the west holds in common with the rest of the Dominion is the remarkable enlistment of the last decade in the ranks of the Canadian Manufacturers' Association. The Dominion membership, which in 1910 numbered 2,600 now totals more than 4,100. In 1919 there were in the province of Manitoba 102 members; there are now 343. Alberta and Saskatchewan a decade ago had but 16 members between them; they now have 173. British Columbia's membership, in the ten years, has grown from 113 to 162. Whilst in the decade, the Dominion increase was 1,500 or approximately 58 per cent., the four western provinces combined have, in the same period, increased their membership by 447 or 190 per cent.

The rapid development that has taken place in Western Canada during the past two decades is well illustrated by the records of progress made in the various manufacturing industries, the value of whose products in 1900 was but \$34,330,000, whereas in 1917 it was \$405,557,000. The following is a comparative statement of capital invested, wages paid, and the value of products covering a period of 17 years.

### BOOK REVIEW.

**THE IRON ORES OF LAKE SUPERIOR.** Crowell and Murray, Chemists and Metallurgists, Cleveland, Ohio. Published by the Penton Press, Cleveland, 1920, 6 by 9 inches, Buckram Boards.

This standard reference work on the Lake Superior Iron Ores and all that appertains thereto is issued in a fourth revised addition. New chapters have been introduced, presenting the average analyses of all the iron ores of the Lake Superior district since 1902. The statistical part of the volume has been added to in order to bring all figures up to date of 1920 from the last edition of 1917.

An interesting chapter is that which describes the method pursued at the loading docks to ensure a uniform analysis of the ore contents of a given pocket. By the addition of one or more cars of ore of known content, known as the adjusting or balancing cars, to a partially filled pocket of ore, the average grade of which is also known, the average grade of the ore in each of the selected pockets is brought up to precisely the analysis specified.

A concisely summarised account of the progress of beneficiating the Superior iron ores is given in Chapter Six.

The following account of the Canadian extension of the Lake Superior deposits is accurate, and we could wish it were more promising. The possibilities of beneficiation, however, allow a more cheerful view to be taken of the future of iron-ore mining in the Lake Superior ranges in Canada than has hitherto been possible.

With regard to the Canadian deposits, the volume states:

"On the Canadian shore of Lake Superior, and in the adjacent territory, there are large areas of iron-bearing formation similar to those found on the American side, but as yet most of the exploration in these areas has been disappointing. The oldest productive range in Canada, and the largest shipper, is the Michipicoten Range, which lies on the north-eastern shore of Lake Superior northeast from Michipicoten Island. This range was first opened up in 1897, as a gold mining district, but soon became far more valuable as an iron range. The Helen Mine has been a shipper from this range since 1900. The only other producing mine on the range, the Magpie Mine, made its first shipment in 1913. The Moose Mountain District is located about 30 miles north of Sudbury, Ontario. It was first opened up in 1902. The only mine at present on this range is the Moose Mountain Mine, which began shipping in 1908."

# HARDINGE Conical Mill

*Night and Day they grind away*

One of the three Hardinge Conical Ball Mills at the McIntyre plant. An average test of this 6' Mill showed:—

Feed—Quartz, crushed to pass 2"  
Product—10 mesh  
Capacity—155 tons per day  
Power required—38 H.P.  
Ball consumption—0.5 lbs. per ton

*They helped  
McIntyre Porcupine  
reduce milling costs  
and increase tonnage*

WHEN the McIntyre Porcupine Mill was re-built to reduce production costs and increase tonnage, one of the most important changes made was the substitution of Hardinge Conical Ball Mills for previous equipment of stamps and Chile Mills.

The installation, made after competitive tests, was successful in every detail and is typical of experience at scores of other plants.

The way to secure the lowest possible grinding costs is to install Hardinge Mills.

Whether you are planning a new plant or, like McIntyre-Porcupine, re-building an old one, you should know the possibilities of the Hardinge Mill. Send for "Grinding Data" and specific information.

See our Exhibit at the Sixth National Exposition of Chemical Industries, Booth No. 60, Grand Central Palace, New York, week of Sept. 20.

**GOOD YEAR**  
MADE IN CANADA

# For Outside Drives— KLINGTITE—an All-Weather Belt

The service given on outside drives by Goodyear Klingtite Belting (formerly Extra Power) is unusual enough to be of interest to every belt user.

Not because there are a great number of outside drives—but because the outside drive is just about the ultimate test of a belt's ability.

The specially designed fabric of Goodyear Belting gives it the strength to withstand brutal outside service.

But the best of cotton will rot and whip to pieces outdoors if not protected.

So we have forced generous quantities of high-grade rubber through and through the plies of Goodyear Klingtite Belting, forming one solid unit, proof against weather and ply separation, yet flexible, pulley-hugging, efficient.

The special friction surface on Goodyear Klingtite Belts (formerly Extra Power) grips through dust or moisture and prevents slipping.

How well these belts serve is evidenced by this letter from the Beaver River Lumber Co. regarding their Extra Power Belt (now Klingtite). At last report (June, 1920) this belt was still in service after 32

months' use, when this mill was burned recently.

In their letter the Beaver River Lumber Co. say: "The belt driving the conveyor runs direct from a small engine to the conveyor drive. It is subject to steam and heat in the engine room and to cold and dampness on the outside. Under these conditions, there is no sign of deterioration and there is no slippage."

The same testimony is advanced by hundreds of farmers and threshermen who bought Goodyear Klingtite Belts (under their old name of Extra Power) for severe outside service on the farm.

If you have an outside drive, by all means investigate Goodyear Klingtite Belts. If you have **any** transmission drive, let a Goodyear Belting man show you how Goodyear Belts, which are good enough for outside service, will render heaping value on inside work. Phone, wire or write the nearest Goodyear Branch and a man will call without obligation to you.

## The Proper Use of Self-contained Oxygen Breathing Apparatus

Oxygen breathing apparatus are devices that have suffered in reputation from too enthusiastic advocacy on the part of those who favored their use. Invented in the first instance by an Englishman, forgotten for many years in the land of its birth, and adapted and placed on the market by the Germans, they were hailed by persons uninformed of the obliterating character of modern colliery explosions as a panacea. The reaction of those who knew the realities of colliery explosions, and the very definite limitations of the oxygen breathing apparatus, went too far, and in some instances these devices were as unsparingly condemned as in other quarters their usefulness was overdrawn. The truth is that breathing apparatus are delicately constructed devices, with a limited range of usefulness, requiring to be used with knowledge and discretion by trained persons possessed of expert knowledge of underground conditions. They should never have been named "rescue apparatus," for that unfortunate misnomer has given rise to much misapprehension. The chief usefulness of the self-contained breathing apparatus is as an adjunct to a mine fire-brigade, and in this respect they are as necessary to a metal mine as to a coal mine. The record of self-contained breathing apparatus is combatting mine fires has established these devices as having very great usefulness, and, properly used, they have saved life on a number of occasions following the outbreak of mine fires and mine explosions.

Unfortunately, a number of fatalities have occurred among men wearing the apparatus, but investigation will show that in at least a proportion of the cases, this deplorable result has followed the use of the apparatus under conditions for which it was not designed. It is also due to many brave men who have worn the apparatus under desperately trying conditions to state that some of the earlier types of apparatus were designed in ignorance of certain physiological phenomena, and that some lives were sacrificed because wearers of breathing apparatus were asked to perform feats beyond human endurance. Admitting this, it is nevertheless true that the greater part of breathing apparatus fatalities have been occasioned by failure to recognize the limitations of a delicately constructed device, and to realize that a person wearing a breathing apparatus in irrespirable air must die if his apparatus for any reason does not function.

We would draw our readers' attention to the report of the Chief Inspector of Mines for British Columbia upon the recent fatality at the Black Diamond Mine near Seattle, the gist of which is contained in his statement that the fatalities occurred because men "attempted a feat in ordinary practice that any sane man would have given very serious consideration before permitting even in a case of emergency."\* Equally pertinent are the comments of Mr. Rice, the Chief Engineer of the Bureau of Mines of the United States, who fears that misunderstanding of the facts may create a prejudice against "an apparatus which has greatest value when it is carefully used in accordance with well established rules."

To those who are interested in self-contained breathing apparatus there is available a mass of information collected by the United States Bureau of Mines and the Home Office in Great Britain, and by the military authorities of both countries who used oxygen breathing apparatus during the war on a scale that has not been approached in industrial mining.

General agreement among those who have investigated the use of the apparatus under dangerous conditions exists on the following points. The apparatus itself must be in good order, and at least equal care should be given to its condition as is given to the airplane, the diving apparatus, or any other instrument which man has devised to enable him to exist under unnatural conditions of environment. The wearer himself must be in good physical condition, should be certified by a medical man as being a proper person to wear breathing apparatus, not all men being so by any means. The wearer must be expert in the functions of the apparatus, and familiar with the conditions under which it is required to be used. The apparatus must be used with discretion, and with due weighing of the dangers to human life against the object sought to be accomplished.

Self-contained oxygen breathing apparatus is not a plaything, nor a scientific curiosity, nor a device concerning which ignorance is to be excused. It is fitted, within well-recognized limits, to achieve certain objects, but, used as it is under conditions of imminent danger, if these limits are not adhered to, disaster is certain.

\*See page 697, issue of August 27th, 1920.

*NEWFOUNDLAND.*

We have pleasure in publishing the letter which appears in this issue from Mr. P. B. McDonald of New York. The "Journal" has from time to time given news of mining progress in Newfoundland, but confesses that its extent has been disproportionate to the importance of the subject. The fault is not altogether ours, but, as we have previously pointed out, is one of the disabilities under which Newfoundland must suffer until a government geologist is appointed. It is not to be wondered at that the outside world is poorly informed of mining possibilities in Newfoundland, seeing that the people of Newfoundland are themselves only very partially informed thereon. The best monograph on a Newfoundland mineral deposit was made by an official of the Canadian Geological Survey, and published by the Mines Branch at Ottawa. We refer to Dr. A. O. Hayes's Report on the Iron Ore Deposit of Wabana. This deposit, as Mr. McDonald points out, is not by any means the only one in Newfoundland, although, so far as is known, it is the most important one. We believe that the situation is accurately represented when we state that Newfoundland has not yet been either surveyed or studied from a geological point of view in anything approaching an adequate manner. There is one district, hinted at by Mr. McDonald, near Port-au-Port, the stratigraphy of which is only obscurely understood, but which seems to have very promising mineral occurrences.

If Newfoundland is to progress, it must be in mining, fishing and lumbering, as agriculturally, the country has definite limitations. The appointment of a government geologist, and the provision of some centre from which accurate and informed news of mining progress and possibilities can be disseminated, are two matters long overdue in Newfoundland, and their omission, so long as it is continued, constitutes a definite source of hindrance to the country's progress. Newfoundland played her part well during the war. The drain on her all too meagre man-power was proportionately very heavy, and the bill is proving onerous. All who know the Ancient Colony—now a Dominion—will wish her well, and we trust these comments will be taken in the kindly spirit in which they are conceived.

*GOLD PRODUCTION IN ONTARIO.*

Ontario, according to the figures recently issued by the Ontario Bureau of Mines, shows an increase in gold production in 1920 for the first half of the year of 22 per cent compared with 1919. In face of the declining gold production of other countries—the United States in particular—this is altogether a matter for sincere congratulation. The passing of the silver production by the output of the gold mines is an interesting phase of the half year's work, but

we think the greatest significance attaches to an increase of gold production in face of all the adverse conditions that are now attached to the production of gold. It bears witness, most effectively, to the favorable conditions under which gold is being mined in Northern Ontario. It is also worthy of note that three great mines, situated not far from each other, contribute 97 per cent of the gold production of the Porcupine area, and 88 per cent of the total gold output of Ontario, to wit, the Hollinger, McIntyre and Dome Mines.

*OIL vs. COAL.*

The conversion of the "Empress of France" to an oil-burner is not without significance to the Maritime coal trade. When this vessel, under her previous name of "Alsatian" called at Halifax, with other large converted passenger liners, during the war, their coal requirements made large drafts on the coal-handling capacity of Halifax, and on the output of the Nova Scotia collieries. Such vessels as the "Caronia" and the sister ship of the "Empress of France," the "Calgarian," took up to six thousand tons of coal at one time. The available quantity of bunker coal is at this time so insufficient that it matters little where it is obtained, whether in Canada, in Britain or at United States Atlantic ports. It affects the general market fairly equally in any case.

The adoption of oil in substitution for coal is more a matter of convenience than of cost. Many troubles are avoided by the use of oil fuel, notably complications with that trial of the chief engineer, the boiler fireman. It is also typical of the reaction of scientific minds against that most unscientific process, the burning of coal as it is ordinarily employed to raise steam power. It is one of the surprising features of our times that we should have improved so little in practice in the methods employed in the use of coal. Most persons who have given the subject thought are agreed that the use of powdered coal, the use of producer gas made from coal, or one of the fuel oils that can be made from coal, are all preferable to the burning of the raw material under a water-boiler. In each case the advantage lies in the more intimate combination of the fuel with the oxygen of the air that is possible with fuel capable of fine sub-division.

Those who control the coal areas of the world will find it a useless employment to rail against the substitution of what might be termed "fuel essences" for raw coal. A better and more profitable employment will be to adapt their collieries and preparation plants to deliver coal in the forms that the future will demand.

In the above connection it is interesting to note the interest taken in our western cities in the use of pulverized coal for domestic heating and small industrial

plants. The difficulty of adopting pulverized coal, in the case of a small consumer, consists not so much in the actual employment of the powdered fuel, but in its reduction to the powdered state. It is becoming customary now for firms that specialize in the manufacture and sale of apparatus for consumption of powdered fuel to provide a central pulverizing plant, from which delivery is made of powdered fuel. This system is well adapted to territories having access to fuel of only moderate grade, and it has proved successful, for example, in Washington State in the utilization of coals of Tertiary age.

There have been rumors that the rule of King Coal was endangered by the coming dominance of oil fuel, but those interested in coal need worry but little on this score. While it is certain that the future will see coal employed in more practical and scientific ways than has been the case in the past, it is equally certain that the coalfields of the world contain the only reliable and definitely ascertainable reserve of light, heat and power of the future. Oil is, of course, a most important fuel, and one upon which modern transportation is largely based, but it has many elements of uncertainty.

#### NATURAL GAS IN ONTARIO.

The Report of the Commissioner of Natural Gas for Ontario, elsewhere referred to in this issue, is not a comforting document for the fifteen per cent of the population of Ontario, which, as Mr. Estlin has pointed out, have depended largely on natural gas for household cooking, heating and lighting. The Ontario natural-gas supply is evidently a failing one, and is following the course of other districts in North America, where the supply of natural gas has proved to be limited when subjected to intensive consumption.

The most satisfactory part of the situation as it is revealed by the Commissioner's Report is that under recent legislation the Ontario Government has been able to compile accurate statistics, and is in a position to assess the gravity of the situation. The tendency has been to conserve the diminishing supply of natural gas for domestic uses, and to require industrial users to find other sources of fuel supply. In view of the onerous conditions under which domestic fuel has to be obtained in Ontario, the policy of the Provincial Government appears to be correct. Mr. Estlin points out that the 1919 production of natural gas was the equivalent in heat value of 578,120 tons of coal, worth delivered at present day prices, we calculate, not far from ten million dollars.

The Report states that many of the homes in the district hitherto supplied by natural gas are fitted for gas consumption only. This suggests the thought that instead of a general substitution of individual coal-burning appliances, which will take place gradually as the natural gas supply diminishes, some con-

sideration might be given to the generation and distribution through the existing channels of coal gas from a central station, designed to take advantage of the latest methods of by-product recovery, both of distillates and of coke residues.

#### MINING NEWS OF NEWFOUNDLAND.

To the Editor of the "Canadian Mining Journal".

Sir—As I have scanned the pages of your excellent mining journal I often have wondered at the paucity of mining news from Newfoundland. That Dominion, while separate from Canada, is nevertheless a territory of great mineral possibilities, and exploration goes on there from time to time, news of which would make interesting reading if printed in your journal. For instance, have you published an account of the new iron-ore discoveries at Indian Head, Port-au-Port, on the west coast, which are said to equal the famous Bell Island deposits? Or, have you published an explanation of the efforts being made to work the coal seams at Howley, also in the western part; and what is the present status of the renowned carbide-manufacturing scheme that was interrupted by the death of "Carbide" Wilson? There are, I believe, some indications of a boom coming to England's oldest colony, but, strange to say the capital and enterprise are coming from Scandinavians, who are alive to the immense possibilities in wood pulp, electric power and minerals of this 40,000 square miles of island in many respects so similar to Norway. As a native Newfoundlander remarked recently: "The Norwegians seem to have re-discovered Newfoundland, but I'd like to see a few more Anglo-Saxons coming in." In addition to the iron and coal already mentioned, there are, of course, on the island deposits of copper, pyrites, lead, barytes, oil, etc.

P. B. McDONALD,

New York University, Bronx, New York.

August 30, 1920.

#### GOLD PRODUCTION OF YUKON IS LESS.

Dawson, Aug. 26.—The gold yield of the placer camps of the Yukon Valley for 1920, as estimated by competent authorities, will total \$4,485,000. Six weeks more will wind up the season, as the Winter freeze-up will begin then.

Volney Richmond, superintendent of the Northern Commercial Company, having posts throughout the North, has arrived here after a tour of 3,000 miles, visiting posts in interior Alaska. He estimates that camps in that region for the season will yield \$2,985,000.

George J. Jeckell, royalty collector at Dawson for the Canadian Yukon, estimates the season's yield for this territory, which nearly all comes from the immediate vicinity of Dawson, at \$1,500,000. Practically every camp in the North has suffered a heavy decline in output this season. One reason is that it has been the driest season in the history of the North, this largely curtailing hydraulic operations.

Some plants practically operated none of the season. Other reasons for the curtailment include the heavy cost of supplies, materials being practically twice what they were in normal times, while gold remains at a fixed value, thus reducing its purchasing power one half. This means the cheapening of the commodity to the miner.

# The Natural Gas Supply in Ontario

Part V, of Vol. XXIX, the 29th Annual Report of the Ontario Department of Mines, consists of the findings of an Enquiry into the natural gas supply of Ontario made in 1920, and a report on the industry during 1919, from E. S. Estlin, the Commissioner of Natural Gas.

The gist of Mr. Estlin's Report is contained in the prefatory note to the volume, which is as follows:

"The natural gas situation as it stands to-day is brought out in the following summary of the evidence taken at recent hearings, the general trend of which indicates that:

(1) There are two recognized areas of production commonly known as the eastern and western gas fields, the former having been drawn upon for about thirty years and the latter for about fourteen. Some of the conditions affecting the life of the two fields differ, and they are separately mentioned, where possible, in the evidence.

(2) There is a shortage of natural gas for home use in cold weather, at a time when it is most required.

(3) The shortage is caused primarily by a field depletion common in the history of all gas areas, but this depletion was accelerated by excessive consumption during the war period.

(4) This depletion is not being offset by development work because of prohibitive costs, and for this reason will become more acute each year.

(5) Gas enterprises no longer hold out hope of financial gain under present conditions, and do not attract further capital, which is necessary for the development of new gas-bearing territory.

(6) If a general readjustment in the whole situation does not take place immediately the business will pass into decline, and this valuable fuel supply will be lost to about fifteen per cent. of the population of the Province.

(7) The need of seeking for new sources of natural gas at greater depth is apparent; this not only brings greatly increased costs, but also multiplies the risks, and the production end of the natural gas business is a miner's risk not lightly undertaken.

(8) The commercial end of the enterprise is hedged in with contractual obligations assumed when the fields were young and the wells flush, and the whole situation under prevailing conditions holds out no promise of improvement."

Two significant charts are included in the report on 1919 conditions. One shows the rock pressures in the Kent Field from 1907 to 1919. Pressure has declined from about 565 pounds per square inch in 1910 to about 317 pounds in 1919. During a similar period, namely from 1906 to 1919, the consumption rose from 2.7 million cubic feet to 20 million cubic feet in 1917 and was shown at the end of 1919 as being about 11 million cubic feet. Such a decrease in rock pressure, accompanied by unprecedentedly heavy consumption can have but one result.

The following information is condensed from the text of the Report on 1920 conditions, which itself is an abstract of the evidence submitted during the enquiry.

## Shortage

That a serious and general shortage of natural gas exists throughout the gas area of Ontario is fully borne out by the testimony of many witnesses who gave evidence at the several localities where hearings were held. This shortage occurs during the winter months only, and is most acute when the weather is severe.

The residents of cities have been deprived of gas in about an equal degree throughout the various sections of the city. Here and there a very few urban consumers appear to have suffered less inconvenience owing to their proximity to the point of intake at the city limits.

Some suffering and considerable inconvenience have resulted from the lack of gas during the past winter; the general shortage was first felt in the winter of 1917-18.

The classification provided for in the Natural Gas Act, 1919, and Regulations thereunder, was put into effect at Sarnia, Windsor and Chatham during the past winter. This classification cut off certain large users in the given order of preference in favour of the homes, but in spite of these precautions the shortage continued on very cold days.

During the winter of 1918-1919 the gas supply was fairly adequate to meet the demand, with the exception of a few days of low temperature, because the winter was unusually mild.

The shortage through the winter of 1919-1920 just passed, was fairly uniform throughout the districts supplied by the Kent county gas fields. Gas was not obtainable in the cities even for cooking purposes in many instances on severely cold days.

Some of the evidence shows that rural consumers taking their supply from lines tapping the high pressure pipe-lines have never experienced a shortage except in cases of breakage, etc.; this also applies to smaller towns located near the source of supply.

The general tone of the evidence on gas shortage goes to show that the situation is a serious one. People have used gas for many years, and the shortage has come practically within the last two years. The homes are equipped with gas-burning appliances which do not admit of successful change to coal burning, and the chimneys require in many cases remodelling and rebuilding.

There can be no question that the evidence brings out very clearly the fact that the present available supply of gas is not adequate, under the present conditions of market and consumption, to supply the wants of the people in large centres.

It has been demonstrated that the period of greatest shortage occurs during the meal hours. During a cold wave the pressure at the city limits might be ample in the early hours of the morning, but when all the consumers lighted their cooking fires about the same time, the pressure would very soon drop to a point which made equal distribution impossible. This low pressure would be maintained during the day, but at night when the pull became steadier and more normal the lines would "pack up" and pressure rise again.

Several witnesses point out that the nocturnal rise in pressure is a source of great danger, as it is impossible sometimes to regulate the heaters so that the fire will neither go out nor increase to such an extent as to cause serious damage. No shortage occurs in the summer or during mild days through the winter except where there may be physical reasons such as small or choked service lines.

#### Causes of Shortage

The chief reason given for the shortage is the decline of the gas fields and the small area of new producing territory explored. It has been shown that the shortage and high price of coal increases the demand for gas. Weather conditions affect the consumption of gas to such an extent that there is four times as great demand on cold as on mild days. The output of the gas fields does not provide for the domestic "peak load", which occurs at a time when the weather is most severe. The decline of the Kent gas field was increased by the heavy output during the war, when industries were using immense quantities.

#### Supply

Distributing companies have no power to increase the supply of gas. They take the volume as indicated by the available pressure at the point where the distributing system connects with the high pressure supply line, and transmit to their customers what they can get. Distributing companies do, however, make every effort to relieve the situation during a sudden drop in temperature by cutting down the less important consumption. Only small amounts of gas are used in winter for industrial purposes, where gas is an essential part of the manufacturing process.

The number of domestic services is always increasing slightly, so that the domestic load does not become lighter. The supply is adequate at night even in cold weather. It is shown that, while gas is being consumed under present conditions in the homes, as high as thirty to thirty-five pounds "high" pressure at city limits is required to maintain a full distribution service.

The Union Natural Gas Company issued a notice of expected shortage to their consumers in 1917. The general supply will decline more rapidly in the future because adequate development work is not being carried on to offset the decline of the wells. There is a natural depletion of all gas fields which ultimately results in shortage and rearrangement of consumption. The rate of delivery of gas from the field depends upon the pressure behind it, and when this field pressure decreases the supply from the wells diminishes.

Under a general adjustment of consumers' appliances a constant pressure of two ounces would prove satisfactory. There would be sufficient gas in the Kent field for a reasonably good service if suitable changes in burning and handling were made. There should be enough gas for heating with eight to ten pounds at city limits. It can be expected that eight to ten pounds pressure will be the limit if no new wells are drilled and no further supplies of gas located. The service is good for nine months in the year and bad for three.

All distributing and other regulators are seriously affected by the corrosive elements in the Tilbury gas; this is the reason why varying pressures are difficult to regulate. Witnesses claim that the use of coal nearly doubles the cost of heating, and that natural gas should be restricted entirely to household use. If furnaces were taken off in severe weather during part of the winter, there would be ample gas for other purposes.

#### Consumption Data

If the pressure drops from four ounces to one ounce the reduction in gas volume is 1.3 per cent. As temperature rises and falls, gas expands and contracts; every five degrees drop in temperature causes one per cent. contraction. If gas temperature drops from fifty degrees in summer to thirty degrees in winter, causing a reduction of twenty degrees, the volume of gas is reduced four per cent., and this gives the consumer four per cent. more heat, so that contraction by temperature more than compensation for loss in volume due to low pressure.

On a gas bill of \$10.00 there would be an advance of thirteen cents if pressure dropped from four ounces to one ounce. The correct proportion of air for proper combustion is  $9\frac{1}{2}$  parts to one of gas. If varying gas pressures prevent the use of proper proportions of air and gas, improper combustion results and the consumer complains of absence of heat. Great waste is also caused in this way. Domestic gas burners are connected with mixers which are set to draw in  $9\frac{1}{2}$  parts of air, but when the pressure drops to one ounce the right mixture of air and gas will not result.

Air cannot be introduced into the mains or pipe lines by gas companies because it forms a highly explosive mixture when mixed with gas under pressure. A case is cited where fifteen miles of new pipe-line was blown up by turning in gas to test the line before air had been allowed to escape; the result was that there were not a dozen lengths of pipe left worth picking up.

The best results can be obtained from the use of low pressure gas, but the present equipment in the homes is not suitable. The case of gas engines is cited, where low pressure gas gives the best combustion mixture. The same principle applies to gas used for cooking and other purposes. Satisfactory service was rendered in one home in Petrolia at one ounce pressure. Witnesses complain that at times the flame is yellow and at other times blue. When the pressure is low the efficiency of the flame is impaired and the heat units are not utilized. There is no difference in the quality of the gas; it is the same as it was ten years ago; the difference noticed by consumers lies in there not being enough air introduced at the burner on account of low pressure.

Meters are set to register correctly at two ounces when manufactured and tested, but will record accurately at four ounces with the difference that there will be a better flow of gas at four ounces. If pressure drops to one-quarter ounce the meter will still register the actual amount going through. If gas were flowing through a meter at one pound the customer would gain, because of the increased density of the gas. When pressures are low, the consumer is burning raw gas instead of gas and air in right proportions.

Many complaints were made by witnesses giving evidence at Woodstock, where Tilbury gas is supplied, that the odour given off goes through the homes and is injurious to health and destructive to furnishings. It was brought out that if leaks and unsuitable equipment were given more attention, and more care exercised, the discomfort and annoyance would not be felt. The same gas is used elsewhere without similar complaint.

Witnesses complained at all hearings of the increase of gas bills when gas supply was lowest. This was shown to be due largely to improper adjustment of

air mixer and larger amount of gas required during cold weather.

#### Transmission

The towns on the Southern Ontario Pipe Line receive their gas supply according to their relative distance from the gas field. Those nearest the fields get the better supply when shortage occurs. The transmission of large volumes of gas under reduced pressures through long pipe-lines is greatly retarded owing to the friction created. This is a serious factor when the field is supplying to its limit and a sudden increase in consumption takes place, reducing the pressure in the lines, so that the gas has to flow faster through the line. Duplicate delivery pipe-lines for conveying the products of different gas fields to market are a great and useless expense.

It was brought out that it is clearly in the interest of the consuming public that independent exploration work be encouraged and that where small fields are opened (at considerable distance from market but within reach of existing pipe-lines), some method should be found so that present pipe-lines become the carriers of such gas under circumstances encouraging to the smaller operators.

#### Field Conditions

The decline of the Tilbury gas field was first indicated when gas compressor stations were first erected in 1913 and 1914. In the case of the Tilbury field the presence of salt water underlying the gas is found to be a great menace to the life of the field because, as the field pressures decline, the water invades and seals up the porous rock containing the gas. There was a general decline in rock pressures in the Union Natural Gas Company's field from 540 pounds in 1912 to 318 pounds at the present time. In 1915 the open-flow measurement of the Union wells was 90,000,000 cubic feet. In 1919 it was 33,000,000 cubic feet. Pumping outfits have to be maintained on the Tilbury wells for keeping the water down. These outfits consist of a separate gas engine unit for each well. The Union National Gas Company has 171 producing wells and 14 non-producers.

A former field with conditions somewhat similar to those of the Tilbury field was known as the Essex gas field. This field supplied the city of Windsor and large quantities of gas were exported to Detroit and Toledo. The field was drawn on for about ten years and ceased suddenly, causing great inconvenience. Every gas field begins to decline as soon as it is tapped.

In the drilling of wells in the Tilbury field the gas is encountered just above the big water, consequently pockets cannot be drilled down so as to form a gathering basin for the water at the foot of the well; this is a serious inconvenience because it makes constant and frequent pumping necessary. Wells are tested daily and weekly for shut-in pressures. This is a necessary part of the field work to determine what gas the well is making. Only three wells were frozen during the past winter in the Union Natural Gas Company's field. No producing wells were shut in during the winter.

The evidence goes to show that the Union Company's wells and those of the Glenwood and Beaver Companies, situated in the same field, were given the very best attention.

The open-flow measurements of all the wells in the Tilbury gas field show a decline of about one-third according to measurements taken in 1919. There is a strong possibility of the Tilbury field being drowned out if the output is not materially reduced; water is gaining in the field as pressures are lowered. The gas

is being withdrawn at about one-third of the open-flow, which is much too fast for the safety of the field.

Water conditions in the eastern field are not nearly so serious and wells will produce down to a very low pressure. Tilbury field is a "tank" field; one part of the field communicates with another through the porous rock. In the Welland-Haldimand field there are wells where the rock pressures have declined from 500 pounds to 300.

The open-flow measurement of a well is not the amount of gas which the well will deliver into the lines; the actual delivery of the well is about one-third of the open-flow.

Large companies look after the field conditions more systematically than small companies or individuals, therefore the larger companies obtain the better results.

Recent drilling shows smaller results than formerly; this is true of all the Ontario established gas fields. Early drilling in the eastern field brought wells of from 200,000 cubic feet to 500,000 cubic feet open-flow per day. The Port Colborne-Welland Gas Company drilled five wells last year and kept three of them. Deep drilling has been tried in the eastern field and twelve wells failed. One witness claims that he could double his capacity by drilling on his reserve territory in the eastern field. In Rainham and Canboro townships the rock pressure has declined from 200 pounds to 120. The Chippewa Oil and Gas Company drilled eighteen wells in the eastern field at a cost of \$21,600 and had five dry holes. It does not take the full output of all the wells to supply the summer demand.

The wet wells in the Tilbury field vary as to the time required to operate pumps. In some wells the water can be removed in a few hours; in others a whole day is required. All wells are operated to full capacity in all the fields to supply the winter demand. Some wells in the Tilbury field are being pumped at considerable expense although not producing gas, as it is found that this method keeps the water off the adjacent producing wells.

In Dover township the six deep producing wells which were drilled within the last two years by the Union Natural Gas Company, and which were connected to the Sarnia pipe line, have declined in production over one-half since they were drilled in. This is a far more rapid decline than that shown by the Tilbury wells. It is estimated that the gas field in Tilbury controlled by the Union Natural Gas Company will yield 58,859,510,000 cubic feet of gas when pressures drop to fifty pounds.

Total gas from the Dover wells drilled by the Union Natural Gas Company was in December, 1919, 5,961,524 cu. ft. per day, and in February, 1920, 3,439,858 cu. ft. per day, a reduction of about two and one-half million cubic feet.

Producing companies endeavour to maintain a reserve acreage in order to drill for increased supply and to protect their producing wells.

In the Glenwood Company's Tilbury wells the pressure is kept back to about 100 pounds to retard the flow of water into the wells. If the compressor plants were operated, the back pressure against the water would be lowered and there would be no gas. The Glenwood Company drilled nine wells in 1919, and the Beaver Company three, in the Tilbury field. More wells drilled in the Tilbury field would deliver the gas more quickly but would not increase the supply. The pressures would decline so much faster. The Glen-

wood Company would not keep a new well unless it measured over 20,000 cubic feet when brought in.

Twice as many pump-men are required to tend the wells in winter as in summer in the Tilbury field. The Union Company has sixty-five pumps out of one hundred and sixty-six wells; siphons are being replaced with power pumps as quickly as equipment can be obtained and installed. The expense in handling the water in Tilbury field is increasing. Water is being pumped from wells drilled as recently as 1918 in Tilbury field, but the greatest amount of water is found in the older wells.

The Glenwood Natural Gas Company has spent seven years in constructing a plant for removing the sulphur content from the Tilbury field. This plant is the only one of its kind in existence and is located in the heart of the Tilbury gas field. Crude ammonia in 17 per cent. solution is reduced to 9 per cent. and the gas passed through the liquid. The ammonia absorbs H<sub>2</sub>S out of the gas and ammonium sulphide is the product. The difficulty is in freeing the ammonia from the sulphur. This purifier cannot be operated continuously because of constant corrosion, which necessitates repairs. The only practical purifying plant is the oxide system, but this system develops water vapour which condenses and gives trouble. The life of a gas pipe varies, depending upon the kind of soil in which it is laid, the attack from electrolysis, and the corrosive elements in the gas. Some pipes last forty years and other only one year.

The Dominion Natural Gas Company operating in the eastern fields carries 55,000 acres of operated leases and 64,000 acres of unoperated leases. Some companies hold ten times as much unoperated as operated acreage. The largest area held by the Dominion Company is where the limits are not yet developed; the smaller area is where the district is tested out as in the older fields.

The Dominion Company at the beginning of the year 1919 had 773 wells, and at the end of 1919 had 796 wells (having drilled 38 producing and abandoned 22 wells). Seven dry holes were drilled in 1919. More wells were drilled by them in 1916 than in 1919, but more money was spent on the drilling in 1919. The open-flow of the Dominion Company's wells showed a decline between 1906 and 1919 of about 90 per cent., between 1907 and 1919 of about 95 per cent., between 1908 and 1919 of about 50 per cent.

Increased costs of materials and labour prevent development work. Shallow drilling has been almost abandoned. Deep drilling costs have increased from 100 to 120 per cent. The Union Natural Gas Company has stopped drilling operations entirely. Companies cannot get funds invested in the natural gas business sufficient to continue exploration work and the opening up of new producing territory. The cost of drilling a deep well at the present time is from \$20,000.00 to \$25,000.00, while wells in the Tilbury field cost approximately \$2,000.00.

In Dover township, where new gas and oil production has been opened up within the last two years by deep drilling, there are seven producing wells out of twenty, while in Tilbury the Union Natural Gas Company has 166 producing out of 179. The Union Company drilled eight wells in 1919 (four in Dover and four in Tilbury), not all producers, but got more gas in 1919 than in 1918. The Union Company has drilled thirteen deep wells. The Tilbury gas field is now thoroughly drilled. The drilling of twenty wells in

the township of Dover was an effort to recover production. One deep well drilled on Rondeau Provincial Park, Kent county, cost \$125,000.00 and was a dry hole.

There are large areas of gas producing formation underlying vast districts in the province of Ontario. The large area held by the National Gas Company, consisting of 30,000 acres in the eastern field, admits of great development. After operating for six years ten additional wells were drilled; one of them came in with an output of two million and another of one and a half million cubic feet per day. This company have only eighty-five wells on the 30,000 acres and ten of these have been pulled. The territory is good for 200 wells and the output could be trebled if funds were procurable. There are many dry wells scattered over the eastern gas territory. One opinion claims that there is not enough productive area tributary to the city of Hamilton to furnish that city with a full supply of gas.

Many wells are abandoned in both the eastern and western gas fields, which are not replaced by new drilling; this is a strong factor in decreased production. The Union Natural Gas Company spent \$250,000 trying to locate more gas when abnormal conditions caused by the war created a shortage.

**Waste**

Lack of efficient equipment in the consumption of gas is responsible for a large percentage of waste. There is approximately forty per cent. of waste between transmission of gas and the consumer's burner.

**Average Waste Percentage.**

	1918	1919
Sarnia . . . . .	24.8	14.5
Petrolia . . . . .	41.5	34.0

The decrease is caused by the improvements made in the distributing plants.

The unrestricted consumption of gas without charge under freehold agreements is a very great source of wastage. In January, 1919, 100 free users consumed 46,400 cu. ft., while 100 pay users in Sarnia consumed 24,400 cu. ft. a difference of nearly 100 per cent. Considerable waste was encountered in defective lines in the town of Petrolia, but repairs to these lines resulted in reducing the leakage. Some meters were found to be running slow and these are being repaired and tested. The readjustment of all conditions from the gas field is required to reduce the waste of gas to a minimum.

An excellent idea of Canada's great mineral wealth is given in the Ontario Government's display at the Canadian National Exposition, a feature of which is an exact reproduction of the underworkings of a mine—a drift in which the latest type of drill is set up ready for operation and manned by a typical miner. That Ontario is one of the richest provinces in mineral resources to be found in the world is apparent from a cursory glance at the minerals and metals and a study of the figures that are set forth of the total value of the chief minerals produced in Ontario during 1919. These include silver, \$198,000,000; nickel, \$150,000,000; iron, \$80,000,000; gold, \$61,000,000; copper, \$54,000,000; cobalt, \$7,000,000. These figures indicate that Ontario produces 45 per cent of the total mineral output of Canada, and tell a vivid story of the vast natural resources of this province. The exhibit is well arranged and has attracted a great deal of attention.

## Northern Ontario Letter

Owing to the high price of silver during the last half of August having induced some of the heavy holders to release large quantities, quotations commenced to recede again during the opening week of September. It is not believed, however, that the price will long remain at a point near the 90 cents mark, but may be expected to again gradually work up to not far under \$1.00 an ounce.

The leading Cobalt producers, in common with other large holders of silver in other parts of the world, took advantage of the recent high quotations and released a large amount of their hoarded stock of bullion. It is still believed, however, that close to \$2,000,000 worth of the metal is contained in local vaults.

On Labor Day, September 6th, the members of the Imperial Press Conference visited the mining districts of this part of Northern Ontario. The magnitude of mining operations together with the other industries including agriculture and paper manufacture appeared to be somewhat of a revelation. The thought that all this wealth lies adjacent to the railway and that in the vast stretches lying beyond, no roads have yet penetrated, seemed to impress the visitors with the importance of the future which is unfolding before this country.

Arrangements are to be made to enlarge the milling equipment of the Beaver Consolidated mines, according to unofficial reports. This is said to have been made advisable owing to the large quantity of low and medium grade ore opened up during the past six or eight months. The plan to virtually work the Beaver mine over again promises to have been well advised and, in addition to encountering quite important shoots of high-grade ore, the life of the mine has been considerably lengthened by blocking out a large tonnage of low-grade ore. It is a quite general belief that the Beaver Company, in addition to its own earnings, may commence to receive revenue from the operation of the Kirkland Lake Gold Mines during the coming year. Should such prove to be the case, substantial dividends appear to be indicated for the Beaver stockholders.

A rock crusher together with an automatic shovel and loader is being installed at the Kerr Lake mine for the purpose of handling the large tonnage of low-grade ore lying in the dumps. It is intended to crush the ore to about 2½ inch ring, after which it will be conveyed by aerial tramway to the customs mill of the Dominion Reduction Company. In the meantime, this low grade material is being shipped at the rate of about 4,000 tons monthly, and constitutes at least half of the total current output from the operation of the Kerr Lake. Production from all sources is being maintained at upwards of 50,000 ounces monthly.

Ore shoots, quite rich in places, but more or less limited in extent, have been encountered on the old Lumsden mine. Work has been under way for several months, and it is understood an endeavor will be made to send out a shipment of ore at a reasonably early date.

Leaseholders of the old Ruby Silver property, situated in the south-eastern part of the township of Bucke, close to the old Green Meehan mine, have taken out a small pocket of high-grade ore and will make a shipment this month. The shoot is said to have con-

tained about \$5,000. Further work is planned with a view to opening up low or medium-grade mill-ore as well as possible shoots of high-grade ore.

Plans are being arranged to commence sinking to deeper levels on the Oxford-Cobalt property, situated in Gillies Limit. Lateral work at the first level has not opened up commercial ore but has offered encouragement to continue the work to a lower horizon and to a point where lateral work may be carried on in closer proximity to the contact.

### The Gowganda District.

Advice from Gowganda indicates that another shipment of high-grade ore will be made this month, and may amount to about ten tons. It is intimated in semi-official circles that current output is about equal to expenditure, and that in addition a substantial quantity of low and medium-grade ore is being blocked out. It is also understood the question of installing a small mill is under contemplation. Should this course be adopted, it is quite reasonable to suppose that the winter roads would be taken advantage of to haul the heavier parts to the property.

The policy of temporarily patching up the Gowganda road has been adopted by the present Ontario Government. This method has already cost the country between \$300,000 and \$400,000 for work on this 27-mile road, and still leaves the field without satisfactory transportation. Last year, the defeated government recognized the folly of the policy and decided to construct a macadam road, but with the rise to power of the U.F.O.-I.L.P. party, this work was discontinued and the old game still goes on with the mines of the Gowganda field paying the piper.

The first unit of the power plant of the South Bay Power Company, at Gowganda, is said to be nearing completion and current may be turned on within a short time.

Everywhere throughout the active silver-mining districts, including Cobalt, Gowganda, South Lorrain and Elk Lake there is a tendency to look to the coming year as one likely to be marked by continued high quotations for commercial bar silver, and with this belief in mind arrangements are being made to carry on work at the fullest possible capacity.

## THE GOLD MINES.

### The Porcupine Field.

The trend of the price of commodities during the past month or six weeks has given rise to the hope that a definite turn has taken place in the downward motion of the price of material. If this is actually the case, net earnings at the gold mines will increase accordingly, because with them the gold will always command the standard price, while cheaper material will reduce the cost of production.

An interesting report originated in Porcupine this week in which it is said the Moneta mine which adjoins the Hollinger on the immediate west may figure in a deal with English interests and may be worked in a big way. This property is regarded as one of the most favorable of the undeveloped pieces of ground lying in close proximity to the producing area. With its neighbor the Hollinger Consolidated having actually mined close to \$38,000,000 and with more than \$40,000,000 more blocked out, and with indications of these bodies continuing to enormous depth, the prospect of the Moneta ultimately developing in a satisfactory manner appear to be extremely good. The

strike of the Hollinger ore bodies is directly into the Moneta.

Concerning this property, it will be recalled that a report was in circulation last spring that interests identified with the Hollinger had offered 25 cents a share for the Moneta, but publicity given to the matter caused the report to subside.

In connection with opening the Porcupine V.N.T. Mines, it is believed the balance of this year may be occupied in de-watering the underground workings, etc., but that by early in the new year the property will be in full operation. The \$30,000 provided in the sale of the first block of treasury stock at 15 cents a share is to cover this preparatory work, while the sale of the next block of 200,000 shares at 30 cents each, as per the underwriting arrangement, is expected to place \$60,000 in treasury with which the mine can be brought to the producing stage and probably pay its own way. It is just possible the mill may also be overhauled and enlarged so as to treat about 150 tons daily, in which case the operation would become an important one.

Considerable criticism continues to centre around the McIntyre-Porcupine's purchase of a coal property in Alberta. Full details are not available, but a good many stockholders, particularly those resident in Northern Ontario and familiar with the situation, are expressing open resentment of this attitude of the President of the McIntyre Co. employing funds of the company on a venture of that kind when the McIntyre is itself but getting away to a fair start.

The Davidson Company is also under fire. The company recently made the proposal that the stockholders option at least fifty per cent of their shares "until nine months after the completion of a 500-ton mill," but some of the shareholders see in this a situation amounting to the same thing as though they joined the pool. With their shares tied up, they would not be in a position to take advantage of a favorable market to sell, nor would they be able to get out provided things failed to go well. The company is said to have arranged with English interests to underwrite a large amount of treasury stock, provided they are given an option on 50 per cent of the outstanding stock. Sailing may not be altogether too smooth, judging from the attitude of stockholders who know there is no law to compel them to either option their shares or to place them in a pool.

Reports are current that the Big Dyke property in the township of Deloro may resume operations this fall. The plan is said to be an endeavor to carry work to deeper levels with a view to finding whether or not the gold content increases at depth. Values from surface to a depth of 100 feet, as shown in work done a year or so ago are comparatively low.

A diamond drill is being transported to the Clifton-Porcupine property and will be used for the purpose of ascertaining the extent of the continuation of ore-bodies opened up as a result of the large amount of underground work formerly done. This is expected to serve as a guide in determining the future development policy.

#### The Kirkland Lake District.

The proposed consolidation of the Kirkland Lake, Teck-Hughes and Orr Gold Mines is one of the chief topics of discussion in the Kirkland Lake district. It is believed, however, to be altogether too soon to esti-

mate the possibilities of this being brought about. Proposals and counter-proposals will probably be made, and no doubt the balance of the year may be occupied in an endeavor to arrange terms mutually satisfactory.

The Ontario Government has placed a force of men at work of building a road from the Tough-Oakes mine, east through Lebel township to Mud Lake for the benefit of the property owners in that district. The large amount of activity and the favorable results being achieved on such properties as the Bidgood, Wood-Kirkland, Moffat-Hall and others tends to indicate that another gold mining camp of importance may be in the making. It is believed advantage will be taken of the winter roads to transport a good deal of machinery this winter, and a number of properties will likely be equipped with mining plants by next spring.

Advices from the Argonaut Gold Mines at Beaverhouse Lake continues favorable, and the decision to carry work to a depth of perhaps 500 feet has aroused more than ordinary interest. The proving of a mine some twelve miles east from the present producing part of the Kirkland Lake gold area is regarded as being of the utmost significance—especially so on account of the mine being on an unbroken belt of rock formation extending all the way from Kirkland Lake, which makes the intervening territory highly promising from a mining standpoint.

T. J. Flynn has secured an option on the Patricia mine at Boston Creek. The price is said to be in six figures, and the option of quite short duration. This property was formerly equipped with a small mill, but the entire plant was destroyed by fire in 1919, and the property has remained idle since that time. Dr. Flynn is associated with the Matachewan Gold Mines, but whether or not he is in any way acting on behalf of that company in the present instance is not stated.

On all sides in the gold mining districts of this part of the province, everything points to increasing activity with the approach of winter and a better labor supply.

Mr. P. E. Hopkins, geologist of the Provincial Department of Mines, returned to Toronto this week after spending about three months in survey and geological work in the vicinity of Schreiber, from which localities come reports of a gold strike. According to Mr. Hopkins' report, however, it would appear as if the prospects of any big output of gold from the district are small. The Jackson claim, which was the original strike, is about three miles east of Schreiber. Mr. Hopkins states that it is a high-grade gold prospect with considerable galena also showing. The quartz vein is situated in Keewatin, close to the granite. "It is a very narrow high-grade gold vein," said Mr. Hopkins, speaking of the discovery, "it is likely that more little veins will be found, but whether they will amount to anything I could not say." He was of the opinion that the veins would prove too small to be worked. The prospect looked promising, however, and formations in the district might promise further discoveries. Mr. Hopkins is getting out a map of the whole district showing the territory fifteen by ten miles which should prove of value in further prospecting work.

**TORONTO MINING STOCKS.**

Following are the average quotations for gold, silver and miscellaneous stocks on the Standard Stock Exchange, Toronto, for week ending September 4th, 1920.

Silver.	High	Low	Last
Adanac Silver Mines, Ltd. . . . .	2½	2	2⅛
Bailey . . . . .	5	4¾	4¾
Beaver Consolidated . . . . .	42½	39	42
Chambers-Ferland . . . . .	7	7	7

**TORONTO COAL PRICES.**

Toronto, September 9.—Toronto coal dealers report that hard coal is particularly tight and that there is practically no production. Last week's prices remain unchanged, mine run still being quoted at \$14.25 to \$14.50 f.o.b. Toronto; Smokeless coal \$14.50 to \$15.00; hard coal \$8.00 to \$11.50 gross tons at mines, American funds.

**METAL QUOTATIONS.**

Fair prices for Ingot Metals in Montreal Sept. 9th 1920. (In less than carload lots).

	Cents per lb.
Copper, electro . . . . .	23¾
Copper castings . . . . .	23½
Tin . . . . .	53
Lead . . . . .	9½
Zinc . . . . .	10½
Aluminum . . . . .	35
Antimony . . . . .	8¾

**NOTES FROM THE NOVA SCOTIA COLLIERIES****Production of Cape Breton Collieries of Dominion Coal Co.**

The total coal output for the month of August was about 9,000 tons less than the total output for July. The total output last month reached 260,667 tons, while the output for July was 269,116 tons. The output for August, 1919 totalled some 242,495 tons. Several one day strikes and accidents to machinery is responsible for the low output last month. The following are the individual outputs of each colliery.

No.	Tons.
No. 1 . . . . .	28,693
No. 2 . . . . .	44,564
No. 4 . . . . .	25,537
No. 6 . . . . .	19,980
No. 9 . . . . .	19,541
No. 10 . . . . .	10,317
No. 11 . . . . .	14,634
No. 12 . . . . .	14,520
No. 14 . . . . .	15,939
No. 15 . . . . .	9,066
No. 16 . . . . .	13,078
No. 17 . . . . .	2,540
No. 21 . . . . .	13,442
No. 22 . . . . .	16,898
No. 24 . . . . .	3,979

Total . . . . . 260,667

The interesting features of the individual production of the collieries is the high percentage of Emery Seam coal, which exceeded eleven per cent of the total; the recovery of output rate in the Waterford District, and the appearance of No. 17 as a substantial producer, and the comparatively small quantity of coal coming from the older mines in the Glacé Bay District, from Nos. 2 and 9 in particular.

The shaft of the hoisting engine at No. 12 Colliery broke recently, and repairs may necessitate the idleness of this colliery for several weeks. In the meantime every effort is being made to place the men at the neighboring collieries.

**Labor Matters**

The Royal Commission is holding final sessions in Sydney, and its Report is shortly anticipated. The miners' leaders are endeavoring to affect the findings of the Commission in their favor by giving out interviews to the newspapers threatening serious trouble unless their demands are granted in full. The judicial status of the Commission, and the etiquette of the judicial procedure is meeting with scant recognition.

In view of the undertaking of the U. M. W. representatives in Montreal in January 1918, which was that wage rates and conditions in the United States were not to be made the basis of comparisons with wage rates and conditions in Nova Scotia, it is revealing to note the statement of the President of the U. M. W. in Nova Scotia, recently given out, as follows: "One thing is certain, if the United States branches succeed in obtaining their demands for increased rates, which they have made, we, of the Canadian United Mine Workers, will make the same demands here, and we will press to have them granted. In this we shall have the support of the American miners without doubt." The President of the Nova Scotia District also expressed his opinion that "nationalization of mines will prove to be the only cure for the miners' troubles, which exist over the world today."

### Miners' Relief Societies.

A disappointingly retrograde step was recently taken by the miners and steel-workers at Sydney Mines, who voted for the dissolution of the Benefit Society which, since the full operation of the Workmen's Compensation Act, has afforded relief payments in disability to work arising from sickness. This action is the more surprising, as the Glace Bay miners have decided to increase the extent of their payments and the scope of the benefits. It has been established by careful recording of statistics over many years in the Cape Breton coal-mining districts that two-thirds of the disability to which the miner is subject arises from sickness, and only one-third from occupational accident and disease. Where the sick benefit societies have not been in existence, the miners have usually been frequently requested to contribute to pithead collections for relief of the victims of sickness, and while this system has not of course proved satisfactory or equitable in practice, it has also made greater demands than the regular dues of the sick societies upon men who are thoughtful towards their neighbors' misfortune.

### New Bankhead for Nova Scotia Steel & Coal Co.

The Nova Scotia Steel & Coal Company will shortly erect a concrete and steel bankhead at the Jubilee Colliery, Sydney Mines. The existing bankhead was not intended to serve as a permanent erection, and it possesses some inconvenient features. A bankhead capable for handling an immediate tonnage of 1,200 tons, and an ultimate tonnage of 2,500 tons daily is projected. Two electric winding engines are proposed, one to handle the coal from the lower seam, and one to deal with the upper seam output. Modern screening arrangements, including picking belts and shaking screens of the "Marcus" type will be employed. Box-car loaders are also to be provided. The bankhead and its equipment will be electrically operated and will include the labor-saving arrangements for tub-handling that are usual in modern bankheads.

The underground equipment of the Jubilee Colliery is of modern type, including electric storage-battery locomotives. The longwall method has been used with success, the thickness of the seams and the roof cover being, both in the upper and lower seams, well adapted to the longwall system of mining.

### JUDGMENT AGAINST GRANBY COMPANY IN DISPUTE OVER TITLE TO CASSIDY COLLIERY SITE.

In giving judgment in favor of the Esquimalt and Nanaimo Railway Company, of Vancouver Island, in a very important settlers' rights suit, entitled E. & N. Railway vs. Wilson & McKenzie, Mr. Justice Gregory finds that the Granby Mining Company loses its title to the property on which it built the fine town of Cassidy a few years ago. The Granby Company has an investment there of close on a million and a half dollars.

It is quite certain—the fact is even mentioned by His Lordship in giving his judgment—that the case will be carried finally to the Privy Council in London. The Granby people are carrying on mining operations at Cassidy, which is a prosperous and growing mining centre, and work will it is understood, go ahead in any event until the disposal of the case by the highest court.

First, the appeal will be taken to the highest court in British Columbia at the sittings in October in Van-

couver, and it may be possible to secure final judgment in London some time next year.

The Granby Company purchased the property from Messrs. Wilson & McKenzie, who were executors of the estate of the late Joseph Ganner and Mrs. Dunlop. The property involved is in the Cranberry district, a few miles south of Nanaimo. The parties named had received the coal lands under the Settlers' Right Act, having been in possession of the surface rights prior to the building of the E. & N. Railway. Upon application a crown grant was issued to the Granby Company by the Government about three years ago. On February 18, 1918, the E. & N. Railway brought suit for a declaration that the crown grant is null and void, and that the plaintiff railway company is the proper owner of the coal under the old grant made by the Dominion Government in consideration of the building of the railway.

The trial was held at Victoria in January and February of this year.

"It seems to me to be abundantly established," said Mr. Justice Gregory, in giving a written decision of considerable length, "that the legal estate in the disputed lands is in the plaintiff company, and that it is the proper party to bring the action." His Lordship adds that he agrees with the ground set up by Mr. Davis in his argument that there was no proper hearing of all parties concerned as provided by the statuteness into the six other questions raised by Mr. Davis in his argument.

Mr. Taylor, for the Granby Company, had urged quite vigorously that no hearing before the Lieutenant-Governor-in-Council, of which the plaintiff was entitled to notice, was necessary. He urged that the hearing was an act of the executive, that it was secret and could not be inquired into, and that in any case the executive probably had complete information before it before giving the crown grant to the Granby Company.

### THE LATE MR. BEN COOKE.

Mr. Ben Cooke, who for fourteen years acted as drill demonstrator, and service man for the Canadian Ingersoll-Rand Co., died at his home, Garson Quarries, near Winnipeg, Manitoba, on August 26th, after a short illness.

Mr. Cooke was a mining man of wide experience, having started his mining career some thirty five years ago in the old Phosphate Mine near Buckingham, Quebec. Working from there through the various mining camps of the east and middle west through to British Columbia. He also spent considerable time in the Sudbury district, working at the Canadian Copper Co. as foreman of the rock house at the old Copper Cliff Mine. He also had an extensive experience in the contracting field, having for some time been in charge of the Kenora Office of the Canadian Ingersoll-Rand Co., Limited, during the time they were double tracking the C. P. R. between Fort William and Winnipeg. He was also for some time in charge of drilling for the Cooke Construction Co. on their work at the Halifax Terminals, in Halifax, N. S. and with the Norman McLeod Construction Co. when they excavated the rock for the Spanish Aero Car installation at Niagara Falls, Ontario.

He leaves a widow and three children.

# Ontario's Metalliferous Production, First Half Year--1920

Returns received by the Ontario Department of Mines for the six months ending June 30th, 1920, are tabulated below, and for purposes of comparison the quantities and values are given for the corresponding period in 1919. Tons throughout are short tons of 2000 lbs.

**General Remarks.**

The aggregate output from metalliferous mines, smelters and refining works of the Province of Ontario for the six months ending June 30th shows a considerable increase in value over the 1919 figures. For the first time since 1903, when the Cobalt silver camp was discovered, the output of gold exceeds that of silver in valuation. The new electrolytic refinery of the British American Nickel Corporation is now in operation at Deschenes, near Ottawa.

**Product.**

Product	Unit	1920	1919
Gold	(ounces)	277,656	231,729
Silver	"	4,474,322	5,744,172
Platinum metals	"	184.45	30.08
Cobalt (metallic)	lbs.	113,239	59,337
Nickel (metallic)	"	4,854,979	5,147,745

<b>Total</b>		.....	.....

**Gold.**

Ontario's position as a producer of gold is becoming increasingly important. For the first half of 1920 the output was nearly 22 per cent. greater than the 1919 production. Production of gold by individual mines is presented herewith:

**Porcupine.**

Hollinger	\$2,928,079
McIntyre	1,085,298
Dome	989,566
Porcupine Crown	70,017
Dome Lake	46,809
Northerown	31,019
Davidson	13,489
<b>Total</b>	<b>\$5,164,277</b>

\*Copper in matte was valued at 13 cents and nickel at 25 cents per pound in 1919. For 1920 the values have been placed at 14 and 28 cents per pound respectively. The total matte produced contained 15,030 tons of nickel and 7,705 tons of copper. See heading "Nickel-Copper" for explanation.

xTotal shipments of iron ore were 13,962 short tons worth \$74,073.

!Total output of pig iron was 321,826 tons valued at \$8,255,916. Figures in the table represent proportional product from Ontario ore.

**Kirkland Lake.**

Lake Shore	243,977
Kirkland Lake	137,676
Teck-Hughes	125,137

Total ..... \$506,790

From miscellaneous mines the output was \$17,138, of which the Argonaut in Gauthier township contributed \$16,938. There was also a recovery of gold worth \$2,498 from nickel-copper refining operations. In addition gold mines produced 49,156 ounces of silver worth \$56,364. During the period 673,694 tons of ore were milled — the milling capacity at Porcupine at the end of June was 5,296 tons and at Kirkland Lake 330 tons daily. The 150-ton mill of the Wright-Hargreaves mine at Kirkland Lake is nearing completion.

**Quantity**

**Value \$**

1920	1919	1920	1919

.....	.....	22,101,580	18,759,829

**Silver.**

The quantity of silver marketed during the period was considerably less than the output. An average price of \$1.30 per fine ounce obtained for the first quarter of 1920, while for the half year the average New York price was \$1.17 for silver in the open market as distinguished from the fixed price, retroactive to May 13th, of \$1.00 per ounce (1000 fine) under the Pittman Act for metal produced, smelted and refined exclusively within the United States. For the month of June the average open market price in New York was 90.84 cents. This disadvantage to the Ontario producer, however, was more than offset by the exchange rate. Since June the export price of silver has risen gradually until it approaches the quotation for domestic silver.

During the period a total of 4,474,322 ozs. worth \$5,077,028 were marketed. Of this total 225,513 ounces came from the Miller Lake O'Brien and Castle properties at Gowganda, 23,414 ounces from nickel-copper refining operations and 49,156 ounces from gold ores. Some producers of silver were paid for the cobalt content of ores, concentrates and residues marketed. In all \$138,317 was received for 296,116 pounds.

**Refineries.**

During the half year 1,445 tons of ore, 581 of con-

concentrates and 1,185 tons of residues were treated in the southern Ontario refineries located at Thorold, Doloro and Welland for a recovery of 1,477,490 ounces of silver in addition to arsenic, metallic nickel, metallic cobalt and compounds of these last mentioned metals. The companies operating were the Coniagas Reduction Co., Deloro Smelting and Refining Co., and Metals Chemical Ltd., respectively. The last mentioned operated for the first three months of the year only, after which the plant was taken over by Ontario Smelters and Refiners Limited. Alterations in plant and process were made, which prevented production during the second quarter of the year. This new company also owns the plant at Chippawa formerly operated by the Standard Smelting and Refining Company. Copper sulphate was recovered from residues by one of the companies. It should be pointed out that the output of metallic nickel oxide from silver ores is small compared with that from nickel-copper refining. Only 203,713 lbs. of metallic nickel and 15,384 lbs. of oxide were marketed. In the table under the heading "Other Cobalt Compounds" are included cobalt carbonate, hydroxide, sulphate and acetate.

**Nickel-Copper.**

During the half year 627,681 tons of ore were raised and 520,705 tons smelted, the total output of nickel-copper matte being 28,365 tons containing 15,030 tons of nickel and 7,705 tons of copper. The British America Nickel Corporation and the International Nickel Company of Canada worked the Murray and Creighton mines respectively, while the Mond Nickel Company raised ore from the Garson, Levack, Bruce, Worthington and Victoria No.1.

**Refineries.**

As regards shipments of matte, 7,944 tons went to Canadian refineries at Port Colborne, Ont., and Deschenes, Que., 16,323 tons to the United States, and 1,123 tons to Wales. During the period the new electrolytic refinery at Deschenes commenced operations and had 1,185 tons of matte in process on June 30th although no refined metals were ready for market at that date. The new plant which permits recovery of metals of the platinum group in pure form is reported to be working very satisfactorily as is also the smelter at Nickelton, one mile from the Murray mine, where the ore is smelted direct without preliminary roasting. In addition to metallic nickel, nickel oxide and blister copper, there was a by-product recovery at Port Colborne of the precious metals, gold, silver, platinum, palladium, rhodium, ruthenium, osmium and iridium. There was also a small recovery of copper in the United States from Ontario silver ores.

**Iron Ore and Pig Iron.**

Shipments of siderite ore from the Magpie mine by the Algoma Steel Corporation and of briquettes produced from magnetite ore by Moose Mountain, Ltd., Hutton township, totalled 13,962 short tons valued at \$74,073. The first mentioned used its entire output in the blast furnaces of the Corporation at Sault Ste. Marie, while the latter shipped its product to Quebec and the United States. The new Helen mine of the Algoma Steel Corporation has been diamond drilled and it is estimated that over 100 million tons of siderite are available for mining.

The pig iron output by the Algoma Steel Corporation at Sault Ste. Marie, Steel Co. of Canada at Hamilton and Canadian Furnace Company at Port Colborne

was 321,826 short tons valued at \$8,255,916. Only 58,387 tons or 8.94 per cent. of the total of 653,137 tons or ore charged to the 7 furnaces in blast was of domestic origin, the balance being imported from the United States. Furnaces of the Midland Iron and Steel Co., Parry Sound Iron Co., and Standard Iron Co., were not operated during the period. The output of steel from pig iron was 337,048 tons valued at \$1,661,570. These figures do not include any secondary steel produced in the electric furnace from scrap iron and turnings.

**Lead.**

The entire output of pig lead came from the mine and smelter near Galetta on the Ottawa River operated by the Kingdon Mining, Smelting and Manufacturing Company. The product was consigned to the Jas. Robertson Company, Limited, of Montreal, manufacturers of plumbing supplies. There is a small recovery of lead from the silver ores of Cobalt treated in the United States refineries, returns of which are received at the end of the calendar year.

**PRODUCTS OF THE MINES USED IN PAINT AND VARNISH INDUSTRY.**

A statistical review of the paint and varnish industry in 1918 in Canada, issued by the Dominion Bureau of Statistics, shows a varied use of the products of the mine in use as solvents, pigments and fillers.

Of interest to the coke oven industry is the use during 1918 of the following thinners and solvents, which are, or can be, the product of coal distillation:

	Quantity	Value
		\$
Creosote (gals.) . . . . .	53,073	13,747
Naptha (gals.) . . . . .	904,673	286,053
Benzine etc. (lbs.) . . . . .	2,863,110	166,711
Benzol (lbs.) . . . . .	338,639	16,133

Among the pigments and driers, is noted the use of 7,198,248 pounds of zinc oxides and lithopone, valued at \$721,527, and 1,462,636 pounds of white lead, valued at \$168,255.

As a filler, there was used the following:

	Quantity	Value
	pounds	\$
Asbestos . . . . .	3,738,230	24,325
Barytes . . . . .	4,326,670	76,278
Whiting . . . . .	8,422,276	116,817
Pig Lead . . . . .	10,593,351	874,638

Among the exports from Canada during 1918 is included 588,229 pounds of cobalt oxide and cobalt salts, valued at \$853,737, together with mineral pigments, oxides and ochres totalling 15,389 hundredweight and valued at \$18,377.

Among the exports into Canada are included considerable quantities of various preparations of lead, ochres and umbers, metallic oxides, zinc and coal tar bases.

It is evident from the statistics of the Bureau that the paint and varnish industry is an important customer of our mines, and that notwithstanding that over \$17,000,000 of paints and varnishes were manufactured in Canada during 1918, there still remains further room for expansion in the business, seeing that imports totalled \$6,309,836 worth in the same period. Of course, much of this import value was made up of primary products which enter into the finished article, and are not the product of Canada.

# Stench Warnings in Metal Mines

By A. C. Fieldner (Chemist Bureau of Mines) and  
S. H. KATZ (Assistant Physical Chemist,  
Bureau of Mines).

Signals and warnings are necessarily of such a nature as to be perceived through one of the five senses. Most signalling devices appeal to the eye or the ear, and the principal means of sending a warning from the surface down to the miners in a metal mine has been by messengers, electric gongs or lamps, telephones, interrupting the flow of compressed air or introducing water in the compressed air lines.

Recent investigations (Katz, S. H., Allison, V.C., and Egy, W. L., Use of Stenches as a Warning in Mines, Technical Paper 244, 28 pp., 1920) of the Bureau of Mines in co-operation with several large metal-miners through the sense of smell are exceedingly simple to install and are on the whole as effective as any other system heretofore used.

Briefly, the door or stench system of warning consists of injecting one-half to one pint of a very strong smelling liquid (preferably one with a vile odor) into the main compressed air line at the surface. The air current quickly vaporizes the stench liquid and carries it to all parts of the mine where compressed air is used. Thus miners in working places operating air drills receive a positive warning to come to the surface within a few minutes after the stench has been introduced at the surface.

## Nature of Stench Liquid:

Obviously a stench liquid must not produce a poisonous or injurious vapor. The warning must be harmless under all possible conditions. The odor preferably should be disagreeable rather than pleasant in order to be most effective as a warning, and should be distinctive so that there would be no danger of mistaking it.

Of the large number of substances investigated, ethyl mercaptan ( $C_2H_5SH$ ) has proven most suitable from the standpoint of cost, availability and effectiveness. Ethyl mercaptan is a volatile liquid boiling at 98 deg. F. and freezing at 228 deg. F. below zero. It has a disagreeable and characteristic skunk-like odor which will not be mistaken for any odors commonly found in mines. Less than 0.01 per cent by volume of ethyl mercaptan vapor in air will give a strong odor.

Ethyl mercaptan may be obtained from certain chemical manufacturers at a cost of approximately \$2.25 a pound. It is not usually kept in stock by drug and chemical dealers. For this reason, experiments have also been made with amyl acetate, artificial "banana oil," which may be purchased from any chemical supply house or dealer in paints and lacquers.

Amyl acetate does not evaporate as quickly as ethyl mercaptan and requires a somewhat larger quantity to give a strong odor; however, in actual mine tests it proved quite effective and may be used as a second choice when ethyl mercaptan is not available. The odor is distinctive but rather pleasant to most people, and therefore is not so suitable a warning as the stench.

## Practical Tests in Metal Mines:

Practical tests of stench warnings have been made with excellent results in the following mines:

North Butte Mine (copper), North Butte Mining Co., Butte, Mont.  
Central Mine (gold), North Star Mining Co., Grass Valley, California.  
Empire Mine (gold), Empire Mining Co., Grass Valley, California.  
Bennett Mine (iron), Bennett Mining Co., Keewatin, Minnesota.  
Caspian Mine (iron), Pickands, Mather and Co., Caspian, Mich.

The test at the Caspian mine with ethyl mercaptan was especially successful. A. H. Trestrail, range safety inspector, stated on coming to the surface after this test was made, that "the entire fourth level was completely saturated in about 2½ minutes and that there could be no mistake in detecting the odor." As a result of this test Pickands, Mather and Co. plan to install stench injectors on the air lines of all their underground ore mines.

Amyl acetate was used in the test at the Central mine, at Grass Valley, California. The time required for the warning to traverse various distances in the mine are given in the following table:

Observer No.	Distance by pipe, Feet.	Time in minutes.
1	4000	3
2	4800	10
3	3600	7
4	3800	4
5	7800	8

The warning was positive in all cases.

## Quantity of stench liquid required for test:

One and three-fourths pints of ethyl mercaptan or three and one-half pints of amyl acetate are required for each 100,000 cubic feet of free air (compressed air and ventilating current) entering the mine per minute.

The injector is easily constructed from a stout glass cylinder, or an air-tight metal cylinder with a sight glass, and capable of withstanding the pressure in the line. It is connected both above and below the liquid to the air line with short one-half inch pipes. The stench liquid is put in through a removable plug, a valve is placed in the pipe below the liquid and one in the pipe above, the latter to allow air at the line pressure to fill the space emptied when liquid flows into the air line. Satisfactory results have been obtained by simply running the stench into the air line with no baffle for holding the liquid up to the passing air. Such an installation need not cost more than \$20 to \$30. Complete instructions for making stench warning tests and details of apparatus required are given in Bureau of Mines Technical Paper 244, which may be obtained by writing to the Director of the Bureau of Mines, Washington, D.C.

Stench warnings are not considered suitable for use in coal mines, as the stench must be introduced into the ventilating current which travels at a much slower velocity than the compressed air used in operating drills in metal mines.—U.S. Bureau of Mines, Reports of Investigations.

## CYANIDE IN CANADA.

(By J. A. McRAE, Cobalt, Ont.)

A peculiar situation is developing in connection with the use of cyanide at the precious metal mines of Canada, particular in the silver and gold mining districts of Northern Ontario, including the Cobalt, Porcupine and Kirkland Lake fields.

Up until quite recently, the Cassel Cyanide Company, of Glasgow, Scotland, supplied the great majority of the mines with cyanide, the price of the chemical ranging from around 16c a pound before the war up to about 24c a pound at the present time. Although the increase has amounted to about fifty per cent above pre-war prices, yet it is interesting to note that the manufacturers of similar grade cyanide in the United States are charging the American consumer about 35c a pound. In fact at one time during the war, the price of the chemical in the United States soared to over a dollar a pound. As to this, it has always been more or less a mystery why the Cassel Cyanide Company of Glasgow did not take advantage of this opportunity to enter the remunerative United States market. This is a condition which has given rise to wonder as to whether or not the manufacturers may have some understanding among themselves as to what field they are to bid for business.

### The New Competitor.

Recently, however, a new competitor has entered both the Canadian and United States field, even extending its activities to Mexico. This is the American Cyanamid Company, of Niagara Falls. Moreover, it has become quite evident that its bid for trade is one to be reckoned with quite seriously. Already the mines of the great silver mining camp of Cobalt are procuring the greater part of their cyanide from this new source, and although the inconvenience caused by using this low grade article is considerable, yet the saving in cost is said to more than compensate for this added inconvenience.

It is now interesting to learn that the leading gold mines of Canada are turning their attention to the possibility of effecting a saving by using the low grade cyanide, toward which end the Hollinger Consolidated and the Dome Mines have each ordered a carload and will conduct exhaustive experiments. Should the tests prove to be satisfactory, it conveys the threat of possibly eliminating the Cassel Cyanide as a serious competitor.

The truth appears to be that although the product of the American Cyanamid Company is low grade as compared with the Cassel cyanide, yet by using large quantities of the low grade material the same result is obtained, and that about 19 or 20 cents worth of the low grade material goes as far as about 24 cents worth of the high grade article.

It seems to be quite obvious, therefore, that in order to continue to do business in this country the Cassel Cyanide Company will be obliged to do some close figuring and possibly reduce its price to around 19 cents a pound. In event of this, the mines would probably be found giving the high grade article the preference.

### An Expression of Fear.

Among certain representative mining men the fear is expressed that the precious metal mines are beset with danger on account of the present situation. They point to the fact that in the chemical industry in various countries a careful study reveals the fact that

when one competitor begins to find business unprofitable it is very often found ready to retire entirely from the field, its successful rival paying a fair amount as compensation. This gives rise to the thought that were the American Cyanamid Company to offer the Cassel Cyanide Company a lump sum to retire from the Canadian field, just what would be the result? In event of this it is asked, would the successful competitor be willing to continue to sell cyanide at the present extremely low margin of net profit, or would advantage be taken of the opportunity to increase net earnings.

The mining men anticipating the possibility of such a result as that outlined are in the minority, and the majority seem to believe the Cassel Cyanide Company will never retire from the field. It is due to this that close observers scent the smoke of a possible battle, in a contest waged on the one hand by the Cassel Cyanide Company and on the other by the American Cyanamid Company. It is intimated that interests closely associated with the Dupont Powder Company are vitally interested in the affairs of the American Cyanamid Company. This being so a lively contest may develop provided the Cassel Cyanide Company decides to remain in the field.

Those who have followed the trend of developments in every phase, are free to admit that the fears expressed have some little foundation, and that the present is the time for mine operators to give the matter careful study.

First of all, the body best suited to take up the question is the Ontario Mining Association, representing as it does the great majority of precious metal mines in this country. It does not seem to be too much to expect that this association might find it advisable to encourage the Cassel Cyanide Company to remain in the field as a serious competitor for Canadian business.

### Cassel Cyanide of Canada, Ltd.

This view is strengthened by the fact that only a few months ago, the Cassel Cyanide Company of Canada, Ltd., was incorporated as a subsidiary of the parent company in Glasgow. While the functions of this new organization have never been officially outlined, there are many reasons for believing that it may prove to be the nucleus of a powerful company on this continent, with a large plant to be erected along the border of the two countries, Canada and the United States, and bidding for the trade of the entire continent.

Competition of this kind would likely be beneficial to the mines, as it would tend to reduce the price of cyanide to a minimum.

To sum up the situation: On the one hand is the possibility of competition being eliminated with results not beneficial to the mines, while on the other may be seen the possibility of competition being ultimately intensified. The question is: Which will it be?

### QUICK LOADING OF COAL FREIGHTER.

What is claimed to be a world's record in the loading of a coal freighter was established by the Baltimore and Ohio Railway at its Curtis Bay coal piers on May 10th. A cargo of 6,967 tons of coal was placed in the S. S. "Malden", belonging to the New England Gas Company, in 2 hours 44 minutes, an average of 2,548 tons an hour. The "Malden" is well known in Cape Breton ports from whence she has freighted coal for the Everett Gasworks.

# Contribution of Oil Geology to Success in Drilling

(Bulletin of Associated Petroleum Engineers). FREDERICK G. CLAPP, Chief Geologist.

The question is frequently raised as to what proportion of geological work has resulted in successful wells or what proportion of favorable structures have ultimately been found productive. In the early days of applied geology the percentage of success was not so high as now. Since then geology has attained a high degree of efficiency and accuracy and has become a recognized branch of engineering applied to the oil business. During the first few years of this century oil was supposed to be found mainly in anticlines, or rather, geologists were supposed to credit oil as existing only in anticlines, as anticlines constituted the most important type of geological structure that geologists then knew to be productive. During the past fifteen years the situation has changed to such an extent that a considerable number of other types of structure are known to be petroliferous in regions where other conditions are satisfactory. Every particular type of structure is given a technical name and studied from the standpoint of the habit of oil when associated with that particular type.

When we realize that fully ten different classes and twenty sub-classes of geological structures are favorable for oil, we understand the complexities of the petroleum geologist's work. His difficulties are doubled when it is necessary also to consider the degree of metamorphism or natural alteration in character of the strata, their hardness and porosity, the number and character of the "sands" that are expected to be productive, their known or calculated depth, whether certain beds are persistent or lenticular, their geological age, water conditions, etc. Although some persons expect a geologist or petroleum engineer to be infallible in his advice, it is generally understood, after a realization of the difficulties encountered in making predictions, that infallibility may not reasonably be expected and that the percentage of successful wells depends not only on the accuracy and quality of the geological work and the abundance of geological outcrops but also on the variability of unknown underground conditions, such as porosity, metamorphism, water problems, levels, etc., which frequently have no evidence on the surface.

Consequently the success of drilling based on geological advice can be represented by a different factor in practically every oil producing country, state or county in the World. For instance, in nine townships in Northern Oklahoma, Frederick G. Clapp has calculated that success in drilling increased from about 60 per cent. previous to 1913 (during which time no geological advice existed in the region) to 87 per cent. throughout the years 1913-1916 in the wells drilled entirely on locations made by the geologist.

Dorsey Hagar shows, in a paper presented before the American Institute of Mining Engineer, (Vol. 57, 1917, page 892), that 70 per cent of the pools located in Oklahoma, during the four years immediately preceding October, 1917, were opened on geological ad-

vice. He has also calculated that whereas only one well in 150 had opened a new pool in ordinary haphazard drilling in Oklahoma, on the other hand under geological advice one well in three had opened new pools. Hence, he states, an oil operator who prospects on the basis of geology has 50 times as much chance of striking a pool as one who does not.

Similar results have been found by other writers on the same region, more recently. Oklahoma stands at the head of oil-producing states respecting appreciation of geology, and is fourth from the bottom in the proportion of dry holes. Out of a total of 8,196 wells in 1919, Oklahoma had 62.4 per cent. of oil wells and 10 per cent. of gas, while but 27.6 per cent were dry.

In this connection it is interesting to note that Dorsey Hagar in another paper (Trans. Am. Inst. Min. Engrs. February, 1917, pp. 195-8) finds that out of the 75 most important oil pools of Oklahoma and Kansas located during the same year, all but four are on well defined structures such as domes, anticlines or terraces.

It should not be supposed that such a high degree of geological success as in Oklahoma can be attained everywhere. Nevertheless, The Associated Petroleum Engineers had only one failure in Wyoming from 1915-1917; the only wildcat well recommended in Canada was a success; and in Southern Oklahoma three new domes, deciphered in detail and recommended for testing, have all resulted in new pools. Whereas these illustrations perhaps show the extremes of success, the other extreme may be found where a geologist is asked to make a location in a region where he must tell his clients frankly that the chance is not good. Accordingly, all that he can do is to select the least unfavorable location: that is, the location where oil will be found if it exists at all in the territory in point.

In drilling without the aid of geology, there is, of course, complete failure in certain states which have been considerably prospected but where oil does not exist. Among oil producing states, on the contrary, the highest percentage of failure without geological advice has been 45.4 per cent. in the Gulf Coast fields of Texas and Louisiana. This applies where all the fields lie on saline domes, seldom more than one or two miles in diameter, many of them not apparent topographically, and hence with a chance not greater than 1 in 1000 of striking oil by an ordinary "wildcat" well.

The statistics tell us that out of the 1,236 wells drilled in the Gulf Coast fields in 1919, 52.6 per cent were oil wells, 2. per cent. gas wells, while, as above stated, 45.4 per cent. were dry holes. Inasmuch as the figures include both wells located inside or in extension of fields and also "wildcat" it is evident that a consideration of "wildcat" alone would result in an extremely small percentage of success. Although many persons suppose a geologist to be of no great value in the Gulf Coast fields, this is far from being true. Geology has in many cases discovered

saline domes and is furthermore of great value in properly locating new tests on domes which have been inadequately tested. The domes are so peculiar in type and results that after as many as fifteen wells have been drilled on a dome without success, yet later a field has been located on the very same dome. Every well that is drilled on a dome furnishes evidence for the geologist in making recommendations for the drilling of a well that will ultimately find production. The utility of geology in the Gulf Coast dome locations is properly attested by the fact that the Spindletop dome, the first one opened up, was drilled by Capt. A. F. Lucas, a mining engineer, who had given years of study to the subject.

Next to the Gulf Coast fields in proportion of dry holes, considering both those drilled on geological advice and those without, are the Illinois fields, which in 1919, out of total of 370 wells drilled, yielded 68.4 per cent. of oil wells, 1.3 per cent. gas wells and 30.3 dry holes. This is probably a lower percentage of success than would have attained in Illinois during the height of drilling in that state some years earlier. While the original drilling in Illinois may have been done largely without geological information, it is a fact that in recent years geology has been of tremendous assistance in Illinois, particularly in warning prospective investors away from unfavorable territory. Undiscovered potentially productive domes do exist in Illinois, yet nearly all structures and supposed structures which the Associated Petroleum Engineers have been called to examine in that state have for one reason or another been decidedly unfavorable. Notwithstanding the general flatness of the surface of northern and western Illinois and its deep covering of glacial drift, there are many portions of the state where detailed geological studies can be made and where results are of great value.

One who understands the high degree of success attained in Wyoming may be surprised to learn that 7 per cent. of the 303 wells drilled in that state in 1919 were dry, 8.9 were gas wells, while only 62.4 per cent. resulted in oil wells. It must be realized that a large proportion of drilling in Wyoming has been of a "wildcat" nature, that not all of the formations outcrop at the surface as prominently as in the Salt Creek, Big Muddy and other well known fields, and that in many cases little data are available to guide the geologist. However, as stated above, the results of at least one geologist as to Wyoming have been 80 per cent. successful.

The Central Ohio fields in 1919, out of a total of 940 wells, had 23.6 per cent. of dry holes as compared with 47.8 per cent. oil wells and 28.6 gas wells. Since Ohio has great gas fields, it is a fair assumption that a large proportion of the gas wells were actually drilled for gas and hence successful. The market is such that gas has sometimes as great value as oil. In the Central Ohio oil fields conditions are more difficult in some respects than in any part of the United States, because in the northern portion the formations are buried deeply by glacial drift, while throughout the fields the general structure is that of an eastwardly dipping monocline or homocline in which oil has accumulated at localities of slight interruption of the dip or of change in texture of the sand. Such localities are found by careful fieldwork south of the drift border and where the drift covering is slight.

Although the value of geology might be supposed to be slight in the Central Ohio fields, yet as the result of extended explorations made in those fields by The Associated Petroleum Engineers and other geologists, several good pools have been opened up. While the proportion of successes there is lower than in many other states, it is, nevertheless, so considerable that, because of the great value of Ohio oil, the geological work has been eminently desirable. In Central Ohio, as in the Gulf Coast, one must not depend on finding the pool by a single test. The proper plan is to drill first on what is apparently the most favorable part of the structure. This generally results in a "showing" of some sort and it is then desirable to work up or down dip towards the center of the structure, according to whether a showing of oil or of gas or of both be found. Companies that have proceeded on the assumption that a pool could be located by a single test have in some cases failed of success, while other companies later entered the very same fields and "proved up" the pool by making two or more tests.

In Kansas, out of the total of 3,432 wells drilled in 1919, 75.8 per cent. were oil wells, 5.5 per cent. were gas wells, while only 7 per cent. were dry holes. A large proportion of the latter were "wildcats" drilled in the extreme eastern part of the state or in outlying unproductive counties in hunting a repetition of the known big pools. The Augusta-Eldorado fields were discovered largely owing to geological fieldwork, and it has seemed reasonable to suppose that similar fields would be found on similar anticlines in central Kansas. This has been tried, and some cases of failure may be due perhaps to the fact that granite comes within drilling distance of the surface under a wide area in central Kansas. These factors bring down the percentage of geological successes in that state, but they do not affect the percentage in non-granite parts of the state or in other states where granite does not approach the surface.

Among the oil-producing districts of the United States, that one with the highest degree of success in 1919 from all classes of wells, including "wildcats" and those geologically located, was Kentucky. There 3,716 wells were drilled of which 85. per cent. achieved success as oil wells, while 3.7 were "gassers" and only 11.3 were failures. This is a remarkable record and refutes the remark sometimes made that geology is of little value in Kentucky. In Kentucky fields geologists have been active as in no other part of the United States, except Oklahoma and Texas, and a large proportion of the pools are in favorable geological structure.

In a general way, the use of geology has kept pace with the oil industry. Although there were no petroleum geologists for about 20 years after the discovery of petroleum in this country and although in 1908, when the consulting office of Frederick G. Clapp was opened in Pittsburgh, only one other oil geologist in the United States had a consulting office, yet by November, 1918, the columns of The Oil and Gas Journal carried 19 professional cards of petroleum geologists and engineers. By June, 1920, this number had increased to 43, most of these cards representing more than one individual. This depicts only the private practice phase of the profession. In addition, a number of the larger oil companies now maintain

## ROLLER BEARING MINE CARS

We make any type of Mine Car desired by the buyer. We also design and build special cars, if none of the standard types will suit.

Let our Engineering Department help you reduce your costs and increase your output and general efficiency.

This view shows the oil or grease retaining cap removed to show the Roller Bearings supplied on our Mine Cars.

Same car as shown above, but in Dumping position.

geological staffs of considerable size. Thus the petroleum geologist or engineer has taken his place in the business as an essential factor.

Many persons believe that geological activities are directed mainly to the discovery of new pools or new producing regions. This, however, applies to but one part of the profession and that the oldest one. At the present time, fully as important a group consists of the resident geologists in large fields and the research men on the large staff whose business it is to study all factors of importance that may affect the production of known fields or be otherwise of interest to the business.

Another new province is that of appraisal. If proficient in the appraisal field the geologist becomes fully entitled to be known as a petroleum engineer. He is called into consultation by companies desirous of making purchases in order to evaluate producing and potential properties. By means of decline curves, character, thickness and oil content of sands, spacing of wells, water and gas conditions and other factors, the petroleum engineer is enabled to estimate closely what a property will produce in future.

### THE POLITICAL EMBARRASMENTS OF CANADA'S FUEL WEAKNESS

Canada's important function in foreign affairs is frankly stated by Sir Auckland Geddes, British Ambassador to the United States. He calls upon Canada to play a large part in the building of a "golden bridge of sympathy and understanding" between the British Empire and the United States. "On the basis of such a friendship the peace of Europe could be es-

tablished," says the Ambassador. "I doubt if for many years it could exist in any other form."

It follows that the role this country is called upon to play is an essential one. Upon Canada's service to the cause of world peace the highest considerations depend. The opportunity and the responsibility are both impressive.

In this connection, it is most unfortunate that Canada should depend upon the United States for coal. Canada's fuel weakness is a fertile source of misunderstanding and trouble. It remains an invitation to the worst elements in American politics to involve Canada in their anti-British crusade, and it causes our best friends across the border endless embarrassment. Industrial quarrels, now so prevalent, aggravate the condition.

Sir Auckland Geddes has devoted himself passionately to the cause of Anglo-American goodwill. For the tricks and arts of diplomacy he substitutes a frank and open appeal to the good sense of the people. His is a momentous duty, in which he has the sympathy of all Canadians. He deserves practical assistance as well. Whatever Canadians can do to silence the voices of mischief-makers should be done resolutely and without delay. And let us take steps to wipe out this lingering coal disgrace by developing the huge coal resources of our own country to the end that the American people may have in Canada, a self-respecting, self-sustaining neighbor.—"Montreal Star."

### PERSONAL

Mr. Samuel W. Cohen of Montreal, is now in Newfoundland on examination work.

## TORONTO NOTES

At a special meeting of the Dome Mines Company, Limited, held in Toronto this week the proposals of the directors to purchase the property of the Dome Extension Company were ratified. The shareholders were represented by proxies exceeding 360,000 shares. With the taking over of the Dome Extension property, 76,667 shares of Dome stock will be distributed among 2,300,000 shares of Dome Extension, which means one share of Dome for thirty shares of Dome Extension. It is generally felt in mining circles that the taking over of the Dome Extension by the Dome Mines will add considerably to the wealth of the Dome if the recent exploration work can be depended upon. It was recently reported that diamond-drilling operations by the Dome on Dome Extension showed important ore bodies. The negotiations between the two mines have been going on for some time, and last March, owing to the incompleteness of the explorations, an extension of the option was secured until September.

The English Electric Company, Ltd., in addition to their four plants in England has purchased the Siemens Works at Stafford and has taken over the business of the Siemens Company of Canada Ltd. The English Electric Co., Ltd., will handle a complete line of electrical equipment. Offices will still be at Transportation Building, Montreal and Mr. C. W. Stokes remains as manager.

## FOR SALE

- 1—20 x 42 Jenckes First Motion, Double Drum Mine Hoist, Friction Drums 72 x 30, Corliss Twin Engine complete with 1200' 1 1/4" Cable.
- 1—14 x 20 Jenckes Geared Double Drum Mine Hoist, Friction Drums 72 x 48 with special Reduction Gears and extra 6" Shaft for Electric Drive.  
(Note. Was operated at times with 150 H.P. Motor since removed.)  
1200' 1" Cable on Drums.
- 1—36 x 24 Jenckes Jaw Crusher, Bolted Pitman, Manganese Jaw Plates.
- 1—300 H.P. C.G.E. Variable Speed, Slip Ring Motor, 2000V., 3 phase, 60 cycle, 300 R.P.M., Type 1, Complete with outboard bearing, Resistance Frames and 60 x 24 C.1. Sheave for Rope Drive, Starter, etc.
- 2—300 H.P. Westinghouse Type 'C' Constant Speed Motors, 2000V., 490 R.P.M., complete with Starters, outboard bearings, 36 x 24 C. 1. Pulleys and adjustable sliding Bases.
- 1—Briquetting Mill complete, rated capacity 5 tons per hour, manufactured by The Henry S. Mould Company, Pittsburg, Pa.
- 1—24" S. & A. Type A.C. Troughing Belt Conveyor. Distance C. to C. Head and Tail Pulleys 102'.
- 1—24" Link Belt Company's Troughing Belt Conveyor, C. to C. Pulleys 116'.
- 4—Standard Gauge Slag Cars, capacity of Bowl 225 cubic feet.
- 1—5 1-2 x 3" C.B. B.V. Canada Foundry Vertical Triplex Plunger Pump, Direct Geared to 25 H.P. C.G.E. 550V. Motor.

We have a large assortment of Mine Cars and Steam Pumps and miscellaneous equipment, and will gladly send booklet on request.

Immediate Shipment. Write or Wire for Prices and Information to:

## Books For Your Library

## Ore Mining Methods

Second Edition.

By **WALTER R. CRANE, Ph.D.**,  
Dean of the School of Mines and Metallurgy,  
and Professor of Mining, The Pennsylvania State College.

Deals authoritatively and in a practical manner with the methods of support in extraction of ore, stoping and mining in narrow and wide veins, bedded and massive deposits, including stull and square-set, filling and caving methods, and open-ent work.

Every mining engineer should have a copy of this standard book, for constant reference. "CRANE" has 272 pages, 6 by 9 inches—83 graphic illustrations—the price, \$3.50

A New Edition,

Issued Oct., 1919.

## Technical Methods of Ore Analysis

Eighth Edition, Revised and Enlarged.

By **ALBERT H. LOW**,  
Formerly Chief Assayer, U.S. Mint,  
Denver, Colo.

A number of new methods for Molybdenum, Potassium, Tungsten and Uranium have been placed in the Appendix of this up-to-the-minute edition.

With "LOW" in your possession, you will find your hardest problems quickly and correctly solved.

"LOW" has 388 pages, based on actual experience—the price, \$3.25.

# EDITORIAL

## The Provision of Housing by Mining Companies

A statement which has attained such wide publicity as to appear in a Toronto newspaper is attributed to an organizer of the A. F. of L. regarding housing conditions in the Cape Breton colliery districts. This observer's comments contain sufficient truth to give them sting, but he goes too far when he says that conditions are far worse in the mining districts of Cape Breton than in the worst slums of the great cities of America, San Francisco's notorious Chinatown not excepted. The veracity of this much travelled critic is shadowed by a further remark to the effect that after studying the development of the British Empire Steel Corporation he believes it will attempt to import coolie labor into Canada. As the British Empire Steel Corporation has not yet any corporate organization, having no designated officers, it is difficult to see how such an intention can be imputed. The gratuitous assumption reveals a bias that would make impartial criticism from this observer rather difficult.

Yet it is nevertheless true that some undesirable community conditions have concentrated themselves into one or two districts in the vicinity of Sydney. It is difficult to assess the blame, but the chief causes have been those which have usually brought about slum areas in Canada, and elsewhere. Lack of any system of town planning, inexorable laxity of building regulations, property speculation, non-Canadian elements of population, transplanted habits of dirt and congestion from European countries, and the ignorance of the immigrant, may be mentioned.

Circumstances have forced the industrial companies to become large providers of housing accommodation, and the ideas of these companies have necessarily not advanced faster than the conventions of the times and population in which they evolved. The Dominion Coal Company, for example, was founded upon the financial ruins of a number of independent smaller companies which commenced their chequered careers anywhere between 1857 and 1893, and the new consolidation inherited the plants and housing provision of earlier, but not better days. The style of housing provided in the successive stages of the progress and expansion of the Dominion Coal Company has improved, and the company's houses at the newer collieries are eagerly sought after, being better houses at lower rentals than are elsewhere obtainable.

The Dominion Steel Company in Sydney is not a large landlord, and its houses also are sought as a favor.

At Sydney Mines, a very large proportion of the mine workers own their own houses, and slum conditions do not exist in this colliery town. It is also true that a large number of the steel workers and coal miners in the Sydney District are their own landlords.

The provision of houses for employees has been to the coal and steel companies of Nova Scotia a necessary thing, but also an unprofitable thing, a source of much anxiety. Willy-nilly, the Nova Scotia companies—and this is a statement generally true of mining companies in a new country—have been compelled to become landlords, shopkeepers, provider of all public utilities and communal requirements and of transportation. In doing this they have naturally combined the vulnerability and possible points of attack of this combination of much berated responsibilities.

The slum areas, which undoubtedly exist, have evolved as a parasitical growth, and enquiry would reveal that the worst rack-renter and the genderer of undesirable housing conditions is the former immigrant, now grown rich, who takes advantage of the ignorance and trustfulness of his newly arrived compatriots, and sees no hideousness in slums that are an offence to our Canadian ideas. Some of these men, by their control of sources of illegal liquor supply, and their financial grip upon their fellows, achieved through the supply of housing, food, liquor and every possible source of profit, can exercise a sinister influence on labor matters, nor are they lightly offended by either corporation or municipal officers.

It is this position of vulnerability which accompanies the function of general fatherhood of the community, and the impotence of municipalities and corporations, to prevent the growth of parasitical slum areas and their concentrated evils, that has driven mining corporations in Canada to build "closed" towns, and to oppose municipal incorporation. Labor organizations have imputed other motives, but wrongly so.

A Social Survey was undertaken some years ago of a well-known section of the City of Sydney. The existing conditions were properly criticized, but the

blame was laid upon the industrial companies. The truth is that these same companies have provided the most substantial part of the decent housing accommodation of the industrial centres of Cape Breton, and they probably contemplate with something like consternation the expenditure on housing that will be necessary, at existing building costs, to accommodate all the additional population that mooted expansion of operations will require.

The foregoing gives point to a statement that Mr. Adams, of the Town Planning Division of the Commission of Conservation, is to be asked to advise the Dominion Coal Company, through its newly created Department of Industrial Relations, regarding the plan of a town to serve the workers of a new colliery

near Glace Bay. This, at any rate, shows a willingness to learn, but there will be people, not necessarily in the official ranks of the industrial corporations, who will consider it as fussy faddiness—which it most distinctly is not.

In comparing the corporation-built mining towns in some of the newer fields of the United States, with those of Nova Scotia, it should be remembered that the Nova Scotia companies never had the financial resources to warrant much heavier expenditures on housing than they have actually undertaken, for at no time in its history has any Nova Scotia coal company ever had sufficient funds at its disposal for necessary development work and capital expenditure on new collieries.

## More Corporation Baiting

The Toronto "World" animadverting upon our comments on the statements of the Chairman of the Mond Nickel Company in a recent issue, asks: "Is the 'Canadian Mining Journal' with all its claimed professional knowledge, ignorant of the value of the precious metals (platinum, iridium, polonium) the Mond and the International concerns take out of the nickel ore of Sudbury, and of which no return has yet been made?"

Previously dealing with this matter, in the issue of August 27th, the quantities of metals of the platinum group recovered in Canada and in New Jersey from Sudbury mattes was given, as excerpted from the returns of the Ontario Bureau of Mines and the Mines Branch at Ottawa. The latest returns of the Ontario Bureau of Mines mentions the by-product recovery at Port Colborne of "gold, silver, platinum, palladium, rhodium, ruthenium, osmium and iridium. The recovery of polonium is not referred to.

Polonium is an emanation of radium, and was first isolated by Mde Curie, who named it in honor of her native country, Poland. The presence of radioactive substances in the Sudbury ores would not be surprising, as they are widely disseminated in the crust of the earth, but its recovery, and stabilization for sale as an article of commerce, would be extremely interesting to learn about. Perhaps the "World" will vouchsafe more definite particulars regarding this little-reported achievement in metallurgy by the nickel companies?

There is no mystery about the by-product recovery of precious metals from the Sudbury ores, but there has been much definite achievement. It is customary to regard the recovery of the long list of rare metals that are specifically mentioned in the latest figures by the Ontario Bureau of Mines as a *fait accom-*

*pli*, forgetting the long road of metallurgical research that has made it possible, and forgetting also that chemical and metallurgical achievement are progressive things.

So far as we can gather, our Toronto contemporary accuses the nickel companies of concealing the presence of an element they have probably never found, and certainly never recovered; and of concealing statistics which are public property, and available to any person who will take the trouble to write to Toronto or Ottawa for them. These charges are fairly typical of the complaints made regarding the nickel companies.

Everyone who appreciates the strategic value of Canada's virtual monopoly of nickel and asbestos deposits will desire to see this country obtain full benefit of an advantage that serves, to some extent, to offset our dependency in other and more essential raw materials, and hopes to see in the future more complete refining of nickel and greater domestic fabrication of asbestos goods in Canada; and we take it that the Refinery at Port Colborne and the completely domiciled character of the enterprise of the British-America Nickel Company are concrete realizations arising from this very general and natural sentiment.

The "World," with some lack of elegance, states with reference to Mr. Mond's remarks: "We would fix that gentleman and his corporation so that they "would pay all their taxes to the Dominion of Canada, and the Province of Ontario." Perhaps it would be incorrect to remark—as is remarked of our own observations—that this is "childlike and bland," but the procedure that would ensure this result would be almost as interesting to learn as the achievement of the recovery of polonium from Sudbury mattes.

## Western Coal

The progressive and anticipatory spirit that is at this time noticeable in the Western Provinces in regard to the future of the coal mining industry is one of the signs of the times that should gladden the hearts of those who desire prosperity and political permanence to attend Canada in the years to come. Better team work has hardly ever been witnessed than is now being carried on by the combined efforts of the Government of Alberta, the University of Alberta, and the coal operators and dealers.

The first annual convention of coal operators and dealers of Western Canada was held in Calgary during the third week in August, being called at the instance of the Minister of Mines of Alberta. It is an auspicious beginning. The older coalfields of Canada have suffered through lack of such gatherings, and associations of coal operators have been frowned upon, when, had governments been well advised, they would have been encouraged.

The members of the Canadian Institute of Mining & Metallurgy should be pleased to note that the President, Mr. O. E. S. Whiteside, took a prominent part in the convention, and an interesting feature to eastern men was the part taken by men formerly connected with coal mining in Nova Scotia.

Dr. Tory, President of the University of Alberta, stated that two of the ablest and most suitably trained chemists available in Canada had been secured for the University, and that in a year the University expected to have five men employed on research, principally on coal storage, and the peculiar problems of western coal. Dr. Tory correctly pointed out that there was no need to stress the amplitude of the coal resources of Alberta. "We have not found out what 'these are,'" he said, "but we have undoubtedly the 'greatest united body of coal resources to be found 'in any place in the world, with probably one exception, and it is necessary that this great asset 'should be developed.'" Light and leading in matters of public interest is precisely what universities are established to provide, and there is no asset of Alberta, or for that matter of Canada, that is so potential for material welfare and so pregnant with promise for our national security, as the great coalfield of the West.

W. J. Dick, of Winnipeg, said that at the present time Winnipeg was using 200,000 tons of hard coal, and 250,000 to 300,000 tons of bituminous coal. If that could be all provided by the West, it would mean up to 600,000 tons, or ten per cent of the present production of Alberta coal. We cannot think of any conceivable reason why Winnipeg should burn coal that is not the produce of Canadian mines. At least not any reason that can be weighed in the balance against the necessity that Canada should be self-

sufficient, and not the final mendicant situated at the point remotest from the source of supply. The monetary value or cost of an imported article is one of the least important factors in these times, as a study of the exchange quotations in the morning paper will disclose.

The decision of the Canadian Institute of Mining & Metallurgy to hold its Annual Western Meeting in Winnipeg towards the end of next month fits in well with the events of the summer. The programme indicates that much attention will be devoted to the fuel question, and, while it is hardly likely that the scope of the papers which will be presented can be wider, or more representative than those which were prepared for the March meeting in Toronto, it is likely, after the experiences of the summer, that more attention will be devoted to their discussion.

The Convention devoted much time to the consideration of railway rates on coal, and the impression we gain from reading the discussion is that up to this time the railways have not viewed the coal traffic of the West in an understanding manner. That is to say they have not yet apprehended the fact that in days to come the carriage of coal will be the most important function of the western railways, and one, which if it is favored and fostered by the railways, will provide the bulk of the freight revenues. The day is coming when the tonnage of coal, and the tonnage of those things that are made with the assistance of coal, will bulk far larger and be of more financial importance than the grain yields of the prairies. If the railways will cease to regard coal as a necessary nuisance, and will build for that day when Alberta will be the Pennsylvania of Canada, they will get a proper starting viewpoint in arranging appropriations for rolling stock equipment. The carriage of coal, in very large quantities, at all seasons of the year, for very long distances, is going someday to be the principal business of the western railways.

The question of storage was discussed, and it was pretty generally agreed that this was one of the peculiar problems relating to western coal that must be solved before the industry could be really successful. A competent committee was selected to study this question.

The more the various phases of the western coal industry are discussed, the more plainly it is revealed that, at least west of Fort William, Canada can and should be completely self-supplying in coal, whether it be required for domestic heating, steam-raising, metallurgical uses or the production of gas. And, the most pleasing revelation of these days, if the present temper of the West is any indication, is that western Canada has made up its mind to become self-supplying in regard to coal.

### THE INCREASE ON FREIGHT RATES FOR COAL.

Mr. Carvell, the Chief Commissioner of the Board of Railway Commissions, states that in consideration of the high cost of coal at this time, the freight rate increase granted to the railways on coal is "less than one-half of what it should have been to be fair to the railways," and he threatens quick action against any coal dealer who uses the freight increase as an excuse for profiteering. We believe the special consideration given to coal freights is well advised, in view of the fundamental nature of coal costs, which are reflected in every stage of manufacture and transportation. Equally well advised is the warning regarding increase of retail costs excused on the ground of increased freight charges, which gives point to the opinion previously expressed in these columns the coal producers should seek as far as possible to control the distribution of coal to its ultimate destination. As in so many other commodities, the price of coal as paid by the ultimate consumer is not necessarily proportionately related to the price obtained by the producing coal company.

### "LOST PLACERS."

Those who were present at the Annual Meeting of the Canadian Mining Institute in Toronto last March will recollect that Dr. A. P. Coleman suggested that the debris from the glaciation of the gold and silver bearing rocks of Northern Ontario might conceivably be found under the clays on the way to James Bay. He drew attention to the fact that, with two notable exceptions, placer mining had preceded quartz mining namely South Africa and Ontario. The S. A. Mining & Engineering Journal for 7th August last, contains an article on "Deep Level Alluvial Leads," by "A.D.", who asks: "Is there no alluvial of the present or past age derived from the bankets of the Witwatersrand? Here we have more gold to the square mile than anywhere in the world, reefs outcropping for sixty miles or more. In the past ages there has been enormous erosion from the upturned edges, yet no alluvial gold of any importance has ever been located." The South African writer, as did Dr. Coleman, suggests search under the ice drift along the presumed course of pre-glacial and glacial rivers.

### SOUTH AUSTRALIA OFFERS REWARDS FOR DISCOVERIES OF OIL AND GRAPHITE.

The South Australian government, to encourage prospecting for oil, has offered a bonus of £5,000 "to the person or body corporate which first obtains from a bore or well situated in South Australia 100,000 gallons of crude petroleum, containing not less than 90 per cent, of products obtainable by distillation." A bonus of £1 per ton on marketable graphite from a mine in South Australia, on the production, to the approval of the Minister of Mines, of account sales of graphite sold prior to June 30, 1922, is also offered.

### MR. CHAS. CAMSELL, THE DEPUTY MINISTER OF MINES, HONORED BY VANCOUVER AT FAREWELL DINNER.

The farewell dinner tendered to the new Deputy Minister of Mines on leaving Vancouver was a notable gathering of prominent Vancouver citizens, and a tribute to the esteem in which Mr. Charles Camsell is held by his many friends in the West.

The Dinner was held under the auspices of the Vancouver Branch of the Canadian Institute of Mining & Metallurgy. Among those assembled to do Mr. Camsell honor were the Hon. William Sloan, the Minister of Mines for British Columbia, W. Fleet Robertson, the Provincial Mineralogist, Mr. Nichol Thompson, chairman of the Mining Bureau of the Board of Trade, Mr. A. E. Haggan, Editor of the "Mining & Engineering Record" and about one hundred other citizens of prominence. Mr. H. Mortimer Lamb, the Secretary Emeritus of the C. I. M. & M. was Toastmaster. Mr. Lamb's remarks, which were in the happiest view, are elsewhere published in this issue. Mr. Camsell was presented with an engraved gold watch, and in his speech evinced that wide knowledge of the mining industry in Canada, and that terseness of phrase that doubtless commended him to the authorities at Ottawa for his new position. Among Mr. Camsell's epigrams may be noted the following: "Canada's resources are only slightly developed, and mining least of all. The only limitations which can be placed on mining in Canada are the boundaries of the country. Today more mineral wealth is being placed on the market than during the Klondyke gold rush." Mr. Camsell expressed his gratitude at the occasion, and for the reception accorded to him, and said that he would strive to do right in the new office he had undertaken.

"Since spending a few days at Ottawa", he said. "I have felt the sense of responsibility more than ever. At first I doubted my ability, but on mixing with those connected with the department and finding my way about I feel now a confidence which will aid me in the work. I have a feeling of optimism in the future of the mining industry of Canada, and when one considers what has been done in this country in a comparatively short time, one is justified in such optimism". Mr. Camsell spoke of the discovery of a new area in which nickel had been discovered in B. C., and said that the report of the finding of oil in the Mackenzie Basin district was of the greatest importance.

The Committee in charge of the arrangements for the dinner included Messrs. H. Mortimer Lamb, Nichol Thompson, G. Middleton of the Dominion Assay Office, J. C. Nettell of the Geological Survey, A. E. Haggan, and F. E. Payson, the Vancouver representative of this journal.

### An Appreciation of Charles Camsell at the Farewell Dinner in Vancouver.

*H. Mortimer-Lamb.*

The Committee in charge of the arrangements for this auspicious event has ordained that lengthy orations this evening shall be taboo. They have handed me a memorandum in this connection, wherein their regulations are set forth. I note therefrom that the Chairman is allowed ten minutes in which to explain "why we are here." Other speakers, with the exception of our guest of honour, are granted three minutes in order to explain why they are here; and

I am particularly desired to request all speakers to stick to the point, and not, even if they be professional politicians, branch off into disquisitions on controversial topics, such as the sex of Dolly Vardon, Ireland, prohibition, why I am a Bolshevist, and so forth. It is reckoned that by adhering to these rules of debate, we shall be able to dispose of all the preliminaries in fairly short order, and thus leave the rest of the evening, say three or four hours, free to us to enjoy and be edified by the address of the Deputy Minister of Mines for Canada, on the theme, "How I rose in Life: or Geology as a Stepping Stone to a Career."

So much by way of official announcement.

To come now to my text: "Why we are here." Gentlemen, this is both a mournful and a joyous occasion. We are here to mourn the translation of a noble and dearly-beloved soul to another more transcendental sphere; and yet to rejoice that one—our own familiar friend—has been called to sit in the seats of the mighty. As "The Province" in an able editorial on Mr. Camsell's elevation so appositely remarked, it is good to have a friend at court, and we all felt that if by giving Mr. Camsell this dinner we could convince him that we were still his friends and place him under an obligation to us on that account, it would be money very well spent. There is a good deal to be said as a business proposition, in favour of throwing bread on the waters. But you may ask, "Why a dinner; wouldn't a trip to the summit of Grouse Mountain, a picnic in Stanley Park, or a garden party at Burnaby Lake, have been equally appropriate and at the same time cheaper." The reply is, "No, emphatically, No. Geologists are not as other men. You can only appeal to them in one way. Feed them. I refer you to the Bulletin of the C.M.M. for July if you would know what privations Mr. Camsell endured in his early career by reason of a lack of proper nourishment, and how for a whole winter on the Skeena he subsisted on a diet of squirrels and frozen blue-berries. He has had a splendid appetite ever since, and has told me confidentially on more than one occasion that nothing pleases him so well as a good dinner. In fact, I question whether Mr. Camsell would have abandoned field-work and its freedom for the worries and responsibilities of his new office, had the gastronomical arrangements of the Department in respect of the former been more satisfactory.

But while we don't want to be too serious this evening, I should like to say a few words in all seriousness. I want to express in the strongest possible terms the acknowledgements of the mining industries of this country to the magnificent services rendered these industries from the time of Logan to the present day of the Department of Mines, and particularly of the Geological Survey; and to pay humble and grateful tribute to the geologists in the public service of Canada, who serve us so ably and so conscientiously. The value to Canada of the labours of the great founder of the Survey, and of the men who have carried on the work he so ably began, the work of Selwyn, Dawson, Fletcher, Adams and Barlow, of Dowling and Faribault, of LeRoy and Broek and Camsell, and Cairnes—to mention only a few notable names—the value of the work of these men to the Dominion is incalculable. And yet there is no class

so poorly, so incommensurably, remunerated. If pecuniary reward were the only inducement to scientific men to enter the service of the Dominion Government, the probabilities are that we should have no Geological Survey. But as we all know the world's best work is not done for the sake of pecuniary reward. If it were, if success and high achievement in life, were to be gauged always by the dollar standard, a Charley Chaplin would rank higher than a Shakespeare, a Mary Pickford than a George Eliott, a Beav-erbrook than a Borden, a Lipton than a Lloyd George, a Carnegie than an Abraham Lincoln, or a Vancouver plumber than a geologist of the Canadian Department of Mines. But, thank God, money is not the sole, nor the highest criterion by which to measure merit. Yet it is not to the credit of society that all the very highest forms of labour and services are the least well requited—art and science, pedagogy, statesmanship rank among the most unremunerative of callings; buffoonery, prize-fighting, financial buccaneering among the most profitable.

But while the members of the staff of the Department of Mines are more interested in their work than in their pay, they are now being compelled to think more about the matter of pay. Many, especially those who are married men, find that they can't make ends meet on the wholly inadequate salaries they draw, and so have been practically forced out of the service. The loss to the Survey and to the country has in consequence been most serious. The rectification of this state of affairs is one of the matters with which the Deputy Minister, Mr. Camsell, will naturally concern himself. It is a most vital one. And I can assure him that in this, as in all of his endeavours to maintain the Survey at a high standard of efficiency and usefulness he may depend on the sympathy and active co-operation of not only the mining men, as represented by our Institute, but by all other classes of the country, having its interests at heart. I submit to you that to attain the maximum of efficiency and usefulness, it is not enough that the Technical Departments of Government should be divorced from politics, they should be relieved also of the interference of commissions, Civil Service or otherwise.

Finally, I desire to felicitate our guest on the high honor that has been bestowed on him; and to felicitate the Government on its selection of so capable and worthy an official to fill the exalted position of Deputy Minister of Mines for Canada. It is without doubt the highest honour to which a member of the profession of mining in this country can aspire; and the creditable performance of the duties of that office pre-supposes the possession by the occupant of qualities and talents of no common order. The successor of Logan and Dawson must necessarily be above his fellows in natural ability. The appointment of Mr. Camsell, moreover, is significant and satisfying from another aspect. Political pull had no relation to it. Merit alone determined it. And what is more surprising in this age of advertising, modest and unassuming merit was recognized, and received its just due. I will not embarrass our guest by enumerating all his virtues in his presence, but he will permit me to tell him that those virtues have won our hearts, and that no man in British Columbia is richer than he in the sort of wealth that neither rust nor dust can corrupt—the esteem and respect and affection of his fellow citizens.

## Letter to the Editor THE ASBESTOS INDUSTRY.

Editor "Canadian Mining Journal,"

Dear Sir:

I notice the article in your valued paper on Page 722, "Asbestos Fibre of Canadian Origin Supplied to Japan by United States Exporters."

I believe that Mr. Bryan, Canadian Trade Commissioner, was a little hasty in his remarks. Is he aware of the fact that some of the largest asbestos mines in Canada are owned outright by American interests? Is he aware of the fact that some of the Canadian miners have their selling organizations in the United States? The writer personally has been in Japan on various occasions and is interested financially in some of the largest asbestos mines in Canada. The Japanese buyer knows perfectly well that asbestos is not produced in the United States. He cannot help but know this, for the reason that shipments are made to him direct from Canada via Vancouver. The result is that not alone do the Canadian miners dispose of their material, but the Canadian railroads and steamship companies also benefit through the sale.

The remark:—"it is time we became a little more independent of our southern neighbors," does not cause a friendly feeling. The southern neighbors are the largest customers that Canada has and everything should be done to make business relations still more pleasant than they are at the present time. I do not blame Mr. Bryan for advising the Canadian exporters to have their own branch houses in all overseas countries, but he must grant that if the American has already done so, that it is another example of their "pep" and tenacity as he states. I believe that any asbestos miner in Canada will agree with me and state that to a great extent, the prosperity presently enjoyed by the Canadian asbestos miner is due to a great degree to the American exporter and consumer.

Trusting that you will give the foregoing your usual courteous consideration I beg to remain,

Very truly Yours,  
ASBESTOS & MINERAL CORPORATION.  
B. Marcuse,  
President.

### Note:

We are pleased to have the opportunity of publishing Mr. Marcuse's letter. We think, however, that Mr. Bryan missed the main lesson to be learnt from the policy of the Government of Japan in encouraging the asbestos products industry in Japan. The handling of crude asbestos through New York brokers is in line with the practice of mineral brokerage in North America, and it should not be forgotten that not only is the United States the great market for Canadian asbestos, but many of the asbestos mines in Canada are owned by citizens of the United States, and, as Mr. Marcuse points out, the selling organization of some of the Canadian asbestos producers is placed in New York. This is what would be expected, seeing that the market is there.

It is progress towards utilization of Canadian asbestos in the arts in Canadian factories that is chiefly to be desired, but this is a point that the country has not yet attained. The utilization of asbestos in the industrial arts is very varied, quite specialised, and is spread over many branches of industry. A manu-

facturer of asbestos goods in Canada could only look to Canada for a market, and he would require to make such a variety of articles, that outlay on plant and technical supervision would be disproportionate to the probable sales. That is the existing situation. That this situation will indefinitely continue is not to be expected.—Ed.

Haileybury, Ont.

September 13, 1920.

Editor Canadian Mining Journal.

Dear Sir:—

In the recent issues of Sept. 3rd and 10th, your Northern Ontario Correspondent has referred to the poor road between Elk Lake and Gowganda. That the mining industry of Gowganda has suffered from lack of transportation facility no one will deny. The writer is of the opinion that the present Ontario Government acted wisely in the early part of this year, in holding off the construction of the macadam road begun by the late Government. Such competition as a macadam road would offer, would have very seriously mitigated against the successful operation of a Light Railway, and a part of our Northern Ontario Press advised us a number of times that the Light Railway was assured and would, like the mushroom, develop over night.

The writer understands that the present Government is going to connect Gowganda and the few miles of macadam already laid down with a good gravel road, which can be built in one quarter of the time required for macadam and at one tenth of the cost per mile of road as built by the late Government. In the writer's opinion your correspondent is more interested in adversely criticising the present Government than in the transportation problems of Northern Ontario.

Yours sincerely,

A Prospector.

### THE CANADIAN SECTION OF THE BRITISH CHAMBER OF COMMERCE IN PARIS.

Amongst British Chambers of Commerce established abroad, that of Paris is conspicuous for its enterprise in serving the requirements of British Trade and Industry, and, furthermore, possesses a very active Canadian Section.

The Committee of this Section is composed of persons themselves interested in trade with Canada, and consequently is in a position to supply all the requirements of Canadian Members. The membership of the Chamber is restricted to firms of British nationality, it receives no subsidy from the Canadian or British Governments, and carries on its most necessary work entirely through the subscriptions of its members. To enable the Chamber to take up a firm position and thus sufficiently combat foreign competition, it very naturally deserves to continue to add to its membership.

Amongst other things it puts its members into touch with suitable agents in France, obtains information on the Commercial standing of French firms, supplies exact Customs classification of goods, notifies changes in French Customs duties and proposed commercial legislation, communicates enquiries from French buyers of British goods, and, furthermore, publishes a very useful Bulletin of information.

Applications for membership should be made to the Secretary of the Canadian Section, British Chamber of Commerce, Incorporated, 6, rue Halevy, Paris.

# The Breathing Apparatus Fatalities at the Black Diamond Colliery, Washington State

Report of Accident of Saturday, July 10th, at the Black Diamond Mine of the Pacific Coal Company, State of Washington, in which Three Members of Mine rescue Teams lost their lives.

By JAMES McGREGOR, Chief Inspector of Mines.

The Hon. William Sloan,  
Minister of Mines, Victoria, B.C.

Sir,—In compliance with instructions received from you on the 12th inst. to investigate and, if possible, learn the cause of the accident which occurred at the Pacific Coal Company's Black Diamond Mine, in the State of Washington, in which three men lost their lives while wearing rescue apparatus underground when making an examination of an abandoned slope owned by the Pacific Coal Company, and which had not been operated for four years, I have the honour to make the following report:—

I proceed to Seattle on the above-mentioned date, reaching there at 9.30 p.m. On the morning of the following day I called at the office of James Bagley, State Inspector for the State of Washington. There I learned that the Coroner, Howard McDonald, after questioning some of the men who had been at the scene of the accident, decided that an inquest was unnecessary. From Mr. Bagley I learned the following:

The day previous to the accident Mr. Morgan, the superintendent of the Black Diamond Mine, mentioned to James Murphy, captain of the Black Diamond rescue team, that he would like them to go down the old slope to learn if the water had risen or lowered since their last visit about three months previous, and remarked at the same time that, as they were going to enter the contest which is to take place at Roslyn, Wash., on August 14th, it would be good practice to make the trip through the black-damp area of the slope. It was agreed that they would go on Saturday.

The team was composed of five men—James Murphy (captain), Harry DeWinters, Hugh Hughes, Fred Ponton, and Julian Conda. Mr. Morgan, the superintendent, accompanied the team to the entrance of the slope, where they prepared their apparatus. Before putting them on the superintendent asked them if they had sufficient oxygen. In talking the matter over they were all satisfied they had plenty, remarking that it was only a short trip, the distance down to the water being 1,400 feet from the surface. At about 200 feet from the surface, known as the dead-line, they would be in the gas. They then looked at the gauges and were satisfied they had enough oxygen.

Harry DeWinters, using a Draeger type of apparatus of the 1916 model, had 50 minutes' supply; Hugh Hughes, using the Draeger of the same type, had 50 minutes' supply; James Murphy, captain, using a Gibbs apparatus of the old type with no by-pass, had 45 minutes' supply; Fred Ponton, using a Gibbs of the same pattern, had 60 minutes' supply; and Julian Conda, using a Gibbs apparatus of the same pattern as the others, had 90 minutes' supply.

They started down the slope at about 9.30 a.m. on the 10th instant, the superintendent, Mr. Morgan, going with them to the dead-line about 200 feet underground, where a safety-lamp was left burning. He intended to remain there until they returned and re-

ported. After waiting about twenty-five minutes he became anxious at seeing nothing of them, knowing the trip had been made by the same team three months previous in twenty-seven minutes. In another few minutes he heard a call for help from Hughes. He, being alone and without apparatus, hurried to the phone and phoned the rescue team from the Burnett Mine, also phoning for Mr. Bagley, State Inspector, and Stephen H. Green, the general manager, who both arrived on the scene in about an hour and a half. By this time the Burnett team had arrived and gone underground. The statement made by the survivors of the first team to go down, to the State Inspector, was to this effect:

They went down to the water-line, taking the end of the rope with them to be left there and hauled up after returning to the surface, and there measured to determine the distance to the water. When the water was reached DeWinters showed signs of distress. When the captain examined his apparatus he noticed he was almost out of oxygen and decided to assist him out. After getting De Winters up the slope about 70 feet, Hugh Hughes dropped. When the captain realized by this time that they were all short of oxygen and could not stay longer, he ordered them all to go out and secure help, which was done; being compelled to leave Hughes and DeWinters behind.

The Burnett team, who went to rescue DeWinters and Hughes, were equipped with the Gibbs apparatus. After being underground about twenty minutes one of the party returned in an exhausted condition and was taken to the hospital, where he recovered.

The next to become exhausted and fall was James Hudson, of the Burnett mine-rescue team, who was equipped with a Gibbs apparatus. He was at once brought to the surface and every effort made to resuscitate him. After working with him for one hour and a half there was no sign of life. I was unable to learn whether or not he had any constitutional weakness.

Owing to a scarcity of apparatus to equip the twenty men organized into relief squads, the State Rescue Station having all but three of their apparatus away East to be remodelled, necessitating the use of those which had already been in use that day. Among them was the Gibbs apparatus Hudson had been equipped with. It was taken from him, recharged, and used again without having undergone any repairs, and was apparently in good condition even after having been somewhat roughly handled.

Upon the arrival of James Bagley, State Inspector, and Stephen H. Green, general manager, they organized a corps of twenty men equipped with rescue apparatus, sending four in a team and other teams of four following each other at a distance of 250 feet between teams, and taking a sled with them to where DeWinters was left. Placing the body on the sled and attaching the sled to the rope already mentioned, which had not yet been pulled up, the sled with the

body was hauled by those at the dead-line. The rescue party merely kept the sled in the best course until they met the next party 250 feet farther up, leaving the sled in their care and continuing on out to the surface. Each party did the same until the body was recovered.

I was informed that each apparatus given to the Black Diamond rescue team on the morning of the 10th was tested, before being given out, by the usual method known as the soap test, and appeared to be in good condition. This is confirmed by the same apparatus which Hughes wore being recharged with oxygen and used again the same day without any repairs.

This slope is very difficult to operate in, wearing rescue apparatus, the rails having been removed and many of the old ties having been left, making travelling heavy. The slope pitches about 35 degrees.

The consensus of opinion among the remainder of the first team to go down is that they were too confident and were not well enough supplied with oxygen in case they were delayed, if only for a short time.

The rescuers from the Burnett Mine, upon arriving at the scene of the accident, were somewhat tired and nervous, which accounts for so many of them being unable to proceed far, wearing apparatus.

In all there were three fatalities and five overcome; none of these were shown to be through defective apparatus.

I am greatly indebted to James Bagley, State Inspector, and to S. H. Green, general manager, for what information I have been able to gather. It is unfortunate there was no inquest, which prevented me from securing valuable and important information in detail, which is necessary in such a serious accident as this.

Respectfully submitted.

Victoria, B.C.,  
16th July, 1920.

#### Supplementary Official Comment Re Fatal Accident In Use Of Mine-Rescue Apparatus.

This accident in no way discredits the efficiency and safety of the apparatus when handled properly.

The plain facts of the case are that this team attempted a feat in ordinary practice that most men would have given very serious consideration before allowing it even in a case of emergency.

The place to be travelled was dangerous, being full of carbon-dioxide gas, CO<sub>2</sub>. There was no need to take the risk in ordinary practice-work.

The roadway to be travelled by the team was the worst possible for men wearing mine-rescue apparatus, being of heavy grade and very rough.

To go in with such a supply of oxygen, knowing the conditions, was suicidal.

The slope to be travelled by the team is 1,400 feet in length and pitches 35 degrees, and with the rails being lifted was in a very dangerous and rough condition for walking. A person in good physical condition without mine-rescue apparatus would have his work cut out to make this return trip in 30 minutes, yet the men attempted to make it with one of the men only having a 45-minute supply of oxygen, two having 50 minutes' supply, one 60 and one 90 minutes' supply.

It is noticeable that the one with the 45-minute sup-

ply was one of the survivors, the machine he was wearing being a Gibbs. This can be attributed to the automatic feed, which would function according to the wearer's demands. Both men lost were wearing the Draeger type of apparatus, 1916 model, which are not equipped with automatic feed arrangement, the machines giving a constant supply of oxygen and not functioning according to the wearer's demands. This, no doubt, is the reason DeWinters and Hughes, the two wearing this type of machine, came to get in distress on the heavy, rough travelling on the heavy pitch slope. After the accident the machines were all found to be in good condition, and if they had been properly charged before going in the mine there would have been no accident.

The rough conditions encountered on the slope can be imagined when it took five teams of four men each to get out the bodies of the victims.

Why a trial with such risks attached should be selected for ordinary practice is hard to understand, even if the machines had been charged to the limit. But to go in with about one-third full charge is difficult to understand.

#### PRECAUTIONS IN USE OF OXYGEN RESCUE APPARATUS.

By GEO. S. RICE,  
Chief Mining Engineer, Bureau of Mines.

Three men lost their lives in the Black Diamond Coal Mine near Seattle, Wash., recently while wearing oxygen breathing apparatus. The press dispatches stated that these men lost their lives while practicing with the apparatus. Later reports stated that the men died while attempting to make a trip 1,200 feet down a 25 degree slope which was filled with black damp, in order to measure the amount of water that had accumulated at the bottom of the mine, and the trip was attempted with oxygen in the tanks of the apparatus with dials indicating only 45 minutes' supply. The oxygen in the tank was used up and the men therefore lost their lives from a deficiency of air to breathe.

In spite of all the education and training done by the Government to prevent accidents, men are prone occasionally to take unnecessary chances. Every piece of apparatus, no matter how perfect, has its limitations. The Government, through the agency at the Bureau of Mines, has trained many thousands of miners in the use of mine rescue apparatus. The training has been given to all miners who requested it, and the Bureau has gone to the extreme of urging miners to join the rescue and first aid classes. In spite of all the efforts of the Government, men occasionally attempt the impossible.

To go 1,200 feet down a 25 degree slope, make observations, rest, and then return 1,200 feet, thus making a total distance of at least 2,400 feet, in 45 minutes is a quick trip when a man is not encumbered with a heavy load, but to attempt it encumbered by an apparatus weighing about 40 pounds makes it more than a hazardous undertaking.

Modern apparatus when fully charged will furnish oxygen for two to two and one-half hours when used with moderate exertion or with periods of rest, but a person uses four to five times as much oxygen in climbing a steep slope with a load of 40 pounds, than he would when walking at a moderate gait along a level road. It is quite probable therefore, that the

45 minutes charge indicated by the dial will not last 45 minutes with the violent exertion necessary. The Bureau of Mines in its handbook on "Rescue and Recovery Operation in Mines After Fire and Explosions," on page 49 makes the following statement:

"The rescue crews should observe every known precaution for their own safety while travelling in after-damp or other 'noxious' gases. Each crew should be composed of at least five men, including the captain, and the members of the crew should not become separated. If any one member complains of feeling unwell or is observed to be staggering or breathing unnaturally, the entire crew should immediately return to fresh air. In view of the liability of a member receiving some injury or his apparatus being damaged, a crew should never advance such a distance nor travel over such faults or wrecks as would prevent the crew from carrying one of its members back to fresh air. With the types of breathing apparatus now in service, the maximum straightaway unobstructed course should not exceed five thousand feet with a reserve crew at the fresh air base."

While in the foregoing it is to be noted that the maximum distance to be traversed is 5,000 feet, this for a level, unobstructed road, and as previously indicated, a trip of 2,400 feet down a steep incline would be more than equivalent to a 5,000-foot trip on the level and which maximum distance calls for a fully-charged apparatus, that is, with at least three times the amount of oxygen which it was alleged the three men had who made the disastrous trip in the Black Diamond mine. While all of the details of the affair are not known, at least enough has been indicated to send out a caution against men making such a fool-hardy attempt, and it is desirable that full facts shall be known so that the public shall not be prejudiced against an apparatus which has greatest value when it is carefully used and used in accordance with well established rules.—U.S. Bureau of Mines, Reports of Investigations.

#### OBITUARY.

##### Mr. Henry Berry, Montreal.

Mr. Henry Berry, the Vice-President and General Manager of the Canadian Asbestos Company died at his residence in Montreal, on the 13th September, after a long illness. The Montreal "Gazette" states that general regret is felt in business circles in Montreal at the passing of Mr. Berry, who had been associated with the asbestos industry most of his life, there having been comparatively few uses for the mineral when he first became interested in it, but in the course of some thirty years of active development work he made it known all over the Dominion. He built up a large business which is now in a flourishing condition.

He had a strong personality, was richly endowed with energy and foresight, and these qualities made themselves felt in the extension of the business, in the interest of which he travelled from coast to coast hundreds of times.

Mr. Berry was 54 years and ten months of age. He was a member of the Montreal Board of Trade, and a member also, of the Masonic Order. In religion, he was an Anglican, belonging to St. Stephen's Church. He leaves a widow, formerly Miss Olive Grout, of Grimsby, Ont., and three sons: John and Frank, of Montreal; and Robert C., B.Sc., C.E. of Ottawa.

#### NOTES FROM THE NOVA SCOTIA COLLIERIES.

##### Nova Scotia Steel & Coal Co.

The output for August totalled 47,843 tons, made up as follows, Florence Mine, 16,467 tons, Princess, 13,843 tons, Jubilee, 12,346 tons, Scotia, 5,287 tons. This is slightly less than June and July figures, the lessened production being chiefly due to holidaying. September production will not be high at the Cape Breton collieries, being a short month, and one not generally marked by maximum production.

##### Labor Matters.

The Royal Commission is stated to have forwarded its findings to Ottawa, and the Department of Labor is expected to make an announcement regarding this during the current week. A significant statement was given to the newspapers by Mr. Wolvin, President of the Dominion Steel Corporation, on his return to Montreal from a visit to the collieries. He expressed the view that owing to the conditions existing in the country at the present time, and with the cost of living on the decline, together with the prospect that there would be considerable unemployment during the coming winter, the commission could not with consistency recommend an increase in wages. The investigation of that body, he stated, would undoubtedly show that the increased wages granted during the past three years had generally resulted in a decrease in the output of coal at the mines.

The miners' leaders have gone out of their way to intimate to the Commission that they not only expect a very substantial increase in wages, but that a new demand will be made immediately following the publication of the findings of the Commission. The original demand of the miners asked for an increase retroactive to 1st May 1920. There is a wide divergence in the declared attitude of the union leaders and the opinion expressed by Mr. Wolvin. It is very much to be doubted whether the increased selling prices obtainable for coal have in the case of the Dominion Coal Company offset the increased costs of production due to decreased outputs, and undiminished—in some cases actually increased overhead expenses, and the lessened turnover of sales. It is generally admitted that one-third additional output could be obtained from the Dominion collieries without adding a single non-productive laborer to the payroll, if the necessary number of coal miners could be placed at work. The attitude of the miners' unions in regard to the distribution of the working forces and general working conditions is a much more serious question than the wage increase question, although that is sufficiently serious to warrant Mr. Wolvin's rather ominous comment.

The Report of the Royal Commission on working and wage conditions at the collieries in Nova Scotia has been forwarded to Ottawa, and it is understood that copies of the recommendations of the Commission are being forwarded to the parties interested. A despatch from Sydney contains what purports to be the gist of the findings of the Commission, which are generally favorable to the case presented by the union, but the Minister of Labor has not as yet announced the nature of the findings.

It is reported the Greenwood Coal Company has been acquired by Montreal purchasers.

## Northern Ontario Letter

### THE SILVER MINES.

Producers of silver in various instances have come to base their calculations on a minimum of 90 cents silver, with frequent fluctuations up to around \$1.00 an ounce. A decline to around 90 cents is usually marked by a curtailment of bullion sales, while an advance to above 95 brings out more or less large quantities of hoarded metal.

Silver production from Ontario mines during the first half of the current year declined more rapidly than previously estimated, the number of ounces produced amounting to 4,474,322 as compared with 5,744,172 during the first half of 1919. The value of the silver produced during the first half of 1920 amounted to \$5,077,028 as compared with \$5,951,362 during the corresponding period of the preceding year.

In view of the average price of silver having declined still further during the last half of the year, it is quite evident an added decline in the value of the output will result and the value for the whole year may fall below \$10,000,000. This compares with \$12,747,621 during 1919.

Quite a number of prospectors from the Cobalt district have staked out claims on the shore line of Lake Temiskaming, in the vicinity of Paradis Bay. Oil seepage is said to have been found. At best, however, it is believed but a very limited quantity or basin of oil shale could occur in that section owing to the known occurrence of volcanic formation in the surrounding territory.

The annual report for the fiscal year ended August 31st on the Kerr Lake mine is already in the hands of the printer and will be ready to present to the annual meeting which has been called for September 27th. This is believed to be a record, in regard to the brief time occupied in placing full information before the stockholders, following the closing of the company's year.

Cyril Knight, Ontario Government Geologist, is making excellent progress in the geological survey of the Cobalt field. The Beaver-Temiskaming areas in south-east Coleman has been completed, as also has the south-eastern part of the township of Bucke. Mr. Knight will continue the work up until November, and will be obliged to leave the finishing of the task until the Summer of 1921. Part of the current month will be spent in the Kirkland Lake gold area in making an examination of conditions met with at the 900-ft. level on the Kirkland Lake gold mines.

A cross-cut at a depth of 425 feet on the Keeley Silver Mines in South Lorraine has reached the "Beaver Lake" vein, according to a report just received. In view of work in the upper levels having opened up ore in this vein all the way from the surface down to a depth of about 300 feet, the present development is believed to indicate the occurrence of ore all the way from surface to the contact between the overlying Keewatin and the underlying diabase, or a total depth of between 425 and 500 feet.

On October 20th, the Nipissing Mining Company will disburse \$600,000 to its shareholders. This will make a total of \$1,200,000 in dividends, plus \$600,000 in bonuses paid during the current year by this company. The financial statement recently issued, showed a balance of over \$5,200,000. In following out its usual

policy, the company will likely make another disbursement in January, amounting to \$300,000 in a regular dividend of 5 per cent. and a bonus of equal amount.

Announcement has been made that financial arrangements have been made to operate the property of the Cane Silver Mines, situated in the township of Cane on the Elk Lake branch of the T. and N. O. Railway. It is planned to assemble as much high-grade ore as possible from the surface showings with a view to making a shipment early in the winter. The development program includes the sinking of a shaft on vein known as No. 1, and after reaching a depth of a hundred feet or so, to drift east to where the diabase comes in contact with the quartzite formation. In connection with the financial arrangements, it is learned that interests closely identified with the Abitibi Power and Paper Company have become associated in the enterprise, and that earlier reports that one of the Cobalt mining companies had been requested to participate in the venture were erroneous. The silver on the Cane property occurs in veins in the diabase formation, spectacular patches of the metal being found at surface.

### The Gowganda District.

During the first six months of the current year, the mines of the Gowganda district produced 225,513 ounces of silver. This was made up chiefly of silver from the Miller Lake O'Brien, the balance coming from the Castle property of the Trethewey Company. The output is somewhat lower than for the corresponding period last year.

The prediction last spring, made by the promoters of the Canadian Light Railways Construction Company that Gowganda would be provided with a narrow-gauge railway within a month or so following the granting of a charter has not been made good, and there is a growing relief that the camp is once more to be disappointed in regard to the question of a solution of its transportation problem.

With the approach of winter, the mines will be able to lay plans to advantage of the sleigh roads for hauling the material and supplies, as well as sending out ore. The freight rate, however, promises to be high and will amount to at least a dollar a hundred, all of which tends to constitute a serious handicap in the development of the district's mineral resources.

### Ore and Bullion Shipments.

During the week ended Sept. 10th, five Cobalt companies shipped an aggregate of eleven cars containing not far under a million pounds of ore.

The Nipissing alone sent out six cars containing over half a million pounds, which is shown in the following summary:—

Shipper	Cars	Pounds
Nipissing . . . . .	6	581,311
Coniagas . . . . .	2	151,000
La Rose . . . . .	1	83,902
Hudson Bay . . . . .	1	62,640
Beaver . . . . .	1	60,000
Totals . . . . .	11	948,853

During the corresponding period the Nipissing made two large bullion shipments, the combined consignments amounting to 225 bars containing 299,352 ounces. In addition to this, a large shipment is reported from the Mining Corporation which was not recorded in last week's statement. This shipment amounted to

158 bars containing 162,247 ounces and added to the Nipissing shipments makes a total of 383 bars containing 461,599 for this week's report.

The Nipissing also reports a shipment of 66 bars containing 69,116 ounces, apparently omitted from former bulletin reports. In adding this to the above statement, the total report for this week amounts to 449 bars containing the enormous total of 550,715 ozs.

Figuring the metal at 12 cents to the pound, that sent out by these two big producers amounts to nearly twenty-three tons of pure silver.

### THE GOLD MINES.

Next to the nickel mines, the gold mining industry of Ontario is the greatest factor in the mining industry of this province. In the order of importance the three metals produced are nickel, gold and silver. The figures compare as follows for the first half of 1920:—

Nickel matte . . . . .	\$5,338,120
Nickel (metal) . . . . .	1,696,687
Gold . . . . .	5,690,504
Silver . . . . .	5,077,028

This clearly illustrates the relative importance of each, but also requires a note of explanation.

The known silver deposits have been worked extensively for about sixteen years and are declining. The nickel deposits are large, and although worked for many years, are likely to maintain an output for many years, in fact many decades at the present rate. The gold deposits are comparatively new and the industry is growing rapidly. This tends to indicate that gold production is definitely in the lead of the silver mines, and may in time exceed the record of the nickel mines.

As a consequence of this, interest in gold mining is increasing and money for development work in the vast prospective area outside of the proven districts seems certain to flow in larger volume when it becomes fully realized that the prospects are excellent for new important gold mining districts being opened up.

For the first half of 1920 the Hollinger mine alone produced \$2,928,079, in addition to carrying out a large amount of exploration and development work.

The McIntyre-Porcupine was the second largest gold producer in Ontario for the first half of 1920, its output amounting to \$1,085,298 for the period. This company is also proceeding with the development of its recently acquired coal lands in Alberta, and is placing orders in the East for additional machinery to be shipped to the property. It is believed to be the intention of the company to make as good a showing as possible on its coal lands, so as to impress the stockholders of the Temiskaming Mining Company with the importance of the project and in that way enlist the financial co-operation of that company.

The Dome Mines easily occupied third position among the gold producers for the first half of the current year, the output from the this mine amounting to \$989,566. The Dome has definitely arranged to take over the Dome Extension property and assets, both contracting companies having ratified the deal, and thereby leaving it only necessary to carry out the details. This will mean the transfer of one share of Dome for each thirty shares of Dome Extension, the total of the latter to be taken over amounting to 2,300,000 shares.

A feature in connection with the gold mines of the Porcupine district is the increase in the value of the ore as found at depth on the Dome. The indications are said to point to the likelihood of the Dome's average gradually working up to a point almost on a par with the Hollinger.

Cross-cutting is under way at the 250-ft. level of the Porcupine-Keora property. This work is for the purpose of proving up the ore bodies indicated previously by diamond drilling.

A mining plant has been installed on the North Davidson property in north-eastern Tisdale, and the work of shaft sinking will be speeded up. At a depth of over fifty feet, values are said to run high over a width of between four and five feet. The work has so far been financed chiefly by Toronto men, although finances have been subscribed by English interests, the money only being held in England pending a reasonable adjustment of exchange rates.

A statement has been issued by the president of the Clifton-Porcupine Mines for year ending June 30th, 1920, in part as follows:

"During the period under review we have made encouraging progress in the development of the Clifton property. An electrically-driven Mining Plant, of adequate capacity for the complete development of the property has been installed. The main shaft has been sunk to a depth of 225 feet, and several hundred feet of lateral work has been carried out on two levels with encouraging results.

"We have recently embarked on a policy of diamond drilling. It is expected that the information which will be gained from this work will make it possible to conduct further underground development at a considerable saving."

The Annual Meeting of shareholders is called for September 14th.

### The Kirkland Lake Field.

Excavations for the foundation of a new 100-ton mill commenced this week on the Ontario-Kirkland Gold Mines. It is planned to get the foundations ready this fall before cold weather sets in, after which the winter months will be occupied in hauling machinery to the property so as to proceed with the installation of the plant in the early spring. Underground developments continue favorable, the grade of the ore at the 450-ft. level showing still further improvement over that opened up at the 300-ft. level.

For the first half of 1920, the Lake Shore mine produced \$243,977, while the Kirkland Lake Gold Mines produced \$137,676 and with an output of \$125,137 from the Teck-Hughes.

The Ontario Government has notified the mining interests of Kirkland Lake that in view of the Government having complied with their request for a macadam road, and on account of the Associated Goldfields of Larder Lake not having been willing to submit its property to an examination by engineers appointed by the Government, it has been considered best not to proceed with the construction of a railway through that district at the present time.

In the meantime, it is learned that some of the heavy shareholders in the Associated Goldfields are planning some move to secure an independent report on the property. They have expressed dissatisfaction over the attitude of the management of the enterprise.

On the Bidgood, King-Kirkland, Wood-Kirkland, Lebel Oro and Moffat-Hall properties in the Eastern part of the Kirkland Lake district, some very satisfactory progress is being made, and the results achieved have been highly encouraging. The correspondent of the "Canadian Mining Journal" has concluded a visit to that district and finds considerable justification for the present enthusiasm over the outlook.

### THE GOLD OUTPUT.

Statistics have been published recently by the United States Geological Survey and others showing how the production of gold throughout the world has fallen off during the past eight years. In 1912 the world's output of gold was £95.9 million. Last year the total was only £72 millions, while this year it is likely to be still lower. This is a fact that will probably surprise many people, and it is assuredly a fact that leads to most serious reflections, not only upon its causes, but upon its consequences.

The war has been largely, but not entirely, responsible for this falling off. Labour has been withdrawn from the mines, there have been transport difficulties, high costs and so forth, while some mines have become exhausted and there have been no discoveries of importance. While the output of the precious metal has been diminishing the world's need of gold has increased, and will continue to increase, so that an enlarged production of gold for an indefinite time to come, if this be possible, is imperative. But we see to-day famous mines on the Witwatersrand having to close down because, owing to high costs of working, in which high wages play a great part, they cannot make ends meet. And when once a mine closes down it is difficult to restart it. The greater the number of mines that close down the less employment is there for miners and others who depend for their livelihood upon the mining industry.

We see all the great countries of Europe struggling with immense difficulties owing to the great manufacture of paper money and the resulting inflation, Great Britain's difficulties are bad enough, but those of many other European countries are infinitely worse. The United States is in this respect the most favored of all, and it is practically the only country that can be said to have a free market for gold. The great mass of paper is in most countries no longer linked with gold, but is linked with debt only, and before paper money can become linked with gold once more these massive debts must be removed or considerably reduced. This applies, for instance, to our own mountainous floating debt and likewise to our indebtedness abroad, especially to America.

But a greatly increased output of gold will not remove the difficulties against which these debt-laden, currency-inflated countries labour if they will not make the fullest use of their energies in increasing their natural wealth. Gold from the mines will not irresistibly flow towards any unless they can attract it by the magnet of wealth production. The more rapidly they and ourselves produce wealth the sooner shall we be able once again to link our paper currency with gold—in other words, to re-establish the gold standard. And while producing wealth, nations must likewise economise. In short, they must not consume more than they produce and attempt to exist as a parasitic individual does.—"Financier," London.

### CONTINUED DECLINE OF GOLD PRODUCTION IN UNITED STATES.

The gold mining industry of the United States will be completely shut down unless constructive aid is provided without delay, according to H. N. Lawrie, mining engineer and economist of the American Mining Congress of Washington. Mr. Lawrie has just returned from an extended tour of all the mining districts of the United States and says that conditions in the gold mining camps are much worse than he had expected to find them.

"Gold production in the United States has declined from \$101,000,000 in 1915 to \$58,500,000 in 1919, and from present indications will probably still further decline to about \$40,000,000 this year," said Mr. Lawrie. "Now, added to that, the gold stock is being depleted by excessive exportation and industrial use, and this will seriously impair the public confidence in the nation's finance and currency during the present period of credit and currency contraction unless a normal gold output is very shortly insured. The mines are reducing production or closing down, and if this is allowed to continue it will take years to again develop a normal output, and at a tremendously increased expense. Moreover, to shut down the deep mines means that they will become filled with water,

"Industrial gold is the only commodity which manufacturers can obtain today at pre-war prices. The average wholesale price of all commodities for the year 1919 was 112 per cent greater than for the year 1914. The Government is selling gold without limitation for industrial consumption at \$20.67 an ounce, the pre-war price, which is less than the cost of production. An ounce of gold had during 1919 a purchasing price of only \$9.70. Now the economic pressure which has forced the decline in the purchasing power of the dollar and thereby created the pressure upon the gold mining industry has operated to increase the purchasing power of the public to such an extent that they have been buying luxuries, especially jewelry, and that has made a great increase in the demand for industrial gold.

"The gold produced is in the same position today as a person who received the same income in 1919 as in 1914 and finds that \$1,000 has shrunk to a purchasing power of \$485. It is an interesting condition when the production of gold has become so expensive that it does not pay to mine it, and the shutdown of our mines for that reason is imminent. The people of this country must recognize the situation and must urge constructive legislation to relieve it if they wish confidence in our finance, currency and the gold standard to be retained in this country and abroad."

### PERSONAL.

Mr. Arthur A. Cole, Mining Engineer, T. & N. O. Railway Commission, who was recently operated on at the Mines Hospital at Cobalt, is rapidly convalescing, and was able to leave the hospital for home on Saturday the 4th instant.

### MINING INSTITUTE INCREASES FEES.

The several mining societies in Britain, which are federated into the Institution of Mining Engineers, have decided to raise the annual fees to a minimum of three guineas for members and associate members. This is the second increase in some instances since the beginning of the war.

**TORONTO MINING STOCKS.**

Following are the average quotations for gold, silver and miscellaneous stocks on the Standard Stock Exchange, for week ending Sept. 11th 1920.

**TORONTO COAL PRICES.**

Toronto, Sept. 14.—Hard coal continues to be particularly tight and although a slight softening in bituminous was noticeable the advance in freight rates just about offset the slight drop. Mine run is quoted at \$14.25 to \$14.50 f.o.b. Toronto; smokeless coal \$14.50 to \$15.00; hard coal \$8.00 to \$16.00 gross tons at mines American funds.

**METAL QUOTATIONS.**

**ASSOCIATED GOLDFIELDS MINING COMPANY PROPOSES BUILDING OWN RAILWAY FROM BOSTON CREEK TO LARDER LAKE.**

The Toronto "Globe" publishes the following letter from the President of the Associated Goldfields Mining Company stated by him to have been forwarded to the Minister of Mines for Ontario under date of 27th July. The letter is as follows:

"In pursuance of our conversation of to-day, and our interview with the Premier a few days ago, I may say that I have taken up the matter with the directors of Associated Goldfields Mining Company, Limited, and those of the Poreupine-Rand Belt Railway, which charter, as you know, this company owns.

"It was originally the opinion of our directors that our transportations needs would be served more quickly if our company were to build its own line of railway, and at the same time we would be able to locate it at such points as would serve our interests best, and it was only with the idea of serving as many of the other deserving operators in the district as possible that the course of the road was more or less diverted to the Kirkland Lake-Swastika route.

"It is the opinion of our directors that only a very comprehensive investigation of our ore bodies would be fair to the Province, and figuring all the assistance which we would be able to give the men in charge, this investigation would still entail several month's time. Coupling this with the fact that the Kirkland Lake-Swastika route would be more than twice as long our directors feel that our requirements would be more speedily served by the company constructing its own line of railway from the point at or near Boston Creek to Larder Lake.

"Presuming from our conversation that your Government has no objection to our following this course, we have decided to send our engineers at once over the short route and give us facts and figures as to the cost of this line.

"Thanking you and your Government for their kind consideration in this matter, I beg to remain, yours respectfully,

Geo. A. MacKay."

**BOOK REVIEW.**

Compressed Air Power. A Treatise on the Development and Transmission of Power by Compressed Air, by A. & Z. Daw. Sir Isaae Pitman & Sons, London and New York. Cloth Boards. 5½ by 8½ ins. by 5 inch. \$7.50.

This volume does not treat so much on the applications of compressed air, as on the development and application of the principles of the compression, expansion, exhaust and flow of air and gases. The mathematical theories underlying the design of compressed-air devices are very fully developed and the steps by which formulae are deduced are exhaustively detailed. The book is designed to fit the requirements of designing engineers and draughtsmen, and students of applied science, and it is not an elementary treatise. The tables and diagrams are particularly numerous. The Air Lift Pump is very thoroughly investigated, and their authors believe that their presentation of the Displacement Theory of the Air Lift Pump is the most complete mathematical analysis of its action yet offered. The functions of the receiver and inter-cooler in designing a really efficient compressed-air power-plant are extensively discussed, as are controlling and unloading devices.

### VIRGIN COAL AREAS IN THE ROCKY MOUNTAIN AND FOOTHILL SECTIONS OF ALBERTA.

The Summary Report of the Geological Survey for 1919, Part C., contains reports of explorations in unworked coal areas of Alberta, all lying in remote and mountainous territory, and unlikely for many years to become the scene of coal mining on a commercial scale. The occurrences are all shown on the maps attached to Mr. D. B. Dowling's Report on the Coal Resources of Canada, the essential correctness of which is strikingly illustrated by more intensive subsequent explorations.

#### Coal Areas Northwest of Brule Lake, Alberta.

This area was examined by John MacVicar in the field season of 1919, with the main object of determining what further Kootenay coals might be found, and also to ascertain the feasibility of a railway line to them, and the coal areas of the Smoky River, by way of the foothill country. The territory examined lies northwest of the Jasper Park area, and consists of a tongue of coal-bearing strata roughly paralleling the crest of the Rocky Mountains. A number of coal seams that will yield bituminous coals, suitable for steam, metallurgical and domestic uses were noticed, but no anthracitic coal, similar to that on the Smoky River was found.

It was found that the country did not present great obstacles to railway building, and a route is suggested, starting from Solomon Creek on the Canadian National Railway, following the water courses to the junction of the Smoky and Muskeg rivers (an airline of about 70 miles), with grades that will not exceed two per cent.

The coal resources of the region have not been prospected, and in this hurried reconnaissance no attempt was made to prospect them in detail. Coal seams were ascertained to occur at three horizons, namely in the Montana, Colorado and Kootenay formations, but only the last-named is important as likely to contain workable coal seams. Outcrops in the Kootenay are sparingly represented, probably because the seams are covered by glacial drift, or only the barren parts of the Kootenay are exposed. A number of seams, varying from 3 ft. to 5 ft. were noted, containing coal generally friable in character. No analyses are given.

#### Little Smoky River, Alberta.

The field season of 1919 was spent in a reconnaissance examination of the valley of the Little Smoky river, but owing to lack of time and scarcity of outcrops the results were unimportant. Lignitic seams were noticed. The area lies within the general sub-bituminous district.

#### Highwood Coal Area, Alberta.

The Highwood area is a continuation of the Crows nest field, and has similar rock successions and structural features. The report is made by Bruce Rose, who has been engaged since 1915 in examining Rocky Mountain coal areas. Mr. Rose is linking up the stratigraphy northwards along the range.

At one point, on Cat Creek on the H. A. Ford holdings, fourteen seams are located in a distance of approximately three-quarters of a mile across the meadows. The seams vary from 4 ft. to 38 feet in thickness, and give a total of coal thickness of 151 feet. The seams have been prospected by tunnelling, and analyses are given showing fixed carbon contents of from 60 to 76 per cent. Volatile matter is low, running from 14 to 15 per cent, but the ash is comparatively high, although it is explained that some of the sam-

ples analysed included portions of shale parting and roof stone. Making allowances for loss of moisture in transit, and corrections for shale content that would be eliminated in commercial mining, an average analyses of these Highwood district coals is given as follows:

	Per Cent.
Moisture . . . . .	1
Ash . . . . .	8
Volatile Matter . . . . .	16
Fixed Carbon . . . . .	75

### DEMAND FOR GYPSUM PLASTER IN CUBA.

Major H. A. Chsholm, Canadian Government Trade Commissioner in Havana, Cuba, writes as follows:—

"If Canada manufactured sufficient gypsum plaster the Cuban market could consume many times the quantity imported from Canada at the present time, which amounts to some 2,000 or 3,000 barrels a month. It appears that a good deal of the building plaster imported into Cuba from the United States is manufactured from gypsum mined in Canada. I should think that Canada has a good opportunity to build up a new industry in the manufacture of gypsum building plaster for Latin-American countries."

There should be no difficulty in supplying any outside market with either crude or calcined gypsum from Canada, provided shipping facilities were convenient and reasonably priced. Of 304,532 tons of gypsum mines in Canada during 1919 there were calcined 121,499 tons. 148,394 tons of crude gypsum were exported mainly to the United States, and gypsum products were exported to the value of \$140,235. There were quite important imports of gypsum, crude and ground, and of plaster of paris. Canada's ability to produce gypsum and gypsum products of high grade is much larger than any market that has as yet been obtained, and during the cessation of building during the war period many of the gypsum quarries and calcining plants in Canada have been idle, and many are yet.

#### Cheticamp Gypsum Quarries Reported Likely To Resume Operations.

Before the war a gypsum property at Cheticamp, Inverness County, Cape Breton Island, had been quite extensively developed. The gypsum is present in large quantities, and it provides the raw material for plaster-of-paris of very good quality. A good demand for this material came from the Montreal district, before the war stopped building operations, and some of the larger buildings, such as the Ritz-Carlton, used this Cape Breton plaster in large quantities. The quarries are conveniently situated for water transportation to Montreal by small steamers.

It is now stated there is a probability that this property, which includes a short railway line, rolling stock, and factory for making plaster of paris, will operate again in the Spring of 1921. There are a number of excellent gypsum properties in Cape Breton Island, but they have all been idle during the war, and are idle now, with the exception of the quarries of the Iona Gypsum Company, situated near the point where the Canadian National Railway crosses the Bras d'Or Lake at the Grand Narrows.

## British Columbia Letter

### Dawson, Y. T.

The placer camps of the Yukon Valley, it is estimated, will yield \$4,485,000 for the season of 1920. Practically every camp in the North suffered a heavy decline for the reason that it has been a very dry season. Hydraulic operations consequently have been much curtailed. Yields by camps of the Interior of Alaska and the Yukon for the season drawing to a close are estimated by competent authorities as follows: Dawson, \$1,500,000; Fairbanks, \$750,000; Tolovana, \$750,000; Iditarod, \$500,000; Tacotna and Ophir, \$500,000; Hot Springs, \$100,000; Ruby, \$100,000; Koyukuk, \$75,000; Circle, \$70,000; Marshall, \$50,000; Forty Mile, \$50,000; Rampart, \$20,000; Chandler, \$20,000. Total, \$4,485,000. In commenting on the situation thus disclosed the Dawson "Daily News" observes that, if the decline in gold production is to be arrested, it will be necessary to restore the purchasing power of gold by bonus or otherwise as low-grade alluvial gravel cannot be worked under present conditions.

### Stewart, B. C.

It is reported that the present bond holders of the Big Missouri Group of Mineral Claims, Salmon River, Portland Canal District, do not intend to continue development work. Operations have been under way for some time by a syndicate known as the Pacific Coast Exploration Co. prominently identified with which is Sir Donald Mann, of Toronto, Ont. Both diamond drills with which exploration work has been in progress have been withdrawn. The only information made public, and it is unofficial, is that the Big Missouri presents an unusual problem, that the small amount of drilling done has not given satisfactory results, and that the complete exploration of the entire mineralized zone is a work of such magnitude that the Company does not feel disposed at present to continue.

The Dunwell Group of Mineral Claims, adjoining the Lakeview on Glacier Creek, is being developed with promising indications. The ledge has been stripped for 300 feet and cross-cut in places. It is five feet in width and averages \$20 in gold, silver and lead.

Stringers of native silver have been struck on the Silver Tip Claims, Salmon River, the samples seen closely resembling those of the high-grade ore of the Premier Mine. This property is under bond to a Vancouver City Syndicate.

The Algonic Development Co. has decided to do some diamond drilling on the Spider Group of Claims. Work of this kind has been in progress on the Northern Light Property.

A recent heavy rain did considerable damage to various avenues of transportation in the Portland Canal District, chiefly in the carrying out of bridges. The Bear River, however, again has been bridged with cables permitting the crossing of prospectors and their supplies.

The Portland Canal Branch of the Canadian Mining Institute held a meeting at Stewart, on September 1.

### Alice Arm, B. C.

There are now 250 men employed at the Dolly Varden Mine, Kitsault River, and the output of ore for the

month of July totalled 5,600 tons, all of which was sent to the smelter at Anyox. In addition a quantity of high-grade ore was forwarded direct to the Tacoma Smelter. The force indicated has been divided during the summer equally between the Mine and the Railroad and, if the snow of the forthcoming winter makes the continued operation of the railway impossible, only some 65 men will be kept on, their work being the prosecution of development. At present power for the air compressors is secured from oil engines but a hydro-electric plant is being installed on the Wolf Claims which will be used for all purposes. It will be capable of providing 500 horse power for the operation of a 12-drill compressor. The Wolf, which is situated three miles up the river from the Dolly Varden, is reported to have given gratifying indications in diamond drilling and tunnelling is to be commenced without delay.

Good reports have been received of other properties of the Alice Arm Section, notably of the Esperanza Group, from which a quantity of high grade native and ruby silver ore has been taken and now is awaiting shipment to the Tacoma Smelter. There also are the Silver Tip Extension, the Moose, and the La Rose Properties all of which are showing up well and on all of which considerable development has been done this summer.

### Hazelton, B. C.

The construction of a waggon road to the Silver Standard Mine by the Provincial Government meets with the warm approbation of those interested in the development of the mineral of the district. It is stated that the road when completed will be a "regular speedway."

The Peerless Mine, Kleanza Creek, is attracting much attention. Last year some 150 tons of ore were taken out and this season there have been shipped 100 tons. The work at present consists for the most part of development and the ore blocked out, it is stated, runs about \$100 to the ton in values. That the property has merit is indicated by the fact that the Provincial Government is improving the trails to it.

Other prospects on which development has been done are the Continental on the north side of Bornite Mountain, the New Era Group, the Montana, and the Golden Crown. The latter was purchased recently by the Kleanza Mining & Development Co.

### Slocan, B. C.

The "Evening Star Mine," Dayton Creek, is being opened up and there is every reason to believe that it will be shipping again soon. Pumps and other plant necessary for the unwatering of the shaft and workings of the No. 3 Cameron Group were installed some time ago and have done their work well, it being stated that a body of high class ore has been uncovered. Work has commenced on the construction of a 50-ton flotation mill for the Ottawa Mine, Springer Creek, near Slocan City. L. H. Biggar and A. L. McPhee hold this property under bond from the Consolidated Mining & Smelting Co. and the mill referred to has been designed by Mr. Biggar, who is an Eastern Canadian engineer. A tramway from the mine to the mill is to be built, the distance being about half a mile and a pipeline also is to be installed. It is planned to have the mill ready for operation in the course of a month or more, but the heavy machinery is to be taken over the snow.

### Nelson, B. C.

The Perrier Mine, situated on Cotton Wood Creek on the slope of Morning Mountain and close to the line of the Great Northern Ry., which recently was taken over by a re-organized Company with a capital of \$250,000 and the officers of which are: C. E. Crossley, president; R. W. Hinton, vice-president; W. M. Cunliffe, secretary-treasurer; and A. H. W. Crossley, George Leece, T. H. Turner, and Ralph Young, directors, was discovered in 1910 and named after the late King Edward's famous horse. Mr. Turner, one of the original discoverers, states that the property is and always has been owned by those responsible for its staking. The main shaft of the Mine has been sunk 120 feet and there are two others on the vein, one 40 and the other 20 feet. The present plant consists of a small Huntington three-foot mill of five-ton capacity for taking care of ore from the drift. From this mill \$3,300 in gold has been taken, other values not having as yet been recovered. There also are a Rand drill, a Rand hammer-stopper and a three-drill Rand compressor driven by a Pelton wheel. There is an abundance of water, and Messrs Crossley and Turner claim they have invented an automatic pump to keep the mine free from water which will work for 12 months without attention. It is planned to put in a stamp mill and a modern hoist equipment. There is to be considerable more underground development. About 80 per cent of the ore is free milling.

A second vein has been discovered by surface stripping on the property of the Mountain Chief Copper Mine, Renata, on the lower Arrow Lake. A tunnel has been driven exposing considerable mineralization, the ore for the most part being oxidized.

Another property on which a new vein is reported to have been found is the Barnett Silver-Lead Group at the head of Lemon Creek. The new lead is very similar to that on which work has been done and runs parallel to it. Already ore from this source is being sacked for shipment. The Barnett Mine was re-opened by R. G. McLeod some four or five weeks ago. It has been a shipper in past years.

### Ymir, B. C.

Good progress is being made in the opening of the Yankee-Girl Mine. Operations underground are proceeding satisfactorily. Considerable new development has been done and a substantial body of ore has been blocked out. John W. Shaw, superintendent, has left for Toronto, Ont., to submit a report to the Mining Corporation of Canada which is behind the enterprise and in the meantime A. W. Newberry, of New York, is in charge. Development is being prosecuted upwards on No. 5 Level by means of two raises and each now are up a distance of some 300 feet on the dip vein, both being in ore. There still is about 400 feet to go before No. 2 Level, the next in the vein, is reached. Exploration of the ore body has been carried on from No. 2 Level and at present four hammer-drills and two piston drills are being used.

### Trail, B. C.

Ore receipts at the Trail Smelter of the Consolidated Mining & Smelting Co. of Canada for the last 10 days of the month of August totalled 11,257 tons, making the aggregate for the year 221,312 tons. The feature of this period was the return of the Iron Mask Mine, of Kamloops, to the list of shippers.

## THE HISTORY OF SILVER MINING IN ONTARIO. An Address to the Imperial Press Conference by the Secretary of the Ontario Mining Association.

On the occasion of the recent visit to Cobalt of the members of the Imperial Press Conference, an address was given by Balmer Neilly, secretary of the Ontario Mining Association, voicing the opinion of mine operators of Ontario in general, and dealing specifically with the silver mines.

Particular emphasis was laid on the necessity for mining men to deprecate and challenge any suggestion made by any public man in Ontario that would cast suspicion on past and present relationships, between the Department of Mines and the mining operators of the province. It should be kept clearly in mind that Mr. Neilly made reference to mining operators, and did not mention in any way promoters or stock operators.

Following is a verbatim record of Mr. Neilly's address reported by our correspondent:

"The time at our disposal tonight is limited by arrangement and our guests must be indeed tired of speeches and possibly of speakers. However I would here tender to the Delegates to the Imperial Press Conference on behalf of those more particularly interested in the Mining Industry, our very keen appreciation of the honor they do us with their presence here tonight. Their presence in Canada is of peculiar significance to us, because we look upon them as British Prospectors in the fullest sense, and just as mining cannot hope to prosper without keen energetic and intelligent prospectors to prepare the way, neither can our British Empire develop as it should, without prospectors such as these.

"We have undertaken to sketch in the briefest possible way tonight the history of Silver Mining in Ontario, with particular reference to the Cobalt Camp.

### EARLY HISTORY OF SILVER MINING.

"Back in the early sixties some small and unimportant discoveries of silver had been made along the north shore of Lake Superior, but in the Spring of 1868 the first real discovery was made on Silver Islet, a small bare rock 25 miles from Port Arthur and having dimensions of only 80 x 100 feet.

"In these days Ontario, then known as Upper Canada, gave little promise of its world position of to-day. The Government attached little importance to the Mining Industry and insisted, where the prospector desired to back his opinion with his money, that he should take up a mining claim 5 miles long and 2 miles wide and pay for the land at the rate of 4 shillings per acre. Moreover all rights for gold and silver were reserved to the Crown.

After the discovery at Silver Islet the Government decided to encourage real mining by giving up their rights to Gold and Silver, but as an offset levied a royalty of from 2 to 10 per cent. No royalty accrued to the Crown and the year following the royalty was struck off and real mining commenced.

The first round of holes blasted on Silver Islet blew out all the silver ore above water, but it was rich and they continued to mine under the water and during their first summer mined ore to the value of 6,751 dollars.

During the succeeding summer 10 men in 14 days took out another \$16,364, and the engineer in charge feeling sure they had a real mine, asked the British owners for \$50,000 to install plant and equipment. However the reports as to the richness of the ore sounded too good to be true and they preferred to sell and did sell their entire interest to Americans for the sum of \$225,000.

For the next few years the company were most successful. The island by breakwater was built up to 2 acres, splendid accommodation was provided for the men, and in the mainland schools, churches and hospitals were built and a thriving community established. Such was the history of the first silver discovery of importance, in Ontario down until 1883, up to which time ore valued at \$3,500,000 had been produced. In that year the ore mined was low grade and a cargo of coal failing to arrive before the close of navigation, the Company were forced to pull their pumps and the mine was closed down.

Why have I taken your time in describing the work at Silver Islet?

### HISTORY REPEATS ITSELF.

Because there is an old saying that history repeats itself and it is true with respect to Cobalt.

In 1903 the Ontario Government were engaged in constructing a railway now known as the T. N. O., between North Bay and New Liskeard. This was projected as purely a colonization railway with the idea of linking up what is now known as the Great Clay Belt, with the older portions of the Province.

A blacksmith named LaRose in the employ of one of the railway contractors found or had brought to his attention a peculiar piece of ore which he proceeded to melt in his forge then situated on the present LaRose property at the north end of this town. This was the beginning and soon Dr. Miller, Provincial Geologist, pronounced the find genuine. To stimulate interest he had samples of this extremely rich ore prominently displayed in the Parliament Buildings. However, like the original owners of Silver Islet, the public refused to believe the ore was anything like as rich as was represented. Moreover they had just passed through the Rainey River Gold Boom and were they thought sufficiently acquainted with mines and mining men. Even experienced mining men from other countries considered the high grade samples, but a freak of nature and were sure the deposits so rich would prove mere pockets as to size and of little real importance.

In 1904 some four veins produced important quantities of silver but the public remained uninterested and good ground in the productive area still remained open to the prospector.

However, during the winter of 1904-1905 a real mining fever developed in this province and by spring not only were the original reports believed, but many men who had visited the North Country or had had a friend visit this district, not only confirmed original reports, but were reading and willing to enlarge on these reports to the extent of their imagination. Cobalt was on the map as a mining province.

The Cobalt silver deposits were confined to veins comparatively narrow—measured in inches—but premenally rich. The better surface deposits would average well over 3000 ozs. silver to the ton and about 7 cubic feet of this ore would weigh a ton. The outcrop of the ore shoots was on the surface and the crudest of mining methods enabled the lucky discoverers to produce a fortune with practically no necessity for capital. Never since the placer booms of California and the Yukon had the mining prospector had such a chance.

A railroad with pullman accommodation, a night's run from Toronto, provided transportation of every kind. Fuel grew on the property and good water was everywhere. Labor was plentiful, law and order were well maintained and the Geological Department had published a map showing the geology of the country pointing out the special significance of the different formations with respect to the known ore deposits. Surely never was a setting better prepared for a mining boom on a large scale.

By the spring of 1905 the fame of the camp had spread far and wide. Prospectors started to arrive by the train load and one is probably safe in saying that practically every known country had its representative here.

The price of silver had jumped from an average of 58c. per fine oz. in 1904 to 61c. per oz. in 1905. Buyers were paying 65 to 70 cents a pound for Cobalt—12—15c. per lb. for nickel and 1c. a lb. for arsenic. If a prospector had located a claim with none of these minerals exposed in quantity, but able to show even a little Cobalt bloom in a narrow crack, his property could be and often was sold for outrageous sums.

265 new Mining Companies with a gross capitalization of \$185,357,000 were chartered by the Province in 1906. Promising mining locations were at a premium.

#### Government Helped.

The Provincial Government were interested, insisting on a policy of fair treatment to all. The Mines Department offered their assistance in many ways supplying geological maps of Cobalt and the surrounding country and advice to prospectors that proved most useful. Since the early days of Silver Islet the size of a mining claim had been reduced from 10 sq. miles to 40 acres and again so far as the Township of Coleman was concerned, the area that could be staked on one discovery was reduced to 20 acres.

This condition of feverish activity continued until the apex of production was reached in Cobalt in 1911. In this year 31,507,791 ozs. were produced, or well over 14 per cent. of the whole world's production during that year.

While production from that time forward has steadily decreased Cobalt in 1918 still produced 17,661,694 ozs. and the increased market price of the product still gave returns \$1,387,943 in excess of the amount received in 1911, when the greatest production in ozs. is reported.

Summing up then Cobalt has produced, up to the end of 1919, silver, to the value of \$182,145,699 and at the same time

has paid to the shareholders of the different mines \$80,780,513, or nearly 50 per cent. of the total value of the output. Naturally you will ask how long can Cobalt continue at its present rate. The only way in which this question can be answered is by asking another, viz, what is likely to be the future price of silver per ounce?

#### British and Canadian Capital Shied at Cobalt.

At the outset and after having sketched the somewhat early history of the Silver Islet, the statement was made that history repeats itself. In the case of Cobalt, as also in the case of Silver Islet, the value of the early discoveries was doubted and when British and Canadian capital refused to come through, American capital stepped in and reaped much of the reward and properly so. The same condition holds true with respect to Cobalt.

Permanent industry has been established to the mining operations carried on here and a new portion of the great Northland opened up and settled by a stable, industrious people. The gross production of the Cobalt Camp will exceed the Silver Islet production many times and again let us say, history repeats itself and I believe I am perfectly safe in predicting that at some time, some place and perhaps in the no distant future, new Cobalts will be discovered that in their final production will be as much larger than Cobalt, as Cobalt is larger than Silver Islet.

#### The Result.

Now we have traced the growth of the Cobalt Silver Camp and one naturally asks what good have the people of this Province derived directly and indirectly from this most fortunate and profitable discovery.

1.—The T. N. O. Railway, projected as a Colonization road at great expense to the people has been continued to Cochrane with branches each and west and instead of a weekly service as at first proposed, three first class trains run daily in each direction and the line forms an important link in our National Transcontinental Railway System.

2.—Populous centers have been established all along the Railway and towns of importance have been established for all time.

3.—Hydro electric power has been developed and is now available here to the extent of 23,000 H.P.

4.—Men who made their fortunes have struck out to develop new districts and the result is that to-day we have very important camps at Porcupine, Kirkland Lake, Boston Creek and Gowganda. Canada was one of the few countries to show an increased gold production in 1919 and there is some reason to expect that this year the value of gold produced will equal that of silver.

5.—Our mining success has directed to the Northern District men interested principally in other industries and to-day for example on this T. N. O. we have the largest paper mill on the American Continent. The country is growing rapidly, but the great expanse of territory yet to be prospected and settled is so vast that what we have already accomplished seems small indeed.

6.—To give you some idea of the direct benefits derived in terms of money let me state that in the years 1917-1918 the different Governments received from the silver mining industry, by way of taxes and fees of one nature and another, almost \$1,000,000 and the expenditures of the silver operators represented a purchasing power in Canada equal to \$24,257,000.

7.—Finally if a circle with a radius 70 miles long be thrown over a certain portion of this Province, it will include within this area three and possibly four wonderful mining camps. On the west we have Sudbury, producing 85 per cent. of the world's nickel supply. On the north we have Porcupine producing, during the first six months of this year, gold the value of almost \$6,000,000 and showing an increased production over the same period last year of 22 per cent. South-east of Porcupine we have Kirkland Lake, already now producing and probably destined to become another very important Camp. Last of all we have the Camp under consideration, which may properly be described as the world's greatest silver camp.

Our past progress must be taken as some slight indication of what may be expected in the future and when we say that since 1903 the gross wages paid miners in Ontario have increased over 400 per cent. the average annual wage per miner over 325 per cent. and the gross production over 490 per cent. who is optimistic enough to properly estimate the conditions likely to exist in, say 1930?

#### Critics Are Challenged.

There can be no doubt as to Ontario's ability to greatly increase this production, under careful and intelligent guidance? We require and will continue to require for many years to come, both capital and labor and in our effort to

obtain them we would deprecate and do everything in our power to discourage any attempt to tell anything but the truth and the whole truth and we will deprecate and continue to challenge any suggestion made by any public man in Ontario that would cast suspicion on the relationship that has existed and does exist between the Department of Mines and the mining operators of this Province.

The message we would leave with our Guests this evening is that Northern Ontario is the Land of Promise to all who are willing to work. Drones we don't want and will not support. Capital invested with the same care as that given to investments in other lines, must in the end bring a fair reward and we would therefore ask these Delegates to the Imperial Press Conference to stake out Northern Ontario in their minds and advise their people at home to give this district proper and careful consideration when they are formulating their future plans for development within the British Empire.

### DIFFICULTIES OF DEEP MINING.

In the course of his presidential address before the South African Institution of Engineers, Mr. James Whitehouse dealt with the problems of ventilation, underground temperatures, and pressures encountered in the Rand mines.

The rock temperatures continue to rise at the rate of one degree for every 253.9 ft. of depth. From determinations made recently in the Village Deep Mine, the rock temperature at a depth of 5,487 ft. has been found to be 89.4 deg. Fah. The temperature of the air current which reaches to this depth is 72.6 deg. Fah. dry bulb, and 71.6 wet bulb. This low rise of rock temperature is probably unique, and compares favorably with the temperatures experienced in the St. John del Rey Mine, which is the only mine in the world which is deeper than the Village Deep, and where the air temperature is 109 deg. Fah. dry bulb, and the rock temperature is 114.4 deg. Fah. The depth of this mine is 6,126 ft. vertically. At depths between 5,000 and 6,000 ft. it is necessary to install equipment for circulating large volumes of air.

Whilst the effect of depth on the temperature of underground workings is less serious at the Village Deep Mine than, perhaps, in any mining field, this cannot be said of the resulting pressure, and the difficulty which this causes in deep workings. From a comparison of the actual cost of support of working on a deep-level mine today and in 1914, it is found that the cost of timbering and rock-walling in 1914 was 10d per ton crushed, and in 1919 this charge had increased to 2s 5.4d. On the basis of wages paid in 1914 and the cost of raw material at that time, the cost for this work in 1919 would have been 1s 9.6d per ton, that is an increase equal to more than double the 1914 cost. This represents the increase which is entirely due to depth, the difference between the present cost is 1s 9.6d per ton, which is 7.8d per ton, being due to the increase in wages and cost of materials. Similarly the cost of winding has risen from 1s 8.6d in 1914 to 2s 9.7d for 1919, of which increase 8.5d is due to depth, so that the cost for this work, apart from charges due to the war, would today have been 2s 5.1d per ton. From the above figures, and, quite apart from the increase in operating costs due to the war, the conditions obtaining in deep mines today are very different from those of 1914. To overcome some of the difficulties of increasing depths many suggestions have been made, and these include one that the reduction works should be removed at once from the surface and erected underground in order to save the cost of hoisting.

## The Electrical Location of Lodes from the Surface

For many years past, periodical attempts have been made to evolve a practical method or system of applying electricity in one form or other to the locating of lodes and metalliferous ore deposits which are believed to exist underground, but of which there are no surface indications.

Until recently nobody thought the ideal system had a chance of realization, but with the rapid advance of electrical science during the past decade a new vista has been opened up and many things hitherto thought to be dreams have become accomplished facts.

Therefore, it is not surprising to learn that Mr. Victor Nightingall, a well-known electrical engineer and wireless expert of Melbourne, has worked out and patented an up-to-date system which, after a long series of experimental operations in the Laboratory and practical tests on mining fields, it is claimed, surpasses everything previously attempted in this direction, in that, by combined telephone and scale-readings, a chart or graph of underground deposits may now be prepared with a great degree of accuracy.

Mr. J. A. Dawson, also a well-known electrical engineer, who for some years occupied the Chair of Electrical Engineering at the Ballarat School of Mines, was associated with Mr. Nightingall in the developmental and experimental field-work, and is undertaking the management and working of the system—registered as "Electrical Mine Surveys Pty., Ltd.," 339 Collins-street.

*Practical Application:* Quite recently these gentlemen were afforded an opportunity of proving their system in a practical manner—being engaged by the Indooroopilly Silver-Lead Mines N.L. (a Bendigo company) to go to Brisbane and make an electrical survey of the company's extensive mining leases.

This company, we are informed, had sunk a shaft about 100 ft. north of the G.O.M. mine—in which a rich body of ore was being worked—but the continuation of this lode was not picked up as anticipated in the shaft, the crosscut to the east of the winze, hence the directors decided upon having an electric survey made in order to locate the exact position of the ore. This was done, and a crosscut put in in the opposite direction soon revealed the ore coming in from the west, as the instruments indicated that the main body was on that side of the shaft. The entire survey, by the recorded indications, show that extensive silver-lead ore bodies traverse the Indooroopilly Co.'s leases from near the shaft for a distance of half a mile.

It is interesting to note that the instruments also accurately indicated the position of the lode on which the adjoining (G.O.M.) mine was working—though this position was unknown to the electrical surveyors, who, on inspecting the underground workings afterwards, found the ore body exactly below the points indicated on the surface.

### Far-Reaching Effects.

The plan we reproduce, showing the results of Messrs. Nightingall and Dawson's survey, is not only interesting but is certainly unique in the annals of mining, for probably never before has a plan been published purporting as this does to show the position and extent of ore bodies which lie hidden underground.

This, indeed, is "seeing the end from the begin-

ning!" The general application of such a scientific system, provided it proves successful, will usher in the dawn of a new era for the mining industry, and should do for the miner what the X-ray does for the surgeon, who sees the exact location of the metal in the human body before commencing his operation, likewise the miner will practically be enabled to see an "X-ray" chart of his metal underground before commencing mining operations.

Such a system comes at an opportune time, and will be welcomed by the mining world, for mining at the present time is in need of a stimulus.

The application of electricity in some such form offers a key to unlock the underground mineral wealth of the world, and the system under review appears to go far towards the accomplishment of that aim. With experience in practical working and further development, it should prove a most valuable adjunct to mining.

*Personnel:* Mr. W. H. Cundy, of Bendigo, is associated with Messrs. Nightingall and Dawson as Geological Survey and Mining Engineer.

Electrical Mine Survey work is to be undertaken at once, and in the hands of these three gentlemen, who—together with Mr. W. F. Spry—are directors of the company, the system should soon give a good account of itself by reporting practical results of commercial value.

#### Description of the System.

The system may be described as an application of high-potential electricity applied to the earth's surface by special generating and transmitting apparatus. The presence, position and approximate depths of reefs, lodes, and metalliferous deposits underground may be ascertained and mapped out.

It is based on sound, fundamental principles and electrical laws. An electric current producing a certain sound is propagated through the earth's crust by special electrodes connected with the transmitting instruments, which operates to almost any desired depth and through any given area.

By means of special telephone receivers and graduated visual indicators, worked in conjunction by the electrical surveyor, who "stethescopes" the earth's surface, this not can be picked up anywhere within the area under test, his ear detecting and interpreting any variations which may occur as indicating the presence, or otherwise, of any lode or metalliferous deposit, either near the surface or to considerable depths below, enabling its position, area and continuity, or otherwise, to be marked out on the surface.

*Advantages:* A moment's reflection on these facts is sufficient to show the far-reaching effects such a scientific system must have upon the whole system of mining when it is put into regular practical operation, with experience and further development.

*Giving* information within a few days that, with boring or shaft sinking, would take months to ascertain.

*Directing* operations as to the best sites when shafts are being sunk, by giving the position, length and width of the lodes.

*Locating* the position of known valuable lodes lost through faults.

*Ascertaining* whether a given lode continues through extended leases.

*Indicating* the presence of hitherto unsuspected parallel lines of lode on the same lease, etc.

*In Fact,* scientifically prospecting the interior of the earth from the surface, inexpensively, prior to undertaking costly mining operations to search for minerals or lodes which may or may not be there.

*Effects on Mining:*—The *Electric Mines Survey System* hopes to reduce mining to something like an exact science, so that all operations will be undertaken scientifically and all work—sinking, driving, or cross-cutting—be directed towards a given objective at a pre-determined point, so that every penny will be expended on useful, definite work instead of the old empirical, wasteful method of haphazard exploring underground—with the pick, shovel, and candle as the only instruments and guide—in the endeavour to "pick up" a valuable lost lode, and for want of scientific knowledge often ceasing operations within a few feet of it.

The substitution of scientific methods for the old methods eliminating almost entirely the elements of risk and uncertainty, should place mining on more of an industrial than a speculative basis and as a consequence, attract more capital for development of gold and metal mining generally and bring about a general revival of the industry.

The capital saved by cutting out the wasteful expenditure involved in unsuccessful underground work would naturally be diverted to the development of new or old lodes the position of which has been located electrically.

*Scope of the System:* It is not claimed that this system will do everything and find everything underground, but sufficient practical work has been done to prove that it is sound in principle and will indicate the position of ordinary quartz reefs, which are worse conductors, and silver, copper, lead or similar deposits, which are better conductors, than the surrounding earth.

The method does not consist of a single instrument or indicator only, but is a flexible system, and such that the electrical impulses transmitted into the earth can be radiated, focussed or directed as desired in any plane entirely on the surface or entirely underground, where the workings are accessible, or in the vertical plane connected from the surface to the lower levels of a mine to suit varying conditions.

It should also with development and experience give valuable information to the miner in ascertaining whether a bore is anywhere near its objective or not, and generally be a scientific aid, in expert hands, to the mine manager in solving difficult problems in connection with developmental and prospecting work, and should be the means of saving annually large sums of money now expended in useless, unproductive work.

Note: The foregoing is taken from "Industrial Australian and Mining Standard" issue of 5th August last. It is important—if true.

#### NEW BRUNSWICK COLLIERY CHANGES HANDS.

John Henderson, formerly Manager of the Minto Coal Company, and lately operating an independent mine at Minto, N.B., and Harvey Welton of Minto who has for some years been interested in coal mining in the Minto area, are stated to have purchased the Coakley Mine, in the Grand Lake area. The price is understood to have been about \$35,000.

# ROLLER BEARING MINE CARS

We make any type of Mine Car desired by the buyer. We also design and build special cars, if none of the standard types will suit.

Let our Engineering Department help you reduce your costs and increase your output and general efficiency.

This view shows the oil or grease retaining cap removed to show the Roller Bearings supplied on our Mine Cars.

Same car as shown above, but in Dumping position.

END DUMP  
MINE CARS

This is one of our many designs. Our catalog shows others—End Dump, Side Dump, and Rotary Dump. We make this car any size or capacity you want.

Send for your copy of our new Mining Catalogue.

### PRESIDENT OF IMPERIAL OIL COMPANY REPORTS ON FORT NORMAN OIL WELL.

Mr. C. O. Stillman, President of the Imperial Oil Company, recently returned to Toronto from a western trip and confirmed the statements that have been made regarding the finding of oil at Fort Norman. President Stillman said that while the quantity of oil so far tapped only runs about eight barrels per day it is oil of promising quality. He stated further:

“What we have uncovered at Fort Norman is as good commercial oil as has ever been produced in Canada and runs about 40 Beaume gravity. This is the character of oil the world is looking for as it appears to contain large yields and refined contents.

“Our Fort Norman rigs first struck oil at 80 feet and again at 200 feet and the third strike at 425 feet. We hope to put the hole down 1,000 ft. this fall, which will be sufficient to test the territory.”

# PROVINCE OF QUEBEC

## MINES BRANCH

Department of Colonization, Mines and Fisheries

*The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.*

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

**MINERS' CERTIFICATES.** First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

**WORKING CONDITIONS.** During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

**SIX MONTHS AFTER STAKING.** At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

**MINING LICENSE.** The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

**MINING CONCESSION.** Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

**PROVINCIAL LABORATORY.** Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE J. E. PERRAULT,  
MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

# BRITISH COLUMBIA

## The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$75,722,603; Lode Gold, \$100,272,431; Silver, \$50,432,304; Lead, \$43,821,106; Copper, \$153,680,965; Zinc, \$16,818,487; Coal and Coke, \$199,123,323; Building Stone, Brick, Cement, etc., \$29,991,757; Miscellaneous Minerals, \$786,918; making its mineral production to the end of 1919 show an

### Aggregate Value of \$670,649,894

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462; for the year 1917, \$37,010,392; for the year 1918, \$41,782,474; for the year 1919, \$33,296,313.

### Production During last ten years, \$322,829,310

Lode-mining has only been in progress for about twenty-five years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with Mining Reports and Maps, may be obtained gratis by addressing

THE HON. THE MINISTER OF MINES  
VICTORIA, British Columbia.

# EDITORIAL

## THE MINING INDUSTRY AND THE TARIFF.

THOSE features of the Canadian Tariff which are most objected to by non-industrialists attach to discriminative duties imposed upon imported articles. Those who advocate discriminative tariffs upon manufactured articles and raw materials which compete with a domestic product are loosely termed protectionists.

It has been well stated, however, that the term protection, as now used to describe the commercial policy of a nation, should be so defined, "as to include all the means by which a country undertakes to secure through the positive efforts of the government the complete industrial and commercial development of its resources, and of its parts." These efforts include not only protective duties, but the system of bounties offered for introduction and establishment of new industries; the policy of restricted immigration of the less desirable class of laborers, botanical and geological surveys, experimental farms, fisheries protection and the re-stocking of rivers, afforestation measures, the building of railways and canals and the deepening of waterways and harbors, and the provision of technical education. The successive administrations of Canada have not been backward in such positive efforts to foster our internal development and external importance.

While in theory it may be held that this general programme of national self-help could be carried out without the inclusion of discriminative imposts upon imported commodities, in practice it has not been considered possible by the successive governments of Canada, none of whom—despite much campaign argument—have ever dared to test the theory by making it a fact when they had the opportunity.

The chief reason for this practical diffidence of non-protectionists has been the proximity of Canada to that nation, which pre-eminently among modern nations has adopted the completest programme of national protection, and has pre-eminently prospered.

No person has ever yet satisfactorily demonstrated how a small and undeveloped nation could protect its economic self-sufficiency or its political independence by pursuing a non-protective policy, if, as is the case of Canada and the United States, the smaller an infant nation were geographically a continental extension of

a large and developed nation, irrevocably committed to the ultimate exposition of the whole theory of national protection.

It is this dominant consideration that explains why no Canadian Government has ever considered it possible to abolish tariffs that are intended to deter the importation of commodities that compete with domestic industry.

THE theory of free-trade is admittedly a cosmopolitan concept, and it is apt to be unsympathetic towards a strictly national viewpoint. The persistence of nationality has been abundantly demonstrated in recent years, for, long before President Wilson put the pregnant word "self-determination" into a memorable state document, the leaven of national aspiration, of national languages and ethnological bonds was disturbing Europe, and played no small part in precipitating the great war. Whether it shall prove to be beneficial or not, it must be admitted that the trend of thought is towards national self-consciousness and the strengthening of nationality as distinguished from cosmopolitanism.

There is simultaneously working another ferment, namely the communistic idea of the world unity of the proletariat, with a somewhat visionary concept called "Capitalism" as the great enemy of mankind. Unfortunately for the world, every conception of civilization, every outward expression of man's long upward climb in invention, every outward expression of the resources of earth, every safeguard that men have thrown around family life and the prudential effort of men who strive to assure the comfort of their offspring, is involved in the social framework known as "Capitalism," and is threatened by barbaric ruin by those who would destroy, in order—as they probably sincerely believe—to build a better world.

It is therefore no coincidence that the concrete expression of national aspiration that we call Protection; the guarded and accumulated wealth of the nation that is called Capitalism, should view with distrust any principle that includes cosmopolitanism, or permits another nation to control the economic life of this country to an extent which, if unchecked, would permit of powerful outside influence being brought to bear upon our political life also.

It is well to be frank about these matters, and to admit that the chief objection which protectionists in Canada have against free-trade is the cosmopolitan tendency of that principle. It is, in the position occupied by Canada, one that always has been, and always must be, corrosive of our nationality.

HOW do these conditions relate to the mining industry? The mining industry, so far as the actual application of the existing tariff is concerned, is not a unit. Using the classification adopted by the Mines Branch, of metallics, non-metallics and structural materials, we find that the metallics are little affected by the tariff, and the same may be said of the non-metallics and structural materials, with the two important exceptions of coal and cement; and with the further exception that there are some minerals, such as cobalt, molybdenite, asbestos, chromite, felspar, gypsum and magnesite, that find their most important market in the United States, of which free entry into that country is desirable. Certain concessions are made to miners in the free admission of drilling and cutting machinery not manufactured in Canada, but, generally speaking, the production of minerals in Canada is not materially affected by tariffs, except as the workers in the industry, in a manner analogous to the agriculturists, pay their quota of the cost of protective duties as borne by the consumer in Canada. With one or two important exceptions, hereinafter referred to, the revision of the tariff is a matter in which the miner is little concerned directly.

Indirectly, however, we believe the mining industry is vitally concerned in the maintenance of tariff protection as one of the main props of our national credit and security, and it is possibly more directly concerned, inasmuch as the product of the mine in Canada looks more and more to domestic manufactures for a market, and for that ultimate profitableness which can only accrue to a mining industry when the substances it produces are worked up into finished products in the country of origin.

We believe, therefore, that the interests of the mining industry lie in a continuation of that wide policy of national protection in which the tariff is but one factor, although admittedly a very important factor, and necessary to the maintenance of the whole.

There are some cases in which the wording of the tariff can be made more specific, and some matters of detail that will no doubt be brought to the attention of the Tariff Enquiry Board during its itinerary, but it is to be hoped that local circumstances will not be allowed to obscure or to vitiate the general dependence of the industry upon a retention of protective duties, which we believe to be synonymous with the maintenance of national prosperity.

THE duties on coal and cement are objected to by the agriculturists on the general ground that they add to the cost of living of the farmer. Generally speaking, the tariff has for the past two years played second-fiddle to the discount on the Canadian dollar. The total consumption of cement in Canada during 1919 was approximately  $4\frac{3}{4}$  million barrels valued at about  $17\frac{1}{2}$  million dollars. For the first time, the exports of cement from Canada exceeded the imports into Canada. This is the kind of corrective of the exchange situation that all well-wishers of Canada desire, and it may be regarded as the outcome of the policy of fostering a Canadian industry by judicious tariff protection. How much cement was used by agriculturists is not ascertainable, but a comparison of the size and value of agricultural yields in Canada would not indicate that the financial position of agriculture suffered from the cost of protecting the cement industry, whereas, were the protection removed, the cement industry could not persist in Canada.

In regard to coal, the tariff applies to bituminous coal, that used in making coke for metallurgical processes being imported free of duty. Slack bituminous pays a duty of 15 cents per ton, and round bituminous a duty of 53 cents per ton, the duty having been reduced 15 cents per ton at the last revision of the tariff. There was never any justification for that reduction, and as things have turned out, the net result to Canada has been the loss of 15 cents per ton revenue on each ton of bituminous coal imported, without any saving to the Canadian consumer. Where the whole duty remitted on coal, the Canadian consumer would never know it from inspection of his coal bill. Coal is at this time a very excellent example of an import tariff that functions only as a source of revenue to the Government, the duty being entirely too small to act as a protection in favor of the Canadian producer.

The readers of the "Journal" are familiar with the history of the coal industry in Canada, and reiteration becomes irksome, but perhaps we may be allowed to epitomise the justification for a protective duty on coal by remarking that, east of Fort William, the cost of producing coal in Canada is, and always will be, relatively more than in the coalfields of the United States to the immediate south, and that the duty of 53 cents per ton does not begin to balance the differential in production costs.

We desire, in all seriousness, to make the assertion that Canada, in the great continental stretch that includes Nova Scotia, New Brunswick, Quebec, Ontario, Manitoba and a large part of Saskatchewan, is most meagerly supplied with coal; and that no mine in Nova Scotia or New Brunswick can produce at a cost that is less than two dollars a ton in excess of the average cost of coal production in Pennsylvania and Virginia. This condition is one that is not related to

questions of wages, labor or management, but arises from the more favorable natural conditions under which coal is mined in the United States, and the infinitely largely quantity of coal available there.

Coal production demands consideration from our government much more from the standpoint of national defence than on purely commercial grounds. It needs not only the maximum protection that the tariff can give without crippling other industries, but, in addition a greater share of those "positive efforts of the government", hereinbefore referred to, than any government in Canada has yet extended to it.

The idea of self-sustenance can be, as the Toronto "Globe" points out, carried to the stage of absurdity, but over indulgence in this idea is the last thing that Canada can be accused of. The "Globe" itself, however, indulges in an indefensible generalization when it says that "a year's working out of the theory that a nation should be 'self-sustained' would put Canada where Soviet Russia is today." Canada will have to be sadly changed before her people go collectively daft, or hazard "the cessation for a considerable time of foreign trade," to which condition the degeneration of Russia is attributed. Most people think there are other contributory factors to the present state of Russia.

There are, however, some "raw materials" (perhaps the "Globe" will excuse the use of what it terms "the jargon of the protectionist") without the internal production of which no nation can be self-sustained or even politically independent. Coal is one of these materials. Iron is another. In both these commodities Canada is unnecessarily dependent on the United States. To the extent that this dependence is unnecessary it is evil and nationally dangerous, and it is Canada's most exigent problem to find out how much of the international trade in coal and iron is unnecessary. It can hardly be stated that Canada has erred on the score of advocacy of the "self-sustained school" in the light of the present rate of production in coal and iron in Canada, both of which in 1919 reached their lowest ebb for many years, and promise during 1920 to show little, if any, improvement. Simultaneously, the production of coal and iron reached heights in the United States that are not only unprecedented, but in the nature of a world portent.

#### COAL SUPPLY STATISTICS.

IN this issue will be found a review of the coal situation in Canada prepared by the Chief of the Mining Division of the Dominion Bureau of Statistics, Mr. S. J. Cook, which contains the important information that a monthly bulletin on coal supply is proposed to be issued by this department, being a continuation of the work of recording, and publication inaugurated by the Fuel Controller of the Dominion during the period of his administration. This is a

service that will be much appreciated by the public at large, and by the section that is more intimately interested in coal statistics from a connection with the production or distribution of coal. A similar service has for some time been conducted by the United States Geological Survey. The new service is important as indicating a realisation by the Federal Government of the national viewpoint upon coal supply, and it gives rise to the hope that the easier availability of centralised coal statistics, and their more frequent publication, will lead to the formation of some body empowered to take such action as the statistics may indicate to be desirable.

The review surmises that Canadians will not be content to remain so absolutely dependent on the United States coal miner as is the case at this time. We hope not, but they have remained content for a very long time. "Co-ordination of effort, with elimination of obsolete methods and unnecessary local competition" is advocated to improve our coal supply. There is a nearer approach to co-ordination of effort and the elimination of local competition at this time than has ever been observable before in domestic coal mining circles, insofar as the operators are concerned; and while there is not that unanimity between the employers and their workmen that is desirable, we cannot admit that here lies all the reason for the small production of Canadian coal mines at this time. There is a very serious numerical shortage of miners in Canada and only the slimmest hope of new men being obtained. We would suggest to the Bureau of Statistics that a comparison of the number of men now employed in coal mining in Canada with those employed in the period from 1914 to 1916 would show a large decrease in numbers, particularly in the number of men actually engaged in mining coal. One typical coal company in Canada had in its employment in 1918 precisely half the number of men employed at the actual mining of coal in 1916. Since that date, and almost two years after the Armistice, it has succeeded in adding only 150 men, and is still short by approximately 1,500 men in the mining coal section, or in that class of workers which decided what the output shall be. No cleverness of management or adoption of new methods can produce output without producers.

We cannot admit that obsolete mining methods are in existence in the coal mines of Canada. There has been a concerted stand amongst coal miners of which we have noted instances in Canada, the United States, Anstralia, Great Britain and Germany, to blame the reduction in coal output upon the shortage of modern mining equipment, when, as is very well-known to all readers of technical literature, the equipment of collieries was never so perfected as it is today. It is true that the pit-room has been restricted by shortage of workmen during the war period, which prevented ordinary progress of advance development workings.

but to suggest that the collieries of every important coal-producing country have suddenly become old-fashioned is self-evidently untenable.

There is, admittedly a lack of new collieries, because in coal-mining, as in building, domestic housing and railway construction, the exigencies of the war forced the cessation of new development, and caused the existing openings to be forced beyond the point where a maximum output could be maintained.

The coal industry of Canada is in a state analagous to a person convalescent from disease. It needs building up. More capital expenditure, more workmen, less "controlling" and more encouragement from the powers that be are required. The market needs no enlargement. At no time has the Canadian coal output approached within measurable distance of satisfying the domestic demand.

The Bureau of Statistic's Review mentions that production during the first quarter of 1920 exceeded that of 1919 by half a million tons, and that a continuation of this rate of increase would result in the production during 1920 of an output exceeding that of 1913. Unfortunately, the rate of the Spring months has not been maintained. While there would be some satisfaction in seeing the Canadian coal output return to the figures of 1913, it cannot be admitted that even this record year showed a satisfactory production, and there should have been a progressive annual increase since 1913, bringing the output at this date to somewhere around 18,000,000 tons. The production of coal per capita in Canada is about 1½ tons per annum. In the United States and Great Britain it is about 5 tons per capita per annum. The comparison speaks for itself.

#### THE AFTER-TREATMENT OF INJURED WORKMEN.

The efficacy of massage, electrical treatment and exercises for the limbs and body, have been demonstrated during the war on an unprecedented scale, and certain definite advances in surgery and the cure of physical injuries have resulted therefrom. It is interesting to learn of similar methods being applied on a large and centralized scale to the treatment of physical injuries received in industrial occupations. A Report by Dr. Lister Llewellyn, Medical Officer to the North Staffordshire Coal & Iron Masters, describes in the "Colliery Guardian" for August 20th, the establishment of a massage centre for the intensive after-treatment of injuries by daily massage, suggestion and exercises. The coal and iron operators in the district referred to are united in a mutual indemnity society, and they have established the centre for the free treatment of injured workmen in receipt of workmen's compensation payments. Some striking instances are given by Dr. Llewellyn of the rapid recovery which followed treatment. One important feature of the establishment has been that

many cases of long-standing have been taken over, and that return to work does not necessarily mean a return to old employment. Out of 446 completed cases which have passed through the centre 425 returned to work, 12 settled for a lump sum compensation, 6 were not improved by treatment, and 3 refused treatment.

Dr. Llewellyn states that the loss of function which results from disuse, formation of adhesions in joints and, above all, from the mental inertia that follows most serious injuries can only be satisfactorily treated in large infirmaries, hospitals or specially provided centres. The establishment is stated to be no longer an experiment, and the employers concerned have recently purchased accommodation for a permanent establishment to take place of what was in its initial stages a temporary provision for experimental purposes.

While the actual saving on compensation payments will be sufficient to make such an establishment advisable from a purely financial point of view, there can be but little doubt that the advocacy of medical men and the action of employers has been stimulated by the remarkable results obtained in medical treatment and the civil re-establishment of injured soldiers, and by the knowledge possessed by these men that many a temporary injury has become a permanent one precisely through lack of persistent and patient application, day by day, of the slow but certain curative methods of the modern hospital. The mental inertia referred to by Dr. Llewellyn is a condition that all who have had to do with occupational injuries will recognize.

Where medical aid is afforded under the operation of Workmen's Compensation Acts, it may be anticipated that establishments of this nature will find general adoption, and, under the powers conferred by most of the Compensation Acts now existent in Canada, the provision of such establishments is within the scope of the expenditures and provisions that may be made by the provincial Boards. The provision of artificial limbs, and their proper fitting and adaptation to the requirements of mutilated persons is a service that could conveniently and properly be centralized in similar manner.

#### CONDITIONS AT NOVA SCOTIA COLLIERIES.

The Royal Commission which has investigated wages, and working and living conditions at the collieries in Nova Scotia, conducted its enquiries with great thoroughness, being indeed accused of a too deliberate procedure, and has made a report that will prove a landmark in the social evolution of the colliery districts.

The Report may be regarded as a constructive document in two very important particulars, namely, in the recommendation that a joint permanent conciliation board be constituted, and that a sliding scale based on the daily per capita production of coal should be

adopted. These are two suggestions that should be workable if both sides will co-operate to make them so.

Certain recommendations regarding the larger use of the radial-post type of undercutter in substitution for the "puncher", and the introduction of the cap-type of portable electric lamp in lieu of the oil-flame safety-lamp; and the extension of washhouse accommodation, merely confirm the policy that the coal companies have been following as funds and opportunity would permit.

The Commission do not appear to have noted that the mining practice at Nova Scotia collieries is in some most important respects burdened with methods that are designed to secure the safety of human life, and it is this fact that to a larger extent than the Commission appears to have realised, increases the cost of coal production in Nova Scotia as compared with the cost under the methods used in the United States. The use of underground electric trolley-haulages, (involving naked power-wires on the haulage roads), black powder for blasting, naked lights, blasting "out of the solid," are all examples of methods that lend themselves to cheap and rapid production of coal on a large scale, and are very generally practised in the United States, but, in Nova Scotia, are prohibited by law and by general sentiment. In no small measure, the preference for safer methods in Nova Scotia, accounts for the lower cost of production in the United States to which the Commission refers as threatening the existence of the Nova Scotia industry.

The unqualified condemnation of the general living conditions voiced by the Commission, and the implication that this is something that the companies can remedy, or should have remedied before this, is not exactly fair to the companies, nor is it correct in the assumption the such thoroughly remedial action as is recommended is physically or financially possible. The truth is that there are some of the older collieries, where, if the coal companies had been actuated by purely utilitarian motives, operations would have long since been abandoned and the houses dismantled. In this respect, the coal companies, who have the misfortune to be large landlords, are not better situated or more able to help themselves, than many municipal authorities who contemplate the demolition of slum areas and the erection of new tenements, but are unable to find either the money or the labor to carry out their desires.

The Royal Commission has frankly voiced a viewpoint that is the more understandable because none of its members have ever worked or resided in colliery districts, and so far as it may prove possible, the conditions of which they complain will probably be sought to be remedied, but, to an extent that only the search for a remedy will demonstrate, the Report will be found to be a counsel of perfection so far as the re-

commendations on social conditions are concerned, and it is not possible for the coal companies—unaided—to make the expenditures recommended, combined with the increased wages also recommended, and the capital expenditure that is desperately required to rehabilitate the capacity of the mines for output.

The Commission has not, so far as the Ottawa report indicates, taken cognisance of the numerical shortage of miners, or the necessity to provide new and additional housing for the men and families that must be brought in if the coal production is to be increased to former figures.

All of which, we believe, confirms the opinion we have previously expressed that the expenditure required to put the coal mines of Nova Scotia on a basis commensurate with their potentialities and the country's coal requirements, is beyond the financial ability of the coal companies.

### THE MINING LAWS OF QUEBEC. A Defense by the Superintendent of Mines.

An article which appeared in the Northern Ontario newspapers and also in one of the Toronto newspapers, made reference to "the complicated mining laws of Quebec" and the fears felt towards these laws by experienced prospectors. Mr. Théo. Denis, the Superintendent of Mines for Quebec, was quick to traverse this reference, and the following excerpt from his comment may be of general interest to our readers, and should serve to offset what appears to be a widespread impression regarding the mining law of Quebec. The steady uninterrupted growth of mining in Quebec was referred to at length in our issue of August 27th (page 695), and there is some significance—in the light of Mr. Denis's letter—in the growth of the value of the mineral production of Quebec from \$7,323,281 in 1910 to \$20,813,670 in 1920. No other province in Canada can show a better rate of increase in mineral production.

Mr. Denis' remarks are as follows :

"Such fears are quite unfounded, and I believe that they relate to the Old Quebec Mining laws, which ruled before the year 1910. In that year the principles of the Quebec Mining laws were entirely changed, and they are now practically the same as in Ontario; if anything they are more liberal towards the prospector. The enclosed leaflet will convince you, and also the advertisement which is appearing regularly in the "Canadian Mining Journal", in which the basic principles of the laws are clearly set forth.

"As you will see, a prospector is allowed to stake out claims up to 200 acres, or if in surveyed territory 4 half lots of 50 acres each. He records them without having any fees to pay and may keep them six months, (the months of December, January and February being eliminated) without any expense, except doing 25 days work on each claim. At the end of six months, he may apply for the concession or (crown grant) or if not yet convinced that the ground is worth the five dollars or the three dollars an acre (according as to whether he wants to acquire the rights to the higher or lower minerals), he may continue to keep the land by a mining license, for one year, at the rate of 50 cts an acre. During his holding of the titles, as a recorded claim, or as a mining license, or as an applicant for Crown-grant, his property of the claims is absolutely undisputable, if he has complied with the working conditions, which are very lenient.

"Moreover, the Minister of Colonization, Mines and Fisheries, is always open to advice, and as he has at heart the development of Quebec mineral resources, you may be assured that any concrete constructive suggestion to improve the law always receives his earnest consideration."

# Hollinger Mines as a Criterion

By ALEXANDER GRAY

There is the authority of a Director of Hollinger Consolidated Gold Mines that no diamond drill has penetrated their property to a vertical depth of 2,400 feet.

Without detracting from the integrity of Hollinger strata, this semi-official denial of a report that a drill-hole definitely determined the continuity of the geological features characteristic of these mines insofar as they have been developed, should set at rest injudicious assumptions that the ore bodies exist here, there and everywhere.

Representations, therefore, that the drilling disclosures "in the western end" of the Hollinger properties will benefit this, that, or the other area, can be dismissed as nothing more than a periodic indulgence in indiscriminate projections designed to attract public participation to impending distributions of shares.

That Hollinger Directors and the Management would welcome the further proof of their geology at greater depth, goes without saying. They have no apprehensions in this respect—but they would not select the "western" section of the former Miller-Middleton area for exploration by means of a diamond drill. It is no secret the "western" end of the Millerton is not altogether in the Hollinger geological horizon, and as the Hollinger Central Shaft may reach 2,000 feet by January 1st, the Management has other employment than drilling "stunts" in doubtful territory.

At this writing the Central Shaft is at or about 1,600 feet vertically. The intention is to carry it down to 2,000 feet, and to inaugurate a development programme at that level. Labor shortage is the greatest deterrent, and the attitude of Ottawa toward relief sought for this, is not reassuring. To the urgent petitions for permission to recruit somewhat unskilled labor overseas, the nonchalant official contention is that "muckers" must be "British". It is not material to Ottawa that the Hollinger output in 1920 may be almost a million dollars less than what it was in 1919, or that other mines are similarly affected. Mines producing an average of \$488,000 in gold per month in the first half of this year, but having a daily average of 161 men less in that period than was employed in 1919, are told "muckers" will have to be "hall-marked" neither "Allies" nor "Neutrals" need apply or expect work. Gold, silver and nickel producers are preferred, this as an alternative—while the politicians clamor for "production" as a panacea for economic ills, "British" Miners and "muckers" and their confrères in the States, are "holidaying". Only the practically unskilled of Italy, Poland and Hungary are available in quantity, and they alone are willing to submit to underground conditions. At their own expense mine owners are prepared to bring what labor they need. Confronted as they are by competition, they counted upon government co-operation. Instead of that, there is official diffidence if not dissent, consequently the Hollinger for example crushed only about 360,000 tons in the first half of this year—assuming that the grade of ore milled averaged about \$9, whereas the hope of the management at one time was that at least a million tons would be put through this year.

Bearing in mind that the average number of men

employed was 1,098, as compared with 1,259 in 1919, and that the average tons broken and milled in the six months ended with June showed a gain of about sixty tons per day, the efficiency in force and effect cannot be questioned. The management accomplished important economies. That, however, failed to achieve anything like what was contemplated in the matter of tonnage milled and development. Crushing to only 60 per cent. of the possible capacity and endeavoring to increase ore reserves, hardly is economical, and yet such companies cannot obtain relief. At this moment, when as much as \$6 per day with board is being offered laborers by pulp and paper companies, it is not to be wondered why gold and silver production is less than what it would be were official solicitude bestowed upon mine owners. Men can get more in "the bush", where no questions are asked as to their "British" antecedents, than precious metal mine owners can afford to pay in justice to shareholders. In the aggregate, Ontario's gold output is growing, but the larger mines cannot maintain their ratio without encroaching upon ore reserves. The decrease in the Hollinger gold output, as indicated by the Ontario Bureau of Mines in the figures covering the first half of the year, is disconcerting if not discouraging. Had the Hollinger contributed as much as its General Manager and the Board anticipated, the Ontario aggregate for 1920 would have favorably compared with any of the United States, where California is leading with a gold production valued at \$17,398,200, Colorado being second with \$10,249,300, and Alaska third with \$9,963,500. These totals relate to 1919 production of the yellow metal by those three states. In that year the Hollinger alone produced \$6,924,214.05, of which \$6,722,266.81 was recovered. Pursuing the comparison, Ontario is accounting for more gold than Colorado, and the Hollinger Mines in 1919 yielded 65.589 per cent. of the total reported by the State of California, the "Golden State", so-called.

Obviously the gold mines of Ontario, having superseded the silver mines—the phenomenal silver mines of Cobalt—merit more than the consideration of the tax-gatherers. Regardless of their handicaps, they will excel those of Colorado and measure up to about 70 per cent. of the California production. This, though, does not warrant the rash assumptions occasionally recorded that Northern Ontario will rival the Witwatersrand Gold Fields, from which approximately £600,000,000 had been extracted to 1920. "Boundless optimism" with regard to the future of Ontario Gold Fields, expensive as they are, is apt to undergo revision after a closer analysis of "the Rand"—the only "Rand", of "Rand" age and uniformity. The sixty-odd miles of the Main Reef Series north, west and east of Johannesburg, and dipping south to great depths, hardly will be paralleled. They need not be, it is no disparagement of Ontario to give precedence to the gold mines between Randfontein and Heidelberg, in the Transvaal. Since 1886 the South African Gold Mines have continued to be the chief source of the world's yellow metal and fifty of the mines still possess 89,000,000 tons in their ore reserves. The first gold from the conglomerate beds of the Witwaters-

rand was panned in 1885. In 1886, the year before the first stamp-mill started there, the gold output of the Transvaal was \$420,000, or thereabout. In 1919 the Transvaal contributed \$171,460,123. Nearly \$3,000,000,000 had passed through the mortar boxes of the "Rand" mills at the end of 1919, and there was a further \$600,000,000—or so with more to follow—in the known ore reserves on last New Year day. So horizontal deductions about the similarity of Northern Ontario and Witwatersrand formations, at this stage, partake of an element of "incorrigible optimism". Deep-seated as the Ontario gold-bearing ore bodies are acknowledged to be; widespread as the Ontario gold-bearing areas are known to be, they are altogether dissimilar to the "banket beds". As to the genesis of the "banket", the conglomerates of the Witwatersrand, geologists and engineers differ. Leading authorities assume the conglomerate beds and enclosing sandstone and quartzites were seashore deposits formed during subsidence of a coast line, that after their deposition and consolidation, the banket bearing strata were folded into anticlines and synclines. While decided differences of opinion always existed, the origin of the gold is held by most scientists to have been by means of impregnation, the gold and pyrites present having been deposited in the beds by infiltrating solutions, which sought the pebble beds as the planes of least resistance. There are other "bankets"—pebble beds—but they are not of Witwatersrand age. Misinterpreted to begin with by mining scientists who doubted the vertical continuity of the so-called "reefs", they are yielding one-half of the world's gold. The "Rand" revolutionized gold mining. Porcupine also reversed the order of things and convinced those who were unfamiliar with the occurrence that Canada had disclosed a gold field of first magnitude. Further explorations lent importance to the development. Now, and notwithstanding the adverse conditions prevailing for six or seven years, there is greater appreciation of the gold-bearing sections of Ontario and Quebec—not to speak of the northwest. It is immaterial whether the veins were formed at high or intermediate temperatures. They are in a country of igneous origin, largely so; rocks of Keewatin, Timiskaming, pre-Algonian and Algonian age, a certain amount of the ore deposits being augmented by metasomatic replacement. As was pointed out by Mr. A. G. Burrows of the Ontario Geological Bureau, a great part of the Keewatin is composed largely of volcanic rocks. Considerable of the Keewatin now is altered schist, "and such terms as grey schist, green schist, hornblende schist, carbonate schist, are used to describe certain rocks in various localities. These rocks do not give much idea of the original mineral composition: for example, a grey schist may have been derived from a rhyolite, or from basalt. It does not therefore seem advisable to make any separation of the volcanic rocks of the Keewatin. They can be referred to as a basaltic greenstone series, which may include types of rock from rhyolite to basalt but are now so altered that a division is not advisable. They have all been subjected to vein-forming influences. There are also rocks throughout the Keewatin areas which are diabases and diorites. Rocks which are probably alterations from basalt are of frequent occurrence. They may now properly be called meta-basalts. In various parts of the areas associated with the Keewatin rocks are carbonates to which various terms have been applied,

such as dolomite, ferro-dolomite, ferruginous carbonate and ankerite."

These generalizations need not be carried further. They will suffice to demonstrate that there is nothing in common between Northern Ontario and the Witwatersrand, beyond the fact that precious metal values persist to great depths. Westralian mines relate more closely to those of Northern Ontario, the comparison favoring the latter, as will be more fully demonstrated when labor is more plentiful and development can be prosecuted. Already the Hollinger is in the front rank of the world's greatest mines. It is the richest of the four greatest gold mines. In the matter of grade it is first: in ore reserves it stands fourth, in tonnage, and third in the gross value of its ore reserves. Its development does not call for extravagant conjectures. So extensive is the fissuring there is every reasonable guarantee of longevity. At the same time it is not to be denied that the Government Areas at the Witwatersrand have 10,055,000 tons, worth about \$80,000,000, in their proved reserves; New Modderfontein has 8,800,000 tons, worth \$76,146,000, and Crown Mines, 8,298,000 tons, worth \$52,800,000. Hollinger has the advantage in that it will grow, whereas others of the quartette of greatest mines have their end in sight. Crown Mines have paid between £9,000,000 and £10,000,000 in dividends, and have as much more in the gross value of their reserves. The elastic limits of Hollinger are a long way from being reached; consequently Northern Ontario is deserving of stronger constructive policies at Ottawa and Toronto.

#### DIAMOND DRILLING AT THE HOLLINGER MINE.

The Sullivan Machinery Company has issued a compact booklet on "Core Drilling by Contract", which gives typical examples of the varied uses to which the diamond drill has been put. Included in the examples is a reduced section of the principal workings of the Hollinger Gold Mine, showing the course of a 2,000 ft. angle prospecting drillhole, traversing the strata from the surface to the 1,400 ft. level, and showing the intersection of the veins encountered, and their extent and character as deduced from the drill-cores. It is this definite ascertainment of the character, stratification, and extent of the rocks encountered that makes the diamond drill so useful in proving the value of a given property.

No confirmation has been given of the report that the Hollinger property has been diamond drilled to a vertical depth of 2,400 ft. It is understood the Main Central Shaft is down to a depth of between 1,600 and 1,700 ft. and that within a few months a depth of 2,000 ft. will be attained by this shaft.

#### METAL QUOTATIONS.

## Northern Ontario Letter

### THE SILVER MINES.

#### The Cobalt District.

The decision of the Crown Reserve Mining Company to put down a diamond drill hole to a depth of 2,000 feet on the incline from the 500-ft. level of the mine, or a total vertical depth of 2,000 feet from surface, is one of the most interesting exploration efforts ever undertaken in the Cobalt district. The hole is being put down on the theory that another sill of diabase formation may be found.

In order to gather a correct idea of what such a discovery would mean, it is only necessary to keep in mind the fact that the one great diabase sill which passes through and over the productive mines of Cobalt is regarded as the "mother of silver", this having been the agent which carried with it the silver-bearing solution which found its way into the fractures, cracks or crevices of the adjacent rocks where the silver was deposited, thereby forming veins of ore. These veins occur in close proximity to the diabase and have never been known to extend for more than from 500 to 1,000 feet from this formation. Accordingly, it is obvious the silver deposits have quite clearly defined limits.

It is true that many years will be occupied in mining out this zone of mineralization adjacent to the present known diabase sill, but with ore deposition confined to definite limits, the life of the camp may be measured with a reasonable degree of accuracy.

From these facts, and keeping in mind the other details in regard to an output of more than three hundred million ounces of silver from this one great zone, it is clear that very great importance attaches to the effort on the part of the Crown Reserve to prove whether another diabase sill occurs at a lower horizon, or not—or whether or not another Cobalt may be found lying beneath the old.

At the time of writing, advice has just been received, telling of the discovery of silver in a drift at a depth of 60 feet on the Cobalt—53 property situated in the Gillies Limit. Early reports are very good, but until further work is done it will not be possible to correctly estimate the importance of the find, but it will stimulate interest in that very promising section of the Cobalt field.

One of the heaviest individual shipments in recent years went forward from the Nipissing mine during the third week in September, the consignment consisting of 219 bars containing 299,587 fine ounce of silver bullion and being billed to Shanghai, China.

Opinion is swinging to the belief that some difficulty may be experienced in securing the consent of the shareholders of the Temiskaming Mining Company to join the McIntyre Porcupine mine in the purchase and operation of coal lands in Alberta. On the other hand, certain of the officials of the company appear to be confident no such difficulty will be experienced.

The cross-cut at the 100-ft. level of the Conroy-McAndrews property in the Gillies Limit is at a point where it is believed likely to encounter the vein almost any day. This vein at surface was strong and carried encouraging silver values.

During August, the Nipissing mine produced \$238,959 and shipped bullion and residue from Nipissing and custom ores of an estimated net value of \$701,981, according to the regular monthly statement sub-

mitted by Hugh Park, manager, to the president and directors.

The usual amount of development and exploration work as done at all shafts, says the report. No large veins were found, but general operations continued satisfactory.

The low grade mill treated 7,961 tons, a new high record for any one month. The high grade plant treated 222 tons, while the refinery shipped 598,199 fine ounces of bullion.

The following is a summary :

Low grade mill . . . . .	\$158,654
Washing plant . . . . .	80,305

Total . . . . .	\$238,959
-----------------	-----------

#### Ore and Bullion Shipments.

During the week ended September 17th, two companies shipped ore from Cobalt, a feature being exceptionally heavy shipments from the Nipissing mine, which company alone sent seven cars containing 610,235 pounds of ore. The only other shipper was the McKinley-Darragh with one car containing 84,874 pounds.

#### The Elk Lake Field.

According to official advice just obtained, the management of the White Reserve mine, in the Maple Mountain section of the Elk Lake silver area, has received an offer from English interests which appears attractive to the White Reserve, and also advantageous to the other contracting parties. As a part of the negotiations and terms, mining operations are to give place to exploration work by diamond drilling. Accordingly the mine has been closed down and contracts are to be let shortly for diamond-drill work.

Considerable high-grade ore is being taken out from the surface of the veins on the Cane Silver Mines, and it is believed a medium-sized shipment may be made just as soon as sleigh roads make hauling easy. The distance to the railway is about four miles. As a part of the scheme to work the property, additional camp-buildings are to be erected, and arrangements will be made to carry on aggressive underground operations during the coming winter.

A deal is being negotiated on the Legault property, lying along the north boundary of the township of Auld, and close to the Triangle Silver Mines, and it is intimated there are fair prospects of the deal going through, with prospects of this property also being worked during the winter. The Cane Silver Mines as well as the Triangle Silver Mines, may be reached by mail at Kenabeek, Ont.

#### The Gowganda Area.

The mining plant on the Silver Bullion property, at Leroy Lake in the Gowganda district, has been installed, and will expedite the underground work which has been outlined. Shaft sinking will be continued on the incline from an old 50-ft. shaft which previously yielded encouraging quantities of silver ore.

The mining plant on the Walsh property has not yet been removed from the mainland to an island in Miller Lake owing to financial arrangements not having been completed whereby operations, could be conducted on a large scale. It is believed, however, a satisfactory arrangement may be made at a reasonably early date.

The latest example of "class consciousness" is the Undertakers' Association of St. John, New Brunswick, which has protested against burial at sea.

## THE GOLD MINES. The Porcupine District.

The great merit of the mineral deposits of the Porcupine gold area has been most satisfactorily demonstrated by deep mining operations on the leading properties, and, also, by the geological data gathered by the Northerown Mines during the course of drilling its Porcupine Crown mine to a depth of close to 2,300 feet.

It has been found that the greenstone formation broadens out at depth and that much of the porphyry area as found on surface is actually underlain with greenstone. As it is in this last-named formation where the gold-bearing veins occur in close proximity to the porphyry, the broadening out of the greenstone area at depth is of exceedingly great importance to the properties lying on porphyry formation, but on the edge of greenstone as shown on surface.

The Northerown Mines has outlined an extensive exploration and development program on both of its properties, the Porcupine Crown and Thompson-Krist. This includes driving a cross-cut about 1,900 feet from the 500-ft. level of the Porcupine Crown, calculated to cut the entire prospective area through 700 feet of Porcupine Crown ground and 1,200 feet of Thompson-Krist. The object is to cut the one known ore-bearing vein on the Thompson-Krist, some 1,900 feet away, and to learn what lies in the intervening distance. It is believed quite reasonable to expect that other veins will be opened up in this work. In addition to this cross-cut, as well as operating the mill steadily at from 75 to 100 tons of ore daily, it is planned to drive three diamond-drill holes along the west part of the Porcupine Crown.

A matter of interest to stockholders of the Northerown Mines is the intimation that some move may be made to increase the capitalization so as to provide funds for even more extensive work. This matter, of course, is merely under discussion as yet, and has not been definitely decided upon.

It is said the main central shaft of the Hollinger Consolidated is to be put down to a depth of 2,000 feet, and that diamond drill results have shown no change in geological conditions at this depth. Some years ago, core was drawn from a depth of 1,800 feet on the Hollinger, while recently core has been taken from a depth of nearly 2,400 feet. In connection with this latter report, some of the officials are reported to have denied its accuracy, but in Porcupine it is generally accepted as being correct. It is said the hole was put down at a point some little distance removed from the main central shaft of the Hollinger.

As a result of success at depth on the Hollinger, as well as the geological data gathered on the Porcupine Crown, interests identified with the Moneta mine appear to have just cause for optimism. The property lies adjacent to the Hollinger on the west, and has greenstone formation along part of its property. The data which shown this formation as likely to broaden out at depth is regarded as being important to the Moneta mine, especially so on account of the general trend of the orebodies of the Hollinger being toward the Moneta.

The annual report on the McIntyre-Porcupine for the fiscal year ended June 30, is entirely favorable and shows an increase of about \$1,000,000 in the ore reserves, as well as showing a total production of \$2,080,178 for the year. An average of \$11.02 was recovered from each ton of ore treated, as compared

with \$9.76 during the preceding year. Operating costs increased to \$900,495 as compared with \$825,998. Net profit, before providing for depreciation of plant, amounted to \$818,020, compared with \$683,350 for the year preceding.

### The Kirkland Lake District.

Litigation is again involving the Orr Gold Mines, and the minority interests have taken action to endeavor to restrain the directors from issuing 800,000 treasury shares to Hamilton B. Wills. The now defunct Kirkland-Porphyry Company which was formed some two or three years ago by Mr. Wills, purchased the control of the Orr Gold Mines, and spent a large amount of money on development work. The Kirkland-Porphyry later went into voluntary liquidation, its assets being purchased by Mr. Wills, and Mr. Wetlaufer. As near as can be ascertained, the object of Mr. Wills, is to obtain reimbursement for the money spent, and in view of the details likely to be thrashed out in the courts, it might be injurious to certain of the litigants were a brief and necessarily incomplete analysis of the affair to be presented in these columns. It is clear, however, the minority interests have made the financial arrangements to carry the case through the full course of litigation, if necessary, in an endeavor to prove their opinion.

The work of deepening the shaft of the Lake Shore mine from the 400-ft. level to a depth of 800 feet has commenced.

In connection with the proposed merger between the Kirkland Lake, Teck-Hughes and Orr Gold Mines, such a possibility is now regarded as more or less remote. The Teck-Hughes is generally conceded to be in favor of remaining out of such a consolidation, and the pending litigation on the Orr property is believed as likely to hold up definite negotiations on this property.

Mining operations have been suspended on the Peerless property, formerly the Mondeau, at Boston Creek. The "Journal" has been officially advised the reason for curtailment was not due to lack of merit in the property, but has to do with other matters, one of which has been a failure to get reasonable efficiency from the mine workers engaged. The curtailment is stated to be only temporary, and that the favorable results met with on the property warrant aggressive work.

Progress in the Label township area at Kirkland Lake continues to be very satisfactory and the work of the coming winter is expected to prove up resources of much value. At least such is the opinion of those operating in that district, who base their opinion on the logic that where this series of rock formation has been opened up in the central part of Kirkland Lake it has been found to be rich, and that where it is now being opened up under equally favorable conditions it is reasonable to expect good results. Already the number of gold discoveries made are bearing out this opinion.

### LESS TRANSVAAL GOLD.

London, Sept. 16.—(Special Star Cable).—The monthly return of the Transvaal Chamber of Mines for August giving the gold output of the Witwatersrand and the outside districts is 702,083 ounces, as compared with 736,099 ounces for July, a decrease of 34,016 ounces. The daily production was 22,647 ounces as compared with 23,745 ounces in July.

## British Columbia Letter

### Hazelton, B. C.

After having examined a mica property situated about seven miles from Tete Jaune Cache, John D. Galloway, resident engineer for northeast British Columbia, has returned to his headquarters at Hazelton. Regarding the mica he says that it is owned by a Calgary Syndicate and that considerable development has been done. Four miles of road have been constructed and a number of cabins also have been built for the employees. The material is of high grade and there appears to be a good market. Mr. Galloway also examined the Taltapiu Property on Bahine Lake, which is being opened up with promising results. It is the intention of the government engineer to visit the Driftwood Creek Country where a number of claims have been staked and where the government has spent a considerable sum in trail and bridge construction. The Babine Bonanza Property also will be inspected. Operations there now are being carried on at depth.

### Greenwood, B. C.

The need of added financial support has led to the re-organization of the Canadian Copper Co., what is known as the Readjustment Committee having decided on a plan which provides for the formation of a Company under the laws of the Dominion of Canada or one of its Provinces. The total authorized capital of the new Company would be 2,000,000 shares of no par value or of the par value of \$5 each as the Committee may determine. This is the same number as the authorized shares of the present Company. The new Company is to acquire all the property and assets of the old Company and to assume all its liabilities. The plan also provides for the issue of 1,088,209 shares of the new company and the setting aside of 833,333 shares for conversion of first mortgage bonds, leaving 78,458 shares to be held for future corporate purposes. Under the plan the stockholders have the right to participate on the following basis: The payment of 50 cents with each share of stock deposited and surrendered to the Readjustment Committee under the plan and agreement on or before September 1st, 1920, as hereinafter provided, will entitle the owner thereof to one share of stock of the new company, or in the alternative, without any payment, each three shares deposited and surrendered to the Committee under the plan and agreement on or before the 1st September, 1920, entitles the owner to a share of stock of the new company. Half of the payment was to be made on the 1st September and the other half on or before October 1 to the Readjustment Committee.

### Vancouver, B. C.

The position of General Manager of the Britannia Mining Company now is occupied by A. J. Donahue, for some years its secretary-treasurer. He has been promoted to the post recently vacated by J. W. D. Moodie.

### Victoria, B. C.

In order to obtain full and exact data regarding the market possibilities on the Pacific Coast for the product of Blast Furnaces. Steel Rolling Mills, etc., established in British Columbia a tour of central and western parts of the United States now is being made by members of what is termed the "Steel Committee" of the Provincial Department of Industries. Major

D. B. Martyn, the Chairman, has gone to Chicago accompanied by James H. McVety, one of his associates. Thence they will proceed to California. There they will be joined by Nicol Thompson, another of the Committee, to whom has been assigned the special duty of investigating market conditions in respect of steel and steel products in that and other Coast States. When the Committee returns to Victoria it is expected to be in a position to submit an informative report and it is likely that on their findings will be based the policy of the Provincial Government in regard to the proposed enterprise. That British Columbia possesses the magnetite necessary, together with the needed fluxes, and that general conditions are favorable appears to be generally conceded, so that the question of the market must be determined to assure private enterprise or the government of the attractiveness of such an investment.

The Shipton Steel Smelting Co., of Vancouver, has announced its intention to instal a plant at North Vancouver. Negotiations now are in progress with the municipal authorities with respect to the fixing of the assessment on their proposed site and with a view to the securing of certain inconsiderable concessions.

### THE COLLIERIES.

Litigation has developed in British Columbia the issue of which involves title to some 237 acres of coal bearing land on Vancouver Island now held by the Granby Consolidated Mining and Smelting Co., Ltd., and being a part of the area being exploited by what are known as the Cassidy Collieries.

The result of the first hearing, which took place before Mr. Justice Gregory, of the Supreme Court, was a judgment for the plaintiffs, viz., the Esquimalt and Nanaimo Ry. Co. This Company sets up the claim that the coal rights in these lands were conveyed to the railway by the Province through the Dominion at the time of the construction of the Vancouver Island Railway and by way of a bonus to those who undertook the completion of that at then considerable enterprise. In bringing this suit it is surmised that the railway company is actuated by the desire to see that no part of its alleged coal interests on the Island, which comparatively recently passed to the Canadian Collieries (D) Ltd., are lost to that Company.

The position of the defendants who are given as Messrs. Wilson and McKenzie is that, as executors of the estate of the late Joseph Ganner and Mrs. Dunlap, original holders of the land, they were granted a Provincial Crown Grant to the coal rights thereon by virtue of the Provincial Settlers' Rights Act. This provincial title they passed to the Granby Consolidated Mining and Smelting Co., and the coal rights so acquired are, as stated, a part of what that Company has been engaged in developing at Cassidy. It is well-known that the power of the British Columbia Government to enact such legislation has been questioned and that, as a matter of fact, the Dominion Government has disallowed the Settlers' Rights Acts of the local legislature. This disallowance, however, did not take place until after the Ganner and Dunlap leases were issued.

Mr. Justice Gregory having found for the Esquimalt and Railway Co. the defendants immediately applied to Mr. Justice Galliher, of the Court of Appeal, for a stay of execution which was granted, it being stipulated that they should pay into Court \$75,000 as secur-

ity and should not take from the lands in question more than 100,000 tons of coal without an order obtained from the Court of Appeal.

The importance of this case becomes clear when it is explained that its outcome will affect, favorably or adversely, a considerable section of the holdings of the Granby Consolidated Mining and Smelting Co., which has expended large sums in the development of Vancouver Island Coal Lands and has established at Cassidy Collieries so well and modernly equipped as to have won the favorable comment of all who have been privileged to visit them. The same statement applies to the town, the buildings of which, both those for the accommodation of the men and of the officers, are the last word in point of their conveniences and living comforts.

Influenced by the somewhat alarming accounts published by the newspapers in regard to the situation the officials of the Company have authorized the statement that the townsite of Cassidy is in no way affected by Mr. Justice Gregory's judgment and that "it is not anticipated that there will be any diminution of work at Cassidy pending the appeal and the judgment of the British Columbia Court will not be likely to affect operations of the Coke Plant or the Smelter at Anyox."

The coal production of Vancouver Island Collieries for the month of August was 117,194 tons as compared with 140,512 tons for July, a decline of 23,318 tons.

To the Coal Mine Operators of British Columbia the decrease in output is a serious matter. They state that, notwithstanding their desire and their efforts to see the total increase, it has been found impossible to obtain such a result. The explanation given is labor conditions. The coal is needed, in fact is imperatively required. Never was there so strong a market for the product of the coal mines of this Province.

One prominent operator described the situation as exceedingly aggravating. Just when the fuel can be placed without trouble it is found difficult to induce the miners to bend themselves to the task of getting the material above ground. Orders are being received from foreign sources in shoals but it is doubtful whether the provincial mines, especially as the winter season is approaching, will be able to take care of much more than the local domestic and bunker trade. And never was British Columbia more advantageously placed in respect of overseas commercial possibilities because of the embargo against the export of eastern Canadian coal.

It is likely, however, that the miners will get down to serious work in the course of a few weeks. That should be the tendency at any rate with the advent of the wet weather of the Fall. Fine summer weather, it is assumed, has been too great a temptation to the underground workers to take more time off than is usual although it may be expected, as far as the miners of the Island are concerned, that many will be devoting considerable time to outdoor life during the shooting season.

In a word the problem of the coal mine operator is one of labor, which is the same as that of most of those charged with the administration of mining properties in British Columbia at present.

Figures giving the production of the leading col-

lieries of the Province for the past three months tell the story in striking fashion. The Crow's Nest Pass Coal Co., of Fernie and Michel, produced 62,770 tons in June and 60,245 tons in July; the Canadian Western Fuel Co.'s output for June was 56,474 tons; for July, 55,399 tons; and for August, 34,381 tons; the Canadian Collieries (D) Ltd. had a production of 62,400 tons in June; 65,335 tons in July; and in August it dropped to 60,696 tons.

Detailed production of the collieries of British Columbia for July follows:

**Crow's Nest Pass Field.**

	Tons.
Crow's Nest Pass Coal Co. Ltd., Coal Creek	38,073
Crow's Nest Pass Coal Co. Ltd., Michel . . . . .	22,172
Corbin Coal and Coke Co., Corbin . . . . .	15,763
	76,008

**Nicola-Princeton Field.**

Middlesboro Collieries, Middlesboro . . . . .	6,918
Fleming Coal Co., Merritt . . . . .	2,616
Coalmont Collieries, Coalmont . . . . .	1,984
Princeton Coal Co., Princeton . . . . .	2,114
	13,632

**Vancouver Island Field.**

Canadian Western Fuel Co., Nanaimo . . . . .	55,399
Canadian Collieries (D) Ltd., Comox . . . . .	41,098
Canadian Collieries (D) Ltd., S. Wellington	8,904
Canadian Collieries (D) Ltd., Extension . . . . .	15,342
Pacific Coast Coal Mines, S. Wellington . . . . .	7,680
Nanoose-Wellington Co., S. Wellington . . . . .	3,079
Granby Cons. Mng., Smtg., & p, Co., Cassidy	9,019
	140,512

The statistics for the month of August as far as they are available follow:

**Nicola-Princeton Field.**

	Tons.
Middlesboro Collieries, Middlesboro . . . . .	7,341
Coalmont Collieries, Coalmont . . . . .	2,056
	9,397

**Vancouver Island Field.**

Canadian Western Fuel Co., Nanaimo . . . . .	34,381
Canadian Collieries (D) Ltd., Comox . . . . .	38,051
Canadian Collieries (D) Ltd., S. Wellington . . . . .	7,943
Canadian Collieries (D) Ltd., Extension . . . . .	14,732
Pacific Coast Coal Mines, S. Wellington . . . . .	8,110
Nanoose-Wellington, S. Wellington . . . . .	4,683
Granby Cons. Mng., Smytg., & P. Co. Cassidy	9,330
	117,194

**Present Output of Alberta Coal Mines is Far Below Capacity.**

Official figures recently issued dealing with the coal output of the Province of Alberta, for the first six months of the present year, indicate that compared with the production of the same period for 1919, that considerable progress is being made in speeding up the development of the coal fields of the prairie Province.

The official figures up to the end of June this year gives an output of 3,043,940 tons, compared with 2,-

068,907 last year. This is for both the bituminous and lignite product. It is doubtful, however, in the face of the paucity of orders that have been coming since the end of the period mentioned that the showing will be exceptionally good.

That is a matter over which the operators have no control; in other words, if these has been a falling off in orders the whole bonus must be thrown on the public. The operators maintain that as far as actual quantities are concerned that the fringe of the industry has as yet been but touched.

Summed up in a nutshell, operators state, however, that there has been more coal up to this time in the history of coal producing in Alberta. It should also be pointed out that more coal will be required from these mines than ever before on account of the shortage of coal from the United States.

The present prospects as far as the Winnipeg market is concerned, operators state, is most encouraging. The actual output, however, to that market, and to further eastern points will solely depend upon freight rates. If these are prohibitive, it will mean that a staggering blow will be dealt the industry.

The provincial government has recently been carrying on with some measure of success a very active propaganda in Manitoba and Saskatchewan. This has been greatly helped by the shortage of coal from the United States.

While the bituminous mines in Alberta have been working fairly to capacity, the lignite fields, owing to lack of orders have for some time now fallen far short of this; indeed, in the majority of cases their output has only been about half of what they could turn out.

It is pointed out that the coal deposits of the province are enormous, and that 10,000,000 tons a year could be but a fraction of what could be produced. It is asserted that the tippie capacity at the present time could take care of more than the figure mentioned.

The ChuChua Mine situated near Kamloops has been placed on a shipping basis according to Glenville A. Collins, consulting engineer of Seattle. This property covers about 5000 acres of ground, is situated in the new coal area and it is said is capable of producing a large amount of coal of an excellent quality. There are at present 20 men employed, and the output it is expected will be 2 cars a week. By November it is thought that the employees will be doubled, and the output materially increased. Fred. Jarrett of North Vancouver is the Superintendent. Since he took charge the property has been developed to its present point, and it is believed that the local market will absorb the entire output for a time. Before long, however, it is figured that Chu Chua Coal will find its way into Vancouver and other coast centres.

A new coal mine is being opened up at Coalspur, Alberta, on the mountain park branch of the Grand Trunk Pacific Railway. There are employed at present 35 men and 75 tons of coal are being produced per day. Thomas Davis, formerly of the Michel Colliery is in charge of operation.

Much is expected of the new Collieries being opened up at Coalmont, in the Nicola-Princeton field. This property has been taken over by an energetic and enterprising syndicate, at the head of which is W. J. Blake Wilson, and with whom are associated a number of prominent Vancouver business men. The property is not new as a coal producer, but under the new

management, its plant is being so augmented and development so extended that it is expected to take a leading part among the coal producing properties of the interior of the Province. Initial shipment will approximate 250 tons a day, but this amount is expected to reach at least 1000 tons in the course of a few months. The greater part of this will find its way into Vancouver.

The coal is declared by experts to be superior to any mined in the province. It is an metamorphosed bituminous coal extremely rich in resin, making it valuable as a steam coal, and profitable for domestic use, burning as it does with but little ash. It is free from shale and rock, being mined from the centre of a seam averaging about ten feet in thickness. This is only one of the many rich seams in the property.

Engineers have estimated that between the lower seam in which operations are now being carried on and the surface, there is a thickness of more than 200 feet of coal in seams of unusual thickness. At one point a layer shows 28 feet of clear coal. The narrow divisions between the various seams are bands of clay which separates easily from the coal. The remarkable feature of the coal, particularly noticeable in the workings, is the fact that it is free from dust. When powdered it does not "flower" but breaks into small distinct particles, a quality which is most desirable for industrial use where powdered coal is used as fuel. This and the formation of the coal makes it the safest coal in British Columbia to handle. It is free from dangerous gas. Analysis show it to be: Fixed carbon, 55 per cent; volatile matter, 36.5 per cent; ash, 7 per cent; moisture 1.5 per cent.

The property which is immediately behind the small town of Coalmont, 12 miles from Princeton, was first opened up by the Columbia Coal and Coke Company, a tunnel being started from above the Tulameen River. Later another tunnel was commenced from the other side of the mountain above Granite Creed, the small stream famous thirty-five years ago as the scene of a gold rush. After operating for a time the property was closed. In 1917 it was acquired by local capitalists, headed by Mr. Wilson, on the advice of Mr. Alexander Sharp, M.E., who is consulting engineer for the company. Mr. Sharp was convinced that the property had not been properly worked, and on his advice the driving of the long tunnel from the Coalmont side was abandoned.

The tunnel, which had been started on the other side of the mountain, was examined, and it was found that it had been badly planned, being driven just beneath the big coal measure. Its direction was changed, and Mr. Donald McLean, a mining expert of long experience in the Vancouver Island collieries, was installed as superintendent. Under his direction the work has advanced with such good effects that the seam was soon encountered. The tunnel was driven ahead in solid coal, and upraises were driven on the dip of the body, with new levels being started. At the present time there are about two miles of workings and all in solid rock.

Estimates of the coal body made by the Dominion Geological Department before the big seam was proved, placed the reserve at 98,000,000 tons. Other computations have suggested a higher figure without anticipating any additional seams in the ground below the present workings.

The present production is 140 tons daily, this being

all that can be taken care of by the motor trucks, which haul the coal four and a half miles down the winding mountain road to the temporary loading station at the railroad tracks. The output is absorbed by the Kettle Valley and Great Northern railroads, the engineers of which declare it to be the best steaming coal used in the West.

A big force of men are at work constructing an aerial tramway from the tunnel mouth to the big tippie now building at Coalmont while another force of mechanics are engaged in building a big power house adjacent to the tippie. As soon as the power plant, which is on the ground, is installed, a pole line will be run up the hill, the right-of-way for which has already been cleared. The power plant will develop 600 horsepower, with the machinery ready for installation. It will be added to as the requirements of the mine demand more power. It is expected that another 50 horsepower will be developed from the tramway, which operates on gravity. This tram will transport 100 tons per hour.

A special mine car has been designed for use in the tunnels and for transportation to the tippie. The box of the car unlocks from the trucks and becomes the bucket of the aerial. This is carried direct to the tippie for loading, or bunkering. By this method not only will considerable time be saved, but the breakage of coal will be reduced to a minimum. It is expected that the tramway and tippie will be in operation by October 15. As soon as this has been done the output of the mine will be increased and shipments to the Coast will commence. Work is being pushed ahead as rapidly as possible by Mr. J. T. Johnstone, outside manager, and by Superintendent McLean.

The mine is being put in readiness to double the present production almost at a day's notice. Mr. Alexander Bryden, a well known Vancouver Island mine man has recently been appointed assistant superintendent and is personally directing operations underground.

The operators of the Coalmont mine are fortunate in having an immense supply of timber close at hand for mine purposes. This is cut in the company's mill which has at present a capacity of 800 feet of lumber daily. Timbering in the different levels, of which there are four, is of a most substantial character.

A big fan is being installed and will be in operation in a few days. It is located at the mouth of a tunnel, driven for the purpose, and will distribute 38,000 cubic feet of air, at one-inch water gauge, through the workings every minute. Another fan, a Sirocco, will be installed in a few months. This will have a capacity of 100,000 cubic feet. The underground conditions are exceptional. The mine is absolutely free from gas, and is being worked with naked lights while the coal roof is exceptionally firm, the absence of the usual dust of other British Columbia pits being appreciated by the workers.

Every possible comfort is being provided for the employees of the company. A new dining hall has just been completed at the camp, while a new rooming house is also being commissioned. A boiler will be set up in a few days to serve as a central steam heating plant for the little camp. Every room in the large rooming house will be fitted with radiators, while the dining hall will be made thoroughly comfortable.

Associated with Mr. Wilson, as president of the company, are W. L. Parrish, M.L.A., Winnipeg, vice-presi-

dent; A. H. Douglas, secretary-treasurer, and R. S. Lennie, J. T. Johnstone, D. Donald, J. A. Whittier and J. T. Haig, M.L.A., Winnipeg, as directors. Messrs. Lennie and Clark are solicitors.

### PORT ARTHUR NOTES.

By J. J. O'Connor.

The Silver Islet Syndicate has closed down the Silver Islet mine temporarily, pending a reorganization on an extensive scale, preparatory to the prosecution of active mining operations on Silver Islet, and thoroughly prospecting the veins on the mainland of the Woods Location, comprising some ten square miles.

The Silver Islet Consolidated Mining and Lands Company, the former owners and operators of this property, carried out considerable prospecting by open cuts and shaft sinking on these veins many years ago, in which they disclosed very encouraging values. This work will be taken up and carried to a point where definite conclusions may be arrived at.

The unwatering of Silver Islet was carried down to the second level. Large bodies of high-grade "macfarlanite" were uncovered, thoroughly sampled and assayed, with such gratifying results, that the present operators have determined to prosecute an active campaign of mining on this famous old mine. Silver values were laid bare in the old workings that are far in excess of the cost of recovery.

Reorganization is not sufficiently advanced, as yet, to say whether active operations will begin this Autumn, or be deferred until the Spring of 1921.

Iron ore shipments from Lake Superior for the season of 1920, to September 1st were 35,349,874 gross tons, an increase of 5,751,826 tons, or 19.43 per cent. increase over the same date in 1919. A strenuous effort will be made to reach a shipment of 55,000,000 tons off this Lake, before the close of navigation.

It is expected that there will be a marked shortage of lake tonnage for the balance of this season, and that wild rates for iron-ore, coal and grain will be increased as a natural sequence to the shortage of boat tonnage. Owing to the great delays experienced by boats at Lake Erie ports, caused by car shortage, many transportation companies are behind in their contracts. These delays were so great as to seriously threaten the coal supply of both the Canadian and United States north-west. Coal is now coming forward more freely, with an advance of rates. Already numerous charters have commanded 75 cents per ton for coal from Lake Erie to the head of Lake Superior, and it is reported that in one special instance \$1 was paid. The season rate for coal is 50 cents per ton. The season contract for iron ore is \$1.10 per ton in at least one instance \$1.50 per ton has been bid for wild tonnage. Wild boats in the coarse freight trade are likely to command the highest rates in any season since the development of larger sized ships, and their advent has not displaced dollar ore, or 5-cent wheat, which was confidently predicted when they made their appearance in the ore, coal and grain trade.

### PERSONAL.

Mr. Carl Marsh, Chief Engineer, and Mr. W. H. Graham, Superintendent of Construction, of the Dominion Steel Corporation, have had their duties extended to cover the similar work of the Dominion Coal Company at the collieries and associated plants.

## Royal Commission Reports on Wages and Working Conditions at the Collieries in Nova Scotia

The Royal Commission which for some weeks has been investigating conditions at the coal mines in Nova Scotia, and considering the request made by the United Mine Workers for increased wages and modifications of working conditions, has reported to the Minister of Labor.

The recommendations made may be summarised as follows: That the wage increase asked of one dollar per day for day-paid workmen, and twenty-five cents per ton on contract getting-rates, be granted, effective 1st July (the miners' demand was that the increase should be effective 1st May), subject to the adoption of a sliding scale by which the remuneration paid to workmen shall increase in proportion to any increase obtained in the per capita production of coal. A year is given to work out this sliding scale.

The Commission recommends the formation of a joint conciliation board to act as a permanent medium for the adjustment of disputes as they arise.

A summarised report of the recommendations of the Commission, given out by the Minister of Labor at Ottawa, is as follows:

1.—That the wage increases demanded (broadly \$1 per day for datal men and 25 cents per ton on all tonnage rates) be granted. "The recommendation is, however, subject to the condition that it is to be distinctly understood and agreed that operators and men will agree to co-operate and bring about the adjustment referred to, and within twelve months, or say on or before the first September, 1921, adopt the partial advance and sliding scale scheme" with a view to increasing coal production.

2.—General living conditions of Nova Scotia miners, "with few exceptions, absolutely wretched," and "a menace to themselves and their families." Recommends that companies take necessary steps to remove all conditions referred to, and provide proper sanitary arrangements, men to pay increased rental per month per \$100 or fraction of \$100 expended in improvements, this increased rental to provide for extraordinary repairs after recommended improvements have been made.

3.—At some points both operators and men are prejudiced by inadequate equipment. In some instances, wash houses are inadequate. Recommends special attention by companies to this general question of equipment and sanitation.

4.—Recommends the more universal instalment of radial machines, in fitting places.

5.—Recommends, that where practicable, electric lights should be installed by operators, "as a means to greater efficiency and larger production."

6.—"The present," says the commission, "is not a time for increasing expenditure, but, in view of the requirements for reconstruction and repair of the damages of warfare, is rather a time for increased energy and carefully guarded thrift."

7.—Deprecates practice of men taking "vacations" and "holidays" over minor grievances and asks U.M. W. officials to condemn and discourage such practices.

8.—Points out advantage of United States coal in competitive market, due to lower cost of production, as against Nova Scotia coal, and asks miners to put forth every effort to true the balance "as a matter of self preservation."

9.—Recommends establishment of an "adjustment board" of co-operation between men and operators, "to determine all disputes which may occur during the life of this contract, such adjustment board to be regarded as "the most effective and businesslike method of settling any minor disputes that might arise."

10.—Increases are made retroactive, dating from July 1st, 1920.

### Housing Conditions Bad

Regarding living conditions in the colliery districts the report has the following to say:

"That in view of the fact that the housing, domestic surroundings and sanitary conditions of the miners are, with few exceptions, absolutely wretched and that such conditions have a deterrent effect on the miners ability to produce coal and are a menace to themselves and families, and, further, that children brought up in such an environment have not the same chances of life and health as children reared under better conditions, as proven by government statistics as to infant mortality, it is therefore recommended that the companies that own the houses, put and keep them in proper repair, and that a sewerage system be devised and inaugurated whereby surface closets will be eliminated, or that installation of a modern septic sewerage system be provided where it is found that the ordinary sewerage system is not feasible. Suitable kitchens should also be provided where they do not now exist.

"In the matter of water facilities for the houses of mine workers, your commission recommends that an adequate supply be furnished and so conveniently located that the miners and their families may avail themselves of it. Pure water, which is an essential, should be supplied each family in a quantity sufficient for all purposes of domestic use.

"In making the foregoing recommendations the commission is actuated by the conviction that for humanitarian reasons, for the present and future well being of the miners and their families (it being from the miners' families of today that the miners of tomorrow will be drawn) and to assure to the industry the necessary recruits to maintain the force required to achieve the success of the industry, it is essential that such improvements be effected."

### NEW YORK ADVICES ON THE ASBESTOS MARKET.

Information from the Canadian mines is that production is about twenty-five percent. below normal, with increased demand for asbestos. As a result prices for asbestos crude and fibres are very stiff. European demand is reported to be increasing as industries there return to normal functioning.

Deliveries from Canada are better because of improvement in the car situation, and orders are being filled more quickly. Users of asbestos are strongly recommended to stock up before the Winter sets in, as this will cause further falling off in production, and prices are forecasted to go much higher. A survey of conditions of supply and demand, and the recovery of overseas markets, indicates that no less stringent conditions in the asbestos trade are to be anticipated for several years, and present purchases are advised.

**COAL SUPPLY BULLETIN****A New Service.**

To meet the very evident need for data regarding output, exports, imports, and movements of coal, and in order that the general public may be kept accurately informed regarding Canada's coal supply, it is proposed to issue from the Mining, Metallurgical and Chemical Division of the Dominion Bureau of Statistics a "Coal Supply Bulletin" each month, giving all the available statistics relating to the production and disposition of Canadian coal, and the importation and distribution in Canada of coal from the United States. Owing, however, to the present extremely high costs of printing, the first number of this Bulletin, which it was proposed to publish at this time, has been postponed as changes are now being made in the multi-graph equipment of the Bureau, which, when completed, will permit of the printing, promptly and at greatly reduced cost of such publications as the one proposed.

**The collection of coal statistics.**

During the recent administration of fuel control in Canada under Mr. C. A. Macgrath, the necessity of maintaining accurate records of all data relating to coal production in this country and imports from the United States in readily available tabular form was so emphasized that the principal records inaugurated under that regime were merged with those previously compiled in the Dominion Bureau of Statistics, and when the Mining Division of the Bureau was established last year, with the writer in charge, the collection of adequate records of coal supply was one of the first matters given attention. The whole of this work is now on a permanent basis, and the several Government Department interested are being served through the coordination of provincial and dominion effort made possible by the Bureau. This Coal Supply Bulletin, compiled each month from the wealth of data available in the Mining, Metallurgical and Chemical Division of the Bureau, will provide a new service to the public, and will enable the Bureau to keep its many correspondents on the subject of coal, promptly and fully informed on the subject. The critical surveys made from time to time will serve to review and interpret the data recorded.

**Organization of work.**

Output and disposition of coal figures are obtained in the Bureau through the cooperative assistance of the several Provincial Departments administering the mining laws in the coal producing provinces. This scheme, inaugurated in January 1920, provided for the collection of production data from the mine operators by Provincial officers, thus ensuring the highest degree of reliability in the data collected. Returns are obtained in duplicate, and one copy, after view by the Provincial officers, is forwarded to Ottawa for compilation with the data from the other Provinces, by the trained staff of the Mining Division. This plan has resulted favorably, not the least of the advantage gained going to the mine operator, who now completes one form each month, knowing that he will not be required to do the same work over several times more for other Government Departments. The present arrangements are working so smoothly and well that Coal Supply Bulletin will contain output figures complete for the month preceding its date of publication.

Imports of coal into Canada, and exports therefrom, are supplied to the Bureau twice a month through the

courtesy of the Department of Customs. These figures are absolutely up to date and all coal coming into Canada from the United States is shown by quantities and kinds for each port of entry. Exports of coal produced in Canada are also shown by quantities shipped through each port of exit.

These data, with the production figures obtained through the Provinces, enable the Bureau to survey the coal situation continually, and to determine with facility when a fuel famine threatens. All the information thus collected is carefully compiled and tabulated, and digests are prepared for the various administrative offices, including more particularly the Railway Commission.

A mailing list is being prepared and those who wish to have Coal Supply Bulletin forwarded to them regularly free of charge should send in their names and postal addresses at once to the Chief of the Mining, Metallurgical and Chemical Division, Dominion Bureau of Statistics, Ottawa.

**MEETING OF NORTH COAST DIVISION OF THE CANADIAN INSTITUTE OF MINING AND METALLURGY.**

Stewart, B. C.—The North Coast Division of the Canadian Mining Institute held a two-day meeting recently at Stewart and was attended by representatives of all the important mining centres of the section, including Salmon and Bear Rivers, Anyox, Princess Royal Island, and Alice Arm.

E. J. Conway, presided and among the speakers were E. E. Campbell, vice-president of the Institute, and Peter E. Peterson, both of whom are connected with the Granby Consolidated Mining and Smelting Co., at Anyox. Mr. Campbell declared that the men most needed now were miners and metallurgists who could mine for a dollar when there was but \$1.25 in the ore. He reviewed some of the work being done at Anyox and asserted that the operations there were being carried on at a lower cost per ton than at any other mine in the Dominion. The Company's concentration work he characterised as unique. The latter phase was dealt with by Mr. Peterson who described the concentration methods and stated that these not only were adaptable to the treatment of the ores of the Stewart and Alice Arm zones, but ultimately would be in use at those places.

An interesting talk was given by A. C. Garde, of Prince Rupert, on milestones in the evolution of the mining industry of the Pacific Northwest, the speaker touching on the growth of operations at Anyox, the Surf Inlet Mine development, and the discovery of the Premier Mine in the Portland Canal section and the resulting opening up of that area.

Dr J. A. Bancroft's address on the value of trained geologist in practical mining was another feature. He said that the big mission of the geologist in the mining field, looking at it from a national aspect, would be the working out of the geology of districts before the coming of the prospector, thus saving a lot of useless work by indicating where mineral bodies were not to be found.

At a banquet, which closed the session, Pat Daly, the well known prospector and mining operator, referred to the closing down of the Big Missouri in the Salmon River District of Portland Canal. He said he was not inclined to accept as final the negative results of the limited amount of diamond drilling and the studies of Dr. Bancroft on which were based the decision to abandon work. Mr. Daly made reference to the history of some great mines in support of the contention that engineering mistakes were not uncommon and re-asserted his faith in the Big Missouri ridge.

Among the delegates were: E. E. Campbell, vice-president of the Canadian Mining Institute and assistant to the General Manager of the Granby Co., at Anyox; E. J. Conway, field engineer for the Granby Co.; H. M. Roscoe, secretary of the North Coast Division C. M. I.; J. Tuttle Jr., mine superintendent at Hidden Creek; P. E. Peterson, superintendent of concentration at Anyox; N. E. Nelson, field engineer; John Dillon, assistant superintendent Anyox Smelter; W. L. Wetmore, mechanical engineer; Wm. Weir, chemist; A. B. Wing, superintendent at Swamp Point, Granby Co.; A. C. Garde, consulting engineer; Dr J. A. Bancroft, professor of geology at McGill University; Dr Stuart A. Scofield, Canadian Geological Survey; and G. W. Bain, fourth year student McGill University.

**HIGHER WAGES ACCOMPANIED BY SMALLER PRODUCTION IN BRITISH COAL MINING.**

In the accompanying diagrams, prepared by the statistical department of the Monmouthshire and South Wales Coal Owners' Association, graphic representations are given of the divergent tendencies of outputs and labor costs in the coal mining industry between 1914 and May 1920. The higher labor costs are due partly to the higher wages and partly to the decline in the efficiency of labor. In the United Kingdom the wages cost per ton has increased from 6s. 2.92d. to 22s. 8.75d., while the output in the United King-

dom per person employed above and below ground has fallen from 252 tons in 1914 to 194 tons. In the South Wales coal field the expansion on the wages cost per ton has been from 8s. 1.47d. to about 29s. 8.13d., whilst the output per person employed above and below ground has fallen from 230 tons to 190 tons. In other words, in the United Kingdom the output has declined by 23 per cent. and the labor cost increased by 264 per cent., while in the South Wales coal field the output has decreased 17 per cent. and the labor cost increased 265 per cent.

UNITED KINGDOM.

SOUTH WALES.

### SUIT CONCERNING OWNERSHIP OF MOLYBDENUM PROPERTY AT ALICE ARM, B.C.

There is now before the Supreme Court, Victoria, B.C., an action involving title to The Molybdenum Properties of Alice Arm which, particularly while the war demand for this mineral kept its value high, were considered among the most promising mining holdings of the Province.

The suit is brought by Robert M. Stewart, manager of the Stewart Land Co., of Victoria, and the defendants are the Molybdenum Mining Co., H. A. MacLean, counsel for the latter, in his summing up of the situation explained that the purpose practically was to obtain judgment as to the ownership of the property.

Mr. MacLean, in sketching the origin and history of the litigation, which it may be said incidentally had the effect of preventing the development and operation of the property during the war when its product not only would have had a ready market but when the product was badly needed in the forwarding of the Allies' interests, stated that in 1914, Mr. Stewart agreed to sell the Conundrum Claim to Messrs. C. P. Riel and F. Teetsel and that the assessment work was not done in the following year, the result being that in June 1916 the title to the claim lapsed. Thereupon it had been restaked as two claims by Messrs. Riel and Teetsel.

Messrs. Stilwell Brothers, of Seattle, then were induced, Counsel asserted, to purchase the claims and they incorporated the Molybdenum Mining & Reduction Co., which spent about \$100,000 on development. The Company has suffered through the decline in the value of the mineral since the war and in 1918 when about to obtain a certificate of improvement were met by Mr. Stewart's claim. The latter took the position that Messrs. Riel & Teetsel were only trustees of the property and that they had neither the right nor authority to negotiate a sale.

Mr. MacLean further recalled that, when the suit was started in 1918, an adjournment had been taken in order to give effect to an order of the court that the property be sold. Because, however, of the decline in the metal market this had been found impossible and, he stated, the contending parties now were before the Court in an action the object of which virtually was to decide the ownership of the property.

The case is proceeding.

Prof. J. M. Turnbull, of the B. C. University, visited the Alice Arm District and in 1916 prepared a report on various properties among them being that of the Molybdenum Mining & Reduction Co. The property consists of twenty-five claims, of which six at that time had been surveyed and Crown-granted. Of the Plant he says that the mine is connected with the Mill by a 2-bucket aerial tramway 4,075 feet long, with a drop of about 1,100 feet and a nominal capacity of 100 tons in twenty-four hours. The bunker capacity is placed at 80 tons at the upper and 200 tons at the lower end. The Mill consists of crushing and separating plants in separate buildings.

Describing the Plant he said that it consists of a jaw-crusher followed by coarse rolls, then by fine rolls, connected in series by 2-bucket elevators. The crusher and rolls are on the same level. The fine rolls operate by choke crushing in closed circuit with a set of gently sloping shaking screens, the final product being 40 mesh. A short trial run showed that the fine screen tended to bind, due to slight moisture and sticky

material probably in the ore. The separating plant contains flotation machinery, but was not completed and the writer observes that the Mill appears to be more or less of an experiment and "may require some remodelling before successful operation is attained."

The main mine-workings are at an elevation of 1,200 feet, and begin in a gully, along the bed of which bare rock is exposed for over 1,200 feet, the balance of the ground being largely covered with soil and timber, with occasional rock outcrops or humps.

The formation, broadly speaking, is sedimentary, belonging in the slate or argillite area. The ore occurs as a series of quartz veins, with a general strike about north (mag.) and dips to the west varying, but mostly steep. These veins are quite irregular in width along strike and dip, and form rather a zone than a well-defined vein. Mineralization consists mostly of molybdenite in the form of thin seams parallel to the walls, but often curved and crumpled where the veins have been squeezed by pressure, in which case the seams may be 1-4 inch thick. The ore tends to break along seams, which gives specimens a deceptively solid appearance.

Paralleling the veins, and between them, are a number of dykes which make up a large percentage of the country-rock near the veins. This general dyke-vein zone continues for about 800 feet north of the mouth of the main working-tunnel at which point it is cut off by a tongue of granite rock, mostly moderately coarse feldspar and quartz, which strikes about north-east and has a width of probably several hundred feet. Vein-fissures continue into the granitic rock, but the mineralization seems to change. A 42-foot tunnel, 250 feet above the main tunnel, driven north from the contact with the granitic rock, shows a fissured zone much altered or decomposed, in which small dykes are seen. In this tunnel small lenticular shoots of ore were found, which consisted of quartz with galena, zinc-blende, and pyrite, both coarse and very fine-grained. The best showing was 3 feet wide. Six inches shows in a crosscut near the face in one place. This crosscut shows the fissure-zone to be at least 15 feet wide, and strong, with much gouge on the walls. An assay furnished by the company shows: Silver, 150 oz. a ton; lead, 55 per cent; zinc, 35 per cent, which seems to total up too much, but shows the general character of the ore. The occurrence does not suggest any important tonnage of this class of ore, though it has possibilities.

### SILVER'S OBSCURE OUTLOOK.

The price of silver of late has continued to fluctuate in a most uncertain manner, and from the indications observable it is likely to continue to vary erratically. It is quite impossible in a market where the influences at work are diverse and complex to see a day ahead. The outlook is most obscure, and, therefore, it would be most hazardous for anyone, however close his experience of this market, to enter into the region of prophecy. Within the past fortnight the price has leaped to 63 $\frac{3}{4}$ d, and after varying day by day it has been down to 57 $\frac{5}{8}$ d, and has recovered to 60 $\frac{1}{8}$ d for spot.

This market, as already stated, is swayed by many factors. One powerful influence is the American exchange, which is unstable itself and will, so far as can be seen, continue to be unstable for some time hence. Then the attitude of the Indian bazaars, uncertain for a long time owing to the continued speculation there, remains obscure. India has been a bear of silver for some time, and this speculative selling has been one of the causes of the fall in the price of the metal. If India is greatly oversold it may prove a source of strength later on, when the speculator will have to buy back. But dealers in the market point out that it is by no means certain that this will prove a source of strength, as it is possible that a portion of the silver will be shipped from India. The Continent has likewise been a source of weakness, owing to the further offerings from that quarter.

China has been the chief mainstay of the market,

owing to the demand from the Chinese banks. But the support that has been coming from these institutions is uncertain, and therefore precarious. The banks are by no means keen buyers, and this being so the support they give is not to be greatly relied upon, especially as there is no improvement in the Chinese export trade. Taking a survey of these uncertain elements—viz., speculation in India, uncertain support from China, the American exchange, the little demand from other sources, the possibilities of further offerings from the Continent and the uncertain exports from Mexico—it will be seen that the influences at work now, and which will continue to operate, make the immediate prospect unreliable.

On the other hand, as is pointed out by Messrs. Samuel Montagu in their weekly circular, there should be little risk, of any important set-back in the world-price so long as the United States is a buyer at a dollar the ounce. But the same authorities simultaneously point out that the London quotation will be influenced

by the course of the American exchange, a factor of great complexity. Opinions greatly differ in the foreign exchange market with regard to the future of the American exchange and the extent to which it has been affected by the preparations made by France towards the repayment of her portion of the Anglo-French loan, as distinct from the actual trade position between Great Britain and America.

If it is not possible to see into the immediate future, because of the complex influences that affect the silver market, it is not possible to see more distantly ahead. The price will depend upon future supplies, and Mexico is the principal key to this. There may come a time when supplies from Mexico will swamp the market, and should that time come then we may see a low price for the metal again, and a permanent low price. Much, therefore, depends upon Mexico in the years ahead of us, and in the meantime the price will continue to be swayed by unstable and arbitrary factors.—“Financier and Bullionist.”

## International Mine-Rescue and First-Aid Field Competitions, Ladysmith, B. C.

### A Suggestion for Standardized Breathing Apparatus.

The International Mine Rescue and First Aid Field Competitions held yesterday at Ladysmith under the auspices of the Vancouver Island Mine Safety Association was a success in point of attendance and in regard to the keenness of the competitions. It also was outstanding in the class of work done by participants in both forms of contest, it being demonstrated that the coal miners of British Columbia and of the State of Washington are maintaining a high standard of efficiency in the work so necessary for the preservation and protection of the lives of underground workers and of property.

In the Mine Rescue Competition for the championship shield the Newcastle Team, Pacific Coast Coal Mining Co., Ltd., State of Washington, and the Laird Team, Canadian Western Fuel Co., Nanaimo, both made a score of 94 per cent. In the effort to decide the draw between the Newcastle team, Pacific Coast Mining Co., Ltd., Washington, and the Laird Team, Canadian Western Fuel Co., Nanaimo, B. C., for the Pacific Northwest Championship, the contestants again received an equal percentage. This time both went through the work perfectly. The judges were in a quandry in the endeavor to find a way out of the deadlock. Finally it was agreed that the cup shall remain in Nanaimo for six months and go to the other side for the remainder of the year and that each of the competitors of both teams shall receive medals. This is the first time in the recollection of British Columbia coal miners that there has been so close a struggle in Mine Rescue Competition.

There also was a tie for third place, the Cumberland (Canadian Collieries (D) Lad.) and the Cassidy (Granby Consolidated Mining Smelting and Power Co.) have made a score of 90 per cent. The Ladysmith (C. C. D. Ltd.) and Fernie (Crow's Nest Pass Coal Co. Ltd.) teams were tied for fifth place with 88 per

cent. The Carbonado Mine team (S. of W.) had a score of 83.1 while the Michel Team was disqualified. Two of the judges were Messrs. Bagley (Washington Chief Inspector of Mines) and Strachan (Inspector of Mines, Fernie District), while the third was a representative of the U. S. Bureau of Mines.

The First Aid results follow:

Department of Mines Cup: 1, Nanaimo; 2, Cumberland.

Coulson Cup: 1, Cumberland; 2, Cumberland.

Open Competition: 1, Nanaimo; 2, Cumberland.

One Man Event: 1, Wm. Jones, patient, Toman, Newcastle, Wn. 2, Barton, patient, Thompson, Nanaimo.

Two Man Event: 1, Carruthers, Neave and Wilson, Nanaimo. 2, Williams, Taylor and Franceschini.

Juvenile Event, Ladysmith.

Called upon to present the prizes Hon. Wm. Sloan commented on the increase of interest in Mine Rescue Work. When he first attended the competitions of a similar nature on the Island the showing was disappointing. With the advent of International Competitions, however, the spirit and earnestness of the participants had become marked and the class of work much improved. The Meets of the past several years, as a result, had been more interesting and that of this year, it would be admitted by all who witnessed it, was gratifying in every respect.

Mine Rescue Work was important both for the safeguarding of life and of property and the high standard of efficiency displayed by the competing teams was a matter for congratulation. So long as the rescue teams were well equipped, and their members were kept in touch with the latest developments in the work, the officers and members of the Vancouver Island Mine Safety Association, as well as of similar British Columbia and Washington State organizations, could take satisfaction in the realization of the performance of an important and necessary duty. Mr. Sloan re-

ferred in congratulatory terms to the good work of the judges of the Mine Rescue Contest as well as that of the doctors who had come, some of them a considerable distance, to judge the First-Aid Competitions.

Reverting to the Mine Rescue features of the Meet the Minister spoke of the recent improvements in the apparatus in use, referred to the progress constantly being made in this direction, and commented on the recent accident at the Back Diamond Mine, Pacific Coast Coal Mining Co. Ltd., State of Washington, as having given the work an unfortunate set-back. The Chief Inspector of Mines for British Columbia, Mr. McGregor, had been sent to the scene of the occurrence to investigate and report. He had been courteously received by Mr. Bagley, State Inspector of Mines, and granted every facilitate for the performance of his duty. Those interested in Mine Rescue Work were familiar with Mr. McGregor's report which had been issued in pamphlet form by the Department of Mines. It showed, briefly, that the members of the Rescue Team who had perished had gone underground, and into workings exceptionally dangerous, without an adequate supply of oxygen. The result was that two members of the first team to enter the Mine, both of whom were members of last year's champion team, had succumbed and later one member of the rescuing team from Burnett had lost his life. The members of the two teams had been provided with apparatus which varied as to type and which functioned differently. The disaster was particularly unfortunate because it was absolutely uncalled for, there being no necessity for a team engaged in practice to enter into seriously dangerous surroundings.

The lesson taught by this occurrence was the need for the standardization of mine rescue equipment. Mr. Sloan stated that he had taken this matter up with the Bureau of Mines, Washington D. C. with a view to the securing of joint action towards the adoption of a uniform instrument for the use of Mine Rescue Teams in connection with coal mines on this continent. His suggestion was that there should be a Conference, held either at Washington or at Pittsburg, the latter being the point where the American Mine Rescue Work was centralized, for the discussion of this question. This gathering, no doubt, would be attended by all interested parties both of Canada and the United States and Mr. Sloan felt sure that good results would be obtained. If it were found practicable to adopt a standard apparatus for the two countries it would mean the elimination of the present variety of types, all of which possessed some special merits, and the substitution of something incorporating the best points of all with which the miners in all coal mining fields could and would become familiar. In the event of an emergency, under such circumstances, there would be no question of the knowledge of members of Mine Rescue Team. They would find an apparatus ready for their use with which they were accustomed to work and in which they had confidence.

Personally Mr. Sloan felt keen interest in Mine Rescue Work and he asserted that he had under consideration a policy which would have the effect of rendering further encouragement and stimulus to it in connection with the working mines of this Province.

## TORONTO NOTES.

### Le Pas Has Great Mining Promise.

Mr. B. A. C. Craig, mining engineer, who has just returned from a tour of the Le Pas country, Northern Manitoba, states that he is confident that from a mining standpoint, the entire district has great promise. "Manitoba has the same, or similar mineral formations that Ontario has," he said, "and has already a partially developed copper area that is much more extensive and much richer than any copper area so far found in Ontario." Large deposits of amber east of the Churchill are owned by Mr. Craig, and his last trip was to investigate the extent and quality of his claims. "I don't anticipate any great output of block amber," he said, "as the deposits do not show much promise in that direction. But it can probably be used for making pressed amber and high class varnish which will withstand heat." What is needed to develop the mining assets of Manitoba is first of all an accurate survey, and in the opinion of Mr. Craig this can best be done by aeroplane photography. The other requirement is technical skill and this will be attracted to the district by the large copper deposits. "When these two essentials are introduced you may look for great and rapid development in the mining industry in Northern Manitoba," said Mr. Craig. "They are sinking on the famous Flin Flon property south of the Hudson Bay Railway right now, and it is showing up enormous quantities of solid sulphite of copper. Diamond drilling has also been done, so that there would be no doubt as to the enormous size of the deposit and they have values in sight now of over \$200,000,000. Labor is very scarce in the mining centres there now and every available man is taken on at good wages."

A party of geologists headed by Mr. Cyril Knight and including Messrs. Hill and Pickard of the Haileybury Mining School were in Kirkland Lake over the last week-end, visiting the various properties. The party was favorably impressed with everything in general and showed much interest in the work that is going on in the camp.

### GASOLENE CONSUMPTION EXCEEDS PRODUCTION.

U. S. Bureau of Mines report on petroleum for June and six months of 1920 shows operations of 307 refineries in June with daily capacity of 1,601,295 barrels, against 292 refineries and daily capacity of 1,356,355 barrels in December, 1919. Refineries ran at 73 per cent. of rated capacity against 77 per cent. in December. June production of gasolene totalled 415,159,911 gallons while consumption totalled 427,242,862 gallons. Six months gasolene productions was approximately 13 per cent. greater than that for corresponding period of 1919, while consumption for that period totalled 1,845,775,925 gallons, or 28 per cent. greater than six months of last year.

As Herbert Hoover has recently pointed out, a national policy towards mining is a differing and a better thing than nationalization of mines. A National Policy towards coal mining, for example, is what Canada has never had. Nationalization of mines would bring about that stultification of individual effort and associated nepotism that seems inseparable from government control in a country having a popularly elected government.

## Core Drilling Inside a Glacier

By A. S. WILLIAMSON \*

The Lucky Four Mines, Laidlaw, British Columbia, are situated 16 miles south of the Fraser River at the headwaters of Jones Creek on the Cheam Range. The outcrop that the property was sold on is at an altitude of 5750 feet on a glacier.

I got instructions on the 1st of February, 1919, to take in a Diamond Drill and 20 tons of supplies and start operations.

First we located a trail by blazing through the timber and once above timber line we used small flags. We had two miles of trail above the timber line. Next was the hardest problem, how to make a snow trail that would stand up under horses, as we had 12 inches of snow at the Fraser River, 13 feet at Jones Lake, 2000 feet altitude, and 30 feet at the place we picked out for a camp site—5550 feet up on a ridge.

I had received all kinds of suggestions how to get in. Some said it could not be done. However, I got the trail gang to tramp solid the trail in one-hundred-yard sections, then followed up with a light horse and go-devil, the go-devil made entirely of vine-maple with the runners curved towards the center in the front so that it would follow the curves of the trail without cutting into the snow on the sides. The trail was not over 18 inches wide. After two or three trips with the go-devil loaded up to 300 pounds we could load up to 700 or 800 pounds with one horse. We established camps every five miles and got in with our supplies, without any difficulty, to our camp site within one mile of the mine, which was 1000 feet or over above camp on the glacier.

We dug down through thirty feet of snow to bed-rock and put down three tents—14x16—with split cedar for floors and four-foot shakes all around for sides—making a very comfortable camp indeed.

The next question was, "How were we going to get the diamond drill with its equipment onto the glacier?" This included three poles for the tripod—23 feet long, gasoline, tools, etc., including a zinc tank 5 x 1/2 x 3 feet to melt snow in order to get water for the drill, as there was no water on the glacier.

By this time the snow was getting very soft and I found it impossible to make a trail that would hold up horses from the camp to the mine. So we tramped the trail good, switch-backing up over the glacier, then put 14 men on a rope attached to the go-devil and took the drill up in two sections—first the drill portion and then the gasoline engine. Also the supplies and heavier portions by go-devil. The gasoline we back-packed.

While the trail was being built and supplies coming up we were digging on a ridge below the outcrop for a place to put the drill up. This was accomplished by digging out a cut across the ridge five feet wide by 35 feet deep and 50 feet long, afterwards cutting out a space 25 x 25 feet to place the drill in.

After getting the drill set up we made it as comfortable as possible by putting a large tarpaulin over the tripod and machinery, very much like an Indian tepee, heated with oil stoves, which also melted the snow in the big tank.

Work was started drilling with three shifts under fairly comfortable conditions. But after drilling one hole 700 feet we attempted to drill a hole to the right

at an angle of 15 degrees to the west of the first hole, but after going 60 feet we ran into glacial ice. Repeating the performance to the east, in 35 feet we ran into ice again.

Now there was no possible place to approach the ore body except at the cost of going down the mountain several hundred feet and putting in holes, the shortest of which would have been 1000 feet. So we decided to try putting the drill into the glacier within two or three hundred feet of the ore body, and cross-cutting it.

In order to find out how deep the ice was and what the bedrock looked like, I drove a tunnel 4 x 6 feet through the ice to bedrock, a distance of 80 feet. Now knowing the thickness of the ice and the slope of the bedrock (about 30 degrees), I started an open cut four feet wide paralleling the tunnel.

After driving 80 feet, bed-rock was struck. There I cut out a place for the drill 22 x 22 feet, leveling off the bedrock in order to give a foundation for the drill. At this point there was 50 feet of solid ice above us on four sides.

Now arose the question of getting the drill up to its new position from its old setup about 400 feet below. We decided that we would make the drill pull itself up over the glacier. So we rigged up a set of blocks and tackles and put in "dead men" every 50 feet in a trench in the ice. Using the carriage on which the drill and gas engine were placed as a sleigh, inside of two hours the whole outfit, drill and engine, was standing on the dump ready to haul up a go-devil loaded with gasoline and later all the supplies from the old location. Once this was accomplished we had the drill and engine pull itself right into the face and in two days we were drilling away in good shape in the most unique location that a drill ever was in.

One of the Provincial Government Engineers, who came up one day after climbing up the glacier, and on going in to see the drill said, "Well, I have seen lots of glaciers, but this is the first time I have ever seen the guts of one."

We drilled over one hundred feet from this position with satisfactory results in drilling, using the Sullivan Class No. 3 ("S") Diamond Drill with an ordinary bit. We did not cut through any ice with our drilling; we were just prospecting. After the work was done we pulled the drill out to the surface of the glacier, greased it thoroughly, covering all with a heavy tarpaulin, where we left it in cold storage until needed elsewhere on the property.—"Iron Mine & Quarry."

### TORONTO COAL PRICES.

Toronto, Sept. 15.—Local dealers look for a slight easing off in the hard coal situation owing to the calling off of the vacation strike among the hard coal people in the coal mining districts. It was stated during the week that bituminous coal shipments to Toronto were short a number of expected shipments as a result of the embargo west of Rochester and Pittsburgh Railway. This line will be tied up for a few days but shipments will be continued over the other lines. It is expected that as the result of adjustments of labor difficulties in the mining areas coal shipments will be normal in another week. Hard coal is quoted at from \$8.00 to \$18.00 gross tons at mines, American funds: mine run \$14.25 to \$14.50 f. o. b. Toronto and smokeless coal \$14.50 to \$15.00.

\* Supt. Lucky Four Mines, 322 6th St. West, North Vancouver, B. C.

### NEW TYPE OF LIGHT AIR-DRILL FOR MINE AND QUARRY USE.

The development of pneumatic mining and quarrying tools has been so rapid, and their performance latterly so efficient, that it is but natural they should now be regarded as having reached such a state of perfection that radical changes or improvements are, generally speaking, no longer expected.

Any yet, notwithstanding this popular notion, The Denver Rock Drill Manufacturing Company, which has for quite a number of years been in the forefront of rock drill progress, has recently developed a new type of light mining and quarrying drill which, it is claimed, marks an advance in the progress of air drill manufacture that has seldom, if ever, been equalled by any single achievement.

This new type of drill is built in three models, known respectively as Models NA-90, NRW-93 and NRD-95; the first named being a "dry" Auger Drill, especially designed for work in coal, iron and other soft forma-

Waugh "90" Drill.

tions; the second, a combination "wet" and "dry" rock drill efficiently serviceable in all kinds of rock and under all conditions, either above or below ground; and the last named, a "dry" rock drill particularly adapted to work in wet shafts or where out-of-door conditions prevail.

All three drills are extremely light, so that they can be easily carried about, and each is operated by one man alone.

They are built throughout of the very best steels compounded and with the utmost precision.

While most Waugh Drills are of the valveless type, the "Nineties" are equipped with an entirely new type of spool valve, having a positive action, which is said to be the last word in simplicity, and in efficiency as well.

The rotation mechanism is of exceptionally strong design in which stresses in both teeth and pawls are reduced to a minimum.

Lubrication is effected by pulsations of air which gradually feed the oil from a reservoir at the side of the cylinder into all parts of the machine.

The manufacturers state that comparative tests conclusively prove these "Ninety" drills to be much superior, more powerful and more efficient, at all pressures, than other drills of their general type and weight,

and express themselves as feeling gratified at being able to make such a substantial contribution to cost reduction and stimulation of production in mining and quarrying at a time when the country stands in greatest need of labor-saving improvements in machinery used in these industries.

MR. P. T. PRENDERGAST.

### PRECIOUS STONES IN EGYPT.

According to gossip a company may shortly be formed for the purpose of exploiting an area supposed to be the origin of the famous emeralds so frequently mentioned in Egyptian records. It would appear that in the time of the Pharaohs these stones were fairly plentiful—sufficiently so, in fact, for no specific mention being made as to where they came from. There have been from time to time numerous attempts to solve the mystery, which has been kept alive by some of the gems being occasionally found in possession of wandering Bedouin tribes, identical with the ancient jewels. It was generally supposed that somewhere in the wild desert country west of the Red Sea existed the mines from which the stones were extracted, but the efforts of several expeditions failed to discover the wanted locality. The Government of the time occasionally took a hand in the ventures, and the leading officials were not above joining in the searches, which, however, all proved unsuccessful.

One of the most important efforts to trace the origin of the ancient stones was made about a century ago by Mahomet Ali, who equipped a Frenchman, named Calliard, who after a vain search of many months at

last had to reluctantly give up the quest. Less authoritative expeditions have been formed since then, but it is only within the last few months that something tangible has been reported, a British expedition having been said to have discovered the old workings. They are reported to be in a desolate mountain range, running west of, and parallel to, the Red Sea, between the 24th and 25th degrees north latitude.

The locality shows signs of having at one time been the centre of a huge population of slaves, while the sides of the mountains have been pierced by long tunnels, enlarged here and there into great mining chambers. The workings are said to be big enough to accommodate several hundred miners. To judge from the character of the work and the primitive tools which are scattered about in the vicinity the age of the mines would seem to be about 2,500 years. It is interesting that some of the workings are supported by timber props, which are reported to be still sound and serviceable, due, no doubt, to the dry atmosphere. The indications appear to point to some sudden abandonment of the work, the miners having apparently thrown down their tools and fled. The district is regarded by the scanty wandering tribes as the abode of evil spirits, which may account for the mines having been undisturbed for so many ages.

It is said that the exploring party has found quantities of the gems in a rough state, many being of large size. The stones are reported to be identical with those which have been found on mummies and in the ruins of the ancient cities of Egypt. Further news about the discoveries will be awaited with some interest. That the difficulties connected with transport should not be insurmountable is shown by the signs of a one-time large native population, which must have

existed in spite of the scarcity of supplies and water, the latter appearing to have been husbanded in tanks cut in the solid rock.—W.I.L. in "Financier and Bullionist".

### Demand for Gypsum Plaster in Cuba

Major H. A. Chisholm, Canadian Government Trade Commissioner in Havana, Cuba, writes as follows:—

"If Canada manufactured sufficient gypsum plaster the Cuban market could consume many times the quantity imported from Canada at the present time, which amounts to some 2,000 or 3,000 barrels a month. It appears that a good deal of the building plaster imported into Cuba from the United States is manufactured from gypsum mined in Canada. I should think that Canada has a good opportunity to build up a new industry in the manufacture of gypsum building plaster for Latin-American countries."

There should be no difficulty in supplying any outside market with either crude or calcined gypsum from Canada, provided shipping facilities were convenient and reasonably priced. Of 304,532 tons of gypsum mines in Canada during 1919 there were calcined 121,499 tons. 148,394 tons of crude gypsum were quite important imports of gypsum, crude and products were exported to the value of \$140,235. There were quite important import of gypsum, crude and ground, and of plaster of paris. Canada's ability to produce gypsum and gypsum products of high grade is much larger than any market that has as yet been obtained, and during the cessation of building during the war period many of the gypsum quarries and calcining plants in Canada have been idle, and many are yet.

# EDITORIAL

## Increased Gold Production in Canada a Clear Necessity

The memorandum on "The World's Monetary Problems", prepared by Professor Cassel of Stockholm for the Brussels Conference, now in session, contains matter that is of much interest to the gold mining industry of Canada.

Professor Cassel's main conclusions seem to be two in number, namely, (a) that it is to the common interest of the world to prevent gold from rising again in value, and, (b) that a greater production of gold is required from the mines of the world.

From the viewpoint of the gold miner, these conclusions will occasion some mental perplexity, as they seem irreconcilable in practice.

From the European standpoint, Professor Cassel bluntly states that it is to the interest of all other countries that the United States should not enter on any policy effectively raising the internal value of the dollar, but he thinks it is necessary that one country should take the lead in stabilizing exchanges by fixing the internal value of its money, and this country he believes should be the United States.

The present low value of gold is ascribed to a diminished demand for gold for monetary purposes, due to a general abandonment of gold circulation and the substitution of paper certificates. Withdrawal of gold from circulation, and the disappearance of all definite standards of gold-cover have seriously impaired the value of gold, and if it is to be used henceforth as a monetary standard, special measures to ensure its stabilization are required. Regarding this, Professor Cassel says:

"Stabilization of gold involves, however, special difficulties in connection with its production. If we have a stabilized demand for gold, we must have an annual production corresponding to the general rate of economic progress and sufficient to cover the yearly waste of gold. Assuming the same progress in the years before us as during 1850—1910, we should need at present an annual production of about £100,000,000, increasing 2.8 per cent. annually. The total for the World in 1919 is estimated to be not

"more than £75,000,000.

"As necessary annual production would, under the assumed rate, in 10 years be £132,000,000 and in 20 years £174,000,00, danger of a quite insufficient supply of gold is much more imminent than generally recognized."

The increase in the use of gold in the arts, and for articles of luxury is noted, two developments that threaten to absorb a large part of the diminished annual production. Measures to check the industrial uses of gold are suggested, and it is pointed out that the demand for gold from the Far East should be checked by developing Asia's needs for European manufactures.

The insufficiency of the future supply of new gold impresses Professor Cassel to the extent that he proposes measures "not only to prevent monetary demand for gold from resuming its old dimensions", but also a regulation of the consumption of gold as currency, "with a view to reducing it gradually, as growing scarcity of the supply may require."

Most people find it difficult to form a clear idea of the influence of the gold supply upon commodity prices, and we confess to a similar inability, believing that physical shortage of commodities plays a much greater part than the available quantity of the purchasing medium, but it seems clear that economists fear a runaway demand for new gold (should the process of re-establishing the gold standard be unduly hurried) and an upsetting enhancement of the value of new gold.

In Canada, we are chiefly interested in restoring the parity of our dollar exchange with the United States. According to Professor Cassel's reasoning we shall suffer if the United States raises the internal purchasing value of its dollar. This appears to be now happening. To offset this, we have mines that can produce much more gold than they have as yet put out, provided labor is available, and, in view of the prospect that the demand for gold will become more and more insistent, it is to be hoped that our Government will assist by every possible means the augmentation of our gold output.

### STANDARDIZED OXYGEN BREATHING APPARATUS.

In suggesting a conference upon the desirability of joint action to secure reliability and uniformity in self-contained oxygen breathing-apparatus, the Minister of Mines for British Columbia has expressed a very general desire among mining men both in America and in Europe. Mr. Sloan advocates the calling of a conference, either at Pittsburgh or Washington, to discuss the possibility of devising an apparatus that could be officially adopted as a standard for coal mines in North America. The United States Bureau of Mines has developed such a type of apparatus, actuated by a desire to incorporate the best ideas, and to eliminate the defects, existing in the patented devices on the market. The time would seem to be opportune for agreement upon a standardized type in the western collieries, where the interchange of international courtesies and co-operative effort in first-aid and mine-rescue movements are much more marked than is the case in the East. In Nova Scotia, it is probable that a European type of apparatus will find most favor, but the keen interest of the western men in first-aid and mine-rescue equipment does not pass unnoticed in the East. Many extraneous and irrelevant matters have been introduced into the choice of oxygen breathing apparatus, and it would be pleasing to see the discussion confined to the ability of any given type to support life in irrespirable atmospheres and to enable men to perform physical work when wearing the apparatus in question. We take it this is what Mr. Sloan desires.

### THE "O.B.U." IN THE ALBERTA COAL MINES.

An intimation comes from Ottawa that a strike of coal miners in Alberta, and possibly also in British Columbia, is to be called by the O.B.U. "This is the first time," says the "Ottawa Journal," "that the O.B.U. officials have called a strike openly, and for their own principles."

If it should be that the O.B.U. has called a strike based on political rather than on industrial questions, it will, as was the case in Britain, be foredoomed to failure from the beginning.

The O. B. U. holds that political and industrial questions are one and indivisible, as did Mr. Smillie, but they will probably be taught that strict differentiation between the use of the vote and the use of industrial combinations—whether of men or employers—is one of the main characteristics that has been developed in British ideals of citizenship by our long political evolution. The British people happen to have straightened out their "King and Governor" at a time when the descendants of those from whom some people borrow their political ideals were unlettered savages, and they also happen to have started—either at home or abroad—most of the movements that have led to political freedom.

The adoption of the "closed shop" in the western coalfields, under the direction of the Government, was a step, that, as this periodical has previously stated, may be condoned on the ground of expediency, but is quite indefensible on the ground of principle. Presumably the justification is that the O. B. U. was propagating its communistic doctrine by "boring from within." There need be little trepidation on the part of the Government as to the success which the O.B.U. will meet if it dares to put its theories to an open test by direct action.

The aim of the O.B.U. was well expounded by one of its chief missionaries in Winnipeg recently, who stated: "The O.B.U. is not a national organization. That is absurd. An organization of the working classes cannot be national". Those who regard themselves as Canadians first and foremost will conclude: "Those who are not with us are against us", and will be shy of any organization that makes its first plank the negation of nationality.

It will, at the same time, be a thousand pities if even an abortive attempt of extremists should affect the coal output of the West at this time. Alberta has once again the prospect of leading the provinces in coal production in 1920, and the prospects of permanence in the western coal trade were never so good as just now. Time and time again has Alberta been be-devilled by labor troubles in its coal-mines, which have most definitely reacted to put the Province a long way behind where it should have been in coal output at this date. As we noted in a recent issue, rarely have the government, the universities and the distributors of coal worked together with such unanimity and such prospects of reward as in Alberta, but their efforts have been deliberately annulled by the miners.

### CONDITIONS AT NOVA SCOTIA COLLIERIES.

As was noted in the last issue, the Report of the Royal Commission on coal mining operations in Nova Scotia and New Brunswick was constructive in two important points, namely, the recommendation that joint conciliation boards be appointed to adjust labor questions as they arose, and that a sliding scale of increases in wages should be adopted based upon production.

It may be noted that the formation of joint conciliation boards, after the great coal strike of 1893 in Britain, enabled the peace to be kept in coal mining circles for nearly 20 years.

It is also significant that the Royal Commission anticipated the British Government by their recommendation that new wage increases should be based upon production. There seems every likelihood that a solution of the present difficulty in Britain may be found in just such a sliding scale as the Nova Scotia Royal Commission has recommended. The coincidence would indicate that the reasoning of the Nova Scotia Com-

mission was sound. It is therefore regrettable to learn that the United Mine Workers in Nova Scotia, through their locals, are voting against the acceptance of the findings of the Commission chiefly on the score of the two main recommendations above referred to. It is urged that the establishment of the "adjustment board" would limit the powers of the union leaders, and would institute compulsory arbitration, against which the unions are pledged. It is further urged that increase of production is not possible, and that further decrease of production may be anticipated, which, under a sliding scale, would result in a reduction of existing rates of wages.

It is apparent that the unions are not disposed to be helpful in the matter of increased production, and that they do not realize the fundamentally insecure position of an industry which shows simultaneously a forty percent. decrease in production and a greatly increased overhead charge. Neither do the unions appear to comprehend that by discouraging maximum production at this time, when world coal shortage has created panic values for coal, an opportunity to accumulate the capital required for future development of the coal industry is being thrown away.

There is one phase of the coal production question in Nova Scotia that the unions can assist only in part, namely, the replacement of the miners lost to the industry through causes connected with the war, but even in this respect the policy of the union is to discourage rather than to welcome the bringing in of new men from the outside, or to bring about the transference of former miners from the non-producing classes to the coal face.

We surmise that the Commission favored a sliding scale based upon production, not because they found fault with the daily per capita production of the miners employed at the coal face, but because they found the working forces were unbalanced as between producers and non-producers. The Commission doubtless also realized that successive increases to day-paid men created less and less desire among these men to return to work at the coal face, and wished to make the actual miners interested parties in bringing about the transference of men from day-paid positions where they are not wanted—to work at the coal face—where they are very badly needed. We would place the numerical shortage of coal-face workers at approximately the same percentage of the pre-war total force of employees as is borne by the present output to that of pre-war times. That is to say, the decline in coal production as compared with pre-war days is in direct proportion to the numerical shortage of face workers similarly compared.

It is evident that the capacity of the coal operators in Nova Scotia to pay increased wages would be much greater if they were at this time able to market forty percent more coal than is actually the case. The

establishments of the coal companies, in every material instance, could produce, raise, handle, transport and market, forty percent more coal without adding an additional man, if the number of face workers were increased to pre-war numbers. In discouraging a re-establishment of the balance of working forces, the union in Nova Scotia is damaging no interest more severely than its own.

#### PIONEERS AND "SKY PILOTS".

Although we have been accused of indulging too freely in the foolishness of preaching, the columns of the "Canadian Mining Journal" have not often included the remarks of a Bishop with the excellences of the mining pioneer as his text.

The presence of Bishop Stringer at a Discovery Day celebration at Dawson coincident with the arrival of the first aviators to alight in the Yukon was the occasion of an eloquent tribute to the pioneer of the past, and to his worthy descendants of our own not degenerate age, that makes good reading even at a distance. Bishop Stringer fittingly said he represented "a succession of pioneers older than any other continuous institution in the country". Among the pioneers of Canadian exploration no men have made an earlier or a better mark than the missionaries of the churches, and mining camps—which as a rule mark the frontiers of civilization—have been made better and more habitable places by the labors of men of religion. The spirit that drives the pioneer outwards and northwards is not exclusively the desire of material gain. That instinct plays its part, doubtless, but the prospector and the pioneer are brothers of a craft that are lured by the "sound of the wind on the heath". The result of solitude and of living in the open spaces of the world leads to introspection, and the self-discovery that "there is a spirit in man," which perhaps explains why the pioneer finds himself in closer accord with a bishop than is the case with those who sometimes follow him.

#### COBALT AND NICKEL IN THE PEAK OF DERBYSHIRE.

The "Financier" of London contains an announcement from Mr. C. S. Garnett, of Sheffield University, of the discovery of manganese in the Peak of Derbyshire in sufficient quantity to be of much importance to the steel industry of Sheffield.

Mr. Garnett names six minerals he has identified in the Peak District that have not previously been known to exist there, namely Cobalt, diabantite, nephrite, cimolite, utahite (?) native sulphur and allophane.

The occurrence of cobalt is interesting, as it is associated with nickel ore. With the exception of the manganese deposit, it does not appear that any of the minerals newly noted exist in commercial quantities. From a scientific point of view, the occurrence of the minerals identified by Mr. Garnett add to the already great interest of the Peak District to the geologist.

# Utilization of Ontario Iron Ores

A New Metallizing Furnace Which Gives a Hot Product Easily Finished in the Electric Furnace.

BY REGINALD E. HORE.

The recently issued report on the production of metals in Ontario in the first half of this year contains much information that is pleasing and some that is not. The Ontario Bureau of Mines has collected statistics which show that the production was larger than in the corresponding period of last year. That it was not still greater was due not to lack of ore, but rather to lack of ability to mine and treat the ore on the scale that the operators hoped. Shortage of labour prevented the producing of the amount of gold that our mines should produce. A dull market for nickel and copper kept Sudbury's great industry from making a better showing. The high price obtained for silver materially benefitted the Cobalt silver mining industry.

It is comforting to note, however, that the foundations for great industries are well laid at Sudbury and Porcupine. Splendid ore bodies have been developed and well equipped for production. The nickel and gold and silver industries will add very materially to the wealth of the Province during the coming years.

But when we read the report on production of iron ore in Ontario, we find little ground for satisfaction with what is being done now or planned for the immediate future. Of the 653,137 tons of iron ore charged to furnaces during the six month period, only 58,387 tons was of domestic origin. Over 90% of the iron used was imported.

There is known to be a large quantity of iron ore in Ontario. It is equally well known that under present conditions it is not profitable to mine much of it. Many of the deposits are small. Others are not of a grade which permits competition with ore from the Lake Superior States. To utilize our ores we must find some method of treatment that can be so advantageously used in Ontario that the shortcomings of the ore deposits may be offset.

Our fuel supply is not such as to give us any help in this problem. We have, however, water powers which might be utilized to such advantage that a real iron mining industry and a larger iron and steel manufacturing industry might result.

How can we utilize our waterpowers to make a profitable mining industry in Ontario? Obviously the mere substitution of electrically generated heat for carbon burning will not get us anywhere. We must get some better process than the ones in use. A process is needed which will more adequately take advantage of the greater facilities for controlling heat derived electrically.

This problem has attracted many investigators. Their work during recent years has been especially appreciated by those who wanted small furnaces for melting purposes. The bigger enterprise, that of making steel from the ore, is now receiving more attention. That this problem has now been solved, there seems good reason for belief. It now remains to be demonstrated.

The Canadian who has devised a process for the economical utilization of Ontario iron ores is Mr. Jas.

W. Moffatt of Toronto, a metallurgist who has been carrying on investigations to this end for several years. He has worked out the process and designed the furnaces. I have obtained from him for the readers of the "Mining Journal" some description of the furnaces and the process. Later I hope he will tell the story himself and go more into the details. In the meantime this article may serve to indicate that the utilization of Ontario iron ores in the near future is not so unlikely as it has seemed. Mr. Moffatt's work gives us some substantial ground for hopes, for he seems to have devised a process and designed furnaces that will make the electric furnace a bigger factor in steel making. I write not as a steel maker, for I never made any, but as one who has learned with interest of the results of the investigator's work. It seems to me that he has accomplished something worth while and I believe readers of the "Journal" will be interested in the work, because of the impetus it may give to our iron industry.

## The Process.

The process used is to reduce the iron ore in a metallizing furnace and then without contact with the air and while still hot transfer it quickly to an electric furnace and finish it there. Mr. Moffatt has designed furnaces especially for this work. The accompanying diagrams show the reducing or metallizing furnace. Here the ore is deprived of its oxygen at a relatively low temperature and without fusion. The method of operation is briefly as follows:

Pulverized ore is charged to the retort (5) through hoppers (1) fitted with air tight valves. Pulverized coal or coke for the reduction and subsequent electric furnace work is charged through hoppers (3). The rabblers (7) lift the ore particles and expose them many times to the reducing gas. The metallized product or sponge then falls down on an air-tight conveyor (21) which delivers it hot to the electric furnace.

It will in most cases be necessary to crush the ore to pass 10 mesh. If the ore is porous, however, 5 mesh may suffice. Ores of low iron content must be pulverized until the metallic particles are well separated from the gangue and grinding to pass 100 mesh screen may in some cases be advisable. Magnetic concentration will advantageously be used with some ores. Such concentrates will be ready for the furnace without sintering or briquetting.

To prevent any agglomeration taking place in the furnace and to obtain uniformity of temperature throughout the charge, the mechanical rabbling is kept up continuously from the beginning of the charging to the very end of the discharge. The whole charge is completely reduced and the proper carbon contents obtained before any is discharged.

Most of the heat required is supplied by waste gases. These products are burned outside the retort. The use of much expensive electric energy is thus avoided and at the same time the desired atmosphere in the retort is obtained.

When, near the end of the reduction process the supply of waste gas from the retort runs low, other gas or fuel oil is fed into the outer combustion chamber and the temperature thus maintained. Gas, fuel oil or coal can be utilized as the source of heat at this stage of the process. It is essential that the gases used for the desired chemical reactions and for heat production should be kept apart and this is effectually accomplished.

The perfect control over the metallizing of the oxides makes possible the production of various metals and alloys from their oxides. Nickel and cobalt can be made in these furnaces and the making of nickel steel in Canada from Canadian ores is one of the interesting possibilities.

**Operation of the Furnace.**

In operating the metallizing furnace there will be used an amount of carbon equal to about one third of the weight of the iron in the ore. The charge of ore is preheated in the retort to 250° or 300°C. The carbon is then added in a continuous stream with complete exclusion of air. The retort gives off some gas and the volume increases as the charge warms up. At temperatures between 400° and 500°C the gas is given off most rapidly. The excess carbon, over that required for reduction of the iron oxide, provides a flow of gas richer in carbon monoxide than would be given off otherwise. The furnace operator by reading the retort pyrometer and the gas recorder and consulting his chart is able to accurately regulate conditions in the retort. Towards the end of the operation samples of the charge are taken and analyzed and the carbon feed and temperature regulated accordingly. The thorough mixing of the charge by continuous rab-

bling permits accurate sampling and the operator has thus the information that will enable him to produce the desired result.

Lime for fluxing is preheated to 250° or 300°C and charged to the metallizing furnace a short time before the sponge is finished, so that it may be heated to the same temperature as the sponge.

The furnace show in the accompanying drawings is designed to handle a charge of two tons of ore each heat; ore enough to make one ton of metal. Three such furnaces supply the charge for a three-ton electric furnace. The transfer takes only about ten minutes. The electric furnace starts work with a sponge already heated to 600° or 700°C. The time and the additional heat required in the electric furnace is very much less than for a charge of cold scrap.

FRONT VIEW

LONGTIDUNAL SECTION

REAR VIEW AND END SECTION SHOWING RABBLING DEVICE

The electric furnace is thus used where it is especially advantageous — for the high temperature work. In the lower temperature work full advantage is taken of the heat to be obtained in burning the combustion gases. The complete operation of producing steel from ore is affected at low cost and in small plant-units. The cumbersome and costly blast furnace becomes unnecessary. Full use is made of instruments of precision and complete control of the charge is maintained at all stages.

The electric furnace is thus made more suitable for steel making by preparing for it a charge which it is peculiarly well qualified to handle. A reducing furnace specially suited for the making of the iron sponge has been designed. Mr. Moffatt has also designed an improved electric furnace and is working on plans for a complete plant for the production of steel from such ores as we have in Canada.

## CANADA AS A PRODUCER OF IRON ORE.—THE INFLUENCE OF COAL LOCATION.

(Bulletin of the C. I. M. & M.)

Perhaps the most important topic discussed at the meeting of the Ontario Mining Association, which was held at Sudbury during the past month, was the deplorable position of Canada as a producer of iron ore, and the status of the domestic iron and steel industry generally. The consensus of expressed opinion was that Government assistance in the beneficiating of Ontario ores to smelter grade is, in principle, highly desirable, and the belief was further expressed that it is commercially practicable to use coal from Alberta in smelting these ores. The outcome of the discussion was the appointment of a committee to present the views of the mining industry of Ontario before the Government Commission now investigating the possibilities of the iron ore industry.

As to the desirability of possessing and building up a vigorous domestic iron and steel industry there is no room for argument. One has only to consider the leading nations of the world to find what a very intimate connection there is between the production of iron and steel and national growth and prosperity. Indeed, the one is practically a measure of the other. This is no less true in the case of Canada, and for years the iron and steel industry has been our leading manufacturing industry. Our position would be entirely satisfactory, were it not for two disturbing factors: practically all the iron ore, and a very large proportion of the coal, used in making our iron and steel is imported; and moreover, the production falls far short of our requirements. To put the case more concretely, iron ore and iron and steel products to the value of one hundred and eighty-six million dollars were imported into Canada during 1918. In the light of the figures there would appear to be a very good *prima facie* case for urging the Government to give material assistance to the development of our own iron ore resources. But one must not lose sight of the fact that an iron and steel industry can not be built up on iron ore alone. A plentiful and assured supply of cheap fuel is essential. Examining the position in Ontario we find there is no coal, and, so far as is known, there are no large high-grade deposits of iron ore—practically all the ore now being raised in the province requires beneficiation. This indeed constitutes one of the reasons for urging Government assistance, in order that the domestic product may compete more favourably with imported ore. The development of the iron mining industry everywhere in Canada is most desirable. But even granting that a bounty might have the effect of encouraging the development of Ontario's iron fields to such an extent that the furnaces could be fed entirely or mainly with Ontario ore, we would still be very far from having a purely domestic and independent iron and steel industry in Ontario. The suspension or cutting off of fuel supplies would be just as serious under such conditions as it would be today.

In this connection, therefore, it is of interest to note that the Ontario Mining Association placed on record their belief that the use of Alberta coal is commercially practicable. It would be interesting to have the data on which this belief is based. If it is well founded, might it not be argued that, if only Ontario ore and Alberta coal were in question, the ore would

be sent to the coal, and not *vice versa*. This at least is a fairly general economic rule, and if it applies in this case we arrive at the curious conclusion that the Ontario steel industry must either disappear, or must continue to rely, as at present, on foreign ore and foreign coal. In other words, it would indicate that, if a large tonnage of iron ore can be developed and produced in Ontario, with or without Government assistance, and if our aim is to establish and build up a really independent Canadian iron and steel industry in central or mid-western Canada, the logical centre for such an industry is in the coal fields of Alberta. However this may be, it in no way affects the general principle as to the desirability or probable effectiveness of the policy of bonusing the production of Canadian iron ores.

### TORONTO NOTES.

The Challenger Gold Mining Company, Limited, has been organized and granted incorporation by the Ontario Government, the provisional directors being G. M. Webster, H. P. Rickard and Alexander Miller of Toronto. The capital stock is placed at \$110,000. Another company to be granted a charter by the Ontario Government is the Canadian Casey Cobalt Company, Limited, with a capital stock of \$245,000, the provisional directors being W. W. Perry, C. H. C. Leggott and Edna Fitzsimons, of Toronto.

Another incorporation is the North Country Exploration and Mining Company, Limited, with Montreal incorporators and a capital stock of one million dollars and head office at Montreal. A company promoted in Ontario is the Ellicott Mining Company, Limited, with head office at Niagara Falls and a capital stock of \$250,000.

Corroboration of the reported gradual improvement in the labor situation as well as in mining conditions throughout the camps of Northern Ontario was given this week by Mr. Frank L. Culver, President of the Beaver Consolidated and Kirkland Lake Gold Mines, on his return from Cobalt and Kirkland Lake where he spent a week on one of his regular tours of inspection. "I was very agreeably surprised upon my trip," he said, "to find a material increase in the ranks of labor, and was also informed that a large number of miners who had left the camp in the early part of the year, drifting into the automobile and ship-building centres, are now returning, and seem exceedingly glad to get back at their old jobs in the mines. With such an improved front mining results will soon be found to far exceed those of any time since the Fall of 1914."

Prof. Stanley N. Graham, who has been engaged in geological examinations in British Columbia during the Summer, has been appointed Professor of Mining Engineering at Queen's University, Kingston, succeeding the late Prof. Gwillim.

Mr. H. W. Welsh, former Manager in Sherbrooke, Que., for the E. & T. Fairbanks & Co. Limited, and latterly Manager of the Scale Department of the Canadian Fairbanks Morse Co. Limited, Montreal, Que., has joined the organization of the MacKinnon Steel Co. Limited, Sherbrooke, Que., as Manager, and has already assumed his duties.

### NOTE ON OCCURENCE OF TETRAHEDRITE IN EAST KOOTENAY DISTRICT, BRITISH COLUMBIA

Some notes on Tetrahedrite or Grey-Copper-Ore have been published by William Thomlinson, of New Denver, B. C. They have special reference to the ores of East Kootenay and are of special interest to prospectors.

He says:

Of the various minerals which the prospectors and miners of the Kootenays are daily coming into contact with, the mineral Tetrahedrite or Grey-Copper, appears to be, in many cases, the least understood.

Most of the men referred to are quite aware that for some reason grey-copper-ores are very variable, especially as to silver contents; but few persons appear to know that the mineral has such a variable and wide range in its composition.

Tetrahedrite, or grey-copper, being, I believe, the principal silverbearing mineral found in Kootenay ores, the following notes are given with the aim to benefit our local miners and others who may desire to have a fuller knowledge of the mineral, its varieties, variations in composition, and its usual modes of occurrence.

#### Sometimes is Rich in Silver.

Tetrahedrite or grey-copper, in all its varieties, is known to most prospectors and miners simply as "grey-copper," but to some persons it is still known by the old German name of Fahl-erz (grey ore), and in recent books on mineralogy the silver-rich variety, such as occurs so frequently in this district, is called by the special name of Freibergite; while a somewhat rare variety, in which arsenic supercedes antimony, is known as Tennantite.

Unlike, most minerals, which have definite or exact chemical expositions, the so-called grey-copper-ores have a wide range in their make-up, and may, I think, be considered more as mixtures of various elements than as definite minerals.

Recent authorities on the subject state that the following elements have been found, in varying amounts, in the several varieties of tetrahedrite, viz.—copper, silver, antimony, arsenic, sulphur, iron, zinc, lead and even mercury.

Apparently as a starting point, mineralogists have given to tetrahedrite proper the formula or composition of (by atomic weights), copper, 8 parts, antimony, 2 parts, and sulphur, 7 parts, omitting the silver and other elements entirely. This formula, for tetrahedrite proper, gives a composition of about, Copper, 52 per cent., antimony, 25 per cent, and sulphur, 23 per cent.

Tetrahedrite, when found of this or nearly of this composition, usually takes the form of four-sided crystals known as tetrahedrons, hence the name tetrahedrite.

#### Kootenay Ores are Generally Massive.

Now, having obtained a starting point, I shall try to show where some of the many variations come in; but, as a preliminary, may here state that the crystallized variety, composed entirely of copper, antimony and sulphur, is rarely, if ever, met with by the prospectors of miners of this part of British Columbia.

The grey-copper-ores found in the Kootenays are generally found massive, compact, or without any crystalline structure, and occurring as films, veinlets, bunches, masses, or as finely disseminated particles;

associated with the local ores containing galena, zincblende, chalcopyrite, pyrite and other minerals.

In the grey-copper found associated with Kootenay ores, much of the copper content of the mineral is apparently replaced by varying but considerable amounts of silver, therefore, this variety of grey-copper may properly be classified as freibergite.

In Kootenay ores, showing grey-copper, the silver contents may range anywhere between 50 ounces and 5,000 ounces of silver a ton of ore, according to the amount of richness of the grey-copper in the ore.

According to Dana, an examination of a large number of specimens of tetrahedrite showed that the various elements composing the same ranged in amounts about as follows, viz.—

Copper from 14 to over 40 per cent; silver from a trace to over 30 per cent; zinc from none to over 7 per cent; iron from 0.05 to over 8 per cent. Sulphur varied greatly and antimony and arsenic generally replaced each other in part or altogether.

Although high percentages of copper may be found in specimens of tetrahedrite, the mineral is seldom classed as an ore of copper; it is generally more valuable as a silver-bearing mineral, especially in the ores found in the mining camps of this district.

Grey-copper alters readily when exposed to air and water or to vein solutions, forming secondary minerals such as the green and the blue carbonates of copper and the blackish powdery oxides and other mixtures found in the oxidized portions of veins.

Some miners, not understanding these secondary minerals, call the copper carbonates "bromides" and "chlorides" of silver, and the black powdery material is often referred to as the "sulphides" or "sulphates" of silver.

#### May be Mistaken for Other Minerals.

The compact or massive variety of grey-copper may be mistaken for arsenical iron or arsenopyrite; for copper-glance or chalcocite; or for brittle silver or stephanite.

However, arsenopyrite is much harder than tetrahedrite and it also gives strong reactions for arsenic and iron.

Chalcocite is softer than tetrahedrite and being less brittle cuts more smoothly, besides it does not give reactions for antimony, arsenic or silver.

Stephanite does not react for copper or arsenic.

#### Gives Guides to Recognition.

The following hints may aid in the recognition of grey-copper-ores when met with:

The crystalline variety, tetrahedrite proper, takes the form of four-sided crystals, known as tetrahedrons.

The silver-bearing varieties, freibergites, such as are found in the Kootenays, are usually compact, massive, or granular; although altered forms may be met with having a powdery or even earthy appearance.

The mineral is from 3 to 4 hardness and is somewhat brittle.

The color ranges from light grey to dark grey, and in rare cases to iron-black; the streak or powdered mineral being usually of the same color as the crude mineral, but a certain rare variety may give it a reddish-brown streak.

A test piece, before the blow-pipe, pops or breaks up but the mineral powdered and slightly roasted fuses easily, giving off fumes of arsenic, sulphur, etc., and

in most cases, gives a bead of metallic copper or copper and silver.

Simple chemical tests may be made as follows:

Powder the mineral and dissolve it in warm nitric acid. Take half of this solution, and add some ammonia, when, in the case of a grey copper ore, you will obtain the blue color, indicating the presence of copper.

If you put a clean knife-blade or clean iron nail into the blue solution, metallic copper will be precipitated onto the blade or nail.

To the other half of the original solution add some hydrochloric acid (muriatic acid) or a little common table salt (sodium chloride) when in the case of silver-rich grey copper or freibergite, a cloudy curdy mass of whitish grey chloride of silver will be precipitated. This can be collected, washed, dried and reduced to metallic silver before the blow-pipe or otherwise.

#### **Advises Determination by Fire Assay.**

However, in conclusion, it may be well to emphasize the fact that the silver content of grey-copper-ore may vary greatly in the different mining camps or districts and vary considerably, even in the different mines of a camp; therefore before making a decision regarding the silver content of any sample or specimen of tetrahedrite or grey-copper-ore, be sure to allow a reliable assayer to first determine the amount of silver by cupellation or fire assay.

#### **NOTES FROM THE NOVA SCOTIA COLLIERIES. New Collieries.**

Preparations are being made by a number of interests in Cape Breton to increase the capacity of the coal areas for output, and much capital expenditure is projected.

The most extensively worked coal seam in the Sydney Field is the Phalen Seam, underlying which is a seam of good quality averaging about 4 ft. 6 ins., in thickness known as the Emery Seam. This seam has been opened at three points, namely at the Dominion collieries Nos. 10 and 11, and a new colliery No. 24. The territory of Emery Seam tributary to these collieries approximates respectively to the worked out territory of the Phalen Seam above at the older collieries Nos. 5, 3 and 4 (Reserve and Caledonia areas). It is now proposed to tap the Emery underlying the Phalen workings in Nos. 1 and 2 collieries, which will eventually mean the mining of the Emery Seam under the entire land area of the Glace Bay District, and its ultimate extension to undersea areas, following the history of the three exhausted seams above, to wit, in order of occurrence, the Hub, Harbor and Phalen Seams.

The percentage of Emery Seam in the production of the Glace Bay District is now around twelve per cent, but with the new openings projected, it may be anticipated that this percentage will rapidly increase. The Emery coal is a strong coal, with a light-colored flocculent ash, and is easily washed. It has been largely used for metallurgical purposes, and is in much favor as a locomotive and bunker coal. It will give up to 14,000 b.t.u.'s.

The Dominion Coal Company has entered upon a programme to develop what has always been its largest and most stable coal asset, namely, the large virgin areas of coal underlying the Phalen Seam. As the seams in the Glace Bay district crop concentrically, the seams increase in content under the land area as they are tapped at lower depths, and it is impor-

tant to note that under the Emery there is known to exist at least three workable seams, each having a larger land extension than the seams lying above.

A feature that favors the development of the lower seams is that the surface equipment and housing accommodation which has served the upper seam collieries is available for working the lower seams, in large part.

A similar succession of lower seams is to be found in the Waterford District, where as yet, only two upper seams have been worked to any extent.

In the Morien District, there is at least one, and probably two seams underlying the two collieries now working. The coal in this rather small field in the underlying seams is of good quality, very accessible, and capable of being worked relatively cheaply for that reason.

An unconfirmed report states that the English directors of the Cape Breton Coal Iron & Railway Co., which owns the Broughton Colliery in the Morien Basin of the Sydney Field, contemplate resumption of mining operations.

It is understood the Dominion Steel Corporation has discontinued the search for iron ore in the Loch Lomond District, Cape Breton. The ore, as found is of good quality and desirable for mixing with the Wabana ore, but diamond drilling has proved the occurrences to be discontinuous and unadapted to economical extraction in large quantities.

There is a small synclinal basin in the Loch Lomond district which contains coal seams of limited extent, but of quite good analysis. At the present time, lack of a railway, and the ability of the larger companies to mine coal more cheaply from more favorably situated areas, renders the development of this field unlikely, but it is one of those deposits that is of value as a reserve against future requirements.

The Nova Scotia Steel Company, it is understood, is undertaking the development of a small land area on the Collins Seam, with a view to seaward extension on a larger scale if market demand and other conditions should warrant this at some future time.

A large scale development of the Stubbart Seam on Boularderie Island is contemplated, and a railway some six miles in length, connecting with the Canadian National Railway will be required to connect with the site of the projected colliery.

This new colliery, together with important seaward extensions proposed by the Dominion Coal Company, depends for full realisation of all its possibilities upon the combined operation of the properties of the two companies under financial consolidation. The physical consolidation of the interests of these two companies, so far as the coal areas are concerned, is virtually consummated, to which fact some of the most hopeful developments of coal mining development in the Sydney Field are distinctly traceable.

#### **Labor and Wages.**

The various locals of the United Mine Workers are, one after the other, expressing dissatisfaction with the award of the Royal Commission, and in particular they ask for the increase in wages to be retroactive to May 1st instead of July 1st, as recommended by the

Commission. The disbursement which will be required to make this retroactive payment from July 1st is a very large one, probably reaching for the three months ending September 30th the sum of \$800,000. Under the recommendation of the Commission, this huge sum is to be paid out for work already done, covering a period when production has been most unsatisfactory, and overhead expenses altogether disproportionate to the rate of production. What is still more disturbing to the coal operators is the entire disagreement expressed by the miners with the recommendation of the Commission that a sliding scale be adopted designed to make the remuneration of the workers correspond to some extent to the rate of output.

The extra expenditure entailed upon the coal companies should the full recommendations of the Commission be followed in regard to wages and housing improvements, are not less than stupendous, and in actual practice will certainly be found impossible of fulfillment.

#### Mine Illumination.

The Royal Commission makes the following recommendation with regard to Electric Lamps :

“The Commission recommends that where practicable electric lamps should be installed by the operators as a means to greater efficiency and larger production, instead of the so-called safety lamps, but the advisability of the collateral use of the safety lamps should be borne in mind for the presence of the detection of the presence of gas, that is to say, an occasional safety lamp should be available and easy of access to parties of men working in places where gas is likely to make its appearance, and that the advisability for making the tests should be kept prominently in mind.”

Without any desire to speak disrespectfully of the Commission, this statement from a body of non-technical men regarding one of the most hotly contested features of mining practice, is a little too positive, and trenches upon the jurisdiction of the Coal Mines Regulation Act and those officials of the government whose duty it is to see that these Regulations are carried out. The implication that the desires of the workmen and the operators, based upon “greater efficiency and larger production” are all that is necessary to authorize a change in mine illumination was probably not intended, but some acknowledgement of the functions of the Department of Mines, and some stress upon the primary consideration of safety of life should have been made by a Commission that included no men with technical training in coal mining.

#### Coal Export Embargo.

Lifting of the coal export embargo is expected at the closing of St. Lawrence navigation. As the chief reason for imposing an embargo was to divert coal to St. Lawrence ports—which it has not done—there will be little reason to continue the prohibition on exports. Special consideration is being given by the Nova Scotia collieries to the requirements of Newfoundland. At the present time the coal production of Nova Scotia is not more than sufficient to fill the requirements of the coal consumption of the steel works and the domestic and manufacturing requirements of the Maritime Provinces and Newfoundland. There is a possibility, unless labor troubles intervene, that coal outputs will improve in October and continue at higher than Summer production rate until the Christmas holidays.

## THE TIN DEPOSITS OF VIRGINIA, U.S.A.

BY MARSHALL HANEY. #

Tin has been known to exist on Irish Creek in Rockbridge County, Va., since 1840. Professor Armstrong, of Washington College tested the tin ore from this locality in 1846 and stated that the specimens he tested contained tin and silver. At this time only a few prospect pits had been opened.

Since 1885, a great deal of prospecting has been done along the eastern edge of Rockbridge County parallel to the Blue Ridge Mountains from a few miles north of the James River into Nelson County. The most favorable portion of the area prospected is known as the Irish Creek area located in the northeastern corner of Rockbridge County about 7 miles from Vesuvius, a station on the Norfolk and Western Railway. A company was organized in 1883 for the purpose of working the tin deposits of this section and the first work was done in 1884. The Irish Creek area is about 4 miles long and 3 miles wide.

#### Occurrence of the Ore

The rocks of the Irish Creek area are crystalline of granitic composition; in places the rock is porphyritic, the felspar crystals measuring an inch or more in length. The granitic rock is much decayed at the surface forming a clayey mass about 50 feet thick. Dikes of diabase cut the granite rock in all directions and are frequently associated with the veins of tin ores. The tin ore is found in well defined quartz veins which cut the granite in all direction and have steep dips. The veins are banded and carry pyrite and arsenopyrite in addition to cassiterite. Generally the veins are not over one foot thick and the tin occurs as crystals nodules and stringers. The gangue is quartz with some pyrite and mica. The location and character of the veins have been proved by many openings usually very shallow. Many of the veins are rich. Numerous nodules of pure cassiterite, the size of a hen's egg are found. The Cash Mines are the best developed prospects in the area.

#### Mines.

Boston capitalists obtained control of The Cash Mines in 1890 and in 1891. They erected a \$50,000 mill to concentrate the ore and at the same time they had 300 tons of 3.3% ore on the dumps. They concentrated enough of this ore to get 250 pounds of concentrates which yielded 43% tin. The vein from which this ore was mined runs from 6 to 8 feet wide. The veins have been exposed in about 40 places and vary in width from a few inches to 8 feet and the ore runs from 1% to 13% metallic tin. This section offers superior advantages for profitable tin mining. The veins compare very favorably in character, extent thickness and richness in metallic tin to those of the famous Cornwall district, England.

# Consulting Mining Engineer, Geer, Greene Co., Va.

The use of the word “datal” in the Nova Scotia Royal Commission's Report is quite frequent. The word is of Old Country origin, and should actually be “day-tale”, the corrupted word “dataller” being applied in Britain to a man paid by the day. This use is altogether confined to mining operations. The term “day-paid” is to be preferred.

## British Columbia Letter

**Stewart, B. C.**

That the Salmon River Section of the Portland Canal Mining Division, northern British Columbia, has gone through its boom stage and that there now is in progress much development and prospecting that promises good results are statements credited to Dr. S. J. Schofield, Ph. D., late of the Canadian Geological Survey and now Professor of Geology with the University of British Columbia, who has returned after a season at the head of a Geological Party in that region. He has been engaged in the completion of work commenced in 1919 by J. J. O'Neill, who recently severed his connection with the Geological Survey of the Dominion. The results of Dr. Schofield's researches will be contained in a report to be issued by the Canadian Department of Mines in the course of a few months. He observes, however, that it was notable that much of the ore being taken out of this new and rich silver camp is of a complex character, containing considerable lead and zinc. The Premier Mine was the only property being worked at the time of Dr. Schofield's departure and on it a Mill was being constructed to handle low grade ore. Shipments will be made during the Winter, the snow providing a comparatively easy method of transportation over the thirteen mile trail to tidewater. There were employed about 150 men. Prospectors, he said, were getting good results in the Salmon River District and considerable attention was being devoted to the Bear River area. During the season the work of the geologists was interfered with to some extent by heavy rainfalls and about the time they left snow was beginning to appear on the surrounding hills.

The New Alaska Property is expected to be opened up this winter. It is stated in the Portland Canal District. The showing on this group of claims is good and it is announced that, with the necessary capital available, development will be carried forward briskly.

A small gang of men has been working recently on the property of the Fish Creek Mining Co., located on the Alaska side of the boundary, Salmon River District, Portland Canal. A four foot vein of galena has been uncovered, the values of which are such as to encourage the owners in the belief that the prospect will ultimately become one of the permanent shippers of the camp.

Work on the Silver Tip, Salmon River, has been closed down and there will be no permanent camp this winter. For some time a considerable force has been engaged in stripping and preliminary surface operations, the results of which are reported to have been satisfactory. Stringers of high grade silver have been disclosed and it is planned to continue development next year with a view to the establishment of greater veins with more promise of substantial returns.

**Prince Rupert, B. C.**

While passing through Prince Rupert a few days ago H. S. Munroe, General Manager of the Granby Consolidated Mining and Smelting Company, made the statement that his Company ships fifteen cars of copper a week and that there was no reason why this should

into all pass though the Pacific Coast Terminal of the Grand Trunk Pacific Railway. Mr. Munroe said that the Company would like to ship five or six cars a week by this route right away. The output of Anyox would be increased, it was asserted, as soon as the price of the metal went high enough to make it profitable. The low quotations of the present had resulted in a policy of manufacturing just sufficient to keep the plant in operation, the production at present being about 2,500,000 lbs. a month. With better market conditions this could be increased without difficulty to 3,500,000 lbs. a month.

Referring to the Granby Company's property, the Midas, situated near Valdez Peninsula, Alaska, Mr. Munroe said that this would be made productive as soon as there was a stronger demand for the metal. The ore was of high grade. It would be concentrated and shipped direct to the Tacoma Smelter:

In the course of a visit to Grand Forks, B. C. where the Granby Company has a smelter which has been inactive for the past several months and where, among the residents, there has been much speculation as to the Company's intentions, Mr. Munroe gave the municipal authorities the assurance that the smelter dam and lake will remain as at present at least for some time. Mr. Munroe inspected the mines at Phoenix as well as the plant there and at Grand Forks. He was reticent regarding the Company's mining policy in the Boundary, leaving the impression that not much could be expected while the copper market remained weak but that ultimately it was possible that a concentrator would be erected somewhere in that section of the Province.

**Trail, B. C.**

The Nettle L. Mine, of the Lardeau, and the Payne, the latter being a former large producer of the Slocan Camp, figure among the shippers to the Trail Smelter, Canadian Consolidated Mining and Smelting Co., during the week ended September 7, 1920. The total ore receipts at the Smelter for that week total 7718 tons, making the aggregate for the year up to that date 224,367 tons.

**Kaslo, B. C.**

While there has been comparatively little development on new properties in the Slocan Camp in recent months lessees, working on well-known mines for long inactive are getting good results in many cases. Working on No. 1 Level of the Washington Mine, near the Rambler-Cariboo lessees recently sent a carload of galena ore over the Rambler-Cariboo tramway which had been taken out in three weeks and which averaged more than 150 ounces of silver to the ton and 65 per cent. lead. The indications were such as to lead to the confident belief that another carload can be taken out in a similar period. At the same time lessees on the No. 3 Level of the Rambler-Cariboo are said to be working in rich ore. A part of the Whitewater Mine also is being worked under lease and it is authentically reported that the operators have shipped two carloads of ore from a newly uncovered body which has brought large returns. This work is close to the Wellington Mine where No. 2 tunnel level is being reopened by the Standard Silver-Lead Mining Co. Labor conditions are improving in this District, applications being received for work and a considerable number of men being granted employment.

The Payne Mine, one of the first locations in the Sloean, is under bond and lease to a Seattle Mining Syndicate. A long lower cross tunnel opens the property to a depth of 1500 feet but little exploration of the vein at that level has been attempted. Above No. 5 Level the mine has been largely worked out but below there is a large area that may be expected to contain ore. The mine showed an oreshoot 1200 feet long in the early days extending down to the fifth level from the surface.

#### Hope, B. C.

The re-opening of the Emancipation Mine, near Hope, is assured. Plant to the value of \$20,000 has been installed and it is expected that the first shipment of ore will be made next month. Dr. E. T. Hodge, the manager, states that the ore is of high grade, running up to \$303 a ton. The vein is from 5 to 25 feet wide and proven over the length of two claims.

#### Vancouver, B. C.

All phases of the mining industry of British Columbia were represented in an exhibit presented by the B. C. Chamber of Mines at the recent Vancouver Exhibition. There was copper ore from the Britannia and Granby Mines as well as specimens of the concentrates and the tailings. Ores and concentrates also were present from the Surf Inlet Mine while the Dolly Varden, of Alice Arm, was represented by fine samples of both native and ruby silver. Specimens of copper ore from Spence's Bridge section and samples of the ores of the Kootenay were shown. There also were a number of beautiful examples of British Columbia's product in rough and polished marble.

Accounts are being received regarding activities in the Mayo District, the new silver camp near Dawson, Y.T., from miners and prospectors who are coming south for the winter months. They say that Mayo City, 150 miles south-east of Dawson, on the Stewart River, bids fair to become a "city of tents" because of the rush to that point of miners intent of making locations. The Guggenheim interests, it is stated, have taken in large quantities of plant and supplies and are engaged in operations in Keno Hill, it being planned to take out 3,000 tons of ore this winter. On Lookout Mountain the Yukon Silver Lead Co. are 450 feet down on the vein with a large body of concentrating ore in sight. It is stated that the old prospectors, who went out of the country during the war, are back and are busily engaged in their work and in staking the promising mineral showings.

#### PROFESSOR RUSSELL'S NEW APPOINTMENT.

Mr. J. W. Russell, M.A., of the staff of Woodstock College and manager of Oxford Cobalt Mining Company has been appointed professor of geology at the Western University, London. Mr. Russell is an honor graduate of McMaster University and was a graduate student at Harvard. He taught for a couple of years in McMaster University and has also taught in a number of collegiate institutes in Ontario. For a number of years he has been engaged in mining in Cobalt. In spite of his activity in the practical field, however Professor Russell has been in constant touch with educational work. His new appointment will in no way interfere with his duties as manager of the Oxford Cobalt mine.

#### JOSEPH PAXON IDDINGS.

##### A Profound Student of Petrology.

In a recent issue of "Science" the death is announced, at the comparatively early age of 63, of Joseph Paxon Iddings, formerly professor of petrology in the University of Chicago and at one time a geologist of the U. S. Geological Survey. Mr. Iddings became a member of the staff in Chicago in 1892, at the time of the organization of that geological department which has had such a great influence on the science through its students and the writings and research work of the members of the staff. The work of Chamberlin, Salisbury, Penrose and Iddings, all original members of the staff, has done, at least, as much, it is safe to say, to advance the science during the last thirty years as that of any other four men throughout the world.

During the closing decades of the last century, petrology, or as it was more commonly called petrography, was probably the most popular branch of geology among post-graduate students. The microscopic study of rocks in thin sections was really founded by an Englishman, Sorby, but like certain other sciences was developed in Germany. Heidelberg and Leipzig attracted practically all students of petrography from North America until G. H. Williams began his distinguished career as teacher and investigator on the staff of Johns Hopkins University, ending with his untimely death in 1894. Iddings' professorial work in Chicago continued until 1908. Through their teaching Williams and Iddings exerted a profound influence on petrography. After they took up professorial work it was no longer necessary to leave North America for the best instruction obtainable in this specialized subject.

Iddings' epoch-making work on the rocks of the Yellowstone National Park and his books on Rock Minerals and on Igneous Rocks will serve as lasting memorials to his too brief career. The passing of his contemporaries at early ages, George H. Williams, J. Francis Williams and, more recently, L. V. Pirsson, deprived petrography of profound students and investigators.

The Quantitative Classification of Igneous Rocks, the joint production of Cross, Iddings, Pirsson and Washington, has done much to make petrography a more exact science.

The igneous rocks have come to be recognized as the most important factors in the genesis of metalliferous deposits. Much of the research work of men like Iddings might appear to be of an abstract or academic nature, but, as in the case of other sciences, the study of the pure science has had a far reaching effect on the applied.—W. G. M.

Toronto, September 23rd.

The Nova Scotia miners request of the companies that when two men are compelled to do the work of three men that they receive time and a half. The operators reply "two men cannot do the work of three men". Nevertheless it has been done. Conversely it may be noted that when enlistments took away the younger men around the mines, it often took two men to do a boy's work, and this does not reflect on the men. Agility and youth are requisites in some phases of mine employment.

## Northern Ontario Letter

### THE SILVER MINES.

#### The Cobalt Field.

A quite serious shortage of labor exists in the mines of Cobalt, especially among the unskilled workers. Muckers are decidedly scarce, and working forces in some instances are more than ten per cent below requirements. Added to this adverse factor is the recent increase in freight rates, the two combining to create a situation which is believed will surely reflect upon the cost of producing silver.

Offsetting the adverse factors is the continued high price of silver, quotations ranging around 94 cents an ounce in New York funds, and thus working out at about \$1.04 an ounce in Canadian currency. This leaves all the leading mines with a safe margin of net profit.

The Nipissing, Coniagas and Kerr Lake are believed to be holding costs down to less than 50 cents an ounce, while at such mines as the McKinley-Darragh cost is understood to have risen to about 80 cents, with an even higher cost at the La Rose.

While these costs are very high as compared with earlier years, yet the price of silver is actually about 50 cents an ounce higher than at the time the low costs ruled. This removes any cause for alarm in this respect.

On October 31st, the Coniagas mine will close another favorable fiscal year. An average of about 500 tons of ore is being treated daily, about 100 tons of which is being treated by cyanide process in the leased equipment in the Buffalo mill. Mill heads are understood to average between 8 and 10 ounces of silver to the ton, as compared with 13.07 during the previous year, and this is believed to indicate an increase in costs to not far under 50 cents an ounce as compared with between 42 and 43 last year. As regards the next fiscal year, the mine will be equipped to handle an extra 100 tons of ore daily, and in this way the output is expected to be well maintained.

A meeting of the shareholders of the Temiskaming Mining Company has been called for October 7th, for the purpose of considering a proposal to join the McIntyre-Porcupine Mines in carrying out the purchase of coal lands in Alberta. The Blue Diamond Coal Mines, Ltd., of Brule, Alta., is capitalized at \$1,500,000, while the Canadian Coal Fields, Ltd., is capitalized at 10,000,000. The deal in which the Temiskaming shareholders are asked to participate involves both properties.

During the work of excavating for a foundation for the installation of a crusher at the dumps of the Kerr Lake mine, a narrow vein has been opened up in which native silver occurs. The vein is one which is believed to have been cut underground at a depth of 90 feet, but at this point it did not contain silver. Despite the over-burden of about eight feet of sand and gravel, the vein will be further opened up at surface.

Action has been dismissed in connection with the application of a shareholder of the Bailey Mine to order the company to make reasonable provision for transfer of shares to beneficial owners thereof, and for their registration as shareholders prior to the general meeting of shareholders to be called pursuant to order of 28th June, last.

The McKinley-Darragh is experiencing difficulty to earn its dividend requirements at the rate of 3 p.c. quarterly. However, with net profits not far below requirements of a little over \$67,000 quarterly, and with a surplus at the beginning of the year amounting to over \$365,000, it is generally believed the surplus will be drawn upon to the extent necessary to pay the present rate for considerable time. Drawing on this surplus to the extent of one full quarter for each year, it would last five years.

Two carloads of medium-grade ore have been shipped from the old Ruby Silver mine situated in the south-eastern part of the township of Bucke. The property is being worked by the McDonald Syndicate, of which the following local men are members: Kenneth McDonald and E. J. McMillen, Haileybury; Chas. Johns and E. Lapointe, North Cobalt, and C. H. Moore and J. J. Anderson of Cobalt.

The vein recently encountered at the 350-ft. level of the Keeley Silver Mines in South Lorrain is said to be that known as No. 9. It is about 14 inches in width and contains from 200 to 400 ounces of silver to the ton at the point where cut. The cross-cut at this level has about 35 feet to go before reaching the point where the "Beaver Lake" vein is expected to be encountered. On an upper level of the last mentioned vein, an ore about 170 feet in length has been opened up in which high milling values, said to average over 40 ounces to the ton, occur over a width of from three to four feet. The 20-stamp mill is expected to be ready for operation on the Keeley by the end of November.

Because of the success on the Keeley, English interests are paying considerable attention to mining prospects in South Lorrain, and the opinion is expressed that aggressive work may lead to the development of profitable mines in that area.

#### Elk Lake Area.

A summary of mining news from Elk Lake is as follows:

Silver has been encountered on the recently opened Regent Mines, in the township of James. The property is being equipped with camps and with a steam-driven mining plant.

Members of a Cleveland Syndicate are engaged in examining various properties in this area with a view to obtaining working options, and two or three such deals are pending.

The seizure of ore of the Reeves-Dobie mine in course of shipment, as reported previously in these columns, consisted of 213 bags of concentrates, said to be valued at about \$100 a bag, and followed a judgment against the company for wages and an assignment.

Encouraging gold assays have been obtained from a vein discovered in the township of Bryce, and Elk Lake prospectors have staked a number of claims in that district. Mr. Burrows, Ontario Government geologist, has concluded a visit to that area.

#### Ore Statement.

Following is a statement of ore shipments over the T. & N. O. Ry, for the month ending August 31st. In tons of 2,000 lbs.

SILVER ORE.	
	Tons.
Cobalt Proper	
1. Coniagas . . . . .	66.10
2. Dominion Reduction . . . . .	33.00
3. Hudson Bay . . . . .	30.13
4. LaRose . . . . .	85.18
5. McKinley-Darragh . . . . .	210.19

6. Nipissing . . . . .	898.99
7. Northern Customs . . . . .	32.30
8. O'Brien . . . . .	64.08
	1,419.97

The above shipments were made to the following Companies :

Canada	
Deloro Smelting & Reduction Co. Deloro	
Marmora . . . . .	1,207.62
Coniagas Reduction Co., Thorold . . . . .	32.50
United States.

August, 4th. Lowest . . . . .	92.750
Average . . . . .	96.168

**THE GOLD MINES.**

**The Porcupine District.**

After having been harassed by an inadequate supply of labor, with pleas for higher wages, as well as steadily mounting costs of material and supplies, the gold mining industry of Northern Ontario seems about to reap the benefit of a favorable change in conditions. News despatches which at this date carry the information that substantial reductions are being made in the cost of such articles as automobiles, cotton, leather, corn, etc., are pointed to as marking the commencement of a re-adjustment. These same despatches tell about large numbers of men being laid off, and in this direction lies the hope that an abundant supply of labor will be available at the mines before the coming winter passes.

A full labor supply in the Poreupine field would add greatly to the production of gold. Milling equipment lying idle, and ore blocked out and ready to mine leaves it only necessary to procure the desired number of men in order to add about fifty per cent to the current production.

Ore being drawn from stopes on the Dome Mines is running higher than the earlier estimates showed. Some of this ore had previously been estimated to contain only a little over \$4 to the ton, while actual recovery now shows a gold content of over \$6 to the ton. The mill continues to treat about 1,000 tons of ore daily.

Among the most interesting features in connection with the annual statement of the McIntyre-Poreupine mine may be noted an increase of over 72,000 tons in the amount of broken ore, as well as the increase of about \$1,000,000 in ore reserves and the tendency of the gold content to increase at depth. Perhaps the most important statement made by the general manager R. J. Ennis is that having to do with the discovery of the eastern continuation of No. 84 orebody of the Hollinger, in which Mr. Ennis says:

“Drill hole 180 put out S. 20 degrees W. at an angle of 15 degrees from the 1500-ft level intersected an ore body 530 feet from the main shaft at a depth of 1610 feet from surface. 35 feet of core assayed \$11.10. Hole 184 was then drill from the 1375-ft level, at an angle of 5 degrees, bearing S.20 degrees E. At 480 feet this

hole intersected the same ore body at a depth of 1385 feet from the surface — 26 feet of the core assayed \$14.10.

“Cross-cuts are being driven south from the 1375 and 1500-ft levels to open up this ore body and it is our opinion that the values and widths shown by the drill holes will be confirmed. From the very favorable location of the ore body, it is expected to develop a large tonnage of high-grade milling-ore.”

There is some promise of a resumption of activity in the western part of the township of Deloro and the eastern part of Odgen. The leading property in that section of the Porcupine area is the Hayden-Porcupine Mines, where a mining plant was installed some years ago, and several hundred feet of underground work driven with promising results. Negotiations now involve property in this section and indicate the possibility of American capital becoming interested.

**The Kirkland Lake Field.**

Properties in the township of Lebel, lying to the east of the producing territory continue to stand up well under aggressive work. The number of discoveries made during recent months in this area exceeds any other gold-bearing district in the North during this period and it only remains to be seen how important these finds are. Very favorable reports are coming from the Wood-Kirkland property where gold occurs in a vein measuring about ten feet in width.

The annual meeting of the Orr Gold Mines has been called for Sept. 30th. Business to be brought before the meeting includes the question of proceeding with negotiations in connection with a proposed merger between the Kirkland Lake and the Teck-Hughes Gold Mines. As regards the status of the Orr, president Conrad E. Wettlaufer says: “Since my election on July 15th, 1920, money has been procured and the judgment against, and the debts of the Company have been paid, and an engineer, Mr. J. C. Houston, has been employed. He with his staff have de-watered the mine, have done considerable exploration work, and have extended the cross-cut and cut a vein supposed to be No 1. vein of the Lake Shore mine. This vein is about five feet wide and well mineralized and promises well for future development.”

As regards the issue of 800,000 treasury shares of the Orr Gold Mines to Hamilton B. Wills, the Toronto broker, nothing is said in the notice of annual meeting. However, the minority interests of the Orr are taking the necessary legal steps and are endeavoring to prevent the issue.

The affairs of the Tough-Oakes are still uncertain. Since early last Spring, officials have been expecting matters to be adjusted in so as permit resumption of work, but unforeseen delays have occurred from time to time, and the date of opening now is generally regarded locally as a “guess” at best. In view of the extremely high cost of heating the scattered mine buildings of the Tough-Oakes and the probable difficulty to be encountered in gathering a force of men, one of these guesses is that work may not be undertaken in a general way until next Spring.

Surveyors are at work at Indian Chutes on the Montreal River, near Fort Matachewan, completing a survey of the water power. Provided conditions are favorable, it is reported work may be undertaken so as to have a plant installed by one year from now.

## NORTHERN ONTARIO URGES DEVELOPMENT OF WATER POWER.

The approach of winter in Northern Ontario, the high price of coal, and the great difficulty to procure this necessity at any price has given rise again to serious discussion of devising some scheme that would make it possible to utilize the vast amount of potent heat and power going to waste in the many great waterfalls throughout these northern regions.

A serious obstacle at this time is the exceedingly high cost of material required in connection with installing power plants. The obstacle is a formidable one on account of the largest item to be charged against hydro-electric plants, once they are erected, being interest on the capital invested.

After discussing the problem with a great many experts, and after making inquiry regarding local opinion, it is obvious that any movement calculated to utilize this great natural resource would meet with general approval. And singularly enough, the Temiskaming and Northern Ontario Railway Commission is pointed to as the logical body to launch the project and to place Northern Ontario hydro development under the management of a thoroughly competent expert.

Mention of the T. & N. O. Ry. in this connection is based upon two reasons, one of which is the fact that the electrification of the 300 miles or so of this Government owned railway is considered reasonably certain within the next few years, and the other is the desirability of valuable co-operation between the railway which serves the district and the organization which will direct the hydro-electric developments.

The development of high-tension electric transmission has made hydro-electric energy the most efficient form of power yet devised. The statistics which show American railways are employing one-third of their rolling stock in hauling coal is pointed to as a lesson for Canadians, and offers fair warning in this country where the rigors of a northern climate are bound to cause a repetition of the American experience and where the wide stretches over which no coal deposits occur convey the threat of even more dire consequence.

Although no coal deposits occur in the province of Ontario, the estimated potential power running to waste in the rivers of the province is approximately 7,000,000 h.p., of which only 985,000 h.p. has so far been developed. These facts all promise to be brought into more or less prominence owing to the discussion now developing in Northern Ontario.

## USES IN THE UNITED STATES FOR CANADIAN FELSPAR.

By KIRBY THOMAS, New York.

The resumption of activities in the American plants, engaged in the production of clay products in the form of pottery, crockery, sanitary enamel ware and surfaced tile for building, has led to increased demand for felspar, which is used as a flux in the glaze. This increased demand is being supplied in large part from Ontario, where a number of old mines have been reopened and new ones developed recently. The Canadian product, which is imported without duty, is in competition with the domestic supply, which now comes largely from the southern Appalachian region. The

chief consuming centers for the product are in the Ohio valley district, and therefore the imported felspar has about an even break as to freight rates with the domestic product. Many of the Canadian properties are American owned and operated. There is increased activity in the demand and development for felspar properties in the south, particularly in the Carolina region accessible to cheap railroad transport to northern points. A part of the supply for eastern plants comes from New York state and Maine. The quoted prices of crude felspar range from \$8 to \$18 per gross ton at points of production f.o.b., depending upon the grade and quality, particularly the potash content of the product. Most of the Canadian product is imported crude, but the domestic production is quite largely ground at the mines and brings a correspondingly higher price.

The attempts to utilize felspar as a source of potash which were made during the war when potash was at a high price, owing to the exclusion of the German supply, have quite generally been abandoned, having been a failure from a commercial standpoint. This has left the chief market for felspar as before the War in the field of accessories to the varied clay operations, and as flux. Some felspar is used in glass making.

There are no imports of this material regularly from other countries than Canada.

## A SINKING RECORD.

Thirty-five days for the complete sinking and timbering a 263 ft. shaft, is a recent achievement of the Johnson City Coal Co., at its No. 2 mine at Johnson City, Illinois. The shaft is 10 ft. 6 in. by 15 ft. 6 in. inside and is divided into two compartments. Of these the manway is 4 ft. wide and the air shaft proper is 11 ft. wide. A 6 in. wall is placed between these compartments. A concrete lining extends down the shaft for a distance of 22 ft. from the surface and rests upon solid rock. This lining is 12 in. thick and is reinforced vertically with 1-2 in. rods on 12 in. centres and horizontally on 8 in. centres. The foot of the shaft also is concrete lined for a distance of 30 ft. upward from the top of the coal bed. Footing is made upon the limestone underlying the coal. The lining here also is 12 in. thick and is reinforced in exactly the same way as the lining at the top. The shaft timbers are 6 in. by 6 in. long leaf yellow pine treated with carbolineum. Bearing sets are 12 in. by 12 in. yellow pine resting on a 5 in. ledge of rock throughout their entire length and set into the rock for 2 ft. at their ends. The partition between the manway and air shaft is of 4 in. yellow pine extending between 4 in. by 6 in. wall plates. The shaft walls between top and bottom concrete linings are covered with expanded metal lath upon which has been placed 2 in. of gunite.

On August 16, 1919, shaft sinking was commenced and three shifts per day were kept at work continuously thereafter. Work was also begun from underground in driving the shaft upward, a few men being kept steadily at this work. This upward driving finally attained a height of 60 ft. On September 17, the two portions of the shaft (upper and lower) were joined by sump shots in the upper section. On September 20 the two places were completely connected and timbered. The total distance sunk was 263 ft., and the time consumed was 35 days.

**ASBESTOS PRICES.**

Prices Current—August 1920. (From "Asbestos").

Average market prices paid by consumers for average quantity, quality and freight haul from producer, were about as follows:

Asbestos Air Cell Covering, 4 Ply	35% to 40% off
" Air Cell Paper in rolls . . .	\$10.00 to \$12.00
" Air Cell Paper	
" Cement . . . . .	\$1.75 to \$3.00 cwt.
" Cloths, 10s Commercial . . .	\$1.50 to \$2.00 lb.
" Listings and Tapes . . .	\$1.75 to \$1.90 lb.
" Millboard . . . . .	\$12.00 to \$18.00 cwt.
" Packing, Steam, High Pressure	\$1.25 to \$2.00 lb.
" Packing Sheet . . . . .	\$1.00 to \$1.50 lb.
" Wick and Rope . . . . .	.65 to \$1.00 lb.
" Paper, Commercial . . .	\$12.00 to \$18.00 cwt.
" Paper and Millboard	
Special . . . . .	\$17.00 to \$35.00 cwt.
" Yarns, 10s Commercial . .	\$1.35 to \$1.90 lb.
" Yarn and Cloth, Special . .	\$2.00 to \$6.00 lb.

The foregoing authority also notes there is offered for sale 15 tons of Jacobs No. 1 crude, pre-war grade, at a price of \$2,300 per ton f.o.b. point of shipment, terms 2-10-30 or \$2,200 per ton. Material is in the United States.

Production at Canadian mines is below demand, and prices are likely to advance rather than to decline for crude asbestos. Asbestos handlers lay much stress on amount of low-grade cloths needed for renewal of brake linings on freight cars.

**TORONTO COAL QUOTATIONS.**

Toronto, Sept. 30.—Coal is not moving any more freely and the shortage continues. The market is quiet and last week's shortage of cars affected shipments to this point. Hard coal is quoted at from \$8.00 to \$16.00 gross tons at the mines. American funds: mine run \$14.00 to \$15.00 f.o.b. Toronto and smokeless coal \$14.50 to \$16.00.

**GRANBY CONSOLIDATED.**

**Making About \$60,000 Profit a Month.**

It is understood that Granby Consolidated Mining, Smelting and Power Co., has been making a net profit of \$60,000 a month after all charges, bond interest and extraordinary items.

Copper costs at Anyox have been running close to 10 1/2 cents a pound during the past few months. The increased freight rate, effective since August 26, will be an added burden to the company, as its smelter product traverses the full width of the continent and must pay a higher toll both in Canada and the United States.

Until the metal market improves, the copper producers must pay the higher freight charges, but eventually the producers anticipate a sufficient advance in copper to offset fully the new levy.

Few, if any, copper companies have a longer haul than Granby from smelter to refinery, and the increased freight rates are heavier in proportion to its production than any other properties on the American continent.—"Boston News Bureau".

# ROLLER BEARING MINE CARS

We make any type of Mine Car desired by the buyer. We also design and build special cars, if none of the standard types will suit

Let our Engineering Department help you reduce your costs and increase your output and general efficiency.

This view shows the oil or grease retaining cap removed to show the Roller Bearings supplied on our Mine Cars.

Same car as shown above, but in Dumping position.

END DUMP  
MINE CARS

This is one of our many designs. Our catalog shows others—End Dump, Side Dump, and Rotary Dump. We make this car any size or capacity you want.

### “ ANCHADURA ”. A MODERN SECONDARY SOLUTION CONCENTRATE.

An interesting mineral phenomenon is mentioned in the recent report by Mr. Frank B. Powell on the property of the Colombian Mining and Exploration Company. According to Mr. Powell, the mine has been worked for over 100 years nearly continuously, and he goes on to describe the much-talked-of “anchadura”. “This is a product”, he writes, “which deposits in, and fills in, most of the old stopes throughout the mine. In some instances the whole stope for 20 ft. wide is filled. Its occurrence in such great quantities as are apparent in this mine is hard to account for, but the fact remains that, in practically every old stope that has been worked out and left without a circulation of air, this anchadura is deposited.

“In every instance where sampled it showed values ranging from 8s to 48s, the lower values being in the newly-deposited product. About 30 p.c. of the values are in free gold, the balance in pyrites. The free gold is all crystalline and of secondary occurrence. There are approximately 300,000 tons of this material in the old stopes of the mine, which is worth about 24s per ton.” The only really remarkable thing about this “anchadura” is the quantity. It is very evidently a secondary formation, brought about by the pressure of the surrounding rocks squeezing out siliceous matter in conjunction with water.

There are two ways in which mineralised matter is generally deposited, either by its being held in solu-

tion in water descending or in liquid ascending. If the two bodies meet the contact of cold and hot temperatures usually brings about a sedimentation of the mineral matter which may be held in solution in either of the waters, and naturally such sediment would be carried forward in the direction in which the water can escape. The fact that the newer deposits of anchadura are less valuable than the older deposits tends to show that the values are deposited by water, which evaporates or escapes, and, of course, the longer the siliceous or disintegrated matter has been subjected to the influence of such water, which apparently carries gold in solution, the richer it would become.

The existence of what is commonly called secondary formations is not uncommon in any mine, where the plane of the rocks favours the squeezing out either by pressure or water action of disintegrated material. In the Rand the formation of such secondary formations is, I am informed, not by any means an uncommon occurrence, although it is rare that such formation carries payable values.

Here we have a very ancient mine, where the process has been going on for the greater part of a century, and where there is evidently a water saturation, carrying gold in solution, which finds an outlet in the old workings, carrying with it sand, pulverised rock, etc., in which it leaves the gold as it evaporates or is gradually drained away. As I have mentioned, the quantity is remarkable; that is all.—W. I. L. In “Financier and Bullionist.”

## PIONEERS OF THE YUKON.

### An Address by the Right Rev. Bishop Stringer.

This year's celebration of the twenty-fourth anniversary of the discovery of gold in the Klondyke, held at Dawson City under the auspices of the Yukon Order of Pioneers, was especially notable because there arrived at that historic centre on the same day the aviators engaged in a flight from New York to Nome, Alaska, and return and by reason of an exceptionally able address by Right Reverend Bishop I. O. Stringer, who is well-known and highly respected among Yukon pioneers.

Bishop Stringer's speech so thoroughly sketches the history of the north country and so interprets the spirit of the present residents of that territory that it is well worth publication in extenso.

He said :

#### WORK OF PIONEERS.

"For many years I had hoped to be present at a Discovery Day celebration, but this is the first time that my duties allowed me to be in Dawson on the seventeenth of August. It seems, therefore, strange that I should be asked to give an address of welcome on this occasion, and I know many of you who are present could more appropriately perform the task. However, it may be said truthfully that I represent a succession of pioneers older than any other continuous institution in the country. And most gladly do I respond to the kind invitation of the president and other officers of the Y. O. O. P., and only hope that the few poor remarks I shall make may be taken to show, even in an inadequate manner, my intense interest in all that concerns the people of this great northern land, and especially in the pioneers who blazed the trails and whose memories we shall always revere. The majority of those present are as much at home here as I am and need no words of welcome. To those who may be strangers or visitors I extend to them, on behalf of the Y. O. O. P., the heartiest kind of welcome that human beings can give. We wish all to feel at home: we wish all to learn of our short history and to identify themselves with the town and the country and to stay as long as possible with us. And we have a great history also.

#### HISTORIC POINTS.

"I have recently visited Fort Yukon and the Porcupine River, down which J. Bell made his first journey, coming from the Mackenzie River side in 1846. The next year Murray established a post at Fort Yukon. In 1843 Campbell had come down the Pelly to the river which he named Lewes and in 1848 he established a post which he named Fort Selkirk. Thus within a year of each other these two trading posts were established on the same river 550 miles apart by the same Hudson's Bay Company, and no one then knew that they were on the same water course.

"Only in 1850, when Campbell descended the river from Fort Selkirk to Fort Yukon, did anyone know that the river was one and the same. This explains why the river above Selkirk was named Lewes, after the chief factor of the Hudson's Bay Company, while the river from Fort Selkirk to St. Michael retained the Indian Name, "Yukon" which explained the old name "Kwikipak" (Eskimo for big river), by which the river

was known by the old Russian traders. Campbell, however, spoke of the Pelly as continuing to Fort Yukon. In one respect it may be said that the history of this part of the country began in 1850 so far as the white man is concerned. In that year Campbell came down the river, being the first white man, so far as we know, who passed the mouth of the Klondyke or Thohndik.

#### EARLY GOLD DISCOVERY.

"The sacking and looting of Fort Selkirk by the Chilkat Indians in 1852 broke the connection for the time being between Fort Selkirk and Fort Yukon. For the following twenty or thirty years any information regarding the interior was obtained chiefly through the post at Fort Yukon. In the early sixties gold was known to exist in the Yukon valley.

"The other day I met a miner who was taking out gold on the tributary of Birch Creek where Archdeacon McDonald found some nuggets in 1863, just fifty-seven years ago.

"In the late sixties and seventies a few men began to prospect in various parts of the country. These were men who for the most part were traders and trappers first and prospectors afterwards. Then in the 'eighties pioneers came into the Yukon valley by various routes, chiefly over the Chilcoot and White Passes and by way of the Hootalinqua. The Fortymile and Circle Camps were established.

And then we all know the story of 1896, when, on the seventeenth of August, just twenty-four years ago today, the discovery of gold on the Bonanza opened up a new era in the history of this country. Within a year thousands of gold seekers were on their way to this hitherto unknown and unnoticed region. Many difficulties were encountered and much suffering endured in that great rush to the North. In spite of all obstacles many found their way to this land which was then considered very remote, and many of the early pioneers are with us yet. Some have come and gone, and some have made the last march along the trail in this life and are laid to their long rest in this land. Others have remained on and are living witnesses of the attractions and allurements of this northern country.

#### TEST OF HUMAN CAPACITY.

"All honor to the pioneer. We feel a thrill of pride at the thought of the perseverance and endurance and optimism of the trail blazers of bygone days. The experience of the war proves that the present generation shows no deterioration. That men and women are capable of doing great things now as in past ages. It needs only the occasion and demand to bring out the greatest attributes of mankind. So also the qualities that go to make up the pioneer are not extinct. We have men and women in his country who are as capable and resourceful as the pioneers of older days. The occasion only is needed to prove what they can do. The true pioneer will be prepared to take his place when there is some special call on his energies and resources. But also he has a duty to perform in everyday life.

"This is the second Discovery Day celebration since the conclusion of the war. As time goes on we are apt to lose sight of its lessons. This time of peace is a day of opportunity. The future is before us. We possess a land full of resources and boundless possibilities. Who would have thought in the days when the Harpers and McQuestens and Ladues and Mayos, and, later, the O'Briens, and many others whom we could name, wandered over this virgin land, seeking for gold, that the time would come as it did when within eight years, 1898-1905, a hundred millions in gold would have been taken from the tributaries of the Klondyke, mostly by pri-

mitive methods. When we shall have another Klondike no one can tell, but the possibilities are enormous.

#### MORE THAN GOLD.

With gold and other metals scattered all over this country it is altogether all over this country probable and reasonable to expect that other great strikes should be made. Just where the next great camp may be we do not know. We hope it will be Mayo, but, wherever it is, I believe it will be only the forerunner of other discoveries in days to come. Then we have the other resources, the fur and the products of the forests and streams and the land. In giving lectures to the soldiers in Belgium and France on Canadian citizenship, whenever I noticed the instant and earnest attention by telling of the resources of our great country, and especially by dwelling on the possibilities of the North. We take it as a matter of course that this district can produce potatoes and other vegetables successfully and that certain grains can be ripened, but many people outside are still astonished to hear this and some will scarcely credit it. Yet I believe we are only at the beginning of things agricultural.

"I took forward also to the time when the great barren lands of the North will teem with reindeer and other animals suited to the conditions of the country and climate. Whatever success this country may encounter in the future it will be largely due to the pioneers who led the way and who will still carry on in spite of all obstacles. Some, also, have passed away in the midst of the struggle, but their example is an inspiration to others. May every pioneer who is with us today have the desire of his heart fulfilled and may peace and prosperity be his to the end.

#### A PROPHECY.

"How appropriate it is that at this celebration of pioneers we should now be about to welcome the pioneers of air who alight in our midst for the first time. This feat is prophetic of the time when we shall no longer be isolated from what we call the outside world, when the difficulties of navigation in air will be overcome and when the words "outside" and "inside" will have lost their meaning and when we shall be connected with the world generally by steel on land and by wings through the air. It is an epochal day for Yukon and for the North generally. All honor to the birdmen. May success crown their efforts. We look backward with pride and satisfaction in contemplation of the accomplishments of the pioneer and we look forward with hope and courage and then we endeavor to perform the task of today with the desire of doing our duty to ourselves, our fellowmen, our country and our Maker.

"I referred just now to the lessons of the war which should not be forgotten. We think of the terrible sacrifice during the war—the suffering, the misery incalculable continuing to the present, and we ask, "Will this be in vain?" We think of friends whose bodies are lying in Flanders and France. We know there are many and difficult problems to be solved in the world. We need the spirit of true pioneers if we would take out part in everything relating to the upbuilding of our community and country and in the betterment of the affairs of the world. And as we march along the trail of life let us keep the final camp in view, taking our stand for all that is right, and thus help to make our home, our country and the world the better for our presence and our influence—pioneers—leaders in all that is good and noble in life."

The Royal Commission on Coal Mining Operations in Nova Scotia and New Brunswick states: "The Commission has noted that the output per man per day in the United States is greatly in excess of that produced in the Nova Scotia coalfields, and have also noted that the cost of production per ton is much less in the United States than Nova Scotia. Under these circumstances it takes occasion to remark that in a competitive market the U. S. coal operators have an advantage over the N. S. operators."

It would have been interesting had the Commission noted the reasons for this difference in productive ability. It is much less a matter of individual manual productivity, than of physical conditions and statutory mine supervision, nor would an exhaustive analysis be unfavorable either to the Nova Scotian miner or the Nova Scotian mining engineer.

# WILEY BOOKS

By G. Montague Butler, E.M.,

Dean, College of Mines and Engineering,  
University of Arizona.

## A Pocket Handbook of Minerals

Designed for Use in the Field or Classroom,  
with Little Reference to Chemical Tests.

All the details are given which may be needed to identify most of the minerals which mining men, students, or collectors are apt to encounter.

311 pages, 4 by 6 $\frac{3}{4}$ —89 figures—flexibly bound—price, \$2.50 post paid.

## Pocket Handbook of Blowpipe Analysis

With the proper instruments and this book in his hands, anyone will be able to decide what each mineral under examination contains.

80 pages, 4 by 6 $\frac{3}{4}$ —cloth bound, \$1.00 postpaid.

## Geometrical Crystallography

This book teaches the reader to recognize crystal forms, and especially systems, at sight, with the use of few, if any, instruments.

155 pages, 4 by 6 $\frac{3}{4}$ —107 figures—cloth bound, \$1.50 postpaid.

Also Issued in Combined Form.

## Minerals, Blowpipe Analysis and Geometrical Crystallography

For the benefit of those who prefer these three valuable books under one cover, for additional convenience, this volume has been brought out at an appreciably reduced price.

546 pages, 4 by 6 $\frac{3}{4}$ —196 figures—flexibly bound, \$3.50 postpaid.

Examine these books—prove their worth.

## INDUSTRIAL LEADERSHIP AND THE MANAGER.

The "Atlantic Monthly" for October contains an unusual essay by Mr. Sam A. Lewisohn, a well-known figure in the mining industry of the United States, which is interesting to members of the Canadian Institute of Mining and Metallurgy because of the approving quotation of portions of the notable paper which Mr. C. V. Corless read at the last Montreal meeting of the Institute. Mr. Corless's remarks are quoted as being "rather exceptional".

Mr. Lewisohn and Mr. Corless are at one in pointing out that the severe technical studies and undivided consideration of the material sciences which the technical graduate experiences in the course of his training tend to dehumanize him, and serve to unfit him for handling human relations unless there has been brought to bear some neutralizing influence.

It is pointed out that industrial leadership is more and more developing upon technical graduates, who as the managers of works, forming possibly one link in the chain of operations of a vast corporation, come into contact with men, as well as things, and in these days tend to supersede the former owner-manager. The change is not altogether for the worse, even in the matter of human relations, because as Mr. Lewisohn points out, the owner-manager, while possibly a man of the world, often was a person of dogmatic and biased viewpoint, whereas "the scientific approach of the engineer is unfriendly to intolerance." Therefore it is concluded that "engineer-managers who have combined with their knowledge of the material sciences a scientific study of human relations are usually superior to other industrial managers in their approach".

Mr. Lewisohn concludes by stating that the works manager is the person who is in the position of continuous administrative responsibility, and to him we must look primarily for constructive development in the everyday problems of our industrial life. "Whether he be engineer or layman, he should be properly trained to assume the leadership that is rightfully his." Herein is matter for much cogitation on the part of technical educationalists, for broadly considered, as Mr. Corless pointed out, and as the Committee of the Institute that was appointed to consider Mr. Corless's paper soon discovered when they sat down around a table, it cuts right to the root of training for citizenship.

There is the further consideration that, apart from scholastic training, the type of mind that excels in weighing and measuring material things often instinctively revolts against the study of mankind. Also, it has been fairly well demonstrated that it is much easier to find men with scientific and financial acumen, than to find men with a native capacity for leadership.

Mr. Lewisohn neatly sums up the disadvantage which the technical works-manager is up against when compared with the labor leader. The last-named has an experience which is largely political and forensic. The first-named has had a training which was confined "to studying the reactions of dead matter". Naturally when the question at issue is that of human relations, and what Mr. Corless calls "imponderables", the gentlemen with political and forensic ability possesses the advantage.

This is a sign of our times that was plainly visible at the last Industrial Conference at Ottawa.

## THE SEARCH FOR PETROLEUM IN THE UNITED KINGDOM.

The Petroleum Department of the United Kingdom has issued a statement reporting the depth and showings of ten boreholes that are being drilled by the Government in search of petroleum.

Seven holes are located in Derbyshire. At Hardstoft, production by natural overflow continues steadily at about seven barrels daily. The amount of oil in stock to 28th August has reached 3,696 barrels, or 478 tons. This is the only well that has given an actual flow of petroleum.

The other six holes are down to depths varying from 2,900 feet to 4,006 feet. Three of the wells, at depths of about 3,700 feet are in the Carboniferous Limestone, and in one case, a sand 7 feet thick was encountered which gave indications of oil.

In North Staffordshire two wells are being drilled. Lost tools have delayed this work, and in one case the hole has been abandoned and a new one is being sunk.

In Scotland, one drill-hole is down 3,844 feet at West Calder, which met a slight show of oil at 3,705 feet. Drilling is being continued in shales containing occasional beds of ash. At D'Arcy the drill is down 724 feet where a strong flow of natural gas was encountered.

The search for petroleum in Britain has been carried on against the advice of most of the British geologists, who hold that the geological conditions are unfavorable, but, if the only objection that can be urged is that of expenditure, it can be well replied that much more useless expenditures have been made in the world during the past six years, and, at any rate, the presence of petroleum has been proved at Hardstoft. In regard to a matter of such national importance as the presence of oil within the United Kingdom, even negative evidence is a desirable thing to have, and it is to be hoped that the British Government will continue the search for petroleum until it is definitely proved that it does or does not exist in commercially valuable quantities.

The existence of valuable beds of oil-bearing shales in the South of England seems to be definitely proven, and, now that the Kent Coalfield is producing large tonnages of good coal from ample reserves, there seems reason to expect a territorial readjustment of industrial activities in England of a nature that could not have been remotely guessed at fifty years ago.

The connection of the Kent Coalfield along the course of the Thames Valley with the Coalfield of the Forest of Dean is a possibility seriously discussed. Should workable deposits of coal be ever reached in this part of England it will still further postpone Britain's descent to the home of the everlasting how-bows monotonously forecasted as her speedy destination from time immemorial.

**NEWFOUNDLAND.**

In this issue will be found a full and fair account of the status of the mineral industry in Newfoundland, given by Mr. D. James Davies, the Government Analyst, before the Imperial Mineral Resources Bureau. Mr. Davies correctly states that Newfoundland is a country "which is on the whole practically undeveloped". He has also to admit that for many years no geological work has been done by the Newfoundland Government, and, while it mentioned that the Natural Resources Department of the Reid Newfoundland Company has done excellent work in geological investigations, private enterprise in what is in every other country considered a national affair, does not excuse the omission of the Newfoundland Government. It is this very lack of the functions of a Geological Survey, to wit, investigation and publication to the outside world of the result of investigation, that accounts for the paucity of information regarding Newfoundland in encyclopaedias and geography manuals that Mr. Davies complained of in London. References in current literature cannot be made unless there is a source for the references. We had occasion recently in reviewing Dr. F. H. Hatch's little manual on Mineralogy to note

the omission of any reference to the Wabana ore deposit. We might note that the Germans were extremely well informed about Wabana in the days before the War, but they did not get their information through government reports.

**DAYLIGHT SAVING IS COAL SAVING.**

The "Electrical News" states that in a paper read before the Illuminating Engineers Society of the United States, Mr. Preston S. Millar discusses the advantages and disadvantages of daylight saving. Statistics are given showing the estimated saving in coal consumption and expenditure for artificial light in that part of the United States lying north of the Potomac and Ohio Rivers and east of the Mississippi River.

Mr. Millar estimates the reduced output of electric light and gas stations to have been as follows :

Reduced electricity output, total systems,	
during seven summer months . . . .	3 per cent.
Ditto — residential loads only . . . .	8 per cent.
Ditto — gas station, total output . . . .	3 per cent.

Estimates of the approximate saving in coal and light expenditures throughout the United States during seven summer months under daylight saving are as follows :

	Annual Saving in Coal tons	Annual Saving in Expenditure for Electric Light
Electricity (central stations)	300,000	\$14,000,000
Gas . . . . .	195,000	5,250,000
	495,000	\$19,250,000

Mr. Millar's conclusions are that daylight saving has disadvantages that exceed the undoubted advantages, but it has been generally overlooked that the primary reason for adopting daylight saving during the war years was to save coal and light expenditures, and, insofar as this has been achieved, the adoption has been convincingly justified.

In Europe, where the necessity to economise in coal and every other form of motive power, is infinitely greater than it has ever been on this side of the water, the justification of daylight saving on the economic score is still more complete, and "Summer Time" is probably an established institution in Europe for this generation.

Long before the daylight saving idea was brought to public attention by the exigencies of the war, it had been the custom in mining camps situated at points remote from a railway, to put the clock forward by degrees in the Spring, the idea being to gain extra hours of daylight for outdoor operations, and to save on power consumption for artificial light.

The discussion on daylight saving in North America has unfortunately degenerated into a phase of that deplorable hostility that has come to exist between the town and the country, and it is well to remember

that the questions of suburban gardening, hours of labor and morning dews had nothing to do with the action of governments in their original adoption of daylight saving legislation. It was adopted to save coal, and that it certainly has done.

---

*EN PASSANT.*

One result of the Press Conference that will be very pleasing to Canadian readers is the announcement made by the Managing Director of Reuter's Agency that a news service for Canada is being arranged that will "relieve the Canadian press from the innocent and unconscious, but none the less harmful, coloring of American news." This is prettily put.

If we could also have London cables that were free from political coloring the Canadian reader might have a chance to form independent opinions on European situations without having to wait for the arrival of European newspapers. How it is that no person appears able to transmit news from Europe without seeking to stamp it with some bias intended to form public opinion in Canada? It is news we require, not interpretations.

---

A conflict for priority between shipments of coal and shipments of wheat eastward from Alberta is causing criticism of the Canadian National Railway in the West. The Regina "Morning Leader" states: "the consumption of western coal in Manitoba, and even in the East, has become permanent. But the farmers ought not to be obliged to pay the penalty for that condition, or for the failure of other interests to make use of the railways at the proper season."

Any appropriations made for the enlargement and renewal of rolling-stock on the railways ought to take into consideration adequate provision for the carriage of coal eastwards. The export of coal from Alberta is going to require a large number of freight cars designed to carry coal for long distances in heavy individual loads with protection against the weather, and the railway that sees first the opportunity that coal carriage affords is going to reap a deserved reward.

---

The Toronto "Globe" quotes the assertion of the Railway Association of Canada that "antiquated, overloaded and wasteful systems of distributing goods are much more properly a subject for public anxiety" than railway charges. This statement also asserts that "serious additions to cost by the distributing trades will be found in relation to almost every article of common household use." The "Globe" considers this statement to be in the nature of a challenge to Boards of Trade, demanding an answer.

In the matter of coal distribution, the Railway As-

sociation's statement is exactly descriptive of the facts and corroborates a conclusion several times urged in these columns, namely, that the coal operator, in self-defence, should wherever possible, control the distribution of coal to the point of the ultimate consumers' yard or cellar.

---

A Toronto newspaper falls into a curious error in discussing the abortive O.B.U. strike in Alberta. It states the "alleged cause of the trouble in Alberta is "the refusal of the mine operators to abolish the "check-off", a long standing system for recording "the miner's output." The "check-off" of course is only another name for the "closed-shop", and it is the regulation which was enforced by the Government which permits only members of the United Mine Workers in good standing to work in the coal mines which is the ostensible reason for the strike call of the O.B.U. If this were all the O.B.U. stood for, that organization would have a fair case, but their aims only need to be expounded in order to meet defeat in Canada. Nevertheless, in objecting to the "check-off" the O.B.U. has demonstrated the boomerang action of violating a principle for reasons of expediency.

---

The latest indication of the changing nature of trade routes in North America is the announcement that the Granby Consolidated Mining & Smelting Company is arranging to send its smelter product to the refineries in New England by steamer from Vancouver via the Pauama Canal. A similar announcement is made regarding the smelter product of the Anaconda Copper Company, shipments being made in this case from Seattle. There is somewhere west of the Great Lakes a "watershed" of rail traffic not as yet clearly defined, but becoming so. Along this line will be the division between eastward-bound rail traffic and westward-bound, and we believe the line of departure lies well east of the Rockies.

**INTEREST IN FIRST-AID AND MINE-RESCUE TRAINING AT NANAIMO, B.C.**

The presentation of medals and trophies to the winners in the first-aid and mine-rescue competitions held at Ladysmith, B.C., on Labor Day was made the occasion of a social gathering at Nanaimo recently.

The presentation of prizes was made by John Thompson, who congratulated the teams on the splendid work done during the past year both in Mine Rescue and First Aid work. Mr. Laird responded on behalf of the Resene Team, and hoped to see more of the young men in this year for rescue work. D. H. Simpson's team won the Novices' Shield presented by the Canadian Western Fuel Co., and also the Mines Department Cup with gold medals and the Team event against all comers at Ladysmith, and the Niven Cup.

**BORING FOR OIL AT DAUPHIN, MANITOBA.**

The Manitoba Government is testing the presence of oil in the Dauphin District at a point six miles north of Winnipegosis by drilling. Boring has been commenced.

## "THE TIN DEPOSITS OF VIRGINIA, U.S.A."

By Alex. Gray, Montreal

Under that caption the "Canadian Mining Journal" last week published a brief article from the pen of Mr. Marshall Haney.

The description of the tin occurrences of Virginia and North Carolina hardly is complete, however, without more details as to the experiences of those who gave their attention to those convenient fields.

Whether the cassiterite occurs in quartz veins—or pegmatites—is not material. As one of those who devoted some time and money to these veins, or dykes, fifteen years ago, it may not be inopportune to state that they emphasize the sagacity of the "Cousin Jack" tenet: "Where it is; there it is". Having found cassiterites very elusive throughout the Cornish mines—the crystals being insufficient to yield other than a small percentage of the turnover of ore, the "Cousin Jack" arrived at the conclusion that tin would not be so precious if it was more plentiful. This, notwithstanding the Cornish mines have been worked off and on, more or less continuously, since the Phoenicians paddled or sailed thence.

Tin mining, even in Cornwall became precarious, so much so that were it not for the Straits Settlement supplies the world long since would have been without its standard dinner pail. In later years Tasmania contributed a quantity of cassiterite, and more recently, Bolivia, and South Africa. Of the latter, those of us who felt that the earliest Cornish "carbonas" were going to be dwarfed by the South African deposits, had reason to take the "Cousin Jack" view that cassiterite in bulk couldn't be where it wasn't. The greisen was all it ought to be but, as one sage asserted: "There were not enough fish in the stream", lateral and vertical continuity of the "pockets", the local enrichments, was lacking.

In a sense, the same is true of the Virginia and North Carolina occurrences. They have every operating advantage, are close to transportation and supplies. Labor is accessible, but the percent of cassiterite content made of the openings and shafts spoken of by Mr. Henry so many graveyards. The average yield in cassiterite was too low, regardless of the advantageous working facilities.

About the only benefit resulting to one or two of us from that adventure in the section dealt with by Mr. Haney was, that it made us familiar with Appalachian features informative as to Porcupine when it was revealed. Gold, bearing rocks of Virginia had not been subjected to denudation, the ore was practically free, milling at outcrop. Denudation had taken place in the Ontario North Country, hence the difference between what existed there at outcrop and the outcropping characteristics of the Virginia country.

That has nothing to do with the Virginia-North Carolina tin areas, of course, but the experience as recorded will serve to negative the roseate presentation of Mr. Haney. There is cassiterite down there, not enough of it to "do the needful."

## OBITUARY.

The death is announced of Major Francis C. Connerly, late the Assistant Sales Manager of the Canada Wire & Cable Co., of Toronto, on September 18th.

## BOOK REVIEW

**Modern Tunneling.** With Special Reference to Mine and Water-supply Tunnels. By David W. Brunton and John A. Davis. Linen Cloth Boards. 6 by 9 by 1¼ inches. 450 pages with Bibliography and Index. John Wiley & Sons. New York, \$4.50.

This is a comprehensive treatise on the art of tunneling, more particularly as practised in connection with the extraction of minerals and in the drainage of mine workings. The authors are well known as experts on tunneling, and write from personal knowledge of many of the tunneling operations they describe. The section on "Tunneling" in Peele's mining engineers' handbook was prepared by them also.

The history of tunneling is concisely, but very interestingly dealt with, particularly in the recital of the achievements of the ancients in rock excavation with the aid of primitive appliances. Mention is made of the stupendous undertakings for mine drainage before the invention of the steam pump, the drainage depth secured being, to modern ideas, very disproportionate to the labor involved. A complete resume of modern tunnels, giving all essential particulars in each case, makes a valuable chapter.

The choice of power for tunnel work is considered from many angles, and much attention is given to all phases of air-compression in relation to tunneling. Ventilation, rock-drilling machines, haulage, and incidental surface and underground equipment are each discussed with numerous illustrations. The methods employed in drilling, blasting, removal of material and timbering are described and criticised. A large chapter is given to means of securing safety in tunneling work. Very detailed figures are given on the cost of individual tunnels, which include the Coronado, Gunnison, Laramie-Poudre, Lucania, Marshall-Russell, Mission, Newhouse, Rawley, Roosevelt, Stilwell, and Strawberry tunnels, and the Los Angeles Aqueduct.

A bibliography of sixty pages is appended giving the references to literature arranged under the sequence of subjects used in the chapters of the book.

The work is unusually well bound, and is printed on good quality paper. It contains information of value to the mining engineer having charge of underground excavations.

The authors state they have "endeavored to lay stress upon safe, efficient and economical methods, and upon good points of equipment, while bad practice and obsolete machinery is ignored, except, as examples of the inadvisable, or as they have some bearing historically."

## PERSONAL.

Mr. E. L. Bruce has been appointed Professor of Mineralogy at Queen's University, Kingston, and has taken up his duties.

The plain man, who takes his politics seriously enough when occasion needs, is not overly enthused over the present tariff discussion, as he has a sneaking belief—probably not clearly defined in his own mind—that if those who are so vociferously advocating abolition of tariffs were in a position to put the machinery into motion to bring this about, they would, like so many before them, not dare the experiment for fear of the consequences.

# The Design of Chutes and Ore Bins

By JOHN S. WATTS, New Glasgow.

The functions to be performed by a chute, appear at first sight, to be so simple, as to often lead to failure to produce a satisfactory design, from a lack of appreciation of the vital points to be considered. Literature on this subject, is very meagre, so that the designer has practically nothing to guide him, but his own probably limited experience.

The minimum slope, which will cause the material to slide down the chute is variable for different materials, and even for the same material, under different climatic conditions, and also varies with the sizes and quantity of lumps and fines. The manner of delivery into the chute has also some effect.

Below is given a table for some of the more common materials met with, showing the slope or gradient at which they will slide under fair average conditions. That is with the material reasonably dry, with only a small percentage of fines, and the bottom of the chute, being made of smooth flat steel plates, without projecting rivet or bolt heads.

Coal in lump size,  $18\frac{1}{2}^\circ$  from the horizontal.

Coal in small sizes,  $27^\circ$  from the horizontal.

Iron ore,  $38^\circ$  from the horizontal.

Gravel,  $40^\circ$  from the horizontal.

Sand,  $38^\circ$  from the horizontal.

These gradients are stated in degrees from the horizontal and should be considered the absolute minimum. Whenever possible the angles should be determined by actual experiment on the material to be handled.

It should be noted, that when the material is held in the bin or chute, by closing a gate, and the material allowed to settle, the above gradients will need to be increased, by two or more degrees, depending upon its nature, to overcome the increased friction of the material when at rest.

In designing bins, the bottom should be shaped and graded in all directions, leading to the gate, at the inclination required to start the material sliding, after being allowed to settle to rest.

The effective storage capacity of a bin which will completely empty itself, is much greater than that of one of equal total capacity, which cannot be completely emptied, by gravity alone, because, that part of a bin, where the bottom layer of material refuses to move, becomes filled up and is no longer available. The angle of repose, of the material in the dead part of the bin, may be sixty degrees or more, whereas by grading the bottom of the bin, to that angle required to keep the material moving, which will not usually be more than forty-five degrees, we gain for effective use the space enclosed between the angles of forty-five and sixty degrees.

This may be more clearly understood, by referring to Figure 1, and it must be noted that the inclination to the horizontal of the two inclined surfaces, must be sufficient to make the inclination along the valley, line AA, that which is necessary to start the material sliding under the worst conditions.

It is sometimes necessary to use a twin chute, such as is shown in Figure 2, to take the material from two receiving points to one common delivery point. Obviously, the inclination along line BB, is less than the angle B, and therefore the angle O, must be made such that the angle of inclination, from the horizontal, along line BB, will be that required to cause the material to slide.

When a long chute is used, delivering on to a rubber belt, and the material is mixed lumps and fines, it will be found that the grade which is right for the fines, will be too steep for the lumps, and that the larger pieces will gather so much velocity, that they will cut the belt, and probably bounce off it.

The remedy for this, is to have the chute made in two decks, the upper deck being fitted with a screen,

Fig. 1.

Fig. 2.

to take out the fines, which will fall into the lower deck. The upper and lower decks can then be arranged to have different inclinations, to suit the different sizes, and should preferably be hung, separately, on eye-bolts fitted with turnbuckles; so that the inclinations can be adjusted to suit, and if necessary, altered to take care of the varying velocities, due to variable climatic conditions.

When an extra long chute is required, the grade required to keep the material moving at the top, will cause it to attain a high velocity when the ore reaches the bottom. If the ore is hard, this high speed will cause the lumps to cut and abrade the belt. This can be cured by making the chute as outlined in Figure 3, the curved part of which, at the lower end, can be set so as to reduce the velocity of the material to that of the belt, and so prevent any damage to the belt at the loading point.

Fig. 3

By making the chute in two sections, as shown, hung on adjustable hangers, as suggested before, the grade of each chute can be adjusted independently, so as to get just the right velocity, and, at the same time keep the delivery end of the chute, just high enough to clear the belt, and avoid dropping the material on to the belt and so cutting the surface.

If, in addition, the chute is made a double decked one, as described above, the fines will be fed into the belt first, and give a perfect protection to the belt against damage by the larger pieces, making an ideal arrangement under all the varying conditions.

When the delivery chute, is at right angles to the belt, and the belt is to be used as a picking table; in which case, the material has to be spread over the width of the belt, in a thin even stream, to enable the impurities to be seen and removed, an effort is sometimes made to get this spreading effect, by cutting off the end of the chute at an angle of 45°.

In the plan view, Figure 4, this idea looks allright, but a study of the elevation will show that the point C, is much too high above the picking table, and the material dropping from this point will be detrimental either to the belt or to the material.

This damage can be averted, by making the line, CD, level, when the chute will appear as shown by the dotted lines in the elevation, but this gives a steeper grade along the side C, then along the side D, and destroys the even spreading of the material, by inducing the bulk of the ore to run to the point C, and leaving the rest of the chute bare.

If the material is uniform in size, and delivered to the chute in small quantities at a time, it can be prevented from travelling across the chute, by fitting

Fig. 4.

Fig. 5.

angle or the bars longitudinally along the bottom of the chute, and so forming channels compelling the material to travel parallel to the chute sides.

The neatest way however, is to fit a helical chute as shown in Figure 5. This type takes more head room, and is more expensive to make, but will accomplish the purpose more successfully, if properly designed and made, than any other type of chute.

In this helical chute, we have, as in the last one, a steeper grade along line E.F., than along line GH, but the centrifugal force acts against the tendency to fall towards point F, and if the radius of the chute, is not made too small, will give an evenly spread delivery on to the picking table. The smaller this radius, the greater will be the difference between the grades along the two sides.

Another case, that requires consideration to evolve a satisfactory chute, is that shown in Figure 6. In this case, the chute is a twin one, having one receiving end, and two delivery points, to two picking tables. The conditions to be met, are, that the grades must follow

Fig. 6.

the arrow heads, shown on the plan, in order that the stream may be of even thickness across the width of the two parts of the chute.

To arrange this, it is obvious that lines LJ, and MK must be parallel, and in the same plane, and this will usually involve having a slight drop at the point L, tapering off to nothing at point M. By a judicious arrangement of the respective grades in the single and in the twin parts of the chute, the drop at point L can be kept to a minimum, and sometimes eliminated. This depends upon the conditions as to centers of picking tables, length and height available, and can only be determined by laying out to scale on the drawing board.

**CONSOLIDATED MINING & SMELTING COMPANY ASK INCREASED TARIFF PROTECTION ON LEAD AND COPPER WIRE RODS**

Mr. Warren, the General Manager of the Consolidated Mining & Smelting Company, presented the position of the products of the Trail Smelter during the recent visit of the Tariff Enquiry Board to the West. A readjustment of the tariff protection now given was suggested as necessary by Mr. Warren to meet changing conditions in exchange with European countries, particularly the German mark. Pending consultations between the Consolidated Company and representatives of the lead-metal trade on the advisability of a graded schedule of tariff increases designed to meet the exchange situation, and with representatives of Canadian copper-wire mills, Mr. Warren suggested tentative consideration of a specific duty of two cents per pound on pig lead, and 1 1-2 cents per lb. on copper-wire rods, a bounty on zinc exports, a temporary embargo on zinc imports and \$1.50 a ton duty on fluorspar.

Some of the statements made by Mr. Warren were as follows :

**Lead**

The trial plant could produce 100 tons of refined pig lead daily, just about the normal consumption in Canada, though it had not been doing so lately because of mining strikes. There is now a specific duty of one cent a pound on pig lead imposed in 1919, when the 15 per cent. duty and war tax of 7 1-2 per cent. were removed on the ground that some protection was needed because of the large surplus quantities of Mexican pig lead then held in Great Britain and France ; that Mexican lead was still available for the Canadian market, and in addition Spanish, German and Belgian lead could get into Canada under the British preference by reason of being "touched up" in England before coming to Canada.

**British Preference Unfair**

Mr. Warren said the British preference was unfair and without justification. They produce only 7,000 tons of lead in England a year and yet they send this lead from Germany or Spain to us under the preference at three-quarter cent a pound duty. The witness pointed out that at the average price of pig lead on the United States market for the last six months of eight cents a pound, the United States duty of 25 per cent amounted to two cents pound. Even with that protection the price in the last month of pig lead had dropped from \$8.75 to \$7.45 a cwt., and their own price was \$7.80 to Montreal and \$7.75 to New York, to meet British competition with the cheap leads obtained from Mexico, Spain, Germany and Belgium. In spite of the two cents duty in the United States the United States price had been forced down to \$7.75 by the Mexican and European leads.

**Asks 2c per lb. on pig Lead**

He claimed the Canadian pig lead should have at least an equal protection of two cents a pound. The real difficulty in meeting this competition, however, was that just now the English pound sterling is worth about \$3.90 in Canadian funds and the German mark depreciated to a still greater extent. The exchange situation negatives the protection on a wide variety of Canadian products besides lead.

"With the German mark where it is we cannot

compete with any German product", he said. "As soon as they can make all they need for their own purposes we will have a merry time competing with them and so far as lead is concerned there is grave danger that the producer cannot compete at least until the exchange situation is normal, unless additional protection be granted or an embargo be placed against their import."

### Copper

With respect to copper, Mr. Warren's proposal was that the 1 1-2 cents a pound duty on copper ingots should be extended to include copper wire rods, which are now free when drawn into wire in Canadian plants. While the war duty of 7 1-2 per cent. was on the company began to build a wire rod mill so that it might supply the 12,000 tons of copper rods consumed by the five Canadian wire concerns in making telegraph wires, transmission wires, cables, etc. In addition to the wire rod consumption the normal Canadian consumption was only 6,000 tons in the form of ingots. The ingot demand could be filled with the company's copper refinery established during the war at the request of the British Government, with a capacity of 20 tons daily. To supply the Canadian consumer at a reasonable price it was necessary to increase the capacity of the copper plant 60 or 70 tons a day. That could be done only by building a rod mill so that the increased copper output could be made into wire rods, enabling the company to fill the whole domestic demand. This also necessitated arrangements being made to secure a supply of copper ore or concentrates sufficient to supply the enlarged plant.

### \$4,000,000 expended to enlarge copper production

Contracts had been entered into with the Canada Copper Corporation under which a \$2,000,000 railway branch line had been built from Princeton to the large copper deposit it controlled nearby. The power line of the subsidiary company, The West Kootenay Power & Light Company, Ltd., had been extended 100 miles from Greenwood to the mines at a cost of \$1,250,000, and extensions had been made to the smelter costing \$750,000, including \$250,000 on the wire rod mill.

### Smelter paying 1 1-2c. over New York prices

Hitherto the wire rod consumption in Canada, had either been produced in the United States or made in the United States from copper matte or blister copper exported from Canada. To get ores from the Canada Copper Corporation and to induce it to make the huge expenditures mentioned, the smelter had agreed to pay one-half cent a pound over the New York price. As there was no duty on copper going into the United States, all these provisions had to be made in order to keep the ores in Canada. There was no market for copper in the West either in the United States or Canada, and in shipping East, the Anaconda Smelter, which dominated the interior on the United States side, and the Trail Smelter in Canada, had to meet New York prices based on metals obtained by water from such sources as Chili.

Toronto, Montreal and Hamilton formed the Canadian market for copper ingots and wire rods. The freight rates for that market were therefore lower from New York, being 47 1-2 cents a cwt. to Toronto and 46 cents to Montreal, as against the new freight rates of 95 1-2 cents a cwt. from Trail to Toronto and \$1.10 to Montreal.

The cost of conversion of the copper into wire rods

was two cents a pound, double the pre-war cost. Fifteen per cent, of the copper ores came from the company's own mines and the rest were custom ores from independent mines. The New York price on copper rods was 20 cents a pound plus the freight. The duty of 1 1-2 cents asked for would absorb the difference in freight, the half a cent extra paid for the ores, and leave a small balance as protection.

### Zinc

The zinc situation is entirely different. The Canadian consumption normally is 10,000 tons annually, and the company's zinc plant capacity exceeds 25,000 tons, developed primarily to provide high-grade zinc for munition purposes. In disposing of its surplus it competes in European markets with Germany, Belgium and the United States, and in the Orient with Australia, as well as with factories and mines in consuming countries. The company's zinc, being produced electrolytically, is superior to most zinc made by a distillation process. In war times that was a great advantage, but in peace time for most purposes the purer zinc would get the preference only when quoted at the same price.

### Company Propose Roll Zinc Sheets

As large part of the world consumption was in the form of sheets, the company proposed to put in a zinc rolling mill, and it felt, it should have a bounty on foreign business in order that it might supply the British market. Until foreign exchange righted itself further protection also was needed. Five hundred tons of German zinc were offered in Eastern Canada last month. Australia's example in protecting its electrolytic zinc industry by a temporary general embargo against the importation of zinc, he thought, should be followed partially in Canada by making a limited embargo against all but Great Britain and the United States.

As world-selling prices on metals cannot be increased by Canadian duties, Mr. Warren protested against the freight rate increase in constituting a "direct contribution from the company to the railways." The company had always been handicapped by the long freight haul, and a 35 per cent. increase on its greater rate obviously made the burden heavier than it did to their competitors in New York on copper and lead, and in St. Louis on lead and zinc, with their shorter hauls, and, consequently, lower rates.

Formerly the difference had only been equal to one-third cent a pound, but now it was one-half cent a pound. In considering the duties he asked that this should be taken into account.

Besides the lead, copper and zinc, the company produces refined gold, refined silver, bluestone, fluorspar, and both sulphuric and hydro-fluo silicate acids. With respect to fluospar needed by the company to produce hydro-fluo silicate acid for refining lead, and sent to Canadian steel firms in its raw state, Mr. Warren wanted \$1.50 a ton duty, the same as the United States duty.

While the war duty of 7 1-2 per cent. was in force the company secured a large deposit of rock near Grand Forks, B. C., spending \$250,000 in developing and equipping it, with a concentrating mill. The company's product went no farther east than the Soo, the Eastern iron plants being supplied from a deposit of the rock near Madoc, Ont. He feared that in the course of time Great Britain and the United States would resume their pre-war trade.

# The Mineral Resources of Newfoundland

An Address by D. James Davies, Government Analyst,  
Newfoundland, given before the Imperial  
Mineral Resources Bureau, June 4th.

I have to express my warmest thanks to Lord Morris, your Vice-Chairman, for this opportunity of addressing you on the mineral possibilities of Britain's oldest Colony, — Newfoundland. The making up of this address has been rather uphill work, partly because most of the data necessary are in my office in St. John's and partly because most of our mineral areas and prospects at the present time are in the possibility stage, but if we can obtain the sympathy and co-operation of this Bureau, we hope that many of our prospects will be promoted in a short time from the possibility to the probability class.

Newfoundland has been rather ill-used by the Mother Country in the past and she has had to sit tight for decades listening to and reading about the glories and great resources of her big younger sisters — Canada, Australia and South Africa. She has had to be satisfied with only a column or so in the various popular encyclopaedias describing her fogs and fish. The geography books devote only a paragraph or two to this Island, which formed the foundation of our great Empire. I suppose the official and academic classes of the Mother Country have regarded Newfoundland for centuries as a fish shop far beneath their notice.

We are in the unfortunate position of being a badly advertised country situated quite closely to Canada and the United States, the best advertisers in the world today. We hope to get this defect remedied very shortly. We have today a few live men, chief among them is Lord Morris, who are bent on placing Newfoundland on the map, men who are bent on advertising her big iron ore and copper ore deposits, and in a few years time, we hope, when we visit this country that we will not have to tell otherwise well informed people, that we are not Canadians and that we are not fighting for a bare existence among the Esquimaux in the Arctic Circle.

## Geological Survey of Newfoundland Required.

I am sorry to have to state that the geology of Newfoundland has not been determined in detail. A good deal of geological work was accomplished by Mr. Andrew Murray, our first geological surveyor, and after the death of Mr. Murray the work was carried on by the late Mr. Howley. For many years no geological work has been done by the Government, but, during the past two years some excellent work has been accomplished by the Reid Newfoundland Natural Resources Department — this Department employs many good geologists, who have served their apprenticeship with the United States and Canadian Geological Surveys.

The predominant formation in Newfoundland is the Precambrian which is subdivided into Huronian, Laurentian, and Avalonian. Avalonian is a local term applied to some of the Pre-Cambrian rocks of the Peninsula of Avalon because it has not been determined, as yet, to which sub-division of the Pre-Cambrian these rocks rightly belong.

I am told that the Newfoundland Pre-Cambrian resembles, in many respects, the Canadian Pre-Cam-

brian — the greatest mineral-bearing formation in North America—the rocks in which occur the great mineral-bearing bands of Sudbury and other North American districts. In Newfoundland we have the geological formation which is known to contain large mineral deposits in Canada and I know from my experience covering many years as Government Analyst for the Dominion, that we have a great variety of metalliferous and non-metalliferous ores occurring in the Island.

Even though the geological work done has not been by any means thorough and the prospecting work has been patchy and confined, more or less, to the coast, we might lay claim already to being a mining country. We possess in Bell Island one of the greatest iron ore deposits in the world. The geology of the Bell Island district has been worked very thoroughly by professors and students from Princeton University. A few particulars and figures concerning this mine, though they are widely known, might not be out of place in this address.

## The Wabana Iron Ore Deposit.

The red rocks of Bell Island were used by sailors for anchors and ballast before the actual economic value of the rocks were realised—when the nature of the ore was recognized the property was taken up by Messrs. Butler and Topsail and sold by them to the Nova Scotia Steel and Coal Company in 1893. The first development work was carried out immediately and in 1895 preparations were made for large shipments of ore. In 1899 a portion of the areas was sold to the Dominion Iron and Steel Company. This Company acquired the lower ore bed, the Nova Scotia Company reserving for themselves the upper bed, which was superior to any of the other seams. The sale included a submarine area of 3 square miles adjoining the shore. Additional submarine areas were acquired from time to time as the work on the ore beds progressed and at the present time the Nova Scotia Company own about 83½ square miles and the Dominion Iron and Steel Company about 5½ square miles.

Many geologists have estimated the available commercial ore in these beds; Howley's estimate reached a total of 3,635,343,360 tons.

H. Kilburn Scott, of London, in 1909 estimated the ore on the Scotia property alone to total 652,500,000 tons and total recoverable ore, deducting that lost in pillars, faults and pier zones to total 395,525,000 tons.

Edwin E. Ellis, of Birmingham, Alabama, at one time with the United States Geological Survey, said that claims had been taken as far as 12 miles out from the shore and that it is planned to operate workings of that length—allowing for workings five miles long he estimated the ore at 3,250,000,000 tons.

Edwin C. Echel testified that in Newfoundland there were 3,500,000,000 tons of economically available ore within a radius of five miles of Bell Island—besides this there are billions of tons which are not economically available at this time. In one deposit alone in the Newfoundland district, he said, that the ore runs thirty feet thick and contains about 90,000,000 tons to the square mile.

During the year 1919 a pair of slopes were completed at Bell Island, the construction of which means to the Nova Scotia Steel and Coal Company a permanent supply of iron ore of enormous extent. They are now producing 1,200 tons of ore per day—with improved labour conditions this quantity can be much increased. These workings are over two miles to the dip from the outcrop of the bed and the slopes are among the longest known, yet, the ore extends below their deepest point.

During the past twenty-four years the blast furnaces of the Nova Scotia & Dominion Companies in Sydney Harbour have been supplied and several millions of tons exported in addition from an area of about two square miles of the ore field. The submarine holdings of the Scotia Company cover an area of 83½ square miles and of the Dominion Company 5½ square miles—a total of 89 square miles and the same geological conditions are believed to extend over the greater part of these areas.

Years	Nova Scotia Company	Dom. Iron & Steel Co.
	Tons	
1917 . . . . .	60,735	653,600
1918 . . . . .	76,767	639,300
1919 . . . . .	219,410	478,134
Total: 1917, 713,975 tons.	1918, 716,067 tons.	
	1919, 691,944 tons,	

practically an average of 700,000 tons per year.

On the Mainland immediately adjacent to Bell Island, on the shores of Conception Bay and Bay de Verde district, one can hardly dig a foot or two below the surface soil without coming in contact with lumps of rich haematite ore. These districts apparently, simply require the necessary capital and expert supervision to make them busy mining centres and incidentally to bring Newfoundland to the very front rank as an exporter of iron ore. Besides these haematite deposits, we have very big deposits of titaniferous magnetites on the West Coast and sooner or later it may become necessary for the smelters to adapt their furnaces for the smelting of such ores.

#### Copper Ores.

In Newfoundland copper ores rank next in importance to iron ores both from the point of view of development and probable existence on a large scale.

The locality of greatest development in copper mining is Notre Dame Bay on the East Coast. The map in this Bay is black with fee simple properties which were taken up and partly developed during the copper boom in the seventies and eighties—a time when it was necessary to ship eight and ten per cent hand-dressed ores in order to make a profit—a time when the present cheap concentration methods for sulphide ores were not available. Thousands upon thousands of tons of copper ore have been shipped from the various mines in this area in past years, but most, if not all the mines, were closed down about the same time on account of a slump in the price of copper, and in some cases on account of poor mine management. I have here a few brief particulars of the more important mining locations in this Bay.

#### Tilt Cove or the Union Mine

Operations, which were started in 1864, have been continued, more or less, spasmodically almost up to the present time. The total shipment from the mine to date as far as can be ascertained from available returns, have been 1,491,136 tons of ore, 78,015 tons of

regulus, 5,418 tons of copper ingots. I am told on reliable authority that there are at least one million tons of commercial copper ore in sight at Tilt Cove at the present time.

#### Betts Cove.

This mine was opened in 1875 and it was worked with great activity for ten years during which period 130,682 tons of ore and regulus were shipped, besides 2,450 tons of iron pyrites. Work was suspended on this mine in 1885 owing to the caving in of the mine bluff. It is thought the ore was far from being exhausted when the mine was closed down. The other localities which gave the most promise in this Bay were Barton's Pond, the Colchester Mine, S. W. Arm, Shoal Arm, Little Bay, Whales Back, Hall's Bay, Sanday Cove Island, Rabbitt's Arm, Thimble Tickle, Seal Bay. According to Mr. Howley's reports, the most celebrated of all the fore-going was the Little Bay mine. Operations were begun in August 1878, yet before the end of the season (presumably early in December) some 10,000 tons of ore were raised and shipped to Swansea. Between 1880 and 1885 61,796 tons were shipped from the mine. From 1885 to 1892 over 40,000 tons of ore, regulus and ingots of copper are given in the Customs returns. This mine was closed down about the same time as the others, but now extensive development work is being done at Little Bay and great things are expected of it in the very near future.

Between the years 1880 and 1882 the South West Arm Mine yielded 490 tons of ore, Halls Bay 240 tons, while Rabbitt's Arm Mine which was worked for only one year, yielded 1,260 tons of ore averaging twenty-eight per cent of copper. There is a highly mineralized section around Gull Pond, a few miles inland from the shores of Notre Dame Bay and a local development company, with local capital, are operating in that locality at the present time.

Quite a deposit of native copper is found in Oderin Island, Placentia Bay. Some development work has been done and the opinion of mining engineers, who have visited the Island from time to time, is that it is well worthy of investigation. Another prospect which I believe is now being investigated is situated on the Island of Presque, Placentia Bay.

So far I have only touched on these areas where successful mining has already been carried on. We have many other areas which may not hold forth at this time very much inducement to capitalists, but at the same time they are decidedly worthy of investigation by the Government or some other body who is desirous of tapping new resources for our Empire.

#### Manganese Ores.

Around the shores of Conception Bay we have a very big deposit of manganese ores partly carbonate and partly oxide. These beds are of lower Cambrian age and according to Dr. Dale, formerly of Princeton, the original area of this manganese was approximately from 200 to 300 square miles. Very little work has been done on this deposit. Surface samples have been analysed at the Government Laboratory from time to time. Those from Topsail and Manuels are, as a rule, very low grade, containing from 25 to 28 per cent total manganese. One sample from a ten inch vein at Manuels gave 37 per cent total manganese and one from Hopewell, about six miles west of Kelligrews, gave 38 per cent.

Some development work was done at Topsail some years ago. The manganese at this place is found in

several beds, one of which measuring 1.4 feet appears, according to Dr. Dale, to have been of sufficient importance to have warranted prospecting work being done. The most promising of all the manganese prospects in Conception Bay, is that which is situated at Brigus Head, South Point. Some mining work has already been accomplished at this place and two schooners loads (about 400 tons) were shipped abroad in the summer of 1917. I sampled these cargoes and the average manganese content obtained was about 36 per cent. I took a few chunks from a vein at Brigus Head the same year and I obtained 44.5 per cent of total manganese.

Mr. A. C. Hayes, of Princeton, visited Brigus Head in 1912 and he says that the best manganese measured 4.5 feet thick in a zone fifteen feet, and that manganese is found in the oxidised state in several beds at the water's edge. Bog manganese and bog iron ore are accumulating in the marsh lands on Conception Bay and black powdery manganese ores can be dredged from some of the lake bottoms.

#### Chrome Asbestos and Molybdenite.

The serpentine of the West Coast contain chrome ores and asbestos, and nearly 800 tons of chrome ore containing fifty five percent chromic oxide have been exported from the Bluff Head district. We have a most likely looking molybdenite prospect in the mica schists of Fleur-de-Lys. On the East Coast and on the South Coast around Placentia Bay we have segregations of argentiferous galenas, some of which have been mined in past years.

#### Coal, Petroleum and Oil Shale.

Our coal areas are being examined and developed and the reports, so far, are very favourable. Crude petroleum is being pumped at Parson's Pond on the West Coast. The operations are being conducted by Mr. J. D. Henry. I believe that a small refining plant has been in operation there for some time and it supplies illuminating and fuel oils to the fishermen of the North and West Coasts. Besides crude petroleum we have a tremendous tonnage of oil shale which may or may not be of commercial value. Most of the reports that I have read of this shale deposit are favourable but no actual distillation on a commercial scale has been done up to the present time. We have big deposits of gypsum, marble, limestone and slates. We have already shipped some barytes to the foreign markets and we have great indication of good commercial mica occurring around the coast of Newfoundland Labrador. We have a country within less than two thousand miles of Liverpool which is on the whole practically undeveloped. It possesses the formation which is known to be highly mineralised in North America and any development company would, I am sure, receive every consideration and help from the members of our Government who are keenly interested in the development of what we are proud to call "Our Island Home."

I have lived in Newfoundland for the past nine years and I have been all the time intimately associated with the minerals of the country. I have had long talks at my office in St. John's with almost every mining engineer and mining prospector that has visited our shores, and the opinion of most, if not all of them, is that we have an island with great possibilities,—an island that may develop into a land of husky miners to the extent that it is today the land of sturdy fishermen.

## THE STEEL TRADE AND THE TARIFF ENQUIRY.

(From "Iron & Steel of Canada")

The iron and steel industry in Canada, with all its long train of antecedent and precedent interests, will shortly be made the subject of attack by advocates of tariff abolition, and will be required during the successive sessions of the Tariff Enquiry Board that are planned between now and the opening of the Houses at Ottawa, to give reasons for its existence and for the continuance of protection by import tariff.

Canada is not singular in its possession of convinced adherents of the free trade heresy, nor in the belief among certain non-industrial groups that a fiscal policy devised to suit the temporary requirements of a small and geographically central island, is suitable for any conditions under which the descendants of emigrants from that Island may reside.

A determined attack on protective tariff in aid of the steel industry in Australia is now in progress. The conditions, geographical, economic and social, of Great Britain, Canada and Australia, could scarcely be more dissimilar, yet there are those who believe, and would force others to believe, that free trade is a sovereign and inherently righteous policy applicable to all three countries.

There is no part of the British Empire, however, that is so unsuited for application of free trade principles as Canada, in its present stage of development. Canada is a continental area, only partially known, and containing only one-twelfth of its ultimate population. It lies alongside a friendly country that is opulent, powerful and enterprising beyond all previous historical precedent, with exchanges of industrial products facilitated also beyond all prior parallel by a hitherto unattained perfection in transportation facilities, and international financial combinations.

No advocate of free trade in Canada has ever explained how the industrial advantages possessed by the United States on the American Continent can be offset except by protection of home industries through equalising protective import duties. It has not been shown that the principle of free trade was applicable to Canada, nor have any of the political parties that from time to time have coquetted with the idea, ever dared to apply the principle of free trade in practice, because they knew the inevitable result.

We would distinguish between the incurable free-trader and the advocate of lower duties. The first named is not a reasoning being, and time is wasted in discussing the Canadian situation with him. The advocate of lower tariff is one who accepts the necessity for protection, but thinks the tariff is open to modification. It is the last named that the steel companies will have chiefly to combat, and we would review some of the reasons that suggest the tariff in connection with the steel industry should not be lowered

at this time. We believe the abolition of the protective duties will not be seriously urged by any seriously-minded person.

#### Adverse Exchange and Import Tariffs Have Not Checked Imports of Iron & Steel.

The tariff as a deterrent of importations has been for some time relegated to a second place by the discount on the Canadian dollar. The operation of economic law has — without the intervention of legislation — placed our dollar at a discount, a process that will, by restriction of imports, gradually restore our dollar to exchange parity. A reduction of import duties under these circumstances would be an entirely gratuitous and foolish proceeding, and would indicate that Canada was neither anxious to encourage home industry, or to support her foreign exchange rates.

The value of imports of iron and steel into Canada have averaged during successive five yearly periods since 1898 to 1919 inclusive, as follows:

	In Millions of Dollars
1896 to 1900 . . . . .	17
1901 to 1905 . . . . .	371½
1906 to 1910 . . . . .	51
1911 to 1915 . . . . .	99
1916 to 1919 . . . . .	169

The iron and steel industry in Canada may be said to have commenced in the period between 1901 to 1905. Since 1901 the value of imports of iron and steel has risen from 25 million dollars to 182 million dollars in 1919, or by six times.

From which it would appear that if a check on imports of iron and steel goods had been desired it has not been notably successful, nor can it be said that the import tariff imposed by Canada has been of a character to stifle outside competition.

#### Production of Iron & Steel in Canada.

Production of iron and steel in Canada is best measured by the annual output of ingots and steel castings. This, apart from an annual production that had not exceeded 30,000 tons, commenced with 200,000 tons from the Sydney Plant in 1902, reaching a pre-war peak in 1913 with 1,169,000 tons. In 1918, under the spur of war, steel ingots and castings to the extent of 1,873,000 tons were produced, falling in 1919 to 1,030,000 tons. It may be said, therefore, that but for the unusual and imperative demand occasioned by the war, the steel output of Canada has remained stationary for about eight years, or from 1912.

It is therefore fair to say that the import duties have not been too heavy, if judgment is based either on the volume of imports, or on the volume of domestic production. They have not been remarkably successful in stimulating the basic part of the iron and steel trade in Canada.

#### The General Iron & Steel Trade in Canada.

The statistics gathered by the Government in 1917 ascribe to iron and steel products the following extent

and importance, namely :

Number of establishments . . . . .	1,049
Capital . . . . .	\$307,407,980
Employees on Wages . . . . .	70,071
Wages paid . . . . .	\$ 68,947,610
Cost of Materials . . . . .	\$204,732,121
Value of products . . . . .	\$400,385,086

The number of works in Canada making the basic products of iron and steel, (on which protection by tariff is given) does not exceed nine, if blast-furnaces are counted, and is not in excess of say one hundred, if electric furnaces, small open-hearth furnaces and similar equipment is considered. It is apparent from a study of the foregoing figures that the great bulk of the iron and steel industries of Canada exist by fabricating and making into manufactured articles the partially finished steel and iron goods that are imported into this country, to the extent of almost 200 million dollars worth annually.

It is most evident that the existing tariff has not operated to restrict the growth of the general iron and steel trade in Canada.

#### The Influx of United States Iron & Steel Trades into Canada in Recent Years.

One of the outstanding features of trade in Canada during the past few years has been the large and unremitting increase in the number of United States concerns engaged in the metal trades that have set up establishments in Canada. The lists of incorporations and the trade notices contain a preponderance of items of this nature. The extension of United States concerns into Canadian markets is rather more notable than the formation of new enterprises backed by Canadian men and money.

The cumulative evidence of the increase of imports of iron and steel, before mentioned, taken together with the notable increase in establishments of United States origin within our borders, indicates that while the tariff has not hindered to any appreciable extent the imports of iron and steel into Canada from outside, it does make it desirable, from the viewpoint of United States interests, to come into Canada and set up establishments.

This we take it, was one of the objects of those who framed the tariff—so far as iron and steel is concerned—and it has been attained.

#### A Washington Opinion.

All of the foregoing gives point to the opinion of the Washington correspondent of "Iron Age," who may be taken as accurately representing the viewpoint of our not disinterested friends in the United States.

"Iron Age" in the issue of 26th August, states :

"Plans for the revision of the Canadian tariff laws have a particular interest to the United States's iron and steel industry. No other section of the Canadian tariff statutes is so comprehensive as the one

" which covers importation of iron and steel. More than one hundred individual paragraphs are devoted to this industry. The law, as it stands, was carefully written to protect Canadian industries. If Canada produced the article in question, it was pretty sure to put that article under a protective tariff. If Canada did not, the duty was low, or was removed entirely."

This is a fair statement from a representative quarter, and accurately portrays the viewpoint of the United States iron and steel producer, who, while not disinterested in the matter, yet looks to Canada for such a comparatively small portion of his business, that he can take an unbiased critical attitude regarding the tariff policies of this country.

The existing Canadian tariff was, as "Iron Age" states, very carefully prepared, and has not, as we have attempted to show, worked decidedly to the advantage of the Canadian producer, nor decidedly to the disadvantage of the United States importer. Much has happened, however, since the tariff was written, and new branches of the metal working industries have come into Canada, such as factories for automobile manufactures of various kinds, the manufacture of alloy steels and special tool steels, the manufacture of ship-plates, of black and tin-plate, steel shipbuilding on a large scale, and other important accretions to the industry. The tariff requires to be enlarged so as to foster these new industries, and it is very desirable that clear statements shall be presented to the Tariff Enquiry Board at its sessions.

The interests of Canadian iron and steel producers are diversified, and may conceivably clash, because of the extent of our country, and the relative nearness of certain portions of it to the United States, as opposed to the remoteness of certain other sections from any large centres of population or industrial activity.

So far as the eastern steel companies are concerned, they are most vitally interested in the preservation, and if possible, in the increase of the duties on import coal. In the present state of the coal market the existing duty on coal is entirely a negligible factor, if restriction of imports and encouragement of home production is desired. When coal costs \$12 at the pitmouth, a protective duty of 56 cents is neither here nor there.

On the other hand, the steel trades in central Canada desire coal as cheaply as possible, and may not favor even the retention of present duties.

There are other points of apparent divergence in the interests of the iron and steel trades taken as a whole in the Dominion, but there are far more numerous points of common interest, and much need for common action in arranging that the position of the industry shall be presented to the Tariff Board fairly and accurately.

### THE TOMMY-KNOCKERS \*

\*The tommy-knocker is the gnome of the underground. He is often heard tapping the rock in mines, and superstitious miners do not like to work alone for fear of meeting him.

When I die (said the mining engineer) do not bury me at all;

Cache me on the bottom level, with a pick beside my pall;

Leave a candlestick and matches, then cave the stopes and drifts,

And I'll be a tommy-knocker for a hundred thousand shifts.

Yes, a jolly tommy-knocker, always starting for a walk;  
Always pounding on the rock, searing honest Hunkies  
with my little tap, tap, tap—

Always listening for the blast 'till the pumps are pulled at last,

And the bloody surface tenderfoots are routed from their nap;

Then the depths of earth will be lighted and we can see right through,

And all the lost bonanzas will be nuts for me and you.  
Then we'll dig, dig, dig. (If we've been good engineers)

Ore shot with chunks of metal, through all the happy years.

We'll have angels for muckers, who'll never ask for pay,

And the ore will stope itself, over—under—anyway—  
Anyway you say!

Oh, boy! Don't wake me up

And say the men are striking and the tax-collector's here,

And the bottom of the metal market's gone,  
And how you've lost the ore-shot, and all the other grief;

Jest let me snooze 'till Gabriel blows his hawn!

SAMUEL B. ELLIS,

"Engineering and Mining Journal."

### GRANBY CONSOLIDATED TO SHIP SMELTER PRODUCT TO REFINERY VIA VANCOUVER.

Through arrangements made with the Robert Dollar Steamship Co. the Granby Consolidated Mining, Smelting & Power Co. will hereafter ship its smelter product to the refinery by an all-water route. This will eliminate the necessity of paying the high cross-country rail tariff which would otherwise prevail on the company's copper.

On its Far Eastern-New York service the Dollar Co. makes Vancouver its last port of call en-route to the Atlantic port and Granby will transfer its product to the company's vessels at that point. The copper will be lightered from the Brooklyn docks to the Laurel Hill refinery of the Nichols Copper Co.

It is understood that the copper company was able to make arrangements for shipment through the Panama Canal at a rate sufficiently attractive to decide upon the all-water transportation avenue. It will take something less than a month for the trip whereas during the height of the railroad congestion Granby's copper was sometimes 90 days in making the journey across the continent from smelter to refinery.—"Boston News Bureau."

## SOME RECENT OBSERVATIONS AT THE GOLD & SILVER MINES IN NORTHERN ONTARIO.

By R. E. HORE, Consulting Editor.  
Progress at Porcupine.

The possibilities of the Porcupine gold mines are becoming greater as development proceeds. A statistical review of gold mining in Ontario during the past decade would show remarkable increases in production. It would not, however, indicate with any approach to exactness what the mines are capable of yielding. It has been fairly well demonstrated by the production record that the Hollinger, McIntyre and Dome are great mines, but there is not yet recognition of the fact that they may be very much greater mines in the near future and that their possibilities are as yet only to a slight extent determined. The development work so far done has revealed quantities and quality of ore that assure profitable operation under normal conditions for many years. If men were available the output could be greatly increased almost immediately and the further development would probably show even the increased output to be much smaller than the ore deposits warrant.

Those who visited the Porcupine district, eleven years ago and compare conditions then with the present, are forced to recognize that the development of gold deposits in Ontario is an enterprise worthy of the best attention of our people and one to be encouraged by our governments. Where now there are great mining and milling plants and hundreds of residences and places of business, there was in the fall of 1909, a forest-covered wilderness where a few mine operators and prospectors were endeavoring to find out whether some outcrops of gold quartz were of sufficient size and richness to permit of mining. To reach the camp at that time from the railroad thirty miles away, was a trying trip for the traveller and the source of much worry for operators who had to take in supplies for development work. There were promising outcrops then at the Hollinger, McIntyre and Dome and around those outcrops, and the exploration shafts were anxious men who wondered whether they were warranted in spending the money necessary to secure the properties and develop them. There are many people who assume that the development of a mine like the Hollinger is a constant source of delight to the owners; but if the men who bought the Hollinger did not worry about the outcome in those early days, I am greatly mistaken. They had visions doubtless of the great mine that the Hollinger is today and they had courage to go ahead when payments had to be made, but they doubtless had visions too of an abandoned shaft and a pile of quartz with too little gold in it and a tidy bunch of check stubs to show for their venture. The making of mines is largely in the hands of such men, men who know they are venturing where there is no certainty of success.

Since those days there have been many problems to meet and overcome at the Hollinger; but the one most essentially factor to success, the ore deposit, has given no cause for disappointment. The work done has shown that the deposits are even better than they appeared to be in the early days. Ore faces, at which men may be put to work, are not difficult to find in the Hollinger mine. The problem now is to find the men.

It seems now that conditions are changing in favor of gold mining and it is hoped that before many months the mines will again be fully manned. It will then be found that the operators have not been idle and that preparations have been made to fully utilize the labor as it becomes available.

### Promising Outlook for Gold Mining.

The past few years have been trying ones for gold mine operators, and the present tendency toward lower prices is consequently being hailed with delight. It has been generally known that during the past few months the public has been administering slow poison to the profiteers. Merchants and manufacturers have found it no longer possible to advance prices and continue to do business. They have then attempted to dispose of large stocks of high priced goods without lowering prices. This also has failed and they are now making concessions in order to unload. Actuated by common interest they have maintained prices for some months after it was realized that crash must come if the buying public realized their position. Cost of production of most articles still remains high, but the paucity of orders has made necessary reductions in selling prices. Merchants doing business in this falling market are naturally displaying nervousness in buying. Those who are not willing to believe that price are going lower, base their judgment largely on the fact that costs are still high. The public seems, however, to have concluded that prices are too high regardless of cost of production, and by refusal to buy, are bringing matters to an issue. It is apparent that both profits and costs must come down and possibly some who made unduly large profits in the rising market, may have to take losses in the falling. Someone must take the losses. Our bankers have been fixing things during the summer so that they will not be the goats. The uneasiness in the business world is largely due to the endeavor of each group to make someone else the victim, a normal endeavor when the belief is general that we have entered on a period of falling values.

Whether these views are correct or not remains to be seen. They are not the views of an economist and they are not here supported by arguments. They are views expressed by one who has no unusual advantages for obtaining information concerning the progress of events. They are little more than a statement of street gossip. The reason for expressing the views here is that the writer sees in all this something of vital importance to the gold mining industry, for if the view is a clear one, it can have but one meaning for the gold producer,—a bright prospect for the future of gold mining, where the product is one of fixed value and unlimited market.

### Foreign Labor in the Mining Industry.

To a large degree the great growth of the mining industry in recent decades, has been made possible by the utilization of foreign labor. Comparatively few Canadians or Americans have shown a desire to work in the mines. If mine operators were not able to draw on Europeans, for a large part of the labor needed, it would be impossible to get the work done. It is fundamental to the success of mining enterprises in this country that no obstacles should be placed in the way of men who would come to this country and do work that our own people do not want to do.

When the copper mines of Michigan were opened and the operators looked for experienced miners, they found few American miners available. Miners were

brought out from England and for years the Cornish miners were a very important factor in the development of Michigan's copper industry. As the industry grew, a certain number of Americans were attracted to it, but no large number has ever been available. As the mines developed the operators found it necessary to depend to a large extent on immigrants from Europe. Finlanders, Austrians, Italians and Croatians have furnished much of the labor in recent years. English speaking miners and mine laborers are preferred; but not enough of them can be found.

When the first big mining enterprise in Ontario, the nickel-mining industry of Sudbury, became established, miners of the same nationalities as those in Michigan, came to do the work. Later, at Cobalt and Porcupine, labor was furnished largely by the same countries. In each case a few Canadians were attracted to the work, but the number is quite inadequate for the work.

In order that mining operations may be carried on profitably in Ontario, it is essential that we have men and money. When the money to develop and equip properties is found, the mines and mills should be worked at full capacity. It is in the interest of the laborer as well as of the shareholder that enough men be found to do the work and operate the plants efficiently. To operate at half capacity profitably is in some cases possible; but much greater profits can be made when operating at full capacity, for then the work of each man is more profitable. The miner, as well as the men who supply the money, knows that it is to his advantage that the industry should prosper.

It is the proper function of government to assist in the development of natural resources. Our people want prosperous industries here. It is well known that the mining industry will make better progress if we find more foreigners to work in the mines. To attract such men might reasonably be expected as a proper function of our governmental departments.

Yet there is a growing belief that our immigration authorities are averse to encouraging the incoming of foreign miners at this time.

**Davidson Gold Mine.**

A plan designed to provide the necessary money to operate the Davidson gold mine on a large scale has been placed before the company's shareholders. The English interests, who propose to furnish the money, ask for options on enough of the outstanding stock to give them control at a reasonable price after they have put the enterprise on its feet. The arrangement made with the English capitalists is the result of several months' work by Mr. H. H. Sutherland. He is satisfied that the bargain is a good one and that it should appeal to Davidson shareholders. There seems good reason for this opinion and it will be surprising if the shareholders do not accept the offer.

There have appeared since the offer was made, the usual criticisms in regard to the tying up of stock under option. If we ignore some of the criticism which is founded on improper presentation by the critics of the terms of the option, we find no great grounds for complaint as to the terms, though objection may well be raised to the method adopted in carrying them out.

The Davidson company have what is believed to be a valuable property, but no money to operate it. Mr. Sutherland has found men ready to put up the necessary money. The shareholders can fairly be expected to sacrifice something in favor of those who supply

money to make the mine a producer. They are not asked to make any great sacrifice and they will do well to accept the offer and permit vigorous development of their property, to proceed without delay.

**NOTES FROM THE NOVA SCOTIA COLLIERIES**

**Dominion Coal Company's Output**

The September outputs from the Glace Bay collieries totalled 264,733 tons, compared with 260,736 in August, and 242,628 tons in September 1919.

The individual colliery outputs were as follows :

No. 1	29,613
No. 2	42,313
No. 4	27,786
No. 5	8,383
No. 6	21,793
No. 9	21,008
No. 10	9,704
No. 11	14,433
No. 12	8,162
No. 14	18,169
No. 15	9,030
No. 16	14,578
No. 17	2,738
No. 21	15,049
No. 22	17,439
No. 24	4,444

Totals . . . . . 264,712

The features of interest in the foregoing figures are the continued increase in the percentage of Emery Seam coal, and the very satisfactory production from the Birch Grove collieries, Nos. 21 and 22, which are up to best pre-war performances, or approximately so. The average daily output during September was 10,500 tons, or slightly better than the summer rate. For the first several days in October it has averaged over 12,000 tons, and as October is traditionally a month of maximum outputs, production should improve in the period between now and Christmas.

**The Cause of Reduced Outputs**

Mr. F. A. Carman, in the Montreal "Star" gives, without comment, a recapitulation of the causes of reduced output at the Nova Scotia collieries as given to him by representatives of the coal miners and of colliery companies. The statements repeated by Mr. Carman appear conflicting, but actually they are not so much conflicting as partial and incomplete.

The following figures are quoted as being the average daily output per man employed at the collieries of one company for the years mentioned, namely :

Year	Average Tons Per Man Per Day.	All Classes
1910	2.4	
1911	2.54	
1912	2.5	
1913	2.51	
1914	2.7	
1915	2.73	
1916	2.59	
1917	2.42	
1918	2.23	
1919	2.06	
1920 (July)	1.95	

It is stated that the miners union, by its rule of "one man, one job" has raised the number of workers who handle the coal, as distinguished from those who do the actual cutting. The coal is cut by contract, while the handling is paid for by day wages, the result of the union's policy being that a larger force of day workers is necessary to do the work. This statement, if it is supplemented by one other, will explain the reduced rate of production per capita. There is a definite shortage of men employed in digging coal.

The following statement shows approximately what may be taken as a typical arrangement of the working forces at Nova Scotia Collieries before the heavy enlistments for war service and at this time:

	Preceding		Present Time	
	P.C. of	Tons	P.C. of	Tons
	per	per	per	per
	Employ.	Man	Employ.	Man
Surface Labour .. ..	12%	20.4	18%	10.3
Underground Labour..	41%	6.2	47%	4.0
Mining Coal .. . . .	47%	5.4	35%	5.4
	100%	2.5	100%	1.9

Inspection of these figures will disclose that there is now a total of 65 per cent of non-productive labor employed at the collieries, compared with the total of 53 per cent in the previous period. The average daily production of the mining coal class has not decreased, nor could it very well, seeing that these men's earnings are dependent on the amount of coal they dig, but there are too few men in the mining coal class, and too many in the non-productive class. There has been a reduction of 40 per cent in the numbers of the men mining coal, and there has been a reduction of 40 per cent in the production of coal. A replacement of the shortage of men in the mining coal class would necessarily cause an increase in output proportional to the number of men so replaced, and if they were all replaced the output would be restored to the former figure.

The reduction in coal production in Nova Scotia dates from the heavy enlistment of 1916. Between 1915 and 1916 alone the Dominion Coal Company lost by enlistment the labor of 1,300 unmarried men between the ages of 19 and 35, or 30 percent of this class, and lost also 50 percent of the boys under 19 year of age. Ninety-five percent of the enlistments were from amongst the underground workers. It is this gap that has never been filled.

The re-alignment of working forces and the new sub-division of work amongst those who remained behind has, unfortunately, come to be regarded as a permanent arrangement, and the chief blame for the continued small rate of coal production should be laid, not upon the individual coal producer, but upon that policy of the union which is opposed to any importations of new men, or to any policy that is designed to transfer men from the non-productive class where they are now found, to the productive class, where they were formerly employed.

"Will you tell us how to get some more revenue?" was a question put to the General Manager of the Trail Plant by Sir Henry Drayton at a Tariff Enquiry session. "Tax the farmer" suggested Mr. Warren, "especially the 'smoke farmer'". Not at all a bad idea.

## British Columbia Letter

### THE METAL MINES.

#### Stewart, B. C.

It is reported from the Alaska side of the Salmon river section, Portland Canal, that considerable interest now is being taken in the development of mining properties in this locality. It is likely that at least three properties will be working all winter. The New Alaska is to be opened up and a diamond drill is being used in exploration work on the property of the Fitzgerald brothers. This property is located on Fish Creek. On another group of mineral claims, controlled by the Fish Creek Mining Company, a promising vein of ore has been encountered, and it is hoped that it will be possible to ship ore this winter. There also are properties on Texas Creek of which much is expected.

#### Trail, B. C.

Ore receipts at the Trail smelter during the week ending September 14th totalled 8,869 tons, bringing the total for the year to date to 230,181 tons. The Ruth and the Redress of Sandon, and the Silver Glimpse of Geigerich, added their names to the limit of Slocan shippers, while the Voight of Similkameen also was a contributor.

#### Nelson, B. C.

A galena property has been located at Nakusp on the Arrow lakes. The claim is known as the Luek Rose and is especially interesting for the reason that this section has not hitherto been considered as possessing mineral possibilities. Already a lead has been uncovered for 300 feet and the assays are reported to give returns of from 49.1 ounces in silver, and \$1.80 in gold.

#### Kaslo, B. C.

Hon. John Keen, speaker for the Provincial Legislature, has just returned after a trip through the Lardeau district. He visited the Lardo, Trout lake, Ferguson and other points. Mining he says is rather quiet. The Triune, True Fissure and other claims look well, while the leasers on the Silver Cup and Nettie L have made good progress and have ore ready to ship. The Gold Cure and other claims are promising.

Speaker Keen observed that Trout lake mining was not as brisk as it might be, but that operators there are looking forward to the future optimistically.

As to the labor situation he said that it was showing marked improvements, men were going back to the camps seeking employment and the indications were that in a short time the trouble which has been experienced during the past several months would be settled.

#### Greenwood, B. C.

The Lightning Peak mining section is being opened up by the construction of a trail, under the terms of the "Mineral Survey and Development Act." The Provincial Government has been busy on this for a large part of the past season, and the work now is reported to be practically completed. Lightning Peak has an elevation of about 7,500 feet. In that locality are situated a number of mining properties which give promise of developing into im-

portance. Among these is the Waterloo Mine in which Greenwood people are interested. With the completion of the trail it will be possible to make the trip with pack horses from Greenwood to the peak in four days.

The Rampallo group of mineral claims located near Edgewood is being opened up by a considerable force of men. When in about 40 feet from the mouth of the tunnel a ledge about one foot wide was cut. It carried gold and silver. To reach the main ledge there is still a distance of 250 feet to go. This main ledge shows an average of \$10.00 in gold and 250 ounces in silver at a depth of about 20 feet.

Ore is being shipped from the Waterloo mineral claims and there are about 800 sacks of high grade ore ready to bring out.

On the Killarney a new tunnel is being driven, and the ledge has been struck at about 75 feet. This ledge is about six feet wide.

**Victoria, B. C.**

A small force of men has been employed since last March on the Gabbro Copper Mines, Ltd., situated at Jordan River, Vancouver Island. Several large open cuts have been made with a view to ascertaining the grade and continuity of the ore bodies. Some good ore has been taken from a tunnel driven on Sinn Fein Creek, but the most promising showings were found on the Sunlock Cave Zone where it crosses the Jordan River into the Gabbro group. The open cuts referred to have established a width of from 5 to 25 feet of mineralized material having a length of between 300 and 400 feet. The grade of the ore is exceptionally good, there being considerable body averaging 3 per cent or better, which is the best surface showing as yet found in the Jordan River Section. The zones on the Gabbro group are in basalts of Eocene age, which have been intruded by a stock of gabbro. There has been much shearing of the basalts, due probably in part to the shrinkage of the gabbro mass when cooling, and also to regional stresses.

There has also been some shearing and ore deposition in the gabbro. Continuity of the ore at depth in these shear zones is shown by the tunnels on the adjoining Sunlock property, which give a vertical depth of over 500 feet. The Sunlock is one of the very few mines in this province that has had no serious set back since the beginning of mining operations on it in 1917.

**The Collieries.**

The report that the fuel control system was to be re-introduced was apparently incorrect, but in such an event it is unlikely to affect British Columbia. This Province is a little differently placed, as is recognized by the fact that the embargo against the exportation of coal from other sections of Canada is not made to apply to it. It would seem from this that the Canadian authorities realize that the collieries of the Province may be depended to look after the domestic necessities before undertaking to meet outside demands for fuel. If therefore it is considering that British Columbia is able to look after herself in this respect, it surely will not be thought necessary to introduce legislation covering the distribution of coal within the Provincial borders.

While the British Columbia collieries are working

to capacity, or rather to as near capacity as the available labor renders, there are reports of pending labor troubles from a number of coal fields. One of the most imminent of these appears to be threatening the coal mines of Washington State. There the miners threatened to walk out to enforce demands that a recently established wage scale be made retroactive to August 16th. The operators have announced that in the event of this happening the mines will be kept open for the employment of all men who wish to remain at work. This promised strike was set to occur a day or two after the time of writing, and as it is said to have had the sanction of the United Mine Workers of America, it no doubt has since developed. All but two mines in the States are affected and 3,000 coal miners approximately will leave their work. In an effort to provide against the coal shortage anticipated considerable orders are being placed in British Columbia by consumers in the State of Washington.

New workings are to be opened up on Vancouver Island by the Granby Mining and Smelting Company. This company's operations on the island have been somewhat interfered with by a recent rule of the Supreme Court which decided that rights in two leases of coal lands being exploited by the Company really were owned by the E. and N. Railway Co. Pending an appeal, however, the Granby Company is permitted to mine up to 100,000 tons of coal. While this latitude is permitted the operating company no doubt feels its restrictions, and proposes to proceed with the development of other of its coal lands over which there is no dispute.

In the course of a few weeks the British Columbians will decide through a plebiscite whether they are in favor of a wet or a dry condition as to the liquor traffic. An interesting sidelight on the attitude that the residents of at least one of the coal mining centres of this Province may be expected to take on this question is furnished by a vote which was taken at Cassidy a few days ago. Cassidy is the island mining town of the Granby Company Mining and Smelting Company. There was a general meeting at which arguments pro and con regarding prohibition were advanced. A vote followed and a large majority enthusiastically endorsed government control in preference to the present Prohibition Act.

**August Coal Output in British Columbia.**

The coal output of the collieries of British Columbia for the month of August was as follows:

<b>Vancouver Island Field.</b>

**INTERNATIONAL MAGNESITE CO. OF QUEBEC ON SIX PER CENT DIVIDEND BASIS.**

The International Magnesite Company, Limited, has declared a further dividend of one and a half per cent. payable October 1, for the quarter ending September 30 last. This is the second declaration for the year of a like amount.

The stock of this company has been placed on a six per cent. basis—earnings for the current year being satisfactory and future prospects bright.

The company operates in Argenteuil County in the Province of Quebec, about fifteen miles north of Grenville, where their extensive quarries and plants are located.

Officers of the company are: E. W. Whiting, president; J. R. Colby, vice president; C. F. Gamble, general manager, and R. Thouret, secretary-treasurer. The sales manager is H. Percival Ross.

**PRICE OF LEAD AGAIN REDUCED.**

American Smelting & Refining Co. reduction in its New York price for lead from 8 to 7 3/4 cents is the third in 16 days, and is due to considerable importations from Europe. Sept. 13 the company reduced from 9 to 8 1/2 cents and on Sept. 23 from 8 1/2 to 8 cents. Weakness of exchange is encouraging importation in spite of 25% ad valorem duty upon lead, and with continued weakness in exchange a further decline in the domestic price can be expected. At present the price is the same as it was Jan. 1, 1920.

For the last six months United States consumption of lead has been much larger than production and a considerable importation has been necessary to meet demand. The main cause of the expansion in our lead requirements, and of the rise in lead, has been demand for metallic lead as well as lead oxide for storage battery use. Pigment consumption has also increased, as we are today not only supplying our own market but exporting much lead-paint to South America and the Orient, taking much of the business formerly done by Germany and England. A certain amount of lead must therefore be expected to come in for many months. Domestic price, however, must be such as not to encourage too great importation.

One mining man called attention to efforts of American Smelting & Refining Co. to stabilize lead consumption by keeping the price at proper level. In this aim, it follows a policy similar to that of United States Steel in the steel industry. "Boston News Bureau."

By error, the statement was made on page 808 of the "Journal" in the last issue, that there was a demand for low-grade asbestos cloth for renewal of brake linings on "freight cars". This, of course should have read "motor cars."

## Northern Ontario Letter

### THE SILVER MINES

#### The Cobalt Area

What appears to be one of the most important surface discoveries made in recent years had been made on the Kerr Lake mine, where a series of three veins have been opened up. The "Journal" reported the discovery of the first of these veins last week, at which time no great importance was attached to the find. Later on, however, when blasted into, this vein was found to contain considerable high grade ore, \$2,000 being taken out in two rounds of holes. As stated last week, the first vein was found during the course of excavating for a foundation for the installation of a crusher with which to prepare dump-ore for shipment.

The second high-grade vein on the Kerr Lake was found while extending the excavation work so as to make room for a conveyor, while the third was found while clearing off a place for a foundation for a motor which is to drive the conveyor and crusher.

All three veins occur within a few feet of each other, and are in conglomerate formation which at this point is about 100 feet thick. The strike of the veins is south-east straight into the Kerr Lake, and North-west toward the Crown Reserve, the boundary of the latter property being only ninety feet from the point where the find has been made.

On the strength of the probability of being able to pick up these veins, the Crown Reserve is driving a cross-cut into that part of its property lying close to the Kerr Lake and in line of the strike of the veins. It seems highly probable that these veins will be picked up, although the question as to what values they will contain at that point will be left for the actual work to determine.

The Mining Corporation is re-treating from 300 to 350 tons of tailings daily from the bed of Cobalt Lake. This is somewhat lower than earlier estimates, and with well over 300,000 tons still remaining, about 2½ or 3 years would be required to handle them at the present rate. As regards the silver content, no official announcement has been made, but it is believed the output from this source may reach upwards of 40,000 ounces monthly.

The Peterson Lake is shipping low grade ore at the rate of about 20 tons daily. Also, this company is receiving a moderate amount of revenue from the re-treatment of the large tailings pile. The income is believed to be sufficient to cover the cost of the underground exploration work now being done. Opinion seems to be that the hope of realizing any very large amount of profit rests with the development work underground, and certain interests connected with the Peterson Lake are confident that this old property may still contain some favorable surprises.

Labor is still scarce in the Cobalt district. The chief cause of the present shortage appears to be the high wages being paid by the large pulp mills under construction in various part of the north. It is believed this shortage will be only temporary, and that within the next sixty days the situation may adjust itself. In the meantime, production is not hampered to any serious extent.

The price of dressed cobalt-metal has recently increased to about \$6 a pound. In the rough it is quoted at from \$3 to \$4 a pound. The added revenue

to the silver-producing companies which turn out cobalt as a by-product is quite considerable, it not being uncommon for the cobalt content to increase a single car of ore some \$1,200 or more in value. The smelters pay the mines for cobalt when the content of a shipment amounts to over 4 p. c. For example, a shipment containing 5 p. c. cobalt is paid for at the rate of 2 cents per unit, or 10 cents a pound, and adds \$10 a ton to the value of the shipment. For shipments containing a higher percentage the per unit price is graded up to as much as 4 cents. However, as a further example, and dealing with shipments containing 10 p.c. cobalt, the price per pound at 2 cents per unit would be 20 cents and would amount to \$40 extra for each ton, thus placing a value of about \$400 per ton on a full ton of cobalt. As compared with this, the smelters after separating the cobalt are in line to receive from \$3 to \$4 a pound for it or actually from \$6,000 to \$8,000 a ton.

Information from the Cane township section of the Lake district would indicate that about three tons of ore has been bagged from open cuts on the Cane Silver Mines, and that a small shipment will be made before the end of the year. Among the interests involved in the proposition are J. Houston of Haileybury, and R. S. Potter, of Matheson. It was reported some time ago that interests identified with the Abitibi Power and Paper Company were involved in the operation, but this appears to have been erroneous and to have arisen as a result of Mr. Potter's name having been used in a wrong connection, and by an official of the Cane Silver Mines.

The O'Brien mine of Cobalt has had a scout in the field, inquiring into the possibilities of properties lying in the vicinity of the Cane group.

From information available in connection with the property at Gowganda, the question of installing a small mill may be considered before the end of the coming winter. Underground work continues to be encouraging, although not spectacular as many early reports would tend to indicate.

Tenders are being called for continuing the main shaft of the Silver Bullion property at Leroy Lake, from its present depth of 45 feet to a depth of 145 feet, at which point it is planned to carry out about 200 feet of lateral work. The property has recently been equipped with a steam-driven mining plant consisting of a 100-h. p. boiler, together with a 5-drill compressor and other corresponding equipment. A few bags of high grade ore have been sorted out from the small dump at the 45-ft shaft.

A deal is being negotiated for the Haileybury Frontier property in South Lorrain, and plans are to be made to carry on work at an early date.

The analysis of gas found at Paradis Bay a few mile south from Haileybury on the west shore of Lake Temiskaming has been found to show a fairly high percentage of methane, and is believed to indicate an oil deposit. Leases have been secured from land owners, and arrangements will be made to commence boring as soon as rigging can be secured.

### THE GOLD MINES

#### The Porcupine Field

Relief in the way of labor supply has not yet materialized in the gold mining districts of Northern Ontario. The gold mining companies are obviously determined not to enter into competition with the

companies which are constructing pulp mills in various parts of the country, and will undoubtedly bide their time, content to operate at the present rate of about two-thirds capacity until such time as labor shall be attracted by present wage scales at the mines.

On account of the great depth to which developments are being carried on by the Hollinger Consolidated at the McIntyre-Porcupine, the attention of mining men is gradually being attracted with greater interest to adjacent properties upon which these deposits may reasonably extend, and the belief is expressed that as in the case of the Moneta property as well as the Inspiration, both of which lie immediately west and south-west of the Hollinger it would not come as a surprise were one large concern to make a bid for an opportunity to gain their control and undertake operations on a big scale. In this connection, it was reported last spring that the Hollinger would consider the Moneta control at the rate of 25 cents a share, and the stock which was then quoted at around 8 cents a share moved quickly up to close to 20 cents a share. It has since declined to around 11 at the time of writing, although bids at this price fail to bring out any stock.

As regard the Inspiration, the "Journal" secured an interview with an official and was informed that the leading interests are content to await events, believing the property will steadily take on increased potential value as a result of work on the adjoining mines. This official declared the company was completely out of debt, and was in the happy position of having about 800,000 shares of stock in its treasury with which future work could be financed. He also pointed out that as a result of previous diamond-drill work, the formation was found to be favorable and that one vein was cut in which very encouraging gold values occurs.

The McIntyre-Porcupine is making good progress in the operation of the Blue Diamond coal mine which was recently acquired in Alberta. About 150 men are employed on the property, and the enterprise is said to be on a profit-earning basis. The question of whether the Tenikaming Mining Company is to join the McIntyre in the venture is to be determined at a meeting of the shareholders of that company to be held on October 7th. In the meantime, every effort appears to be exerted to make as favorable a showing as possible before that date.

Although the Hollinger and the Dome mines each conducted exhaustive tests with low-grade cyanide secured from the American Cyanamid Company at Niagara Falls it is significant to note these companies continue to use the high-grade article secured from the Cassel Cyanide Company, of Glasgow, Scotland. No official announcement has so far been made as to the measure of encouragement met with as a result of the tests and experiments with the low grade article.

The Porcupine V. N. T. is gradually getting a staff together, among the latest additions being Wm. Gowans, as mine captain, as well as Mr. J. B. McArthur, who is connected with the Associated Gold Mines of Western Australia and has arrived here. He will act in a consulting capacity with Major J. McIntosh Bell, the manager.

#### The Kirkland Lake Field.

Sinking operations have commenced on the Granby-Kirkland property, on a vein ranging from 4 to 5 feet in width, assays of which range from \$1 to \$15 a ton over the width of the vein. Five highly mine-

ralized veins have been trenched on surface, and parallel each other. It is planned to cross-cut these veins at a depth of about 200 feet.

Work has been resumed on the Mofatt-Hall property. In addition to carrying on underground work, arrangements are being made to employ a diamond drill to make a deep test of formation and veins.

The assessment work on the Crystal Lake property has been completed and an endeavor is now being made to secure finances with which to launch out into an aggressive exploration campaign.

According to the regular monthly report of manager R. C. Coffey to the President and directors, the Lake Shore mine of Kirkland Lake treated 1,281 tons of ore during August and recovered \$35,261.27, as compared with over 1,800 tons and \$52,424.45 produced in July. The lower tonnage was caused by delays due to breaking a ball-mill clutch and relining the mill.

One feature in connection with the statement is that the Lake Shore mine has now past its first million dollar mark in point of production, the total up to the end of August amounting to \$1,011,580. Another feature is that while during the early months after opening its mill on March 8th, 1918, the average recovery was about \$24 to the ton and considered by outsiders to be too high to last, the reports for recent months actually show a higher average, that for the month just closed being \$27.52, while for July the average amounted to over \$28 to the ton.

A leading feature in connection with development is contained in the official statement as of August 31st, that station timbering has been completed at the 400-foot level, as well as a bin for waste rock provided, and a hoist has been installed and the work of deepening the shaft was under way, being then down 17½ feet below that level. The objective is a depth of 800 feet, with main levels to be opened up at the 600 and 800-ft levels.

About 60 men are employed at the Argonaut Gold Mines at Beaverhouse Lake, and the results achieved continue to be highly encouraging.

Work has been suspended on the Nelson group of claims at Fort Matachewan, known as the Thesaurus Gold Mines. Arrangements are being made to take advantage of the better transportation after the freeze-up, and to then resume operations.

Within the next week or two, a crew of miners will leave for the Lightning River district to commence work on the Lightning River Gold Mines. More extended reference will be made to this property in the next issue.

#### Personals.

Mr. P. B. McArthur, of London, is visiting the Porcupine gold district.

Mr. A. A. Cole is back at his office at Cobalt.

Mr. D. Keeley, of the McIntyre staff, has returned to the mine after a month's holiday.

#### GYPSUM EXPORTS RESUMED FROM CAPE BRETON.

The Iona Gypsum Company, whose quarries are at Iona, Cape Breton Island, is making the first shipment of gypsum since operations were resumed after the war. A cargo of 2,500 tons is being loaded for Philadelphia, where before the war, Cape Breton gypsum was in much demand.

# WILEY BOOKS

By G. Montague Butler, E.M.,

Dean, College of Mines and Engineering,  
University of Arizona.

## A Pocket Handbook of Minerals

Designed for Use in the Field or Classroom,  
with Little Reference to Chemical Tests.

All the details are given which may be needed to identify most of the minerals which mining men, students, or collectors are apt to encounter.

311 pages, 4 by 6¾—89 figures—flexibly bound—price, \$2.50 post paid.

## Pocket Handbook of Blowpipe Analysis

With the proper instruments and this book in his hands, anyone will be able to decide what each mineral under examination contains.

80 pages, 4 by 6¾—cloth bound, \$1.00 post-paid.

## Geometrical Crystallography

This book teaches the reader to recognize crystal forms, and especially systems, at sight, with the use of few, if any, instruments.

155 pages, 4 by 6¾—107 figures—cloth bound, \$1.50 postpaid.

Also Issued in Combined Form.

## Minerals, Blowpipe Analysis and Geometrical Crystallography

For the benefit of those who prefer these three valuable books under one cover, for additional convenience, this volume has been brought out at an appreciably reduced price.

546 pages, 4 by 6¾—196 figures—flexibly bound, \$3.50 postpaid.

Examine these books—prove their worth.

### THE DOER.

Make the best of the worst of things, is the attitude of he who would be wise. The optimist insists on cheerfulness. He needs it mentally as the system needs oxygen. A fake optimist is a bubble, bright and brilliant in sunshine, but when touched with rough stuff bursts. The read hard-rock optimist is a tonic and a jewel. He is an expander. The world is too small for him. Incidentally, he is the man with the pick and shovel who starts the movement to new locations. The Yukoners know him well. Many a time they have seen him strike out for the hills with his pack and dog and gun, an independent fellow, earnest, a bit of a fatalist, adapting himself readily to circumstances. He will tackle a raging river on a few logs bound together with willows. If he goes under, no one may ever know the how or when of it. If he wins, thinking nothing of it, he follows his course. If he is out for placer gold, he has an eye for rimrock and gravel banks in creeks and gulches; if a quartz man, he looks for "float" along the bars and fringes of the waterway. Patiently he will dog a likely prospect to its lair in the virgin rock. When the "float" is increasing he knows that he is drawing near the source.

He may find no more than a small piece or two in a whole day's tramp, but he is experienced as well as hopeful. A change in the water course, an eddy, a current, has its effect. He studies nature instructively. The good prospector is a born naturalist and observer. He knows his rock as thoroughly as Faber does his spider or the blind wood borer. When the "float" ends abruptly, there the prospector camps. The glow of his fire lights the darkness, the crackle of burning logs break the stillness. A bit of canvas on a couple of poles, a blanket spread on spruce boughs, a piece of bacon in the pan, a biscuit, a pot of tea, a pipe, and your optimist feels like a lord. If he has luck, a Keno Hill or Mayo boom may result.

And what follows? Look over the history of mining throughout the world. In the glow of his camp-fire on river or mountain did the prospector see a railway reaching across the wilds? Did he see towns, cities? Hear the hammer of the worker, feel the throb of industry? No, likely not. But he made all these things.

His name may never be known outside his own small circle of cronies, but his works ring round the earth.—From Dawson "Weekly News".

Washington reports state that iron ore has been found in the Philippines, on the Island of Mindanao, in very large deposits, up to 500,000,000 tons of ore having been ascertained to exist within easy transportation distance of Dajkin Bay, a fine natural harbor. The United States was not unblessed with iron ore when it had not acquired outside territories, but if the foregoing is approximately correct, the new find, added to the known Cuban deposits and the domestic iron ores, should relieve the United States steelmakers of any pressing anxiety for iron ores in the years to come.

Within one politically undivided territorial unit, the United States possesses the most generous supply of coal and iron of any nation. It is a country that could not avoid commercial greatness, even if it tried.

# ROLLER BEARING MINE CARS

We make any type of Mine Car desired by the buyer. We also design and build special cars, if none of the standard types will suit.

Let our Engineering Department help you reduce your costs and increase your output and general efficiency.

This view shows the oil or grease retaining cap removed to show the Roller Bearings supplied on our Mine Cars.

Same car as shown above, but in Dumping position.

END DUMP  
MINE CARS

This is one of our many designs. Our catalog shows others—End Dump, Side Dump, and Rotary Dump. We make this car any size or capacity you want.

Send for your copy of our new Mining Catalogue.

## Marsh Engineering Works, Limited

Established 1846.

BELLEVILLE,

ONTARIO

Sales Agents:—MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

### COAL QUOTATIONS.

Toronto, Oct. 8—Coal during the past week has been a little easier in the Toronto market, but the car supply for the past week has been very meagre which will mean a considerable curtailment of receipts in the course of two or three weeks. Hard coal is still quoted at from \$8.00 to \$16.00 gross tons at the mines, American funds. Mine run is quoted at \$13.85 to \$14.25 f.o.b. Toronto and smokeless runs at from \$14.00 to \$15.00.

Montreal: Spot bituminous is obtainable at about \$8.00 per ton, American funds at mines. The price delivered to domestic consumers in the City is now about \$17.000 compared with \$18.00 a few weeks ago. Lower quotations on New York funds and better deliveries at the mines are assisting in lowering the price of soft coal. Some deliveries have been made by the mines on contract coal at the lower prices at which these contracts were made, which is an indication that the demand is easier.

No coal is coming to Montreal and district from the Nova Scotia collieries, and none is likely to come this year. For the first time in memory, householders in Nova Scotia are being restricted in their coal purchases, and actually the coal being mined in the Maritime Provinces is insufficient for the local needs, including Newfoundland.

The discovery of a new vein on the surface which excavating for installation of a rock crusher, has given new interest to the possibilities of making other finds by intensive surface prospecting. Silver mines of the Cobalt district die hard, for rich veins are often encountered as work proceeds. It is never safe to predict the end of the life of one of these mines.

### UNDER LICENSE FROM "UNCLE SAM".

The Canadian people heave a sigh of relief at the report that enough coal will be available for another winter. The essential supply comes from the United States.

Until Canada develops her own rich coal deposits, the Dominion will operate every winter under license procured from Uncle Sam. Before a Canadian representative is installed at Washington our relations with the United States should be placed on a self-respecting basis.—"Montreal Star".

### CONSOLIDATED M. & S. CO. COMPLETE TRANSMISSION LINE TO COPPER MOUNTAIN

The West Kootenay Power and Light Company (which is owned by the Consolidated Mining and Smelting Company) has completed the power line extension to Copper Mountain.

The railway company has completed its spur into the property and is now ready to transport the output of the Canada Copper Company to the Smelter at Trail, where the ores will be treated. The power company have contracted to supply 5,000 h.p. to be used in connection with the mining operations at Copper Mountain.

### NATURAL GAS SHORTAGE IN ONTARIO

The Natural Gas & Fuel Co. of Hamilton has cut off supplies of natural gas to manufacturers, and has warned householders and others that natural gas must be reserved for lighting and cooking in domestic establishments, and next for cooking in public establishments. No gas is to be used for heating purposes unless there is a surplus over the first-named requirements.

# MINING OPPORTUNITIES IN MANITOBA

---

---

## Mineral Areas

Approximately three-fifths of the total area of Manitoba is Pre-Cambrian. In the Pre-Cambrian of Ontario, the well-known camps of Sudbury, Cobalt and Porcupine have been developed. In Manitoba, there was but little prospecting before 1912, when the Rice Lake Camp was opened up, and the Hudson Bay Railway gave access to the mineral areas in Northern Manitoba. Attention is being directed particularly to the Pas Mineral Belt and the Rice Lake Area, but prospecting is being carried on in the Cross and Pipestone Lake Area, the Oxford Lake, Knee Lake, God's Lake and Island Lake Area, and the West Hawk Lake, Falcon Lake, Star Lake Area.

## Development

Since 1915, development has been rapid in the Pas Mineral Belt. Twenty million tons of low-grade copper ore have been explored by diamond drilling at Flin Flon Lake and are now being actively developed under option. High grade copper is exported from Schist Lake to the smelter at Trail, B.C.; over seven million pounds of copper have already been realized. Other copper prospects are under development and the building of a smelter at the Flin Flon property will lead to the establishing of a large copper industry. Gold is now produced at Wekusko (Herb) Lake, and active underground development work is being carried on at Wekusko Lake, Copper Lake and in the Rice Lake District east of Lake Winnipeg.

## Transportation

Transportation is available to the Rice Lake Area by steamboat from Winnipeg to the Hole River, and thence by launch and Provincial wagon road. The Copper Belt is reached from The Pas by the Ross Navigation Co's. steamboats to Sturgeon Landing, thence by wagon road and canoe. Herb Lake is reached from Mile 82 on the Hudson Bay Railway (less than one day from The Pas.)

## Mining Regulations

The mineral resources are under Federal control and the Federal mining regulations apply to Manitoba. No mining license is required. Work to the value of \$100.00 a year must be performed for a period of five years on claims filed under the quartz mining regulations. The office of the Mining Recorder for the Rice Lake district is in Winnipeg, and for The Pas Mineral Belt at the Pas.

## Opportunities

The districts are comparatively new, and on the eve of substantial development. There are good opportunities at the present time for prospectors, mining companies, and particularly for development companies.

For maps, reports and general information, apply to—

## McGILL ESTABLISHES ENGINEERING PHYSICS COURSE.

The establishment of a course in Engineering Physics in the Faculty of Applied Science in McGill University, with special facilities for the teaching of electrical science, is a sign of the times, and of the virility of a famous University.

The contributions to scientific knowledge made by the research departments of the great electrical companies, in the United States, in Britain and in Germany, have in recent years been most noticeable. The researches of such men as Langmuir are symptomatic of the entirely novel views on matter, space and time that have been arrived at by those who are attempting to solve the mystery of electrical energy.

No branch of science is today so abstract in theory and so concrete in application as electrical phenomena, or demands for its reasonably full understanding so generous a grounding in mathematics and physics. The studies required to fit a young man to enter the ranks of really well-equipped workers in electrical science are so severe that while probably many will consider themselves called, few will be found among the chosen. It must also be admitted that Canadian universities, when they can refer to such names as Rutherford and McLennan (to select without invidious intent two names from among many) can not be accused of backwardness in physical science, yet the faculties have not been so thoroughly equipped to give such extended and progressive instruction in physical science as is now the purpose of the authorities at McGill University.

One of the objects of the new course is stated to be: "To institute a class of highly-trained engineers who are capable of overcoming the difficulties and 'improving the practice in electric power generation and distribution'". This is an object felicitously chosen to suit Canadian resources, particularly in that portion of Canada within McGill's territorial radius. A paucity of fossil fuel and a plentitude of water-powers, awaiting improved methods of transmission and industrial application, characterise the district served by McGill, and there can be little doubt that the natural necessities of the East, assisted by the facilities for technical specialization that the University has undertaken to provide, will in time develop a local technique that will worthily carry on the traditions of this University,

## MINE TAXATION AND MINE ACCOUNTS.

Our British Columbia correspondent reports that the Local Government is being urged to amend the Taxation Act so as to provide for the depletion of ore reserves in mining properties. The representatives of mining interests in British Columbia ask for statutory recognition of the effect of diminishing ore reserves upon the value of a mine for taxation purposes, in lieu of the present method of mine taxation, which does not admit this principle, but make all allowances as a concession, following an investigation by government officials, and not as a right.

The request is reasonable, and it is pleasing to hear that it was given a sympathetic hearing by the Government.

The equitable assessment of taxation upon mining property is one that has bothered many governments in recent years, and in one or two instances, the finance ministries have frankly appealed to mining engineers and mine accountants to assist in framing regulations that will meet not only the varying conditions of mining, but also the difficulties presented by the differing stages of development of any one selected mine. In the United States, the American Institute of Mining Engineers, in Britain, the Institution of Mining Engineers and the Institution of Mining and Metallurgy were asked by the governments to assist them in regard to this extremely involved question of mine taxation. The proper body to advise our own governments, local and federal, is, of course, the Canadian Institute of Mining and Metallurgy, and it is to the credit of the British Columbia Division of the Institute that it has taken a really constructive interest in the discussion of mine taxation, and the onerous position that existing economic conditions have placed the precious metal mines in.

The principle of diminishing assets is, of course, the one that is most important in deciding a taxation basis for producing mines. There is another principle, however, that is bound up with that of diminishing assets, and arises from the same cause, namely the principle of increasing cost of production, usually found to be in more or less direct ratio to the age of the mine under consideration. The problem which has presented itself to governments in assessing mine taxation has to a large extent originated in the haziness of the accounts of the mining companies themselves, and the general disinclination of mine accountants (or mine directors) to saddle the produc-

tion costs of a mine in its early productive stages with a proportion of the enhanced costs which are inevitable in the last producing stages of the same mine. Mine production costs should not only contain a proper provision for depreciation of equipment and for depletion of ore reserves, but also for the disabilities attending production which are inseparable from increased length of haulages, increased depth of deposits, increased costs of ventilation and pumping and the upkeep of widely extended underground excavations.

The tendency in mining enterprises is unfortunately to let posterity look after itself, and the succession of managements (which is, if not an unmixed evil, yet certainly an evil too common in mining enterprises) leads to a partial view of mine accounts. Partial views are always wrong views, and no system of mine accounting can be actuarially correct that does not conceive of a mine as an enterprise that has a beginning and a definite end, usually comprised within a period that can be ascertained with some accuracy.

There has been too great a tendency in mining enterprises to concentrate on the items of labor and material entering into the mine production costs, and a deliberate avoidance of equally important items, such as bond interest, depreciation, reserves for depletion of areas, reserves for purchase of properties to replace the depleted areas, provision for redemption of capital and disaster insurance. Each of these items has a proper and unquestionable place in a mine cost-sheet, yet so hazy are the ideas of mine directors on these questions, that when government control has forced them on the unwilling attention of mining boards and operating executives, there has been some dubiety of mind as to whether these items were actually permissible.

Many a mining company would have been deterred from paying out unwarranted dividends, voted by boards that based their decisions on partial, and necessarily incorrect information, if mine accounting had been actuarially correct.

The formulation of a standard mine-cost sheet that shall contain every proper charge against production is suggested as a worth-while activity of the Canadian Institute of Mining and Metallurgy. Even if the attempt did not produce a form that satisfied all requirements, the discussion of the many-sided problem of mine taxation might clarify individual thinking and add to the general fund of ideas.

#### *THE BRITISH COAL STRIKE.*

The coal strike in Britain is in many respects a more dangerous occurrence than the outbreak of war in 1914. Britain could never have gone down before the German so long as she remained sound at home, and so long as she had access to the whole world supply of bituminous coal except that in Cen-

tral Europe, but a coal strike is aimed at Britain's most vital and vulnerable spot, and is excessively dangerous, because the effect, if not the intent, of a strike of coal producers is to bring about a general cessation of work barely distinguishable from a general strike. An uneasy questioning can also hardly be avoided when simultaneously with the British strike similar action is announced by the miners in Belgium and France, and there have been "conversations" between the British leaders and the coal unions on this side of the Atlantic. There is too evident a connection between the Geneva Convention and subsequent happenings to be ignored. We suggested some weeks ago that the miners of the countries represented at the Geneva Convention had accepted their selection to lead a frontal attack upon society as it now exists, because of the absolutely essential and irreplaceable nature of the commodity which they produce, and subsequent events have not dispelled this impression.

The strike can hardly succeed in its object, even if that be limited to obtaining increased wages, because the market value of the product of the British coal mines will not pay the rate of wages demanded by the miners, even though they absorb every cent of profit, unless it is accompanied by increased individual production. England has always been a free trade market for raw materials from abroad, and it would be an easy matter, even at the present time, for the United States to land coal in Britain at a cheaper delivered price than it can be mined there. When the United States has really sized up the European coal market, and measured its own tremendous advantage in coal areas and production costs against Europe's needs, it will become apparent that even in the home markets, let alone such formerly exclusively British coal markets as South America and the Scandinavian countries, the United States is in a position to limit the wages which the British miner can be paid by his employer, whether that employer be an individual or the State itself.

At the present time the United States can mine the same tonnage of coal with one-quarter the workmen employed in British coal mines. The United States also possesses today a tidy mercantile marine, and is not looking for ships to carry freight, but is looking for freight to employ its ships.

It is also becoming evident that the workers in the United States are just as shy of foreign labor entanglements as they are of foreign political entanglements, and if the British miner goes dancing after the bubble of communism, he will not be followed by the American worker. The public in the United States possesses probably the highest general level of informed intelligence in any country outside of Canada insofar as relates to business matters. The people of the United States see clearly the trend of the

times. They know that whatever goes up must also come down, and market movements, the recurrent cycle of depression and prosperity, commodity prices, and all the significant information contained in the financial pages of the newspapers, are popular knowledge in the United States, but this is by no means the case across the sea, hence the greater instability of the workers.

The United States coal operator, and the mine-workers in that country will see nothing more in the British situation than an enlargement of their country's newly-founded coal export trade, and they will wonder at the curious insanity which has driven the British miner to strike for additional wages at a time when unemployment parades have commenced in London, and a scaling-down in commodity prices is energetically in progress.

So far as markets are concerned, Britain's defect as a coal producer will not affect Canada, inasmuch as we have not yet attained to the decent dignity of being self-supporting in coal supply. It should, however, increase the demand upon the British Columbia coalfields.

In all other matters of trade and commerce the British coal strike, if prolonged, will be an unmixed evil to Canada. It will further depreciate our exchange, and will close off one of our best markets. We have every reason to hope that the strike will be of short duration and limited extension.

#### SELECTION OF WORKS COAL BY THE MICROSCOPE.

The microscopic examination of thin coal sections is commencing to yield useful results. Early observers, as Lomax in Lancashire, laid the basis for empirical deductions by examining and tabulating the appearance revealed by the microscope; and eventually Lomax was able to build up sections disclosing the nature of coal seams from floor to roof, which when correlated with accepted theories of the formation of coal seams from forest growths, annually deposited over periods of inconceivable vastness, and chemical investigations of the main constituents of coal, as disclosed by the microscope, have thrown light upon problems connected with the suitability of selected coals for industrial uses, that ultimate chemical analyses of coal did not explain.

For example, two coals of similar appearance and identical chemical analysis will act dissimilarly, say in the coking process.

A paper read before the Iron and Steel Institute at the Autumn Meeting (Sept. 21-22) by Mr. A. L. Booth of Manchester intimates that Messrs. Armstrong, Whitworth and Co. have used the microscope in the selection of some 250,000 tons of coal used annually for different purposes. It was found that coals that had for years been found satisfactory for certain purposes, when examined microscopically, had

certain characteristics of color and structure which made them distinguishable as a type, and that coals selected because of recognizable type resemblances—irrespective of analysis—were found satisfactory upon trial.

A series of colored plates (which typographical limitations prevent reproduction of) accompany Mr. Booth's paper, and show clearly three main types of coal, namely humic, spore and cannel coals.

There is now fairly general agreement among investigators of coal substance that the original vegetable component of coal has much more to do with its behavior in the various processes of industrial use, than the subsequent forces of heat, rock pressure or geological age, and it is the nature of this original substance that the microscope is eminently fitted to disclose.

Mr. Booth states that the microscope not only helps in the selection of coals, "but in some cases is of use in deciding whether or not it will pay to wash them, and will explain why an apparently good, clean coal has, for instance, a high ash content. Washing may be quite useless in such a case."

The presence of disseminated free sulphur, of infinitesimal fineness, is also detectable by the microscope, as has been shown by Dr. Rheinhardt Theissen.

Coal sections from representative Nova Scotia bituminous seams indicate by their characteristic reddish tinge and abundance of cuticle matter that they belong to the group of "humic" coals, which are stated by Mr. Booth to coke well, and to give a good hot fire without too long a flame. This describes accurately the behavior of these Nova Scotia coals.

Other qualities that are determinable from microscopic examination are tendency of a given coal to yield an inflammable dust, or liability of coals to spontaneous combustion.\*

Coal from a given seam will show generally uniform characteristics, over large tracts, which points to the employment of microscopical examination to determine the correlation of seams separated by folds in the strata, or areas of denudation.

In deciding upon the suitability of seams of unknown qualities, and in formulating opinions on such limited evidence of suitability as may be obtainable say from a diamond-drill core, the combined use of the microscope, with chemical analysis, for comparison with sections of well-known coals, suggests itself.

The microscopic study of coal sections is a younger and in some respects, a more difficult art, than the related sciences of metallography and petrography, but it bids fair to yield equally important results, and to become as indispensable a part of industrial laboratory equipment, in the allied steel and coal industries more particularly.

\*See Lomax, Trans. Inst. Min. Eng., Vol. XLVI, Pt. IV.

# The Pas Mineral Belt in 1920

By R. C. WALLACE, Commissioner of Northern Manitoba.

During the present summer development work in that territory from Flin-Flon Lake eastwards to Herb Lake, now generally known as The Pas Mineral Belt, has been confined mainly to the western and eastern ends of the district. There has, indeed, been considerable diamond drilling in Copper Lake and a good deal of interest in gold discoveries at the north end of Elbow Lake, as well as a larger amount of prospecting in the Reed Lake territory than during any previous summer. The fact remains, however, that the two pivotal points are the Flin-Flon ore body in its importance to the copper mining industry in the western part of the belt and to the mining industry in the eastern part of the belt. As far as copper development is concerned in particular, there has been a tendency to await the development of railway facilities consequent on the operation of the Flin-Flon property before any very considerable expenditure of capital is made on other copper properties in the western part of the belt.

## The Flin-Flon Ore Body.

From the work that has been done during the present summer by the Thompson interests, through the Longyear Exploration Company, it is now possible to study the ore body underground and to get a clearer conception of its relationships to the country rock than heretofore. There are many questions of very great importance in this connection which need not be discussed here. The work which has now been done has exposed an ore body in which the Province of Manitoba will legitimately take very considerable pride.

In No. 1 (the south) shaft there has been two hundred feet of sinking, and in the beginning of September two hundred and ten feet of cross-cut, as well as some hundred feet of southward drift. When the cross-cut has been completed to a width of two hundred and fifty feet there will be exposed over a hundred feet of solid sulphides, thirty feet of high-grade disseminated copper ore and some ninety feet of low-grade disseminated.

In No. 2 (the north) shaft the cross-cut has been run at the hundred-foot level to a length of some hundred and seventy feet, entirely in ore with the exception of some forty feet of horse. Sinking is now proceeding to the three hundred foot level.

The work already completed underground has been of great value, not only in checking up the diamond drilling but particularly in determining the costs of mining and best method of mining development. There are undoubtedly many problems ahead which will attract the most skilful metallurgists before the best method of ore treatment and smelting practice is determined for this ore body. The fact that is so satisfactorily established is, however, that there is an ore body of very large dimensions in the Flin-Flon deposits; an ore body which will become increasingly important, not only to Northern Manitoba, but to the Province as a whole. It is for all who are interested in provincial development to assist by all the means in their power in the work of seeing this property placed on an operating basis, not so much for the sake of those who are financially interested in the property as for the sake of the development of the Northland and the Province as a whole.

## Other Copper Properties.

There has been considerable activity in the district immediately north of the North Arm of Lake Athapuskow, the district which would seem to provide at the present time the best field for intensive prospecting in the whole belt.

In a property held by Baker and Patton, in which the country rock is a quartz porphyry striking north and dipping 80 deg. east, an iron sulphide body has developed on surface showing at least one hundred and thirty feet in width and bounded on one side by muskeg, in which there is a probability that the ore body also will be found. Generally speaking, this iron deposit is similar to many others in the mineral belt. There is, however, for a width of eighteen feet in the centre of the body, very considerable copper mineralization, and in other places more limited copper pyrite. The surface showings of copper are sufficiently important to warrant expenditure on diamond drilling in order to determine the extent of the copper mineralization underground. It must be remembered that a deposit like the Flin-Flon is simply an iron sulphide deposit with sufficient copper mineralization to make an ore body. All iron sulphide bodies which show surface copper should be prospected underground. It is understood that there are other showings of copper sulphide of somewhat similar type in this area. A very interesting discovery during the summer, from a mineralogical point of view, was that made by Rosen, east of the Big Island Lake district, which it was impossible, owing to limited time, for the writer to visit, but on which very full notes were kindly furnished by Mr. L. G. Thompson. At the contact between granite and greenstone there has developed very considerable mineralization of cobalt minerals, particularly smaltite in very fine grains weathering into cobalt bloom. Associated with this, and more particularly in a trench seventy-five paces to the East, chalcopyrite mineralization is found in the greenstone and also in the granite. The occurrence of cobalt minerals is an interesting one in the district and seems, judging by other work in the mineral belt, to be fairly wide-spread. The importance of cobalt minerals and the cobalt bloom stain in the Cobalt country in Ontario has been the close association of cobalt minerals in narrow calcite veins, with native silver and silver sulphides. Unless the geological conditions are similar there is no necessary connection in this field between cobalt minerals and native silver. If, however, a late diabase and associated narrow calcite veins can be found in this territory, it should be considered to be a favorable prospecting ground for silver.

## Copper and Elbow Lake Territory.

In this central part of the mineral belt diamond drilling proceeded during the summer months upon the large quartz property of J. P. Gordon of Copper Lake. It is understood that the diamond drilling showed the quartz to be associated underground with very considerable porphyry, and that mineralization with iron sulphides was found in a heavier degree than on surface showings. No further work has been done on the Red Rose vein of high-grade ore. Work is now proceeding on some claims east of Bear Lake, imme-

diately north of the Third Cranberry, in which stringers of chalcopyrite are found in a fairly solid greenstone and more particularly in quartz porphyry intrusions into the greenstone rock. The quartz porphyry holds a clean ore, which, if developed in sufficient quantity, will readily concentrate.

At the north end of Elbow Lake considerable prospecting was done during the earlier part of the summer, owing to the fact that discoveries were made by Webb of high-grade quartz veins on the Sherlock claim, immediately west of the mouth of Webb Creek. The quartz is irregularly distributed through a twisted hornblende schist, and at the present time a showing about one foot in width of highly quartzitic rock is being mined and hand crushed and pulverized in order to recover the gold by sluicing. In the same property several exposures of quartz, one at least four feet in width, occur, the value of which has not yet been determined. Interest has also been taken in other properties at the east end of an island in the north part of Elbow Lake. The Bow vein was staked in greenstone schist, and as its name implies, is characterized by reduplicated folding. The average is probably fifteen inches; the vein in places is thirty inches thick. This vein has been found, on careful sampling, to give high gold values. Immediately east of this vein, and parallel to it, is an intrusion of quartz porphyry varying in width from four feet to twelve feet and extending over the greater part of two claims. This porphyry is mineralized with pyrite and a little galena and is criss-crossed with narrow quartz veins. It would appear to be a rock of a type which might prove of value for fluxing purposes.

#### The Herb Lake Situation.

While considerable prospecting was done in the Reed Lake district this year, the men in the field confined their attention mainly to the working of properties in the Herb Lake and Little Herb Lake areas. A very interesting discovery was made north of Little Herb River, at the right-angle bend, by R. Kerr and P. Gasse in a rock which is an altered sediment, and which varies in composition from a typical mica schist to a quartzite. Very considerable galena has been deposited by replacement apparently from a granite, contact of which with the sediment is immediately west of the main discovery. Associated with the galena is pyrite, a little pyrrhotite and arsenical iron and here and there stibnite (antimony sulphide) in considerable quantity. From the trenching which has been done it would seem that the mineralization has taken place in more or less parallel bands which strike at an angle of about 30 deg. west of the schistosity of the rock. In the main trench, for a distance of fifteen feet, there is heavy mineralization, mainly of galena, partly of pyrite and to a slight extent of pyrrhotite and stibnite. The importance of the discovery is that the galena carries high values in silver. It is interesting that north-west of Osborne Lake galena has also been found in a very similar rock type by J. Kerr, while east of the main discovery galena is found by P. Kobar and stibnite by E. Stewart. It would thus appear that the mineralization is fairly extensive and much surface trenching, and particularly diamond drilling will undoubtedly be carried on in this district in order to determine the extent of the silver values. This is a new type of mineralization in the belt and adds one more to the possibility of economic development of a belt which is remarkably many-sided in its mineral types.

During the past year R. Woosey and others have prospected the northwest end of Herb lake. On an island immediately south of Woosey's Island a heavy mineralized basic rock shows iron and copper sulphides over a width of fifty feet from the top of the cliff to the lake shore. The rock, which is rather unusual for the district, is of a type in which a basic segregation of sulphides is possible, and the occurrence has particular interest for that reason.

On the east side of the lake, the Rex mine and the Bingo property have been responsible for the development work during the Summer. On the Rex mine work is now proceeding to develop the mine to the 300-foot level, and at the same time to stope from the 100-foot level in order to supply the mill, which is now operating. Great credit is due the management for carrying on under considerable difficulties. It will now be possible to stope over 150 feet in the south drift with an average width of three feet, and 70 feet on the north drift with an average width of two and a-half feet, at the same time as sinking is continuing to the 300-foot level. When there is sufficient labor available to run the mill to capacity, the clean-up from those remarkably large stopes should be sufficient to place the property on a good footing for subsequent development on a much larger scale.

At the Bingo property sinking has been completed to 50 feet, the vein averaging to this depth approximately eight inches, with at the bottom some quartz coming in, which will increase the average width by perhaps two inches. A contract has now been taken by Mr. Kennedy to sink to the 300-foot level and to do considerable trenching and cross-cutting. The assay values obtained to the depth at which the shaft has developed the vein are very high.

To many observers of the situation in the eastern part of the mining field, it has been clear for some time that the advisable procedure would be to consolidate several properties on the east side of Herb Lake, making the Rex the centre of operations and conveying ore by an air line from the other properties to the Rex. If a strong mining corporation could succeed in effecting such a consolidation, the future for the Herb Lake district would be very good. The vein at the present time developed on the Rex mine is such as should attract a strong corporation, provided that a sufficiently large number of other properties could be consolidated with the Rex, in order that practically all the capital expenditure on mining machinery could be concentrated on the one property. There is a feeling in favor of such a movement on the part of owners of property in the district who realize that in this way the Herb Lake mining field will come to its own much more successfully and satisfactorily than in any other possible way.

#### INCREASE OF WAGES AT WABANA IRON ORE ORE MINES, NEWFOUNDLAND.

The Dominion Steel Company has increased the wages of day-rate men employed at the ore mines by four cents an hour. An increase of fifteen per cent has also been granted to the staff.

It is understood the Dominion Company has made satisfactory arrangements with the Newfoundland Government in connection with the export tax that the Government proposed, and that this will not unduly penalise the export trade which, it is anticipated, will eventually attain large proportions.

# The McIntyre Porcupine Mines Ltd.

Making Strong Bid For Position of Second Greatest Gold Mine in Canada.

By J. A. McRAE.

The McIntyre-Porcupine Mines, Ltd., situated at Schumacher, in the heart of the Porcupine gold area, has now challenged all others for the position of second place among the gold producing mines of Canada, and at the time of writing is establishing a record second only to that of its big neighbor the Hollinger Consolidated.

Output at this time is being maintained at a rate well over \$2,000,000 a year, and the ore reserves are being added to, in an extensive way. The deposits, which close to surface were extremely erratic, have been found to be uniform below the 700-ft. level, and a future of great magnitude has opened up before this company.

Mining interests who may find their early efforts disappointing, and who may feel somewhat discouraged, may turn their attention to the experience of the McIntyre and find consolation in the fact that this concern, only a few years ago, was also obliged to flirt with chance. At times, money was difficult to secure, and on certain occasions the McIntyre mine might rea-

Nov. 1912, to June 1913, a total of 1,400 tons of ore were milled from which \$31,243 was recovered. Operations were greatly retarded by the strike, but a 150-ton cyanide mill was carried to completion, and development work got well under way by the end of that year.

During each of the next three years, the mill was enlarged by adding equipment to treat an additional 150 tons daily, bringing the total up to close to 600 tons in 1916. Since that time, no milling additions have been made, attention having been directed toward enlarging underground operations and adding to the physical condition of the mine.

### The Merged Properties.

During 1915, the McIntyre Extension Company was organized, taking over 120 acres formerly belonging to the Pearl Lake Company. Also, in November of the same year, the McIntyre-Jupiter Company was formed, taking over the holdings of the Jupiter mine. On the 31st of December, 1916, an amalgamation between the McIntyre, McIntyre Extension, and McIntyre Jupiter

THE McINTYRE-PORCUPINE MINE, SCHUMACHER, ONT.

sonably have been classed as an exceedingly long shot, with the chances pointing strongly toward failure.

From the humble beginning of a doubtful prospect, optimism on the part of a few men has finally overcome all adversities, has brought the mine to the position of second producer in Canada, and has enabled the company to disburse large dividends. As an illustration of its growth, the McIntyre mine, in addition to producing over two million dollars during the past fiscal year, and realizing net profits of around one million dollars, was able to add nearly a million dollars to its ore reserves. That is to say, in a period of twelve months, and at a time when economic conditions were exceedingly unfavorable for gold mining, this company was able to develop close to three million dollars.

### The McIntyre History.

The original McIntyre claim of 40 acres was located by "Sandy" McIntyre, one of the best known prospectors in Northern Ontario. Shortly after its location, the property was purchased by the present company. Development work commenced in 1911. During that year, the West McIntyre of 34 acres, and 68 acres under Pearl Lake, were purchased. It was in 1912 that the first mill was erected and placed in operation. The plant consisted of only 10 stamps.

Up to the time of the labor strike which lasted from

was effected. And, with a view to still further pursuing the policy of expansion, an option was taken on the Plenaureum mine, a property of very attractive possibilities which is situated adjacent and on the east side of the Jupiter in direct line with the strike of the main vein system of the Jupiter. This option is still held, and the 130 acres which it involves would give the McIntyre-Porcupine a total of 462 acres.

The McIntyre-Porcupine also holds an option on the Newray, but this is regarded as very speculative and should not be as yet referred to as a likely addition to the holdings of the company. The company has also recently purchased coal lands in Alberta, taking a half interest with the Temiskaming Mining Company in the Blue Diamond Coal Mine and the Canadian Coalfields. These properties are generally regarded as of speculative value.

The present policy of underground development work on the McIntyre itself, is gradually placing the mine in such a strong physical condition as to lead to the belief that further milling additions may soon be considered, in which case the yield would be accordingly increased.

### Ore Richer at Depth.

An extremely favorable feature has been a steady increase in gold values encountered as the workings of the mine reach deeper levels. The following figures:

illustrate the increasing value of the ore per ton, and the steady increase in total production:—

Year	Val. per ton Recovered	Production
1912 . . . . .	\$5.25	\$ 76,166
1913 . . . . .	7.05	225,752
1914, to March 31, 1915 . . . . .	8.39	718,332
1916 (fiscal) . . . . .	7.38	779,991
1917 (fiscal) . . . . .	9.55	1,864,914
1918 (fiscal) . . . . .	9.61	1,714,258
1919 (fiscal) . . . . .	9.29	1,671,646
1920 (fiscal) . . . . .	11.02	2,080,178
		\$9,131,237

**The Dividend Record.**

The company paid its first dividend of 5 p.c. on Feb. 15, 1917, the disbursement amounting to \$180,514. Up to Sept. 1st, 1920, dividends totalling 55 per cent, and \$1,985,656 have been paid.

In addition to returning this amount to its shareholders, the company has built up an ore reserve of \$5,595,500 and has a surplus of \$1,445,000.

**The Pioneer Work.**

Any written history of the McIntyre-Poreupine would be quite incomplete without mention of the few men who steered the enterprise through its days of uncertainty, the outstanding figure being the late Col. Alexander M. Hay. It is to Col. Hay that the greatest credit is given for the sound basis upon which the affairs of the company were placed, and although he died in January, 1917, just one day before the company declared its first dividend, he handed down to those who succeeded him a mine already developed to a place of importance.

Among others who contributed to the successful efforts in a manner second only to Col. Hay, is R. J. Ennis, the general manager, as well as a former president, Albert Freeman, and Director C. B. Flynn.

The company is capitalized at \$4,000,000 made up of 4,000,000 shares of the par value of \$1 each. Of these some 3,600,000 are issued.

From these figures, and keeping in mind that profits are exceeding \$1,000,000 a year, dividends at the rate of about five per cent quarterly appear reasonably to be looked for in the immediate future as compared with interim disbursements during recent years at the rate of five per cent at intervals of each four months.

**Conclusions.**

In concluding, the point should perhaps be made clear that the success of the McIntyre has hinged upon the development of what is known as No. 5 vein, upon which development work has been carried to a depth of nearly one-third of a mile. In its brief history, the work done has revealed a total of approximately \$14,700,000 of which \$9,131,237 has been produced, with \$5,600,000 in sight, and the reserve increasing from year to year. To grasp the full significance of the possibilities of the future, it is necessary to keep in mind the fact that the company controls 462 acres, and that only during recent months has discovered another ore body below the 1000-ft. level which is believed to be the eastward continuation of the No. 83 ore body of the Hollinger, and appears not unlikely to develop into a healthy rival of the great No. 5 deposit. This new ore body is a tremendous potential asset.

**CANADIAN INSTITUTE OF MINING AND METALLURGY.**

**Annual Western Meeting, Winnipeg, Oct. 25th to 27th.**

Owing to unforeseen circumstances the complete programme of the Winnipeg Meeting of the Institute is not available for publication, but the following provisional arrangements indicate the scope of the Meeting.

On Monday the 27th, the meeting will be opened by the Address of the President, Mr. O. E. S. Whiteside. The Institute will be the guest of the City at luncheon, and will be welcomed by Mayor Gray, who is himself an engineer.

In the afternoon a paper will be read describing the Manitoba Rolling Mills at Selkirk, and a general discussion on the outlook for an iron and steel industry west of the Great Lakes will take place. The subject will be considered in relation to location in British Columbia, Alberta, Manitoba and Western Ontario.

The evening gathering will include general papers with popular addresses, and lantern slides and moving pictures showing water-powers and mineral resources of the West.

Tuesday's proceedings will hinge largely on questions connected with coal. Mr. Lewis Stockett and Mr. F. W. Gray have prepared papers on this subject.

At luncheon, the Institute will again be a guest, this time of the Winnipeg Board of Trade.

In the afternoon, coal matters will again be taken up. An account of the result of steaming tests carried out on Alberta coals by E. H. Oliver of the Alberta Department of Mines will be given. The work of the University of Alberta in connection with the more efficient utilization of western coals will be reviewed by Professor Norman C. Pitcher, of the Department of Mining Engineering. Mr. David King is expected to discuss the problems connected with the marketing of Western coal.

The Smoker and usual entertainment will take place on Tuesday evening.

On Wednesday morning papers on the mineral resources of Northern Manitoba, Southern Manitoba, Saskatchewan, and the West generally are expected to be given by Mr. J. A. Campbell, M.P., Commissioner R. C. Wallace, Prof. J. S. DeLury and others.

The luncheon will be an Institute affair, addressed by local Institute celebrities.

The afternoon will be taken up by a sight-seeing trip and a visit to the Selkirk Steel Mills.

The Banquet will be held on Wednesday evening, and will conclude what bids fair to be a worth-while programme.

Mr. R. R. Rose, the Assistant Secretary will attend the meeting.

**CANADA AS A COAL CADGER.**

Canada's unnecessary dependence upon the United States for coal involves the Dominion and, industrially, the British Empire in American domestic affairs, Canada is pictured always as a suspicious character prowling around Uncle Sam's coal-bin. At a time when the American public is naturally anxious and apprehensive as to the fuel supply for the on-coming winter, to represent Canada before the people as a cunning appropriator of fuel needed in the United States is to arouse feelings destructive of international sympathy and good-will. Yet this will be done, every year, regardless of the facts, until Canadians work their own coal deposits.

“ Montreal Star.”

## VISIT OF BRITISH CHAMBERS OF COMMERCE TO HAILEYBURY, ONT.

The first half of October was marked by a visit to Northern Ontario of the members of the delegates of the Chambers of Commerce of the British Empire. These men, representing all portions of the Empire, expressed keen pleasure and surprise at the advanced stage to which the mining industry of this new country has been developed, and showed actual amazement over the magnitude of the potential resources awaiting utilization.

The visitors were shown through the Cobalt silver field as well as the gold mining district of Porcupine. They were shown more than a score of mines in operation, and their journey by railway and by motor through the vast stretch of territory lying along the T. & N. O. Ry, and around the mining centres which have sprung into being during the past few years, left them deeply impressed and they left with the promise that they would spare no effort in making known throughout other parts of the Empire the opportunities presented in Northern Ontario.

At the conclusion of their visit to Cobalt, the delegates were tendered a reception in the Armories at Haileybury, at which some 600 guests were present.

During the course of the evening, Balmer Neilly, speaking on behalf of the mining industry of Ontario, and making special reference to the silver mines which has just been shown the visitors, tendered the following address, the full text of which is given, the "Canadian Mining Journal" being specially represented at the gathering.

### The Address.

Since the discovery of Cobalt, in 1903, we have had the honor of entertaining many distinguished people and great among those distinguished parties are our guests of this evening. On behalf of those interested in the Mining Industry, we would bid them a most hearty welcome here tonight. We hope their visit to this North Country will prove not only interesting, but that from an Imperial standpoint, it will provide fair and conclusive evidence that Canada is indeed developing at a pace that can only be understood by those constantly in touch with the situation. When this Congress last met in Canada, Cobalt had not been discovered, but to-day — 17 years later — we have a new, vast country stretching from North Bay to Cochrane and ere long to the waters of the Arctic Ocean.

The land has been cleared, railways built, numerous mining camps of world prominence have been opened up, providing a ready market for the pioneer settler and farmer. From an agricultural standpoint we are gradually becoming self supporting and our great forest resources are being called upon to supply a world deficiency in the paper market.

Teniskaming proper has an estimated population of 45,000 people, all optimistic as to Canada's future within this Empire, and during the war sent overseas some 5,000 men, who classed second to none and who won commissions on the field ranging from the junior position to that of Brig.-General. Those who remained at home worked to support those overseas and their families who remained at home. Without casting reflections upon the efforts of other towns here; but speaking particularly of Cobalt because I am personally familiar with their work there, let me say that that camp, with a population of say 7,000 people, produced and shipped one per cent of all Red Cross Supplies, sent overseas from Canada. This was, of course, mostly the work of the women and we are proud of them, but the men were not idle and with the assistance of the ladies, raised almost \$5,000 every month, so that the raw material could be purchased and the families of the soldiers assisted through the Patriotic Fund on a scale somewhat better than that generally prevailing throughout Canada, during the war.

And we didn't stop there. Our welcome to those brave men whom the fortunes of war permitted to return, was genuine and sincere. Club houses have been provided in nearly every town in Northern Ontario for the exclusive use of these men and not only, have they received their old jobs, but better and more suitable position have been provided where possible.

Many of our men, unfortunately, were not permitted to return and while we sorrow with their relatives, we also join in

their pride because of a noble sacrifice given freely that right and justice may prevail and that this old Empire may continue to function, standing for relief and freedom to all mankind.

Tonight I have been asked to speak concerning the Mining Industry in Northern Ontario, and Cobalt in particular.

### The Discovery of Cobalt.

The Cobalt Camp was found purely by accident in 1903. A blacksmith named LaRose, working with the contractors then constructing the present T. N. O., either found or had brought into his little shop a fair sized piece of a peculiar looking mineral. Little attention was paid to it and the story goes that it was hammered and examined by many a man before the suggestion came that it might be valuable. Samples were sent south and finally, Dr. Miller, our Provincial Geologist, came North and pronounced the find of silver — cobalt — nickel and arsenic genuine.

Every effort was made by the Dept. of Mines to enlist interest in this new mineral field, but the people of the Province knew little and cared less about mining and the men of experience reasoned that ore so rich indicated pocket formation and would probably amount to little in importance.

In 1904 some four veins were worked, but little staking was done, and not until 1905 was the real value of the discovery appreciated. Indifference gave way to unbounded enthusiasm and prospectors, from all parts of the world, flocked to this district.

The veins are comparatively narrow, averaging perhaps 2' to 4' in width, but the ore is phenomenally rich. The ore taken from the surface in boom days probably averaged over 3,000 ozs. silver to the ton and miners, in many cases, with only hand steel, produced a fortune.

A boom developed and many properties, with little or no merit, were sold to the public at fabulous prices.

However, many of the prospects did develop into mines and have returned to fortunate shareholders, many times their investment.

Gradually real miners were attracted to the country, inexperience gave way to experience and mining methods were developed suitable to this class of deposit. Working constantly to improve their process, the men of Cobalt have contributed several very important improvements to the art of metallurgy and ore dressing.

### Growth of Output.

Cobalt's production increased in leaps and bounds and in 1911, when the apex of production was reached, the Camp produced 31,507,790 fine ozs. silver, or 14 per cent of the world's production for that year. Since then the production has gradually declined, for two reasons. Firstly, it was but natural to mine the high grade deposits with the least possible delay. Secondly, with concentrating machinery, the mines were able to give proper consideration to the lower grade ores and as the price raised, the grade workable at a profit naturally lowered. This is well illustrated by pointing out that while the production in 1918 had dropped to 17,661,694 ozs. as compared with the 1911 production of 31,507,791, the money return for 1918, by reason of the higher price of silver, was some \$1,387,943 in excess of that obtained in 1911.

### Dividend Record.

Up to the end of 1919, Cobalt had produced silver to the value of \$182,145,699 and had paid dividends to the extent of \$80,780,513. If to the dividends we add the liquid reserves of the operating companies, it is found that the mines have returned to their fortunate shareholders, up to this time, about one-half the value of their gross output, and we are proud of this record.

### Lead to New Fields.

Those who were successful in Cobalt struck out to prospect and develop the surrounding country and to-day in addition to the Sudbury Nickel Mines, supplying as you were told 85 per cent of the world's nickel requirements, we have Porcupine, producing at the rate of nearly \$12,000,000 a year; about 60 miles Northeast, we have Kirkland Lake Camp, just coming into the profitable production stage. About 50 miles Northwest we have Gowganda, another silver camp of importance, and 20 miles South of here, the South Lorraine Camp, where British capital will apparently reap a bountiful reward.

You may be inclined to ask as to the future promise of this Camp. The deposits are high-grade and erratic and you may be interested to learn that few mines have ever been in a position to announce over two years' positive ore reserve. New discoveries continue to be made and they in turn suggest other possibilities, but the big factor in any estimate must turn on the future price of silver. The amount of ore classified as profitable or unprofitable in any mine will continue to fluctuate with that price.

### Nationalization Impossible.

Mining is described as a gamble. In the same way insurance is a gamble, if you confine consideration to any one individual

risk. However, it can be proved mathematically that insurance, by grouping many risks and working on known averages, is after all the very opposite of gambling. Positive data, such as insurance companies have available, is impossible in the case of mining and a certain hazard must always be connected with the industry. For this reason, if for no other, it is not possible to nationalize the industry. If a Government were to take over our industry to-day for the benefit of the State, the hope of individual reward would, to a great extent, be removed and the prospectors would not, nor could they be expected to risk their time, health and money, sowing for others to reap.

Gradually the known ore deposits would be worked out, the money thus made and perhaps large additional amounts, would be spent in prospecting with little hope of success. Not only is nationalization impossible, but great care must be taken to prevent any lessening of the prize, that now keeps prospectors interested in their calling.

There is no known method whereby the profitable risks may be separated from the bad risks, be it mining or insurance. Nevertheless we would not be justified in accepting all risks. Careful investigation of all the conditions surrounding or pertaining to any risk, is essential. And that investigation must be made by those who have had long and successful experience. Sending a plumber, described for the job as a "well known mining engineer," to take grab samples and having those samples assayed to the third and fourth decimal place, is not economy and should be a criminal offence. We were asked by some of the members of the Imperial Press Conference how best we could co-operate to prevent flotations of ill advised ventures on the British market. Our answer is that you have in the Institution of Mining and Metallurgy, London, an organization well fitted to function in this respect. Their membership is world wide and their opinion may be generally accepted at par.

**Per Capita Output.**

Canada's position from a mining standpoint is so promising that only the truth and nothing but the truth will serve her best interests. To trace the growth of our mineral production, let us quote as follows: Canada's per capita production in mineral wealth was in

1886	\$ 2.33
1896	4.38
1906	12.81
1912	18.27
1918	24.59

And let me say here in all sincerity and as one who has spent the last 14 years in this country, that we have only begun.

Statistics at a function of this kind are generally tiresome,, but in order to give you some definite idea as to the distribution and present production in Ontario alone, let us quote the following figures for 1918, giving the market value in the nearest thousand of dollars:—

Nickel	\$27,840,000
Silver	17,416,000
Copper	8,533,000
Gold	8,503,000
Cobalt	1,616,000
Iron Pyrites	1,145,000
Iron Ore	625,000
Arsenic	567,000
Talc	247,000
Graphite	209,000
Fluorspar	154,000
Feldspar	112,000
Molybdenum	60,000
Mica	50,000
Corundum	27,000

Turning to the purely metallic production of this Province note that in 1903 the year in which Cobalt was discovered and Temiskaming born, the total value of Ontario's production was \$12,870,000, while in 1918 that total had increased to \$80,309,000.

In 1903 taking Canada's mineral production as a whole, the value was \$61,741,000 and in 1918 that total was \$211,302,000.

We are, therefore, progressing, but by no means as fast as conditions would warrant.

We are advised that of all railroad borne freight in the U. S. 53.09 per cent originates in the product of the mine. On our T. N. O. the last available report shows that their income from handling products of the mine is 48 per cent of the total freight returns.

A similar report from Dept. Railways & Canals, Canada, shows only 38 per cent and when it is admitted, as it is on all sides, that Canada's mineral resources are second to that of no other country in the world, it is but fair to assume that we are behind in our proper development, at least to the extent of an annual tonnage equal to 15 per cent by weight of all goods freighted on our Canadian Railways.

So much authentic information is available in the way of Government reports concerning the wealth and distribution of our mineral resources, that I think we may fairly take their possession for granted. Let us then consider what we have in the way of ready resources that will assist in the proper development of new mines.

**Summary of Resources.**

1. We have in the great pre-Cambrian area radiating North-West and North-East from say North Bay to the shores of the Arctic, a country dotted with numerous lakes and rivers so distributed that it is possible by means of short portages to travel the whole district by canoe. Water is everywhere wholesome. Fuel abounds, game and fish will supply much of the prospectors food requirements.

2. Railways and telegraph lines supply a ready means of communication as between different districts.

3. The mining laws are simple and equitable and administered without partiality.

4. While we lack coal, fire-wood is available for the early stages and nature has been lavish in her distribution of water power in this North Country. In 1918 Government reports show that in all Canada water power had been developed to the extent of 2,305,310 H.P. and of this Ontario had developed 53 per cent. The possible amount to be developed is to-day unknown but it might be interesting to state here that in Northern Ontario there has been developed for the use of the mines approximately 50,000 H.P., and the financing of this development has been largely the work of the mining companies.

5. There has been attracted to this district a fine class of citizen — men and women who are not easily discouraged, but on the other hand, are full of hope and resource and constantly striving to the end that success must eventually crown the efforts of those who ever and honestly use the talents with which nature has endowed them.

**What Are Our Difficulties?**

(1) The people of Old Ontario have a very different knowledge of the problems of the Mining Industry. Their ideas have been obtained from brokers' circulars describing astounding profits made and predicted. As a result of these mistaken ideas many honestly believe that practically all the profits derived by successful mining companies should be taken by the Government to pay for improvements in Old Ontario.

(2) While we as pioneers in a new country must clear the land, develop water power, build roads, bridges, construct telegraph lines and railroads, provide schools, hospitals, water, fire protection and many other public utilities, we are taxed as though all these things were provided by the community, as in Old Ontario.

(3) City life, with high wages and expensive tastes as developed during the war-time munition-manufacturing period, has permanently unfitted many for the privations and hardships of pioneer life. City population has approached the point of saturation and only a gradual decrease in industrial development within the cities coupled with immigration from countries where the people are not socially above handling a pick and shovel, can remedy the present grave labor shortage.

**What We Hope To Do.**

(1) We hope to provide the load that will make the development of our water powers an economic possibility and provide power in such abundance as to largely offset our lack of coal.

(2) We hope to develop our iron ore resources by means of beneficiation to the point where Ontario and Canada may depend upon our own resources, in place of importing 95 per cent of our iron ore, and iron and steel products to the extent of some \$180,000,000 as in 1918.

(3) We hope to educate the people of Old Ontario and incidentally the Government, to the problems and possibilities of the North Land and then persuade them that our necessities should in no sense be contingent upon conditions in Old Ontario alone.

(4) We hope to encourage an influx of real men in sufficient numbers to permit industry to follow well-balanced and economic plans.

(5) We will welcome capital carefully invested, from any quarter, and more especially will we welcome the interest and council that would naturally follow capital coming from other parts of this Empire.

(6) Finally, by more intensive prospecting we hope to broaden the scope of the mining industry, until the whole pre-Cambrian country is a hive of industrial activity. Mining will continue to do the pioneer work with agriculture, lumbering, pulp and paper-making following in our wake.

The objects of the Chambers of Commerce, as we understand it, is to foster a better understanding between the different partners in the Imperial Commonwealth. But it must go further than that and seek a better understanding among the nations of the world. Surely then there is no place better fitted to carry on this plan of education, than on the frontiers of

civilization. The boundary lines are ever moving outwards. The lure of the new country is drawing men from their old homes and old surroundings, social caste disappears, old prejudices are forgotten, a broader vision is the result, and plans for the future can be formulated on the basis of merit rather than expediency.

Our appreciation of the honor done Temiskaming through this visit of the Chambers of Commerce is genuine. We are full of unbounded faith in and loyalty to the Empire, and we hope that through discussion of the various problems unfolded through observation, as you travel across Canada, much good will result and that your memory will ever keep green the possibilities and the promise of this North Land, the land of lakes and rivers, farms, forests and mines.

### LABOR SITUATION AT THE NOVA SCOTIA COLLIERIES.

The coal operators, with the exception of representatives of small companies, failed to meet the Wage Scale Committee of the United Mine Workers in conference at Truro as requested. The large companies take the stand that if the recommendations of the Royal Commission are not accepted by the union as a basis of agreement, the award of the Mc. Kinnon Conciliation Board and the agreement of January last which resulted from the work of the Conciliation Board, automatically come into effect. This agreement provides the machinery for adjustment of any interim disputes during the life of the contract, and the operators stand prepared to meet the men as provided under the January 1920 agreement.

The Executive of the Union is taking a strike vote on the 22nd October, and there is little doubt that a majority of the miners will vote for a strike, although, under a secret vote, the issue would not be so certain.

A conference is to be held in Montreal on the 20th between representatives of the larger companies and the union officials. The conference is being held at the suggestion of the Minister of Labor, who is expected to be present.

While the large companies are adopting a definite attitude and insisting upon the carrying out of existing agreements, there is a tendency among the smaller operators to take advantage of the brisk market which will be available should the workmen of the big operators go on strike. This disunity among the operators has for some time been very skilfully employed by the union officials, who in their public statements make no distinction between the small or large pits, but accord to each individual operator equal importance, much to the mystification of the newspaper readers at a distance. The deciding factors nevertheless are the Dominion Coal Company, the Nova Scotia Steel Company and the Acadia Coal Company, which between them mine 85 percent of the coal produced in Nova Scotia.

Should a strike take place, about 12,000 mine-workers will be directly affected, and possibly 8,000 steel and railway workers would be immediately thrown idle. The running of the trains on the Canadian Government Railway, and other public utilities would not be immediately effected, as resources would be had to winter stocks, but curtailment of service, both freight and passenger would be necessary within a week, should the strike take place.

The course of events will turn upon the Montreal conference, and at the time of writing cannot be forecasted.

### NOTES ON ASBESTOS & OTHER MINING IN QUEBEC.

By Mr. THEO. C. DENIS (In C. M. I. Bulletin).

The Asbestos Corporation of Canada has given a contract to the firm of Fraser, Brace & Co., for the removal of 600,000 cubic yards of overburden at the King mine, Thetford, to enable them to extend their operations. An hydraulic transportation system is being installed to remove the soil and sand to a dump across the Thetford river, a mile and a quarter from the mine. This will uncover an area of asbestos-bearing ground 1,300 feet by 1,000, that had previously been proved by diamond drilling. Prospecting by drilling is being continued over the property, and reserves are said to be now assured at that mine for some thirty years of operation at the present rate of mining.

The Reed property near Black Lake has been leased to the Maple Leaf Asbestos Company, in which the Wisser interests, of Prescott, have a controlling share. Plans are being made to remodel the small mill, which was built some twelve months ago by Messrs Blais & Fillion, the previous lessees.

The Consolidated Asbestos Company, which took over the properties formerly controlled by the Jacobs Asbestos Mining Company, are hastening the underground development work on the second level at the Jacobs mine to begin mining as soon as possible. Hoisting from the first level is now proceeding satisfactorily. At present the underground development work at this mine comprises a total length of nearly three miles of haulage ways, cross-cuts, inclines and shaft.

The Mutual Chemical Company of Canada which is working a chrome mine near Caribou lake, between Black Lake and Coleraine, has sunk the shaft to 300 feet, but all mining is done on the 200-foot level. The lens of chromite on which they are now working appears to be about 500 feet in its longest dimension. The new concentrator is giving good results and shipments of chrome concentrate have been continual all summer.

J. V. Bélanger Mining Company, which is working the chrome property adjacent to that of the Mutual Chemical Company of Canada, started the new concentrator early in July, and it has been in operation practically without a stop ever since. The mill capacity is 180 tons of ore per day.

Metal mining is extremely quiet in the province. At present the only metal mine in operation is the Weedon mine, working a deposit of copper-bearing pyrite, at Weedon, north of Sherbrooke. Steps are being taken to resume operations at the Montauban mine, of the Zinc Company, Ltd., at Notre-Dame des Anges, where mining had been suspended some time ago in order to concentrate the work on diamond-drilling exploration.

Quarrying and brick-making are extremely active throughout the province. The operations are only limited by the shortage of labour. Production of lime has also been handicapped by the shortage of coal for the kilns, to the great inconvenience of the paper-pulp industry, which uses a very large quantity of lime in the production of pulp. The output of one of the largest lime companies in the province is practically all taken by the pulp mills.

## Northern Ontario Letter

### THE SILVER MINES.

#### The Cobalt Field.

Cobalt mine operators have taken an optimistic view of the silver situation. They believe the recent decline in quotations is only temporary, and will be marked by a gradual rise to not far under the price obtaining in the United States. For instance, on Oct. 12th, quotations declined to 83 cents an ounce with no sales reported. On Oct. 13th, the bid increased to 87 cents an ounce with no sales reported. Meanwhile, the United States Treasury continues to pay 99½ cents an ounce for all silver produced in the United States, and this is regarded as the factor which seems certain to so deplete the market for general consumption that the world price of the metal cannot long remain below that point.

According to advice just obtained, the Mining Corporation of Canada is on a fair way to establish a production record for 1920 equal to that of 1919. The output for the year will actually exceed the amount of silver estimated in the reserves at the beginning of the current year. As to this, in common with other important silver producers in this field, the Mining Corporation is mining over a large part of its underground workings and finds that early operations were directed toward mining high grade ore shoots and that a large tonnage of medium and low grade ore was passed up. In view of the great extent of the underground workings of the Mining Corporation, the life of the mine is expected to be comparatively long. In this connection, it is significant to note that no ore has as yet been drawn from the Buffalo mine which was acquired early this year. The Buffalo, with its large amount of medium and low-grade ore remains a big reserve asset. Added to this is the 350,000 tons of old tailings which are being treated at the rate of about 3.50 tons daily, and which will last for nearly three years.

W. G. Miller, Ontario Government Geologist, together with Thos. W. Gibson, Deputy Minister of Mines, have just completed a visit to the leading mining district of Northern Ontario, including Cobalt, Gowganda, Porcupine and Kirkland Lake. This is the first general visit for a long time, and the press of Northern Ontario has made special comment, the following editorial appearing in the "Mining Review:—

"The visit to Northern Ontario this week by Dr. W. G. Miller, Provincial Geologist for Ontario, together with Thos. W. Gibson, Deputy Minister of Mines attracts interest. These gentlemen are in charge of important Departments bearing vitally upon one of the basic industries of the Province.

"In the North, the visit is welcome, and is only marred by the thought that their coming should of necessity be referred to as a "visit".

"Surely the mining industry of Northern Ontario should receive more frequent calls, and surely the requirements of the industry could be better ascertained by frequent tours through the mining areas.

"The Mining Review has no complaint to register in regard to the ability of either of these men who have won the good-will of mining men in general in Northern Ontario. We merely desire to urge upon those filling impor-

"tant posts the advisability of making personal close-up observation of progress and results. We are confident the industry would benefit from such added attention."

The mines have as yet found no relief from the shortage of underground workers, and with attention being directed toward maintaining production, the amount of exploration and development work, is suffering as a consequence.

The wage problem at the silver mines is due for consideration on or before Nov. 1st. In Aug. 1919, the mining companies in dealing with their employes after breaking up the Western Federation organization, agreed to pay a flat wage on silver below 80 cents an ounce. On 80 cent silver or over, an extra bonus of 25 cents a day was agreed upon, with an extra 25 cents for each 10 point advance. As a consequence, when silver went to \$1.37 an ounce early in the year, the bonus amounted to \$1.50 above the flat wage. Later on, when it commenced to decline, the mining companies, in May, last spring, announced voluntarily that they would continue to pay a \$1.25 bonus daily until Nov. 1st, even though silver should decline below \$120 an ounce. Therefore, although according to the former agreement with the men, the bonus on silver at under 90 cents an ounce would be only 25 cents daily, the mine workers have received the benefit of an extra \$1 a day.

As regards what action will be taken on Nov. 1st, it is difficult to say. But, in view of the \$1.25 bonus plus the flat wage combining to make a total just about equal to the wage being paid in Porcupine and at Sudbury, it is believed the mines in Cobalt will continue to pay this rate of bonus, at least until the cost of living declines or other factors enter into the situation and make it necessary to reduce the bonus.

Cyril Knight, Ontario Government Geologist, who is making a re-survey of the geology in the Cobalt district, is now engaged in a study of conditions at the Kerr Lake mine and that vicinity. Mr. Knight will discontinue the work a little later in the year, and will resume in the spring with a view to completing the task next summer.

#### Elk Lake and Gowganda.

Announcement is made that operations are to be commenced on the property of the Anvil Lake Silver Mining Company, situated at Anvil Lake in the Maple Mountain district. Chas. Dalby has been engaged to manage the work, and operations are to be carried on throughout the winter. The property lies close to the White Reserve mine.

In the meantime, negotiations are still under way between the White Reserve Mining Company and British interests, whereby it is hoped to complete a deal which would cause the property to be worked in an aggressive manner. Just now, only two men are kept at the property, pending the outcome of the negotiations. It is understood the White Reserve Company is itself prepared to proceed with work even though the present deal does not materialize.

Considerable disappointment has been caused over the failure of the Canadian Light Railway Construction Company to provide Gowganda with a narrow-gauge railway this year. However, with the advent of good sleighing, transportation will again be made more satisfactory, and is expected to lend added impetus to activity in this area during the coming winter.

During the week ended Oct. 15th. five Cobalt companies shipped an aggregate of thirteen cars containing nearly one million pounds of ore, the weeks shipments ranking among the highest during the current year.

The Mining Corporation was the leader, with the Nipissing a close second. Following is a summary:—

Shipper	Cars	Pds.
Mining Corporation . . . . .	6	391,042
Nipissing . . . . .	4	307,307
McKinley-Darragh . . . . .	1	100,976
Hudson Bay . . . . .	1	63,756
Kerr Lake . . . . .	1	61,137
Totals . . . . .	13	924,208

### THE GOLD MINES.

#### The Porcupine District.

The gold mines of the Province of Ontario are receiving a premium on their gold, at the rate of over a million dollars a year. This added income has offset to some extent other adverse economic factors, and the total income of the gold mines for the current year will be greater than ever before in the history of gold mining in this province.

This record is being established at a time when labor is so scarce as to permit the mining plants to be operated at only two-thirds capacity, and for that reason the achievement is doubly significant. In due time, with a full force of workman available, the increase in output and net earnings will be large and may reasonably signalize a general increase in the rate of dividend disbursements.

Achievements in the gold mining industry of Northern Ontario, where the mines of Porcupine and Kirkland Lake are alone producing nearly twenty-five per cent as much gold as the entire United States, are regarded as exceptionally remarkable. The gold output of these mines has been increased at a time when the production from mines in many other countries has been gradually falling off. For instance, in 1915 the gold output of the United States amounted to \$101,000,000. For the year 1920 it is estimated as likely to be below \$50,000,000. This state of affairs is alarming for the United States, Canadians, therefore, have reason to be especially pleased to witness the steady increase in production of the yellow metal in Northern Ontario, with the promise of this output being greatly increased just as soon as sufficient workers can be secured.

It is reported in unofficial circles that the Dome Mines Company is considering some plan to increase its capitalization. Officials are reticent regarding this, but the object in view is to prevent unreasonable taxation, according to rumor. This would in no way alter the dividend policy, and would give the present stockholders the benefit of any increase in capitalization. As regards the present operations, the developments at depth are understood to point to the likelihood of the Dome Mines experiencing very little difficulty in going on a dividend paying basis of 20 per cent annually, just as soon as the necessary number of workers can be procured.

The extra dividend of 1 p.c. declared by the Hollinger Consolidated, payable No. 3rd, is the seventh disbursement made this year. The disbursement will amount to \$246,000 and makes total of \$1,722,000 paid so far this year.

During recent years, the Hollinger has made 1 p.c. disbursements every eight weeks, with one extra in December, making 7 p.c. a year. The custom has been to have a regular disbursement fall early in December with the extra at the end of the month. Therefore, it is believed the stockholders will as usual receive the two December disbursements, in which case the total for this year will be brought up to 9 p.c. or a total of \$2,218,000.

Provided the December disbursements actually materialize, the Hollinger Consolidated will again regain its position of being the largest dividend paying mine in this district, the second largest being the Nipissing with an annual record of \$1,800,000.

Not only this, but the Hollinger achievement is being accomplished at a time when workers are scarce and when it is possible to operate the company's mill at about two-thirds capacity. This holds out great promise for the future when workers are available in adequate numbers.

The Hollinger has close to 1,000 men on its pay-roll, but is anxious to secure several hundred more. In the meantime, pending the securing of these additional men, the mill is operating at about two-thirds capacity, and the output for the current year promises to approximate \$6,000,000.

A diamond drilling program of 1,200 feet has been completed on the Porcupine-Miracle property. A wide zone of mineralization was intersected, and the core has been shipped away for assay. Provided the gold content is sufficiently encouraging, further drilling may be undertaken during the winter.

Work has not yet been resumed on the Premier-Langmuir Barite Mine, in Langmuir township. The directors recently visited the property in company with an expert, and this gave rise to an earlier report that work had been resumed.

#### The Kirkland Lake District.

Outstanding features in connection with the Kirkland Lake district include the fact that the main shaft of the Lake Shore Mine is well on its way from the 400 to the 800-ft-level, that the mill of the Wright-Hargreaves mine will be completed by the end of the current year and that machinery for a new mill on the Ontario-Kirkland will be hauled to the property during the coming winter.

The Tough-Oakes mine is still idle, and it is believed no move will be made toward resuming general operations until next spring at least. The cost of heating the plant is a factor against deciding to start up at this season, while the difficulty of securing men is another. The chief underlying cause of the prolonged idleness is difficult to determine, as arrangements were made last spring to start up. The opinion has taken form locally that the causes may be more serious than is generally believed, and may have something to do with the amalgamation arrangement between the Tough-Oakes, Burnside and Aladdin-Cobalt.

A deal is said to be pending for the Elstone-Duncan property, situated about half way between the proven part of the Kirkland Lake district and the Argonaut mine at Beaverhouse Lake. Although sand overburden conceals the greater part of the rock in this territory, it is generally believed the gold-bearing formations extend all the way from Kirkland Lake to the Argonaut. For that reason, any movement or deal calculated to develop the Elstone-Duncan would be interesting and success in such work would open up possibilities over a wide field.

Clifford E. Smith, Chairman of the Toronto Branch of the Canadian Mining Institute has just completed a brief examination of the Associated Goldfields of Larder Lake. Mr. Smith has found the large low-grade bodies do not carry sufficient gold to make them profitable to mine on a large scale at a profit, and will probably recommend an entire change in policy. Provided this proves to be the case, the advertised plan to construct a large low-grade mill will have to be abandoned, and mining will take the form of prospect work to learn whether or not it will be possible to make a profit out of the smaller streaks of ore. This will no doubt come as a distinct disappointment to stockholders who had been led to believe in the latest annual report that a huge volume of ore exists in which the gold values average \$11.15 to the ton, the total indicated value being over 159 million dollars. To fall from such high hopes to the fact of having only a mining prospect with really no assurance of success is something which is reducing the enthusiasm born in the past of vague inference and mysterious reports.

A party of men left Haileybury this week for Lightning River where they will carry on operations throughout the winter on the property of the Lightning River Gold Mines. They were accompanied by Dr. Lucy of Guelph, who is going in to make a brief inspection of the property.

Operations are being resumed on the Mondeau property, at Boston Creek. Work was suspended a few weeks ago, at which time an official announcement was made that the step was only temporary and was not in any way due to lack of merit in the property.

On the Miller Independence mine, cross-cutting operations are proceeding in three directions at the 500-ft. level. As yet, no high grade ore has been encountered at this depth, although favorable indications are in evidence.

**COAL PRICES.**

Toronto, Oct. 22.—It is considered likely that the British strike will have a tendency to advance the export market for coal. Another feature which will have more or less effect on the market is the calling off by the Attorney General at Washington of the Fair Price Commission which may have the effect of stiffening the market. Hard coal is still quoted at from \$8 to \$16.00 gross tons at the mines, American funds. Mine run is quoted at \$13.85 to \$14.25, f.o.b. Toronto and smokeless runs at from \$13.50 to \$14.50.

*Vancouver.*

Bituminous coal retails in Vancouver at \$14.50 for lump coal, delivered in sacks, \$13.50 for nut coal, and \$10.00 for slack coal. The use of slack coal, combined with wood, in domestic furnaces is common, and permissible because of the milder climate of the Coast.

*Sydney.*

A general increase in the price of coal will be necessitated by the findings of the Royal Commission, as notwithstanding the failure of the parties to agree, some increase in the expenditure of the operators on wages is certain, and there is little disposition on the part of the miners to increase production. Sydney operators have already increased the price of runmine coal to local consumers from \$5.50 to \$6.50 per short ton. Screened coal is quoted at \$6.75. Higher prices are likely.

**TORONTO MINING STOCKS.**

Following are of average quotations for active gold, silver and miscellaneous stocks on the Standard Mining Exchange for the week ending 17th October, 1920.

Silver.	High	Low	Last
Adanae Silver Mines, Ltd.	2¾	2½	2½
Bailey . . . . .	4½		4½

Antimony . . . . .	8¼

## British Columbia Letter

### The Metal Mines.

Representatives of the Mining Operators of British Columbia are anxious to induce the Provincial Government to amend the Taxation Act in order that allowance may be made for the depletion of ore reserves in mining property. As it now stands anything that is allowed comes as a concession from the Minister of Finance after an investigation. The opinion among mining men is that the principle of allowance for depletion of ore reserves should be recognized in arriving at the basis for the taxation of a producing mine. A delegation from mining companies interested in this Province recently met the Premier and members of the Executive to discuss this and other phases of the Taxation Act. The hearing given them was sympathetic and they are confident that the force of their arguments will have the effect of producing the desired amendments at the next session of the legislature.

Instructions have been given the Provincial District Mining Engineers of British Columbia to prepare to deliver a series of lectures at the different important centres of their several districts during the winter months. They will deal with elementary geology and mineralogy, the idea being to give prospectors and others interested an opportunity to obtain the knowledge necessary to guide them in selecting prospecting ground and to enable them to recognize mineral when encountering it. Hon. Mr. Sloan, Minister of Mines, in adopting this policy has accepted a suggestion from the Prospectors' Protective Association of British Columbia. This organization made a number of recommendations, and that of the establishment of schools for the benefit of the prospector and the "would-be" prospector was among them. Mr. Sloan thought it a good suggestion, especially in view of the decline in the numbers of the men who search for mineral wealth in the Summers and return to think out what they are going to find next season, and also because of the extensive field offered by this Province for this class of pioneer work.

Members of the Canadian Geological Survey, who have been at work in British Columbia, are beginning to return and to leave for Ottawa to compile their reports. J. B. MacKenzie, who conducted a party into the Taseke (Whitewater) Valley, Clinton Mining Division, for the purpose of making a geological and topographical survey with special reference to the reported large deposits of limonite and hematite iron ore deposits of that Section, is one of the latest to be heard from. He states that on arriving in this District he met F. J. Crossland, who was at the head of a party sent in by the Provincial Government to pursue investigations bearing particularly on the tonnage of iron ore available. The two expeditions co-operated in their researches and their reports are being awaited with interest. Mr. McKenzie explains that he is unable to make any statement of values in connection with the iron deposits. He explains, however, that "the ores are derived from a pyrite, iron sulphide, which occurs in some places near the base of a great series of volcanic rocks, and these cover a very large area in Central British Columbia. The iron has been extracted from the pyrite by a process of oxidization, has been carried down the slopes, and deposited in the flatter ground. The beds of limonite, the subject of in-

vestigation, thus are found in different parts of the lower sections of the valley. "In September, Mr. MacKenzie make a reconnaissance across the eastern Coast Range, passing the headwaters of Tyaughton and Churn Creeks, and the Yalakon River down French Bar Creek to the Fraser River. Only general geological work could be done owing to the lateness of the season but nevertheless the trip was of importance because it was the first geological survey of any kind of that country.

W. E. Cockfield and M. F. Bancroft, also of the Geological Survey, are other workers in the western Canadian field who are en route East. The former has been working in the Keno Hill, Mayo, and other adjacent sections of the Yukon while the latter has spent the summer obtaining material necessary to tie-up geological maps of the Lardeau District of the Province.

Of the Keno Hill region Mr. Cockfield has little to say regarding general development except that there is much activity and that much development is being carried on by the Yukon Gold Company, one of the Guggenheims' enterprises. The Company expected to ship 3,000 tons of ore this winter. The ore assayed high-grade silver-lead, running from 200 ounces of silver and from 50 to 60 per cent of lead to the ton.

The principal ore was galena, occasionally carrying freibergite. The gold content was small, not exceeding, as a rule, \$4 to the ton.

On the upper Stewart River there were some stamp mills in operation but little placer mining was being done. A gold dredge had been in operation on Highett Creek during the summer.

Referring to the Lardeau Mr. Bancroft explained that he had examined the central mineral belt where are located such mining properties as the Silver Cup, Triune, Nettie L., and further north, the Truefisher, Broadview and Great Northern. Lack of capital was retarding development work. The belt was remarkable for its fissures, the rocks being carboniferous with fine grained sedimentary rocks, such as quartzites and limestones, much in evidence.

Discussing general conditions it was stated that much of the mineral had been Crown granted and left without development. The difference between this section and the Slocan was that in the latter the ore deposits were found closer to the surface, so that the expenditure required in opening and proving them was not so great.

A shipment of ore from the Nettie L. ran \$290 silver to the ton while other shipments have given returns of 21 ounces of gold, 230 ounces silver, a considerable percentage of lead and a small percentage of zinc.

### Vancouver, B. C.

Drilling for oil continues in the Fraser River section of British Columbia and, from reports, the indications at the Empire Company's well, which is down 2,200 feet, are encouraging. A gray gumbo, thickly studded with what is described as oil sand, has been encountered. Small quantities of oil have been brought to the surface in mud, it is asserted, and the statement has been made that the Well, as it stands, is capable of producing a considerable quantity of oil.

### Nelson, B. C.

At the Nelson Fall Fair one of the features was a Mineral Exhibit collected by the prospectors and operators of that section of the Kootenays. A specimen of copper ore from Iron Mountain, Beasley, was awarded first prize in competition with samples of other dis-

coveries made during the past year. A collection of gold ores from the Bayonne District was highly commended. These specimens averaged \$75.30 in gold, besides carrying silver and lead. A first-class sample of placer galena from Boulder Lake was much admired. Copper-silver and copper ores from Crawford Bay, silver ore from the Providence Mine near Greenwood; and lead ore from the Lardo were among other samples that held the attention both of local and visiting mining men.

**Trail, B. C.**

During the last nine days of the month of September ore receipts at the Trail Smelter, of the Consolidated Mining Smelting & Power Co., aggregated 12,744 tons, bringing the total for the year to 251,735 tons. The Washington Mine, of Sandon, is added to the list of shippers. Mines of the smelter company contributed 11,549 tons of the total for the last days of September leaving 1195 to the credit of independent operators.

**Stewart, B. C.**

W. R. Tonkin, president and manager of the Fish Creek Mining Co., is quoted as stated that seven years work on their property, situated on the west of Salmon River and on the American side of the Portland Canal area, has justified a continuance of work and that shipment of ore will commence as soon as transportation facilities are secured. The leads, he states, are quartz fissures carrying high values in silver and gold and it is proposed to instal a concentrator. Mr. Tonkin declares that as large a tonnage of ore will be developed on the American side of Salmon River as within Canadian territory, affirming that it has been only because of the remarkable showing of the Premier Mine that the adjoining section has not received the attention its merit deserves.

About 600 feet of diamond drilling is to be done on the Titan Group of Claims, located on Fisher Creek. This property possesses a well defined quartz vein. The Riverside Group also has been under development, 350 feet of tunnelling having been done with satisfactory results.

On the Premier Mine the concentrating mill, which will have a capacity of 100 tons a day, is making good progress. Water power is to be utilized and electricity will be available both for the mine plant and for all buildings of the camp. Employees will be provided with comfortable housing, being supplied not only with light but as well with hot and cold water. Equipment now is being hauled over the road on the American side, over the border and the river to the mine. A warehouse has been built on the new dock for storage of the ore pending shipment. There are 200 men on the payroll at the Premier Mine Camp.

**THE COLLIERIES.**

The situation in the coal fields of Eastern British Columbia and the Province of Alberta has not mended during the past week. In Alberta it is about the same. The claim is made by representatives of the U. M. W. of A. that the tie-up is not general and that few of the mines are seriously affected. The O. B. U. officials, however, declare that the strike call has been responded to by the majority of the workers and that more have been coming out every day. The Crow's Nest Pass District, B.C., the mines have been practically closed down since the 6th inst.

It is an unusual condition because the issue does not

appear, at any rate at present, to concern the operators so much as the two rival labor organizations, viz., the United Mines Workers of America and the One Big Union. The latter want the "check-off" system abolished, this being the practice of taking from the men's wages the dues which go to the U. M. W. of A. The U. M. W. of A. asks that its Agreement with the Operators be re-opened so that provision may be made for an increase of wages to day-workers. The O.B. U. failing to get satisfaction called a strike. The U. M. W. of A., did not go that far, advocating negotiation. Consequently the original dispute seems to be somewhat obscured in the heat of the struggle for control between the two labor factions. The Operators, for their part, have declared that there can be no action on the question of a revision of the Agreement to provide for additional wages until the men go back to their work.

The possibility of a fuel oil famine in the northwest is turning the attention of transportation companies to the task of providing for a substitute. Joshua Green, president of the Puget Sound Navigation Co., in testifying before the Washington State Public Service Commission recently, stated that his Company probably would continue to use oil as long as it could be had, but that it was increasing so in price that increased passenger and freight rates were imperative. It was his opinion, however, that within the next two years the use of oil for fuel and gas making would have to cease in the Pacific Northwest. Consumers of fuel oil would have to turn to something else, presumably coal. "We are experimenting now with powdered coal", he said, "but the result still is doubtful. We find that the coal cannot be pulverized at plants on shore but must be powdered aboard the boats." It is difficult and dangerous to handle, Mr. Green asserted, because of its inflammability.

The total coal production by the collieries of Vancouver Island for the month of September was 150,807 tons. This is made up as follows :

	Tons.
Canadian Western Fuel Co., Nanaimo . . . . .	56,775
Canadian Collieries (D) Ltd., Comox . . . . .	42,005
Canadian Collieries (D) South Wellington . . . . .	8,461
Canadian Collieries Extension . . . . .	14,545
Pacific Coast Coal Mines Ltd. S. Wellington . . . . .	7,088
Nanoose-Wellington, Nanoose Bay . . . . .	5,456
Granby Consolidated Mng., S., & P. Cox, Cassidy . . . . .	16,477
	150,807

These figures indicate that the coal fields of the Island are holding their own in point of output. The outstanding feature is the increase in the production of the Granby Collieries at Cassidy, 16,477 tons for September as against 9019 tons for the month of August.

**PORT ARTHUR NOTES.**

By J. J. O'CONNOR.

The Port Arthur Shipbuilding Company announce that negotiations are proceeding for the manufacture of mining machinery at their plant here.

Mr. Samule Hoare, representing the Canadian Mining Shovel Company, of Virginia, Minn., and closed contracts for the construction of a considerable num-

ber of Armstrong shovel loaders, in addition to the contract already in hand. The first of those completed was thoroughly tested out during the past week, and came up to requirements. Others are being assembled, and the first shipment of them will go forward the early part of next week.

In addition to mining machinery, the company will add the manufacture of a full line of papermaking machinery including all classes of grinders, wet-machines, chippers, digesters and heavy paper making machines.

The acreage, and floor space of the shops are ample to accommodate an enterprise of this kind, in addition to the shipbuilding operations of the company.

Vice President P. G. Chase, states that the company is assured of steady work for another year, and that with negotiations for further shipbuilding contracts that have reached a favorable stage, he expects to be able to announce the signing of new contracts in the near future.

The Reliance Mill and Trading Company, of New York, will handle the sales of the paper-making machinery for the company.

A magnetic survey is being carried out on a large tract of iron ore lands, lying east of Poplar Ledge, Lake Nepigon. These lands were recently diamond drilled by United States interests, with very gratifying results.

A new shaft house has been constructed at the Grace Mine, Eagle Lake, and an Ingersoll steam hoist, with ventilating fan attachment is being installed. The old Camp, and mine buildings have been put in thorough repair, preparatory to an active campaign of mining development work, on or about November 1st. next.

#### DOVER OIL FIELD, ONTARIO.

Messrs. Kiely & Smith, stock and bond brokers, Toronto, have sent out the following circular:

New developments are under way in the Dover Oil field which undoubtedly will be of considerable importance to the different companies operating in this district.

A franchise has been granted to the Petrol Oil & Gas Company, giving this company the right to build an independent pipe line from the producing field a distance of about twelve miles to connect with the Southern Pipe Line Company, a subsidiary of the well-known Doherty interests of New York. This new pipe line should be completed within two weeks, and will allow of the producing companies in the Dover field obtaining a market for their gas at a price over three times that now obtainable.

The Petrol Company has already accepted a contract to deliver gas to the Southern Pipe Line Company, and no doubt other companies in the field such as the Vacuum Gas & Oil, Eureka, Thames Oil & Gas, Inland Oil & Gas, etc., will be very glad of the opportunity to enter into arrangements with the new interests for the sale of their gas when producing wells are brought in by them.

The fact that these important United States interests have become interested in the Dover field indicates that from this district very great things are expected in the way of production.

The Petrol Company has at present two wells producing oil and about 1,000,000 feet of gas per day, and a third well nearing completion. The Vacuum Gas & Oil Company is drilling at a depth of about 2,900 feet with every indication an important producing oil and gas well will be brought in within the next thirty days. The No. 3 well of the Petrol has reached a depth of something over 2,800 feet, and expectations are that this company will soon have three producing wells in this district. English interests are drilling a well near Painscourt which has reached a depth of something over 2,700 feet, and we understand already shows indications of oil. These interests have something like 5,000 acres under lease.

The building of this new pipe line at considerable expense will naturally encourage and benefit all those interested in this important oil and gas field. The higher market available to the producer will mean in the case of the Petrol Company increased net yearly earnings of not less than \$60,000. While a number of wells are at present being drilled by different companies, the fact that a better market for gas is obtainable, due to the new pipe line coming into the district, will undoubtedly result in extending the field of operations.

#### LADY GEOLOGISTS IN CANADA.

Shortage of the right kind of men, presumably, has led the Canadian Geological Survey to engage women. Two lady geologists are reported to be in the field. They ought to be able to collect all the information necessary for a useful report; indeed, they are said to carry a gun and a revolver as part of their outfit, so that if anybody is slow in coming forward with the necessary data they will be in a position to exercise persuasive powers of more than usual feminine effectiveness. We shall expect sundry distinctive touches in the writings of these ladies, and the introduction of new descriptive terms. For instance, they are likely to find pleats in the shale, ruching in the rhyolite, and tucks in the trachyte. Stranger things have happened. The "selvage" of a vein is akin to the "self-edge" of a piece of cloth. "Seams" came into mining by grace of the seamstress. Joking apart, geologizing by women is no new thing. The oldest Geological Society, namely the one in England founded by Lyell and Murchison, includes a considerable number of the gentler sex. Many of them have contributed valuable articles to the proceedings. Geology used to be considered a polite study, it was one that was untainted by commercialism, it appealed to gentlemen and ladies, that is, to amateurs. And that is why the geology of the Victorian period in England contributed so little to the aid of mining. The geologists of both sexes looked askance at any phase of their subject that touched on money-making. They delved in fossils, they delighted in glacial drift, they enthused over stratigraphic difficulties. All that is changed, and the ladies too. Undoubtedly the new recruits to the Canadian Survey will have an eye to the economics of their subject; they will be in sympathy with the miner, and they will collect the data helpful to him in his search for metals. We welcome them with the grave courtesy suitable to the occasion. There is plenty of work for men to do; many of them are doing the work that women can do; it is well that there should be a proper distribution of talent and energy into suitable channels.

## PITY "POOR" MINERAL INDUSTRIES

ALEXANDER GRAY.

"The output of the property is dependent upon the supply of native labour".

"Orders amounting to over six months output are now in hand; in fact, owing to the uncertain conditions of labor, it is necessary to refuse orders for execution so far ahead".

This is the crux of the situation prevailing at the New Modderfontein property—the second largest gold mine in the world—at the Rand, and at the properties of the Cape Asbestos Company, in Cape Colony.

The statements re-echo throughout mineral industries, everywhere and anywhere.

Gold is needed to replenish the depleted treasuries of the nations. The New Modderfontein is producing nearly \$13,000,000 per annum.

The Chairman of the Cape Asbestos Company confidently declares "the general outlook is distinctly promising; the asbestos industry is still in its infancy, each year seeing some new application of the materials".

Like views in endless reiteration might be offered in behalf of coal and silver producers—the nickel industry—the copper mines—it is altogether too obvious that go-as-you-please-see-the-line-of-least-resistance policies are hobbling them. Mineral industries are running on flat tires—while politicians and economists prescribe speed limits of production, without thought of how that can easiest be brought about—by the immediate provision of domestic or imported labor, as well as by the elimination or material modification of surtaxes. No surer sources of new wealth exist than in the diversified mines of the Dominion. Lloyd George very aptly took the stand that advances in wages must be based upon increased production. With this as the datum line, the do-as-little-as-possible dictum of trades organizations would have a reciprocating action not much in evidence at present. Languishing industries have to make other than lean purses. Mineral industries were not privileged to operate during the War on a cost plus basis. Nickel producers abstained from profiteering. The gold mines could not retain their labor and were confronted by special taxation and war costs of everything.

So, a National Policy by which mineral resources more speedily can be brought into the credit balance is something which might receive official consideration. The shortage of basic materials is no less acute than that of precious metals.

## A MODERN PLANT FOR MINING, CONCENTRATING & SMELTING MAGNETITE FORTY MILES FROM NEW YORK.

Lean Siliceous Ore of 36 per cent Iron Content.

An iron-ore mining enterprise of significance to Canadian readers as bearing upon some much debated problems of the utilization of magnetite, is that of the Replogle Mine near Wharton, New Jersey, which is described at length, with many illustrations, in the "Engineering & Mining Journal" of 2nd October.

The ore is described as lean, and high in silica, running about 36 per cent iron. It is being concentrated, first in a dry mill by magnetic separators, and the tailings by tables in a wet mill. At Wharton, two new blast furnaces are being built with a capacity of 500 tons of pig iron daily from each furnace.

New Jersey in 1882 produced 920,000 tons of iron-

ore, but the industry has decayed owing to competition of lake ores. Increased cost of carriage from the lakes and the improved methods of concentration now available are tending to revive magnetite mining.

The deposit controlled by the Wharton Steel Co., which owns the Replogle Mine, is estimated to contain 27 million tons of ore, as proved by diamond drilling. About 875 to 1,000 tons of crude ore are being crushed daily. The ore body is described as a lens of magnetite in gneiss, without definite contact between the magnetite and the gneiss, there being a gradual change from one to the other. The installation of the wet mill was made necessary by the occurrence of martite ( $Fe_2O_3$ ) intimately mixed with the magnetite, which makes a portion of the ore non-magnetic and not susceptible to the magnetic separation process used in the dry mill.

A sintering plant of 800-900 tons per 24 hours capacity is being erected, intended to sinter a portion of the concentrates, mixed with flue dust from the old furnaces, of which a considerable accumulation is available. Lime for fluxing is being obtained from Ogdensburg, N. J.

The article describing the Replogle Mine is by A. H. Hubbell, and it is interesting in Canada because of the somewhat parallel conditions of ore occurrence. The Replogle Mine has, however, the advantage of being close to an industrial centre, being about forty miles from New York.

## THE USE OF GRAPHITE, TALC AND MICA IN SOLID LUBRICANTS.

(Condensed from "Financier and Bullionist")

Quite a number of solid materials can be used for lubricating purposes, as graphite, talc, soapstone, mica, white lead and flowers of sulphur. Some of these, as flake graphite or mica possess a tough and flaky character which allows them to withstand considerable pressure without disintegration. Others, such as amorphous graphite or sulphur, are easily crushed into a very fine powder under pressure.

Again, certain solid lubricants can be changed into a colloidal form and carried in suspension in liquid so as to render them easier of application. Examples of these are the colloidal graphite preparations known as oildag and aquadag being diffusions of graphite in a colloidal form in oil and water respectively.

Of all solid lubricants graphite in one or more other of its forms is perhaps of the most use to engineers, as it is not changed in composition by high temperatures and will resist the action of acids and alkalis.

Talc, which is very soft, resists acids and alkalis, and also cold and heat, and commercial preparations of this should find a number of uses in the engineering world. The refuse from mica works, when finely ground, forms a material suitable for lubricating purposes.

This problem of preventing separation of solid and liquid lubricants is one that is causing many difficulties and no satisfactory method of dealing with the matter has yet been devised. Some little time ago a firm patented a mixture of finely-pulverised graphite and glycerine for lubricating the cylinders of steam engines. Before mixing the graphite with the glycerine it was impregnated with a sufficient amount of petroleum or other similar material insoluble in glycerine so as to reduce the specific gravity of the more solid portion to that of the glycerine itself, so that there was no tendency for the mixture to settle out. This compound was quite satisfactory in use and could

# STEEL MINE CARS—Built To Your Liking

be pumped by a mechanical lubricator in the ordinary way.

Solid lubricants of all kinds can, of course, be mixed with oil to any consistency and applied by hand to bearings or parts requiring lubrication, but for general purposes it would seem that the colloidal preparations of graphite give the most satisfactory results. A report recently received from a British railway is to the effect that good results have been obtained by using either colloidal graphite or flake graphite mixed with the ordinary locomotive engine oil. The graphite is not used for regular running, but only as a temporary remedy whenever important bearings are inclined to heat. In a number of industrial works excellent results have been obtained on heavy duty bearings, such as those of pumping engines, by the continued use of colloidal graphite mixed with pure mineral oils.

This form of lubrication has been remarkably successful with bearings which previously gave trouble, even when using oils heavily compounded with fixed oils. Not only did the bearings run cooler, but there was an appreciable reduction in the consumption of oil. Bearings of high speed machinery, such as draught or ventilating fans, which were troublesome with oil alone, ran reasonably cool when the same kind of oil mixed with graphite was used.

## QUICKSILVER PRODUCED IN THE UNITED STATES DURING THE SECOND QUARTER OF 1920.

From April 1 to June 30, 1920, inclusive, 3,685 flasks of quicksilver of 75 pounds net, was produced in the United States, according to F. L. Ransome of the United States Geological Survey, Department of the Interior, who obtained the figures from the producers.

This is 1,214 flasks less than was produced in the first quarter of 1920 and 255 flasks less than was produced in the second quarter of 1919. Only 13 mines were reported as productive—8 in California, 1 in Nevada, 1 in Oregon, and 3 in Texas. California produced 2,704 flasks, Texas 952 flasks, and Nevada and Oregon together 29 flasks.

The average monthly price of quicksilver per flask in San Francisco for the quarter, as quoted in the Mining and Scientific Press, was \$100 in April, \$87 in May, and \$85 in June. The average price for the quarter was therefore about \$91 as compared with about \$86 for the first quarter.

The chief cause of the decrease in production during the second quarter was the destruction by fire, on June 20, of the reduction plant of the New Idria mine, in California, and the consequent loss of quicksilver already reduced during the earlier part of that month. Because of this misfortune the production for the third quarter of 1920 will probably be still smaller than that for the second quarter. Reconstruction is in progress, and it is expected that the plant will be in partial operation in August or September of this year. Other causes that contributed to the decrease in production were a shortage of efficient labor and a reduction in the average grade of the ore.

At a time when initiative in the quicksilver-mining industry is at a low ebb and the tendency is rather to abandon enterprises already begun than to embark on new ones it is of interest to note that the formerly productive Klau mine, in San Luis Obispo County, Calif., has been reopened under very capable management as the Carson mine, and that its 50-ton furnace has been put in repair, so that the mine is likely to become a considerable producer.

# The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY,  
 GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

**Coal** Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

**Iron** The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

**Gold** Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

**Gypsum** Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and other Literature may be had free on application to

HON. E. H. ARMSTRONG, - HALIFAX, N.S.

*Commissioner of Public Works and Mines*

# EDITORIAL

## THE SECOND WESTERN MEETING OF THE C. I. M. & M.

The Canadian Institute of Mining & Metallurgy is meeting in Winnipeg this week for the first time in annual general assembly, following the precedent of an annual western meeting inaugurated last year at the unqualifiedly successful gathering in Vancouver.

The choice of Winnipeg, hitherto the metropolis of an almost exclusively agricultural population, for a convention of mining men and metallurgists is significant of several things. As was the case in Toronto, so has been the course of events in Winnipeg, when the northern extension of a railway into the mineral-bearing pre-Cambrian rocks led to the discovery of valuable metals; and, although, with the possible exception of the Flin-Flon deposit, the mineral belt north of Le Pas has not yet been demonstrated to contain mineral wealth comparable with that of Northern Ontario, the conditions geologically are so similar as to suggest a possibility amounting to a probability that it may do so.

The Institute is to be the recipient of the official hospitality of the City of Winnipeg and of the Winnipeg Board of Trade, a compliment that the Institute will thoroughly appreciate.

The selection of domestic production of coal and iron as topics for discussion is recognition of their importance in Canada, which may be expressed in a sentence. The total value of the mineral output of Canada in 1919 was 173 million dollars. The value of importations of coal, petroleum, and iron and steel into Canada in that year was 272 million dollars. In mineral production alone, to say nothing of other items, this country is 100 million dollars per annum on the wrong side of the ledger.

## OIL AT FORT NORMAN.

The finding of oil at Fort Norman is one instalment in a modern romance of prospecting. Fort Norman is as far north of Edmonton as that city is north of Denver, being only 400 miles upstream from the mouths of the Mackenzie River and just outside the Arctic Circle.

The difficulties of commercializing an oil-flow situated so remote from transportation routes, and so very far north, are great, but need justifies great effort and creates initiative. With an annual importation of 450 million barrels of petroleum into Canada, and a domestic yield of only 240,000 brls, Canada's necessity for a domestic source of petroleum is quite clear.

While such an oil-flow as is reported from Fort Norman would have been more immediately useful if found further south, yet the important thing is to know that it is contained within Canadian territory.

The President of the Imperial Oil Company has given out for publication a cautiously worded statement which very properly points out the uniquely difficult geographical location of the oil-strike, and expresses the opinion that while the strike is scientifically of much value, from a commercial point of view it is not of immediate value. The implication in Mr. Stillman's statement that the Imperial Oil Company is prepared to spend years in making the oil available for sale in the Canadian market, and that oil may be present in such volume as to justify the laying of a pipeline through the inhospitable wilderness, strike us as the most important portions of Mr. Stillman's remarks, as they disclose the intention of the Imperial Oil Company to prosecute an enterprise on which already much expenditure has been risked, and apparently not without good grounds.

The incident is the latest justification of the employment of the geologist, and confirms the deductions of the officers of the Canadian Geological Survey as to the possibilities of the Mackenzie River Basin, and especially Mr. D. B. Dowling's statement in our issue of April 9th last. Mr. Dowling noted the existence of Devonian beds that exhibit a very slight degree of folding in the Mackenzie Valley. These beds are divided by the Nahanni Mountains into two distinct basins, in one of which the Fort Norman well is situated. In both these basins, stated Mr. Dowling, "There seem to be great masses of oil-saturated shales, and porous dolomites, from which oil is expected to be obtained by drilling."

The Imperial Oil Company's oil-prospecting campaign is widely-extended and scientifically directed. In addition to the party that wintered on the Mackenzie River and the well drilled at Fort Norman, there is a drilling rig near the Great Slave Lake, and others in south-western and eastern Alberta and in south-western Saskatchewan. The mass of exact stratigraphical information which the drillings will enable to be compiled, and the utilisation of this by the trained economic geologists that are in the Imperial Oil Company's service will, it is hoped, be placed at the disposal of the Canadian Geological Survey by the Company, and will form a very welcome and a very substantial addition to the literature on this matter.

Some entirely novel developments in oil transportation seems likely to arise from any attempt to get this

northern oil to market, not the least of the difficulties to overcome being the handling of oil under low temperatures of long-sustained duration, and it looks as if once again the peculiarities of our geographical position will call out that adaptability for developing a special technique that, as in many other instances that could be named, gives Canadian technical workers a distinctive and honored position, and has in great measure created a characteristic national mentality that welcomes the hard jobs and is bored by the easy ones.

### THE ASSOCIATION OF WORKMEN'S COMPENSATION BOARDS.

The Association of Workmen's Compensation Boards in Canada is becoming an important body. Originally planned to exchange information, statistics and other data interesting to men engaged in the administration of workmen's compensation in the various provinces of Canada, this association is rapidly developing into a national advisory council in matters pertaining to occupational accidents.

Co-ordination of statistics, comparison of the incidence of accidents, exchange of views of accident prevention, on rates of compensation, medical aid, pension funds, and many other matters that might be mentioned, provide useful and proper activities for conference by the representatives of provincial compensation boards, but, according to newspaper reports, the Association has extended its deliberations to the passing of resolutions advocating changes in workmen's compensation laws that amount to advice to the various provincial legislatures interested. Such resolutions are within the proper province of a meeting of citizens, but we think they are distinctly improper activities for an association of officials charged with the administration of workmen's compensation laws that differ in every province of Canada.

For example, a newspaper report states the opinion of the delegates to the Association at one session to have been that workmen's compensation should be extended to every workman, and not limited in its application to any set of industries. Another resolution passed was that accident prevention work should be placed under the compensation boards in each province, following the lead of some provinces that have already adopted this plan. There is much to be said for these opinions of the Association, and we would not wish to attack the merits of either proposal, but we conceive it to be distinctly outside the function of provincial officers, appointed to administer a statutory office, to advise the country at large as to what should be the trend of workmen's compensation legislation. As private members of an accountants' society, medical association, or bar society, such opinions might be properly advanced over the names of

their advocates, but they are distinctly not the business of an "association of Workmen's Compensation Boards in Canada."

### HOOKWORM INFECTION IN A CHINESE MINE.

The "Mining Magazine" (London) contains a first instalment of a paper by Dr. F. C. Yen, Dean of the Hunan-Yale College of Medicine, China, describing the measures taken to control the hookworm disease (ankylostomiasis) at the Pingshiang Colliery in the province of Kiangsi, Central China. The colliery has been in operation twenty-two years, employs 12,000 men, and produces one million tons annually. The climatic conditions are tropical, hot and damp. The temperature in the mine does not fall below 78 to 80 degrees F. and the average humidity of the mine air is 97.7. The mine is wet and muddy, no toilet facilities are provided, the workers dispense with clothing, and the water in the mine drains is used for drinking and washing purposes. The conditions are therefore ideal for intensive and repeated infection, and are shockingly opposed to every western idea of sanitation.

In strange contradistinction to this state of affairs is the attempt that is being made by Dr. Yen, who judging from his scholastic titles is a medical man of eminence even to western ideas, to combat the all pervading infection of the hookworm larvae by sanitation, microscopical examination, and the resources of modern medical science. It is a picture that is typical of the social condition of a great nation, not so far removed by distance from Canada, that we can afford to be entirely indifferent to the phenomenon.

The debilitating effect of hookworm disease is pathetically told by the figures of production; for, even the primitive mining methods of the Chinese colliery do not explain a production of less than one-third of a ton per man per day.

Dr. Yen emphasises the necessity for control of the hookworm disease by pointing out that mining is an industry only just beginning in China, and that if the old mines could be freed from the infection, the new mines could be saved, and an inestimable boon would be conferred upon the industry.

It is impossible to remain unmoved by sympathy at the unvarnished—and in some details revolting tale—of a lone fight by a man of science against a disease that has its origin and residence in dirt and filth. Even the patient persistence of a learned Chinese doctor, equipped with all the armory of medical science against parasitic diseases, might quail before the herculean nature of his task. Neither self-sacrifice nor high romance can be said to have flown the earth in face of undertakings like this.

In Canada, probably the last thing we may fear in our mines is hookworm infection, and this is chiefly attributable to our climatic conditions, and the absence,

so far, of any deep hot mines which are at the same time moist mines. There is little doubt that if Canadian mines were possessed of the disposition to receive hookworm infection, such would have been reported, because infected workers have undoubtedly been employed, and, with some notable exceptions, such as the mines at Sudbury, no particular attention has been paid to underground sanitation. It has not been regarded as necessary, and from the point of the possibility of hookworm infection, it has probably been unnecessary. Nevertheless, reasonably sanitary conditions are just as important underground as they are on the surface.

### PROBLEM OF THE WORLD'S GOLD. RECEDING OUTPUT.

Below is reproduced a condensation of a speech delivered before the Brussels Conference by Mr. Henry Strakosch (South Africa), Managing Director of the Union Corporation, taken from the "Financier." Mr. Strakosch's conclusion that economy in the use of gold for monetary purposes is only possible through the restoration of sound monetary and credit policies, so largely destroyed by the financial straits occasioned by war expenditures, seems essentially sound. Artificial methods of gold stabilisation cannot restore the wastage of war, and as Mr. Strakosch lucidly phrases it, international credit can only be restored by the accumulation of savings resulting from increased production.

#### Currency and Exchange.

Dealing with the question of gold production generally, and especially as it has been affected by the war, Mr. Strakosch said the gold production of the world has steadily increased from 1893, when its value was 32.4 millions sterling, to 1915, when it reached the high-water mark of 96.4 millions. Since then it has rapidly declined, until in the year 1919 the value of the total world output was reduced to 72 millions sterling. He estimated that the yield for the current year would probably not exceed a value of 69 millions sterling, and he predicted that the world's gold output would show a further decline in 1921, and that from then onwards the output would more or less steadily recede.

#### The Uses of Gold.

As to the uses to which the gold output of the world has been put, he stated that from 1907 to 1913, when the output of gold on an average amounted to 94.7 millions sterling, the amount absorbed was to the extent of 22.6 millions (or 23.8 per cent.) for industrial purposes and for the arts in Europe and America, while the East, and especially India, has taken 17.7 millions sterling (or 18.7 per cent.) of the world's production, so that the world consumption of gold for purposes other than money has amounted to 40.5 millions (or 42.5 per cent.). The balance of 54.4 millions (or 57.5 per cent.) he assumed to have been devoted to monetary purposes.

#### The Diminution in Output.

"The rapidly diminishing world output of gold and the radical change which has taken place in the uses to which that metal is put at present, as compared with pre-war days, deserve special attention," he went on. The diminution in output, it was clear, had been brought about by increased cost of production, which was unaccompanied by a corresponding rise in the value of gold. As to the change in the uses of gold, the conclusion was irresistible that the low value of gold, in terms of commodities, had very materially extended the demand for that metal in the East and for industrial purposes. The increased prosperity of the country and the rise in silver and the fall in gold have had as their natural consequence an increased demand for the yellow metal, "for which these Eastern peoples are evidently prepared to pay more than the Western world is willing to give in order to secure it for monetary purposes." The cheapness of gold had also very naturally stimulated its demand for industrial purposes in the West. Hence the material curtailment of the supply of gold for monetary purposes.

"The prospect of a diminished world gold output very natu-

rally invited consideration of the possibility of measures which have for their object economy in the use of gold for monetary purposes, while the heavy depreciation in the currencies of many of the countries which formerly adhered to the gold standard suggests measures to prevent the value of gold from rising to its pre-war level.

#### Stabilising Present Value.

"To prevent the value of gold from rising means, in other words, to stop the price of commodities from falling in terms of gold. I, for my part, entertain great doubt as to the possibility of achieving this by international agreement. But if it were possible, what would be the consequences? The figures which I have given you, showing the material changes in the uses of gold since its price in the terms of commodities has fallen, clearly indicate the effect of any attempt to fix the value of gold at its present level. It would lead to a materially diminishing world output of gold, and, what is more, it would divert, as it has done during the last year, an increasing proportion to non-monetary uses. Is not then the conclusion forced upon one that it is neither practicable nor desirable to prevent the price of gold from rising in terms of commodities? I should add that a rise in the price of gold, while probably not increasing the world output of that metal, will certainly tend to retard its decline. But what is more important, it will have the effect—as in pre-war days—of preventing a predominant proportion of the gold output from being used for purposes other than money, so that we may, in these circumstances, again look forward to a very substantial proportion of the gold produced annually being devoted to monetary purposes.

"It is true that a rise in the value of gold—connoting as it does a prolonged process of deflation with falling commodity prices—would have detrimental effects on trade and enterprise, and consequently upon employment. But can it be expected that the maintenance of high commodity prices, by a more or less permanent depreciation of the monetary standards, will avert these pernicious effects? I, for my part, doubt it. The ravages of war have naturally very materially reduced the real purchasing power of the people, and that can only be gradually restored by savings resulting from increased production.

#### Economising Gold.

"A word about economising gold for monetary purposes. Great strides in that direction have been made in the decade or so prior to the war. The progress in that direction is undoubtedly due in a very large measure to the increasing mutual confidence in the methods of money and credit creation practised by the great commercial nations. This must surely be a sine qua non to any attempt at economising gold for the purpose. The money and credit policies imposed upon most of the nations—it is true by the hard necessity of war—are not conducive to restoring that confidence immediately. Only the putting into practice of a fixed determination to revert to sound methods can in time re-establish it, and thus pave the way to economies in the use of gold for monetary purposes."

### OLIVER IRON MINING CO. SUED FOR ALLEGED INFRINGEMENT OF ORE WASHING PROCESS.

A \$40,000,000 suit by Capt. Alexander McDougall, of Duluth, against Oliver Iron Mining Co. for damages in connection with alleged infringement of an ore washer process is on trial in Federal Court here before Judge Booth of St. Paul. Plaintiff claims damages at rate of \$2 a ton on ore mined by defendant company between 1913 and November, 1918, and treated at its ore washing plant at Coleraine, Minn.

In evidence presented, attorneys for Capt. McDougall sought to prove that no genuine difference exists between the washer he invented and the type used by the iron company. Plaintiff alleges he submitted his invention to defendant company in 1908, and was informed that use could not be made of the stripping device, but the usefulness of the ore-washer was not denied.

Oliver Iron Mining Co. is contending that the McDougall patent is invalid, since a similar ore washer had long been in use. It denies that John G. Greenway, an engineer in its employ at the time, filed a patent for an ore washer after he had seen the McDougall invention and that the former's device was based on the latter.

# The Case for a Bounty on Iron Ore Mining in Canada\*

Iron Ore Mining, and an Adequately Developed Iron and Steel Industry, are Essential to Industrial Independence in Canada

The present status of iron ore mining in Canada is in anything but a satisfactory condition, considering the enormous bodies of iron ore within its borders.

The majority of the known deposits are what is known as low-grade ore, and require more or less treatment to bring them to merchantable grades, to meet furnace requirements.

The general classification of low-grade ores contain all non-merchantable ores. On the basis of iron content, they may be classified as follows:

1. Ores containing less than 40 p.c. of natural iron.
2. Ores containing between 40 p.c. and 50 p.c. natural iron that are used to some extent at the present time as concentrating ores, or are mixed with ores of high iron content, in order to increase the tonnage.
3. Ores containing over 50 p.c. natural iron that are not of the necessary physical structure to meet demands of furnace practice.

The necessary treatments take the form of magnetic separation, roasting, calcining, grinding and briquetting, and are collectively known as "beneficiation". All of these forms are well known to metallurgists, and have been brought to a high degree of perfection, especially on the iron ranges of Minnesota, where enormous sums have been expended in exhaustive experiments to demonstrate the commercial feasibility of magnetic separation, and other forms of beneficiation, with results that are so highly satisfactory that millions of dollars are being expended in the construction of plants for the exploitation of low-grade magnetites, averaging between 25 p.c. and 30 p.c. natural iron content.

The Mesabi Iron Company expended \$750,000 in testing magnetic separation, in an experimental plant, at Duluth, Minn. on ores of this character from the Eastern Mesabi range, and are now constructing an operating plant at Babbitt, Minn. the first unit of which, will entail an expenditure of \$3,000,000 and have a capacity of 3,000 to 4,000 tons per day. They are laying out a town on broad and permanent lines at this point, including all modern conveniences for a large force of operatives, metallurgical and office staffs, showing their confidence in the future outcome of their enterprise. This plant will be in operation this Autumn, and will enter the shipping class on the opening of navigation in 1921. It is fully expected that it will be a prominent factor in iron ore shipments from Lake Superior in the years to come.

This undertaking is being carried out by experienced metallurgists and iron ore mining operators, after thoroughly satisfying themselves that ores of the low iron-content mentioned above, can be mined, treated and placed on the market, in a form to meet the highest furnace requirements, at a profit, in competition with the high-grade ores of the Mesabi range. The efficiency of the machines developed in the Mesabi Iron Company is such, that the concentrates can be perfectly controlled, from the lowest grade, up to

72.4 p.c. iron content, thus enabling them to meet any furnace demand. The concentrates are produced in the form of a porous sinter, a most desirable form for furnace use.

The iron deposits of Northern Ontario are very similar in character to the low-grade ores of the Eastern Mesabi, and are largely amenable to the same form of treatment. Therefore, we should consider ourselves fortunate, that experience and responsible individuals, have successfully carried the beneficiation of low-grade magnetites through the experimental stage, and set the pace for what may be done with similar ores in Ontario.

Canada has immense quantities of beneficiable ores in the prospected parts, more particularly Northern Ontario, that are known to contain many millions of tons, at points traversed by the Canadian National Railway, the Canadian Pacific Railway, and the Algoma Central Railway. This will obviate a large initial expenditure for transportation facilities, which, ordinarily have to be overcome in the development of new iron fields.

Estimates, based upon diamond drilling, place the quantity of ore in certain Northern Ontario deposits at figures ranging from 100,000,000 tons downward. In other provinces of the Dominion, there are very large, but less definitely measured, possibilities in available ore.

In this connection, it may be pointed out that only about 50,000 feet of diamond drilling has been done on the Ontario ranges, as against some 10,000,000 feet on the Minnesota ranges. Drilling so far carried on, has resulted in disclosing large bodies of good merchantable ore, where only lean jaspilites showed on the surface. It may reasonably be assumed that further, and sustained drilling will locate other valuable deposits, when iron ore mining receives the encouragement that is its due.

Statements covering details of tonnage of the various Northern Ontario and other ranges, are included in an appendix hereto.

Our known deposits of iron ore thus represent supplies for years to come. The potentialities of the unprospected portions of the Dominion are enormous.

Iron ore mining in Canada is confined to Northern Ontario. The Algoma Steel Corporation, Ltd., operating the Magpie Mine, producing siderite ore, and the Moose Mountain Ltd. operating magnetite properties in the District of Sudbury, constitute the only activities in iron ore operations. Both these companies have extensive reserves of ore, proven by diamond drilling and milling development work. Both companies have carried beneficiation processes to such an extent, that they are convinced, that with reasonable Government aid, these low-grade ores can be profitably converted into marketable grades.

This has been arrived at, only after an extremely large expenditure, and is highly significant of what the possibilities are in beneficiating low-grade ores. It shows that under proper encouragement, Canada

\* A memorandum presented to the Tariff Commission at Port Arthur, 16th October, 1920.

may produce sufficient domestic ore to displace the United States ore we are importing at the present time.

Canada's imports of iron ore has passed the 2,000,000 ton mark annually. Imports of iron and steel products for the year ending March 31st, 1920 reached the enormous figure of \$189,907,602. With an extensive railway mileage, years in arrears for betterments, and necessary upkeep, after six years of almost complete cessation of all classes of constructive development. With the necessity of catching up these arrears, and meeting the growing wants of our fast developing country, the imports of iron ore, and iron and steel products, may reasonably be expected to increase, unless active steps be taken to develop a domestic iron and steel industry, and displace the imported ores, and iron and steel products by our own resources.

The tonnage of domestic ore charged to furnaces in Canada, has fallen from about 300,000 tons in 1915, to less than 100,000 tons in 1919, or about 5 p.c. of the total tonnage smelted. Of the total of 653,137 tons of ore charged to 7 blast furnaces in Ontario, for the six months ending June 30th, 1920, only 58,387 tons were of domestic origin, the balance being imported from the United States. Exports of domestic ore are negligible.

#### What Iron Ore Mining Means to Canada.

It is quite obvious that the successful operation of iron mines means more than the employment of so much labour. It implies a maximum of activity in all lines of endeavour, a continuous flow of freight traffic, so necessary to our National Railways, the erection of steel works, by-product plants, wire, and wire nail plants, slag-cement works, and all classes of industries subsidiary to iron and steel works. It also implies the upbuilding of prosperous communities in the agricultural areas surrounding the iron ore deposits. The magnificent stretches of arable land in the great clay belt of Northern Ontario will be brought under cultivation, with markets provided by an iron mining industry. No class in the community will receive greater or more direct benefit than the farmer.

An iron and steel industry, on an adequate scale, will do more to solve the tariff problems of the former in Canada, than anything that could be done in his behalf, by way of tariff changes. We can never hope to have cheap agricultural machinery while we are obliged to import raw material in the vast quantities we are now doing.

If trade and commerce in Canada is to be put on a sound foundation, it is plain that this must be built up on a combination of the two great basic industries, of mining and agriculture.

Canada has done her part well in the upbuilding of the blast furnace industry, in granting \$17,000,000 in bounties during the period of 1896-1912. Without these furnaces, Canada would have been in a sorry plight during the Great War. While they have been, and are doing splendid service, they have been built up at the expense of the neglect of our own ores. This can be accounted for, largely from the fact of the easy accessibility of United States high-grade ores, and the further fact, that beneficiation had not been brought to the high state of perfection it is in today.

There are many reasons why Canada should take definite and immediate steps to develop an iron ore mining industry, some of which may be briefly summarized as follows:

1. The vital necessity of establishing an iron and steel industry on a stable basis, in order to secure

the industrial independence of Canada in the matter of iron ore.

2. The development of our vast resources in iron ore, as a means of defraying the tremendous financial obligations created by the war, the profitable development of our gigantic railway system, and the improvement of the water-ways of the Dominion.
3. The Canadian National Railway traverses four-fifths of the iron ore deposits of Northern Ontario, and would be immediately and directly benefited by the increased traffic developed by an iron mining industry. The product of the mine may be made the largest single source of railway traffic in Canada. In the United States, the mining industry contributes between 55 p.c. and 60 p.c. of all freight moved. Iron ore mining contributes a larger volume of freight traffic than any other branch of the mining industry.
4. To produce from its own ores the plates necessary for the construction of the ships of Canada's Merchant Marine, a branch of industry vital to the future prosperity of the Dominion, if a profitable and successful export trade is to be built up, and to enable Canada to take her old place in the world's shipping lists in the matter of registered tonnage, that she occupied at Confederation.
5. To furnish the traffic necessary to keep the ships of Canada's Merchant Marine profitably employed in exporting manufactured articles to world markets.
6. To solve the farmers' tariff problem, by the manufacture of cheaper agricultural machinery, more and more of which will be required as the west develops.
7. The development of Northern Ontario's iron ore resources would do more to wipe out the "East and West" in Canada, than anything else that could be undertaken. It would form a complete union of the two geographical sections.
8. It would materially decrease imports, right the balance of trade, and stabilize exchange.

While Ontario's iron ore resources have been more particularly referred to in this memorandum, these reasons apply with equal force in every Province of the Dominion.

#### NEEDS OF AN IRON ORE INDUSTRY.

As mentioned above, the iron ores of the Ontario ranges require some form of treatment to bring them to grades suitable for furnace use. The cost of this treatment varies with the different grades and qualities found in the Canadian ranges. To place Canadian iron ore operators on a parity with United States producers, some form of Government aid is vitally necessary to enable them to overcome the cost of the necessary beneficiation.

The Dominion Government has been memorialized by a larger number of Boards of Trade, Municipalities, Mining and other Industrial organizations, praying for the granting of a subsidy, to cover a period of fifteen years, of a fixed sum of seventy-five cents per ton, on all Canadian iron ore mined and marketed without restriction.

If Government aid to the extent of seventy-five cents per ton, be granted on all iron ore mined in Canada, it would immediately make possible the development of the immense deposits of low-grade magnetites, hema-

tites, and siderite ore of the Northern Ontario ranges. As iron-ore mining is now at such a low ebb in Canada, the amounts accruing to iron-ore operators under this system, would be very small for the first few years, as it would take some time to equip and develop ore lands, before the shipping stage could be reached. The amounts payable thereafter, depending as they do, on ore actually mined, beneficiated, shipped and sold, will simply be a measure of the growth of the industry. The larger they are, the larger will be the benefit to the country generally, as the subsidy would bring about disproportionately large returns in the stimulation of industrial activity.

Tangible assistance of seventy-five cents per ton on all Canadian iron ore mined and marketed without restriction, will unquestionably induce widespread activity in iron ore mining in Canada. The subsidy should be:

- (a) In force for fifteen years.
- (b) Paid monthly to mine operators.
- (c) Reckoned (1) when the ore is milled or treated, on the long ton weights going into the milling or treating process; and (2) when not milled or treated, on the long ton shipping weights going to the furnace.

#### **Necessity for Utilization of Our Low-Grade Ore.**

The Province of Ontario is wholly dependant on the United States Lake Superior ranges for its supply of high-grade iron ore. The enormous tonnages of these ores that are being mined, shipped and smelted—between 55 and 60 million tons annually—naturally suggests the question: How long will these ranges hold out an available supply of high-grade ore for Canadian furnaces? The terrific drain on their resources must, within a measurable length of time, bring them to the point of depletion, insofar as the high-grade material is concerned. It would seem, therefore, that Ontario ores must, at no distant date, be called upon to supply the furnace requirements of this province. It is but the part of sound economy to be prepared for that eventuality. The only means of reaching that stage, where we will have an abundant supply of our own ores, is through Governmental assistants by way of a subsidy, to offset the costs of beneficiation.

When the utilization of our low-grade ores is undertaken, it must be on a large scale, with large plant units, capable of handling large tonnages daily. The plants must be built in the most substantial manner, equipped with machinery that will operate efficiently and continuously, under heavy loads, with a minimum of personal attention. This requires a large investment of capital, that can only be induced to take up the enterprise, with the Government assistance above referred to. These plants will require to have heavy and costly machinery installed, most of which, would have to be imported, on which, the Government should remit the duty, as a further measure of assistance.

To show that the references to the high-grade ore supplies of the United States Lake Superior ranges, have not been overdrawn, I beg to quote Prof. Edward W. Davis, of the Minnesota School of Mines Experimental Station, University of Minnesota, Minneapolis, Minn., in Bulletin No. 7, May 22nd, 1920 in "The Future of Lake Superior District as an Iron Ore Producer:"

"It is, of course, recognized by everyone, that at some future date all of the merchantable ore will have been removed from the district. This date is placed by various estimators at from 15 to 30 years hence. This statement is based on the assumption that the present rate of shipment will continue until

the end of the season of the last year. This, of course, cannot be the case. The history of any successful mining district shows that during the first few years of life, small tonnages of high-grade material are mined. As time passes, and a district is more largely exploited, the tonnage mined each year increases. As the tonnage increases the grade of the ore usually becomes lower. After a certain time, the yearly production reaches a maximum, and after the maximum is passed, the production gradually decreases. The rate of decrease is quite rapid at first, but absolute depletion may not occur for many years. The distribution of the Lake Superior ores among the various furnace companies shows that, while some companies have a sufficient supply of ore to last them 30 or 40 years, other companies have enough to last only 5 or 6 years. These companies are already looking about for new sources of ore supply, and if they are not found in the Lake Superior district, the companies will go elsewhere."

It may thus be seen that the present source of supply of high-grade ores for Ontario furnaces, have but a comparatively few years of expected life.

#### **Electrical Development**

Northern Ontario is in the fortunate position of possessing an abundance of water powers, that, on development, must play a considerable part, and be an important factor in the development and utilization of our iron ores.

The Nepigon River, in the District of Thunder Bay, is now under development by the Hydro Electric Power Commission, of Ontario. This River has a capacity of 200,000 H.P. of electric energy. The two first units of the present development will be ready for distribution at the Head of the Lakes, December 15th, 1920, followed by a further distribution up to 75,000 H.P. early in 1921.

When these powers are linked up with the modern methods and processes, for metallizing, and furnacing by electricity, already designed by a Canadian metallurgist, Mr. James W. Moffatt, of Toronto, we may reasonably look for the creation of a stable iron and steel industry, based on domestic ores, at an early date, provided the suggested aid be given by the Government.

These water powers are so located throughout Northern Ontario, as to be within easy access of all the iron ore ranges from the District of Rainy River on the west, to the most easterly deposits in the Districts of Algoma Sudbury.

#### **APPENDIX.**

##### **Sources of Canadian Ore Supply.**

##### **ONTARIO.**

1. Titaniferous magnetite ores of the Rainy River District, on Rainy Lake, where a large amount of diamond drilling has been done, disclosing large bodies of iron ore, high in iron content.

2. Steep Rock Lake, the most westerly extension of the main iron belt, quantities of high-grade hematite float led to the discovery, by drilling, of a body of soft ore some 70 feet in width. It is almost assured that the main body of the Lake is underlaid by this same deposit.

3. On the Atikokan range, west of Sabaw Lake, some 15,000,000 tons of magnetite has been proven by drilling operations, averaging 55 p.c. iron, 12 p.c. sulphur, and 10 p.c. phos. These are high sulphur ores, which, when roasted, make a most desirable furnace product.

4. East of Sabawe Lake, the Atikokan Mine, the only developed mine in the district, shows some 10,000,000 tons, averaging 55 p.c. iron, 2 p.c. sulphur, and 10 p.c. phos. This mine has produced 86,433 tons of ore, averaging 59.85 p.c. iron; 2 p.c. sulphur, and .11 p.c. phos.

5. On the Mattawin range, about 35 miles west of Port Arthur, and in Conmee township, in the same neighborhood, a large tonnage of lean ore is exposed averaging 35 p.c. or better. This deposit runs into many millions of ton, and can be quarried and handled by steam shovel. Tests made by the Dominion Testing Laboratories, Ottawa, show that by coarse crushing and jigging, a product running 50 p.c. iron can be obtained with a 2 to 1 concentration.

6. On the east shore of Lake Nepigon, known as the Nepigon range, there are numerous bodies running around 45 p.c. iron, or better. Drilling operations on this range located large bodies of good ore, where nothing but lean jaspilites showed on the surface.

7. At Little Long Lake, the eastern extension of the Nepigon range, there are extensive areas of iron outcrops. One body 30 feet in width, averages 42.67 p.c. iron, .05 p.c. phos. Another exposure 400 feet wide, averaged 42.35 p.c. iron, and another outcrop 20 feet in width averaged 49.78 p.c. iron.

8. The Loon Lake iron field is situated 26 miles east of Port Arthur. It is of a different geological age and character to the ores mentioned above, and is an undoubted extension of the Mesabi range in Minnesota. The beds are flat-lying, consisting of interbanded layers of high-grade hematite, and lean taconite, having a total thickness of 20 feet. The ore is easily separated by hand-sorting, yielding from one and three-quarters to two tons of merchantable ore, for every three tons of material handled. Less than one-third of this field has been tested by diamond drilling and pitting, yet 5,448,000 tons of ore, averaging between 48 p.c. and 55 p.c. iron, have been proved. Conservative estimates of the possible tonnage of this field are placed at 25,000,000 tons.

9. The siderite ores of the Michipicoten district in Algoma have been extensively drilled, and a tonnage estimated at over 2,000,000 tons have been proved at the Magpie Mine, and the New Helen Mine, by the Algoma Steel Corporation Ltd.

10. Over 100,000,000 tons of magnetite have been proved by diamond drilling at Moose Mountain in the District of Sudbury, by the Moose Mountain Mining Company. Estimates of the possible quantity of available ore go far beyond this figure.

11. Extensive deposits of magnetite are found on the Groundhog River, Rush Lake, and Wapoose Lake, on all of which diamond drilling has been done, disclosing large tonnages of ore.

#### QUEBEC.

1. The Bristol Mine is known to contain large deposits of magnetite, but has not been diamond drilled.

2. The Forsyth deposits of silicious magnetites have an estimated tonnage of 500,000 tons.

3. Extensive deposits of magnetic sands on the north shore of the St. Lawrence are estimated to contain 500,000 tons of magnetite.

4. The St. Charles deposits of titaniferous ores are estimated to contain 5,000,000 tons.

#### NOVA SCOTIA.

1. The Torbrook range with an estimated tonnage of 250,000 tons.

2. The Martin hematite property, with an estimated

tonnage of 115,000 tons.

3. There are extensive deposits in the Arisaig area, with no available records.

#### NEW BRUNSWICK.

1. The Bathurst deposits are a mixture of hematite and magnetite, and have an estimated tonnage of 7,000,000 tons.

2. Hematite deposits at Woodstock, and limonite deposits at Maugerville; no available estimates.

#### BRITISH COLUMBIA.

1. The Texada Island deposits of magnetite, having an estimated tonnage of 5,000,000 tons.

2. The Puget Sound deposits of magnetite, estimated at 4,500,000 tons.

3. The Glen iron mine in the Kamloops district, with an estimated tonnage of 8,000,000 tons of magnetite.

4. Further discoveries are being located by sustained prospecting and development work, in various sections of this Province, that hold out great promise on development.

#### MANITOBA.

1. Black Island in Lake Winnipeg, has large outcropping of hematite ore of good quality.

#### ALBERTA.

1. Recent investigations by the Geological Survey, show a large indicated tonnage of low-grade ores.

Note.—Graphs and tables showing production and importation of iron ore and iron and steel products in Canada were appended to the foregoing memorandum.

### COPPER PRODUCTION IN SEPTEMBER.

#### Lessened Production, and Little Demand.

Production of smelter copper by the 19 leading mines of this country and South America amounted to 99,202,841 pounds in September, compared with 105,516,912 pounds in the preceding month, a decline of 6,314,071 pounds.

In the nine months to Sept. 30, however, the same mines report an output of 934,000,000 pounds, or approximately 76,000,000 pounds more than in the first nine months of last year.

It is fair to assume that the total copper production of all mines in North and South America is now running between 115,000,000 and 117,000,000 pounds a month, on the lowest estimate at the rate of nearly 1,400,000,000 pounds of smelter copper a year.

Notwithstanding present mining operations throughout the country are cut to 60% capacity, the resultant output is still far ahead of demand. Copper quotations last week broke through to new low levels, the metal being offered at 16 cents per pound, with virtually none taken. Copper consumers believe they are safe in buying on a hand to mouth basis; they feel that the American copper market cannot advance very rapidly when Europe is unable to purchase and domestic business is in a hesitant state.

It is estimated present surplus of refined saleable copper amounts to 600,000,000 pounds; approximately 400,000,000 pounds more is enroute to refineries and in process of reduction. There is, therefore, virtually 1,000,000,000 pounds of copper above ground today.

Formerly Europe took between 40% and 45% of our production. Since 1914 productive capacity has been greatly expanded to meet the abnormal demand engendered by the war, so while current operations are down to 60% of capacity, production is still virtually the same as in the years prior to 1914 and demand distinctly less.

### BRITISH COAL OUTPUT & WAGES.

#### The Danger of Flat Rate Increases. Bad Effects of the Disappearance of the Differential between Day-wages and Contract Rates.

(From "Iron & Coal Trades Review")

If the miners obtain another flat rate advance without any guarantee in regard to production, it is almost certain that the output per person employed will show a further decline. Flat rate increases are unsatisfactory; they assure exactly the same advance to workers of 18 years of age as in the case of married men, and the earnings of different classes of workers are disproportionate.

Assuming the owners' hands have not been tied in negotiations, they would appear to have missed an opportunity in attempting to equalise the "percentage" advances received by the various classes of workers employed in the industry, instead of suggesting a settlement on the basis of a wage advance for actual coal-face workers only, whose "net" earnings to-day, in comparison with pre-war days and other sections of mine workers, show a much smaller percentage increase. When it is considered that coal-face workers are entirely responsible for larger or smaller output, it is certainly in the interest of the coal trade in particular, and the country in general, that production should be stimulated, but any wage advance should be restricted to coal-face workers.

The percentage advances to coal-face workers varies with the bare getting price, but generally speaking it will be somewhere about 140 per cent.; against this, day workers in many cases have received advances of well over 200 per cent., whilst in the case of boys and youths it is even greater. On the face of things, therefore, it is obvious that the actual coal getters are entitled to something which should be given as a percentage increase on the bare getting price—not as a flat rate advance. By this means production might be improved.

The present flat rate advances paid to all workers over 18 years of age are:—War wage, 3s.; Sankey, 2s.; advance as from March 12 last, 2s. A total flat rate advance of 7s. per shift worked. After the commencement of the war, the first advance to workers engaged in the industry was given in May, 1915, in the shape of a war bonus of 15½ per cent. on total earnings. And it is very significant that each successive advance has been followed by a reduction in the output per person employed in the industry. The annual output per person employed in 1915 was 270 tons; 1916, 260; 1917, 247; 1918, 232; 1919, 197½. As from July 16, 1919, working hours were reduced from eight to seven per shift, it is necessary in order to get a true comparison to base the output as though eight hours had been worked the whole period. On this basis the output per person would have been approximately 211 tons. To be perfectly fair we must add to this a figure equivalent to the loss of something like five million tons as a result of the Yorkshire and other sectional strikes that took place during the year. If, therefore, we place the output per person for 1919 on an eight-hour shift basis at 216 tons, the fall in the production per person employed as between 1915-1916 was 10 tons; 1916-1917, 13 tons; 1917-1918, 15 tons; 1918-1919, 16 tons. A total reduction per person of 54 tons as between 1915 and 1919.

At the present time there are approximately 239,000 more persons employed in the industry than the average number during 1915, owing to the fact that in that year such large numbers joined H. M. Forces, so that on the face of things it is obviously a wrong method to fix the datum line on that of total outputs, because, provided a sufficiently large number of persons were employed, the output could be attained, in spite of a further reduction in output per person employed. Therefore, the datum line should be fixed on the output per total persons employed in the industry.

The output per person employed for the first half of this year was at the rate of 204.8 tons per annum for seven-hour shifts. This is equivalent to 234 tons (approximately) for eight-hour shifts, and shows a decided improvement by comparison with last year's tonnage. So far as it goes, this is satisfactory, but there is still a good deal of leeway to make up to bring the output per person employed into the parity with that for 1915.

**F. H. SEXTON****Director of Technical Education in Nova Scotia.**

(From the Bulletin of C. I. M. &amp; M.)

Professor Sexton was born in New Boston, N.H., on June 9th, 1879, and his early education was obtained in the public schools at Billerica, Mass., and the English High School, Cambridge, Mass. From the latter he entered the Massachusetts Institute of Technology, taking the mining engineering course and graduating in 1901 with the degree of B.Sc. For a short period after graduation he was engaged as assayer and chemist with the Carmichael Reduction Company of Boston and then acted as instructor in metallurgy at his *alma mater* for about eight months. For about two years following he was engaged as research metallur-

sequence this matter was brought to the serious consideration of the Military Hospitals Commission. He provincial premiers and representatives in Ottawa in September, 1915, and placed the matter of industrial retaining before them with the result that the Commission was charged with the duty of actively proceeding with this important task. In March, 1916, he was asked to assist in the work of training the maimed and disabled soldiers for new occupations and was appointed a delegate from Nova Scotia to the conference of pointed to the position of Vocational Officer for Quebec and the Maritime Provinces. For four and a half years Professor Sexton has given his best efforts to this work in pleasant association with other prominent members of the Institute such as Mr. W. E. Segsworth and Professor H. E. T. Haultain. This work is now

PROFESSOR F. H. SEXTON, D.Sc., LL.D.

gist in the research laboratories of the General Electric Company, Schenectady, and left to take up the position of assistant professor of mining and metallurgy at Dalhousie University, Halifax, N.S.

When Nova Scotia led the other provinces of the Dominion in establishing a comprehensive system of technical education in 1907, Professor Sexton was appointed Director of Technical Education and President of the Nova Scotia Technical College, Halifax, which position he has held to the present time.

During the summer of 1915, he prepared memoranda on the vocational rehabilitation of war cripples for Sir Robert Borden and Sir George Foster, and in con-

being finished under the Department of Soldiers' Civil Re-establishment and none can deny that Canada's efforts in this direction are as noteworthy as her record in the field.

Professor Sexton was honoured with the degree of D.Sc. from Acadia University in 1918, and LL.D. from Dalhousie University in 1919. He has always taken an active interest in social service, civic improvement and education of all kinds, sorts and description. His chief diversions are angling and gardening and his pet aversions snakes and Bolsheviki.

For five years Professor Sexton was a member of Council of the Mining Society of Nova Scotia and Pre-

sident of the Society for two years. He joined the Institute in 1914 and was first elected to the Council for the two-year term 1917-1918. He was re-elected last spring as one of the Councillors for Nova Scotia and is also serving at present on the Council of the Mining Society of Nova Scotia.

He is a member of the advisory committee on mining and metallurgy to the Honorary Advisory Council for Scientific and Industrial Research, member of the Council of the Association of Professional Engineers of Nova Scotia, District Governor of Rotary Clubs for the Maritime Provinces, member of the Nova Scotia Institute of Science, of the National Society for Testing Materials and of numerous other educational and public organizations.

## Northern Ontario Letter

### THE SILVER MINES.

#### The Cobalt Field.

Operators in the Cobalt silver area have announced that beginning with November 1st, they are prepared to pay their men a flat wage equal to the former wage plus the daily bonus on the high price of silver. This announcement came as a surprise, owing to the fact that silver quotations have declined steadily during the past six months.

The decision to include the bonus of \$1.25 daily as of silver commanding \$1.20 an ounce, will make the flat wage higher than ever before in Cobalt's history. It will add about \$2,000 daily to the pay-roll or at the rate of about \$750,000 annually, as compared with what it would have been had the companies decided to discontinue the bonus and maintain the former base wage.

On November 1st the Coniagas will disburse a dividend of 2½ p.c., which will call for the distribution of \$100,000. This brings the total for the year up to \$500,000 and makes a grand total of \$10,040,000 since the mine was first opened. The company will close its fiscal year at the end of this week, and is understood to have had another successful year.

Some alarm was felt during the past week when silver quotations declined to a low of 76¼ cents per ounce. This quotation was about on a par with the cost of producing silver at some of the smaller mines, and left net profit to come only from the premium received on New York funds for which the silver is paid. Leading mines like the Nipissing, O'Brien, Kerr Lake and Coniagas were not threatened, but such properties as the La Rose, Crown Reserve, Peterson Lake, and even the McKinley-Darragh were obliged to do some close figuring. At the McKinley-Darragh, with production running at the rate of a little over 50,000 ounces monthly, the cost of producing the silver is understood to be not far under 80 cents an ounce. It may be seen, therefore, that at such properties the slump in silver quotations constituted just cause for alarm. At the time of writing, the price of the metal has strengthened several points, so that with the 10 p.c. premium, the margin of profit at such mines as the McKinley-Darragh is brought up to a very substantial amount.

The annual statement of the Temiskaming and Hudson Bay Mines shows an output of income of \$102,688 for the fiscal year ending with August. Expenditure during the period amounted to \$99,000, leaving a net profit of only \$3,688. Ore reserves are estimated to

contain 30,800 ounces of silver in the dumps, exclusive of the small areas underground which may yield limited quantities. The report refers optimistically to the company's holdings at Kirkland Lake and Gowganda, and points to these properties as valuable assets. As regards the Dome Lake which has been extensively backed by the T. & H. B., nothing definite has been decided upon as to future plans.

In view of the small profit realized on the Hudson Bay Mines, a good deal of strength is added to the reports that this property may be absorbed either by the Coniagas or by the Mining Corporation. In fact, it is intimated in usually well informed circles that the Mining Corporation is even now negotiating for a lease on the old mine.

The tailings pile on the Penn-Canadian mine has been optioned to the brokerage firm of F. C. Sutherland, Toronto. The Penn-Canadian has remained idle since the labor strike of last year, although a fair tonnage of medium grade ore still remains in the mine. No announcement has been made as to whether the Sutherland interests intend to re-treat the tailings pile or endeavor to arrange a sale to other interests.

At a depth of about 100 feet on the Ruby Silver mine, in the south-eastern part of the township of Bucke, a narrow streak of high grade ore has been encountered. Leaf silver also appears in the wall rock, and at the present point of operations shows commercial values over a width of close to three feet. The property is being operated under lease to Cobalt and Haileybury business men.

#### The Gowganda and Elk Lake Areas.

Another small shipment of ore has been made from the Castle property at Gowganda. About ten tons of high grade material came out recently. It is generally understood that current output is being maintained at a rate that covers the cost of operations, and that in the meantime, much necessary exploration and development work is being carried out. Latest advice would tend to show that the cross-cut at the 86-ft level has encountered the vein and with high values occurring at this point.

Unofficial advice just obtained conveys the information that the Miller Lake-O'Brien has encountered another high grade ore shoot. Whether or not this is in a new vein or on one formerly worked has not been ascertained.

As a result of favorable developments on the Miller Lake-O'Brien and the Castle, as well as general favorable conditions in the district, mining interests in this area have become more enthusiastic than usual, and a busy winter is anticipated.

Mr. Miller, Provincial Geologist for Ontario, together with Thos. W. Gibson, Deputy Minister of Mines, concluded their visit to this area last week.

The small mining plant on the Regent property near Elk Lake will soon be ready for operations, and sinking is to commence just as soon as steam can be turned on.

It is also learned that an endeavor is being made to raise finances to re-open the old Moose Horn property.

A shipment of about five tons of high-grade ore has been made from the Cane Silver Mines, a property situated south of Kenabeek, P.O., on the Elk Lake branch of the T. & N. O. Ry. The ore is said to contain from 500 to 1,000 ounces of silver to the ton, and was gathered by open-cutting a number of veins along the surface. It has now been arranged to commence sinking operations, and two shafts are to be put down

on two of the more promising veins.

During the week ended Oct. 22nd, four Cobalt companies shipped an aggregate of eight cars containing 653,339 pounds of ore. The Mining Corporation headed the list with four cars, as shown in the following summary :

Shipper	Cars	Pds.
Mining Corporation . . . . .	4	283,230
Nipissing . . . . .	2	194,815
Temiskaming . . . . .	1	87,979
La Rose . . . . .	1	87,315
Totals . . . . .	8	653,339

During the corresponding period, bullion shipments were largely withheld owing to the slump in the price of silver. The Mining Corporation was the only bullion shipper, sending out 24 bars weighing 24,933.50 fine ounces.

Low water on the Montreal River has caused a shortage of power in Cobalt, as a consequence of which the mines of the district have been obliged to temporarily curtail work to some extent. Fall rains are considerably overdue, and relief is expected daily. In the meantime, the mines have mutually arranged to work alternately so as to share equally in the loss of time incurred.

**THE GOLD MINES.**

**The Porcupine District.**

The outlook for the gold mining industry as found in the Porcupine gold area is steadily improving. One of the most interesting and hopeful developments in the labor supply is now taking place, as found in the information that a large number of miners are already on the Atlantic, coming from the British Isles to work in the gold mines of the Porcupine field. It is learned to-day that 130 men are now in course of passage over the Atlantic and will be added to the strength of the force engaged at the Dome Mines. Another group of about equal number are to follow shortly. This information seems to suggest that the Dome has solved the problem of labor shortage and that by the end of the year this mine may be on a fair way to operate at full blast. In preparation for the improved situation, it is also learned the company has placed orders for additional mechanical equipment among which is included more than two dozen extra machines for underground work. As a consequence of all this, the general outlook has greatly improved.

It is reported that the Hollinger and McIntyre are planning to import about five hundred men from Wales but this report so far lacks official confirmation and is for that reason not emphasized in a manner equal to the more authentic advice regarding the Dome.

Mr. H. C. Hudson, superintendent of the Ontario Employment Bureau, Toronto, has stated some thirty mines in Northern Ontario gold and silver areas are prepared to take on an extra 1,850 men almost immediately, while an additional 500 could soon be absorbed. Wages are high and steady employment offered, and Mr. Hudson has issued a statement urging men to not overlook this opportunity to obtain steady work.

On November 3rd, the Hollinger Consolidated will disburse a 1 p.c. dividend, amounting to \$246,000. This is the seventh disbursement so far this year or a total of \$1,722,000. In addition to this, the company is expected to follow out its usual policy of paying two dividends during December, in which case the total for the year may be brought up to 9 p.c. or a total of \$2,218,000 for the period.

The McIntyre-Porcupine is the center of increased attention owing to the great probability of ore reserves being added to at a rapid rate as a result of the aggressive development of the new ore body found below the 1000-ft. level, North of vein No. 5. This new orebody is believed to be the easterly continuation of Hollinger's No. 84 which is at present the largest individual deposit in evidence on the Hollinger.

Announcement is made that negotiations are under way in England, with the object in view of disposing of the Davidson Consolidated to English interests. The company is capitalized at 5,000,000 shares, a majority of which is understood to already be under option to the English interests mentioned.

**The Kirkland Lake District.**

A meeting of the shareholders of the Hunton-Kirkland is being held to-day at which arrangements are to be made to proceed with increasing the capitalization from 1,250,000 to 2,500,000 shares. This added million treasury shares will be used as a means of financing future work.

The newly incorporated Kirkland Lake Proprietary, 1919, Ltd., is appealing to the shareholders of the Ontario Tough-Oakes Company to transfer their shares on the basis of two of the old for one of the new. Announcement is made that this new company has completed the details of acquiring the assets and undertakings of the English Tough-Oakes, the Aladdin-Cobalt and the Sudbury Syndicate, and is now negotiating with a view toward taking over the assets and the undertakings of the Burnside, as well as the Ontario Tough-Oakes and the Sylvanite. These details are secured from an official source.

In regard to the Kirkland Lake Proprietary, 1919, the one point not clear in this country is the financial status of the concern and the plan of operation. No definite information seems to be available on this side of the Atlantic, a fact which has caused certain of the stockholders in the merging companies to hesitate about making transfer of their shares.

On the Kirkland Lake Gold Mines, Ltd., developments at depth continue quite favorable. At the 500-ft. level as well as at a depth of 900 feet, high gold values have been encountered during recent months. Frank L. Culver, president of the company, came north at the end of the past week and made the statement that the outlook is exceedingly good.

Nothing has been mentioned during recent weeks about the possibilities of a merger between the Teck-Hughes and the Orr Gold Mines with the Kirkland Lake. The proposal was regarded as doubtful from the beginning, owing to the complicated status of the Orr as well as the financial obligations of the Teck-Hughes to its bondholders, as well as the debts owed by the Kirkland Lake to the parent company the Beaver Consolidated.

A small shipment of ore has caused interest in La Santa Lucia property, formerly the Cartwright Gold fields, in the Painkiller Lake district east of Matheson. The ore was taken out of a narrow deposit. The property is not far from the Croesus mine which a few years ago yielded very rich ore, but which contained no great volume.

The feeling is getting abroad that the gold mining industry has reached a point where from this date forward steady improvement will be shown, and the next few months are expected to witness considerable growth.

## British Columbia Letter

**Hazelton, B. C.:** The activity of the Kleanza Mining Company and of the Kitselas Mountain Copper Co. Ltd., the development being pushed steadily ahead by James Cronin, and the general interest being displayed in prospecting, the immediate future looks bright for the Omineca District, from a mining viewpoint.

For some years the deposits of Hudson's Bay Mountain have been receiving attention. On the north-eastern slope are the Schufer, Martin, Carroll and Hanson properties and on the southern slope are the Coronada, Victory, Mamie, White Swan and several other claims. On the recommendation of J. D. Galloway, resident mining engineer, the Provincial Government has this year made substantial expenditures in the improvement of the roads and trails in this region. The road from Smithers to the Coronation and other groups in the same locality, as well as the transportation avenues on the northeastern side of the mountain have been much improved. Consequently a section giving promise of noteworthy productivity has been made accessible and may be expected to develop shipping mines.

The Kleanza Company is at work on a vein on Kleanza Mountain and is driving a tunnel which, it is figured, will make it possible to put their property in the shipping list. This tunnel should connect several veins of good ore if the plans of the management are realized. A sample of gold-copper ore came from this group carrying 4.2 oz. gold and 15 per cent. copper.

On Bornite Mountain, three miles out of Usk, the Hazel Group of Claims is being developed with promise of a successful outcome to those who have invested in the enterprise. The ore is a chalcopyrite and bornite, with a small quantity of grey copper. Specimens have been assayed with returns of 28 oz. silver, 24.4 per cent. copper, and 0.10 oz. gold. Tunnel operations are to be started on a vein about five feet wide of mixed high grade and milling ore. There is a large mineralized dyke in this section which has been cut by Emma Creek and through the action of this waterway the ore being opened up was discovered and located.

From the Peerless Claims of the same locality was taken a specimen which was awarded first prize at a recent northern British Columbia Exhibition for copper ore. It weighed over a hundred pounds and is estimated to contain over 50 per cent. copper. Epidote and hornblende from the matrix of the vein from which this was taken. It has been stripped for over 100 feet and several deep cuts made, the result being the uncovering of 26 inches of very high class ore, the remainder of a width of 7 feet being milling material. There are some one hundred tons on the dump for shipping and plans are being made for the resumption of operations next season on a large scale.

There is a force of fifteen men at work on the Kitselas Mountain Copper Company's property also situated close to Usk. North and south drifts respectively are being driven on No. 1 and No. 2 A veins and a foundation of concrete is being laid under the Mill and so extended as to provide for an addition when one is required. The concentrates coming from the chalcocite and bornite ore are high

grade, giving returns of 48 per cent. copper, 40 oz. silver, and 2.20 oz. gold.

It is reported from the same section that notable success has attended the development of the Silver Horde Group of Claims at the head of Chiminess Creek, native silver being found in grey copper ore. The occurrence is in bands from an inch to a foot in thickness in a ten-foot dyke of calcareous material, lying in porphyritic trachyte. Assays have given returns of 266 oz. silver and 17 per cent. copper.

The Cronin Mine of the Babine Range has been under development for some years, the work most recently engaging attention being the driving of a tunnel into the ore from a level considerable below the outcrop.

The objective was reached this season, the workings now being in a substantial body of ore of a good grade. James Cronin, the owner and manager, is a well-known British Columbia operator. He proposes carrying on next year with a view to the commencement of shipping and it is possible that the Government, if its engineer's report is favorable, will make an appropriation for the improvement of the road into the district.

### Stewart, B.C.

The Algonican Development Company has decided that further development of the George Group of Mineral Claims, situated on the south side of Bear River, Portland Canal Mining Division, shall be postponed to next season. The Company considers this as one of its promising holdings in northern British Columbia. Discussing it in a report recently issued George Clothier, resident mining engineer, explains that the country rock is greenstone, locally called the "Bear River formation" after McConnell; that there are several veins on the property lying in an extensive mineralized zone of from 70 to 80 feet in width; and that this large mineralization occupies an altered, more or less silicified area in the greenstone, and in which iron sulphides are disseminated, accompanied in some places by chalcopyrite. It is stated that combined chalcopyrite and pyrites also occur in bunches. There is a tunnel in this ore-body 105 feet long which is practically barren, the surface over the tunnel showing very little mineralization. This zone, it is asserted, might develop a large tonnage of low-grade ore. About 600 feet east of the tunnel at an elevation of 4,000 feet is a strong cropping of three veins contained in a width of 50 feet. Little mineralization can be seen on the surface in the filling between these veins but it is very probable that they are all in the same ore-zone. The best ore in all three will aggregate 10 feet, averaging \$4 a ton in gold, 30 cents in silver, and 3 per cent copper. The veins stand practically vertical and have been traced for considerable distance on the surface.

Progress of importance has been made in opening up the property of the Indian Mines Ltd., situated on the west side of Cascade Creek, between the Salmon river glacier and Cascade Creek, Portland Canal Mining Division. The claims are at an elevation of 2400 feet and fourteen miles from tidewater at Stewart. Development consists of three open-cuts on the croppings and two tunnels. The former expose a vein from 12 to 20 feet in width, which can be followed on the surface for about 2,000 feet. The vein is quartz and appears to follow a wide dioritic dyke

which intrudes the greenstone-schists. The minerals found in the quartz are galena, sphalerite, and pyrites, the respective values being in the order named. The first two open-cuts going up the hill show very little galena the values being about \$10 a ton in gold and silver. The upper or main open cut discloses the vein for a width of 20 feet of which from 5 to 8 feet is a high grade of galena while on the hanging wall are found values in galena and zinc and on the foot wall there are quartz and pyrites.

In describing the showings that have resulted from the driving of a tunnel for about 150 feet vertically below and for a little over 400 feet with the vein. Roy Clothier, who has been in charge of the work this season, states that each of the ore-shoots exposed on the surface has been located. No. 1 shoot, it is said, shows considerable galena at this depth; No. 2 shoot is entirely quartz and pyrites and will yield chiefly gold values; No. 3, or the main shoot, was struck at about 400 feet in the tunnel and drifted on for 30 feet. The ore started from a seam on the footwall and has widened to 14 feet at the face, as exposed by two cross-cuts. Three sectional samples across the face averaged \$2.40 gold, 3.5 oz. silver, 10 per cent lead, and 16 per cent zinc. The hanging wall crosscut at the face is in heavy zinc ore. Further work in driving this drift is considered of importance at the footwall portion of the vein, carrying the galena, is widening.

A lower tunnel, 150 feet below No. 1, has been driven about 60 feet on the vein in which there is from 1 to 3 feet of ore on the hanging wall.

#### Alice Arm, B.C.

For some weeks there has been a force of about 200 men employed at the Dolly Varden Mine, Alice Arm. During the summer large shipments of ore have been made, development and construction work also being carried on. The railway from the Mine to the Alice Arm townsite will have to be closed down, it is expected in the winter. It is understood that some 65 men will be kept on the payroll for development in the mine during the closed season.

Progress is being made in the opening up of the Wolf Claims, which belong to the same company and lie close to the Dolly Varden. Diamond drilling has been underway with satisfactory results and tunnelling is to commence without delay. An hydro-electric plant is being installed on the Wolf property of sufficient capacity to furnish the power necessary for the entire enterprise.

The Esperanza Mine, of the same district, has a shipment of high grade silver ore on the dump awaiting shipment to the Tacoma Smelter.

The Moose and Silver Tip Extension also are giving promise of becoming producers.

#### Slocan, B.C.

The lost vein of the Evening Star Mine, situated near Slocan, is reported to have been located from the old tunnel. There are indications that the old property will be in the shipping class again before long.

#### Grand Forks, B.C.

A. M. Johnson, who is interested in the Molly Gibson Mine at Paulson, states that there are good prospects of the property being a regular shipper,

seven feet of high class ore having been uncovered in the old shaft. The intention is to sink to the tunnel which has been driven into the mountain a distance of 200 feet. The Molly Gibson recently shipped ore to the Trail Smelter from which excellent returns were obtained.

#### Marysville, B.C.

The Canadian Consolidated Mining and Smelting Co. is about to commence the construction of a concentrating mill on the old site of the Marysville Smelter. Preliminary work is in hand.

#### Cranbrook, B.C.

William Thomlinson, collector of ore samples for the Dominion Department of Mines, is engaged in assembling an exhibit of British Columbia ores for the Chemical and Metallurgical Exposition to be held in New York City. The co-operation of the B. C. Prospectors' Protective Association and the Boards of Trade of different provincial centres is being secured in the endeavor to make the display truly representative. Specimens about 12 inches square and from 3 to 8 inches in thickness are being asked for and it is announced that transportation will be free from points about the line of the C. P. R.

#### Vancouver, B.C.

An illuminating sidelight on the enterprise and the energy of the British Government in advancing the work of opening up regions at present very little developed, is furnished by Major General J. W. Stewart B. C., a Canadian contractor of national repute, who has just returned from England where he has been in touch with the Colonial Office regarding an important contract to be awarded for railroad construction on the Gold Coast, South Africa. The project involves the building of a railroad to the north extending into Togoland, formerly German territory, as well as the construction of a dock at Sekondi, the chief port of the territory. Besides the agricultural resources of the district which will be tapped at the completion of this work, General Stewart explains, will permit an iron property owned by British interests to increase its annual shipment of 20,000 tons to 200,000 tons. The ore is of an exceptionally fine grade.

While the coal strike in Alberta and Eastern British Columbia still was in force on October 15th last, the indications at that time were that conditions soon would be back to normal. Predictions were made that most of the mines of the Province of Alberta would be operating much as usual in a few days. The mines of the Crow's Nest Pass District continue to be idle. The situation in this field may be expected to improve as soon as it mends in the adjacent Province.

An interesting occurrence in Alberta during the past week has been the granting by the Courts on application of the Coal Mine Operators of Alberta of an injunction restraining the operation of the One Big Union in the Drumheller field. The Order was issued on two grounds, namely, that the striking O. B. U. miners did not ask for a board of arbitration under the Lemieux Act before striking, and that O. B. U. officials were inducing men to break a contract entered into as members of the United Mine Workers of America which has two years more to run.

The newly designed Carbon-Monoxide Detector, approved by the U. S. Bureau of Mines, has been adopted by Hon. Wm. Sloan, Minister of Mines, for use in the coal mines of British Columbia. He took this step as soon as the value of the tester was demonstrated and each of the Inspectors of Mines will be furnished with one to assist them in the discharge of their duties. Heretofore the only practical test of mine air for the detection of this deadly poison was the carrying of a canary or some small animal known to be very susceptible to its influence. By noting the behavior of the bird or animal it was possible to arrive at some conclusion as to the condition of the air. This test, at the best, however, was unsatisfactory. The perfection of this Tester, therefore, is a decided advance in the direction of making underground conditions in coal mines safe for the workers, especially as the instrument records carbon monoxide content as low as 0.05 per cent. The deadliness of carbon monoxide to the human is well-known but it may be stated that less than 0.5 per cent. in a mine atmosphere may cause death.

That negotiations are in progress between a syndicate representing the British Admiralty and the owners of the Ground Hog Coal Lands, northern British Columbia, for the purchase of the latter property by the former is an announcement that has been received with much interest in the Canadian West. The coal lands are situated about 150 miles from Hazelton, B.C., and the coal is claimed to be as of high a grade as that of Wales and Pennsylvania, and of unexcelled quality for steaming purposes. The property has been undeveloped because of the necessity of constructing a railway for some distance and at considerable expense. However, the owners have a charter which, of course, would be transferred in the event of a sale. It is known as the Naas & Skeena Rivers Ry., starting at a point near Nasoga Bay on Portland Inlet and running back 120 miles to the nearest coal lands. A deal in which the British Government was supposed to be interested was under consideration from 1912 to 1914, during which period examinations by capable engineers took place, but no conclusion was reached because of the outbreak of the war.

J. M. Savage, for some years General Manager with headquarters at Victoria, B.C., of the Canadian Collieries (D) Ltd., has been appointed Chairman of the Company's Executive, vice-president Henry S. Fleming, resigned. This announcement was made after a meeting in Eastern Canada of the directors at which it was decided to concentrate the executive management of the concern in British Columbia. Mr. Fleming's retirement comes somewhat as a surprise inasmuch as he was in the Province this Summer investigating the iron ore resources of the country in view of the possibility of the Company launching an iron and steel industry in the Canadian Northwest.

Coal production by the collieries of British Columbia for the month of September follows:

**Crow's Nest Pass Field.**

	Tons
Crow's Nest Pass Coal Co, Coal Creek . . . . .	36,611
Crow's Nest Pass Coal Co., Michel . . . . .	21,086
Corbin Coal & Coke Co. . . . .	15,381
	73,078

**Nicola-Princeton Field.**

Middlesboro Collieries, Middlesboro . . . . .	7,445
Fleming Coal Co., Merritt . . . . .	2,143
Coalmont Coal Co., Coalmont . . . . .	1,141
Princeton Coal Co., Princeton . . . . .	1,952
	12,681

**Vancouver Island Field.**

Canadian Western Fuel Co., Nanaimo . . . . .	56,775
Canadian Collieries (D) Ltd., Comox . . . . .	42,005
Canadian Collieries (D) Ltd., S. Wellington. . . . .	8,461
Canadian Collieries (D) Ltd., Extension . . . . .	14,545
Pacific Coast Coal Mines Ltd. S. Wellington . . . . .	7,088
Nanoose-Wellington Co., Nanoose Bay . . . . .	5,456
Granby Cons. S. & P. Co., Cassidy . . . . .	16,477
	150,807

Note:—Between the time of writing and mailing word has been received that the miners of the Crow's Nest Pass, B.C., have returned to work. This would indicate that colliery labor conditions in British Columbia and Alberta once more are settled and all disputes in process of satisfactory adjustment.

**ORE STATEMENT.**

Following is a statement of ore shipments over the T. & N. O. Ry., for the month ending Sept. 30th, as shown in the regular monthly report by Arthur A. Cole.

**Silver Ore.**

Cobalt Proper.	Tons
1. Beaver . . . . .	30.00
2. Coniagas Mine . . . . .	75.50
3. Dominion Reduction . . . . .	40.00
4. Hudson Bay . . . . .	31.32
5. LaRose . . . . .	83.25
6. McKinley-Darragh . . . . .	42.44
7. Mining Corporation . . . . .	212.09
8. Nipissing . . . . .	985.87
9. O'Brien . . . . .	104.02
10. Temiskaming Mine. . . . .	32.48
11. Temiskaming Testing Laboratories . . . . .	30.00
	1,606.97

The above shipments were made to the following Companies:

**Canada.**

Deloro Smelting & Refining Co., Deloro Mar-mora . . . . .	1,427.72
Coniagas Reduction Co., Thorold . . . . .	62.50

**United States.**

American Smelting & Refining Co., Pueblo. . . . .	74.32
American Smelting & Refining Co., Perth Amboy . . . . .	42.43
	1,606.97

**Price of Silver.**

Sept. 15th. Highest . . . . .	95.000
Sept. 1st. Lowest . . . . .	91.500
Average . . . . .	93.675

**CANADA COPPER CORPORATION COMMENCES OPERATIONS AT ALLENBY PLANT, B.C.**

It is announced from New York that the Canada Copper Corporation started up its new plant at Allenby, British Columbia on October 18th. The plant was ready to commence work on July 1st 1919, but transportation facilities were delayed until recently.

## Richard Trevithick, His Life and Inventions\*

By J. HARVEY TREVITHICK.

Richard Trevithick was born on April 13th, 1771, in the Cornish Parish of Illogan, about midway between Camborne and Redruth and not far from Dolcoath Mine, one of the oldest and deepest tin-mines in Cornwall, of which his father, Richard Trevithick, Senr., was the manager. The elder Trevithick was manager of several Cornish mines, as he came from a line well known in the annals of Cornish mining, and easily traceable back to the sixteenth century. He claimed kinship with the Vivians, a name as familiar almost as Cornish cream, and still farther back to the Llewellyns. At the time of his son's birth, the elder Trevithick was manager of Dolcoath Mine and mine agent for the Tehidy Estates. He is described as being a man of sound judgment, and, as a manager, was his own engineer.

At the age of 24 Richard Trevithick stood forward prominently as the leading competitor of the celebrated James Watt. Up to this time no one seems to have appreciated the advantages to be effected by the use of high-pressure steam. Trevithick, however, wrestled with this subject for a long time, and to him seems to be due with but very little doubt the honour of pointing out its great advantages. Watt, of course, was Trevithick's greatest opponent, being a strong advocate of low-pressure steam; indeed, he was so strongly opposed to the use of high-pressure steam that he tried to get a Bill passed by Parliament to stop Trevithick from making such engines on account of danger to the public. There seems, however, to have been only one recorded serious explosion, but Watt made most of this to strengthen his opinion. Watt and Trevithick were engaged in patent litigation for many years. Trevithick, nothing daunted, and still obsessed with the idea that high-pressure steam was the correct thing and the most economical in working, invented the single-flue or Cornish boiler, which was cylindrical in shape, and had a cylindrical flue inside. How rapidly Trevithick's appreciation of high-pressure steam developed is proved by the fact that in 1813 he supplied boilers 40 feet long and 5 feet in diameter to work at a pressure up to 100 pounds per square inch, a very remarkable fact in view of the manufacturing limitations in those days.

At the age of 26 Richard Trevithick was selected to fill the position of engineer to the chief Cornish mines. The first marked improvement that he made in this year (1797) was the plunger-pole pump, which was to take the place of the old wooden mine pumps that had barrels hooped with iron, with a packed bucket inside containing a valve. Much trouble was experienced with these pumps owing to sand-jamb. Trevithick's invention was the now well-known plunger-pump, with the plunger working through a stuffing box, but quite free from the casing. In the following year came the invention of his water-pressure engine the first of which was erected at Weald Druid Colliery. Its object was to make use of the energy that is available where there is a large supply of water with a considerable fall. Another instance is that of a water-engine erected at Trenelthick Wood in 1799. A third instance was his

Derbyshire water-engine, erected in 1803, which operated on a beam like a steam-engine.

In 1800 Trevithick had produced the first high-pressure expansion steam-condensing winding-engine at Cook's Kitchen Mine for raising ore from the lower workings. The cylinder was double-acting, and the steam-pressure 25 pounds above that of the atmosphere. This engine had a crank, which was introduced probably for the first time, to give motion to the shaft; and with its 19-inch cylinder and 5-foot stroke was a standard type of beam-engine for nearly a century.

The most important period of his career saw his invention and development of the locomotive. It was, of course, the invention of the high-pressure steam-engine that made the locomotive possible, for the huge bulk of the low-pressure cylinders and boilers and the larger quantity of water required for condensing purposes were quite prohibitive on wheels. His first model (made in 1797) consisted of a horizontal cylindrical boiler with a vertical steam-cylinder let into the top at one end; connecting-rods from a cross-beam communicated the motion through cranks to the road wheels. A fly-wheel was attached to carry the engine over its centre.

In 1801 Trevithick brought out his first practicable locomotive. It consisted of a sort of Cornish boiler, but with a return flue; the steam-cylinder was embedded vertically in the boiler at one end and the motion transmitted through head connecting-rods to cranks on the road wheels. The following are notable details:—A fusible plug in the flue to prevent damage from shortness of water in the boiler; bellows worked by the engine to create a draught; an exhaust in the chimney for the same purpose and a feed-water heater. In order to ascertain whether there would be sufficient adhesion between a smooth wheel and the road, he had experimented with a heavy carriage by causing it to go up a steep hill by turning its wheel round by hand.

Several trials were made, and finally it was upset, and while Trevithick and his friends were having dinner the machine caught fire and was destroyed. A result of these trials was an application for a patent, which was granted to Trevithick and Andrew Vivian on March 24th, 1802. The road-locomotive which Trevithick constructed in 1802 had two rear wheels about 9 or 10 feet in diameter and one front steering-wheel. The experience which Trevithick gained from the trial of this engine proved to him conclusively that a smoother road, made of iron, was necessary to enable the best running results to be obtained, and from this time onwards he devoted his attention to the form of engine which ultimately led to the modern railway-locomotive. In 1804, at Merthyr Tydvil, South Wales, Trevithick built and set to work his first tramway-locomotive, when he won a bet of £500 with Mr. Hill, of the Plymouth Iron Works, by running a train from Penydarran to Quaker's Yard, a distance of about 10 miles, at the rate of 4 miles per hour. It drew a load of 25 tons of material and carried several passengers. This engine had smooth driving wheels, but the rails were flanged in order to keep it on the track. In the latter part of 1804 Trevithick had another locomotive running at Newcastle-upon-Tyne. This engine had flanged wheels and ran on plain top rails—the universal practice to-day. All these locomotives were fitted with some form of blast-pipe, either under the fire or connected to the chimney.

From 1804 to 1808 Trevithick did little or nothing with the locomotive, but in the later year we find him

\* From a paper read before the Institution of Mining Engineers, Manchester, September, 15th, 1920.

## THE MARSH HOIST

The Modern Up-to-Date Mine Hoist

Safe, Strong, Powerful, Dependable

For a quarter of a century we have been building Mine Hoists. During all this long time we have been constantly improving and improving, and the Hoist we are building today is the result of the accumulated experience of all these years.

Every little detail is carefully studied by our competent designers and worked out so as to produce the requisite strength and durability.

We use the right materials to give the needed strength in every part. We then carefully inspect the workmanship in detail, and give the finished machine a thorough test before we allow it to leave our hands.

We have built up a reputation for a dependable Hoist. When you order a Marsh Hoist you are sure to get a good one. That is the only kind we make. May we demonstrate?

again busy on an improved engine, which he called "Catch me who can." In conjunction with this locomotive he constructed a circular railway in London, practically on the spot where Euston Station now stands. This locomotive weighed about 10 tons, and could obtain a speed of nearly 12 miles an hour. For several weeks it was exhibited and run on this circular railway. Trevithick, who by this time had exhausted all his means, was obliged to give up his endeavours of trying to convince the public of the enormous advantages to be gained by the use of the locomotive. After this mishap, he seems to have given up this branch of engineering.

During his locomotive period—from 1797 to 1808—Trevithick was not idle in other directions. In 1801 he erected an engine at Tredegar Iron Works for operating large rolls for puddling. This engine remained at work up till 1856. In 1803 he constructed what was undoubtedly the first steam-dredger. The dredger worked for some 10 years.

Other inventions which emanated from Trevithick's fertile brain included:

Ship's tanks of iron to replace the old wooden barrels for holding drinking-water, and also for ballasting purposes.

A paddle wheel for propulsion by steam.

The steam-winch about the year 1805.

It is on record that Trevithick had steam threshing-machines and grinding-machines, and even steam-ploughs at work in 1813.

In 1813 an event occurred which brought about a break in his career. A man of great influence in Lima, Peru—Don Francisco Uville—came to England to see whether he could obtain engines for pumping water in

the Peruvian mines. He placed orders with Trevithick for six engines complete with pumps. The cylinders of these engines were 24 inches in diameter by 6 feet stroke, and the pumps were 12 inches in diameter. The conditions were that the engines had to be despatched within four months. These conditions were fulfilled, and Don Francisco Uville persuaded Trevithicks to come with him to Peru to erect and start up his engines, with the result that he sailed for Lima on October 16th, 1816. He remained in South America for about ten years—till 1827. He was in Peru up to 1822, erecting engines, all of which worked with great success. In this year civil war broke out, which upset all the ambitions both of Don Uville and Trevithick. All the machinery was destroyed by the insurgents and thrown down the mine shafts, and Trevithick left Peru, sacrificing all his prospects of great wealth and apparently losing all that he possessed. From Peru he made his way to Costa Rica, where for the next five years he had a most venturesome time amongst the rich copper-mines there. In 1827 he returned to England. With all his genius, Trevithick never knew how to make money, or to keep it when he had made it.

For some time before his death, Trevithicks had been engaged at the works of John Hall, at Dartford, now the celebrated firm known as Messrs. J. and E. Hall, Limited. It was at these works that he and John Hall undoubtedly constructed and developed what is universally known as Hall's condenser. Trevithick was working at John Hall's works when the end came. Within two months of the design of the Reform Column, namely, on April 22nd, 1833, he had passed away at the Bull Inn at Dartford. He was penniless and without a relative by him in his last illness, and for the last offices

of kindness was indebted to some who were losers by his schemes. He was buried in the churchyard of St. Edmund King and Martyr in an unmarked grave. There is, however, inside the church, close to the pulpit, a handsome bronze tablet suitably inscribed "In memory of Richard Trevithick," which was placed there some years ago by Mr. Everard Hasketh, now managing director of Messrs. J. and E. Hall, Limited.

#### METAL QUOTATIONS.

Fair prices for Ingot Metals in Montreal, October 27th 1920. (In less than carload lots).

Aluminum . . . . .	34
Antimony . . . . .	8¼

#### TORONTO COAL PRICES.

Toronto, Oct. 27.—There is very little buying of coal in Toronto in anticipation of a further reduction in prices and the market is quiet. The bituminous situation is still described as being up in the air although it is expected that a couple of weeks' time will see conditions back towards normal. Hard coal is still quoted at from \$8 to \$16 gross tons at the mines, American funds. Mine run is slightly lower, the ruling quotation ranging from \$13 to \$14 f. o. b. Toronto Smokeless coal, also, shows a downward tendency, being quoted at from \$11.50 to \$13.

#### NIPISSING COMPANY OF COBALT PURCHASES MAGNETITE MINE IN NEW YORK STATE.

Nipissing Mines Co. has purchased Magnetite Mines Co., an iron property some 60 miles from New York City. The property contains, it is estimated, ore reserves of many millions of tons, and up to time of its shut-down, 30 years ago, constituted the largest working iron deposit east of the Mississippi. Both the New York Central and the New Haven could serve the new acquisition of Nipissing.

It is understood the purchase price, together with cost of erecting a plant, does not entail much over \$1,000,000. Nipissing has a surplus of between \$5,000,000 and \$6,000,000.

The ore runs about 37 per cent iron and concentra-

tes about two into one, with a resultant product averaging 60 per cent iron. It is believed this would find a ready market, but greater profits would probably result from a pig iron product. This would entail erection of blast furnaces.—Boston News Bureau.

#### PERSONAL.

Mr. Allen B. Taylor of the firm of J. G. Beatty & Co. left on the "Mauritania" for Great Britain in connection with business pertaining to the Murray-Mogridge Mining Company.

Mr. Samuel W. Cohen, Consulting Engineer of Montreal, sailed recently on the "Empress of France" and will be in Europe for two months on professional business.

## Bureau of Canadian Information

THE Canadian Pacific Railway, through its Bureau of Canadian Information, will furnish you with the latest reliable information on every phase of industrial and agricultural development in Canada.

In the Reference Libraries maintained at Chicago, New York and Montreal is complete data on natural resources, climate, labor, transportation, business openings, etc., in Canada. Additional data is constantly being added.

No charge or obligation attaches to this service. Business organizations are invited to make use of it.

# Canadian Institute of Mining and Metallurgy

Second Annual Western General Meeting, Winnipeg,  
25th to 28th October, 1920

Another milestone in the Institute's progress, marking a new outlook for the Institute, the inauguration of a new era in the West, and a new Orientation of Industrialism in Canada.

The Canadian Institute of Mining and Metallurgy increases in influence and importance with a progressive persistency pleasing to those who composed its membership and worked for its advancement in earlier days.

Since the First Annual Western Meeting held at Vancouver in November 1919, the Institute has held general meetings at Toronto, at Glac Bay and at Winnipeg, thus gathering together under its leadership truly representative assemblies of the mining profession of Canada in the Far West, the Far East, the Middle East and the Middle West, and covering every activity of mining and metallurgy in Canada.

A series of meetings and deliberations so completely representative in attendance and subjects discussed, and so geographically comprehensive has probably not been recorded within any previous eleven months since the Institute was founded.

The Second Annual Western Meeting, just concluded, was the first general meeting of the Institute held in Winnipeg. The significance of the event was quickly apprehended by the citizens of Winnipeg and was expressed by the "Manitoba Free Press" which stated editorially that the selection of Winnipeg was: "a recognition of the fact that our province is on the eve of very important developments in the establishing of a mining industry in copper and gold, and that a convention of the mining men of Canada to discuss the situation in Manitoba will do much to direct those developments along the best channels."

The true function of the Institute, which is to be a centre of light and leading in every new field of mining endeavor in Canada, could not have been more accurately defined than by this quotation from the "Free Press", a newspaper that it is hardly necessary to state is an authoritative exponent of western sentiment.

Three things dominated the meeting, which in days not far gone would have seemed strangely alien to everyday life in Winnipeg; namely, the mining of coal, gold and copper, although, as will be seen from the list of minerals shown in the Fort Garry Hotel, these by no means exhaust the list of local mineral possibilities.

An encouraging feature of the proceedings—includ-

ing the public gatherings—was the evidence that the West is alive to the serious consequences to Canada's national credit that must follow if the country continues to import more minerals than it mines at home, as it has hitherto done. This point was very lucidly exposed by representatives of the Government of Manitoba and leading industrialists at the concluding dinner.

Another western tendency of most hopeful augury is the manner in which the development of mineral resources is being entrusted to the universities and to trained technicians. It has most evidently been recognised by legislative leaders in the West that the minerals of the better known sedimentary areas along the main railways, and the little known pre-Cambrian and older sedimentaries of the North Country, present special problems in their utilisation which must be overcome by the gradual development of a special localised technique, necessarily based upon a broad-based foundation of scientific attainments.

The obvious regard in which the Commissioner of Northern Manitoba is held by the people of Winnipeg, and the importance attached to the scientific study of coal by the Government of Alberta, as expressed by its interest in the University of Alberta, are two indications, among many others, that the West is alive to the near approach of its predestined mineral predominance in Canada, and is in the act of seizing its opportunity.

In many respects the Winnipeg meeting was reminiscent of bygone Toronto meetings when Cobalt was young, and although the transportation question is a much more serious one in Northern Manitoba than was the case at Cobalt, the analogy of a metropolitan city with a hinterland of mineralized pre-Cambrian rocks to the North, naturally presents itself, and suggests that as Toronto experienced a vivifying influence when Northern Ontario disclosed its treasure house so will Winnipeg be stimulated when in Northern Manitoba, as the maps of the Geological Survey indicate to the prospector likely places for his pick and the diamond drill, more becomes known of the gold, copper, silver, zinc, and nickel of Northern Manitoba, already proved to be of first-class importance.

# Proceedings of the Meeting, October 25th to 28th 1920

Monday Morning, 25th Oct., 1920.

The meeting opened in the Fort Garry Hotel, in the morning of the 25th October. Approximately one hundred persons were registered or in attendance throughout the three days during which the sessions were extended. A list of the registrants is published elsewhere in this issue. An important and illuminating feature of the meeting was the collection of mineral specimens displayed in the rotunda of the Hotel, assembled and arranged by Mr. L. G. Thompson of the University of Manitoba, a list of which will also be found in this issue.

The Institute was officially welcomed by Hon. Thomas H. Johnson, the Attorney General of Manitoba, who spoke on behalf of the Provincial Government and as representing the Premier who was absent from Winnipeg and prevented from welcoming the Institute in person.

## The Attorney-General's Address.

Mr. Johnson said that those who lived in Manitoba were perfectly conscious of the advantages possessed by the City of Winnipeg, but he was disposed to attribute the selection of Winnipeg for the holding of the meeting not to its geographical position, but to the fact that the Institute has recognized the growing importance of Manitoba's mineral development. Especially in view of this did he welcome the Institute. There is, said Mr. Johnson, no organization which was regarded as of more importance in Manitoba at this particular time than the Institute.

Proceeding, Mr. Johnson said:

We are glad to be associated with Canadians, and Manitobans would prefer that our mining development, to as great an extent as possible, be in the hands of Canadians.

It is our privilege to have been associated with the national development, which has been so rapid that I have not heard of its like in history.

Within the limits of our short lives, Canada has changed her position absolutely and has emerged as one of the ambitious energetic nations of the world.

There devolves upon you a heavy responsibility by the fact that you are associated together to take a national view of our mineral resources, so comparatively undeveloped. There is a great deal of work to be done.

We are on the eve of a great development. Canada is just becoming known to the world. Canada's sacrifices in the war are going to influence her future for good. It is today a great privilege to be a Canadian. I have no doubt our development will be great, and sensible and intelligent, and that it is not going to be submerged by the disasters that have submerged other nations in our times, but is about to take her rightful place among the nations of the world.

### The Question of Ownership of Natural Resources.

There is one Manitoban question in which we bespeak your interest in, because it directly concerns your own activities, that is the ownership of our natural resources.

I am not going to ask you to pass resolutions or memorials, but I want to point out that this is a question of very long standing. Many attempts have been made to settle it, but it will never be settled until it is settled right. The people of Manitoba are preparing now to renew their urging of the settlement of the question. Unfortunately there has been a disposition on the part of the Federal Government to temporise on this question by bringing in the other provinces of Canada, which has resulted in confusion, and has made a settlement more difficult than it otherwise would have been.

We seek to take nothing from any other province, but hold that the resources of Manitoba belong to Manitoba, and we make our claims solely upon the historical basis."

The President, Mr. O. E. S. Whiteside, delivered the Presidential Address, as follows; which took for subject the extension of the Institute's scope of usefulness.

## The Presidential Address.

### The Extension of the Institute's Scope of Usefulness.

In 1898 when the Canadian Mining Institute came into being it is quite certain that its founders would have scoffed at the idea of Manitoba ever being a field in which it might exercise its functions to useful effect. Indeed it is only within the last few years that any of us have regarded this Province as anything more than the great wheat growing area of the Dominion — the region whose wheat has made Canada famous the world over, but as if to prove her impartiality, and to insure that every Province of our country shall be possessed of mineral wealth, however richly endowed it may be with other natural resources, Nature has established within your borders an area of PreCambrian rocks, which already have been proved to contain mineral deposits of great actual and potential value. Hence you have now in Manitoba the beginning of what we all trust will become an important and flourishing mining industry, and your faith in the future of that industry has justified you in founding here a Branch of the Canadian Institute of Mining and Metallurgy, which thanks to the energy and zeal of its officers and members has become one of the most active of all the local organizations of our Institute.

The aims and objects, the functions, and the past record and traditions of the Institute were doubtless now as fully realized and appreciated here as in those Provinces in which mining had been the premier industry for many years past. I may therefore be permitted to take advantage of this first Regular Meeting of the Institute in the Province of Manitoba to address you briefly on the possible extension of our scope of usefulness.

What are our aims, and objects and functions? In a word, "Service". Service through co-operation. And I do not hesitate to say that apart altogether from the practical ends we attain and the material good we accomplish, the Institute, in common with other associations of a like nature, exerts a far reaching and eminently beneficent influence in the community in general by reason of the spirit by which it is animated — by which it moves and has its being; a spirit that is essentially altruistic and fraternalistic. With most of our members it is not a question. "What can the Institute do for me, but what can I do for the Institute?" That at any rate has been the spirit that has animated us during the past, and I trust that it will continue to do so in the future. We have had in mind not so much the good of the individual member, as the good of all the members and the industry we represent.

To insist nowadays on the value of co-operation would surely seem superfluous. The power of it, and the value and importance of it was emphasised especially in the Great War; and was indeed the great lesson of the war. But though our Institute exemplifies the co-operative spirit, and could not exist but for the fact that this spirit animates its membership, yet when it comes to everyday business or commercial relationship I am inclined to question whether the majority of our members put into practice the principle of co-operation to any great degree than do any other class of the community. While I should be the last to decry the stimulating effect of competition in any relation of life, I am firmly of the opinion that there are limits to which competition should be allowed to go; for when it exceeds these limits it ceases to be salutary and becomes harmful. It becomes harmful when, in a word, it makes of a man a less desirable, a less useful citizen, or of a community a less worthy unit of the State. Is it too much to say that if in the past less of the spirit of competition between individuals, of rivalry between Provinces, and cities, and communities, had been in evidence, and if instead of sectionalism everywhere we had had displayed more of the communal spirit, the desire to co-operate, more tolerance, a greater disposition to "boost" for others as well as for ourselves and our own backyard, Canada, today would be in a stronger and better position than she is? To my mind then the chief functions of a national organization such as ours,

representing as we do one of the great basic industries of the country, is to teach both by example and precept the value of co-operation. We should begin of course in our own organization, following along the lines already established and steadily extending and amplifying in those directions. We have now, for example, branches or divisions in all the Provinces of the Dominion in which mining is carried on. The establishment of these Branches has done much to increase the usefulness of the Institute to the members locally, but as yet it has not contributed very notably towards the greater consolidation of the Institute. We should aim to make the Branches serve the dual purpose by encouraging them to co-operate among themselves. This would be entirely practicable in a number of ways. There could be not only a frequent interchange of papers on professional subjects of common interests but also an interchange of ideas on matters affecting the general welfare of the Institute, or of the Profession, or of the industry, and so far as possible joint action should be taken to achieve a given purpose.

opinion or advice that is offered will be sincere and disinterested. If co-operation on similar lines between the Department of Mines in Canada (Provincial and Federal) and the Institute can be brought into effect it will undoubtedly enable us to extend our scope of usefulness to a very marked degree.

But there are boundless other opportunities for usefulness and effective co-operation on our part. The Institute represents both the industry of mining and the profession of mining. We are therefore in a position to establish relations for joint service with organizations of two distinct types, namely those primarily concerning themselves with matters of trade and commerce, and those whose objects are essentially the promotion of technical and engineering knowledge.

In the past we have been too inclined to allow Boards of Trade to speak for the mining industry on trade matters; and also we have displayed scant disposition to interest ourselves in the activities of sister societies representing other branches of engineering. These tendencies to stand aloof should be overcome. It should be the duty of the Branches in each

Mr. O. E. S. WHITESIDE,  
Coleman, Alberta.

President of the Institute 1920.

The Institute moreover should persistently offer its services to the Government. This we have not failed to do in the past but our opportunities now, in consequence of our gain in numbers and status, are greater in this respect than ever before. It will perhaps interest you to learn that at least one Provincial Minister of Mines has undertaken to submit all contemplated legislation affecting mining to the Provincial Division of the Institute in his Province for comment and criticism in advance of its introduction in the local legislature. While naturally the Minister is not bound to accept the views that may be presented to him by the Institute, the arrangement referred to will at least bring him into closer touch with the men best qualified to pass judgment on legislation affecting the mining industry; and it is safe to assert that any

Province to educate public opinion concerning conditions affecting mining, and to seek the co-operation of, as well as to co-operate with, such bodies as the Boards of Trade, the Canadian Manufacturers Association, and Mine Operators' Associations, in voicing the requirements of the industry from the trade or commercial viewpoint. In like manner, the establishment of more friendly relations with sister engineering institutions is greatly to be desired; and in the West especially it is conceivable that much benefit would result from joint meetings in such cities as Winnipeg, Edmonton, Calgary, and Vancouver of the different engineering bodies. Engineers of all branches have much in common. The mining engineer of to-day must necessarily know something of practically every branch of engineering. It would therefore be possible to ar-

range a programme of papers at joint meetings that would appeal to all. Discussion on rock work would be of interest alike to the railways, the municipal, and the mining engineer; electricity and mechanics would likewise afford a common meeting ground. And above all, such meetings would serve to promote good fellowship among the engineering fraternity.

A second important function of the Institute, capable of expansion, is educative. Our Charter states that one of our aims is the dissemination of information. No one will assert, I believe, that we have failed to carry out this part of our work well. We have reason to be proud of our publications. Our Bulletin is in a class by itself, and a monument to the untiring zeal and ability of our late secretary, Mr. H. Mortimer Lamb. But still I think we can even go a step further in our educational work. Heretofore we have been content to publish information for the benefit of our members only. This information for the most part has been of a highly technical character, and as such has been undoubtedly valuable. But outside of our membership there is a class, a very big class indeed, sadly in need of education in respect of the mining industry and its importance to the community. That class is the Canadian public as a whole. Because of this general ignorance we are failing to realize the greatness of our own heritage; and we are allowing it to pass out of our hands into the control of others. The biggest and best mines in Canada are not owned by Canadians. It is almost hopeless to attempt to raise capital in Canada for home mining ventures, however worthy. Why? Because the Canadian public has been led to believe that mining is a gamble, a gamble in which the chances of a satisfactory issue are infinitely remote. The majority indeed are unable to realize that to invest money in the development of a promising prospect is an entirely different thing to speculating on margin or otherwise in mining stocks. It is the commonest thing in the world to hear the remark, from otherwise quite sane men in business, "Oh, I've no use for mining. I got badly bitten once, and once bitten twice shy", and if you ask for particulars, you will presently learn that this now discrete and sage person once plunged and lost heavily during the Rosslund boom in some wildcat or prospect without even enquiring concerning its antecedents. Rickard, with his distinguished talent for accurate definition, has told us that capital sunk in mining must be regarded as a speculation rather than as an investment; but approached with due prudence and precaution there is no form of speculation that offers more prizes or yields richer returns. Obviously I refer to legitimate mining enterprise and not to the stock market. While we frankly welcome and sorely need more foreign capital to help us in developing our natural resources, it is nevertheless in the interest not only of the individual, not only of the community, but also of the nation that Canadian Mining should be undertaken by Canadians, and that the title of Canadian mineral resources should be retained as far as possible by Canadians. Hence the urgent need of education, of propaganda along these lines. The task is not an easy one, but that should not deter us from undertaking it. Time does not on this occasion permit me to detail a plan of campaign for the carrying on of this important work, but I may be allowed to suggest one or two preliminary means of attack. The first of these might well take the form of a series of public lectures, under Institute auspices in all the principal commercial centres of the country, followed by a wide distribution of literature of an educative character dealing with the question. We could doubtless enlist the public press of the country as our allies in this enterprise by an understanding that material supplied by the Institute would be directed towards impressing the public with the fact that mining is a business that may be engaged in with a reasonable certitude of profit by exercising ordinary common sense and foresight, and acting under competent technical guidance and advice. That would be our appeal to the individual and his self-interests. But we should go beyond this and show that to sell our birth-right for a mess of pottage is not good business either from the national or any other standpoint; and we should risk being trite by indicating that if it profits foreign capital to develop Canadian mines it would no less profit Canadian capital. Then thinking of the morrow, we should also aim to educate the rising generation in the national importance of a Canadian controlled mining industry; thus in most of the Provinces in which mining is a major industry the educational authorities would no doubt raise no objection to addresses on this theme to school children by members of the Institute who could be deputed to undertake this duty. Also it should not be impossible to provide for the introduction of simple text books in the schools treating of the natural resources and basic industries of Canada, in which of course due attention would be given the subject of mines and mining. Work of this sort, in short, could most fittingly be undertaken by the Institute.

In conclusion, may I be permitted to dwell briefly on the past record and achievement of the Institute, and the service

it has rendered to the profession and industry of mining in this country, and to the country itself. It is true that this service has been criticised. We have been told that we might have done more. But such criticism, in the minds of many is unfair. Yet we may benefit from even unfair criticism if it be constructive, and our friend probably reasoned that way at the time, and I agree with him that the Institute's activities must not be allowed to lag. We must continue to justify our existence; and if we mean even to maintain the position we have won, to equal the record of past service well done, it is imperative that we should develop new fields of usefulness. At the same time the established activities, so ably initiated and performed in the past, will continue to occupy our attention. Of new work, apart from that I have just outlined, certain suggestions were made at the Annual Meeting in Toronto last March. These suggestions were that we might undertake to do in Canada what is done by the American Mining Congress in the United States. In a measure we have already done some work along these lines to good effect, that is to say in the matter of influencing legislation, and it should not be forgotten that the establishment of the Dominion Department of Mines was due almost entirely to the Institute's persistent efforts; which only served to prove the wisdom of further strengthening our organization so as to enable us to do more and more of that class of work.

The opportunities for expansion along the lines suggested seem almost without limit. Have we the ability and initiative necessary to make it a success? Is it a good and proper work to undertake? As a society we can only advance or recede. There is no standing still. Let us all then, individually and collectively, be up and doing. If our Institute is worth maintaining at all if it means anything to us, it is surely the duty as well as the privilege of every member to do his utmost to contribute to its success. Fault finding may of course help in that direction, but I am inclined to think that there are other and more effectual ways of rendering assistance. The Institute may commit mistakes in policy. These, if not too flagrant, may be condoned. Inaction on our part, or an attitude of mere complacency with the position and reputation for good work we have won, with no desire to improve it, would be fatal and uncondonable. I need scarcely say that there is little likelihood of the Institute falling into that grave error.

### Dominion Mineral Royalties.

The question of Federal royalties on minerals and particularly on copper and oil was discussed and it was pointed out that in connection with the Flin-Flon deposit the formulation of some definite policy by the Dominion Government was so necessary as to be almost tantamount to deciding whether this new industry should proceed to develop or not. Capitalists required some definite idea of royalty costs and title rights before making large expenditures. It was stated that Institute Committees had been appointed to deal with the royalties question at the last Annual Meeting in Toronto but that final reports had not yet been received by the Council. The attendance of several of the vice-presidents from the East had been confidently anticipated but at the last moment the vice-presidents were unable to be present. The names of Dr. Allan of the University of Alberta and Mr. C. R. Bancroft of the Mandy Mine were added to the Committee on Dominion Royalties.

### Leasing of Bituminous Sands.

Attention of the meeting was drawn to the fact that the leasing of the bituminous sands in Alberta had been withdrawn by Ottawa but that before this was done a considerable lease had been granted to a private company of which Colonel Lindsay was the head. It was further understood in Alberta that, in the event of any old lease falling out of date, such lease would revert exclusively to the interests controlled by Col. Lindsay. The Provincial Government of Alberta had made many enquiries as to the definite status of the tar sands in regard to leasing and mining, but no definite information could be obtained from Ottawa. The reply of the Superintendent of the Department of Mining Lands and Yukon Branch (Dept. of the Interior) to enquiries as to the terms upon which the

had been granted to General Lindsay states that "as the agreement is not final, and compliance with the terms thereof is dependent on whether or not the preliminary experimental work proves successful, it is not considered advisable, for the present to disclose the terms of the agreement." Similar answer had been given to enquiries sent from Alberta and also from eastern points, and there was a general agreement of the members present that the information vouchsafed was insufficient and that definite information was improperly withheld.

MONDAY AFTERNOON, 25th OCTOBER 1920.

With Dr. Allan of the University of Alberta in the Chair the afternoon's proceedings were largely devoted to consideration of questions concerned with coal and coal mining.

A paper on "Coal" by Mr. Louis Stockett, was taken as read in the absence of the author.

#### Mine Rescue and First-Aid Work.

Mr. Duncan McDonald, who is Inspector of Mines and General Superintendent of Mine Rescue Work in Alberta, read a paper with the foregoing title, and gave a demonstration of the salient points of the latest type of "Proto" apparatus.

Mr. McDonald said that the use of oxygen breathing apparatus was now recognised by legislation requiring its use in many countries, and that it was noteworthy that governments were paying attention to the safeguarding of the construction and use of breathing devices. The careful selection and training of men for rescue work was emphasised, and the speaker noted that no shortage of volunteers for training was found where the mine officials and the management took a personal interest in the work. Where the management was indifferent, poor results were probable.

The necessity for standardization of apparatus was dwelt upon, and the selection of one type for a province or state was considered desirable.

An annual Dominion contest in mine rescue and first-aid work was suggested by Mr. McDonald, in which there could compete teams that had been successful in local contests from every mining district of Canada.

The Province of Alberta has taken a leading part in the provision of mine breathing apparatus, and in the training of men in rescue and first-aid work.

Three rescue-cars and six stations are now located at different points in Alberta under the direction of the provincial government, each car and station in charge of a fully qualified superintendent. Ninety sets of "Proto" apparatus are provided in these cars and stations, and 1,388 men have received training. The work was put under the supervision of the Workmen's Compensation Board in 1919.

Mr. F. W. Gray stated that when in the service of the Dominion Coal Company in 1907 he had brought to Canada the first Draeger apparatus, which, with the single exception of a Giersberg apparatus imported at an earlier date by the Nova Scotia Steel & Coal Co., but never used, was the first modern self-contained breathing apparatus used in North America. The Dominion Coal Company's station had antedated that of the United States Bureau of Mines by some months. Mr. Gray supported the suggestion recently made by Hon. Wm. Sloan, the Minister of Mines for British Columbia (see page 794, our issue of 1st October 1920) that joint action should be taken in Canada and the United States to design a standardized self contained oxygen breathing apparatus that would combine the acknowledged excellences of the main types now on the market and avoid their special defects.

Mr. Gray also urged that the word "rescue apparatus" should be no longer used, and that the oxygen breathing apparatus should be regarded as primarily a fire-fighting device with possibilities for rescue work under certain conditions following mine fires and explosions. Mr. Robert Strachan of Fernie considered the use of the "Pulmotor" should be discontinued, and thought that life could more probably be saved by ordinary methods of artificial respiration. Mr. Strachan pointed out that where accidents had occurred from the use of oxygen apparatus, these had occurred not from failure of the device, but from improper use or lack of training. He thought it would be advisable, and would lead to good results, if the mines departments of the various provinces could get together on this matter of training and standardization of apparatus.

#### The Part that the Coalfield of the West should play in Canadian National Development.

Mr. F. W. Gray read a paper with the foregoing title, which was presented as a follow-up of the paper on "Canada's Coal Supply" presented at the Toronto

Training with Oxygen Breathing Apparatus in the Smoke-Chamber of the Station of the Dominion Coal Co. at Glace Bay, in 1907.

Meeting of the Institute in March last (see C. M. Journal, page 228, issue 19th March 1920.) The speaker urged that his previous contention, namely, that Canada could be made completely self-supplying in bituminous coal had been borne out by the intervening events. The text of the paper will be given in a later issue of the "Journal".

Mr. W. J. Dick, General Manager of the Coal Sellers, Ltd., said that to those actually engaged in mining and selling coal in the West, the annual enlargement of the radius of western coal was encouraging. In past years the coal imports into the Fort William port of entry had run up to 500,000 tons of anthracite and 2,700,000 tons of bituminous coal, so that Western Canada had been importing annually  $3\frac{1}{4}$  million tons of coal that could have been supplied from Canadian mines. Why was this so? In the first place, the railways themselves were the largest users of bituminous coal, and although Pennsylvania was far away, the long stretch of water carriage through the Great Lakes helped the American coal. The railways that transported coal from the mining districts in the States were built as coal-carrying roads, and the cost per ton mile on the Lake Erie roads were much smaller than coal carrying costs on the Canadian roads. We have not the traffic on Canadian railways to enable us to compete with the coal-carrying lines in the States. Considering the low rail rate and the low lake freight rate on American coal coming to Fort William, it was a natural thing, and it suited the operations of the railways, which sent the grain cars westwards loaded with coal. The change in recent years had been very marked. At one time, the Winnipeg Board of Trade had stated that if Winnipeg had to use western coal the people would freeze to death, not realising that all the population to the west of Winnipeg were using nothing else but western coal. Now eight per cent of coal consumed in Winnipeg is mined in the Canadian West. Coal had been sent to Port Arthur, and even to Dryden, Ont., and found to be all right in use.

In regard to the enlargement of the western market, Mr. Dick said that both Alberta and British Columbia would show much larger exports to the adjoining States of the Union in 1920 than ever before.

Mr. R. C. W. Lett, Colonization Agent of the Grand Trunk Pacific said that while the heat values in western coal were much higher than in the American coal, such as was now being received, the great trouble had been disintegration, and he asked what progress had been made in briquetting lignites.

Commissioner R. C. Wallace said that while adverse action towards western coal had been taken in the past by the Board of Trade, no such body in Winnipeg would take similar action in regard to western coal now. Dr. Wallace's statement met with sympathetic general applause.

Mr. George B. Saunders spoke with reference to Dr. Bone's new boiler designed to consume lignite. He had blueprints of this boiler, which he believed would quite revolutionize lignite consumption for power-raising purposes. The installation would be quite expensive, and suited for large power-plants. The principle of this boiler is the prior subjection of the lignite to the heat of waste gases, resulting in sufficient evolution of moisture to reduce the lignite practically to a bituminous coal content before it passes to the chain-grate on which combustion takes place. While the exact process is not as yet understood, Dr. Bone's de-

vice is stated to be thoroughly practicable and will shortly be placed on the Canadian market.

#### **The Use of Powdered Coal in the Selkirk Rolling Mills.**

Mr. H. A. Mackay, Chief Engineer of the Manitoba Bridge and Iron Works, read a carefully prepared paper on the experiences of the Manitoba Rolling Mills in developing the use of powdered western coal for the heating furnaces and the open-hearth plant of his Company at Selkirk. Mr. Mackay's paper was one of those rare occasions at technical meetings when the development of a new utilisation of raw material is outlined from its beginnings to a successful consummation, and the President of the Manitoba Bridge & Iron Company — who was present — and Mr. Mackay are to be congratulated on proving the entire suitability of a local coal for a local metallurgical industry — one of the first, and also one of the most important in the West.

The initial troubles with western coal in powdered form were apparently associated with the low fusibility of the ash, and this was of course more in evidence in the use of powdered fuel for open-hearth use than in the case of heating furnaces, because of the necessity to pass the waste gases, and their suspended ash, through the checkers.

The distinctive feature of the Selkirk pulverizing plant is the long rotary dryer. The length of this dryer, as was explained by Mr. Mackay, was largely accidental and resulting from the fact that the necessary part was in stock, but it has proved most satisfactory in use, and it had been found possible to dry and pulverize coal that was quite saturated with moisture.

Mr. Deacon said they had discovered only one or two coals that would give good results when powdered, and use in metallurgical processes introduced problems very different from those associated with the raising of steam. The question of ash deposition was not so important where it was not necessary to pass the flame and gases through checkers and flues. Mr. Deacon thought from his experience that the use of powdered fuel for central heating plants would develop in western cities.

President Whiteside referred to an incident in his experience fourteen years ago when it had been found possible to utilise washer refuse running 50 to 60 per cent in ash. The fusibility of the ash was often very important.

Mr. W. J. Dick referred to the growing use of pulverised coal in the State of Washington, and its use by the Pacific Coast Collieries. Nut coal from the Lethbridge district, running 34 per cent ash — due to mixture with a draw-slate that could not be separated from the nut — had been burned successfully without any change in boiler setting giving 80 per cent efficiency. The utilisation of high ash coal turned largely on the question of fusibility. With regard to central heating plants, the speaker mentioned the central heating plant of the University of Edmonton and that of the City of Brandon. At the present time the price of pipe was a deterrent to extension of the central heating idea.

#### **Progress of the Lignite Utilization Board.**

Mr. Lemy, representative of the Province of Manitoba on the Lignite Utilization Board, was asked by the Chairman to address the meeting. Mr. Lemy said that although the Board had been working for three years it had made no report, and had not been asked to.

The Board got out weekly reports of progress, and in that way kept each other in touch with all developments. The Board was constituted by Order-in-Council and instructed to investigate the suitability of lignite for domestic fuel and its preparation.

The Research Council seemed to have been under the impression that everything had been learned about lignite that could be learned, and handed over to the Board a mass of literature. The Board started its work, but with the exception of one or two articles, could find nothing of value and had to start from the ground up. They made up their minds that anything that was to be found out would have to be discovered by the Board's own exertions. The engineers went on a tour and visited every plant, and although great hopes were entertained that the problem had been solved elsewhere, the investigations disclosed that this was not so. Carbonizing was the essential part of the problem. The first thing was to devise a carbonizer. Lots of devices were seen, but none proved of value. The Board's engineers had now under erection a device that Mr. Lemy said would do the work required.

A long series of experiments were made with binders. Every possible substance was investigated. About sixteen formulae for binders had been produced that gave satisfactory results. The waste of flour mills and sulphite pitch were promising materials. A briquette had been finally secured that would stand the most trying conditions, including the necessary ones of ability to stand transport, weathering, storage, strength of briquette, and behavior under the process of burning. The Board had not the slightest doubt as to the practicability of manufacturing satisfactory briquettes equal in quality to good anthracite. The Board had planned to have briquettes on the market this Summer, but deliveries of machinery had disappointed them. The plant is about half finished and is expected to be in operation about the end of February. Housing was one of the problems to be overcome, for which no provision had been made in the original estimates. Fifty or sixty employees will be required. Original estimates made in 1916 have proved too small for obvious reasons. Instead of \$400,000, the sum of \$600,000 will be required to finish the plant. For the same reasons, it is not unlikely the cost of the briquettes will be increased from the original estimate of \$10 per ton to \$13 per ton. Plant will have an initial capacity of one hundred tons daily. The plant is of an entirely experimental nature, and not intended to demonstrate manufacturing costs. No private property is involved in the process. Certain features could be patented, and the Board has patented the carbonizer only. The cost has been that of developing a process, and not a plant, and plants which may later be erected will thereby be made possible.

#### The Smoker.

The Smoker was — for the Canadian Institute — a decorous affair, but extremely enjoyable. Messrs. Lett and Atwood showed moving pictures of water-powers of the West, and in particular of Manitoba. No person ventured to sing the Anthem — which is perhaps just as well — for Winnipeg that is.

TUESDAY MORNING, 26th OCTOBER 1920.

With Mr. W. J. Dick, a vice-president of the Institute, in the Chair, the proceedings of the second day of the meeting were opened by a paper read by Mr.

J. F. McColl of Calgary, on "Results of Recently Conducted Steaming Tests on Western Coals."

Mr. McColl, who is the Chief Engineer of Calgary, and introduced himself as "Two Bit McColl", (a cognomen earned through his predilection for moderately priced fuel) described his experiences in successfully utilising for steam-raising purposes Drumheller slack coal — largely considered a waste product — averaging 15 per cent moisture and 12 per cent ash, through using a special setting of a chain-grate stoker under an ordinary B. & W. boiler. The special feature of Mr. McColl's setting is the introduction of a secondary arch. The deflection of the flame by the arch throws it back towards the front of the boiler sufficiently to evaporate the moisture as the coal comes on to the grate from the feed-hopper. Mr. McColl said he had proved indubitably the practicability of using a low-grade western slack, and believed he was saving his employers \$300 per day by consuming this low-priced inferior fuel in place of round coal sold at higher prices. The alterations to the standard boiler setting had cost some \$300 each boiler, and would now cost more because of increased labor and material costs, but in any case would more than pay for themselves.

The Drumheller coal used analysed, approximately, moisture 15 per cent, ash 12 per cent, volatile 30 per cent, carbon 42 per cent, with 11,540 b.t.u.'s.

The Ogilvie Flour Mills had used satisfactorily a coal containing 16½ per cent moisture, 6.3 per cent ash, 33.4 per cent volatile and 43.8 per cent carbon, estimated to yield 9,960 b.t.u.'s.

Mr. McColl said he had no difficulty in burning high moisture coal, even when thoroughly saturated by melting snow or rain. He had burned Souris lignite, containing 30 per cent moisture without difficulty.

Mr. McColl mentioned that some of the western coal received, and received for testing purposes, to assist the missionary work of the representatives of the Province of Alberta, was poor quality, no care having been used in its selection, and little interest taken by the shippers. In some instances valuable standing in the competitive tests had been lost by pure indifference in the preparation of the coal samples, some of which had been taken from old dumps in Winnipeg itself.

President Whiteside said "coal is coal" and it is a matter of getting a proper setting of the boiler, proper firing, and proper adaptation of conditions to the quality of the coal attempted to be consumed. Mr. Whiteside said the present time was a crucial one in the use of western coal, and there was need for consolidation of interests, and cooperation in the grading of coal and its preparation for market.

#### The Mineral Resources of Alberta.

Dr. J. A. Allan, of the University of Alberta, and the author of a comprehensive report to the Government of Alberta on its mineral resources (see Journal of 15th October, page 841) spoke regarding this subject. Dr. Allan referred to Mr. Stirling, the Chief Inspector of Mines, who had been quite ill, but was now recovering, and said he had done a great work for the Institute in Alberta.

Dr. Allan described the geology of Alberta, and stressed the fact that a large part of the province was composed of the central plain containing the sedimentary rocks which held coal and oil and distinguished Alberta from the other provinces of Canada. The occurrences of coal were distinguished by extent, by numerous horizons of varying age, and by marked

differences in the original material and the method of deposition of the coal, and by differences also in the structure of the coal that had been caused by pressure and heat. Any anthracite found in the Province was a result of metamorphism, and there was no large area of true anthracite present. Some areas in Alberta plainly represented limited areas of swamp deposition, which accounted for the disappearance of a well-marked seam within a short distance.

Dr. Allan intimated that the University of Alberta was undertaking a comprehensive investigation of the origin and nature of Alberta coal, in which microscopic examination would play a large part, and said that a necessary preliminary to the full development of the great western coalfield was a fundamental knowledge of these matters.

In regard to oil, a general survey of the provincial occurrences was given by the speaker, who stated, what it is both pleasing and important to know, that the Imperial Oil Company was withholding nothing that it had learned by its borings and geological searching from the officers of the Province and the Geological Survey at Ottawa.

The importance of the oil strike at Fort Norman was that it is believed to be located on the edge of a large basin extending northwards that in all probability contained oil. Oil had been struck at Great Slave Lake, where a drill-hole is down 500 ft. The work has been discontinued until Spring, but indications are good. The oil is heavy, about 16 Baume.

With regard to the bitumen sands of the Athabaska River, Dr. Allan said there was the equivalent of 189 cubic miles of bituminous sands, which if a method could be found to concentrate and extract the oil, would last the World at present rates of consumption for one thousand years.

With regard to iron, the Province was singularly deficient in this material, but some excellent samples had come down from the McKenzie Basin.

Professor N. C. Pitcher, of the University of Alberta, was to have read a paper on the more efficient utilization of coal in Alberta, but had been prevented from coming to the meeting. It is expected that Professor Pitcher's paper will be included in a forthcoming issue of the Institute's Bulletin.

#### Problems in Connection with the Marketing of Western Coal.

Mr. D. King, of the Hargraves Coal Company, read a thoughtful and extremely helpful paper on the problems of marketing western coal. It is understood

that Mr. King has always been sympathetically disposed towards the use of Canadian coal wherever and whenever possible, and his address, which was largely conceived from the viewpoint of a coal distributor, was one that apparently received, and was worthy to receive, the careful attention of western operators, many of whom were present to hear Mr. King.

Mr. King, considered the problems of marketing western fuel were few in number and easy to remove. First, prejudices against Canadian coal must be removed. The consumer must be educated and proof given that our coals compare favorably with imported coals. The operator should prove to the dealer that he is with him, and that there is profit in handling western coal. The preparation of coal for the market required more study, and the speaker urged fewer and better standardized sizes. Mr. King said the Government of Alberta had made a start in educating the public to the use and advantages of western coal, but it was only a start, and he urged its intensive continuance. To stop now would be to stop at the crucial moment.

The opportunity of the western coal miner is today unlike that of a few years ago. It is not a forced opportunity. The market was now in the operators hands to keep or to lose, to make or to mar. When American coal comes back, as it will, it would have to be met on a dollar for dollar basis. "Do not, gentlemen" said Mr. King, "be content with a general statement that western coal is as good as eastern coal. Make sure."

Mr. King said there were too many steam-coal sizes, which he thought must be an unnecessary and heavy expense to the operators, as it was to the dealers. The speaker urged the importance of having a good sales agent, a man who knew what he was talking about, and could be relied upon to make exact statements, and no more.

The consensus of the general discussion that followed Mr. King's paper, was that the present time offered a unique opportunity to gain a solid footing for western coal in the home markets, if the operators and the dealers would work cooperatively to that end.

Mr. J. R. Shanks, of Nordegg, Alt., suggested that the Alberta Government should obtain copies of Mr. King's paper for distribution among the coal producers.

Mr. Stutchbury, of Edmonton, who is a local representative of the Alberta Government in the forwarding of the sale of Alberta coal, said the Alberta Go-

Tipple and Headframe.

in the Souris Lignite Field.

vernment was not discontinuing advertising, although they had temporarily discontinued the newspaper display advertisements through the grain-moving season. The Government was preparing for a four to five months campaign and demonstration in the burning of western coal for domestic purposes throughout the Winter. Mr. Stutchbury said it was the intention of the Alberta Government to lose no opportunity to press the sale of Alberta coal by advertising and educational work. The speaker said that Mr. King's remarks would be all the better received as he was well known as a "booster" for Canadian coal.

Mr. M. A. Daley, the Fuel Supervisor of the Northern Pacific Railway, was asked by the Chairman to address the meeting, as a gentlemen who had much experience both in the use and in the purchase of coal. Mr. Daley, who spoke as a citizen of the United States, congratulated the Institute on the importance of its work, and said that on such bodies rested the future of the British Empire. Mr. Daley said he supervised

than hand-firing. He had known of the use of lignite, containing 40 per cent of moisture, in powdered form, while slack, with 15 per cent moisture had been successfully used in the States. With regard to the difficulty occasioned by low fusibility of ash content in fuel, the difficulty referred to by previous speakers, namely the clogging of narrow flame passages and flues by honeycombs of ash, this had been overcome in a Milwaukee plant, where by the use of water-cooled tubes, interposed so as to meet the flame and fumes at the proper point, it had been found possible to precipitate the ash before it reached the flues.

TUESDAY AFTERNOON, OCTOBER 26th, 1920.

Tuesday afternoon's discussions and papers covered the metallic deposits of Northern Manitoba. The morning's session had been remarkable, for in listening to the papers descriptive of new methods of burning coal, and the obviously rapid development of a

Map, Showing Position of the Estevan Taylornton Field, Saskatchewan. The Commercial Value of the Saskatchewan Lignites is now Firmly Established.

—Reproduced by Permission from the "Bulletin".

the purchase and use of some 21½ millions of tons of coal annually, and he realised the fundamental importance of coal, not only in transportation, but in everything else in civilized life. One of the greatest problems of the coal trade, the speaker suggested, was a better preparation of coal. He had known operators who actually did not know that it was in their own interest to sell a clean fuel.

Mr. Daley urged the opportunity for the utilisation of low-grade coal on railways. He instanced one locality in the United States where locomotives ran over an eight foot seam of coal, but actually went 600 to 1,000 miles to get a better grade of fuel. Pulverised coal on locomotives had yielded much better results

local technique, the impression could not be shaken off that those who were present were listening to the tale of the birth and infancy of what will some day be the greatest branch of the coal trade in Canada. In the afternoon, the meeting was no less remarkable, as one heard, as many did for the first time, of a new mineral area in the Middle West, only recently found, and indeed only recently suspected, which may very well compare some day with Northern Ontario and Northern British Columbia. There was a sense of being among pioneers of a new day in the West that gave the Winnipeg meeting a very distinctive tone, which was most in evidence in the juxtaposition of coal and metal papers in the sessions of Tuesday.

### Gold Deposits of Herb Lake District, Manitoba.

(Dr. F. J. ALCOCK, Geological Survey.)

Dr. Alcock illustrated his remarks by a new map of the Herb Lake District, which he has prepared in the field, and has been very recently issued by the Geological Survey. A memoir by Dr. Alcock is in the press, dealing with this district and should be available for distribution very shortly. A summary of Dr. Alcock's remarks follows:

Gold-bearing quartz was first found in the Herb Lake region in 1914, and active prospecting has continued ever since. Much development work has been done, and on one property, the Rex Mine, a mill has been erected and active mining carried on.

The area is reached from Mile 82 on the Hudson Bay Railway by train from The Pas fortnightly.

Although Palaeozoic rocks occur in the southern part of the district, the pre-Cambrian rocks are alone of significance in mineral content. The pre-Cambrian rocks fall into two main divisions, first granite and its differentiates, and an older complex of sediments and igneous rocks, much folded, and intruded and metamorphosed by the granite. The gold bearing veins are high-temperature deposits genetically related to the granite intrusions, which produced fractures in which during the later stages of the intrusion the gold was concentrated from solutions, and principally in the upper portions of the granite. During the long period intervening between the deposition of the minerals and the laying-down of the Ordovician dolomite, the upper part of the granite, containing the greatest concentration of gold and other minerals, was extensively denuded. Many valuable ore deposits were thus destroyed. Where the intrusions did not come near the surface, erosion uncovered only the irregular upper parts of the batholiths, parts which appear on a surface map as small stocks. These small granite stocks are the most favorable places for prospecting, and where wide areas of granite are now found the likelihood of mineral is smaller. Any area, however, where rocks of the pre-granite complex are exposed, may be underlain at no great depth by intrusive masses, and hence be mineralized. The Rex mine lies at a distance of over one mile from the nearest surface exposure of granite, and the Kiski veins at a distance of nearly three miles.

A description of the Herb Lake properties was given by Dr. Alcock, which included the Rex, the Northern Manitoba Group, the Kiski-Wekusko claims, the Elizabeth-Dauphin claims, the Bingo property, the McCafferty claims, Apex Group and other prospects not fully described.

"In conclusion," Dr. Alcock stated, "It may be stated that there are a number of properties which offer good possibilities of being worked at a profit. The high cost of labor and transportation has as yet hindered development. A possible solution is an amalgamation of several of the more important properties which lie close to one another on the east shore of Herb Lake. This would reduce the overhead cost of separate managements and decrease the actual cost of mining and milling by carrying on operations on a large scale."

Dr. Alcock also mentioned his explorations in the Seal River country. No rock was exposed, and the topography consisted of long ridges of terminal morain deposits, and the typical glacial features of kettle holes, undrained lakes, and similar well-known aspects. The debris was entirely unsorted glacial material, no stratified gravels being noticed. There was of course no possibility of gold deposits in this country.

### Mineral Deposits of Copper Lake, Man.

J. P. Gordon, whose high-grade gold discovery in the Copper Lake district aroused considerable interest some 18 months ago, contributed an address on the mineral deposits of that section.

Mr. Gordon described the geological formation of the Copper Lake district and the mineral occurrences. He outlined the development work which had been done on his properties, and stated that with transportation facilities he was satisfied that the district could supply a large tonnage of low grade ore of commercial value.

Dr. Wallace said a remarkable feature in connection with the quartz in the large vein described by Mr. Gordon was that it broke almost like calcite, with three cleavage planes, and was remarkably uniform. He attributed this to a series of stresses regularly distributed, but in discussing the matter with Mr. Gordon he had made some suggestions that Dr. Wallace thought would interest the meeting.

Mr. Gordon said he took a flat rock from the hanging-wall side of the vein, and on that formed a mould of plaster of paris. He applied heat to the stone under the plaster of paris, and cold above, with the result that the plaster broke in exactly the same way, so that he thought the quartz might have cooled more slowly on one side than the other, and that the peculiar cleavage was the result of this.

### The Flin-Flon Ore Body.

Dr. Wallace described the Flin-Flon ore body, and showed on the lantern cross-sections of the shape of the lense as it appeared to be delimited by results of the plotting of diamond-drill holes. The deposit, which is interrupted by a prominent "horse" at the south end of the property that forms a prominent topographical feature of the area, has a known length of 2,593 feet, and has been proved to a depth of 900 feet for a length of 1,000 feet. The greatest width transverse to the dip is 400 ft., with a maximum width at the 900 ft.

The Roofed-Over Pit sunk on the rich gold-shoot on the "Red Rose" at Copper Lake, Man., which first called attention to this district.

(From the "Journal" of Oct. 1st, 1919).

level of 35 feet. Exclusive of the greenstone horses contained within the ore body, the tonnage of ore is estimated as a result of diamond drilling at 16,000,000 tons, making no allowance for continuation of the ore below the 900 ft. level, or possible ore at depth in the line of pitch at the south end of the ore-body. On the whole, the ore-body is most compact at the north end, and shows a tendency to finger with inclusions of country rock toward's the south end at depth.

The ore-body consists of solid sulphides, which occur in the centre and towards the hanging-wall, and are in places in direct contact with the hanging-wall. Disseminated ore occurs in greater quantity towards the foot-wall.

The minerals of the ore-body are, in order of importance, pyrite, sphalerite and chalcopyrite. Gold and silver values occur associated mainly with pyrite. Galena has been found in vugs in the otherwise unmineralized rock, but does not occur in quantity in the ore-body. Native copper is found in leaf form in the upper sulphite zone, and has been precipitated as a result of secondary processes.

While it might be expected that values in gold would increase, and values in copper and zinc would decrease in depth, no indications of any such variation has been noted to the depth at which diamond drilling has explored the property.

Dr. Wallace's paper is so full, and so little susceptible to condensation, that further extracts cannot be made at this time, and publication of the paper in full must be awaited.

DR. R. C. WALLACE.  
Commissioner of Northern Manitoba.

Particular stress was laid on the question of transportation, and mention was made of the visit of members of the Manitoba Legislature and Winnipeg business men to the mine—elsewhere described in this issue. A railway 85 miles long was required to make development of the ore-body a commercial possibility.

#### The Rice Lake District, Manitoba.

Professor J. S. DeLury, of the University of Manitoba, described the Rice Lake area. Dealing with the general economic aspect, Prof. DeLury said this remained much as it was when Mr. Dresser looked into it, with the normal advance that the district had made since its discovery. The knowledge of the area was still being extended, and that by a very small body of prospectors. A surprisingly small number of persons were working in the district, considering its size, but the known mineralized belt was being continuously extended. He would lay special emphasis on the fact that it was still a prospectors' district. It is an area with many possibilities that has not been scratched, not more than one per cent of the area having been intensively prospected.

Prof. DeLury referred to the discovery of nickel-copper ore in norite of Sudbury type in the Bear River District, of which large samples were shown in the mineral exhibit in the Hotel.

Some interesting slides showing glacial action, sheared zones, flow evidences, and quartz outcrops were shown by the speaker.

#### Bear River Area, Manitoba.

A detailed and fully illustrated paper on the Bear River area had been prepared by Mr. R. J. Colony, but was not read owing to pressure of time. The paper was an important one, inasmuch as it describes an occurrence of copper-nickel, and publication in the Bulletin will be looked for.

#### Evening Session, Tuesday, 26th October.

In the evening Dr. Wallace gave an illustrated lecture on Northern Manitoba, which included some new historical facts in connection with a country which, as Dr. Wallace put it, contained relics of what is almost a forgotten civilization, and of the earliest Canadian explorers. Among other interesting photographs were notable views of old Fort Prince of Wales, with its 42 ft. thick walls; and also of the church at York Factory, which contains a fine stained-glass window presented by Lady Franklin in memory of her husband. This church stands on the river bank, which in the course of 50 years has been eroded until the church is in danger of falling into the river. There is also a library at York Factory containing unique specimens of early Canadiana, that call for preservation.

View of the Hudson Bay Railway, which is complete except for 92 miles of steel rails, were in the nature of new knowledge to many who heard Dr. Wallace and the actual extent of construction work accomplished in a difficult and desolate region is certainly little realised by the Canadian public. One photograph shown by the speaker revealed the terrific intensity of the storms that visit Hudson's Bay.

#### Wednesday Morning, 27th October.

Captain H. E. Knobel, of Port Arthur, read a paper on "The Use of Ontario Iron Ores for Canadian Furnaces." It is hoped to reproduce Captain Knobel's paper in full in a forthcoming issue, but mention should be made of two definite suggestions put forward to assist what is undoubtedly a necessary development in

Canada, and to relieve what cannot by any stretch of the imagination be considered a satisfactory condition, namely, that only five per cent of our blast furnace iron-ore charges are mined in Canada.

These suggestions are:

(a) A suitable bounty on all Canadian iron-ores mined and marketed without restriction, payable to the mine-owner.

(b) The installation, at some suitable point, of a concentrating unit, on a sufficient scale to make economic determinations in the beneficiation of jaspilite ores — this class of ore being most representative of the large reserves of low-grade ores available.

Mr. F. W. Gray, speaking as the Secretary of the Iron & Steel Section of the Institute, said that the section had not been active, and suggested that possibly the policy of sectionalizing the Institute was mistakenly conceived. He thought that the best way for any particular technical interest comprised in the Institute's activities to make itself felt was to contribute to the Institute's papers and be in attendance at the discussions. The Institute had a wide field to cover, and its activities were sufficiently sectionalized by geographical exigencies to make it doubtful whether further dissection of its activities was desirable. The suggestion to make a coal-mining section had not been pressed, largely, the speaker thought, because this fact had been realized when the proposal was analysed in the endeavour to work it out in practice.

Dr. Allan said that unfortunately Alberta contained little or no iron, so far as known, but in the Crow's Nest District there was a deposit of magnetite. It contained a considerable percentage of titanium. Newly detected occurrences of iron ore in the Peace River district had been reported, both hematite and limonite, but were very far from transportation. There was also a hematite occurrence of undetermined extent in the Mackenzie Basin.

#### Mining and Ore Transportation at the Mandy Mine.

Mr. G. R. Bancroft described the now famous transportation achievement of the Mandy Mine, made possible by the extraordinarily rich ore concentration at that property.

Dr. Allen said the Mandy Mine was the only copper producer in the Province, and said that Mr. Bancroft had been modest in describing the transportation of the ore in not telling the members of his own leading part in that achievement.

Mr. F. W. Gray said that the tale of the Mandy Mine had, to most persons outside of Manitoba, been chiefly responsible in spreading the fame of the northern mineral belt of that province; and that if Mr. Bancroft was to be credited with the transportation work, he was also to be credited with putting Manitoba before the public in a way that had called very general attention to the province.

In answer to a question, Mr. Bancroft said the cost of transportation had varied during the four years in which it had been carried on. The hauling of the ore to the head of navigation amounted to about \$14.50 per ton. The steamboat costs had varied with the well-known vagaries of the Saskatchewan River, in which stream the water level was apt to vary quickly and within wide limits of depth. Including loading and unloading the cost had been about \$5.13 per ton, labor and material only, and not allowing for depreciation and interest on equipment.

#### Non-Metallic Mineral Deposits of Manitoba.

Mr. D. C. McArthur read a quite exhaustive paper, including an unexpectedly long list of the non-metallic minerals of Manitoba. Prominent among these is good building stone, as may be seen from a visit to the new Parliament Buildings, built with Tyndall Quarry stone. These buildings are a noteworthy architectural achievement, and will become famous among Canadian architectural records as time goes on. This by the way.

Clay products, bentonite, gypsum, talc, oil, sodium-sulphate, garnetiferous sands, salt, bitumen were among the materials mentioned by Mr. McArthur as being found in commercial quantities in Manitoba.

A matter of some importance mentioned was that arrangements had been made to preserve and co-ordinate all the records of sinkings and borings done by the Government of Manitoba and also of Alberta.

#### Alloy Steels.

Mr. F. A. Fahrenwald was listed to speak on "Non-Corrosive Steels" with particular reference to researches into a possible non-corrosive metal for gun-barrels. Mr. Fahrenwald changed his subject, stating that his prepared paper would be presented through the Bulletin, and gave an illuminating talk of the general question of alloy steels. He showed a table of elements arranged in groups, and explained their family inter-relationships, which guide the metallurgist in his search for alloys designed to fit special purposes.

In connection with the corrosion of gun-barrels, this had been discovered to be occasioned by the alkaline residue of the primers used in detonation. Certain alloys were found to give resistance to corrosion, but also possessed undesirable physical qualities. After exhaustive experiments, iron-nickel and iron-chromium alloys were proved to give the best combination.

The speaker referred to an alloy which he had perfected for use in automobile pistons. The co-efficient of expansion differed from that of the cylinder case in such a manner that clearances between the piston and the cylinder could be reduced to a minimum, with the assurance that when the metals were heated the piston would not bind.

Alloys for resistance to high temperatures were also discussed, in particular the iron-chromium combination is being developed to fill a demand for moving parts required to operate under high temperatures and possess high physical strength. Such a metal would solve some of the problems met with in the utilisation of oil-shales. Aluminum, magnesium, cobalt and titanium were also mentioned as alloy metals. Titanium alloys were assuming considerable importance, and in this connection the mention of a titanium iron in the Crow's Nest District by Dr. Allan was interesting. Chromium, said Mr. Fahrenwald, was becoming a "king-pin" among alloy metals.

In answer to a question, the speaker said that cobalt could be sold for alloy purposes in larger quantities if produced at a lower cost. It was a desirable alloy for many purposes, but its cost was high.

Mr. Fahrenwald commented the provinces of Alberta and Saskatchewan in having scientific men so well represented in public affairs, and said that in new districts today the true pioneer was the scientist, and the greatest progress would be realized where this fact was recognised.

### Excursion to Selkirk, Wednesday Afternoon.

The concluding afternoon of the meeting was occupied by a trip to the Rolling Mills of the Manitoba Bridge & Iron Works, and the open-hearth plant of this Company, and to the plant of the Manitoba Steel Foundries.

At the works of the Manitoba Bridge & Iron Company, the visitors were shown around by the President, Mr. Deacon, and Messrs. Mackay, Smith and other officials, and saw the plant for pulverizing coal, and the application of this fuel to the heating furnaces. The Rolling Mills were making bar and strip iron from rolled scrap. The open-hearth furnace, which is a Mc-Lain-Carter 15 ton furnace, was not in operation, being under repairs. A surprisingly large amount of scrap of excellent quality was observed in the stockyards, and was an evidence of the wear and tear in iron and steel structures and parts in the Middle West.

The plant of the Manitoba Steel Foundries is equipped with two Schneider electric furnaces, which were seen in operation, and the visitors saw a heat poured into the ladle, and from thence into the casting-boxes awaiting filling. The plant has its own motor-generator set for supplying current to the furnaces, which obviates any surge on the power company's lines. The power is supplied from the Lac du Bonnet site by the Winnipeg Electric Company.

The evidences of a local metallurgical industry at Winnipeg and the satisfactory utilisation of a local coal were the occasion of much congratulatory comment among the members of the Institute, who also appreciated the courtesy of the officials of both of the Selkirk enterprises in taking such a part in the proceedings of the meeting, and in arranging the afternoon's visit of inspection.

### The Dinner.

The speakers at the First Annual Institute Dinner held in Winnipeg included Hon. Edward Brown, the Treasurer of the Province; Mayor Gray, of Winnipeg; Mr. J. A. Campbell, M.P., Mr. T. R. Deacon, President of the Manitoba Bridge & Iron Works, and Mr. H. A. Lovett, of Montreal, President of Coal Sellers, Limited. The President of the Institute, Mr. Whiteside, presided. About one hundred guests were present at the Dinner.

The speeches were rather more deliberate utterances than are usual at Institute dinners, and maintained a high order of excellence.

Mr. Brown handled the question of the ownership of natural resources in a very emphatic manner, stating that the stand taken by the Federal Cabinet was indefensible, amounting to flagrant injustice to the province. Mr. Brown's statements were indicative of a general feeling in Manitoba, and he announced that the Province intended to make one more attempt to gain what the people of Manitoba regarded as their inalienable heritage, and their rightful due according to all historical precedent and the practice of the British Empire.

Mayor Gray said he would like to see more British capital interested in mining in Manitoba, and referred to his participation in the recent trip to the Flin-Flon Mine.

Mr. J. A. Campbell — the Institute's sole representative in the Federal House at Ottawa—emphasized Mr. Brown's remarks in even stronger vein, remarking that every local recourse had been tried and that unusual means were demanded if Ottawa would not consent to give Manitoba control of its own things. He

pointed out the detriment to mining advancement associated with the present indeterminate state of mining grants and regulations. He said Manitoba had a mining law, but did not own the mines. Ottawa owned the mines, but had no mining law, and between the two contradictory conditions mining was bedevilled and capital frightened away.

Mr. Deacon referred to the prior position of mining in every civilized country, and to the fact that it necessarily preceded agriculture. He read figures showing the growing excess of our imports over exports, and he pleaded for a decent regard for the rights of capital. Mr. Deacon proved himself an accomplished raconteur, as did also Mr. Howard of Taber, Alta.

Mr. H. A. Lovett spoke on development of western coal resources. The President's wide acquaintance with the membership of the Institute was revealed by his comments in introducing the speakers, and his nice discrimination in the Institute's traditional taste in stories was disclosed when he called upon a gentleman from Tabor, whose response to some extent made up for the omission of the anthem from the programme.

Those who organized the Winnipeg meeting have every reason to be proud of the attendance, the quality of the papers, the fullness of the discussions, and the assiduous manner in which the visitors took in every phase of the programme. The room provided by the Fort Garry Hotel was well suited for speaking, and well removed from first-floor distractions, and the speakers who presented papers had no reason to complain of lack of attention or lack of audience.

### TORONTO COAL PRICES.

Toronto, Nov. 3. — Toronto coal dealers report that buyers are still holding off for lower prices and that the market is more or less on the skid. There is a possibility that the Interstate Commerce Commission in the United States may suspend the order requiring all open top cars at the mines which may have a tendency to stiffen the market. Transportation is slowing down somewhat and the coming of colder weather is not expected to help matters in this regard. Hard coal is quoted at \$8 to \$16 a ton at the mines. American funds. Mine run bituminous has taken another drop and is now quoted at from \$10.50 to \$11.50 f.o.b. Toronto. Smokeless coal is also down and is now quoted at \$10.50 to \$12.00.

### PERSONALS.

Mr. J. B. Tyrrell has returned to Toronto from Newfoundland where he was examining mining properties.

Mr. A. G. Burrows of the staff of the Ontario Bureau of Mines has returned to Toronto after completing a geological survey of the Gowganda district.

Mr. H. H. Sutherland of Toronto is leaving for London, England, in connection with the financing of Davidson Consolidated Mines.

Mr. Robert Mond is visiting the Sudbury properties of the Mond Nickel company of which he is a director.

Dr. F. J. Alcock is on leave of absence from the Geological Survey. He will lecture during the winter in the Departments of Mineralogy and Geology at Queen's University, Kingston, Ontario.

Mr. T. J. Brown, who recently took the position of General Manager of the Inverness Coal & Railway Company, Cape Breton, has resigned. Mr. Brown passed through Montreal this week on his way to Toronto.

## The Registration List at the Winnipeg Meeting

(Copied from the Register.)

J. W. Harris, Winnipeg.  
 Duncan McDonald, Calgary.  
 John R. McDonald, Edmonton.  
 Wm. Ellis, Three Hills, Alt.  
 Jam Troman, Lethbridge.  
 J. H. Hicks, Winnipeg.  
 C. R. Bancroft, Pas.  
 Robt. Graham, Pas.  
 W. P. Williams, Bellevue, Alt.  
 E. W. Jackson, Winnipeg.  
 G. B. Hall, Winnipeg.  
 E. A. Campbell, Winnipeg.  
 John A. Allan, Edmonton.  
 J. D. Perrin, Winnipeg.  
 Jas. A. Richards, Edmonton.  
 A. M. Stewart, Winnipeg.  
 L. S. Thompson, Winnipeg.  
 R. W. Hiebert, Winnipeg.  
 J. P. Gordon, Pas.  
 Robt. Strachan, Fernie.  
 R. C. W. Lett, Winnipeg.  
 C. E. Jeillin, Minneapolis.  
 Peter Davidson, Pas.  
 G. Murray, Pas.  
 John F. Sweeting, Winnipeg.  
 John C. Allan, Montreal.  
 W. J. Dick, Winnipeg.  
 S. Scott, Winnipeg.

WINNIPEG MEETING, CANADIAN INSTITUTE OF MINING AND METALLURGY. OCTOBER  
 25th TO 28th, 1920.

### *Group of Attendants at the Meeting, Fort Garry Hotel.*

The gentleman without a hat is Mr. R. R. Rose, the efficient Assistant-Secretary of the Institute, and immediately above him is the President. Close by are Messrs. Fahrenwald, Stutchbury and DeLury. Dr. Allan is seated at the righthand of the stone bench,

and to the right (standing) is Mr. Richards, Acting Chief-Inspector of Mines for Alberta. Others who may be picked out in the group are Messrs. Lovett, Shank, Howard, Gordon, Lett, Johnson, MacDonald, Williams, Saunders, Kipp, Westcott, Emmerson, McCall, etc.

VISIT OF THE MEMBERS OF THE LEGISLATURE OF MANITOBA TO THE FLIN FLON PROPERTY.

By R. C. WALLACE, Commissioner of North Manitoba.

In the early part of September there was carried out under the auspices of the Board of Trade of The Pas, an excursion which was successful in its completion as it was bold in its inception. The Pas Board of Trade has always shown itself alive to the needs of the country for which it is the central distributing point and the main business centre. Realizing as it did that during the next session of the House the question of the building of a railway to the Flin Flon property would in all probability come up for decision and realizing also that only by personal examination can a clear understanding be reached by those who have to deal with a situation such as this, they decided to invite the members of the Legislature and other prominent citizens of the Province to the property as their guests. The undertaking was particularly important for this reason as well that during the election this summer the Norris Government was returned not as a clear majority of the House but simply as the dominant unit in a house consisting of Norris supporters, Conservatives, Farmers, Independants and Labour Members. It will therefore be necessary in dealing with a business matter affecting the Province as a whole such as the completion of a railway to the Flin Flon property, that the matter be dealt with not in any sectional way but by a House which in all its sections realizes the importance of the undertaking in the development of the North Country and the Province.

Invitations were sent by the Board to all the members of the House and to other prominent citizens of the Province who were particularly interested in the North Country and its development. It was unfortunate that no members

Scale 1 inch = 6 1/2 miles (Reduced)*

which is now a fairly large unit in the House, found it possible to take part in the excursion. All other sections were well represented and Premier Norris and Hon. Dr. Thornton, Minister of Education, accompanied the party. Owing to an imperative engagement the Premier found it impossible to go further than Sturgeon Landing but the Minister of Education visited the property and represented the Government in the party. Mayor Gray, of Winnipeg; T. R. Deacon, President of the Manitoba Bridge and Iron Works; Gen. Dyer, of Minnedosa; P. A. Macdonald, Public Utility Commissioner; J. A. Macdonald, Publicity Commissioner; J. A. Campbell, M.P., and J. Paul, representing Canadian National Railways also accompanied the party. The Town of The Pas was represented by Acting-Mayor Bullock; the Board of Trade by President G. R. Bancroft, to whose energy and organization was due in no small measure the success which followed the undertaking.

The party left The Pas on the Ross Navigation Co.'s steamboat "Nipawin" on Sat. Sept. 4th., reached Sturgeon Landing (130 miles from The Pas) on Sept. 5th. They embarked in canoes for the sixty-mile canoe journey to the property that same evening and camped at Goose Creek that night. Arrangements had been made that the party be met by canoe men and gasoline engines belonging to mining men and prospectors in the district at Sturgeon Landing. Many of the mining men gave their services very freely in assisting the party in this way. On Monday, Sept. 6th., Goose Creek was crossed, the rapids of Rat Creek safely negotiated and camp was made on Monday evening on beautiful Lake Athapuskow. The following day the Lake was crossed under very favourable conditions and the Mandy Mine was reached by nightfall and the party was taken over the property and shown the extent of the rich chalcopyrite lens which has now been mined and transported to Trail for smelting.

The following day the party were conducted to the Flin Flon property, this involving a walk of two miles over a wagon train after unloading from canoes. The greater part of the day was spent at the property and

the underground workings fully investigated by all the members. They had an excellent opportunity of examining the extent of the ore body both at the 100 and 200' levels in the cross cuts and the impression which was created on discussing the matter with the engineers and others who were familiar with the property as a whole was very significant. In a short speech at the mine the Minister of Education stated that it had been difficult for him in the past to get the true perspective in connection with northern development as he had been unfamiliar with northern conditions. Now that that perspective had been obtained he would be relied on to further the interests of north country development in whatever way he could. Many other members of the party expressed themselves as appreciating for the first time fully the significance of development work in the north. After an excellent lunch provided by the Flin Flon Syndicate the party retraced their steps to the Mandy and re-embarked the following morning for Sturgeon Landing and The Pas. The writer was unable to accompany the party on the return trip owing to the necessity of investigating certain properties in the mining belt. He understands, however, that a certain amount of transportation difficulties had to be overcome, such as the stranding on the sand bar in Cumberland Lake and the breaking of a propeller shaft in the Saskatchewan River. Such difficulties did not damp the enthusiasm of the members of the party who expressed themselves in a public function at The Pas before leaving the Town, as one and all enthusiastic for the development of a country which could show the possibility of wealth such as they had seen uncovered in the Flin Flon ore body.

The initiative and enthusiasm of the Board of Trade and the citizens of The Pas will be appreciated the more when it is realized that the party numbered on arriving at the Flin Flon property some seventy members and that the total cost (all of which was subscribed by the members of the Board and their friends) was more than \$3,500.00. J. E. Hammell, who represented the owners of the property was indefatigable in assisting the undertaking by every means in his power.

THE FLIN FLON ORE BODY FROM THE SOUTH.  
No. 2 Shaft can be seen over the end of the ore body to the left.

## THE SILVER MINES.

### The Cobalt Field.

The past week has been marked in mining circles by considerable criticism of an Order-in-Council passed on October 13th, declaring all patented mining claims forfeited on that date on which a certain provincial tax of five cents per acre had not been paid, and declaring these claims open for re-staking on or after noon of the 28th October.

Owners of important properties declare they were totally unaware of the existence of such a tax, having received not the slightest intimation of it from the Government.

On the other hand, the Ontario Department of Mines declares the fact was advertised in the press some months ago, and the claims were all recently listed in the Ontario Gazette. The Department states also that notice was sent in all cases where the address of the owner was available.

The fact is, however, that included in the forfeited claims was the Teck-Hughes Gold Mines, The Hudson-Kirkland, Lang-Caswell and Ontario Solid Silver Mines, all properties considered to be in strong hands. Indeed, the Teck-Hughes, a steady gold producer valued at many hundred of thousands of dollars, became forfeited over a mere tax of something like \$5.50.

A veritable avalanche of criticism swept through the press of Ontario, especially Cobalt and Toronto on the morning of the 28th, and caused the Department to take serious notice of the unprecedented situation. As a consequence, at 11.30, just thirty minutes before the Order was to go into effect, the Teck-Hughes and Kirkland Hudson were withdrawn from staking. It was a little later on the same day that another Order withdrew the Ontario Solid Silver Mines from staking.

In the meantime stakers were on the ground in each case, armed with anything from a pick handle to a telegraph pole, and all participating in the restaking of these valuable properties. Men swarmed around the boundaries of the Teck-Hughes mine bent upon staking out this big gold producer already proven. In their ears was the continual rumbling of the big modern mill steadily grinding out the yellow metal, and each staker conjured up visions of great personal wealth. It was accordingly a cruel moment for these men when it became known that the Government had withdrawn the property from re-staking.

The Lang Caswell mine, in Lorrain, is one of the properties listed as forfeited and still listed among those not withdrawn.

Operations at the Cobalt mines are below normal due to shortage of power, but wet weather has now set in and relief is looked for shortly. Some of the mines have been obliged to close down at intervals, accordingly as regulated by the amount of power available.

Announcement is made that one of the veins on the Lumsden property of the Camburn Silver Mines Company in which rich silver occurrences have been discovered, has been found to carry silver in every round of shots over the last fifty feet of drifting done. It is now intended to concentrate effort on the work of stoping on this vein.

The Coniagas Mines, Ltd., closed its fiscal year on Monday of this week, and is understood to have experienced very satisfactory prosperity. Output is said to amount to close to the previous year's figures, and

the company was enabled to disburse 12½ p.c. in dividends, or some \$500,000. The annual statement is now in course of preparation and is expected to be issued early in December.

Arrangements have been made to explore a part of the Chambers-Ferland mine through a shaft on the Right of Way Mines. Cross-cutting has been undertaken at a depth of 385 feet, for the purpose of cutting through an area of conglomerate formation lying between the Nipissing and the La Rose Mines. This piece of territory is believed to offer considerable promise, and the present plan is to carry out all reasonable work in determining its value. The work commenced about October 5th, and already upwards of 130 feet of cross-cutting has been done.

Accidental fire destroyed the shaft house on the La Rose mine, the property on which silver was first discovered in Cobalt. Miners working underground were brought to surface through another shaft, with no loss or injury to the men.

### In South Lorrain.

The mill on the Keeley mine has been completed, and trial runs were made during the past week. According to official figures, the ore reserves as of the end of August on the Keeley were estimated to contain 400,000 ounces of silver as well as a large quantity of cobalt which it is hoped may be marketed at a profit. This official advice is taken to indicate the Keeley has taken a place among the regular silver producers of this country. The new mill is fitted with 20 stamps with corresponding equipment. The ore in sight is largely the result of less than one year's operation.

Preparations are being made to commence work on the Haileybury Silver and the Haileybury-Frontier properties, situated in the vicinity of the Keeley. These properties are to be worked for the cobalt metal contained in the known veins.

### Elk Lake.

Negotiations are still pending for the White Reserve mine at Maple Mountain. It was stated this week that something definite would be known within the next week or two as to whether the control is actually to be taken over by English interests, or not.

Chas. Dalby, superintendent of the Anvil Lake Silver Mines is now on the ground making arrangements to commence work. This property was formerly known as the Rubicon, and has some very promising silver showings at surface.

Ore shipments during the week ended October 29th from the Cobalt field amounted to more than three quarters of a million pounds, made up of a total of twelve cars. A feature of the week was the large number of shippers, eight different consignees being recorded.

The Nipissing was the leader with four cars containing 284,674 pounds, as shown in the following summary:—

Shipper.	Cars.	Pds.
Nipissing . . . . .	1	284,679
Temiskaming . . . . .	1	106,857
McKinley-Darragh . . . . .	1	94,496
Mining Corp. . . . .	1	66,938
Dominion Reduction. . . . .	1	65,000
O'Brien . . . . .	1	64,033
Coniagas . . . . .	1	60,619
H. F. Strong . . . . .	2	34,643
Totals . . . . .	12	777,265

**THE GOLD MINES.**

The condemnation of the McFadden gold bill calculated to pay a premium of \$10 an ounce on new gold produced within the United States has been announced by the American Bankers' Association. The announcement has not conveyed any surprise to the gold mine operators in this part of Canada. Indeed, these operators have repeatedly stated they did not consider such a measure feasible. This stand was also taken by Sir Thos. White from the beginning when the bonus on gold was first mooted.

Cornish miners for relief of the mines of Porcupine are a reality. Confirmation has been obtained in connection with last week's report in the "Mining Journal" that several score miners were en route over the Atlantic on their way to the Dome Mines. It is also learned that early reports are entirely correct in respect to this company ordering a large number of additional machines with which to be prepared to receive and employ these new miners.

The Hollinger Consolidated Gold Mines is said to be treating an average of about 1,600 tons of ore daily and with prospects of being able to employ additional stamps and increase tonnage before the end of the year. The equipment available and only awaiting the desired number of workmen, is adequate to treat an average of over 3,000 tons of ore daily. This would be at the rate of over one million tons annually, and in view of the ore reserves being estimated to contain an average of \$9.09 per ton would indicate a possible output at the rate of over \$9,000,000 annually. This illustrates the importance of present indicated improvement in the supply of labor, although the point should be kept in mind that the process of securing a full supply of men may spread over several months, and the increase over the present rate of output will in all probability be brought about gradually.

Arrangements have now been completed for the distribution of 76,667 shares of Dome Mines, which have been paid to the Dome Extension Mines, Ltd. for the properties and assets of that company. Each shareholder is asked to send in his shares for transfer and is entitled to one share of Dome for each thirty shares of Dome Extension. Shareholders will also receive 25 cents on each share of Big Dome issued to them. This payment is equal to the dividend declared by the Dome Mines Co., payable October 20th. The Trusts and Guarantee Co., Ltd., are the transfer agents.

It is learned officially that the estimates place a value of over \$1,250,000 on the ore in sight on the Porcupine V. N. T. Mines. Ore is estimated to amount to 130,000 tons, and the grade is not far under \$10 per ton. The plans of the company are to increase the mill to perhaps a capacity of 200 tons daily soon after work is resumed. Development work will be continued to a depth of 900 feet, the present shaft being already down to the 600-ft level at which point commercial ore is in evidence over several feet in width.

**The Kirkland Lake Field.**

During the month of September, according to the regular monthly report of manager R. C. Coffey, the Lake Shore mine produced \$40,150. This compares with \$35,261 during the preceding month. In September, 1,480 tons of ore was treated, an average of \$27.12 being recovered from each ton treated, comparing with the former average of between \$24 and \$25. Total

output to date from this mine, equipped with only a 60-ton mill, now amounts to \$1,051,730. The work of deepening the main shaft is progressing, and was reported to be 72 feet below the 400-ft level at the end of September. The objective is a depth of 800 feet, and the plan is to open up development levels at the 600 as well as 800-ft level.

High grade ore is being developed at the 500-ft level of the Kirkland Lake Gold Mines. Good results are also being met with on this property at the 900-ft level. Average mill heads are now such as would indicate a very substantial margin of net profit.

At a meeting of the shareholders of the Hunton-Kirkland, held in Haileybury, October 28th, a by-law was passed authorizing an increase of 1,000,000 shares in the capitalization. This raises the capital from \$1,500,000 to \$2,500,000, the added shares being for the purpose of financing extensive underground operations as well as to be used at such time as a mill is required. It is believed likely that it will not be necessary to issue the full amount. However, such will be available with which to meet any contingency. At the meeting, it was announced that at a depth of about 70 feet, some high grade ore is in evidence, and the outlook in regard to the physical condition of the mine is considered favorable.

In a statement to the shareholders of the Ontario-Kirkland Gold Mines, president Frank Huth states that the work is proceeding on the new 100-ton mill which is expected to be in operation before September 1st, 1921. Development work on the 300 and 450 feet levels is showing satisfactory results, and a new shaft is projected at the mill site to the 450 feet level to serve as a main hoisting shaft.

On the Argonaut mine, at Beaverhouse Lake, work of extending the shaft below the 200-ft level has commenced. It is planned to carry this work to a depth of 500 feet.

In the meantime, the small mill is being operated, a gold brick valued at \$4,000 having just been sent out.

With the completion of the Wright-Hargreaves mill within the next two months, and with the installation of a new mill on the Ontario-Kirkland by September, next, the combined milling capacity of the plants in the Kirkland Lake field will amount to about 730 tons daily, capable of treating over a quarter of a million tons of ore yearly. Ore is estimated to average about \$13.50, and the indicated output when operating at full capacity is estimated at the rate of \$3,000,000 annually by that time.

With the price of material steadily declining, and with indications of the labor supply increasing the outlook for the gold mines is more favorable than for several years.

**METAL QUOTATIONS.**

Fair prices for Ingot Metals in Montreal, November 5th, 1920. (In less than carload lots).

**TORONTO NOTES.**

According to Deputy Minister of Mines, Thomas Gibson, about ninety per cent of the mining claims in New Ontario that have been forfeited by reason of non-payment of taxes have been voluntarily abandoned as not worth working. Many of the remainder were speculative claims. Justification for withdrawal from staking at the eleventh hour of several claims lies in the fact that much development work might have been lost to the province had the order-in-Council not been passed. It is stated that most of the properties forfeited that are worth anything have already been re-staked by their original owners. In the opinion of some of the mining men from the North, mining in that country was given a severe check by the action of the Government in selling the claims for non-payment of taxes without directly notifying the owners.

The special meeting of the Black Lake Asbestos shareholders called for last week was called off as a result of a temporary injunction obtained by the Toronto shareholders. This week the injunction was sustained in the court, it being held that the dissentients were justified in their objections. As matters

now stand it will be necessary for the Montreal interests to begin all over again if they still desire to call a special meeting with the object of ousting the present board. In the meantime the bondholders committee has not been inactive, and it is expected that further developments will be announced in another week. What these may be is not known, but it is understood that drastic steps are contemplated, and as the existing income bonds are virtually first mortgages, since the redemption of bonds take precedence, it is understood that the income bondholders consider themselves in a strong position.

At the annual meeting of the North Davidson Mines, Limited, held at the head office of the company in the Royal Bank Building, Toronto, the President, R. T. Jeffery told the shareholders that the results from development and exploration had been exceedingly gratifying and that they had every reason to feel enthusiastic over the prospect. The following officers were elected: R. T. Jeffery, Toronto, President, J. Johnston, Ottawa, Vice-President: Directors, L. G. Harris, J. J. Jeffery, Thomas Cain, Toronto. The financial statement submitted showed that \$73,256 had been expended in development, plant etc., up to September 30, 1920.

Mr. Jeffery stated that when the property was purchased the directors regarded it as one of great promise. Diamond drilling brought results which were far beyond their expectations. Veins of great width were cut and the assays disclosed values higher than the average of some of the best mines in the camp. A complete mining plant was purchased in Nova Scotia and shipped to the property and the road from the railway put into shape.

A shaft was sunk away from the ore body with the idea of cross-cutting to pick it up at a depth of 250 feet, where a large body of ore had been proved to exist by the diamond drills. At the depth of 52 feet a vein four feet wide cut where the ore was liberally sprinkled with free gold. Samples taken at random and containing no visible gold assayed over \$400 to the ton, according to Mr. Jeffery's statement.

**Prince George, B. C.**

There is a possibility that one or more of the same type of giant gold dredges that have been operating in the State of California will be constructed and turned loose on the gold bearing gravels of the Fraser River and of the historic creeks and gulches of the Cariboo District. A party of operators from the United States, one of whom represents the Yuba Manufacturing Co., of Marysville, Cal., have been visiting Prince George for the purpose of investigating conditions and forming an estimate of the prospects of success attending the proposed venture. This part of British Columbia would seem to offer a promising opportunity for these monsters of the alluvial fields as it is a virgin territory for operation on such a scale and there is no doubt that the sands and gravels carry values. Years ago, as an aftermath of the Cariboo gold excitement, several small dredges were installed on the Fraser River and elsewhere. The remains of these still may be seen in the river and on the banks just below the town of Quesnelle. There is a dredge on the Quesnelle river and one was taken up stream beyond Fort George to the Little Smoky River, while it lies a derelict today.

## Mineral Exhibit

### WINNIPEG MEETING, C.I.M.&M.

(Specimens assembled and arranged by Mr. L. G. Thompson, University of Manitoba).

#### NORTHERN MANITOBA METALLICS.

##### Flin Flon Ore-Body.—Collection of Rock and Ore Types.

- 1.—Hornblende schist, carbonate gangue, leached quartz-porphry, talc schist from footwall, andesitic porphyry.
- 2.—Banded solid sulphide, containing gold, silver, copper and zinc.  
Ore of disseminated type, containing large cubical crystals of iron pyrite.  
Grey schist, with disseminated sulphides.
- 3.—Leaf copper—very beautiful frond-like specimen.

NOTE.—This collection was representative of all the typical rocks and ore types of the Flin Flon deposit.

**Gold Ore specimens from Rice Lake District.**—Extension Mine. Pan Extension Mine, from 120 ft. level. Shuniah Mining Company, Long Lake area. Deep Rock Gold Mines. Commonwealth group, Gold Lake area. Pendennis Gold Mining and Reduction Co. September Morn and Bruce claims. Martin Mining Company. Wolverine Gold Mines. Montcalm Mining Co. Gold Pan Mine, White Dove Mining Co., Long Lake. Kingfisher Mining and Development Co., Long Lake.

**Gold Ore specimens from Herb Lake District.**—Cabin and Caribou Claims, Little Herb L. Northern Manitoba M. and D. Co., Herb Lake, Bingo Mine, Herb Lake. Red Rose property. Copper Lake.

#### GOLD BULLION SPECIMENS.

- 1.—Northern Manitoba Mining and Dev. Co., Herb. Lake.—53 3-10 ozs. gold, obtained from 30 tons of ore. Concentrates showed value of \$1,260.00 per ton of ore, \$7.80 per ton of tailings and had 20 tons of tailings.
- 2.—Bingo Mine.—3 1-2 ozs. from 1-2 ton of ore, being average sample of ore, for milling test.

**Mandy Mine.**—Rock and Ore types.—High grade copper ore, and low-grade sulphides, with specimens of accompanying rocks.

**Chalcopyrite.**—Le Vasseur claim. N. E. arm of schist Lake, Pas. Baker-Patton property. Rosen property (specimens of molybdenite, cobalt bloom, copper ore). Bear Lake, 3rd Cranberry Lake, Pas.

**Nickel-copper Ore.**—Bear River, Manitoba. (Several large specimens with norite specimen accompanying.)

**Tungsten Ore.**—Scheelite. Falcon Lake, Ingolf, Man.

**Molybdenite.**—Falcon Lake (large crystals).

**Manitoba Non-Metallics.**—Mottled Limestone from Tyndall Quarry.—Rough and dressed specimens. Selenite and Gypsum. Manitoba Gypsum Co., Gypsumville, Man. Clay Products.—Larivier hard shale. Morden soft shale. Red and dark buff bricks, vitrified brick, vitrified pipe and hollow tile, made from mixtures of above shales, by Reliance Clay Products Co.

##### Miscellaneous Exhibits from points west of Manitoba.

**Oil.**—Fort Norman. Great Slave Lake. Okotoks — crude, and gasoline from natural gas. Peace River—McArthur No. 2 well series of oil and distillates, Southern Alberta Oil Co. No. 1 well.

Bitumen, from Athabaska Tar Sands.

Salt.—Salt River, Alberta.

Salt—Solar Evaporation Salt, Senlac, Sask.

Talc.—Alberta B. C. Boundary.

Mica.—Upper Peace River

Sands.—Black Gold carrying sands, North Saskatchewan River, Edmonton, and Garnet Sands same locality. Black sand, carrying gold and platinum from Peace River.

Sodium-Sulphate.—Crystals from Fusilier, Sask.

Bentonite.—Rosedale, Alt.

Bog Iron.—N. Saskatchewan River.

Magnetite shale.—Barmis, Alt.

Iron Ore.—Mackenzie River.

Alabaster and gypsum.—Peace River.

Magnetite, from Atikokan Mine, Ont.

## Books For Your Library

### Ore Mining Methods

Second Edition.

By WALTER R. CRANE, Ph.D.,  
Dean of the School of Mines and Metallurgy,  
and Professor of Mining, The Pennsylvania State College.

Deals authoritatively and in a practical manner with the methods of support in extraction of ore, stoping and mining in narrow and wide veins, bedded and massive deposits, including stull and square-set, filling and caving methods, and open-cut work.

Every mining engineer should have a copy of this standard book, for constant reference. "CRANE" has 272 pages, 6 by 9 inches—83 graphic illustrations—the price, \$3.50

A New Edition,

Issued Oct., 1919.

### Technical Methods of Ore Analysis

Eighth Edition, Revised and Enlarged.

By ALBERT H. LOW,  
Formerly Chief Assayer, U.S. Mint,  
Denver, Colo.

A number of new methods for Molybdenum, Potassium, Tungsten and Uranium have been placed in the Appendix of this up-to-the-minute edition.

With "LOW" in your possession, you will find your hardest problems quickly and correctly solved.

"LOW" has 388 pages, based on actual experience—the price, \$3.25.

## British Columbia Letter

Victoria, B.C.

One hundred and four residents of the coal mining centres of the Province of British Columbia are availing themselves of the correspondence course established by the Government for their benefit. These coal miners are studying all branches of coal mining, from the most elementary to the most advanced, the latter covering the technical knowledge required of the holder of a Mine Manager's Certificate. The different districts are represented in this Correspondent School as follows: South Wellington, 3; Nanaimo, 21; Cassidy, 5; Cumberland, 32; Vancouver, 1; Britannia Beach, 1; Merritt, 14; Princeton, 4; Coalmont, 4; Fernie, 10; Michel, 4; and Corbin, 5.

The discovery of coal in the centre of the City of Vancouver has been reported. While driving a tunnel beneath one of the chief traffic arteries of the community, workmen struck a seam of coal about 18 inches wide. For some weeks the men have been taking home a sackful each night. They report that it is of good quality, burning brightly and furnishing good heat. These fortunate laborers at least appear to have solved the fuel problem for the winter.

Peace and industry once more reigns in the Crow's Nest Pass District of British Columbia. The same condition prevails, in practically the same degree, in the coal mining fields of the Province of Alberta. Strife for the moment is at an end and it should not be long before the collieries of Coal Creek, Michel, as well as those of Alberta, are on a normal basis as to production. It cannot be said what result of the comparatively short walk-out has been except that it would appear that the One Big Union has been worsted and that the Agreement now obtaining between the U. M. W. of A. and the Operators is likely to be amended in such a way as will remove any ground the former organization may have for dissatisfaction and at the same time be acceptable to the Operators.

The Government's Mine Rescue Station at Fernie is being enlarged to accommodate more adequately the apparatus with which it is equipped and for the training of the miners in its use. This Station is provided with about as complete a line of appliances for mine rescue work as can be procured. There are six sets of Gibbs apparatus, one pulmotor, one oxygen inhaler and six sets of Draeger Apparatus, together with the necessary spare parts, etc. The Draeger apparatus is being replaced by a more modern instrument. The Fernie Station was the first in British Columbia and one of the first in the Northwest to be provided with the Gibbs type of breathing apparatus. The government also maintains at a high state of efficiency stations at Nanaimo, Cumberland and Merritt. That at Nanaimo has been outfitted with six sets of the Paul apparatus and four sets of the Gibbs; that of Cumberland is equipped with the Draeger apparatus of the 1917 model but this shortly will be replaced with the modern type, and that of Merritt, which recently was taken over by the Provincial Department of Mines, has six sets of the Draeger and four sets of the Gibbs.

T. A. Link, geologist who has been conducting an exploration of the far northern country with a view to the determination of its oil possibilities, reports from Edmonton, Alberta, that a large oil field, extend-

## EXTENDED Service To Our Advertisers.

Realizing the Development which is bound to take place in trade between Canada and the United Kingdom, the **Industrial & Educational Publishing Co., Limited** will open its own office in England early in January.

Mr. C. H. Armstrong, Jr., who will be in charge, has investigated trade conditions in Canada from coast to coast.

Any advertiser or subscriber who is anxious to make connections as a representative of firms in the United Kingdom, is invited to communicate with Mr. Armstrong, The Canadian Mining Journal, Gardenvale, P.Q.

## *This Service will be Entirely Without Remuneration.*

# STEEL MINE CARS

*With Roller Bearing Wheels. Made any Size or Style You Want*

We show here one of the many styles of Mine Cars we make.  
We also build any other Type of Mine Car you want.

**Rotary Mine Car Dumping at one side.**

It will dump at either side or either end, and positively will not dump until in the desired position.

This car is made any size or capacity, and to fit any gauge of track.

Send for your copy of our Mining Catalogue showing many other types of Mine Cars. It will repay you.

**We Make The Kind You Want.**

Showing the Roller Bearings supplied in all four wheels of our Mine Cars. Note the dust-excluding cap, with ample capacity for holding grease or oily waste.

**Rotary Mine Car Ready For Loading.**

The Roller Bearing wheels shown in the center picture make this car **easy running**. Your workmen will not be chronic kickers when pushing these cars.

**Marsh Engineering Works, Limited, - Belleville, Ontario**

ESTABLISHED 1846

Sales Agents: MUSSENS LIMITED, Montreal, Toronto, Winnipeg and Vancouver

ing from Fort Norman to the Arctic Coast, has been discovered. He is quoted as stating that the season's work has absolutely proved the existence of an enormous body of oil-bearing rock in the Mackenzie territory.

S. G. Benson, a prospector, just returned from a season's work on Portland Canal prospects, refers optimistically to the Blue Bird and Nest Egg Groups of Mineral Claims on the Salmon River section. Several veins have been uncovered from which samples have been taken that give very high assay returns. Mr. Benson and his partner have been prospecting this particular country for years, confident that their perseverance would be rewarded, but it was not until last year that they found the mineral. This was due to the fact that a glacier, which has been receding about two hundred feet each year, formerly covered the outcrops. It is the intention to begin tunnelling next season. On the Lucky Boy Group in the same locality it is said that a vein has been found about sixty feet in width and carrying values as high as \$400 to the ton, the average being estimated at \$120 to the ton. It is stated that the galena from this property is the cleanest seen in the country so far, there being no zinc shown so far. Considerable development has been done but next year permanent camps will be established. A tunnel will be driven into the hillside about fifty feet from which a shaft will be sunk an equal distance, this being followed by cross-cutting. This property is situated between the Premier Mine and the town of Stewart. Much is expected, too, of the

New York Group of Claims, also in the Salmon River region. The results of recent work is reported to have been so satisfactory that arrangements are being made for the expenditure of a considerable sum on development. Owners of the White Mouse, also, have been encouraged and are understood to be planning the installation of mine plant for the further facilitation of the operation of the property.

### **Alice Arm, B. C.**

The Esperanza Group of Mineral Claims, Alice Arm, has been taken over by a syndicate of Vancouver businessmen. The consideration is said to have been \$75,000 which nets the owner, Petro Salina, a comfortable profit which will be appreciated when it is stated that he acquired the property some years ago at a Sheriff's sale for \$200. Recent development work has been encouraging in its results it being stated that a considerable body of high grade silver ore has been uncovered.

### **Princeton, B. C.**

Active mining operations have been started by the Canada Copper Corporation at Copper Mountain and Allenby, the power line from Bonnington Falls and the railway to the mine both having been completed. The power has been turned on and the trains are running. Thus starts an industry which in its initiation has involved the expenditure of approximately \$7,000,000. The first train of ore moved to the concentrator at Allenby on October 19 and shipments are being increased daily. The force of men employed gradually is being increased and it is expected that

## Built to Lower Industrial Costs—This Steam Hose

Goodyear Steam Hose definitely lowers industrial costs:

- by giving longer service.
- by doing away with the nuisance of *heated* wire-winding, and *bent* wire-winding.
- by enabling you to cut steam hose to any desired length.
- by preventing blistering and bursting from unequal expansion.

These things Goodyear Steam Hose does because Goodyear has developed a steam hose so strong and tough that wire winding is unnecessary.

Goodyear would not have developed this new type of steam hose had Goodyear been content to build industrial hose in the same old way.

But Goodyear investigation and research into hose failings and hose possibilities revealed whole new fields of endeavor. The result is a complete line of industrial hose of super-serviceability and unusual economy.

Goodyear builds steam, air-drill, water, suction, fire, and other types of industrial hose. The expense of hose in your plant can be decreased and the amount of work done increased by a Goodyear analysis of your hose problems. A trained Goodyear man will call on you without obligation. Phone, wire or write the nearest branch, or Goodyear Mechanical Goods Service Station.

The Goodyear Tire & Rubber Co. of Canada, Limited

Branches—Halifax, St. John, Quebec, Montreal, Ottawa, Toronto, Hamilton, London, Winnipeg, Regina, Saskatoon, Edmonton, Calgary, Vancouver.

**GOOD YEAR**

## Engineers in Every Industrial Country Endorse Goodyear Belting

**I**NDUSTRY of other countries approves the economical and satisfactory power transmission which Goodyear Belting is rendering daily throughout Canada.

In the factories and mines of South Africa, the workshops of India and the Orient, the mines of Australia; in industries throughout the world, Goodyear Belting is daily solving power problems. Every obstacle overcome teaches us something more about the efficient specification of the proper belt for each drive. Men all over the world who have problems similar to yours will now contribute their experience to the fund of knowledge possessed by the Goodyear belting man who calls on you.

To meet the conditions of this world-wide trade,

it has been necessary to change some of the brand names of Goodyear Belts.

For instance, Goodyear Extra Power is now Goodyear Klingtite Belt.

But the change is in name only. Goodyear Klingtite Belt is the old Extra Power in every particular.

Any Goodyear branch will send a man who has studied power transmission problem solved by the use of Goodyear Belting the world over—who will bring this knowledge to bear in solving yours.

No obligation. Phone, wire or write the nearest branch

**The Goodyear Tire & Rubber Co.

**KLINGTITE GLIDE BLUE-STREAK**

the daily shipment will be brought to 2,000 tons as soon as the plant is brought to a capacity production.

#### Anyox, B. C.

The Ecstall Copper Property, for several years bonded by the Granby Consolidated Mining & Smelting Co. which did much drilling and other development, has returned to the original owner, the Company's option having been allowed to lapse. The General Manager of the Company is quoted as saying that the property no doubt would be worked eventually but not for the copper. Sulphur and iron are found in the ore but its copper content is not as high as in the product of the Hidden Creek Mines.

#### Trail, B. C.

Ore receipts at the Trail Smelter of the Consolidated

Mining and Smelting Company for the first week of October totalled 8,133 tons. For the week ending October 14th they were 7,900 tons. This brings the total for the year to 267,768 tons as compared with 266,543 tons at the same date last year. The year 1919 started well but declined in its closing months because of the strike at the Sullivan Mine. The same reason gave 1920 a bad start, which handicap was accentuated by the suspension of Rossland shipments for a while in the Spring and Summer and the tie-up in the Slocan District. When the Kimberley trouble died out and the Sullivan hit its strike, on a larger scale than before, and the Rossland shipments resumed, 1920 started overhauling 1919 at a rapid rate, until this month the record of the previous year was passed.

## EDITORIAL

### MORE WORKERS FOR THE MINES.

The number of workmen available for the mines in Canada is becoming more adequate than for some years past. The rate of immigration into Canada is being accelerated, and, what is equally effective from the Canadian viewpoint, the flow of immigrants into the United States is becoming very large. Reports of unemployment in the large cities of Canada are being heard. The International Nickel Company is curtailing its working forces at Sudbury, and, presumably following the closing of ancient tin mines in Cornwall, miners from that county are coming to work in the mines of Northern Ontario. A bad fishing season is bringing about a resumption of the long-interrupted influx of men from Newfoundland to the Nova Scotia mines. Accentuating these scattered tendencies is the approach of winter, which curtails many mining operations, and also provides an inducement to seek underground employment.

There is also a feeling abroad that an era of uninterrupted and highly paid employment is drawing to a close, and that leaner times are coming. Such conditions bring about increased individual production and lessened unit costs. It is only by greatly lessened unit costs of production that even an approximation to existing wage schedules in Canada can be maintained.

That we need production in Canada a little observation will prove. New Zealand butter is sold in Nova Scotia as "our prime Bluenose butter"; New Zealand lamb is sold in Montreal as "Best Spring Lamb" and is cooked by Pennsylvania coal in a stove made from United States ore and served on a platter that came from Europe, or Japan maybe. It is eaten with a Sheffield or Connecticut blade, and the platter is washed with soap from Chicago. Why?

### " APPROPRIATE LEASING UNITS. "

The latest issue of the Press Bulletin of the U. S. Geological Survey contains the following pregnant little announcement, namely: "Under the new mineral-leasing law it is incumbent upon the Geological Survey, Department of the Interior, to determine the

geologic structure of producing oil or gas fields, and to divide the coal, phosphate and oil-shale lands of the public domain into **appropriate** leasing units."

There is much condensed wisdom in this little note. As a concrete example of the trouble that follows from dividing the public domain into **inappropriate** leasing units there might be adduced the case of the submarine coal leases in Nova Scotia, where a complete ignoring of technical considerations and the entire neglect of all geological limitations has led to inextricable confusion.

Similarly lamentable results are occurring in inland coalfields, as may be gathered from a recent report of the Chief Inspector of Mines for Alberta, who has stated that in mining 47,000,000 tons of coal an area containing 100,000,000 tons had been broken up in such fashion that some 30,000,000 tons "is lost beyond any chance of recovery."

The application of the new principle enunciated in the foregoing announcement to Canadian oil, gas and oil-shale fields does not require to be emphasised. The desirability of extracting oil, gas and oil-shale from virgin areas under conditions that would be dictated by geological and technical considerations, and not by accidental, geometrical and man-made boundaries that have no relevance to the physical boundaries of the deposit to be won, is sufficiently obvious.

The desirability of leasing mineral deposits in "appropriate leasing units" is nevertheless one that has occurred to our legislators only at infrequent intervals, and usually after the damage has been done.

### SHAKING FAITH IN TITLES TO CLAIMS.

The acreage tax on mining claims in Ontario is not considered a serious burden by mine operators, but the Mines Department is evidently determined that payment of the tax must not be neglected. Recently a number of companies have found their titles to property in jeopardy because of failure to pay the tax. In some cases the companies are notified by the Department when the taxes are due; but apparently the onus is on the companies and lack of notification is not accepted as sufficient reason for delay in payment. In

some cases officers of companies have been notified only after it is too late to permit them to comply with the regulations and then their money is refused. This is obviously not the intention of the Mining Act; but the Department is technically right in its position. The furor caused by the throwing open of claims may serve to call the attention of claim holders to the necessity for paying taxes; but the mode of procedure is not one that will make mining in Ontario a popular enterprise. To put titles in jeopardy for such slight cause is not good business for the Province.

Title to property is something that should not be trifled with. It is true that harsh measures have to be used sometimes to prevent misuse of privileges granted under the Mining Act; but the exacting of penalties that are so unreasonable as the threatened action of the Department of Mines should not be permitted.—R. E. H.

#### ASSOCIATED GOLDFIELDS.

It has been courteously suggested to the Editor that a statement of our Northern Ontario correspondent made in the "Journal" of 22nd October relating to an examination of the properties of Associated Goldfields by Mr. Clifford Smith of Toronto reflects unfairly upon him inasmuch as it pre-supposes some disclosure of confidential information. We hasten to dissociate the "Journal" from any such manifestly impossible supposition.

A reference to our correspondent's note does not disclose any statement sufficiently positive to imply anything more than an intelligent guess, but it would have been better had no attempt been made to anticipate the nature of any report that might be made, and, in doing so, we believe our correspondent did not realise the difficult position in which even a surmise of the contents of a confidential report may place a professional man, whose etiquette will not permit of his defending himself until such time as his principals consent to publication.

The management and the prospects of the Associated Goldfields Mining Company have received attention in the public prints to an extent that is to be deprecated, but with the result that what should be the purely private concern of the shareholders has assumed a phase of public interest that will not permit complete silence on the part of this paper.

We considered it under these circumstances to be a proper proceeding in a recent issue to call attention to the fact that if the statements made in the last annual report to the shareholders were correct it should be simple to demonstrate their accuracy. In the employment of Dr. H. C. Cooke in the Spring of this year, and in the later employment of an experienced mining engineer to report on the operating of the property in the light of the ascertained geological facts, the policy of the Directors calls for the completest approval, more especially if, as is presumed,

the reports are eventually given to the shareholders. Not until this is done will it be possible to know whether or not the faith of the shareholders has been justified.

#### ECHOES OF THE WINNIPEG MEETING.

The Winnipeg "Free Press" reported the proceedings of the Institute meeting fully and ably, and gave a publicity to the event that was much appreciated by the members.

Arrangements had been made from which it was confidently expected that Messrs. Dresser, Neilly, Russell and Brown would have been present at the Winnipeg gathering, but at the last moment an evil concatenation of happenings prevented the attendance of any one of them.

The color scheme at one of the tables at the Annual Dinner at Winnipeg was much admired. There was a red rose, a Manitoba Brown, two shades of Gray, and a Whiteside, whose chief characteristic is that he is all white and no "side" at all. No wonder the Deacon felt himself in the pink of condition.

The suggestion is made, in order to prevent a time-honored custom from falling into a never-sufficiently-to-be-deplored desuetude, that Major MacDonald, or Major Brock, or both together, should record the anthem of the Institute on a phonograph cylinder for use at Institute dinners in a less vociferous age that is apparently upon us. It is rather a pity, however, that the anthem is not more tuneful and less declamatory.

#### CORRECTION.

A reader kindly draws attention to the statement in editorial comment in the issue of 29th October, which gives the annual importation of petroleum into Canada as being 450,000,000 barrels, which was compared with the domestic yield of 240,000 barrels. The first figure should, of course, have been 450,000,000 gallons, or at 31.5 gallons to the barrel, approximately equivalent to 14,300,000 barrels. The figures are quoted from the Preliminary Report on Mineral Production of the Mines Branch at Ottawa.

#### "COAL" AT SHELBURNE, ONT.

A syndicate, composed of Mr. H. A. Chamberlain of Shelburne, Ont., and Mr. L. H. Leale, broker, of Toronto and associates, is reported by the "Financial Post" to have undertaken to prove by diamond drilling whether or not coal is present in the vicinity of Shelburne. Lumps brought up from the well-shaft in which the original discovery of a black material was made, are stated, upon analysis, to be a good grade of anthracite.

The possibility of finding coal in the neighbourhood of Shelburne is of the slightest description, and, if it were found, could indicate but one thing, namely, that the geological mapping of the district is incorrect.

# The Part of the Coalfield of the West in Canadian National Development

A Paper prepared for Presentation at the Second Annual Western Meeting of the Canadian Institute of Mining & Metallurgy, October 25th to 28th, 1920, Winnipeg.

By F. W. GRAY.

At the Toronto Meeting of the Institute in March last, the writer developed the argument that Canada could become self-supplying in bituminous coal.

The events of the Summer have gone far to establish the necessity, if not the soundness of this aim. We have read on the one hand the statement of the Minister of Railways that Nova Scotia coal should be brought to Ontario, and we have seen, on the other hand, the greatest extension eastward of the use of western coal yet recorded in Canada, accompanied—under emergent conditions it is true—by definite proposals for the forwarding of Alberta coal to Ontario.

### Existing Fuel Situation is Unrepresentative.

The present bituminous situation is not representative. In Nova Scotia the existing output does not represent the capacity of the mines. Neither is the transportation deficiency to be considered representative that has brought about a coal supply emergency in those districts of North America that lie furthest removed from the great central coalfield of Pennsylvania and Virginia.

These are post-war conditions of limited duration.

The western coalfields have been so slightly and so recently developed that a statement of existing production is interesting only as a contemporary record, and has no bearing on the future.

What then is the outlook for making Canada self-supplying in bituminous coal, and what in particular the role of the western coalfield?

### Bridging the Gap between our Bituminous Fields.

There is no doubt as to the presence within the borders of Canada of sufficient bituminous coal to supply not only our present population, but also that of the future, whatever it may be. Unfortunately a gap of 2,000 miles intervenes between the eastern coalfield and the beginning of the Saskatchewan lignites along the international border.

This gap can be bridged, if we adopt a national policy on coal supply, but not immediately. Two things are eminently required to achieve this end:

(a) An extension of the Great Lakes waterways that will enable Nova Scotia coal to enter Lake Ontario by water carriage without breaking bulk.

(b) Adoption by the railways of a comprehensive programme for the annually increasing transport of coal from the western coalfield, as a permanent feature of traffic.

The following tables are self-explanatory, and show the existing and possible production of bituminous coal in Canada, with existing mine openings and colliery equipment, and the very substantial improvement that even full utilization of existing development would bring about.

The total possible production estimated in Table 2 is, curiously enough, what the total production of Canada should have been in 1920, had the curve of rising coal production before the war continued uninterrupted.

Leaving for Export from Canada:

Alberta	1,650,000
British Columbia	1,200,000
<b>Tons</b>	<b>2,850,000</b>

The objective of the Canadian coal miner is of course to limit the importation of United States coal to the smallest area possible. The extent of this area depends on the radius of distribution of Nova Scotia coal in the East, and on the radius of western coal east of Calgary and Edmonton.

The difference between the East and the West is that the coal resources of Nova Scotia are not large, while those of the western coalfield are as large as it is desired to make them.

In the case of Nova Scotia, there is distinctly a limit to the quantity of coal that can be mined annually, and this quantity cannot probably much exceed 10 million tons.

The limits to production from the western fields

are set by availability of labor and money, by distance and markets, but not by the available quantity of coal.

**Our Coal Salvation comes from the West.**

Canada's salvation in coal supply must therefore come from the West, and the vision of western coal miners, when considering the future, should be as wide as the possible markets, and detached from present-day conditions, for these are very ephemeral, and very different from the conditions that are to come.

It is evident that at this time the domestic requirements of the four provinces west of Fort William do not require any enlargement of existing collieries, these being already more than sufficient to supply the home demand to the entire supplanting of United States coal by the native product.

**An Export Market for Western Coal.**

An export market is therefore desirable, and the statistics of the Ottawa Mine Branch disclose substantial beginnings of coal export, both in Alberta and in British Columbia.

<b>Alberta.</b>	1917	1918	1919
Exported to the U.S.	90,239	137,765	121,264
<b>British Columbia.</b>			
Exported to U. S. . .	845,128	842,986	
Other countries . . .	42,796	65,427	852,704
	978,163	1,041,178	973,968

The exports of 1920 will in all probability be larger than in any previous year. British Columbia, in particular, has found entirely new markets.

There is very little good coal on the Pacific Slope of this continent, except in Vancouver Island and British Columbia, and the whole Pacific Slope should provide a market for British Columbia coal, not excluding South America.

An inspection of the map will show that the better-

**Table 3** *Change possible in Canadian Coal Trade Balance by full utilization of existing Collieries*

	Present	Possible
Canadian Consumption	29,900,000	29,900,000
Canadian Production	14,400,000	10,700,000
	<u>15,500,000</u>	<u>9,200,000</u>
Necessary to Import	16,900,000	12,100,000
Available for Export	1,400,000	2,900,000
<b>Net Deficit</b>	<u>15,500,000</u>	<u>9,200,000</u>

Showing possible lowering of coal debit balance by 6,300,000 tons, or, say, a value of \$30,000,000<sup>00</sup> per annum on the basis of 1920.

grade bituminous coals which are found at high elevations in the Rocky Mountains are relatively near to the Pacific Slope, being only one-third the distance from, say the Crow's Nest Pass, to Winnipeg.

Coal is an article that in the future, because of its relative scarcity, will stand much longer rail-hauls to a shipping port than has hitherto been considered reasonably economically possible, and Alberta coal is not much further from tidewater than is West Virginia coal from Atlantic ports. The position of the port of Vancouver has been much improved by the regular use of the Panama Canal route, and the projected port improvements are fully justified at Vancouver, being indeed undertaken rather too far behind those of Seattle.

The coal deposits of the West are so large, and the world need for coal so pressing, that it may well turn out that an export trade in coal will precede the development of the western coalfield for the purpose of providing fuel for local manufacturing industries, and, because it has hitherto been unusual, the possibility of rail-hauling western coal for export shipment at Vancouver, and at Prince Rupert, is not thereby lessened.

The markets held by the British collieries hitherto, such as South America, the Levant and Scandinavia, are being rapidly lost to them by the unreasonableness of the miners' demands and the diminishing productivity of the remaining coal seams. United States coal is rapidly supplanting British coal in markets previously exclusively supplied from Britain.

It might be suggested that the position of the Alberta collieries with reference to Vancouver, and those of Northern British Columbia with reference to Prince Rupert, is not dissimilar to the relation of West Virginia collieries to Atlantic ports—as previously mentioned—and the opportunity to enter British markets is open to any coalfield in North America that can get its coal to tidewater within commercial limits of cost of rail-haul.

**The Western Coalfield An Assurance of National Independence.**

No country, however, achieves lasting prosperity or national permanence from mere export of raw material, and while the search for an export market is suggested as an immediate requirement for the healthy development of the western coalfield, the real role of

**"THE INTERESTING FUNCTION OF ALLOTMENT OF FUEL SUPPLIES"**

"Canada being the most distant market, the most in direct to reach, the last applicant at the final source of coal fuel, will in all probability witness in future years many a recurrence of the situation of 1917-1918. When the united demand is moderate and production going well, Canada will be supplied, but when the demand is heavy and production low, Canada will again be a participant at the interesting function of allotment of fuel supplies; a fact which must inevitably be a detriment to her economic and social development." (From an article contributed to the "Journal", April 2nd 1920, by a writer in the United States)

this field will be played when, in the inevitable course of events, it has become the site of industries, metallurgical, chemical, ceramic and textile, based upon bituminous coal.

Then, and only then, will the West rise to its full dignity as a pillar of Canadian nationhood and the most stable guarantee of our political permanence as an independent people. But for the coalfield of the West, Canada would sooner or later be compelled to subscribe to that political ascendancy and tutelage which is the certain outcome of economic subserviency, and inseparable from dependence on another nation for so essential a commodity as coal.

The coalfield of the East has assisted and will continue to assist in relieving our national fuel inadequacy, but its extent is too small to build a nation on.

The coalfield of the West is fortunately not small, but worthy to be called large, even in comparison with the generous fuel resources possessed by the United States.

In advocating maximum independence of the United States in the coal supply of Canada, it is perhaps necessary in order to avoid misapprehension, to emphasise that this advocacy is based upon no unfriendly or envious feeling. As between individuals, so between nations, dependence involves Canada in other peoples' affairs, places us in the position of the poor relation who is blamed for the sins of the family, but dare not express his mind because his allowance may be cut off.

A restoration of our international coal balance-sheet to the fifty-fifty basis of previous years would go a long way to restore Canadian self-respect, to bring our dollar nearer parity, and to remove the inhibition on our freedom to talk and act nationally without the repressive dread of a coal shortage.

This is where the West will serve this nation most effectually, for it possesses in greatest abundance that article without which no modern nation can survive except on sufferance.

#### **Anthracite Supply not Considered Vital.**

No consideration is given in the foregoing remarks to anthracite supply. Where bituminous coal is available in Canada, from Canadian mines, anthracite can be dispensed with, at the sacrifice of convenience, and its use under these circumstances, however desirable, is nevertheless a luxury.

#### **The Fuel Role of the West a Predominating One.**

There is another consideration. The entire mineral production of Canada in 1919 was valued at 173 million dollars. The value of our imports of coal, iron and steel, and petroleum, totalled 273 million dollars.

The West, containing as it does 99.3 per cent of Canadian coal resources, and apparently containing some oil also, must assist in our national fuel problem correspondingly to its fuel resources, or default in its share of national development. This is the part that the West must take.

#### **NEW MAP OF HERB LAKE DISTRICT, MANITOBA**

A new map is issued by the Geological Survey, Publication No. 1801, on a scale of 2 miles to one inch, compiled by Dr. F. J. Aleock, to accompany a memoir prepared by him on the Herb Lake (Wekusko Lake) and Reed Lake Region. The map is a geological one, and shows the relation of the district to the north of Mile 82 on the Hudson Bay Railway.

## NATURAL GAS ASSOCIATION OF CANADA HOLDS SECOND ANNUAL CONVENTION.

The second annual convention of the Natural Gas and Petroleum Association of Canada was held at Chatham, Ontario, on October 15, with a registered attendance at the afternoon session of 76 members and 36 guests. The convention was the most successful in the history of the association. Throughout the proceedings the chair was occupied by President C. E. Steele, of Port Colborne, Ontario.

Reports were presented covering the work of the past year. For the board of directors Secretary-Treasurer S. A. Morse reported a uniform decline in gas production but a growing inclination on the part of the public to pay more adequate prices. The membership of the association showed a substantial increase, the lists showing 107 active, 5 associate and 28 company members, a total of 140, being an increase of 22 active, 3 associate and 10 company members since the last meeting. The association had a cash balance of \$1,043.81.

Reports were presented, for the Laws and Legislation committee by Major E. F. Sweet, of Brantford; for the publicity committee by H. R. Davis, of Buffalo, N.Y., and for the committee on constitution and by-laws by Gordon Wickett of Windsor.

The following officers were chosen for 1920-21:

President, C. E. Steele, Port Colborne, (re-elected).

First Vice-President, A. M. McQueen, Imperial Oil, Ltd., Toronto, (re-elected).

Second Vice-President, T. P. Pinckard, Windsor, (re-elected).

Secretary-Treasurer, S. A. Morse, Chatham, (re-elected).

Directors: H. R. Davis, Buffalo, N.Y., (unexpired term); J. B. Williams, Sarnia, (unexpired term); P. S. Coate, Chatham, (re-elected); P. A. Little, Buffalo, N.Y.; R. L. Pattinson, Chatham; H. B. Pearson, Calgary, Alta.

F. W. James, manager of the Union Natural Gas Company of Chatham gave a comprehensive paper on "The Natural Gas Industry," dealing with the various essentials in the successful operation of a natural gas field from the first leasing to the delivery of the gas to the customer.

A feature elucidated in the discussion was the development by the Union Natural Gas Company of a double-engine automotive plant for deep drilling, using natural gas as fuel.

Samuel S. Wyer, of Columbia, Ohio, gave "A Talk on Natural Gas" pointing out that the age of large-volume, low-priced gas sales was past, and that the future of the industry depended on efficient and economical use of the product. The one way to secure this was by advancing the price to a figure that would make saving worth while; which would in turn facilitate the development of low volume, low pressure wells and make profitable the extraction of gas from old wells that could not be profitably operated under present conditions. He urged education of the consumer in the efficient use of natural gas. Following the talk, an extended discussion took place, Mr. Wyer answering questions by many members.

Harry J. Hoover, president of the Natural Gas Association of America, spoke on "Percentage of Consumers Not Bearing their Just Proportion of Costs" citing figures to show that in a composite compilation of re-

turns for 447,441 customers, 227,262 or 68 per cent were served at a loss. If the 19,823 largest consumers were cut off, the companies represented would break even but operate without a profit. Of his own company's consumers this summer, numbering 123,423 in all, 114,692 or 92 per cent represented a financial loss for each of the summer months of \$52,874.89. Such figures should be presented to regulatory and price-fixing boards, and to the public. He urged publicity as a step toward a better understanding with consumers.

At 6 p.m. a banquet was held, a musical program being also given, followed by an evening business session, at which Mr. D. A. Coste read a paper by his brother, Dr. Eugene Coste, on "Petroleum and Coals, Compared in their Nature, Mode of Occurrence and Origin." Informal talks were given by E. S. Estlin, natural gas commissioner for Ontario, Dr. M. Y. Williams, of the Geological Survey of Canada, and others. The next annual convention will be held at Niagara Falls, Ontario, in October, 1921.

## THE NOVA SCOTIA COLLIERIES.

### Labor & Wages.

Matters have made little progress since the notes in the issue of the 22nd October. The conference between the miners' officials and representatives of the larger operators arranged by the Department of Labor was postponed owing to the inability of international union officials to attend from Indianapolis, but during the week ending November 6th conferences of a protracted character were in progress in Montreal for four days. Two of the union officials from Nova Scotia accompanied by Mr. John P. White from U. M. W. of A., headquarters represented the union members. Representatives of the Dominion Coal Company and the Nova Scotia Steel & Coal Co., and officers of the Department of Labor took part in the meetings, regarding which no information has been given out.

It is understood that the proposals made will be submitted by the union officials to the Wage Scale Committee, after which the attitude of the union will doubtless be declared.

It is generally recognised that economic conditions have undergone a complete change since the date of the deliberations of the Royal Commission, and that, in view of the decline in steel prices and the slowing-down of demand, any attempt by the coal companies to pay the full increase recommended by the Commission will result in curtailment of work at the steel plants, as the increased cost of fuel would rule the Nova Scotian plants out of the market. At the same time there has occurred a substantial lowering of commodity prices, and the downward tendency is undisputed. A forecast of a settlement is not possible at the time of writing, but it has become evident that the demands of the miners exceed the ability of the coal companies to pay, and the necessities of the case will make a compromise a likely ending.

### Production.

The Dominion Coal Company's production, notwithstanding a number of accidents and other interruptions in October, shows a rising tendency, and reflects the employment of a larger proportion of face workers which it has recently been found possible to obtain.

was 272,283 tons, comparing with 279,964 in October. Production of the Glace Bay collieries in October

1919, and 275,890 in October 1918.

A comparison of the production of the individual collieries during the past three months follows:

	August.	September.	October.
1 .....	28,693	29,613	24,277
2 .....	44,564	42,313	45,357
4 .....	25,537	27,786	24,717
5 .....	7,939	8,383	9,243
6 .....	19,980	21,793	24,233
9 .....	19,541	21,008	22,009
10 .....	10,317	9,704	11,992
11 .....	14,634	14,433	14,834
12 .....	14,520	8,162	12,842
14 .....	15,939	18,169	19,693
15 .....	9,066	9,030	7,949
16 .....	13,078	14,578	13,614
17 .....	2,540	2,738	2,392
21 .....	13,442	15,049	16,485
22 .....	16,898	17,439	17,294
24 .....	3,979	4,444	5,652
	260,667	264,712	272,283

Noticeable in these figures of production is the increasing production of the Emery collieries, Nos. 10, 11 and 24, now contributing twelve per cent of the output, and the large outputs coming from the Birch Grove collieries, Nos. 21 and 22. The contribution of the Phalen Seam at forty per cent is probably the lowest in the history of the Company, and from now on will be a steadily diminishing quantity, except as it is maintained by the contribution of the Lingan Seam collieries, Nos. 15 and 16 on the Waterford side, which is the continuation of the Phalen Seam from the Glace Bay area.

Indications are that the production of the Glace Bay collieries for 1920—if no serious interruption of work occurs between now and the year-end, will reach 3,220,000 tons, which will compare with 3,087,638 tons in 1919 and 3,271,755 tons in 1918.

The mines of the Nova Scotia Steel & Coal produced 50,800 tons in October. The output would have been larger but for an accident by which two of the best respected miners in the district lost their lives. The production for the year will probably reach 620,000 tons, which will be the best annual production for Scotia since 1914. This Company has not suffered anything like such a decline in production as the Dominion Coal Company. Comparing 1920 with 1913 the Dominion output shows a decline of approximately 32 per cent. Scotia output shows a decline of 24 per cent.

The Indian Cove Coal Co. at Sydney Mines has increased its output from 5,000 tons annually to 50,000 tons approximately in 1920. The Tom Pit is now producing 240 tons of coal daily, and has recently been equipped with an air-compressor and coal-cutter.

The discovery of a seam of coal at Inverness Colliery overlying the seam which has been extensively worked there is reported. Many attempts have been made to locate this upper seam but unsuccessfully, it being known locally as the "Thirteen Foot Seam". The seam is now being worked.

## CANADIAN OIL SHALE INDUSTRY LOOMING. ALEXANDER GRAY.

After a quarter of a century religiously devoted to the demonstration of their extent and varied contents, the Oil Shales of New Brunswick are about to be practically and profitably employed.

It is understood a plant is being designed. The Anglo-Persian Oil Company, through the D'Arcy Exploration Company, are said to contemplate a forward movement; so Canada in due course may rival the Scotch oil-shale industry.

Something like \$600,000, it is stated, was expended in the preliminary investigation and demonstration of these shales, much of it by Canadians who were "prophets without honor in their own country." The further capital needed for the undertaking had to come from oversea. Oil operators accustomed to puncture strata and busy themselves drawing cheques against pipe line receipts, could not see where New Brunswick shales had a chance. Money there was and is for "gusher" country—before production is far advanced—but New Brunswick shales and their owners went a'begging. They were altogether commercial-lacked glamor—manufacturing oils, wax, ammonia, and other characteristic contents of such shales, was too methodical.

So situated they can be steam-shoveled, known to consist of hundreds of millions of tons, offering gasoline, illuminating fuel and lubricating oils, paraffin wax, sulphate of ammonia and coke, these New Brunswick shales had to await responsive outside capital. That an initial plant is likely to be installed in the no distant future presages the development of another very important resource. Mr. Mathew Lodge, of Moncton, and Sir William Mackenzie, therefore, who continued steadfast in their conviction that their shales ultimately would be the basis of an industry, are to be congratulated. Year-in-and-year-out, Mr. Lodge "ploughed the lonely furrow." When construction work is advanced and as results are obtained, interest in the shales will increase.

The contention of the larger oil interests all along has been that oil shales have not arrived. Labor, they claimed, and the cost of mining, retorting and distilling processes, precluded profits. It was easier to tap strata, let the oil flow into tanks or pipe lines and bank the proceeds, notwithstanding the example set by Scotland with its shales. Only at long-drawn-out intervals have the shales of Colorado, Utah, Wyoming, and elsewhere, been mentioned as auxiliary sources of certain supplies of oils. Just as soon as shales were suggested, the oil experts laid away the ghost by decreeing that shales were out of the question. Something "labor-cheap," as Director Smith of the United States Geological Survey expressed it—that would pump coin into the coffers of companies or individuals, was preferable. Mark Requa, an outstanding authority, even now asserts that oil shales are a "dernier resort." Professor Alderson, of Colorado, is more affirmative. Generally, the expert judgment is that oil shales are a rear or second line of economic defence. Consequently it devolves upon Canada to take the lead in making its shales an active force in the attack upon its poorly-protected oil position. So irksome has the oil situation become, great oil corporations and adventurous smaller companies, are exploring in Canada's Northwest—with more of disappointment, as yet, than of success. The Fort Norman Well brought in by the Imperial Oil field party, is auspicious, but it is 1,200 miles from the near-

est railway, in a latitude where there is a short season for what water transportation is available. It cannot be immediately helpful, however, "scientifically of much value" as president Stillman, of Imperial Oil Company puts it.

Apart from Ontario's production, Canada cannot upon a further domestic supply of oil until more is known of the Northwest development and the New Brunswick shales are being dealt with in quantity. The Fort Norman country may form a base of supply. Pipe lines costing fifty million dollars are not to be lightly undertaken. If the Anglo-Persian Oil Company, therefore, meet with success, and go ahead, as it is alleged they will, the twenty-five year effort of Messrs. Lodge and Mackenzie should be amply rewarded.

Fortunately, repeated drillings over large sections, and bulk tests, have satisfied international authorities as to the exceptional richness of the New Brunswick shales. There is no disputing this point, that Messrs. Lodge and Mackenzie established their excellence. They sought and obtained the judgment of Prof. N. S. Shaler, of Harvard University; they interested Dr. R. W. Ells, who made tests of these shales in Scotland; they consulted Dr. Charles Baskerville, of the College of the City of New York, and they induced the Imperial Government to send Dr. Boverton Redwood and assistants, who retorted and distilled some of the shales. Dr. Marshall Hall, Sperry Hunt, and a number of noted scientists in turn passed upon the shales. Dr. Hall roughly estimated the tonnage indicated over a large outcropping area, although a small portion of the one hundred and ninety-two square miles held by Messrs. Lodge and Mackenzie interests, at 150,000,000 tons. In recent years the holders of these areas have seen them drilled to a depth of 1,500 feet, indicating much more than Dr. Hall at the time cared to project. Taking the shales he had in hand as a basis, Dr. C. S. Lomax, of New York, gave estimates on a plant with a daily capacity of 1,500 long tons, equal to 547,500 tons per annum; and he presented a possible production of 32.7 imperial gallons per ton of shale, or 18,000,000 imperial gallons per annum of crude oil which, when refined, would provide 2,137,500 imperial gallons of gasoline, 7,961,500 imperial gallons of illuminating oil; 2,666,000 imperial gallons of lubricating oil; 6,120,000 lbs. of paraffin wax; 13,687 tons of sulphate of ammonia, and 1,530 tons of coke. The 32.7 gallons of crude oil and 65 lbs. of sulphate of ammonia were believed to be conservative.

Mined as these deposits can be mined, and treated by proven processes, it is likely that New Brunswick is on the eve of more than was foreseen by those who have scoffed at Messrs. Lodge and Mackenzie. English capital is undemonstrative, and its technical representatives are reticent, but the shale industry is gathering momentum.

A good grade of coal is being mined at the junction of the Healy and Nenana Rivers, Alaska. The mine, which is operated by the Healey River Coal Corporation, is close to the Alaskan Railway near Fairbanks and a tramway is used to deliver the coal at the railway tracks. Some large seams in the Healey River section are to be explored.

## THE INDIAN HEAD IRON ORE DEPOSIT.—PORT AU PORT, NEWFOUNDLAND.

By a Correspondent.

Newspapers have recently published more or less sensational and absurd reports of the discovery of an iron ore deposit at Port au Port, Newfoundland. These reports are absurd insofar as the price at which the claim is said to have changed hands, is fabulous, while the truth is that the ownership has not really changed hands at all; and sensational insofar as the stressed immensity of the deposit has not yet been proven.

The existence of iron in this locality has been known ever since a road was built through there about 25 years ago, or at least the Dominion Iron & Steel Company were first made aware of it at that time. Nobody seems to have become interested in its possibilities until 1913 when an American lady tourist summering at a resort nearby, brought a drill crew there. But rumor says that these men never used the drill as they apparently failed to locate the ore and anyway their efforts came to nothing.

Within the past few months the Dominion Steel Corporation have been investigating the property. They have had some prospectors at work during the past summer and latterly have had a mining camp built and a regular gang employed. During the summer too, some well known geologists have visited Indian Head in the corporation's interests, and have made very satisfactory reports. Indications encourage the belief that a very large body of workable ore is there, and there are millions of tons in sight along the outcrop alone. The outcrop runs across the main road from Stephenville Crossing to Port au Port, extending half a mile north and three quarters of a mile south of this road.

The rocks of the vicinity are of pre-Cambrian age and are generally metamorphosed, as are most of the rocks in the island, although in this case there is some evidence of sedimentary deposition. These rocks are said to be, in many respects, like the pre-Cambrian rocks of the Adirondaeks, N.Y. In the northern prolongation of Indian Head, they consist of: granites, syenites, diorites, pyroxenites, anorthites, basalt, pegmatites and metalliferous bodies. The more acid members of the series, the granites and pegmatites, frequently exhibit their intrusive nature; while the more basic one shew no evidence of that and occupy banded areas. The typical textures, structures, and mineral composition of all the rocks are those of the normal kind although many of them are changed by metamorphism. Certain parallel structures along which the mineral is aligned could be accounted for on the supposition that after cooling, tremendous vertical and lateral pressure re-melted the rock to a viscous state during which there was a re-arrangement of the minerals. Many of the rocks for this reason are gneiss. Parallel with the sheeting and flow-gneiss are granites and syenites, and with these are associated bands and lenses of magnetite and hematite which may be granular or massive in structure. The heavier particles of metallic iron disseminated through the adjacent rocks would tend to separate out while the matrix was still molten and the bands and lenses may have been formed by magmatic segregation. Both magnetite and hematite is found and the deposit is not unlike the great iron-ore deposits of Norway and Sweden.

Indian Head, the Laurentian mass in which this potentially immense metallic body is found, is shaped like a wedge running nearly North and South, thirty

miles in length and four miles in width, lying between two large areas of Carboniferous rock, with its southern extremity jutting out into the waters of St. Georges Bay.

The rocks shew evidence of movement after the close of the pre-Cambrian period, probably at the end of the Ordovician and again at the end of the Carboniferous. Since the mass was first formed and elevated, erosion has been going on, and the glaciers of Pleistocene times have helped to reduce what was once probably a conspicuous mountain peak, to more or less of a low tableland.

The out-crop opened up by the summer's work, shews for 2 miles an uninterrupted belt of magnetite and hematite varying in thickness from 3 to 9 feet. Occasional faults occur with a slight displacement of the ore-body to a higher or a lower level. This belt dips about N. 10 E., at an angle of about 33 degrees. How far the iron body extends beneath the overlying mountain is what the Dominion Steel Corporation is now endeavouring to ascertain, but it promises to compare with any great iron-ore body of like nature found in the world today. The quality of this ore is all that could be desired, giving a very high percentage of iron and being remarkably free from impurities. Its composition it said to be very like that of Swedish iron-ores.

The accessibility of this deposit adds much to its value. It is 5 miles from the main line of the Reid Newfoundland Company's railroad, and 12 miles in a direct line from Port au Port. A short railroad to this spacious harbour would present no difficulties in the building and would provide splendid shipping facilities, abundant cheap wharfage area with deep water close inshore, and the railroad would be down-grade for loaded trains, when there was a grade, as the mine is four or five hundred feet above sea-level.

#### TORONTO NOTES.

Mr. J. B. Tyrrell, Mining Engineer, who has just returned to Toronto from six weeks spent in the Western part of Newfoundland, where he examined various mining properties for interests he represents, states that the geological conditions are similar in Newfoundland to those of Northern Ontario. Along the shores there are numerous outcrops that have been worked in part, and although they have gold and copper, very few of them are being worked at the present time and in most cases if they have been worked in the past, little can be learned as to what has been done on them, as the maps and reports have been disregarded, and the whole investigation has to be started over again. If any one owns a mining property he wants to sell it, but he wants the buyer to take all the trouble and expense of finding out what it is worth, and there is practically no information available.

The Nova Scotia Steel Company is investigating the iron-ore deposit on the west coast, which contains some very excellent showings, but whether the deposits are large enough to be profitable has not yet been determined. Coal is now being developed along the line of the Reid-Newfoundland railway and it is not at all improbable, says Mr. Tyrrell, that the railways will be able to obtain a local supply of coal at half the cost that it is now obtained for from the Sydney mines

or such other sources from which the supply is being obtained. The cod-fishing in Newfoundland has not been good this year, and many men are looking for employment, so that labor for mining work or in the bush is fairly plentiful.

The withdrawal by the Ontario Government of mining claims in Northern Ontario from restaking has caused a stir among mining in Toronto and in the industry generally. One local promotor points to the fact that several years ago he sold certain parcels of mining lands in Northern Ontario to an English Financier for \$10,000 who naturally would not see the official notice in the Ontario Gazette advising the owners of the Government's intention to forfeit the unworked properties. In the opinion of a good many of the mining fraternity the situation is bound to prove a black eye for the industry as far as British investors in Canadian mining enterprises is concerned.

During the past few days Tom Magladery, member for Temiskaming has brought to Toronto the protests of the prospectors in his district against the Government's discrimination in favor of the wealthy mining companies. He reports that there is a furore in the north country on the part of the small claim owners who have worked several years on the properties, only to lose them now for the non-payment of a few dollars in taxes, while the wealthy companies are protected. Some of the protests are voiced by James Hyland, the well-known Cobalt engineer, who says:

"It is the rawest deal ever attempted and carried out in any civilized community. What would be the opinion of the farmers of this country if a similar law was enacted, and if the farmer one day found that his whole farm was confiscated because he had failed to pay a tax of possibly \$4 to \$10 of which he was unaware."

It is stated that the Teck-Hughes claims were restaked, despite the Government's order, by one prospector who hired all the automobiles and available conveyances in the north country so that nobody could beat him to the recording office. He now demands payment of his expenses from the Government.

The mining claims affected by the Government's order were advertised to be forfeited on October 15th unless the assessment were paid by that date. They were to be thrown open for re-staking on October 28th. It was on the latter date that the Cabinet passed the order-in-Council which saved eleven of them, including the Teck-Hughes and Kirkland Lake-Hudson Bay claims, from being restaked. But they had been forfeited on the previous date. The mining Act does not cover such a situation as that now extant, except to place certain arbitrary powers in the Minister. Hon. Harry Mills, Minister of Mines is consulting the mining commissioner now as to the process of restoring the property to original owners.

#### TORONTO COAL PRICES.

Toronto, November 11.—Coal trade conditions show little change but the closing of navigation is expected to produce a slight easing off in the hard coal situation. Bituminous coal, mine run, is quoted at \$10.50 to \$11.50, f.o.b. Toronto, with slack slightly easier. Smokeless is quoted at \$10.50 to \$11.50. Buyers continue to hold off and it appears as if the only factor that would stimulate the market would be cold weather. Hard coal is still quoted at from \$8 to \$16.00 at the mines.

## The Kirkland Lake Proprietary, 1919, Ltd.

Ambitious Scheme to Merge Several Mines in the Kirkland Lake Field.

(By J. A. McRAE, Cobalt).

The photograph shown in this article as being the Tough-Oakes Mine, of Kirkland Lake, really constitutes a general view of the leading properties which are either already merged or being negotiated for by the Kirkland Lake Proprietary, 1919, Ltd.

The view is taken from the Wright-Hargreaves mine, looking east. On the immediate foreground, the little group of buildings are those of the Sylvanite property which lies directly between the Wright-Hargreaves and the Tough-Oakes. In the upper left corner is the 120-ton mill on the Tough-Oakes Mine itself. The upper central buildings are also on the Tough-Oakes, while the shaft house as shown to the right is located on the Burnside mine.

### Objects of Incorporation.

The Kirkland Lake Proprietary, 1919, was incorporated last year for the purpose of acquiring the assets and undertakings of the English Tough-Oakes, Ontario Tough-Oakes, Burnside Gold Mines, Sylvanite Gold Mines, Aladdin-Cobalt and Sudbury Syndicate. With

In relation to the future plans of the Kirkland Lake Proprietary, 1919, very little if any, really definite information is available in Canada. In fact, practically nothing seems to be known on this side of the Atlantic with regard to what time a re-opening of the enterprise may be looked for and the extent of the work to be expected. Men closely and vitally identified with the enterprise and who reside in Northern Ontario share this dearth of authentic advice in common with the public in general.

### A Commendable Scheme.

Regardless of this, however, careful observers are free to admit that this scheme of consolidation is one of the most ambitious ever undertaken in the Kirkland Lake field, and may be second in importance to the consolidation some years ago of the Hollinger properties, as well as the holdings which now constitute the McIntyre-Porcupine. It is pointed out especially for the readers of this journal, that provided the consolidation plan can be worked out in such a manner as to

THE TOUGH-OAKES MINE WITH ADJACENT PROPERTIES.

the exception of the Aladdin-Cobalt which owns the Chambers-Ferland silver mine at Cobalt, the various companies all have their property situated in the Kirkland Lake field, the greater part being shown in this photograph.

This large acreage not only lies along the strike of the main auriferous zone which has won for Kirkland Lake an important place in the gold mining industry of Canada, but on all three of the properties here shown a good deal of commercial ore has already been opened up. Indeed, it was on the Tough-Oakes that the first successful mining operations were undertaken in the Kirkland Lake district, this property developing to a point where gold was being produced at the rate of over \$600,000 annually. It was only due to more or less bitter and sustained litigation that the mine became inactive while the contending factions battled for control.

### Success is Indicated.

Official advice tends to show that the big merger is gradually working out to a successful conclusion, the possible exception apparently being the Sylvanite. As to the question of this property being brought into line, more or less controversy is heard. An interview with one faction encourages the belief that this property will eventually be included. Discussion of the matter with other parties discourages this thought. For these reasons, the question of the Sylvanite becoming a part of the new Proprietary is left for the future to determine.

create harmony between the various interests involved, the great mass of work and vast amount of worry and details to contend with will have been well worth while.

For instance, with such an acreage available on which to develop ore and to carry on extensive exploration work, and with a first class mining and milling plant already on the property the future possibilities of establishing a mining enterprise of leading importance is considered exceptionally good. Also, the operation of these properties under one management, with the elimination of the costly practise of maintaining managerial staffs for each of the several properties alone offers promise of the cost of operation being greatly reduced, as compared with what has been the case where each property was worked individually.

It is obvious, of course, that a great deal of work lies ahead. The present scattered nature of the work, as well as scattered buildings has suggested to the new control that effort must be directed toward centralizing buildings as well as operations. To centralize the buildings will be to minimize the heating cost during winter, while to centralize the mining operations will tend to reduce costs of work.

### Some Future Indications.

The progress already made in the merging scheme would indicate the likelihood of everything being in shape for general resumption of work in the early spring at least, with the possible exception of the Sylvanite. Factors in support of this and which may explain lack of general and definite information during the past

year, include the fact that the ending of the current year is likely to be marked by certain changes in the directorate of some of the companies involved, with a quite general revision toward electing boards with such views as may assure harmony.

Therefore, apart from the comment heard in regard to lack of definite information as to future plans, the ambitious scheme briefly outlined is believed to be commendable and seems to be calculated to serve the best interests of all concerned.

#### THE INTERNATIONAL NICKEL CO.

One furnace at Sudbury is to be closed down, following a decision to reduce the monthly production of nickel matte from 4,000 tons to 3,000 tons. About 300 employees will be rendered unnecessary, but the reduction will not affect the Company's regular staff.

It is announced that the Company will build a mill to manufacture Monel Metal in various shapes. The mill will be situated in Huntington, West Virginia, and will cost \$3,000,000. The great variety of uses to which this non-corroding and physically strong natural alloy is now put is shown by the new monthly publication of the International Nickel Company, the "Inco" a copy of which can be obtained on request.

There is a great and growing demand for a metal that will retain its properties of non-corrosiveness and physical strength when placed under conditions of high temperature, exposure to acid fumes and physical stresses, such as are met with in new developments of the extraction and use of oil-fuel, particularly shale-oils, and Monel Metal, together with other varieties of the nickel-cobalt-chromium alloy group, is daily extending its uses.

Recent rapid lessening of the automobile demand has caused a slackness in nickel demand, which, added to the as yet uncompleted process of diverting nickel from the uses of war to those of peace, accounts for the lessened activity at Sudbury.

If the directors of the International Nickel Co. could have seen their way to add a rolling mill to the Port Colborne Refinery it would have been a judicious and not necessarily uneconomic decision. Presumably fuel costs have been a deciding consideration, but it is desirable, from the Canadian point of view, that more of the final processes of nickel utilisation should be carried on in Canada.

#### USES OF PEAT.

Devotees of the automobile and motor boat will be glad to know that successful experiments have been made in Sweden in extracting wood alcohol from peat. The process as reported by the commercial attache at Copenhagen, Denmark, is described in a report on peat in 1919 recently issued by the United States Geological Survey, Department of the Interior. Interesting instances of the uses of peat as a fuel are given in this report. A coastwise steamship company of Norway, for example, during the coal shortage, was enabled by the use of peat fuel to keep up its full sailing schedule.

Peat is used also in making up fertilizers and in preparing concentrated food for stock. Last year 69,197 tons of peat, valued at \$705,532, was produced in the United States. This was a decided decrease from the production of 1918, although the peat deposits in this country are extensive.

This report may be obtained upon application to the Director, United States Geological Survey, Washington, D. C.

## Our Northern Ontario Letter

### THE SILVER MINES.

#### The Cobalt Field.

Wet weather which set in at the beginning of November is steadily causing the water to rise in the rivers and lakes of this part of Northern Ontario. As a consequence some hope is promised at the time of writing in respect to an improved supply of hydro-electric energy.

The new wage scale at the Cobalt mines went into general effect November 1st, and is believed likely to have a stabilizing influence on the workers. The increase of the flat rate in pay to a point equal to the former rate plus the high price of silver bonus, has eliminated the uneasiness always present at times when quotations for silver showed a tendency to decline.

An outstanding factor in connection with the silver mining industry of this district is a very considerable improvement in the efficiency of the workers. This improvement has become pronounced during the past week or so, and the reason seems to be that the supply of labor has suddenly improved and is now adequate to meet the full demand. There are instances on record where one man is performing nearly as much work, and with apparently no undue effort, as was done not long ago by two men. This may assist operating costs, and to some extent make up for the lower price of silver. Provided the increased efficiency becomes general, it is obvious the effect would be equally as favorable as though silver itself advanced in price.

Cyril W. Knight, Ontario Government Geologist, will suspend his field work in Cobalt this month, and will resume in the spring at the point where he left off. In view of the importance of the work, and on account of it being extended over another year, thus causing delay in the final report, it is hoped to encourage the Department to issue a brief summary this fall, covering in a preliminary way the result of the work to date.

The McKinley-Darragh has closed down its oil flotation plant as is the usual custom during winter months. This equipment will again be employed following the Spring break-up. The reason for Winter curtailment is due to the difficulty attending the pumping of tailings from the bed of Cobalt Lake during cold weather.

Stopping operations on the Camburn Mines, formerly the Lumsden, are being carried on. The richer parts of the vein are being sorted out and bagged preparatory to subsequent shipment. Some of the ore runs about 2,000 ounces of silver to the ton.

Owing to delays caused by shortage of power, the cross-cut work on the Kerr Lake mine has not advanced as quickly as expected, and as a consequence it will perhaps be some little time before development work proves the importance of the high grade veins found at surface some weeks ago. Work is proceeding steadily, though slowly, and the composition of the veins together with the nature of their occurrence leaves little doubt but that they will be found to be important.

Official advice estimates the silver content at 400,000 ounces in the ore now in sight on the Keeley Silver Mines. This reserve has been built up as a result of development work of a considerable less than a year. In view of the property having formerly been considered of only prospective merit, the success achieved seems to offer reason for believing considerable work may be encouraged in all the more promising parts of the

South Lorrain silver area. As stated last week in the "Journal", the new 20-stamp mill has been completed and was then being tried out. Just as soon as the power situation adjusts itself, the entire plant will be utilized to full capacity.

On the Ruby Silver Mine in the south-eastern part of the township of Bucke, the operators are still meeting with encouragement and expect to be able to make comparatively regular shipments of ore. The work is being conducted only on a moderate scale, as yet.

The Lang-Caswell mine in Lorrain was restaked October 28th by J. C. O'Donald of Haileybury. The property was among those listed as forfeited on account of the non-payment of a provincial tax of five cents an acre, a procedure on the part of the Ontario Department of Mines that has aroused quite general resentment in all parts of the country.

Letters to the "Journal's" correspondent from the United States from interests whose property was involved in the general listing of forfeitures openly declare a loss of confidence in Ontario mining laws. It is believed in Northern Ontario that the affair has caused very great injury to the general effort to encourage foreign capital to enter this field.

**Gowganda and Elk Lake.**

A. G. Burrows, Ontario Government Geologist, has prepared a report on the Gowganda Silver Area, the entire summary being presented in the 29th annual report of the Ontario Department of Mines. The report deals with the leading properties, and estimates production to date at approximately 5,430,152 fine ounces of silver. Output reached its highest point in 1917 with 1,064,635 ounces. The second highest year was in 1919 when 722,564 ounces were produced.

The Burrows report goes into considerable detail when dealing with the leading property the Miller Lake-O'Brien. The details presented, also, seem to refute former reports that the O'Brien interests practised the policy of being uncommunicative in regard to the property and the occurrence of the ore. The opposite appears to now be the case in the light of the report just submitted by Mr. Burrows.

Work on the Cane Silver Mines is proceeding, and silver values are said to persist to the depth so far reached namely about 25 feet.

Elk Lake prospectors endeavored to re-stake the Cane township claims of the Ontario Solid Silver Mines, at noon on October 28th, but found the Department had withdrawn the group from forfeiture before the designated hour.

**Ore and Bullion Shipments.**

During the week ended November 5th, four Cobalt companies shipped an aggregate of seven cars containing 609,115 pounds of ore. The Nipissing headed the list with four cars, while the feature of the report is the appearance of the Bailey Mines for the first time.

Following is a summary :

Shipper	Cars	Pds.
Nipissing . . . . .	4	325,786
La Rose . . . . .	1	109,992
Bailey . . . . .	1	87,116
McKinley-Darragh . . . . .	1	86,221
Totals . . . . .	7	609,115

**THE GOLD MINES.**

**The Porcupine Field.**

A brief financial statement issued by the Dome Mines for the five months beginning March 31st and

ending August 31st, shows a net profit of \$198,000, an amount equal to 49 cents a share, or at the rate of close to 12 p.c. a year on the company's 400,000 issued shares, of \$10 par value each. A feature of the statement is the large amount written off for depletion, depreciation and taxes. This amounted to \$307,849 and is at the rate of \$738,800 a year. Such liberal allowances are pointed to as a policy which tends to minimize the profit, and that with a less liberal writing-off, the percentage of net profit could easily have been shown to be a good deal higher than 12 p.c. Development work at the mine is proceeding satisfactorily, although low water on the Temagami River has conveyed a threat of a shortage of electric energy. The arrival of wet weather may now avoid this difficulty.

Ore reserves on the Porcupine V. N. T. Mines are officially estimated at 130,000 tons, and believed to contain about \$1,250,000. This has been placed in sight as a result of development work to a depth of 600 feet. The plan of future operations is to continue the main shaft to a depth of 900 or 1,000 feet, and to so enlarge the scope of work as to make it advisable to enlarge the present 100-ton mill to 150 tons daily, with the ultimate object of doubling the capacity. Work is to resume just as soon as the terms of the recent underwriting agreement are concluded whereby a block of treasury stock, amounting to 200,000 shares at 30 cents per share is taken up. This will provide the company with funds estimated to be adequate to place the enterprise on a self-supporting basis.

Negotiations for the Davidson Consolidated control are still pending. H. H. Sutherland, of the firm of F. C. Sutherland & Company, is now on his way to England in connection with the deal. The plan is to dispose of the entire undertaking to certain English interests who are already heavily interested.

**Kirkland Lake Field.**

It is officially announced that high grade ore has been found on the Ontario-Kirkland property, at a point west of a fault encountered in the earlier stages of work at the 450-ft level of this property. Assays taken on ore from the first round show a gold content of \$73 to the ton. The find is considered to be important, and the result of work at this point during the next few weeks may have considerable bearing on the general merit of not only the Ontario-Kirkland, but all other properties lying in its vicinity and along the southern belt of mineralization.

In this southern belt are the Ontario-Kirkland, Canadian-Kirkland and the Hunton-Kirkland, the latter of which is also developing rich ore in its underground workings.

Just as soon as the temporary shortage of electric power becomes adjusted, a general increase in work is expected at the leading mines of the Kirkland Lake field. The Teck-Hughes is planning to add another shift of workers, and increase its tonnage to over 3,000 tons monthly. The Kirkland Lake Gold Mines is also planning to increase the amount of ore going through its mill, while the Wright-Hargreaves will join the producing mines early in the new year.

Arrangements are being made to prepare for a campaign of exploration work on the Vindicator Gold Mines. This is made up of two promising mining claims lying adjacent to the Wright-Hargreaves and the Lake Shore Mines on the North. The Vindicator is controlled by interests already involved in the leading mining operations of the Kirkland Lake district.

On the Lake Shore, the main shaft has reached a depth of 500 feet. The objective is a depth of 800

feet. Heretofore, work on this property has been confined chiefly to the 200 and 400-ft levels, sufficient ore being developed at these levels to keep the present mill operating for a number of years. The most remarkable feature has been the high grade nature of the ore, and the maintaining of average mill heads of over \$25 per ton. Interest is unusually keen in connection with the prospects of duplicating these favorable results at great depth, and the work of extending the shaft to a lower horizon is regarded to be among the most important and interesting developments under way in this field.

At the end of the current calendar year, a change is indicated as likely to occur in the directorates of certain of the companies involved in the merger by which the English Tough-Oakes, Burnside, Sudbury Syndicate, Ontario Tough-Oakes, Aladdin-Cobalt and possibly the Sylvanite will be brought under the control of the Kirkland Lake Proprietary, 1919, Ltd.

A geological report has just been issued by the Ontario Bureau of Mines, dealing with the geology on the Argonaut Gold Mine, at Beaverhouse Lake. The report was prepared by Cyril W. Knight and contains much useful and interesting data. It seems to place the Argonaut in a favorable light. Since the notes were gathered on which the report was based, considerable underground work has been done and a quite large tonnage of ore blocked out. Work centered largely at the 200-ft. level, and has recently been extended by starting the shaft to deeper levels, the 500-ft being the objective.

## British Columbia Letter

Victoria B. C.

A Provincial Election will take place on December first. Much interest is taken in questions relating to the mining industry. Under the administration of the past four years, during which time Mr. Sloan has been the Minister of Mines, improvement of the mining law has been given much attention, and among the more important matters dealt with are the division of the Province into Mineral Survey Districts, with a Mining Engineer in charge of each district; the expenditure of public money on aid to the construction of mining roads and trails, the financial assistance of experimental work in the treatment of the magnetite ores of British Columbia, and the passage of legislation making it possible to control the sale of mining stocks so as to safeguard the investor against fraud.

Other forms of aid that are being pressed upon the provincial government include several requests from the Cranbrook Prospectors Association, who ask for a customs ore-sampling plant in the Kootenays, for powder for prospectors at cost, plus transportation charges, and for still further aid to mining roads and trails. They also suggest an annual or semi-annual conference of representatives of the prospectors and mining men and the Minister of Mines with regard to matters affecting the industry. Some of these requests are reasonable and will doubtless be so regarded by the Government.

For some years the ownership of the most promising molybdenum properties of British Columbia, which are situated in the Alice Arm District, has been the subject of litigation. Because of the legal tangle these deposits, referred to as favorable by George Clothier, resident mining engineer, were permitted to remain

undeveloped and unproductive during the war, the period when the mineral was much in demand and the prices high.

The issue now appears to have been settled, at any rate it is closed as far as the Supreme Court of British Columbia is concerned. The action is known as Stewart vs. the Molybdenum Mining and Reduction Company Ltd., and Chief Justice Hunter, who finds for the Company, says in his judgment;

"I think that the plaintiff Hayes had no right of action against the Company. As to the other plaintiff, I am of the opinion that the Conundrum Claim (one of the claims of the group) lapsed on June 13th, 1915 and was not revived by the Exemption Act, 1915. The Conundrum ground was re-located and recorded by Riel and his associates, who conveyed it to the Company, but the Plaintiff rests his action mainly on the Agreement of August 19th, 1915, by which the co-owners of the Conundrum and Hayes, the owner of the Blackwell, agreed to sell these claims for \$35,000 to Riel."

Later on the Chief Justice says:

"Moreover it appears to me that the action of Riel in locating and dealing with the new claims was acquiesced in by the plaintiff and this view is strongly corroborated by the giving of the subsequent Agreement to Riel pending the litigation.

"At any rate the Plaintiff stood by while large sums of money were expended on the ground without notifying either the Stilwells or the Company that he had any claim against them or it and the principle applies that if a man is silent when in fairness he ought to speak he must remain silent when in fairness he ought not to speak."

Vancouver B. C.:

The suits predicted with reference to the Engineer Mine, of Atlin B.C., one of the best known lode-gold propositions of the Province, are before the courts. W. L. Goodwin, and eleven other prospectors, have taken out a lis pendens to prevent the sale of the property until their claims can be brought before a Grand Jury, is being suggested that a sale for \$3,000,000 to Cobalt interests is in negotiation. Mr. Goodwin and his associates assert in effect that they, and not the estate of the late Captain Alexander, are the lawful owners of the mine. Twenty years ago, it is declared they staked the claims now known as the Engineer Group and Capt. Alexander, it is alleged, staked over them, altering the lines and making the eleven claims which afterwards were known as the Engineer Claims. It is, therefore, set up that their property was fraudulently "jumped" and recorded and that Crown Grants were wrongfully issued to the Alexander party. The second action against the estate of Captain Alexander is brought by W. Pellard Grant, of Vancouver, who claims a one-fifth interest in the Mine and affirms that documents in his possession will prove that Capt. Alexander was his trustee for the one-fifth interest in the Mine referred to. Mr. Grant states that one of the business matters bringing Capt. Alexander South when he met death through the foundering of the S. S. Sophia was to arrange for the transfer to him of this interest.

The Canadian Advisory Council for Scientific and Industrial Research has made an appropriation to permit an investigation and the carrying out of experiments in the treatment of the silver-lead-zinc ores

of British Columbia. Mr. Horace Freeman, Chemical and metallurgical engineer, and secretary of the British Columbia Branch of the Council, states that the grant is sufficient to cover the first twelve months work. Mr. Freeman will begin his researches immediately and is hopeful of finding an economic method for the handling of the complex sulphide ores of the Province, particularly its eastern districts. Mr. Freeman is responsible for a formula, now in use at Niagara Falls, for the making of cyanide from atmospheric nitrogen and the product is in use in gold and silver extraction in the United States and Canada. The Plant at the Falls was erected under his supervision. He also initiated at Vancouver research work that led to the preparation and use of hydro-cyanic gas for fumigation, now utilized for the fumigation of citrus trees in California.

The Liberator Mining Co., owners of the Emancipation Mine, near Hope B. C., are proceeding with the development of this property with satisfactory results. Edwin T. Hodge, under whose supervision the work is being conducted, is very optimistic. Considerable has been spent in the installation of a Compressor Plant, and an Assay Office. A tunnel is being driven at the rate of about 10 feet a day with the object of cross-cutting five high grade ore shoots which are shown in the old workings situated at a higher level. There is said to be a large tonnage of low grade milling ore already in sight with prospects of enough of the high grade to pay for development until the Company is in a position to undertake the treatment of the first mentioned.

The Northwest Mining Convention is to be held from February 28th to March 5th, 1921, at Spokane Wn. Preparations already are being made by the mining men of the City of Spokane.

#### Grand Forks B. C. :

Diamond drilling on the Gloucester Group and the G. H. Claim of the Franklin Camp, near Grand Forks, which has been in progress for some months under the direction and the supervision of the Provincial Department of Mines has ceased. The contractors have decided that it will be impossible to continue during the Winter, but P. B. Freeland, government mining engineer, is looking forward to seeing the work taken up again in the Spring. A total of 2,888 feet of drilling was done in the Camp, most of it on the two properties mentioned, although some work was done on the Mountain Lion Claims. No statement has been made as yet as to the results of the work.

#### Princeton, B. C.

That a vein of platinum, four inches wide and thirty feet long and in a seven foot ledge of serpentine rock, exists at the headwaters of the Tulameen River is the assertion of Robert Stevenson, one of British Columbia's pioneer prospectors, who is one of the few remaining to take part in the gold stampede of the '60's into the Cariboo and who continues hale and hearty at the age of 82 years. This find was made, Mr. Stevenson states, in 1877 and ever since, year after year, he has kept the claim alive. With platinum at 50 cents an ounce he did not pay special attention to the development of the property but in recent years he has been active in the endeavor to reach the mineral which, it appears, has been covered first by a fall of timber and next by a landslide. Now, however, he asserts that the vein is almost in sight and he has taken a gang

of men with him to finish the work. He is confident that his goal will be reached this year or early in 1921 and, with a store of platinum at his command, worth approximately \$100 an ounce, anticipates that his old age will not be without those comforts with which an active life should be rewarded.

#### Trout Lake, B. C.

In the development of their property in the Lardeau District near Trout Lake the Mansfield Mining Company has uncovered a large vein of silver-lead ore. It was encountered at a depth of 350 feet, according to M. R. Leahy, the manager, and is low grade, assay returns being about \$12 a ton. The Company contemplates the installation of a Concentrator.

#### Nelson, B. C.

The Millie Mack, a property situated on the Arrow Lakes, is being worked up by H. E. Foster and some 50 tons of high grade ore is ready for shipment. This is one of the oldest shippers of the district and its ore is silver-gold, with the silver returns running high.

#### Hazelton, B. C.

J. D. Galloway, resident mining engineer for the northeast mineral survey district of the Province, recently inspected the Babine Bonansa property of J. Cronin. He states that Mr. Cronin has opened up a promising vein as a result of the tunnel work in progress for some time. It has been decided to continue drifting on the vein by hand until the arrival of machinery. Owing to the recent rains the roads into the section are in bad conditions and it is difficult to get supplies but the government has men out making repairs.

#### Stewart, B. C.

The Premier Mining Co. plans to ship a considerable tonnage of ore from the Salmon River District, Portland Canal, this winter over the snow. Other properties, under development in the same locality, also are preparing to make shipments in the same way. Prospects in the Tide Lake region have caused some excitement because of high returns in silver given by samples sent out for assay. These are narrow veins but the richness of the ore is unusual even for this district. Preparations have been made to work the Hercules Group all Winter. Considerable valuable ore was taken from the Silver Tip Group where a camp was established under the direction of P. W. Racoy during the summer. The Algonian Syndicate in its development of the Spider Group has installed an internal combustion engine for the operation of the air compressor and the tunnel now has been driven 600 feet. Both the United States Government and the Government of British Columbia have done much read work in the district this year and the district has been made more accessible for mining operations as well as for prospecting.

#### Dawson, Y. T.

With reference to the Maye Silver Camp, some 200 miles from Dawson City, Lt.-Col. Alfred Thompson, M. P. for the district, states that he will ask the Dominion Government to build a road into the discoveries, provide either wireless or ordinary telegraph communication, and instal an assay office. Col. Thompson anticipates that the development of the silver deposits will bring the Yukon into prominence again as a mining centre and will assure Dawson that permanence which the placer industry fails to do.

### Juneau, Alaska.

A property which gives promise of developing into an important gold producer has been recorded and now is being opened up on Chicago Island. Work is being continued throughout the Winter by the Falcon Mining Company. A tunnel has been driven for 220 feet and it is said that the showings are so encouraging that the owners are looking forward to commencing shipment in a short time and are confident of the success of the enterprise.

### THE COAL MINES.

After the storm of October in the coal mining camps of Alberta and eastern British Columbia the collieries have settled back into normal conditions. Most of the mines are operating as near to capacity as the availability of labor permits. It is reported that in the Crow's Nest Field there has been some dissatisfaction among some of the men because of charges of discrimination in the re-engagement of those who went on strike but these are minor troubles not expected to develop into anything serious. All through Alberta and British Columbia coal is being brought to the surface and shipped probably in as large quantities as ever before in the history of the industry in western Canada. It would appear, therefore, that there is no cause for apprehension on the score of lack of fuel for domestic and industrial use in this section of the north-west during the winter.

The demand for British Columbia coal outside of the Province continues. One of the latest export orders to be accepted is for 7,500 tons to be delivered at Auckland, New Zealand, and it is stated that the Steamer Waihora has been chartered to carry it. The call for Vancouver Island coal for the mercantile traffic of the Pacific also is increasing; in short there is no lack of market for the product of these collieries, rather the difficulty of the operators is to get it out in sufficient quantities.

A short time ago a syndicate of businessmen undertook the re-opening of workings, known as the new East Wellington Slope, on property adjoining the Jingle Pot Mine, recently closed down because of exhaustion. There are several hundred acres of coal bearing land in the particular area in question and good prospects for the development of a first-class mine. The operators, however, met with a setback at the start, one of the coal miners being seriously burned. Open lights were in use. It is understood that the Inspection Branch of the Department of Mines has insisted on the use of Safety Lamps in future. This is being given as the reason for the cessation of operations. According to report, however, the work has been closed down only temporarily.

That the Canadian Collieries (D) Ltd., owners of large areas of coal bearing lands on Vancouver Island, are contemplating opening up new sections is indicated by drilling work that is in progress at Sable River, near Union Bay. A number of holes have been driven and the results are said to have been quite satisfactory in some cases. Similar explorations are being carried on in other districts and word of the Company's plans with regard to the opening of the new mines is being awaited with interest.

These Are **WILEY** Books

## DANA'S Manual of Mineralogy

Thirteenth Edition, Entirely Revised and Rewritten by **WILLIAM E. FORD**, Assistant Professor of Mineralogy in the Sheffield Scientific School of Yale University.

Dana's Mineralogies have been world-famous for considerably over a half-century. Here is one of them which has been rearranged and practically rewritten by an authority (Prof. Wm. E. Ford), bringing it abreast of current practice.

This book is intended particularly for the student of mineralogy, the mining engineer, the geologist, the prospector, the collector, etc.

"Manual of Mineralogy" has 460 pages, 5 by 7¼ inches—357 figures, and is issued in both cloth and flexible "Fabrikoid" bindings,—prices, \$2.50 and \$3.00 respectively, postpaid.

## TECHNICAL WRITING

By **T. A. RICKARD**, Mining Engineer, Editor, Mining & Scientific Press.

A book by a master of English, on a question of vital importance to every engineer. Its study will lead to vastly improved reports.

178 pages, 5¼ by 8—\$1.50, postpaid.

Test these books NOW.—Send the coupon.

### PRECAUTIONS DESIGNED TO SECURE GREATER SAFETY IN BRITISH COLUMBIA COAL MINES.

Early in 1917 there occurred an explosion in No. 3 Mine, Coal Creek, Crow's Nest Pass Coal Company, which caused the death of thirty-four coal miners.

The newly appointed Minister of Mines, Mr. Sloan, immediately got to work and, with the assistance of Mr. George Wilkinson, shortly before appointed Chief Inspector of Mines, formulated a comprehensive and sweeping policy for the improvement of working conditions in the Crow's Nest Pass Coal Fields as well as in other active coal fields of the Province.

Some of the improvements introduced in connection with the mines of the Crow's Nest Pass District, and which reduced to a minimum the danger to the underground worker in this section, may be summarized as follows:

(a) Cleaning out of the main haulage roads and treating them with second burned ashes.

(b) Installation of rock dust barriers at the District Entrances in order to localize the effect of an explosion should one occur.

(c) Installation of a water sprinkling system to permit the constant use of water at the working faces.

(d) The improvement of the condition of the airways and the increasing of ventilation through the underground workings, thus reducing materially the percentage of gas in the return airways.

#### The Rice Report on "Bumps" at Crow's Nest Pass Collieries.

It was at the time that this work was under consideration and being initiated that the report of Prof. George S. Rice, of the American Bureau of Mines, who had been deputed to make an investigation of conditions in the Crow's Nest Pass Coal Field, with particular reference to the seismic disturbances common to the district known as "bumps," came to hand.

The findings of Prof. Rice are contained in detail in a special report issued by the Bureau of Mines in 1917, which is available to the public on application. He declared, it may be stated, that the Crow's Nest Coal Field proper was the most gaseous in the world, and made a number of recommendations on which the Department of Mines acted and others which were made the subject of research and consideration.

One was that, if less coal was taken out in initial operations, leaving a large proportion for removal when in retreat, there would be less likelihood of "bumps" taking place. Another was that rash and top coal should be taken down as mining proceeded.

#### Reduction of Gas Content in Mine Air Necessary.

Professor Rice laid stress on the large flow of gas in the Crow's Nest Mines and one of the first actions of George Wilkinson, Chief Inspector of Mines, who had the benefit of the cordial co-operation of the Crow's Nest Pass Coal Co., in this and other work undertaken in the same direction, was to institute experiments as to the bearing of the breaking of coal on the gas flow.

His tests of the mine air, taken over a long period, both while the mine was active and inactive, indicated that there was little relationship between the breaking of coal and the volume of gas given off, the coal of the region being saturated with gas as a sponge may be with water, which it is continually bleeding.

The reduction of the percentage of gas in the underground workings of the Crow's Nest Pass Mines was the chief problem with which the Minister of Mines

and officials of the Department of Mines had to grapple. To make conditions safe for the miners it was of first importance that this should be solved and the Chief Inspector, backed by his Minister and assisted by the management of the Company, set to work to accomplish it.

The enlargement of the system of ventilation, both in respect of the volume of fresh air forced into the mines and in the improvement of the facilities for its free distribution underground, was the best method, in the opinion of Mr. Wilkinson, to keep the percentage of gas down to well within the safety zone. This line of action was adopted, special attention being paid, in working out the details, to providing more "splits" than usually are considered necessary and reducing the number of working places in each "split."

As soon as this plan was given effect, underground conditions became much more satisfactory, particularly in regard to the percentage of gas in the return airways of the mines.

Confirmation of these gratifying results is contained in the report for 1918 of Andrew Strachan, Senior Mines Inspector, who says:

"The percentage of methane in the various air-currents is fairly low, as shown by the Burrell Gas Detector, only in four cases rising above 1 per cent namely, South level split, No. 3 mine; No. 1 South; North Split, No. 1 East; and the incline split, B. North, of Coal Creek Mines."

With further reference to the question of the gas content of mine air, a problem, as has been stated, to the solution of which intensive consideration was given because of its bearing on the safety of the lives of the miners, it was decided that a rule should be applied to all the collieries of the Province requiring that the men be withdrawn as soon as the mine air in any working place showed a percentage of 2.5 methane or greater. This regulation was a part of the Act amending the "Coal Mines Regulation Act" which was enacted by the Provincial Legislature early in 1919. It has been the law since then and undoubtedly the additional safeguard it furnishes the miners is understood and appreciated.

#### Researches in Relative Significance of "Gas-Caps."

For convenience in establishing when this percentage of gas is present it was found, as a result of months of research, involving of many analyses of mine air and their comparison with gas caps on safety lamps, that a 5/16 inch gas cap in the Coal Creek Mine equals the 2.5 percentage fixed as the point at which the men must be withdrawn. In the Coast and Nicola Districts these investigations proved that a 1/2 inch cap equalled 2.53 per cent of gas in the air. An illustrated report, giving this important information in brief form, was published and circulated among those known to be interested. There are still some copies available which will be gladly forwarded on application to any who may care to know more of this work.

#### Treating of Coal Dust.

The coal dust menace was another phase of coal mining in the Crow's Nest that had to be taken into account. Next to the reduction of gas percentages it was the most serious of the department's problems. It was to eliminate the danger that previously has always threatened from this source that it was decided that the main haulage roads would have to be cleaned out and treated with second burned ashes and that it would be necessary to instal a water sprinkling system that would permit of the use of water at the working faces. Both these innovations have had the effect of keeping

the underground workings comparatively free of coal dust. The inflammability of this material is a matter of such common knowledge, and it is so clear that its presence must constitute an added danger where there is possibility of an explosion, that the value of the improvements scarcely need further emphasis.

#### Rock Dust Barriers.

Having done everything that appeared practical to safeguard the workers in a general way, the Chief Inspector of Mines decided that if, in the face of all these precautionary measures, an outbreak were to occur, such steps would be taken as would be likely to confine its effect to the district of its origin. Hence the placing of Rock Dust Barriers at the District Entrances. These are so adjusted that, in the event any disturbance within the area of a Mine District, a curtain of rock dust is precipitated into the air and the advancing flames probably would be smothered before reaching other sections of the mine or at least so far checked as to give the miners an opportunity to escape.

#### Flame Lamps Displaced by Electric Lamps.

Another move along the lines of "safety first" was the displacement by the Edison Electric Lamp of all forms or types of flame lamps heretofore used in the Crow's Nest Pass Field. Before the Wolf Safety Lamp was used and, while in its time it was about the last word as an instrument for providing safe coal-mine illumination, the development of the electric lamp admittedly has given to the collieries something safer and as dependable.

This insistence on the use of nothing but the best type of safety Lamp wherever the slightest possibility of danger existed was applied, not only to Eastern British Columbia, but to all the Province. When the Coal Mines Regulation Act was amended in 1919 it provided for the introduction of an approved Safety Lamp "in any mine where the air current in the return airway from any ventilating District in the mine is found normally to contain more than one-half of one per cent of inflammable gas."

The acquirement of the Burrell Gas Detector was another step forward. This was first put into use in the Crow's Nest District but it since has been furnished all Provincial Inspectors of Mines for the facilitation of the discharge of their duties. A modern instrument approved by the United States Bureau of Mines for the quick and accurate analysis of mine air it has proved very useful in the experiments carried on by the department. It has proved, in fact, indispensable for the quick determination of the percentage of gas in mine air and has filled a much felt want as previously it has been necessary to send samples to Ottawa for analysis, which meant a wait of several weeks for the returns.

#### Regulations as to Winding Ropes.

In discussing generally additional safeguards drawn around the coal mining industry in this Province through the 1919 amendment to the Coal Mines Regulation Act reference should be made to the stringent regulations introduced relative to cables or ropes used in the mines for the conveying of miners and other employees. Attention was directed to this matter, as one requiring special action, through the accident which occurred in Protection Shaft, Canadian Western Fuel Co., on September 10th, 1918. Following a very searching inquest, which resulted in a verdict that the cause was a defective cable, Mr. Sloan ordered a special inquiry to be held at which expert testimony was given.

The cable, the breaking of which was responsible

## EXTENDED Service To Our Advertisers.

Realizing the Development which is bound to take place in trade between Canada and the United Kingdom, the

### Industrial & Educational Publishing Co., Limited

will open its own office in England early in January.

Mr. C. H. Armstrong, Jr., who will be in charge, has investigated trade conditions in Canada from coast to coast.

Any advertiser or subscriber who is anxious to make connections as a representative of firms in the United Kingdom, is invited to communicate with Mr. Armstrong, The Canadian Mining Journal, Gardenvale, P.Q.

## This Service will be Entirely Without Charge.

for the accident, was taken by William Fleet Robertson, Provincial Mineralogist, to an eastern laboratory to be tested. Mr. Robertson's report is a matter of record and the outcome was the amendment of the Act to provide that "every winding rope shall be given a bath in hot oil before being installed. Every winding rope shall be recapped at intervals of not more than six months—and that no winding-rope which has been in use for more than TWO YEARS or which has been spliced shall be used for raising or lowering persons." The latter point is especially notable because in no other part of the world is the winding rope granted so short life in the interests of safety. The period granted in Great Britain is three and one half years. Another amendment bearing on the maintenance at a high state of safety and efficiency of mine conveyances is that providing that "all cage-chains in general use shall be annealed once at least in every six months, and detaching hooks shall be cleaned and refitted once in every three months."

Another change of importance, also in the interests of safety, is that which gives a clear statutory definition of the duties of a Fireboss in a coal mine. The stipulation is made that this official shall not be assigned a district of such size as to prevent him from carrying out his inspection duties in a thorough manner. Further it is set out that "every Fireman shall devote his whole time to his inspection duties except where the duties assigned to or undertaken by him in addition to his inspection duties are not such as to prevent him carrying out his inspection duties in a thorough manner." This amendment was designed to do away with the complaint that Firebosses frequently were required to attend to a multitude of duties in addition to their inspection responsibilities with the result that the latter were apt to be neglected. Often Inspectors of Mines, in censuring Firebosses, were given the reply that they had so much work to do that possibly matters at the working face were being neglected. The continuance of such a condition could not be tolerated, hence the amendment with its terms so lucid and detailed as to be beyond misunderstanding.

The establishment of a Minimum Wage Board is another of the provisions of the 1919 amendment to the Coal Mines Regulation Act. It became effective on the 1st of July last and since the organization of the Board has been in progress and is expected shortly to be completed so that it may make an early start on its duties. There will be three members, one appointed by the Coal Mine Operators, another selected by the Coal Miners, and the other being the Chief Inspector of Mines, who shall act as Chairman.

Under the Act this Board has power to define Coal Districts within which to carry on investigations as to wages paid on which to base judgment as to the equity of the schedules of pay found to be in force.

The statement is frankly made that it is hoped that the effect of the activities of this Board will be to remove from the coal mines of the Province those Orientals now employed. For years the presence of this form of labor in some of the coal mines of the Province has been the subject of critical comment and it has been his object to find a means of effectually ridding the collieries of these unfair competitors of the white wage earner. The Minimum Wage Board should be able to do this as well as, through its inquiries and work, so keeping in touch with operations in the different coal mining fields as to assure the constant maintenance of a satisfactory standard in respect of wages.

## PERSONAL

Mr. G. R. Airth, Managing Director of the Anglo-French Exploration Company, of London, Eng., has arrived in Toronto and is the guest of Mr. John B. Tyrrell, Mining Engineer, Confederation Life Building.

**EARLY BIRDS AT THE WINNIPEG MEETING OF THE C. I. M. & M.**  
(What the President said will never be known).

This group was taken by the camera man of the Winnipeg "Free Press". Names of those included are as follows: Back row, left to right—G. R. Bancroft, superintendent of transportation, Mandy Mine, Northern Manitoba; C. Emerson, late coal manager for the Cerro de Pesso Mine, Peru. Front row—Dr. J. A. Allan, professor of geology, Alberta University; Prof. J. S. De Lury, geological department, Manitoba University; President O. E. S. Whiteside, manager International Coal company, Coleman, Alta.; F. W. Gray, editor of the Canadian Mining Journal, Montreal; R. R. Rose, acting-secretary of the Canadian Mining Institute; R. C. W. Lett, industrial and colonization agent, C. N. R., Winnipeg; B. Westcott, immigration agent C. N. R., Edmonton; Dr. E. M. Burwash, geological department, Alberta University.

#### "THE TIN DEPOSITS OF VIRGINIA, U.S.A."

To the Editor of the

"Canadian Mining Journal".

Concerning Mr. Alex. Gray's difference of opinion on the merits of "The Tin Deposits of Virginia" published in the Journal of October 8th, page 816, I desire to state that I fear that Mr. Gray has drawn the conclusions on the merits of the tin deposits of Virginia from his unprofitable mining venture in this section some fifteen years ago. The publication of the state and U. S. Geological Surveys presents the matter in a more "roseate" manner than I did in my article yet Mr. Gray thinks his experience "will serve to negative the roseate presentation of Mr. Haney"? This section offers superior advantages for profitable tin mining and compares favorably to the deposits of Cornwall, Eng.

Yours truly,

Geer, Va.

MARSHALL HANEY.

The following item is taken from a well-known newspaper:

#### "Globular Salts Discovery.

Just as Regina Beach, 40 miles north of here and famed as a prairie summer resort, was retiring for its

winter nap, the citizens of that village have been brought to life with thrills of excitement.

Globular salts have been located, and a rush has developed. Every available inch of ground is being staked by prospectors, and every hour people are arriving to join the fortune that for years remained un-stated the salts were worth \$60 a ton, later this figure was cut to \$5 per ton, but still the excitement grows despite the drastic reduction."

Page the pale shade of Johann Rudolf Glauber. They may be different at Regina Beach, but the usual reaction to decahydrated sodium sulphate is not characterised by thrills of excitement.

The development of the plans of the Coalmont Coal and Coke Company is proceeding satisfactorily. The aerial tramway and electric light and power plant should be completed this year, or at least early in the new year, at the present rate of progress. Four of the tramway cables are stretched and the buckets and other equipment is on the ground. Two large marine boilers will supply power for the electric plant, which will be housed in a new building of pressed brick and steel. Light and power is to be furnished both for the mine plant and for the town. A water system is to be installed.

# ELECTRIC MINE HOISTS

Made to Your Order, the Way You Want Them Made—To Suit You and Your Mine

We illustrate herewith two standard types of Electric Hoist. These are built to conform to all mining laws and regulations. We can make any variations you want in the details of these machines, and can also fit them with Depth Dial, if desired.

MADE ALSO WITH TWO DRUMS SIDE BY SIDE

**ELECTRIC MINE HOIST**, with Drum keyed fast to shaft, so it cannot revolve in either direction except the power is applied.

This type Hoist is made also for Steam Drive. These Electric Hoists are now offered in 7 sizes, from 10 to 150 Horse Power, and with any diameter drum up to 48".

WRITE FOR CATALOG AND FULL INFORMATION.

**ELECTRIC MINE HOIST**, with Drum friction driven, permitting loads to be lowered without the expenditure of power, but kept under perfect control by the powerful Band Brake.

This type Hoist is made also for Steam Drive. These Electric Hoists are now made in any size you want up to 150 H.P. and with any diameter drum up to 48".

SPECIAL ATTENTION PAID TO MINERS' REQUIREMENTS. CORRESPONDENCE SOLICITED.

Steel Works and Head Office : **NEW GLASGOW, NOVA SCOTIA**

**ASBESTOS MINING NOTES.**

(From our Thetford Correspondent.)

The production of asbestos at Thetford Mines, the most important asbestos producing district in the world, has received a serious set back owing to the strike in two mines operated by the Asbestos Corporation of Canada. Men doing ordinary labour demand an increase from a minimum of \$4.00 per day to \$4.50 per day. The Asbestos Corporation has not seen fit to grant this increase, with the result that their Thetford Mines plants have been idle for three weeks. The Company contends that they gave their employees a 25 per cent increase last March and that in accordance with other products there is a tendency to lower prices for asbestos in 1921. The Company therefore feels that they cannot grant this increase of 50c. per day for ordinary labour and a proportionate increase for skilled labour. The men who are organized under a local union refuse to return to work until such time as their increase is granted. The other mines are still operating. One company has met the men's demand and is paying \$4.50 per day. Another company is paying \$4.25 and still another company pays \$4.00. Owing to a shortage of labour throughout the year, it is generally believed that production for 1920 will be considerably lower than the previous year. The present strike will, of course, lower the tonnage of asbestos crude and fibre for 1920. It is generally known that the demand for raw asbestos is far greater than the present supply and with a drop in production, one may reasonably expect higher prices.

One of the large companies in Thetford Mines has recently given a large contract for stripping to the Fraser Brae Company. It is understood that there is a considerable deposit of asbestos-bearing rock in this district, hitherto undeveloped, which has been prospected. The results obtained have evidently been good enough to warrant a large contract for stripping.

Hon. Geo. R. Smith, General Manager and Vice-President of the Bell Asbestos Mines has been recently confined to his bed, but we are glad to report that he is again attending to his business.

Sir John Carson, General Manager of the Consolidated Asbestos Limited is at present in England.

Mr. E. E. Spafford, Manager of the Quebec Asbestos Corporation, East Broughton, has taken a motor trip to New York. We trust he has escaped the snow storm that is prevalent at the mines.

We are just in receipt of the monthly Market letter issued by the Asbestos & Mineral Corporation, 17 Battery Place, New York, who are large Asbestos dealers. They predict higher prices for 1921, and advise the trade to stock up in advance.

Mr. C. Bindman, Secretary-Treasurer of the Canadian Crude Asbestos & Fibre Corporation Limited, Thetford Mines, will be in Montreal shortly.

Mr. T. H. Crabtree, Asbestos Inspector has just returned from a visit to England.

**FLOTATION SAVED THE SITUATION.**

To the Editor, "Canadian Mining Journal."

With Copper at 15 cents and every mineral industry languishing—cash customers being scarce and metal markets doleful it may not be amiss to emphasize what "Flotation" made possible, even in these "nothing-doing" days.

The very great value of the flotation process evolved under the aegis of Mr. John Ballot, of Minerals Separation, should find a larger appreciation and a clearer

understanding during these times of falling prices, but high costs of production, than when metals were high and buyers plentiful. I believe I am safe in saying, without fear of intelligent fair-minded disproof, that if the use of flotation processes in general were to be discontinued to-day by "all users"—by licensees as well as by those who are said to be infringing or illegally using them—not one of the great sulphide-copper and zinc mines in Canada and the United States could afford to operate under prevailing conditions. Flotation—and flotation alone—is saving them, and making it possible for 90 per cent of that class of mine to live and keep men employed.

Regardless of controversy, and malversations, it is to the originators of flotation that other than precious metal mines survive and are earning profits. Defamation of flotation scientists and capitalists has obscured the facts. Quite recently recoveries by means of flotation have saved the situation at more than one Canadian metallurgical center—and it seems to be quite in order to enter of record these few words of commendation for the much-maligned who accomplished this.

Yours truly,

Montreal.

ALEXANDER GRAY.

**O. B. BUSH, PARLIAMENTARY CANDIDATE, ATLIN, B. C.**

Mr. O. B. Bush, the well known mining man is to enter the election contest for the British Columbia parliament at the election to be held December 1st. Mr. Bush will contest the Atlin District. The people interested in the mining industry in the Atlin district are anxious that a practical mining man represent them, and have asked Mr. Bush to enter the contest, and he has consented to do so. Mr. Bush is a staunch supporter of the present government.

Being an active mine operator in the North, and prominent as the discover of the Premier Mine, Mr. Bush without doubt will be a good man to represent the district.

## EDITORIAL

### A Permanent Tariff Commission Indicated

In this issue Mr. Alexander Gray discusses at some length the complex, unco-ordinated, in some respects contradictory, and in other respects exotic character of our mineral and metallurgical industries in Canada, which, it may as well be admitted, are disproportionate in their extension to the domestic production of the raw materials on which they subsist.

Our contributors's review pulls out the national skeleton to view, and emphasises the statements made by the retiring President of the Canadian Institute of Mining & Metallurgy at the Toronto Meeting in March last, namely, that our mineral resources are very specialized and not inexhaustible, and that our possession of certain minerals of strategic value, such as nickel, asbestos and cobalt, should be utilised to enable Canada to drive a fair bargain with those nations which possess essential raw materials with which our country is meagrely or unevenly supplied.

Our bargaining position is bad, because in some important respects it is a mendicant position, but the application of a remedy is not simple. It calls for skil-

ful and studied diagnosis. Snap judgments and emergent policies will not avail us. The policy of Protection—in its widest sense—has up to now proved the most effective medicine, but the tariff prescription requires skilful compounding. The enquiry which is now being made by a committee of the Cabinet, when completed; will be a record of symptoms, but a consultation is required for a decision regarding procedure. The tariff enquiry so far has revealed divergent and conflicting economic conditions, and the wishes of the East are not those of the West, nor are those of the Centre easily reconciled to either.

Nor is there any visible finality to the fiscal incongruities of Canada. Adjustment to environment is a first requisite to persistence of existence in a growing organism, and while the present enquiry is, in our opinion, a proper and a necessary proceeding at this juncture, it would seem that a permanently continuing process of enquiry and the indicated adjustment is required.

A permanent Tariff Commission, for advisory purposes, and not a legislative body, seems indicated.

---

### Terms of Settlement of the British Strike

An inspection of the arrangement under which the British coal miners have gone back to work will reveal that it is not so much a settlement as a mutual agreement to work out a basis of co-operation, and it defers until the 31st of March 1921, or some previous date, the joint elaboration of a scheme for the regulation of wages in the industry "Having regard among other considerations, to the profits of the industry, and the principle upon which any surplus profits are to be dealt with." The text of the terms of settlement are quoted in extenso elsewhere in this issue.

An interesting feature of the agreement is the provision by which the coal-owners acquiesce in a variation of their profits as the wages of the miners are

reduced or increased under the application of the sliding scale.

Things have moved very rapidly in Britain, and the return of the miners to work, which is a proceeding tantamount to defeat of the extremists among the leaders, should not obscure that fact that the question which the Mining Association and the Miners' Federation have undertaken to answer is the extent to which private ownership is permissible.

An enquiry into the disposal of "surplus" profits is not in principle to be distinguished from an enquiry into the right of the individual, or a combination of individuals, to possess ownership in profits, as the word "surplus" is not one that has hitherto been regarded

a definable in law, or existent in fact, in British jurisprudence.

The whole system of coal control in Britain is an extraordinary and emergent war measure, and, presumably, will some day be abrogated.

In attempting to control essential industries in the best interests of the nation, British statesmen have brought about a practical test, under constitutional procedure and without popular excitement, of political theories that could only have been so tested without the accompaniments of revolution and bloodshed under the whole-hearted agreement of the British nation to adopt virtually anything that seemed necessary to concentrate the country's energies upon prosecution of the war. One hidden danger has been plainly disclosed, namely, that the substitution of the State for the individual, or the corporation, as employer of labor in no wise lessens the danger of industrial strife, but it increases it dangerously, inasmuch as disputes which under the private employer were matters of internal policy, in which the State intervened only as little as possible, become, under State employment, indistinguishable from political revolution. This tendency of the socialistic or communistic state has often times been pointed out by far-sighted students of forms of government, but the war has brought about an actual demonstration that cannot fail to have a deterrent effect upon those whose enthusiasm for political innovations so often exceeds their ability to forecast the outcome of untried schemes of social changes.

The disturbing feature of the situation as it now exists, is that the the postponed question is still a political one, and not purely a matter of wages and hours of work.

In making the rate of wages paid to miners dependent upon the increase in the aggregate output of coal, the British Government has apparently confused two distinct issues, namely, that while a reduction of the unit cost of coal production can only be obtained by an increase in the individual rate of production, the value of the thing produced, for purposes of sale, is dependent upon the demand. Any attempt to frame a permanent basis of wages upon the fluctuation of aggregate production will fail, because it presumes an unchanging demand and an unchanging selling price, neither of which presumptions are justified.

The proposals so far put forward for satisfaction of the miners' desires and improvement of production have ignored the chief cause of the reduction in output, which is, in Britain, and elsewhere, a shortage of skilled workers at the face, and a superfluity of non-essential, non-productive employees in the auxiliary operations of handling, preparing and marketing the coal produced. A new generation of face workers must grow up, to replace those who are lost through war causes — death, disablement, and entry into other occupations — before the aggregate production of coal

can climb back to pre-war figures. The chief problem of the colliery executive, and of those governments that have usurped the functions of the colliery executive, is to restore the balance between face-workers and auxiliary employees, between coal-getters and coal-handlers. Out of the preponderance of this last named class, who necessarily include the less responsible elements of the coal-mine workers, arises much of the difficulty that miners' leaders experience in these days in advocating moderate methods and recognition of the fact that the miner is not the only gooseberry on the communal bush.

#### CANADA AS A PRODUCER OF PETROLEUM.

The "Petroleum Times," of London, deprecates the exaggerated accounts of Canadian oil occurrences which appear in the daily press, and particularly a statement which describes the Fort Norman strike as indicating "the largest oilfield in the world."

"So far," states this comment, "there is nothing proved which has altered our opinion that the liquid-oil riches of Canada are very limited, and though some fairly decent oil-wells may be brought in round the Mackenzie River, it must not be imagined that Canada has the slightest hopes of ever becoming a great oil-producing country; at least, not until such time as its shale wealth is commercially developed."

We think our contemporary doth protest too much. "Not proven" is still the verdict upon Canadian oil occurrences, and it is yet too soon to conclude that Canada has "not the slightest hopes" of becoming an important oil producer.

In direct contradiction of the London opinion quoted may be mentioned the conclusion of Mr. G. C. Ommanney, Investigation Engineer of the Canadian Pacific Railway, which appears in the monthly review of progress published by this railway. Mr. Ommanney points out that in September there were 24 locations at which drilling for oil was in progress throughout western Canada, not including eight in the coastal district, and he contends that Canada will, in the comparatively near future, "become an important contributor to the world's oil supply." Mr. Ommanney's observations have at least the merit of closer acquaintance with western oil possibilities than those of our London contemporary.

The officers of the Canadian Geological Survey have carefully outlined the possibilities of oil occurrence in the great plains, but their conclusions are necessarily incomplete because the surface exposures only incompletely indicate the nature of the rocks that lie below. Thorough and protracted prospecting by drilling is necessary to determine a number of stratigraphical unknowns, and this kind of prospecting is now taking place. The campaign of the Imperial Oil Company is establishing many things of "scientific value," to use Mr. Stillman's description of the Fort Norman find,

and the Company is, we understand, fully imparting this new information to the Canadian Geological Survey. It will still be some years before the potential western oil area is thoroughly tested, and, in the meantime, long-range prophecies, unaccompanied by reasoned argument, are out of order.

As to the oil-shale resources of Canada, these are very tangible assets, with no uncertainty attaching to them. Neglect of oil-shale utilisation is not confined to Canada alone. Canada had an oil-shale industry, with fair prospects, sixty years ago, but it was killed by the tapping of large petroleum flows in the United States. When petroleum ceases to become an unassailable competitor, as may well occur should a reduction in petroleum yield continue to be accompanied by an extension of the uses of petroleum, then, presumably, the distillation of oil-shales will be resumed in Canada.

#### DOMINION ROYALTY ON COPPER.

Mention was omitted from the report of the Winnipeg Meeting, contained in the issue of 5th November, of the text of the resolution passed regarding federal royalties on minerals, which has a particular bearing upon the operation of the Flin Flon ore-body, and is also linked up with the question of provincial ownership of natural resources that is at this time being energetically discussed in Manitoba.

The Resolution, after recital of existing regulations, read as follows:

"That this Convention strongly urges the Government of Canada to so amend said regulations as to set out specifically what are to be the royalties charged on the different minerals produced, and particularly that the time for which copper shall be exempt from royalty shall be extended for a period of ten years."

The Manitoba Government is finding itself in an impotent and embarrassing position because of its non-ownership of the natural resources over which it is charged with civil administration, and the demonstrated presence of mineral deposits in Northern Manitoba has interjected considerations that render it very desirable, from Manitoba's point of view, that the indeterminate status now existing in connection with mining lease laws, royalties, and mines regulation should be brought to an end.

#### Dr. W. H. COLLINS APPOINTED DIRECTOR OF THE GEOLOGICAL SURVEY.

Announcement is made by the Civil Service Commission, under date of 15 November, that Dr. W. H. Collins, who for a number of years has been a geologist of the Department of Mines, has been appointed director of the Geological Survey.

Dr. Collins has been a geologist in the Geological Survey branch of the Department of Mines for fifteen years. His work has largely been in the mineral fields of Northern Ontario and has been extremely valuable to the department. He was born near Owen Sound, Ont., and received his education at the State University of Wisconsin and the University of Toronto.

#### TEXT OF TERMS UPON WHICH BRITISH COAL MINERS VOTED TO END STRIKE.

The terms of settlement upon which the British coal miners took an inconclusive ballot, and on which they eventually returned to work, are as follows:—

1. Recognising that on the increased production of coal there depend not only the prosperity of all who are engaged in the coal industry, but also the welfare of the nation and the cost of life of the people, and having in view that this urgent need can only be met if the miners and mine owners throughout the country work together cordially for this common purpose; and further, having regard to the necessity of setting up machinery for regulating wages in the coal trade so as to get rid of the present anomalies and provide against future difficulties;

The Mining Association and the Miners' Federation solemnly pledge themselves to make every effort to achieve these objects.

To that end they shall:—

(a) Co-operate to the fullest extent to obtain increased output, and for this purpose will arrange to set up district committees and a National Committee.

(b) Proceed forthwith to prepare a scheme for submission to the Government at the earliest possible moment and not later than the 31st March for the regulation of wages in the industry, having regard, among other considerations, to the profits of the industry and to the principle upon which any surplus profits are to be dealt with.

2. Pending the preparation of the scheme referred to in 1 (b), wages shall be regulated on the following basis without prejudice to the ultimate scheme above mentioned:—

(a) An advance of 2s a shift to persons of 18 years of age and over, 1s to persons of 16 and 17 and 9d to persons under 16 will be paid from the date of resumption of work to the classes of colliery workers entitled to Sankey wage, and subject to the conditions under which Sankey wage is payable.

(b) For the purposes of this temporary arrangement the advance referred to shall be automatically adjusted on the basis set out below from the 3rd January, 1921, in the light of the results of the five weeks ending 18th December, 1920, and similarly from 31st January, and thereafter every four weeks on the results of the four weeks immediately following the last preceding test period, but the Christmas holiday week shall not be counted in any such period. And an adjustment will be made in those cases where the holiday period falls wholly or partly within the New Year week.

The basis on which the advance shall be adjusted is as follows:—

If the weekly averages of the proceeds of export coal during the test period are maintained at the weekly average of the proceeds of export coal during the September quarter the advance shall be 1s, 6d and 4½d respectively. If (after deduction of the cost of extra output), they exceed the September figure, an additional 6d, 3d and 2½d respectively will be paid for every complete £288,000 of the excess.

(c) For this purpose the amount of export coal in each period shall be assumed to be the excess of the tonnage produced over the rate of 219,000,000 tons annually; the proceeds shall be calculated by multiplying that excess tonnage by the average f.o.b. price as shown in the Trade and Navigation accounts for the quarter ended 30th September, 1920; and the cost of extra output shall be taken as 15s per ton for each ton produced in excess of the rate of output for the quarter ended 30th September, 1920.

(d) As part of the settlement hereby concluded, the Government undertake to make an Order under section (3) of the Mining Industry Act which shall provide for the variation of the one-tenth share of the excess profits of the industry payable to the owners under the Coal Mines (Emergency) Act by the deduction therefrom or addition thereto of one-quarter of said tenth part for each 6d by which the men's advance is reduced or increased.

(e) The certificate of the Secretary for Mines as to the amount of the proceeds and the advances payable shall be accepted as final.

Russell J. Spry, mining engineer, formerly with the Eustis Mining Co., at Eustis, Que., is now located in Salt Lake City, Utah.

# Canada's Complex Economic Mineral Problems Surveyed

Natural Resources Largely Unexploited, While Foreign  
Fuels, Iron, Steel and Other Products,  
are Being Imported.

ALEXANDER GRAY, Montreal.

"The big problem of the next twenty-five years is to advance and if possible energize the development of the natural resources of this Dominion. We are now in a position to challenge the world in competition if we only pursue sane and well-tried lines of policy and do not be misled into false ones."

In his speech at Kamloops, Prime Minister Meighen cast this ambitious and optimistic horoscope.

Partisans will disagree as to the methods to be employed to bring this about, for there is no denying the complexities and disconcerting incongruities in Canada's economic affairs.

Not only does the Premier reaffirm the Parable of the Talents and give precedence to the most certain sources of great working capital; his plea for more confidence and sanity has had reawakening influence.

Out of the maze of post-War adversity and perplexity, while Elder Statesmen overseas are floundering in frenzied finance, Mr. Meighen has argued the case for Canada with refreshing candour and admirable affirmativeness.

Canada is to have stronger diversified industrialism — is to place itself upon a constructively competitive basis—instead of "taking it lying down", in the parlance of the pugilist. If opulent and impoverished nations avail themselves of advantageous exchange to undersell Canadian producers, then Mr. Meighen offers Canadian energies and resources, and Government support of them, as assured means of prosperity and expansion. In doing this, he is not unmindful of internal and external complications. Hereafter the "equal opportunity and fair trade" advocated by Sir Auckland Geddes is to have more of our own making in it.

## Putting the House in Order.

Liquidation has proceeded apace. Frozen credits are being thawed out by drastic processes. Consumers of commodities went on strike. Canada under the new leadership at Ottawa has decided to raise more steam and move faster. Ways and means whereby it will obtain a larger participation in the world's marts are being devised. Whatever of tariff revision be given effect, sentiment is becoming aggressively favorable to the promotion of the coal trade, fostering of the iron and steel industries, of assisting mineral industries throughout. Specifically, a bounty is desired for iron-ore mined in Canada; a royalty or other form of first-aid for copper producers; the levy of added duties upon coal, copper, zinc and lead and their products, as well as the restriction of the foreign steel-products free-list. In justification of the comprehensive correctives for excessive importations and the unbalanced international exchange situation, the latter facilitating the offloading of surpluses in Canadian markets—Mr. Meighen enters the plea that Canada has enough and to spare in its own resources. It is all serene to those who find it convenient to underbid, or to dominate Canadian trade, but the tide of commerce is running

too rapidly the wrong way. Were it not for the pulp and paper, asbestos exports and activity in the coal trade East and West, the protective programme would require enlargement rather than curtailment.

## The American View.

There is all the more reason for altered policies because of recent utterances of a pessimistic nature. Mr. Vanderlip has proclaimed that the States are confronted by a period of unprecedented depression. Since there is no disputing that in the plenitude of counsel there is wisdom, and as international finance enters largely into Canadian matters, besides the remarks of Mr. Vanderlip no more informative précis has been presented than that issued by the Guaranty Trust Company of New York, as follows :

"During the half century preceding the war, a period representing the golden age of English industrial and trade development, a large and profitable British overseas commerce was developed. A low unit of cost in production was largely responsible for this growth. Germany, likewise producing at a comparatively low cost, developed a highly organized commercial system and made serious inroads into British commerce during the ten years just prior to the war. The United States, electing to operate upon a different standard of living, involving a higher wage cost, was unable to gain a position as a large exporter of manufactured goods, compared with Great Britain and Germany, except in those lines where our wider use of automatic machinery reduced the unit cost of production to a point that permitted competition with similar products manufactured on the lower European wage scale.

"Fortunately for the United States, the post-war period finds the condition decidedly altered. European labor costs have advanced tremendously until they now parallel, to a considerable degree, labor costs in this country. This change deprives Europe of one of her greatest foreign trade assets and improves, in like measure, the outlook for American foreign trade so far as competition in productive costs is concerned. Wages will, of course, vary, but a comparatively level situation seems assured."

Deprecating trade barriers, if international exchange is to be readjusted in order to unshackle commerce, and enable the United States to reap rewards without which its overplus production cannot find adequate markets, this trust corporation urges the broader policy, fiscal preparedness and a hundred per cent. efficiency.

While that ideal may not become universal—for obvious reasons, since overseas nations will not concede open markets,—and American industries insist upon the maintenance of protective principles, the thought uppermost in Canadian minds at the moment is: "What shall we do to be saved?"

Is it possible to obliterate trade barriers, to forthwith establish industrial fellowship, synchronizing with a League of Nations, that may not become a reality?

### What the States Did.

Canada has been hesitant on the point whether it should become more self-reliant, self-contained, self-supporting, more exacting in behalf of its own industries, without jeopardizing its trading privileges. So complex are its problems that the decision to be rendered when the Tariff Commission makes recommendation, will be fraught with momentous consequences. Meanwhile, there is general acknowledgment that the Government at Ottawa must step on the accelerator.

Sentiment is divergent as it was years ago, when iconoclasts in the United States, low-tariff, and no-tariff advocates, execrated "Pig Iron" Kelley as the incarnation of corporate iniquity.

To those, the Apostle of pig iron was the archtrave, as it were, of Protection running riot, before Dingley, McKinley, Payne or Penrose projected themselves into the arena and saw to it that the "trade barriers" the Guaranty Trust would abolish, were buttressed.

"Pig Iron" preached Production and Protection as the complement of each other, insisted that pig iron was the basic factor if the States were to have a steel industry commensurate with their vast iron-ore and coal deposits.

That was when Schwab was trundling a barrow, Gary was receptive toward fees in petty cash, Carnegie was propagating hard luck tales about the pauper labor of Europe, and Gates was at the throttle of a locomotive.

Needless to write; the "Pig Iron" Congressman was anathema to American Cobdenites; yet he was perennially returned to Congress from his Philadelphia district, and remained in Congress as the "Father of the House" until the "Last Post."

This all may be considered irrelevant and reminiscent, but the personality and his creed are recalled by the petitions for a bounty upon Canadian iron-ore, or upon pig-iron made from Canadian ore. Moreover, it might as well be admitted that behind the "Pig Iron" Congressman was the Laird of Skibo, the canny Carnegie, whose genius created the nucleus of the greatest of steel corporations.

Carnegie, too, was pilloried, along with Friek and Phipps, but it was that triumvirate which the assistance given to pig iron made possible. They made steel, began the movement whereby the ranges of Wisconsin, Michigan and Minnesota reverberated with blasts throughout the iron country. The coal fields of Pennsylvania, Ohio, West Virginia, Illinois and Indiana shared in the movement, which was later followed by developments in Tennessee and Alabama. So stupendous has been the progress since that "Pig Iron" Congressman was berated, that the States, although protecting what long ago ceased to be "infant industries", now would lower or wipe out "trade barriers", in order to secure a still larger portion of international business. In the circumstances, therefore, Canada is concerned with the following exhibit:

### Contrasts In Credits and Debits.

In the aggregate, the \$199,285,714 which the following table totalled in 1920 suggests more than surgery.

The sum of Canada's mineral output in 1919 was \$173,000,000. What it will be in 1920 cannot alter the fact that the imports of coal and coal products, and iron-ore and its products, will greatly exceed in value the grand total f.o.b. worth of Canada's mineral production.

### IMPORTS OF COAL AND METAL PRODUCTS INTO CANADA.

"Our country must reconstruct itself" is a cure prescribed in another sense by Calvin Coolidge, Vice-President-elect of the United States. Its domestic application is imperative.

Granting every claim as to limited domestic markets and the necessity of cultivating reciprocal trade relationships, no logical deduction can be formed other than that Canada has not learned to walk by itself, as did Kipling's metaphorical cat. The hiatus made manifest in the foregoing data constitutes "an aching void". "Keeping the home fires burning"—at this price—is more ominous than optimistic. "Living on Capital" may benefit individuals but the effect is to jeopardize a greater number. The imports exhibit is convincing evidence the country "must reconstruct itself" by promoting Home Industries while cultivating overseas and over-the-border trade on a more advan-

tageous bartering basis. Nor is it adequate that our exports showed a gain. Instability is in evidence, wherever industries are dependent upon such prime factors as coal, coke, iron and steel, and the agitation for the encouragement of iron-ore production is opportune. A lonesome satisfactory item is the 1,299,424 tons of coal exported in the half year, worth \$9,103,196. Alberta is pushing its coal trade in the States. The 12,316 tons of iron ore exported valued at a paltry \$60,845, is a rather pitiful contribution. There is no denying the reasonableness of the aspiration voiced by Mr. Balmer Neilly when recently addressing the Empire Pressmen:

"We hope to develop our iron ore resources by means of beneficiation to the point where Ontario and Canada may depend upon our own resources in place of importing 95 per cent. of our iron ore and iron and steel products to the extent of some \$180,000,000 as in 1918."

Generally speaking, Canada's total trade with the United States for the twelve months ended with September, was \$1,462,213,748. This was an increase of about \$300,000,000 over the preceding corresponding period. On the other hand, imports from the United States amounted to \$919,367,989, an increase of \$200,000,000. Exports from Canada to the States were approximately \$542,845,759, an increase of not quite \$100,000,000. In the period in review, Canada increased its imports while its exports decreased. The imports were \$1,352,767,940, compared with \$888,139,956 in 1919. Exports were \$1,208,919,175, as against \$1,210,541,387, in 1919. Clearly one-half of our total trade with the world was done with the United States. about two-third of our imports were from the United States, and nearly one-half of our exports were disposed of to the United States.

**IRON AND COAL.**

**Weakest Links in the Chain.**

Pittsburg "base" prices and the "Bessemer limit" may be meaningless terms to the laity. They are branded into our economic system. Apart from the huge iron deposits of our eastern seaboard, we have yet to find another iron-ore field of first magnitude, free from impurities or which do not require beneficiation. Here and there we have hematites; magnetites rather low in grade have presented themselves; sulphur and phosphorous are too prevalent in some of these, and we have titaniferous ores awaiting economical processes and profitable uses. Exploration may supply the greater requirements. Meanwhile the "line of least resistance" has been followed, and the central provinces have no steel industry they can call their own.

In the six months ended June 30th, only 8.9 per cent. of the ores fed to Ontario furnaces were of domestic origin. Altogether 1,332,881 tons of iron-ore were imported, and we exported 12,316 tons.

Sydney and New Glasgow plants, and the iron and coal mines tributary thereto, have been handicapped by labor troubles, notwithstanding the exportations of coal in the six months ended with September, were a redeeming feature. Most of that coal went oversea, some of it across the border. Apart from Sydney and New Glasgow, all the steel mills obtained nearly all their coal from the States. The Algoma Steel Corporation was alone among its Ontario contemporaries in availing itself of what iron-ore in bulk it could muster from its own domestic mines. It used its own siderite from its Magpie Mine, where 100,000,000 tons have

been determined by diamond drilling. Latterly the Algoma corporation does not appear to have drawn so steadily upon this siderite, but the three months ended September 30, notified gratifying tonnage results, as follows:

	1920	1919
Magpie Ore . . . . .	32,210	67,420
Coke . . . . .	142,593	65,998
Pig Iron . . . . .	116,362	50,149
Steel Ingots . . . . .	92,671	55,456

Doubtless imported iron-ores entered into this production. More Magpie ore might be availed of, and probably will be, when beneficiation practice is encouraged in some way. It was explained to the Tariff Commission that this siderite has an original iron content of 35 per cent, and sulphur content of one per cent, and more. To roast this ore in brick-lined kilns, raising the iron content to 50 per cent, and reduce the sulphur content to .16 per cent., using powdered coal, is an added cost at which patriotism shies. The cost of roasting in 1918, was \$1.25 per ton; in 1919, it was \$2.64 per ton; because of the advance in the price of coal, since one ton of raw ore makes only .7 ton of finished ore. Ostensibly that is why a bounty rather than a higher duty is sought, especially by the Algoma people. On the other hand, those without iron-ore ask for tariff protection, while Canada is seeking domestic ores of Bessemer grade. On the Pacific Coast conditions are identical with those in the central provinces, with the exception that a small tonnage of iron ore and coal is going to boundary States. The British Columbia Minister of Mines in his report for 1919 was obliged to admit that "so far there has been no metallic iron produced in British Columbia, but it has been strongly advocated in many quarters that the conditions are favorable for the establishment of an iron-smelting plant somewhere on the British Columbia coast. So far nothing definite has materialized, although there is apparently a prospect of such a plant being established. As is well known, there is on the Coast, in the aggregate, an adequate supply of magnetite, quite sufficiently free from impurities as to be within the "Bessemer limit" to supply such a plant."

Undoubtedly the situation is more than embarrassing for, aside from the work at the Magpie Mine and Moose Mountain, nothing of consequence is happening in the way of iron mining, between there and the Belle Isle section on the east, whereas what is going on in British Columbia is trifling, as yet. Diamond drilling in other sections of Ontario is understood to have disclosed considerable tonnages of satisfactory ore. "Pittsburg base prices", however, for the time being, removed the incentive for further territorial exploitation by individual companies or syndicates. With assistance given to iron miners or pig-iron producers, an element of impetus might be supplied. Otherwise, Canadian steel mills and fabricating plants in general have recourse to the States, as the imports for the six months ended with September reveal. Addressing the Tariff Commission, Mr. J. A. Hussey plainly put the situation when he said: "At the present time, it is admitted by all that iron and steel are the basic industries of Canada, depending, one might say almost wholly, on ore imported from the United States and elsewhere (Newfoundland). These importations inevitably have helped to turn trade balances against us, and trade balances are a matter which affect everyone in the country."

### Our Coal Account.

Accentuating this is the Coal Account, amounting in the six months dealt with in the table of imports, to \$51,886,743, for 32,908,218 tons, more than twice the quantity of coal mined altogether in Canada in any two years. Affiliated with the Maritime Provinces' iron-ores there is coal in abundance. Between there and Alberta and Saskatchewan, what coal there is has not as yet been utilized in steel and fabricating plants. This necessitates, or has necessitated, reliance upon imported coal, despite the fact that in one form or another there is about 1,200,000 million tons of coal of all kinds within the Dominion to go on with. Of this 2,000 million tons is semi-anthracitic; 283,000 million tons is bituminous, and 950,000 million tons, sub-bituminous and lignite. More of these fuels could be marketed even now, were railway freights readjusted, instead of consumers paying \$50,000,000 to \$75,000,000, plus exchange on New York, plus freight. Convenient markets—and natural markets—are available, without violating railway rights. Alberta's increasing output is demonstrating that. Concededly Ontario plants are between two stools. Coal is a commodity, dependent upon locality, quality and market. Of the coke produced in 1919 in British Columbia, about 10 per cent. was exported to the States, the remainder going to the smelters at Trail and the Boundary District. But in that year the output of coke decreased about 51 per cent. Coal production in that province fell off about 6.5 per cent. For that matter the coal and coke output there has fluctuated somewhat on a dead level since 1908, 1914 and 1915 reflecting special depression following on the outbreak of the War. Nor have the Maritime Provinces provided their quota. Labor disputes tended to increase costs, and "Pittsburg base prices" cannot be trifled with. The New Glasgow and Sydney export business cannot be dissociated from competitive factors. No doubt needed economies will be effected when the units constituting the Empire Steel Corporation are correlated, but its coal has not relieved the strain upon the popular purse, at least to an appreciable extent.

### The Nickel-Copper Position.

Suggestion is made that copper production be fostered by a bounty or a royalty of some sort. An export duty has been suggested, similar to what is the vogue with the Portuguese, Mexican, or Latin-American countries. Perhaps the arrangement whereby the buyer pays the Quebec Government's exaction upon asbestos producers may be urged. Here a difficulty arises, for Quebec is the chief source of supply of asbestos, whereas copper markets hardly would be amenable to any arrangement of the sort. Outside of the Granby, Howe Sound, Weedon and nickel-copper Companies, Trail is the only important contributor of the red metal. Granby has got along without flotation methods of recovering a greater portion of the copper content of its ores. Two of the nickel companies are making copper. Otherwise, without flotation few if any of our sulphide mines would be in operation, unless their ores are of a grade high enough to defray transportation and smelting charges in addition to abnormal mining costs.

Imports of copper and its products in the six months to October, were valued at \$5,406,015, as compared with \$3,386,733 in the corresponding period of 1919. Blister and refined-copper production is increasing and Canada should not find it necessary to go far afield

for copper products. In 1917 Canada reported 109,227,332 lbs. of copper; in 1918, 118,769,332 lbs., and in 1919, 81,500,000 lbs. This is all-sufficient for domestic consumption, if refined and manufactured. Not unexpectedly, there has been a slump in the copper metal market.

Canada is equipped for larger outputting, but Granby was shut down part of the time, Trail has lacked copper ores, Howe Sound operations were curtailed, and the nickel-copper companies cannot force metals for which there is a minimum demand. Combined with liquidating markets has been the insufficiency of labor and freight cars for over-the-border service. If nickel was moving in greater volume, Canadian copper would be more in evidence, consequently discussion of a royalty on refined-copper exported might not be well-received by consumers. On the other hand, General Manager Warren of the Consolidated Mining and Smelting Company, proposes that the 1½ cents a-pound duty on copper ingots be extended to include copper wire rods, which are now admitted free, if drawn into wire in Canadian plants.

Mr. Warren is in a position to state the needs of his corporation. He comprehends the limitations of the home market. Protection for finished products is what he craves, as may be seen from his remarking:

"While the war duty of 7 1-2 per cent. was on the company began to build a wire rod mill so that it might supply the 12,000 tons of copper rods consumed by the five Canadian wire concerns in making telegraph wires, transmission wires, cables, etc. In addition to the wire rod consumption the normal Canadian consumption was only 6,000 tons in the form of ingots. The ingot demand could be filled with the company's copper refinery established during the war at the request of the British Government, with a capacity of 20 tons daily. To supply the Canadian consumer at a reasonable price it was necessary to increase the capacity of the copper plant 60 or 70 tons a day. That could be done only by building a rod mill so that the increased copper output could be made into wire rods, enabling the company to fill the whole domestic demand. This also necessitated arrangements being made to secure a supply of copper ore or concentrates sufficient to supply the enlarged plant. Contracts had been entered into with the Canada Copper Corporation under which a \$2,000,000 railway branch line had been built from Princeton to the large copper deposit it controlled nearby. The power line of the subsidiary company, The West Kootenay Power & Light Company, Ltd., had been extended 100 miles from Greenwood to the mines at a cost of \$1,250,000, and extensions had been made to the smelter costing \$750,000, including \$250,000 on the wire rod mill.

Mr. Warren's exposition of the copper situation within his jurisdiction, explains why the Trail plant has to have more copper ores, a measure of Government assistance, and support in domestic markets. They had to offer a premium of one-half cent a pound on the New York price of the metal to induce the Canada Copper Company to construct a railway in order to ship their ores to Trail. In other words the Canada Copper Company insisted upon a bonus before it would enter upon a capital expenditure not justified otherwise. The readiness of the Consolidated Company to pay more than the New York price per pound, bespeaks more than Mr. Warren in all modesty could impart to the Tariff Commission, when it is borne in mind that there was "no market for copper in the West," on either side of the border, and in shipping East, the Consolidated and Anaconda Companies have to compete with copper produced closer to the big market, or copper which can be transported by water. Toronto, Hamilton and Montreal, as Mr. Warren has explained, are the Canadian markets for cop-

per, and freights from New York to these Canadian markets are lower than they are from Anaconda and Trail. From New York, the rate is, or was, 47½ cents a cwt. to Toronto, and 46 cents to Montreal, as against the new rate of 95½ cents a cwt. from Trail to Toronto, and \$1.10 to Montreal. Besides, the cost of converting copper into rods is two cents a pound, double what it was in the pre-war period. Moreover, only fifteen per cent. of the Trail copper ores treated came from the company's own properties.

The duty sought by the Consolidated Company is designed to offset the difference in freight, the half-cent extra per pound paid to the Canada Copper Company, and leave a slight margin for protection. Such a duty would obviate royalties, or export duties, and if the plan carried out by which the Canada Copper Company got more than the market price for its copper, was extended, perhaps a greater supply of custom-ores would be forth coming in due time. No doubt, also, the Consolidated will find more ore in its own areas. At any rate, the Canadian copper industry is seeking support.

In this respect it differs from the nickel industry, which is full-grown and husky, requiring only more business and less taxation. The International Nickel Company has a refinery at Port Colborne that is modern in every respect. An investment of close to \$6,000,000 upon that plant does not betray any timidity about the future of the nickel industry. Moreover, the new storage-dam on the Spanish River is one of the largest of its kind. It cost \$3,000,000, or more. So that corporation — now watchfully waiting — is in an unprecedented state of preparedness, and will be all the stronger when the mill at which Monel Metal will be rolled, is completed. Supplementing these expenditures, are those of the British-American Nickel Company, amounting to a further \$14,000,000, or \$15,000,000, as near as can be calculated by an on-looker. Then there are the Mond plants, primed for larger contributions of their special products. Unlike copper, Canada has a practical monopoly of nickel, and it is an everlasting credit mark to which it is entitled, that the nickel industry did not profiteer throughout the War.

With the lower prices for copper prevailing in the current year and operating costs remaining at or near to the peak, the output cannot be increased. Few companies can produce copper at 14-15 cents. Were it not for the adoption of flotation at Trail, and other improvements at those metallurgical works, together with what came from the nickel-copper Mines, the red metal would cut a sorrier figure in our score sheet. Given a chance in a better copper market, fortunately the overhanging supplies are liquidated. Granby and Howe Sound will resume their place in the output. The success of flotation at Trail and the Britannia Mine of the Howe Sound Company has established standards of excellence in recoveries of metallic contents which no longer leave Canada apologetic. Metallurgical works are enabled to get more of what they are entitled to from the sulphides. Without flotation the tale might not be worth the telling of it.

#### Zinc and Lead Prospects.

A vote of confidence in the zinc and lead properties of the Dominion would not be amiss, followed, as it might be, by the maintenance of a protective policy that will not suggest reprisals. Imports of zinc and lead and their products in the first half of the official year, are given as \$1,741,515. That is nearly half as much as

the total value of the zinc produced in 1919 in British Columbia. It is a third as much as the grand total of the zinc and lead produced in British Columbia in 1919. Considering that British Columbia is the chief source of those metals, Mr. Warren was upon firm ground when he urged the continuance of the duty on lead, the imposition of a limited embargo upon imports of zinc, other than from Great Britain and the States, and a duty of two cents a pound on zinc; for there have been importations upon an extensive scale of those metals and their products, and they are far from inspiring in their influence upon domestic producers, or upon those who are planning to produce in Gaspé. To have Spanish and German lead dumped here and given the "British preference" hardly is consoling, however, brotherly the affection is for the Homeland.

The Consolidated Mining & Smelting Company finally having evolved a practical and economical process whereby the complex ores of British Columbia can be treated, Mr. Warren takes the position that "as a large part of the world consumption of zinc is in the form of sheets, the company proposed to put in a zinc rolling-mill, and felt they should have a bounty on foreign business in order that it should supply the British market. Until foreign exchange rights itself, further protection also is needed. Five hundred tons of German zinc was offered in Eastern Canada in September." Besides lead, copper and zinc, the Consolidated Company is producing refined gold and silver, bluestone, fluorspar, and both sulphuric and hydro-fluoric acids. Manifestly the Consolidated management has rendered notable service and is more ambitious now the problems contained in complex ores have been solved. Trail expenditures and the magnitude of the Sullivan Mine, taken in connection with the necessity for stimulating British Columbia mineral industries, are matters of national importance. Competition with Germany, Spain, Mexico, Belgium, Australia and India—and with American producers who are prominent in metal markets—is accentuated by increased freights; so Mr. Warren has argued for a duty of \$1.50 a ton on lead, the same as the United States duty. Nor did he mince matters when he spoke of the "British Preference". The Canadian consumption of zinc is about 10,000 tons annually, whereas the Consolidated Company's capacity is 25,000 tons, superior in quality. The company's daily lead capacity is about 100 tons, about what Canada normally requires. There is now a specific duty on pig-lead of a cent a pound. Mr. Warren insists "there is no sense in the British Preference. They produce only 7,000 tons of lead in England a year; yet they send large quantities of German and Spanish lead to Canada under the preference of three-quarters of a cent a pound duty." Furthermore, it was contended by Mr. Warren that a "real difficulty in meeting this competition is that just now the English pound sterling is worth about \$3.90 in Canadian funds and the German mark had depreciated to a still greater extent." So "the exchange situation negatives the protection on a wide variety of Canadian products besides lead."

#### Quebec Asbestos—Gaspé Zinc-Lead.

Minister Lemieux having joined the late Premier, Sir Lomer Gouin, in favoring protection for Quebec mineral industries, which topped the score in 1919 with a production of \$20,813,670, it is to be expected that more official solicitude will be displayed. Quebec asbestos retains pre-eminence. The asbestos industry is exceptionally prosperous, though short-handed.

Equally unique, though awaiting transportation facilities, which are being provided by private enterprise, are the Gaspé zinc-lead fields, located about fifty miles from Cascapédia. While it is premature to present the Federal Zinc and Lead Mines of the Gaspé Peninsula as rivalling the New Jersey zinc property, or the Sullivan Mine, the extent of the occurrence and purity of the metals assure to Canada a supply that can compete with other producing areas. Apart from asbestos, it is becoming clearer that Quebec has something akin to the Joplin country — a commercial mining section certain to become an industrial factor — with or without protection, however scant has been official appreciation of it.

Unmindful of what happened in Missouri, where Joplin ores enriched those who foresaw their worth, the Canadian view has been that these Gaspé zinc-lead ores are irretrievably handicapped by the long haul from the mines to rail. Montreal owners, though unsupported, were undeterred, however, and there is every reason to believe Gaspé is going to market zinc and lead at a profit, unless the flood-gates of competition are opened. A noted international authority identified with one of the greatest zinc corporations advised his principals that the thickness of the formation is, perhaps, 5,000 feet, and that "the zinc occurs as a practically pure blende, clear-yellow in color, even more pure than the Arkansas blende. There is almost no iron as pyrite to be seen \*\*\* It seems to me that the way is open to a big development scheme. \*\*\* It looks like a real mining country to me, in which there may be found deposits of copper, chrome, iron, etc., as well as zinc and lead."

Yet Canada has joggled along with the Galetta Mine, in Ontario, what came from Port Neuf, and what the Consolidated Mining & Smelting Company, found precarious. Even with its present transportation difficulty, the Gaspé properties of the Federal company, owing to the exceptionally clean character of the ores, will largely supplement the Canadian output. It has involved the expenditure of a substantial sum, no doubt, to prosecute the work of exploration and development; yet the results already indicate that Gaspé has something near enough to the coast and to a railway to obtain recognition. What is going on was foreshadowed by the noted international authority already quoted, when he stated to his principals that these controlling the Federal were locating additional blocks of ground. "Block B", he wrote, "is the only one on which the timber is cleared off. This was done for fire protection to the camp and for building and mining purposes. There are fifteen vein-outerops showing on this hill. On only one vein has work been done. \*\*\* Roughly calculating, they can be allowed a block 2,000 by 200 by 10 feet, or 2,000,000 cubic feet, or 200,000 tons from the present workings on this one vein to a depth of 200 feet. \*\*\* I might describe this as, in its infancy, one of the possible great zinc-lead mines of the world. It embraces a district. It is the district that is more important than the ground already opened up."

Singularly enough, let it be reaffirmed, Canada has been skeptical about this Gaspé country. Upon the one-body described, development has continued until its vertical extent makes conservative the estimates of the authority quoted. But why labor the point? Professor Mailhiot, of the Polytechnic School, in behalf of the Quebec Government, reported among many other things, as follows :

"As the deposits are fillings of great fractures of the earth's crust, it would seem that they must go down to the base of the slaty sedimentary rocks. At the slight depth reached some veins show an increase in the volume of ore, while its character remains the same. There are outcroppings of ore distant from each other between which are differences of level of several hundred feet, and it is almost certain that the highest deposits go down in depth at least to the level of the lowest ones. Some veins (that was in 1917) have been followed for distances of 3,000 feet, and it is probable that they extend still further under the cover of superficial deposits."

The international authority heretofore quoted went further than Mr. Mailhiot, and advised his principals :

"Exceptionally pure concentrates of lead and zinc can be made easily. The milling of this ore would be simple. Resulting products from these ores would be of good grade."

Flattering as this testimony undoubtedly is, considering it was given to the responsible chiefs of a prosperous competitor, the average of about 8 per cent zinc and 3 per cent lead, without dwelling upon the traces of silver or the gold content, makes of these Quebec fields more than has been realized by the Government of Quebec or the industrial leaders of the country at large. Trail facilities and the accumulating features of Gaspé obviate the necessity of Canada buying abroad what it already possesses in superabundance. Obviously the last word has not been said upon this Gaspé subject. The simplicity of the ores and ascertained contents furnish conclusive reasons why domestic zinc and lead should have a reputation commending them to international buyers. For the time being a lead smelter on the spot will reduce the outgo of money for continental leads passed on by British distributors under the "preference."

#### PROTECTION OF MINING INVESTORS IN BRITISH COLUMBIA.

The protection of the guileless public against the designing salesman of worthless mining stock is the subject of a recent pronouncement by the British Columbia Minister of Mines. He says: "The Minister of Mines has been given wide powers (under the Mineral Survey and Development Act), as any statement in regard to any company made by him is absolutely privileged. This is a policy intended primarily, and in fact solely, for the protection of the investing public. The Resident Mining Engineers, being in the field and in close touch with actual mining operations and development, are in a position to know whether statements made by stock mining companies for the inducement of the sale of shares are accurate, or if they do not, can readily confirm such statement. British Columbia in the past has been afflicted with too many flotations designed to 'mine the public.' The Department of Mines is determined that the issuance of worthless mining stock shall cease. Hence the legislation by which the government mining engineers are charged with the responsibility of assisting the Minister in seeing that the statements made by mining companies in prospectus or any documents issued for stock selling purposes, are strictly in accordance with the facts. In the course of the last few years there has been occasion more than once to apply the terms of the Act with results of value to the public and the same policy will be continued if being the intention that all money invested in mining shall be spent in legitimate mining development.

# Recent Geological Reports on Gold and Silver Areas in Northern Ontario

## Ontario Department of Mines.

Part III of the 29th Annual Report of the Ontario Department of Mines recently issued contains reports on five gold and silver districts in Northern Ontario made by officers of the Provincial Department of Mines.

### Ben Nevis Gold Area.—Cyril W. Knight.

Mr. Knight's examination of the Ben Nevis area occupied less than two months' time between the Summer and early Autumn of 1919, and consequently, it is noted, the geology has not been worked out in any great detail, and the map is to be considered as a reconnaissance one. The area is a part of that great belt of Keewatin rocks which stretches across north-eastern Ontario, and as it is underlain by dark-coloured lavas which are intruded by a few masses of syenite and felspar-porphry, "it is a prospective field in which gold-bearing quartz veins of economic value may be found." Part of the area, which embraces 300 square miles, is not geologically mapped, and is practically unprospected. With the exception of work done by the Nipissing Company in the southeast corner of Katrine township there has been little activity in the district. The following interesting surmise is made by Mr. Knight:

"While in all probability the locality is one in which prospectors would preferably search for gold, still it may be pointed out that there is an intrusion of serpentine at the west side of Tannahill township. A somewhat similar intrusion elsewhere in Ontario, at the Alexo Mine, has associated with it an economic deposit of nickel and copper ore; while chrome iron-ore, platinum and microscopic diamonds have also been found associated with similar rocks in Reaume township, although not in paying quantities.

The topography of the district is interestingly described, by one who, following the commendable tradition of the Canadian geologist, both sees and records the natural beauties that are seen by the officers of the Surveys, often for the first time by white men. Witness the following description of a part of Katrine Township "From the highest peak on these mountains, which have been named the Workman mountains, a remarkable view of the surrounding country to the north, west and south may be obtained, particularly on a bright clear day. The landscape looks like a vast plain, in which hills a hundred feet high scarcely make themselves discernible. Far off to the northward, a distance of twenty miles, the outlines of the stately Ghost mountains along the north boundary of Harker township may be readily seen, coloured a soft hazy blue, and wonderfully silhouetted against the sky."

The map which accompanies the Report is on a scale of one mile to the inch, and includes Elliot, Tannahill, Dokis, Clifford, Ben Nevis, Pontiac, Arnold, Katrine and Ossian Townships, the townships of Elliott and Dokis being unmapped.

### West Shiningtree Gold Area.—Percy E. Hopkins.

Mr. Hopkins report covers an examination made during four weeks in September 1919, and is accompanied by a geological map on a scale of one half mile to the inch, covering Churchill, Macmurehy, Asquith and Fawcett townships.

Mr. Hopkins summarises the economic possibilities of the area as follows.

"Since the first discovery of gold in 1911, when the railway was sixty miles distant, numerous other finds have been made in parts of four townships. The railway now passes within twenty miles of West Shiningtree lake, and is connected by a wagon road with most of the properties. Freight in summer is still quite expensive. Not only the poor transportation facilities, but also conditions during the war period, have retarded mining development; hence very little underground exploration has been done."

"Gold occurs in numerous deposits, some of which are quite large, but in many of them the precious metal is not concentrated sufficiently to pay for working, while in others it is irregularly distributed. A few small pockets of high grade ore have been found on half a dozen properties, but this does not necessarily signify that these will make mines, since the other portions of the veins may contain little or no gold. According to the manager's reports on the Herrick, ore shoots of considerable size are indicated by surface sampling, by sinking and sampling a 50-foot shaft, and by diamond drilling. The Ribble vein, which outcrops on the Wasapika, has also been exposed on the Miller-Adair claim, and is traceable for about one-quarter of a mile on the Foisey, being in all over a mile long and of a satisfactory width. The manager, Geo. R. Rogers, reports that the outcrop of this vein on the Wasapika shows 800 feet of \$9.00 ore across four feet, while in addition a cross-cut on the 100-foot level showed 23 feet of schist and quartz, assaying \$7.20 in gold per ton. One-half mile south of the Wasapika, on the Miller-Adair, there are also indications of ore in the Ribble vein on the surface; and further south still, on the Foisey, the vein is large, and carries visible gold. Shoots of ore may occur in various places along the Ribble vein, but it will not necessarily all be ore."

"A few properties in the area have promise, but they are still in the prospect stage. Whether they will become mines or not will only be determined by further developing the veins underground and sampling the same."

"It may be said that during the geological examination of a deposit such as one of iron or copper, it is often possible to form some idea regarding its value; but in the case of gold deposits it is usually more difficult to do so, systematic sampling being required. It is not the practice of the Bureau of Mines to undertake systematic sampling of gold or other deposits, this being naturally the function of the technical or professional men employed by the property owners."

"No gold has yet been produced apart from what may have come from a few high-grade samples, some of which might be called bullion. The encouraging results obtained on a few properties will probably lead to mining being conducted on a larger scale. There seems no reason why the veins which have a satisfactory length and width should not extend to considerable depth. One would also expect to find the values underground much the same as they are within a foot or two of the surface, since any oxidized or weathered surface zone has doubtless been removed by glaciation. All the rock formations are worthy of prospecting except the granite and diabase. Gold may even be found in the granite, although this rock has not yet, generally speaking, proved very favourable for gold in northern Ontario. The intersection of veins with iron formation or pyrite formations should be a favourable place to look for enrichment. The Iron formation or pyrite formations do not usually form gold ore bodies themselves, unless cut by numerous secondary quartz veins.

Detailed description of the various mining properties is given in the Report.

### Matachewan Gold Area.—A. G. Burrows.

The general geology of this district having been previously reported upon\* this report deals chiefly

\*The Matachewan Gold Area. A. G. Burrows. Ont. Bur. Min. Vol. XXVII, 1918.

Geology of Matachewan District. H. C. Cooke. Memoir 115, Geol. Sur. Can., 1919.

with the mining properties in the area, which include the Davidson claims, and the Otisse (now the Matachewan Gold Mines) claims, and the Nelson claims in Baden township. The mineralogy of the Otisse ore is discussed at length, and the presence of scheelite is noted.

#### *Barite in Yarrow Township.*

The presence of barite has been located near the north boundary of Yarrow township, on the west side of Mistimigon Lake. A selected sample of barite contained 98.25 per cent barium sulphate, while a channel sample taken by M. B. R. Gordon, contained 81.24 per cent. A sample of fine-grained barite taken by M. Burrows carried 94 per cent barium sulphate. As far as can be ascertained the deposit appeared to be free from sulphide minerals. "From the amount of work done, it is apparent that there is a large tonnage of high-grade barite.

Another large deposit of barite, known as the Biederman, in Cairo township, was described in the 1918 Mines Report.

#### **Argonaut Gold Mine.—C. W. Knight**

At the request of the management of the Argonaut gold mine, Mr. Knight spent ten days in 1919 in examining and making a detailed map of the property. The map in question is bound in with the Report, and is on a scale of 400 ft. to the inch.

Mr. Knight does not express any opinion on the economic possibilities of the property, but mentions that the felspar-porphry is said by Burrows and Hopkins to be similar to that at Kirkland lake.

The 15-stamp mill on the property was remodelled during 1919 by Mr. John E. Hardman, of Montreal, and is now used for testing purposes only. The intention is to construct a 300-ton mill. The following description of the milling operations is furnished to Mr. Knight by Mr. Hardman:

The mill was remodelled solely to act as a test mill, so that data might be obtainable for the construction of a large mill that would successfully extract the largest possible percentage of the total values contained in the ores. The present mill was not intended to produce bullion commercially and permanently.

The mill contains 15 stamps of the ordinary pattern, each weighing 1,250 pounds; these drop 100 times per minute and discharge through "Tyler" wire screens having an aperture of about .55 mm.

The batteries have an inside "V" plate, an outside splash plate 8 inch wide, a "quadrant" plate with a radius of 9 inches and the usual 8 feet of table plate. The mercury traps are of the usual Homestake type and all the table tails run through a 4-ft. clean-up pan before passing to the concentrating tables.

It is not probable that the new mill will use stamps to comminute the ore, as it has been proved that this can be done more cheaply by other machines that are not so expensive to erect or build.

The main items that are desired from the test mill are: (a) the average value in free gold that is amenable to amalgamation; (b) the percentage of metallic sulphides in the ore and the gold values therein contained; (c) the gold values in the non-metallic tails. The necessity for (b) arises from the fact that the Argonaut sulphides are cupriferous, carrying from 3 to 12 per cent. of metallic copper, and putting their treatment quite outside the usual cyanide methods. A process is now being devised that promises to recover both copper and gold values at a favourable cost so that both metals will help the profits.

The results that have so far been obtained from working some 2,000 tons have been very satisfactory; the average amalgamation recovery being 68 per cent. of total assay value, and the values in the concentrates averaging but 17 to 18 per cent. of total gold values. The 15 per cent. in the final tails yields its gold to a dilute cyanide solution.

Argonaut Gold, Limited, will not decide on either the process or the equipment of the new mill until a sufficient number of tests have been made on the red porphyry ore that underlies the Keewatin basalts. A cross-cut, No. 203, is now driving to

cut this porphyry ore, but is not expected to reach it before midsummer; it is possible that a different mineralization may demand additional niceties or equipment in the mill.

#### **Gowganda Silver Area.—A. G. Burrows.**

This is a report on a two weeks examination of recent developments in Gowganda, particularly in the vicinity of Miller Lake. Since the discovery of silver in the vicinity of Miller Lake in 1908 there has been produced 5,430,152 ozs. of silver to the end of 1919, most of it from the Miller Lake O'Brien Mine. With the exception of an ore-shoot in conglomerate in the Millerett Mine, which produced about 500,000 ozs. of silver, all the ore has come from the diabase sill.

A series of ideal sections through Miller Lake are given together with a sketch map showing the relation of the diabase sill to the older rocks. Mr. G. M. Colvocoresses is quoted from the "Canadian Mining Journal" of April 15th, 1912, as pointing out that the westerly side of the diabase sill exposed to the west of Miller Lake is the footwall. Mr. Colvocoresses, who was at one time manager of the Millerett Mine, stated:

"The Huronian rocks underlying the particular sill on which the O'Brien and Millerett are located are very clearly exposed less than a mile west of these properties, and prospecting there has so far had no good results. It would seem, nevertheless, that the claims thus located would merit particularly thorough development if Professor Miller's theory as deduced at Cobalt is in any measure applicable to the Gowganda district. Professor Miller states that at Cobalt 85 to 90 per cent. of the production has come from the veins found in the foot wall of the diabase sill; and it is strange that up to the present time absolutely nothing has been found in the foot walls of the several diabase intrusions which carry silver in the Gowganda district."

Mr. Burrows emphasises the fact that silver production in the Gowganda district has so far been from veins in the diabase, whereas at Cobalt it has come from below the diabase. "No silver ore has yet been produced, as at Cobalt, from the formations that were once below the diabase sill and are now exposed by erosion. Under favorable conditions one would expect that silver ore would occur in some parts of this area, where the footwall is exposed in proximity to the diabase."

This series of Reports is annotated with references, and indexed and shows signs of very careful editing and proof-reading, as is usual with publications of the Ontario Bureau of Mines.

It is announced that the Haileybury Frontier Mine, about fifteen miles south of Cobalt in South Lorraine, has been sold by Joseph Newburger of Memphis, Tenn. the owner, to New York interests represented by H. F. Strong, under a leasing option to purchase at a price said to be \$135,000. It is understood that operations under the new ownership will commence immediately.

Certain shareholders of Wasapika Gold Mines, Limited, have applied for an injunction restraining the company from issuing stock to the Wasapika Consolidated Mines, Limited in the manner as set out in their circular of November 1st. It will be recalled that the exchange proposed was on a basis of three shares of the new stock for one share of the old and that on November 11th the opportunity for shareholders to avail themselves of this offer would lapse it being intimated that after the date mentioned, the original certificates would have no value. The injunction proceedings were called at Osgoode Hall this week when George R. Rogers, the president, was unprepared to proceed with the argument and an adjournment was granted.

## Northern Ontario Letter

### THE SILVER MINES The Cobalt Area.

By eliminating all non-essential work it is believed the power situation at the mines of Cobalt will not become any more unsatisfactory than as at present. It has been found that the consumption of energy may be conserved very considerably by dispensing with certain branches of work. The curtailment of operations in connection with the re-treatment of tailings by oil flotation will be one of the big factors toward relieving the situation. This policy is usually followed out during winter months even under normal conditions. Another factor is that after the close of navigation on the Montreal River, the power company will be permitted to draw more heavily upon the reserve supply of water, and it is felt this will carry work through until the spring freshets set in. In the meantime, should soft weather still set in before real winter commences, the entire situation would become quickly adjusted.

For the month of October, according to the managers' regular monthly report, to the president and directors, the Nipissing mine produced \$184,578, and shipped bullion and residue from Nipissing and customs ore of an estimated net value of \$316,475. The report states that owing to "power interruptions", the amount of development work done during the period was considerably below normal. The report states that no new veins were discovered during the month, but that developments on old ones were generally satisfactory. The output for the month shows a decline from \$225,100 during the preceding period. This decline was partly due to the decrease in the price of silver, the October estimate being based upon silver at 82 cents an ounce as compared with 91 cents during September.

An average of close to thirty tons of ore are being shipped from the Peterson Lake mine, to be treated in the mill of the Dominion Reduction Company. In addition to this, underground work is proceeding as rapidly as the power supply will permit. The management is optimistic over the outlook and confident of a comprehensive scheme of development work resulting in success. The area still undeveloped is quite extensive.

The Crown Reserve Mining Company is stated to have secured an option on the old Farah property, more recently known as the Nipissing Extension. The Crown Reserve is also continuing its deep drilling scheme in which it is planned to explore the formation to a depth of about 2,000 feet. The drill is already down between 700 and 800 feet, working on an incline from the 500-ft level. The crosscut is also proceeding on its way toward the zone in which it is hoped to open up the continuation of the three high-grade veins opened up not long ago on the Kerr Lake, at a point within ninety feet of the Crown Reserve boundary, and running directly toward the Crown Reserve.

Operations have been temporarily suspended on the Beaver Consolidated. The reason for this is that the supply of power has been adequate only to operate at reduced capacity and in addition to this a break occurred in the crushing equipment which has also interfered with milling. These causes provide the reason for deciding to remain closed until repairs can be completed and pending the return to a more satisfactory power supply.

### The Elk Lake Field.

Announcement is made that the National Mining Corporation has taken an interest in the White Reserve mine, in the Maple Mountain section of the Elk Lake district. This important corporation has its head office in London England, and was incorporated less than two years ago, having a paid up capital of £2,500,000 for investment in connection with mining within the British Empire. Mr. J. B. Tyrrell, Toronto, is the company's consulting engineer for Canada. The plans of the company are to conduct a diamond-drilling campaign on the White Reserve, where silver showings are highly encouraging.

During the last 25 days of October, the Chambers-Ferland extended a cross-cut 140 feet from the 385-ft level of a shaft on the Right of Way Mine. This drive will ultimately be about 500 feet in length and will connect up with the main workings of the Chambers-Ferland. It is passing through highly promising prospective territory.

Silver mine operators are inclined to the belief that the January silver market will be marked by a substantial increase in price. This belief is based on the fact that Far Eastern demand usually attains its high point about that season. As an instance of such an influence was the sensational rise in January 1920, when the price of silver rose to the record price of \$1.37 an ounce.

New interest centers around the Mining Corporation, due to this important silver producer being interested in the exploration of the Flin-Flon mine in Northern Manitoba. Added interest attaches to the new venture owing to a statement issued by Charles F. Ayer, New York, in which it is pointed out the option holds good until March, and that up to the present time, the results have been quite as favorable as expected.

Mr. Ayer points out two questions which will have vital bearing on the final decision. First is as to whether the good results continue underground, and second is the question of a change in the Dominion mining law in which it is provided that refining must be done in Canada and that the Dominion Government has the option of imposing whatever royalty it desires.

The operators of the Flin-Flon recognize that they are confronted with a big problem in getting the enterprise under way. Enormous expenditure will be incurred. For that reason they believe the enterprise should be exempted from the royalty clause for a period of from 15 to 20 years and that after such time a definite maximum be decided upon so as to estimate its bearing on the economic operation of the property. In mining circles the request appears to be entirely reasonable. As regards release from the provision that refining must be done in Canada, it is felt that this might also be done for a limited period at least, say 10 years. This would enable the operators to proceed quickly with production and be able to realize income pending the determination of the extent of the deposit and the size of the refinery required on or near the mine itself.

### Request Is Reasonable.

In view of the great importance of the Flin-Flon enterprise to the economic development of that part of Northern Manitoba, mining men express the opinion that nothing should be permitted to impede progress, and the Canadian Government should be willing to make the temporary concessions requested, knowing that in the end the country will be in a position to

benefit in a maximum degree from the success met with in the meantime.

In regard to development work to date on the Flin-Flon, Mr. Ayer has this to say:—"We can say that the results obtained from development to date are fully up to our expectation. This fact, and the statement of our engineers that the diamond-drilling, on which the original ore-estimate was made, has been very carefully done, lead us to the belief that the grade and tonnage of ore on the property will be as high as anticipated."

**Ore British Shipments.**

During the week ended November 12th, four Cobalt companies shipped an aggregate of five cars containing approximately 382,011 pounds of ore. The Coniagas was the heaviest shipper with two cars.

Following is a summary:—

Shipper	Cars	Pds.
Coniagas . . . . .	2	168,977
McKinley-Darragh . . . . .	1	85,696
Nipissing . . . . .	1	67,338
Beaver . . . . .	5	60,000
<b>Total . . . . .</b>	<b>5</b>	<b>382,011</b>

During the corresponding period, the Nipissing mine was the only bullion shipper, sending out one of the largest individual consignments in recent months, made up of 183 bars and containing 250,065.68 fine ounces.

**THE GOLD MINES.**

**The Porcupine Area.**

At the beginning of this week, the mines of the Porcupine district took adequate steps to meet the power situation, and the plan adopted conveys re-assurance of steady operation. It has been arranged to reduce the power consumption about twenty-five per cent., and thus establish a rate which may be maintained throughout the winter. To offset this reduction, the leading mines are ordering a large amount of coal and will employ their auxiliary plants. As in the case of the Hollinger Consolidated, the company is stated to have arranged to order some 8,000 tons of coal and to have a part of it delivered by special train. In this way it is hoped to maintain operations at the present rate. The Dome and the McIntyre are also making arrangements to use all the auxiliary power possible.

These arrangements are calculated to assure steady operation throughout the winter, pending the freshets in the spring. At the same time, the peculiar nature of the present Autumn is not without promise of still bringing rain, in which case with the auxiliary power being provided, the mines would be enabled to speed up work to full capacity, and attain records in excess of anything so far in their history. The ore in sight, together with the milling equipment ready to operate, and the steady influx of men go to make up the reasons why a sufficient power supply would lead to great expansion in operations throughout this field.

Cross-cut work at a depth of 250 feet on the Porcupine-Keora has advanced about 200 feet, and with a little less than 180 feet remaining between the present face and the point where it is expected to encounter the first of two veins indicated by former diamond drilling. Circular information from the company brokers is optimistic, it being shown that the diamond-drill core indicated two wide veins in which gold values were high. Until such time as the veins are reached, however, it will be impossible to estimate the accuracy of the information so far available. The pro-

perty is equipped with a small steam-driven mining plant.

The labor problem at the Dome Mines has been solved to a large extent by the arrival of 109 Cornish miners, imported direct from the Old Country. These men arrived a few days ago and are already at work. They will work out a four months' contract at the Dome, and with the Canadian labor supply having undergone a favorable change, the question of procuring adequate working forces is lessened very considerably.

A report on the strength of which the deal in England for the sale of the Davidson Consolidated is being negotiated has just come to hand. It was prepared by R. C. Fielding, A.R.S.M. and is couched in most optimistic terms. It is addressed to the General Mines Investment (1920) Ltd., of London. Mr. Fielding estimates "probable ore" at 350,000 tons, with \$11 per ton in extractable gold content. He estimates costs at \$4 a ton, and thus indicates a profit of \$2,450,000.

**The Kirkland Lake Area.**

In common with Cobalt, from which district the Kirkland Lake field receives its electric power, the shortage of energy is felt more or less seriously. Arrangements have been made to reduce the current about 25 per cent. until the water in the Montreal River rises. With the close of navigation it will be permissible for the power company to draw more heavily upon the reserve supply, and even though no more rain falls it will be possible to continue operations as now arranged for. Should a thaw set in, normal rate may then be resumed.

A statement issued to the shareholders of the Kirkland Lake Gold Mining Company, under date of 9th November, states that the No. 2 shaft has been deepened from 700 ft. to 900 ft., at which depth a cross-cut encountered the ore zone 35 ft. wide.

"Drifting on this ore zone", states the Report, "we encountered assay values in sulphides from \$18 to \$42, and recently, in drifting on the foot-wall side, we encountered free gold and tellurides, special assays of which give values of \$34.70 and \$122.75, and channel assays across the face of the drift—five feet—average \$52.10." The presence of the ore-body at the 900 ft. level is believed to establish a proven body of ore of 700 ft. in depth. The mill is treating 110 tons of ore daily, but has a capacity of 150 tons daily. It is decided to deepen the main working shaft to 900 ft. from its present depth of 520 ft. Operations have been restricted by labor shortage, and also by shortage of hydraulic power caused by dry weather.

As a result of the completion of a large program of surface exploration on the property of the King-Kirkland Gold Mines, in the eastern part of the Kirkland Lake district, careful assays taken show comparatively high values, and the company is now in a position to select the most suitable at which to commence underground operations.

On December 3rd the Bourke's Gold Mines will be sold in Haileybury at public action, subject to a reserve bid. The property is situated at Bourke's Siding, some twelve miles north-west from Kirkland Lake. It is equipped with a small steam-driven mining plant and has generally been regarded as a promising mining prospect. Development work has been carried to a depth of 200 feet and one or two short ore-shoots opened up. The grade of the ore is quite high, although the deposit is narrow. In an endeavor to induce the stockholders to protect their interests, the Company

issued an appeal some months ago asking each shareholder to pay a certain amount per share to cover the debts owing, at the same time guaranteeing not to get into debt again. In view of the present announcement by the Sheriff of the district of Temiskaming it is believed the appeal did not meet with the desired response.

An injunction has been secured by minority interests in the Orr Gold Mines restraining Hamilton B. Wills of Toronto, as well as the majority interests in the Orr from transferring some 800,000 treasury shares of that company. The trial of the case will come up in due course. It has to do with an apparent endeavor of the Wills' interests to recoup expenditure incurred previously through the Kirkland-Prophyry Company which for a time held an option on the Orr and which subsequently went into voluntary liquidation.

An injunction has also been granted in connection with plans of the Wasapika Gold Mines of West Shining Tree to liquidate and exchange its shares for stock in the Wasapika Consolidated. The point objected to was the setting of a certain date, November 12th, as the final date on which recorded owners of shares would receive credit and specifying the intention of the Wasapika Consolidated to issue its shares to those holders of Wasapika who appear on record. It is said that large blocks of this stock is held by individuals who have never placed themselves on record.

## British Columbia Letter

### Stewart, B.C.

George Clothier, Government Mining Engineer, has returned after making a final tour of the Salmon River Section, Portland Canal, Mining Division. He expresses satisfaction with the progress made this season in the prospecting of this mineral zone, and in the development, both of new claims and other mining properties. He now is engaged in the preparation of his Annual Report.

The first winter's shipment of ore from the Premier Mine, Salmon Arm, took place a few weeks ago. Last winter's shipments totalled approximately 1,500 tons, and this year it is expected to double the output.

Gratifying reports are received regarding the development of the Silver Tip Group of mineral claims. It is said that thirty-seven open-cuts were made on the veins during the summer, and three tunnels driven an aggregate of sixty-eight feet. As a result important ore showings have been developed. The values include lead, zinc, and iron sulphides, carrying native ruby and brittle silver. The silver values in places are very high.

W. A. Meloche, managing engineer of the Algonic Development Co., states that ore will be shipped this winter from the Spider Mine, Salmon River, and that if the development planned shows up an ore tonnage equal to three times what is in sight, a mill will be working on the property by next July. With further reference to his Company's operations in the Portland Canal District, Mr. Meloche says:—

"We will carry on development at the Spider all winter and hope to make a mine there. Operation of the George copper group, Bear River, will be undertaken next year but to what extent will depend upon results.

"While we have obtained some satisfactory results here we have also obtained some unsatisfactory ones. But this is true of any camp. On the whole, I am very satisfied with what

has been done.

"I want to commend the Department of Mines and Department of Lands, and Hon. Mr. Sloan and Hon. Mr. Pattullo, for the way they went ahead and what they accomplished in this district with small appropriations. It was difficult work under difficult conditions. The transportation facilities provided put a country in a position to develop more than anything else.

"I am genuinely sorry to leave Stewart for I have received every courtesy and co-operation from the people."

The headquarters of the Algonic Development Co., have been transferred from Brussels, Belgium, to San Francisco, Cal.

### Anyox, B.C.

That the Hidden Creek Mine of the Granby Consolidated Mining & Smelting Co., has 11,000,000 tons of ore designated as No. 1, and containing 2.4 per cent copper, and 14,000,000 tons designated as number two ore containing about 1.25 per cent copper, is the effect of a report recently published. Smelting is said to be limited mainly to the No. 1 ore, but the No. 2 will become available after concentration.

### Prince Rupert, B.C.

H. A. Guess, President of the American Smelting & Refining Co., and now head of the Premier Gold Mining Co., arrived from New York recently to visit the latter property. He was accompanied on his trip north, by H. MacDonald, mine foreman.

### Nelson, B.C.

The Ottawa Mine, Springer Creek, is rapidly being put in shape for active operation and shipment of ore. The machinery for the tube mill is on the ground, and the cable for the tram is at the upper terminal, which has been finished. The latter will be about 2,000 in length. L. H. Biggar, the mine manager, is gratified by the progress made and is looking forward to the Ottawa becoming a regular producer in the near future.

### Trail, B.C.

Ore receipts at the Trail Smelter of the Consolidated Mining & Smelting Co., for the week ending Oct. 21st., totalled 9,239 tons, bringing a total for the year up to that date to 284,497 tons.

### Merritt, B.C.

A large clay deposit located near Merritt, has received special attention from Officials of the Department of Mines, Ottawa. It appears that it is a high class bentonite, and as far as known the only such body in Canada. There are deposits in the State of Wyoming occurring in connection with coal deposits similar to those of the Nicola Valley, B.C.

A sample of the clay has been taken to Ottawa for analysis, and the owners of the property are hopeful that the outcome will be the establishment of an important industry.

### Vancouver, B.C.

At a recent meeting of the Mining Committee of the Vancouver Board of Trade there was some discussion with reference to the falling off in British Columbia of the production of gold, the upshot of which is the unanimous endorsement of the following resolution which explains itself.

"Whereas the maintenance of the gold production is essential to the financial stability of the Dominion;

"Whereas this bureau therefore views with alarm the falling off in the national gold reserve at Ottawa and in the gold production of the Dominion;

"Whereas the latter condition is due to the abnormal cost of production under existing conditions;

"Whereas these conditions are intensified by the incidence of taxation;

"Therefore, the Vancouver Board of Trade urges on the Dominion and Provincial governments the necessity of action to encourage the gold production to the utmost, and offers the following suggestions:

(a) Removal of all taxation of gold mines and a customs duties on machinery and supplies not produced here and imported for use in the industry, until such time as cost conditions return to normal:

(b) Return to Canada of all gold produced from exported ore, the purchase thereof by the mint at Ottawa and the Dominion assay office at Vancouver. For all gold sold by these institutions for industrial purposes the selling price shall be such as shall cover the normal cost of production, such surplus revenue to be distributed among the gold mining companies in proportion to production."

In the hearing of the trial of Grant vs. Alexander estate, in which the plaintiff seeks to establish his right to a share in the Alexander Mine Property, Atlin District, some rather startling evidence has been submitted. A New York handwriting expert has declared that Captain James Alexander's signature to the declaration of trust, giving W. Pollard Grant a one-fifth interest in the property, is a carefully made tracing of the Captain's signature. It was positively stated that the signature on the trust agreements was copied from that on a check which had also been put in evidence.

Something has been learned of the terms of the settlement of the recent trouble in the eastern British Columbia coal fields and the mining centres of the Province of British Columbia.

It is understood that the day wage men have received an additional \$1.15 per ton which is along the lines of their demand. This no doubt will mean an increase in the price of coal in these fields. In fact information has come from authoritative quarters to the effect that both bituminous and lignite coal will advance 60c a ton at the Collieries affected.

Under amendments to the Coal Mines Regulation Act passed in 1919, the Minister of Mines of British Columbia is authorized to arrange for the appointment of a Minimum Wage Board. The powers given this Board include the definition of coal mining districts, within which it may carry on investigations as to the wage scale paid to coal miners.

It also may carry inquiry to the point of ascertaining, by means of evidence taken openly, general working and living conditions among the miners. Although this provision was made by the Legislature of 1919 it did not become operative until July of this year. Since then the Minister of Mines has been engaged in the work of organizing the Board. The Coal Mine Operators of the Province have selected George Wilkinson, Supt. of the Pacific Coast Coal Mines, Ltd., as their representative, and the coal miners now are busy choosing, by means of the ballot, their representative. It is understood that the Minister looks forward to having the Board well launched and able to commence its activities in the course of a few weeks.

The shortage of fuel oil is causing some concern to western transportation officials. The Canadian Pacific Railway is reported to be seriously considering reverting to coal for its locomotives. The Union Oil Company has a contract to supply the C. P. R. with oil until the end of the year, and is of the opinion that it can still

still continue to keep the Company after that. In view of the uncertainty, however, the C. P. R. men are making such arrangements that in the event of a definite shortage of fuel-oil they will be able to carry on without inconvenience. The Pacific Great Eastern has four locomotives that can be readily converted to coal burners. In the meantime this Company is fortunate in having secured a large reserve of fuel oil.

### THE NOVA SCOTIA COLLIERIES.

After protracted conference between representatives of the Nova Scotia District of the U. M. W., representatives from international headquarters, officers of the Department of Labor, and officials of the Dominion Coal Company, Nova Scotia Steel & Coal Co., and the Acadia Coal Co., a basis of agreement was reached which the miners' representatives have laid before the men for ratification, or otherwise, accompanied by strongly worded advice to accept.

The text of the proposed agreement is as follows:

After canvassing the situation from every angle, recognizing the importance of industrial peace in the coal fields at this time and with a full knowledge of both sides that the agreement of January 1920 was still in effect, it was deemed expedient in the interests of peace and harmony that something should be done to improve the existing labor situation. The representatives of the Dominion Coal Company, Ltd., Nova Scotia Steel and Coal Company, Ltd., each submitted the following, as its final offer:

Tonnage rates to be increased 10 cents per ton over present schedules. All datal hands to be advanced 55 cents per day above present schedule rates.

All local contract rates to be advanced 12½ per cent. over those in existence at the present time.

This agreement when approved by the members of District No. 26, United Mine Workers of America to become effective from the first of November, 1920, to November 30th, 1921, both sides to agree to meet at Halifax, twenty days before the expiration of this agreement for the purpose of arranging a new understanding.

The following provisions were also agreed to by the representatives of the companies and the men for inclusion in the new agreement which is to supercede the existing agreements, namely:

#### Management of Mines.

The right to hire and discharge the management of the mine and the direction of the working forces are vested exclusively in the company, and the United Mine Workers of America shall not abridge this right. However, the Company agrees not to discharge employees or refuse work to applicants on account of, or because, of their affiliation with the United Mine Workers of America. Employees shall perform such work as the management may direct.

#### Hours of Work.

Hours of labor to be in accordance with the provisions of the agreement of February 21st, 1919, in this respect as follows:

The collieries will commence to hoist coal at 7 a.m., at which time all the men must be in the mine.

The days work will cease at 3 o'clock when all arrangements will be available for conveying the men to the surface.

The surface men around the bankhead and screens associated with the handling of coal are to be on duty between the hours of 7 a.m. and 3 p.m. and for a short time after, if necessary for the purpose of attending to such duties as will facilitate their own work, such time not to exceed a half hour.

The standard of other surface labor around the collieries to be from 7 a.m. to 4 p.m. with half an hour for dinner.

There continuous attendance is required the shifts will be eight hours instead of twelve both surface and underground.

#### No Stoppage of Work.

No stoppage of work shall take place owing to any dispute arising at any mine under the jurisdiction of District No. 26, except for refusal of employers to pay wages on the regular pay day without satisfactory explanation, or danger to life or limb.

It is distinctly understood that no other grievance shall be considered where men suspend work to enforce adjustment and employees striking in violation of contract shall not be sustained in such cause.

The international organization and District No. 26 officials guarantee the fulfillment of this agreement and pledge co-operation and support in every legitimate way to maintain and encourage increased output.

**Duties and Limitations of Mine Committee.**

The duties of the mine committee shall be confined to the adjustment of disputes between the mine officials and any of the members of the United Mine Workers of America working in and around the mines arising out of this agreement or any local agreement made in connection therewith where the mine officials and said miner or mine laborer have failed to agree. Thereafter, the matter in dispute shall be referred to the district executive of the U. M. W. of America and the district superintendent of the company and the higher officials.

In the event of their failure to settle the matter it shall be referred to arbitration and the majority decision shall be final and binding upon all concerned.

If within ten days the representatives of the operators and miners fail to agree upon an arbitration when the selection of an arbitrator shall be made by the prime minister of Nova Scotia who shall make such selection on within ten days and such selection shall be final, miners to continue to work from the inception until the final adjustment.

**Funerals.**

It is recommended that the operators and miners executive draft a suitable rule to govern the operation of the mines in the event of fatal accidents and funerals.

**Housing.**

Housing and rental are not part of this contract. However, we recognize the necessity of improving the housing conditions in the mining centres but would respectfully refer the subject back to the management and those who may be affected and recommend that in looking toward betterments in improved housing conditions that where substantial improvements and extensive repairs are requested by the occupants and the same are made that such rental charges covering such substantial improvements and extensive repairs be mutually agreed to between the officials of the company and the parties affected.

**Price of Miners Coal.**

It is recognized that the price charged miners for house coal has not been in keeping with the cost of production and it is felt that in future the price to the miner for his own use must be considerably advanced and for this reason the price where it is less fixed at \$2.25 per ton at the mine or coal yards.

Where it is necessary to transport the coal from the mining centres over a railway in order to make delivery, the cost of said transportation shall be added to the above price.

Comparison between the terms of this agreement, and the working conditions demanded before the Royal Commission, can be made by reference to the "Journal" of 30th July, page 621.

In commending this agreement to the acceptance of the workmen, the President and Secretary of the Nova Scotia District, after detailing the declining trend of business, the difficulties under which the U. M. W. is laboring in the United States, and the reduction in coal selling prices at United States mines, state that the miners in Nova Scotia have the choice of two courses, namely:

"(1) A strike under the adverse circumstances outlined, which would in our opinion jeopardize the life of our organization, and all the gains made during recent years, or

"(2) Accept as a settlement the proposed contract, which we have been, with the assistance of the international union, able to negotiate, after conferences held both in Montreal and Indianapolis, and thus preserve all we have gained."

The terms of settlement have been under discussion by the Wage Scale Committee of the District, and the question of acceptance or rejection is to be decided at a conference of delegates from the locals to be held on the 16th November.

### PHYSICAL CONDITION OF THE HOLLINGER CONSOLIDATED GOLD MINES.

By J. A. McRAE.

Now that the general economic conditions are improving, and steadily moving toward at least a gradual solution of part of the problems which have made gold mining difficult in recent years, the time seems opportune to review the status of the Hollinger Consolidated Gold Mines in its physical aspects.

The Hollinger has produced a little over \$37,000,000 to date. In doing this, not far under 4,000,000 of ore has been treated.

As against these figures, the ore reserve as of the beginning of this year amounted to 4,388,940 tons containing \$39,894,770.

These total figures show that the amount taken out and that placed in sight aggregate at least 8,250,000 tons containing a total of something like \$77,000,000.

Such figures in themselves are exceedingly impressive, but are made doubly so when the general physical condition of the mine in all its aspects are taken into consideration. For instance, these figures deal only with a total of 38 veins which have been developed underground, and only contain estimates of ore to a depth of just 100 feet on 39 other known veins which have been opened up to a limited extent at surface. In reality, the big achievements on the Hollinger are the result of work on approximately one-half of its known veins.

The importance of the 39 veins awaiting develop-

ment is apparent from the fact that they are officially declared to range in width from 4 ft. to 25 ft., and the average gold content is estimated at \$9.88 to the ton. One of these veins is over 11 ft. wide and carrying average gold values of \$23.50 to the ton. Another is 16½ ft. wide and carries an average of \$20.30 to the ton. As a matter of fact, the average value in these 39 undeveloped veins as shown at \$9.88 to the ton is actually higher than that found in the 38 veins being developed which average \$9.09 to the ton.

It would perhaps not be in keeping with sound business for the Hollinger officials themselves, to indulge in advance expectations, but to the general observer who endeavors to analyse the physical status of the mine, it is permissible to deal with these enormous potentialities. One half of the known veins having proved to continue rich to great depth, it would be unreasonable to suppose the remaining half do not do likewise.

Another factor having an important bearing on the future outlook is the development at depth on the McIntyre-Porcupine mine, which lies right beside the Hollinger, and in which gold values have been found to increase as greater depth is attained. Indeed on the McIntyre at a point below the 1,000-ft. level, what is

believed to be the continuation of vein No. 4 on the Hollinger, has been encountered and contains high-grade ore over great width. This vein where it occurs on the Hollinger was estimated at the beginning of this year to have \$5,786,590 in ore reserves, above the 800-ft. level. Below this point very little work has so far been undertaken, but from the results on the adjoining McIntyre, the prospects below the 800-ft. level on the Hollinger warrant optimism.

Of the total estimate of 4,388,940 tons on the Hollinger, containing \$39,894,770 in ore reserves, the entire amount (with the exception of 306,920 tons containing \$2,433,480) lies above the 800-ft. level. These facts show that the \$77,000,000 so far mined or placed in sight is contained in only one-half of the known veins, and these developed to no great extent below a depth of 800 feet.

Geological conditions, as found by diamond-drill tests, are said to undergo no change as so far tested to a depth of over 2,000 feet. Actual developments on the McIntyre-Porcupine show high-grade values over extensive areas at a depth of around 1,600 feet. There fore, as a consequence of all this, it seems certain the Hollinger Consolidated is only in its early stages of development.

Adverse economic conditions have retarded progress on the Hollinger. Since the completion of its mill, adequate to treat from 3,000 to 3,500 tons of ore daily, at no time has it been possible to procure a full supply of workmen. Nevertheless, development work has been

A Recent View of the Hollinger Mine.

maintained, ore reserves have not been depleted and the conditions of the mine is such as will make it possible to take full advantage of favorable conditions whenever they materialize.

This period seems to now be in sight. Warnings in certain of the leading cities for men to seek employment elsewhere, and the expression of fear over the possibilities of a "bread-line" in such centres, indicate a more plentiful supply of workers for the gold mines, and resulting increase in production.

The recent achievements on the Hollinger are the result of working at not much more than half capacity. Results of capacity operating should be most satisfactory.

**NEW MAP OF THE FLIN FLON LAKE MINING DISTRICT.**

We have received from the Surveyor General of the Topographical Surveys Branch at Ottawa copy of a new map of the Flin Flon Lake Mining District — which lies partly in Manitoba and partly in Saskatchewan. The map shows all the surveys of this district, and is issued to meet a general public demand. It is sold by the Department at a nominal price of five cents per copy. Scale is one mile to one inch.

### NEW MAP OF THE FLIN FLON LAKE MINING DISTRICT.

## PLAN INSTRUCTION CLASSES FOR ONTARIO PROSPECTORS.

### Ontario Department of Mines Takes steps to Aid Prospecting.

What is regarded in Northern Ontario as a commendable scheme to establish "Prospectors' Classes" at strategic points in the North, is announced by Thos. W. Gibson, Ontario Deputy Minister of Mines.

It is planned to commence these classes as soon as possible after the New Year, Dr. W. L. Goodwin of Queens University being in charge. In view of mining Schools being already established at Haileybury and Sudbury, it is believed these two points will offer ideal conditions under which to commence such Prospectors' Classes.

The Mining Recorders, Secretaries of the High School Boards and Instructors in the Mining Schools mentioned, are being advised in connection with the scheme, also the Prospectors' Association and Miners' Unions of the various mining camps throughout the Province.

The statement announces that the Minister of Mines, Hon. H. Mills, is desirous of carrying on instruction classes for prospectors at the various mining centres where sufficient interest is shown to justify the undertaking. It is the intention to place at each of these centres an instructor competent to give an outline course in geology, particular reference being given to the principal rock formations with which economic minerals are associated. A collection of minerals will be used for illustration purposes, and an opportunity afforded for all who take the course to familiarize themselves with these specimens and their mode of occurrence.

Evening classes cannot be started advantageously until March, in order that mineral-spotting may proceed in daylight. Day classes are preferable if it is possible to arrange for same. The course will be of two weeks' duration, or longer if conditions warrant. In centres where High Schools or Collegiate Institutes are located and laboratories are available, blow-piping instructions will be included. A minimum attendance of ten persons will be necessary in order to justify the holding of a class.

The foregoing briefly outlines the official information coming from the Deputy Minister of Mines, and mining men recognize in the plan a movement calculated to greatly benefit prospectors in the mining areas. The addition of even a little technical knowledge to the information gathered by practical experience is expected to be very beneficial. Not only this, but men desirous of engaging for the first time in prospecting may in this way educate themselves in respect to the rock formations most favorable for the occurrence of economic deposits.

Apropos the course of lectures to be given by government mining engineers of British Columbia this winter under the auspices of the Department of Mines it is announced that the subjects to be dealt with include Chemistry, Mineralogy, Lithology and Geology. Elementary discussion of these subjects, for the special benefit of prospectors and those wishing to become prospectors, will be followed by a lecture on the general process of the formation of the earth; another on igneous rocks and their origin, and a third on ore deposits.

## EXTENDED Service To Our Advertisers.

Realizing the Development which is bound to take place in trade between Canada and the United Kingdom, the

**Industrial & Educational Publishing Co., Limited** will open its own office in England early in January.

Mr. C. H. Armstrong, Jr., who will be in charge, has investigated trade conditions in Canada from coast to coast.

Any advertiser or subscriber who is anxious to make connections as a representative of firms in the United Kingdom, is invited to communicate with Mr. Armstrong, The Canadian Mining Journal, Gardenvale, P.Q.

**This Service will be

Charge.**

### ONTARIO MINING TAX ACT.

#### Decision of the Mining Commissioner "in re" Appeal of Canadian Copper Company Against Assessment and Tax Levied Under the Act.

The Canadian Copper Company, a subsidiary of the International Nickel Company, appealed against the assessment of profits and the amount of taxes levied by the Mine Assessor for the year 1918 and subsequent periods.

The Tax Act was amended in 1917 in regard to the method to be used in arriving at the taxable profits of nickel and nickel-copper mines, and it was the contention of the Canadian Copper Company that not only were certain specified mining costs to be deducted, but that a further allowance should be made "of the actual cost of marketing the metal, or other product, and of each process by which the metal or other product is refined and treated." It was further contended that the taxes assessed in the United States, where the product of the appellant is refined, forms part of the marketing costs and is properly deductible from profits for purposes of tax assessment in Ontario.

The Mining Commissioner, Mr. T. E. Godson, K.C., finds against the appellants, expressing in his judgment the opinion that the Tax Act specifically details all the allowable deductions, and that the deduction of United States taxation is neither allowed nor contemplated by the Act.

Mr. Godson states "The sole issue before me is can a profit tax levied by the Government of the United States against the appellant Company, or the International Nickel Company, be considered 'a cost of marketing the metal'."

"It will be observed the words used are 'actual cost', not 'expenses', 'payments' or 'allowances'. The words 'actual cost', are used, however, in the statutory deduction clauses such as actual cost of transportation, working expenses, cost of supplying power and light, hiring horses, the actual cost of explosives, insurance upon the mining plant and work done on the mine. In each case it is the cost of the particular work done, the specific article purchased, cost of proper insurance, or as the case may be, as in clauses A to J contained. There is no room for speculation as to what shall be allowed as a statutory deduction as they are definitely and specifically named in clauses A to J and sub-section 3 of Section 5 further ties the hands of the Mine Assessor by stating, 'No other expenses, payments, allowances or deductions shall be deducted and made' except as provided in the case of nickel mines by the provision of clause 3a. From the above I gather the import of the words 'actual cost of marketing'. The language of the sub-section must be taken to mean exactly what the words imply in the light of the intent running through the clauses of the Act under consideration and that is the actual cost have been provided for and allowed; even a profit tax has been provided for by clause 'J' but it is only deductible when taken by the Parliaments of Great Britain and Ireland or the Dominion of Canada.

"While clauses B and C of sub-section 3 (a) are separate and distinct in their several methods of arriving at the profit tax they are properly read together as part of a definite scheme of fixing the basis of the tax with reference to nickel mines and so read elucidate the meaning and construction of the words 'cost of marketing'."

"I find no insuperable difficulty in determining the meaning of the words at issue because all allowable deductions have been provided for by the Act up to the stage where the metal is ready for sale. The assessor is only concerned with the cost of marketing. He has allowed statutory deductions with reference to mining, roasting, smelting, converting and refining. Clause 'J' negatives the right of allowance of a tax levied within the United States. It breaks new ground when allowing the deduction of a tax payable on profits taken by the Parliaments of Great Britain and Ireland or the Dominion

of Canada. 'J' and S.S. 3 (D) seem therefore to refute and work against the argument of the appellant company.

"In my opinion the tax is not a cost of marketing any more than it could be said to be a cost of each process by which the metal is refined.

"I can vision a foreign state taking all the profits and there would be if the tax as contended for is deductible no provision under the Act as now framed to preserve to the Province a share of the profits. Such a contingency is however provided for in S. S. 3 (D) in the case of the imposition of a War Tax in Great Britain and Ireland by fixing a minimum tax of not less than 3 p.c. This sub-section again emphasises when and where a tax imposed outside this Province may be allowed as a deduction.

"In Mr. Osler's very thorough and earnest argument he referred to the fact that if this tax was not deducted as 'a cost of marketing' it would not be a tax upon the profits but upon the gross receipts of the Company.

"The answer to this contention is found I think in clause (C) of S. S. 3 A 'and the balance' after making the said deductions and allowances, shall be deemed and taken to the annual profits of the mine.' Whatever the tax is in effect it is deemed to be a profit."

"This appears to be a case that might properly be taken to the Minister under Section 22 of the Mining Tax Act. It in part says 'where owing to special circumstances it is deemed inequitable to demand payment of the whole amount imposed under this Act the Minister may compromise the matter by the acceptance of such amount as he may deem proper'; The tax levied by the United States undoubtedly absorbed a part of the profits of the Company but whether it is inequitable to disallow it as a deduction is a matter now for the Minister."

Following the dismissal of its appeal, the International Nickel Company has paid to the Province of Ontario the sum of \$504,000, being taxes due in 1920 and arrears for the years 1918 and 1919, amounting to over \$300,000.

### BOOK REVIEW.

**MINE BOOKKEEPING.** A comprehensive system of records and accounts for mining operations of moderate dimensions. Robert McGarraugh. Cloth boards. 9 by 6 ins.; 118 pp., with index. McGraw Hill Co., New York.

This work is evidently compiled by one who has a good grasp of both operating and accounting details in metal-mining enterprises, and it is designed to cover the bookkeeping of mining operations of modest size. The writer agrees with Gillette and other competent writers on unit costs that "the segregation and distribution of cost data is essentially an engineering undertaking," and states that mine costs, if left entirely to clerks, will develop into a cut-and-dried thing of no value. That the writer has been behind the scenes is evident when he pleads for a simple set of accounts, with accurate classifications, which he states "is of incomparably greater value for the analysis of costs than an elaborate subdivision, the details of which have been largely approximated or guessed at." The importance of daily records are insisted on, monthly statements being properly classed as "past history." In many cases they are worse than that.

Correct opinions are expressed regarding amortization, depreciation and the distinction between capital and operating expenses. There are rules applying to these things, although mine executives and presidents delight to make hash of them.

We note that the scheme of classification of operating expenses is based on operations, such as "tramping," "timbering" and "breaking ground," to which we take exception, believing that a simpler and more effective classification is into classes of labor,

as "trammers," "timbermen," etc., but this is an expression of personal preference, and is not accepted practice.

The book may be taken as a correctly written manual of mine accounting for mines of moderate size, and it is fully illustrated by specimen forms which can be adapted to suit the varying necessities of differently conditioned operations.

F. W. G.

**USEFUL MINERALS AND RARE ORES.** Practical Instructions in the Search for and Determination of the Useful Minerals, including the Rare Ores. Alexander McLeod. Second Edition. John Wiley & Sons, New York, 6½ by 4 ins., limp leatherette backs. 254 pages with Index.

This little book, first compiled in 1913 and re-issued in 1917, is from the pen of a Cape Breton prospector with much practical experience in the field. The book is intended to be a field guide to persons without extensive technical knowledge, although it is not an elementary treatise except in the simplicity of the wording and the tests for minerals that are recommended. It is the aim of the book, states the author, "to furnish severely simple, but fully dependable, means by which anyone can determine the useful minerals." Himself a practical prospector, the author has written an understandable volume that contains much meat and little non-essential trimmings, and the simple tests suggested should be of such value to the prospector "remote from more refined methods in the fastness of the everlasting hills." The author states that he has drawn freely from acknowledged authorities in compiling his volume, but this fact in no wise detracts from its usefulness, which lies in lucidity of wording and arrangement, and in its application to the requirements of the average prospector. The book would form a handy textbook for prospectors' classes such as are being held under the auspices of the provincial departments of mines in several provinces.

**METAL QUOTATIONS.**

Fair prices for Ingot Metals in Montreal Nov. 17th, 1920. (In less than carload lots).

	Cents per lb.
Copper, electro . . . . .	19¼
Copper casting . . . . .	19
Tin . . . . .	46½
Lead . . . . .	8
Zinc . . . . .	8¾
Aluminum . . . . .	34
Antimony . . . . .	8

**COAL PRICES.**

St. John, N.B.—The Dominion Coal Company on November 10th advanced its price here for bituminous coal from \$12.25 to \$13.25 per ton delivered. Anthracite sells at \$20.50 delivered.

Fredericton, N.B.—Anthracite is quoted at \$20.00 per ton delivered. Recent prices for anthracite have ruled as high as \$25.00 per ton.

Toronto, Nov. 16.—Navigation has practically closed down and so far there has been no apparent change in the situation, with receipts very meagre and business correspondingly dull. The price of hard coal remains unchanged. Bituminous mine run is quoted at from \$10.00 to \$11.00 with bituminous slack slightly easier. Smokeless is still selling at from \$10.50 to \$11.50. Bituminous lump coal is scarce. Hard coal is quoted at from \$8 to \$16.00 at the mines.

**TORONTO MINING STOCKS**

Following are the average quotations for active gold, silver and oil stocks, on the Standard Mining Exchange, for week ending 13th November, 1920:

	High	Low	Last
<b>SILVER</b>

**BRITISH APPLICATION OF ASBESTOS.—USES IN INDUSTRY AND WAR.**

(Communicated by Turner Bros. Asbestos Co., Rochdale, England).

Beyond the fact that the word Asbestos suggests something of a fireproof nature, the general conception of this marvellous production of inorganic nature is of a very hazy character. As a matter of fact, it is extremely doubtful whether even the user of Asbestos, in one or other of its multitudinous forms of manufacture, has any idea of the extent to which the industry has grown.

To enumerate only the "Group" headings, into the composition of which Asbestos enters, results in a formidable list, including fibre, yarn, cloth, webbing, listing, tubing, braiding, sheeting, jointing, compressed Asbestos fibre rings and joints, millboard, paper, tubes, packings of all kinds for high pressure, superheat, for medium and low steam pressures, for hydraulic and feed pumps, for ammonia and acid pumps, packings with and without rubber, some metallic and some non-metallic. In fact, the variety appears to be

almost endless. Then, it is used in the manufacture of such goods as catalyser nets for oleum, gloves, suits, leggings, aprons, iron-holders, rings for arc lamps, lamp shades, Asbestos-faced beltings and other articles of a special character, mainly of interest to scientists, the laboratory, etc.

In the second category, under the heading of "Pipe and Boiler Insulation," appear sectional blocks, locomotive lagging, sectional pipe coverings, bulkhead linings, Asbestos mattresses for locomotives and marine boilers, etc., Asbestos fibre rope, Asbestos composition, flange and valve covers, etc.

Under the third heading is found an infinite variety of goods made of Asbestos-cement, including building materials such as sheets, slates, tiles, partitions, shutters, doors, etc. These materials are rapidly gaining favour as proof of their weather-resisting properties become more apparent to the building industry generally. Asbestos-cement materials are suitable alike for factory, hospital, barracks, villa, garage, or cottage construction. The architect, moreover, has at his disposal a large variety of tiles, also ridging, etc. of a more or less decorative character.

The part played by Asbestos in the great war was an amazing one. As Asbestos shields on warships, mattresses made of Asbestos saved many lives from the dangers of flying fragments from the guns of small craft, including submarines firing under the cover of smoke clouds and fog. All exposed positions, whether around the guns, the bulwarks, gangways, or other parts of a warship, which have to be continually traversed by the men during action, are well protected by Asbestos mattress shields.

In the stokehold of the battle-ships also Asbestos is found in the shape of jointing rings or gaskets, insignificant rings the use of which can only be appreciated by those who have a more or less intimate knowledge of the working of the engine rooms and stokeholds. Upon the accuracy of these jointing rings depends the high degree of efficiency in steaming. Thousands of these little rings are used in the boiler equipment of a single battle-ship. Any leakage from tubes due to defective rings means enormously increased work, to the point of exhaustion, on the part of the stokers, and what is of still more serious consequence, decreases the speed of the battle-ship. Until these rings were discovered, the naval water-tube boiler never attained its 100 per cent. efficiency, which is now established as the rule.

In the form of packing, Asbestos is comparatively well known. It prevents the escape of the driving force, whether as steam or any other pressure, from stuffing boxes, piston rods, and valve spindles, etc., while allowing easy movement without undue friction. The properties which make Asbestos so valuable in this case are that, whilst it is flexible and of a fibrous nature, it is indestructible by heat conditions. Its coefficient of friction is low, consequently a minimum amount of wear and loss of power takes place. As packing, Asbestos has been used more extensively than in any other way up to the present time.

Asbestos in the form of compressed Asbestos fibre jointing is also used on the principal joints of the auxiliary propelling turbines and plant, and the hydraulic machinery which operates the huge guns; also in regard to the torpedo tubes, and all deck gear, its importance may be realized when it is stated that upon its reliability depends the immediate operation of all the machinery for a sea battle.

In the form of fibre and fibre rope, commonly called Asbestos fibre-filled rope, it is used for covering pipes in battle-ships, the object being to maintain the steaming efficiency of the plant by the prevention of condensation and the dissipation of heat, and also to reduce the consumption of coal.

Asbestos, combined with cement in conjunction with Asbestos corrugated paper, is used for bulkhead linings, *i.e.*, the inside partitions, gangways, cabins, etc., are covered with this material for its insulating properties, with a view to maintaining an even temperature under varying conditions, and also for the prevention and spread of fire. This material is largely replacing wood for the purposes named in all modern battle-ships.

In the form of a metallic cloth, Asbestos was used to make gun "grips" to protect soldiers' hands from the heat of the rifle barrels. Many hundreds of thousands of such "grips" were provided for service during the Great War.

At home also Asbestos in the form of woven nets is used in the manufacture of chemicals for high explosives, the nets being put through a special chemical process necessary for the production of oleum, or fuming sulphuric acid.

For some years prior to August, 1914, the quantity of Asbestos products of British manufacture sold in the home markets was much in excess of the total imports from all other sources, and afterwards the imports formed a very small proportion of this country's requirements. At the same time, British manufacturers were exporting very considerable quantities to the Colonies and foreign countries, including those highly protected, in open competition with the products of Germany and Austria.

There are only a very few bona-fide British manufacturers of Asbestos goods. It is quite a mistake, however, to assume that British firms—though few—have been either insignificant or backward from the scientific standpoint. In the latter connection, particularly, credit is due to one of the pioneer British concerns, in that tests of the goods manufactured by the firm have proved British products to be of superior value to those of German manufacture for many years past.

Following these tests, and before the war, *i.e.*, in 1910, the British Admiralty made their own tests of British products, and approved them for use throughout the Navy in preference to those of foreign manufacture, the use of the latter being then discontinued.

#### B. C. MINERAL EXHIBIT FOR OVERSEAS.

It has been decided to assemble a representative exhibit of the minerals of British Columbia for display in England and on the Continent. This exhibition now is being prepared. It will be the best that ever has been got together for the purpose of illustrating the mineral resources of the Province. A considerable part of it already is in shape for shipping and the whole exhibit, it is hoped, will go forward very shortly. International Exhibitions of importance are being held in England and different centres on the Continent and it is considered imperative that there should be a representative display of the mineral resources of British Columbia available for use on such occasions.

## EDITORIAL

### *THE OCCURRENCE OF GOLD IN THE RAND BANKET.*

A paper by Mr. H. Pirow, Government Research Scholar, South Africa, dealing with the "Distribution of Pebbles in the Rand Banket and other Features of the Rock" is referred to in a recent issue to hand of the "South African Mining and Engineering Journal" which contains interesting speculations on the origin of the Rand Banket, particularly with regard to the distribution of pebbles in the banket, the presence or absence of which, Mr. Pirow concludes, has hitherto been erroneously used as a basis of correlation. Mr. Pirow's observations, which were conducted at the instance of the Research Grant Board, and by the assistance of a scholarship awarded for the purpose, are stated to strengthen the arguments for a placer origin of the gold in the banket. The main points brought out are "the fairly wide-spread occurrence of gold values in the banded pyritic quartzites, which may be regarded as originally layers of auriferous black sands, and the distribution of pebbles corresponding to that found under deltaic conditions". The evidence against the infiltration theory is that the pavability of the reefs is by no means dependant on the presence of a specific kind of foot-wall, and that the gold in the banket is not normally associated with any particular mineral or igneous intrusions.

### *THE NEED FOR CO-ORDINATION OF GEOLOGICAL DATA.*

The remarks, above referred to, of the "S. A. Mining and Engineering Journal" regarding the occurrence of gold in the Rand Banket, are of interest because of the very different conditions of origin usually ascribed to Canadian gold occurrences, but the general remarks which our contemporary takes occasion to pass on the study of geology on the Rand are quite pertinent to Canadian conditions, and conditions elsewhere.

"There are two facts that strike the student of geology," writes the "S. A. Journal", "the first being the amount of fresh information continually avail-

able in the ever-growing area under exploitation in the mines, and the second the urgent need of gathering and co-ordinating data often noted by mine officials, but as frequently lost to geologists owing to the lack of a definite system of compiling geological records. It appears anomalous that mining officials should be forced to have recourse to the journals of scientific societies for geological information concerning the very properties on which they are employed."

Fortunately, in Canada, the institution of a central bureau for the gathering of geological statistics, which is suggested for the Rand, is not necessary, as there already exist in the Canadian Geological Survey and the provincial departments of mines—notably in Ontario and British Columbia—a repository for geological data which is being daily added to by a whole-hearted co-operation between these institutions and mining engineers and prospectors.

Nevertheless, there is quite a lot of information that is lost, particularly in those provinces that have not as yet any separate department of mines. In Alberta, Saskatchewan and Manitoba, many deep wells and other excavations revealing the nature of the strata have gone unrecorded, and an interesting note made at the Winnipeg Meeting of the C. I. M. & M. was that steps were being taken to record the sinking log of all government wells. This does not, of course, cover privately-sunk wells, and some steps seem desirable to secure records of this not-less important information.

Probably the most-neglected province in Canada in regard to mining and geology is New Brunswick, and, so far as we are aware, apart from the records of the Geological Survey, no provincial officer is charged with the preservation of the records of the quite numerous borings that have been put down in this province. Singularly enough, some of the earliest names on the geological roster of Canada are associated with New Brunswick, but, apart from the persistent endeavors of a handful of local men who believe in the mineral possibilities of the province, it has been passed over. To some extent, this is the

fault of the people of New Brunswick, who like the people of Newfoundland, have not yet seen the advisability of entrusting the oversight of their mineral resources to scientists.

It may be safely stated—without exaggeration—that there is no province of Canada (except Prince Edward Island) that can profitably dispense with a competent department of mines.

There is no more hopeful aspect to the mineral industry in the western provinces than the fairly general delegation of the oversight of mineral resources to men of scientific attainments.

The agricultural frontiers of Canada are now well within sight. The day of the pioneers of settlement and transportation is coming to a close. What is now needed in Canada is the scientific pioneer. Many of our mineral deposits must await for their development not alone the axe of the explorer and the advance of the railhead of communication, but the development of processes, the linking up of ascertained geological facts, and a general enlargement of the staffs of the technical departments of the federal and provincial governments.

There is not yet available, for example, a really worth-while text book on Canadian Geology. The nearest approach to such work is the admirable sketch of the Geology and Economic Minerals of Canada, by Young and Brock, published in 1909, but that is over a decade ago, and, as the authors explained, that work was but a sketch, and was published when, in Dr. Brock's words, "the mining industries of Canada may be said to have only just begun."

#### PRESIDENT WILSON.

Mr. T. A. Rickard, in "Mining & Scientific Press," writes in a recent issue regarding the Chief Executive of the United States, in words that have a proper ring of sincerity and sympathy.

"With most of his policies we were never in sympathy," writes Mr. Rickard, "for his irresolution before we went to war we had a feeling of resentment; we did not respond to his idealism and we did not admire his obstinacy, but he has played a great part in human affairs, and he has devoted himself with intense sincerity to the service of his country, therefore at this moment he seems a nobler figure to us than any of his detractors. . . . He sacrificed his health and his political career for the sake of the idea that was nearest to his heart. Today he is broken, humiliated, all his hopes shattered, all his policies frustrated, all his dreams ridiculed. We salute him with the deepest respect and the profoundest regret."

A finely conceived and courageous statement, which we believe the writer will read with increasing satisfaction as the passage of Time places Mr. Wilson in his proper elevation as a great man who played a great and decisive part in a battle of giants that closed an era of history. We are too near the event to assess Presi-

dent Wilson's place in human affairs, but it is within the bounds of possibility that like Lincoln, his memory may survive the ephemeral spleen of a passing moment and become enthroned in the Pantheon of his country. Two years after the Armistice, the news of which sent a world crazy with ebullient joy, it is remembered by some, and apparently forgotten by others, that it was on Mr. Wilson's fourteen points that Germany capitulated. Great as was the military power of the United States, enormous as is her wealth and educated population, history will state, we venture to assert, that President Wilson's personality, projected into European affairs through his category of the "fourteen points" did more to cause Germany and her allies to "crack up" behind the lines than did the pressure of the armed forces of the United States.

It is also within the bounds of possibility that in the years to come the "fourteen points" will overshadow the Constitution of the United States, which is the more probable, as they were founded upon that Constitution, being its modern exemplification; and were animated by the same spirit that urged those who wrote the Constitution and put their lives in jeopardy to defend it.

With no less respect do we salute President Wilson.

#### THE FIREBOSS.

A paper read before the Rocky Mountain Coal Mining Institute by Mr. D. Harrington, of the U. S. Bureau of Mines, on "Duties, Trials and Difficulties of the Coal-Mine Fireboss" touches a sore point in coal-mine organization. Mr. Harrington notes that the "fireboss," (which is the rather inelegant designation of the mine examiner) is a man of whom much is expected and to whom little is given. He is expected to cover much territory, in inadequate time, so that "he must travel at a rapid rate, or even run." Careful examination is in many cases quite impossible within the specified time and examination area. On his conscientious discharge of his duties depend the safety of many men, and yet the fireboss is given little executive authority, and much manual and unskilled labor is required of him that could better be delegated to an ordinary laborer. As to the wages paid the fireboss, Mr. Harrington makes a statement that is precisely correct, namely:

"In many coal mines the fireboss is paid by the day, like an ordinary mine laborer, or he receives a stipulated monthly salary, but deductions are made for days of absence from duty. This practically puts him on a basis of daily pay. Yet the fireboss receives in many mines a remuneration below that given common labor, and certainly far below that received by contract miners. Also, whenever the general wage scale is increased, only too frequently the fireboss, in common with other so-called salaried men, continues on the former schedule, although this may be even at that time, low compared with that which other workers receive."

Under these conditions it is not surprising that it has been found difficult to get good men to accept the onerous and ill-requited duty of the fireboss, who, as Mr. Harrington writes, has "practically no other authority than recommendatory, with practical exclusion from actual operations, generally with inadequate pay, abnormal working hours, and heavy responsibility as to both lives and property."

The tendency has been to fill the position of mine examiner with men who are debarred from other work in the mine by disinclination or inability, though the work of the mine examiner calls for physical and mental strength, and executive initiative in full measure. In addition, the fireboss should be technically trained in all matters connected with mine gases, dust dangers, electrical dangers, blasting and ventilation. That this is far from being the case is notorious.

In Canada, it is pleasing to note that provincial mining laws in a number of instances have recognised the anomalous position of the mine examiner, and one large coal company has taken steps to raise the status of the mine examiner to that of a really responsible official, and has also undertaken to make the remuneration such as will attract good men.

The position of fireboss should be considered to be a rung in the ladder of promotion to that of mine manager, as the duties not only require men fitted by mentality and training to fill official positions, but, when conscientiously carried out with understanding and a commensurate sense of responsibility, they develop such a type of man.

In ten out of sixteen colliery disasters investigated by Mr. Harrington, he lays the blame on faulty inspection by the fireboss, and expresses the opinion that the chief fault in coal mine inspection lies in the inadequate status given to this pseudo official in the organization of the mine.

The fireboss has too frequently been regarded as an official when responsibility for disaster was to be assessed, and as a day-laborer, unsupported by his fellows, when wages and hours were being decided.

The indeterminate status of the fireboss, and his unattractive wages, are very largely to be blamed for the paucity of aspirants to official positions at coal mines, and taken all in all the treatment accorded to the fireboss has been shortsighted, and provocative of much discontent and much inefficiency in production.

---

#### *MINES ACT ADMINISTRATION IN ONTARIO.*

There appears to be some danger, judging from a communication appearing in this issue from Mr. J. A. McRae, of Cobalt, that the mining men of Northern Ontario and the Minister of Mines may drift into a position of mutual misunderstanding, if not antagonism.

The opinion is fairly widespread among technically trained mining men that no one is so properly qualified to administer a mines department as one of themselves. Nevertheless, the obvious wisdom of giving the oversight of technical matters to a person who knows something about them is a counsel of perfection to which democratic governments have not as yet attained, and until mining men undertake the distasteful, but necessary, part of citizenship that includes political office, this elementary notion will never gain general acceptance.

The Minister of Mines of Ontario informed the fraternity, in meeting assembled at Toronto last March, that at one time he had swung a pick underground, which makes him an initiate of the honorable craft for which this journal aspires to speak. With such antecedents, it strikes us that Mr. Mills would welcome any reputable medium through which he could avail himself of the advice of the men actually engaged in the mining industry, previously to taking action under the powers of his office. The suggestion of periodical conferences made by our correspondent would seem to afford such a medium, and is in line with a request preferred by the mining men and prospectors of British Columbia to the Minister of Mines in that province, and with accepted practice in the province of Nova Scotia.

The action taken to collect a provincial tax of an amount that is trivial in comparison with the interests imperilled to collect it, was decidedly ill-advised, and not at all in accordance with the usual procedure for the collection of tax debts in municipal practice, where the procedure has been most completely worked out. Nothing alarms investors so much, or deters capital from venturing investments, as insecurity of title to real estate, upon which all stock issues are floated. So far as we are able to judge, the real criticism to which the Mines Department may be subjected in connection with this incident is not so much upon the action taken, but in regard to the failure to make certain that all interested persons were duly advised of the impending action and of their danger from default of payment. The throwing open of lapsed claims to immediate re-staking, without giving the defaulting lessee prior opportunity to re-enter upon payment of the sum owed, seems also to have been a harsh measure, and one that in no way enures to the advantage of the Province.

We believe that Mr. Mills is genuinely desirous to administer the Mines Act for the benefit of all concerned, and in strict compliance with its provisions, of which the Minister is the servant and not the creator; but he will lose a rapidly passing opportunity if he fails to fortify himself with a consideration of the studied opinions that such bodies as the Canadian Institute of Mining and Metallurgy and the Ontario Mining Association are prepared to give, upon request.

### Norite Occurrences.

To the Editor of the Canadian Mining Journal,  
Sir,

A new occurrence of nickel with norite is reported from Manitoba, and, appropriately, at about the same time, Vogt's "Die Sulphid-Silikat-Schmelzlosungen" arrives from Norway. Vogt's report covers very elaborately the question of the origin of the nickel ores of Norway, always associated with norite or closely related rocks, and as he convincingly proves, always of magmatic origin. He describes and figures patches of pyrrhotite completely enclosed in fresh norite where even the susceptible mineral hypersthene is unchanged, and shows how important pyrrhotite-norite is in proving the magmatic theory of the formation of nickel deposits. This is a point which the one or two remaining opponents of magmatic segregation always pass over, since these widely scattered portions of ore in fresh norite are entirely unaccounted for by any theory of replacement. In the Sudbury region probably more than half of the ore is thus enclosed in pyrrhotite-norite.

Vogt shows also that the marginal ore deposits, he uses the Canadian term, have separated from the cooling and solidifying norite because the sulphides remained liquid at a lower temperature than the silicates of the rock. They were forced into all the fissures of the underlying rocks and often formed breccias of these rocks exactly as they have been shown to do at Sudbury. The copper ores, with the lowest temperature of fusion, are found chiefly at the lower and outer margin or in veinlets in the country rock, so that offset deposits are richer in copper than marginal ones. He shows also that the dimensions of the ore deposits are roughly proportional to the size of the norite masses with which they are connected, which accords with the magmatic theory and not with the replacement theory.

He shows, further, that the proportions of iron, nickel and copper in all the ores, whether from Norway or Canada, are much the same, which could hardly be the case if each deposit was formed for itself by solution replacement.

Perhaps the most interesting part of this report, and of a later one, published a year after, is the experimental examination of the relations of basic slags to molten sulphides of various metals, in which dozens of experiments reach results very similar to the actual field relations found in nickel ore deposits associated with norite or less often with peridotite. The solubility of sulphides in silicate magmas is thus studied on a small scale.

Professor Vogt attacks the subject of the magmatic segregation of sulphide ores from a new point of view and completely cuts the ground from under any theory of their formation by solution and replacement.

Canadians interested in the genesis of nickel ore deposits should acquaint themselves with this masterly study of a formerly much disputed type of ore deposits.

A. P. Coleman.

### PERSONAL

Mr. E. V. Neelands, of Toronto, has returned from Venezuela.

## OBITUARY.

James Percy Macnaughten, General Sales Agent of the Dominion Iron & Steel Company, died at his residence, after a long illness, on the 21st November.

Mr. Macnaughten was a resident of Sydney during the earlier stages of the Dominion Steel Company's activity, but in recent years has had his office at the headquarters of the Company in Montreal, and resided in the City. He was born and educated in Ottawa, and was 53 years old at the time of his death.

Those who knew Mr. Macnaughten personally are best able to appreciate his loss to his family, the steel industry in Canada, and to the Company with which he has been associated virtually since its first products were placed on the market. He was a man who did not seek publicity, but whose integrity, and loyalty could always be reckoned upon, as could also his assistance to a friend in need. His early death, following that of Mr. Francis H. Whitton of the Steel Company of Canada, measurably thins the ranks of the steel men of the Dominion, and is a distinct loss to that industry, but a much greater loss to his immediate business associates in Montreal, in Sydney and elsewhere.

### CLOSE OF THE BROKEN HILL STRIKE.

The Broken Hill strike was declared off on November 10th after having lasted eighteen months and cost twelve million pounds in loss of wages and profits. The terms on which the strike ended were arrived at under a judicial commission appointed by the Premier of Australia and the Government of New South Wales. Under the award wages are based on a minimum of 15s. Od. per day, hours to be 44 per week both above and below ground, with the provision that until a technical commission has reported on occupational diseases in the mines, and given a list of incapacitated men, the hours of labor underground are to be five shifts of seven hours each.

The companies in the Broken Hill District had no alternative but to fight the demands of the workmen, as these would have absorbed the whole of the profits of the industry.

With reference to the prospects of an iron and steel industry being established in British Columbia it is stated that the activity of the government in the obtaining of accurate information of the iron ore resources of the Province is to be continued. It long has been known that an important deposit of hematite ore exists on Sand Creek in the Fort Steele Mining Division and A. G. Langley, government mining engineer, recently inspected the property. His report is favorable, showing that there is a considerable body of massive red hematite which assays in places 57.4 metallic iron. He recommends that there should be further development and the Provincial Government, it is understood, will initiate diamond drilling and other work to the end that the deposit may be opened up and some information obtained as to the tonnage. Another property to which attention is to be given is the Zymoetz (Copper) River limonite deposits. These are situated in the Skena River section of northern British Columbia and there is no doubt, from reports of J. D. Mackenzie, Canadian Geological Survey, and Wm. M. Brewer, Provincial Government, that these are of importance.

# A Norite of the Sudbury Type in Manitoba. A Reconnaissance. <sup>(1)</sup>

By R. J. COLONY, Ph.D. <sup>(2)</sup>

[Reprinted by Permission from the November Bulletin of the Canadian Institute of Mining and Metallurgy.]

Eighteen miles north, or slightly northeast of Lac du Bonnet, and about 35 miles east of Fort Alexander on the Winnipeg river, occurs a body of mineralized norite strikingly similar to the Sudbury norite of Ontario in origin and character. This mass of igneous rock is situated in the area bordered on the south by the Maskwa (Bear) river, and on the north by Cat creek, a tributary to the Maskwa river. It is roughly oval in shape at the surface, and occupies an area of 16 or 20 square miles. The shape of the mass, its textural, structural and compositional characters, and its relation to the associated rocks suggest an intrusive of roughly stock-like form and habit.

**Physiographic and Structural Features.**—Low, narrow, strongly glaciated and roughly parallel ridges with a general northeast-southwest trend, having a minimum width of from 150 to 250 feet, and a maximum width of from 500 to 1,000 feet, and ranging in length along the strike from a few hundred feet to two miles or more are characteristic of the region.

The ridges, varying in height from 20 to 100 feet are separated by, and surrounded with, spruce swamp and muskeg, so that while having the same general direction, they stand as islands in the surrounding lower

between the two being in some cases obviously igneous, tight and sinuous in the extreme, the greenstone in such cases exhibiting strong injection and "soaking" phenomena.

In other places both norite and greenstone are so strongly sheared as to suggest fault-contact rather than igneous; not infrequently sheer, vertical scarps, strongly suggestive of fault origin and running approximately in the direction of strike, cause the ridges to rise abruptly in cliff-like form from the muskeg. That more or less faulting has occurred is certain, and the writer judges that the faults are either strike-faults, or else they cut across the general trend of the ridges at very low angles.

A crush-zone of considerable length striking with the ridges may be traced from some distance northeast of the Anaconda claim (in the western end of the area) to as far as the Rio Tinto, and possibly beyond. On the Anaconda claim the crush-zone is about 150 feet wide, and on the Terra, on an 'island' in the muskeg, it is about 250 feet wide.

The extreme traceable length is nearly two miles, so that this sheared area undoubtedly represents a fault of some magnitude. On the northwest side of this crush-zone one encounters only norite; the elevations are here at their maximum, 100 feet or more in places, and the ridges are wide and long. On the southeast side of the crush-zone lies the norite-greenstone complex, in successive low, interrupted ridges separated by areas of spruce swamp and muskeg. Certain of the ridges in this part terminate in a manner suggestive of more or less lateral displacement by possible cross-faulting in an oblique direction, but this is not so absolute in indication as the more plainly evident crush-zones of the strike-faults.

The repeated alternation of norite and greenstone in approximately parallel ridges with alternating igneous and sheared contact between the two formations, and the occurrence of a wide crush-zone in the western part of the area with an abrupt change in structural habit and absence of greenstone, strongly suggest a step-faulted region, although the faults may not necessarily be of very great throw.

An effort has been made to represent this structure by a hypothetical section across the strike. The profile is not drawn to scale nor are the faults exactly shown. The section merely illustrates the structural conditions suggested by the habit of the norite-greenstone complex.

**The Formations Involved.**—So far as the writer's own explorations went, the norite body is completely surrounded with granite. While fairly certain of the delimitation of the area on the northwestern, northern and northeastern sides, he is not certain of the exact conditions of the southern boundary. Granite was encountered, however, on the Kelly claim, which lies in the extreme southeastern part, and the writer judges that it is safe to conclude that the entire mass of norite is surrounded by granite, mixed possibly with greenstone, into which the norite was intruded. (3) The only formations to be considered then, are (a)

Approximate Position of Mineralised Norite Body herein described

ground. The ridges are undoubtedly connected, however, and provided the area was stripped of all cover, it would present an undulating, fluted aspect of interrupted ridges and low, flat valleys, striking northeast-southwest. The ridges within the norite area are in part norite and in part greenstone; many of them are composed of both norite and greenstone, the contact

(2) Instructor in Geology, Columbia University, New York, N. Y.

the granite, (b) the greenstone, and (c) the norite and its various facies.

The granite has been tentatively called Laurentian

(3) The areal geology of the norite body and its exact extent have been worked out by Mr. W. S. McCann, and his assistants, of the Geological Survey of Canada. Mr. McCann camped on the Hititrite claim, near the writer's camp, and the writer had the pleasure of his company in the field. Mr. McCann's report will doubtless appear in the near future as a bulletin of the Department of Mines.

(4) Moore, Elwood S., Region East of the South End of Lake Winnipeg, Geological Survey of Canada, Summary Report, 1913. Sessional Paper 26, pp. 262-270.

(4) in part, and in part "post-Lower-Huronian". Additional and careful work will be necessary before the age of this granite can be definitely established. It differs from the granite one encounters along the Winnipeg and Maskwa rivers in the absence of included blocks of old gneisses and schists of presumably Grenville or Keewatin age, so characteristic of the granite en route to the norite area. Moreover, these xenoliths, representing stoped blocks of Grenville or Keewatin gneiss, had a complicated structural and dynamic history before they were intruded by the granitic magma in which they are now included.

They were *lit-par-lit* or injection gneisses; they do not in the least resemble the greenstones of the norite area in history, composition, structure or mode of occurrence. Yet these greenstones have likewise been

Structural Features and Boundaries of Norite Area

Maskwa River norite. Hypothetical section across strike of ridges, showing structure suggested by the habit of the norite-greenstone complex.

called Keewatin; (5) it is because of the pronounced structural, dynamic, compositional and injection differences between the numerous included blocks in the granite, and the greenstone, that the writer has difficulty in correlation. Whatever the age of the granite, however, in the vicinity of norite, it is intrusive into the greenstone, but is intruded by the norite; and the granite, norite and greenstone are all cut by numerous pegmatitic dykes, more especially at, and near, the norite-granite contacts. It is judged that these pegmatite veins and dykes are related to the norite and represent extreme end-phase consolidation products of it. The granite, as represented by that phase of it which occurs on the Kelly claim, is moderately fine textured, pinkish-gray, and is composed largely of feldspar and quartz with a minor amount of biotite in very small flakes. The feldspar is dominantly potassic, with some admixture of the soda molecule and but very slightly sericitized.

The most striking feature shown microscopically is the marked inequi-granular aspect of the rock, which carries numerous hyp-idiomorphic microcline crystals

Photomicrograph of Maskwa River norite. Light polarized, nicols crossed, magnification 35 diameters. Showing micro-faulted plagioclase and granulation effects.

with crenulated margins, ranging from one-half to one centimeter in size and surrounded with much smaller grains, which give the rock a pseudo-porphyrific texture. There is also, in numerous other grains a strong tendency toward micrographic intergrowths on a very minute scale. The dominance of feldspar and quartz, the extremely variable textural habit and the tendency toward micrographic structures are characteristic of marginal phases of granitic intrusives, such as this rock is judged to be.

The greenstone is also more or less variable in texture, composition and structure, ranging from massive, fine to granular, dense dark-green rocks, to strongly sheared and schistose amphibolitic types. In some places the rock has been much shattered, especially along the sheared norite contact; in such cases healing

(6) Roberts, Hugh M., and Longyear, Robert Davis. type are in general assigned to the Keewatin, and Moore follows the usual custom of placing the greenstones (basic metamorphosed igneous types) of the Rice Lake series in that division. 1918, pp. 27-67.

has been effected largely with quartz, which occasionally forms veins of some size and not infrequently shows mineralization to a small degree, chiefly pyrite and chalcopyrite. Curiously enough, while the trend or strike of the ridges is northeast-southwest, the schistosity developed in places in the greenstone (not along the norite contact) strikes in a variable way from almost directly east-west to West 8° North, thus making evident a secondary or cross structure, in the direction of which lies the foliation in the

Photomicrograph of quartz-norite, taken in combined reflected and transmitted light, magnification 35 diameters. The green amphibole is strongly poikilitic, acting as host for numerous quartz grains. The metallics (magnetite, pyrrhotite and chalcopyrite) are replacing the amphibole and penetrating cracks.

Photomicrograph of norite taken in combined transmitted and reflected light, magnification 35 diameters. A stringer of pyrrhotite replaced in part by chalcopyrite (lighter). The sulphides themselves are cutting and replacing the feldspar (light gray) and are encroaching upon and replacing the green amphibole (dark gray).

greenstone and occasional small shear zones as well. In places near the igneous contact the greenstone is thoroughly impregnated with noritic matter; one of the most remarkable manifestations of this phenomenon may be seen on the Vidi claim, where crystals of labradorite, five to ten centimeters in size and resembling huge phenocrysts, are scattered through

an otherwise fine textured, dense greenstone. Injection and impregnation are so pronounced in this vicinity that the large bunches of plagioclase are clearly due to those processes. In such places, also, the greenstone is slightly mineralized.

The norite is of simple composition, but varies both in texture and mineral make-up to some degree because of differentiation. In general it is composed almost wholly of basic feldspar ranging from andesine to labradorite, and carries as the only ferro-magnesian component a green amphibole, or actinolite, derived by uralitization from a former magnesian pyroxene, probably hypersthene. One of the most striking features of the rock is the manner in which the uralitized pyroxene encroaches upon, cuts through, and penetrates the feldspar (which is otherwise perfectly fresh and unaltered) in every conceivable direction; it is clearly a product of the action of magmatic and-phase-consolidation matters upon an original containing both magnesia and iron, i.e., hypersthene.

The feldspars have not been affected in any other way; they are hypidiomorphic, with crenulated margins, showing granulation along the borders in some cases, with wedge-twinning, bent grains and micro-faulting.

The ore minerals are magnetite, ilmenite, pyrrhotite and chalcopyrite, all closely associated and intergrown. So far as a time relation can be made out they are all of late magmatic stage, essentially almost contemporaneous, but overlapping, so that the earliest are magnetite and ilmenite, the next pyrrhotite and the latest chalcopyrite, with replacing effects on one another in the order named.

They occur in blebs, in irregular patches, stringers and veinlets, lying in, surrounding, cutting and replacing the silicate minerals of the rock, and penetrating cleavages; their mode of occurrence and the manner in which they are associated with the silicate minerals clearly indicate that these ore minerals were formed later than, but immediately following the magmatic alteration of the original pyroxene to uralite, thus placing them very definitely in a late magmatic stage.

The 'ore', therefore, is merely a mineralized phase of the norite itself. The ore minerals of economic

value are chalcopyrite and nickeliferous pyrrhotite, distributed, with a little magnetite, ilmenite and pyrite both in disseminated grains throughout the norite, and more especially, segregated along the igneous contact between the greenstone and the norite, where mineralized zones occur up to 150 feet in width (at the surface).

Various assays have been made of samples taken from different localities, and the maxima and minima are here given. The maxima and minima of a large number of assays of Sudbury material (6) are also given for the purpose of comparison.

	Copper		nickel		Platinum	
	Max. %	Min. %	Max. %	Min. %	Max. oz. per ton	Min. oz. per ton
Maskwa River norite . .	3.60	0.68	1.68	0.29	0.03	0.01
Sudbury norite . . . .	1.79	0.61	2.97	1.14	0.02	0.03

Marked differentiation is exhibited within the limits of the norite area so that one finds typical coarse-textured norite, finer-textured and less basic phase, quartz-norite somewhat similar to the norite (micropegmatitic) of Sudbury, coarse anorthosite, extremely coarse norite-anorthosite pegmatite in which the large bunches of plagioclase separated by much smaller quantities of dark interstitial ferromagnesian, have weathered chalky-white on exposed surfaces, making an extremely striking rock. Very acid, fine-textured facies, doleritic norite, veins and stringers of magnetite as well as a body of magnetite of considerable size that lies in the muskeg on the northeast corner of the Copper Contact claim, and pegmatite and quartz dykes and veins judged to represent the extreme end-phase of consolidation. There are also later basic dykes, from an inch to eighteen inches in width, cutting the norite in many places, and frequently offset by small faults.

The ore minerals are essentially magmatic in origin, but the writer does not conceive them to be the product of simple magmatic segregation; nor have they originated through the action of hydro-thermal process operating subsequent to the consolidation of the rock.

They have been produced by the concentration of materials through the action of selective freezing, and belong to a very late magmatic stage during which the ore minerals, acid 'juices' and mineralizers were concentrated so as to become a very mobile, pervasive solution of essentially aqueo-igneous character, capable of penetrating and replacing to a marked degree. The very extreme end-phase-manifestation of this, the writer takes to be the quartz veins and stringers which, in addition to quartz, carry carbonate and epidote, and sometimes pyrite and chalcopyrite.

The writer has called this norite the *Maskwa River Norite*; judging by (a) its character and origin, (b) its extent, (c) its striking similarity to the Sudbury norite, (d) the occurrence of mineralized zones and the assay returns on these, it seems reasonable to state that this body of igneous rock and its 'ore' compare very favourably with, and is strikingly similar to, the occurrence at Sudbury.

Trench across norite 'orebody' on the 'Hititrite' claim. The 'orebody' is here a mineralized zone 150 feet wide, along the norite-greenstone contact. Muskeg in the background.

# The Administration of the Ontario Mining Law

Minister of Mines Should Consult Representatives of  
Industry Before Taking Legislative Action.

J. A. McRAE, Cobalt.

What is interpreted in the district of Temiskaming, inclusive of the silver and gold mining areas of such fields as Cobalt, Porcupine, Kirkland Lake, Gowganda, etc., as being a chaotic state of affairs, exists in the administration of the Mining Laws of Ontario, at least to the extent which it is taken out of the hands of the Mining Recorders and the Mining Commissioner.

New legislation and the injudicious application of former laws has caused a feeling to grow which threatens to discourage prospectors and capital alike from entering this field. By reason of a few alterations to the Act, and the application of powers of confiscations which were probably never intended to be enforced, the present administration has brought down criticism of the Mines Act of Ontario which formerly held a place with the most satisfactory mining law in existence in any province or state.

Cooperation between business men all over Canada and the United States who have made it their business to assist prospectors with grub-stakes has been eliminated to a large extent by a regulation which prohibits a prospector from staking more than three mining claims or more than nine altogether for himself and on behalf of others. It had formerly been the intention of the past Government to encourage as much staking as must be done in order to hold the claims. Consequently, the more work, the greater chances for developing paying mineral deposits. The new regulation, of course, may be evaded by simply hiring someone to buy a Miners' License and have them do the required staking. The difference is that the prospector is thus obliged to turn employer and is penalized to that extent. The measure seems calculated to cause inconvenience and friction rather than cause any benefit.

Further new legislation renders it necessary for a prospector to first ask for permission to use timber before erecting a cabin or using any such timber for mining purposes. Not only this, but whereas the old law permitted a claim holder to remove pulpwood if he so desired, the new regulation prohibits this. As a consequence, the bushfires which seem bound to occur in areas where extensive prospecting work is being carried on, and where ground must be cleared for building and mining, seems destined to destroy much of the timber which otherwise might be turned into revenue for the claimholder and to the benefit of the country in general. Much of the incentive to protect such timber may be lost where the claimholder has no claim to it.

## Confiscation of Claims.

Perhaps the most unfortunate occurrence of all has been the confiscation Order-in-Council of October 13th, by reason of which serious loss has been incurred by conscientious claimholders. Finding a provision in the Mining Tax Act, being Chapter 26, R.S.O., 1914, that conferred such power on the Ontario Government, the Minister of Mines passed an Order-in-Council declaring all patented mining claims forfeited to the Crown on which a certain provincial tax of some 5 cents an acre or \$2 per claim per year had not been paid. The Order further provided that these claims should be

open for re-staking on and after noon of October 28th. Many property holders declare they knew nothing about such a tax and received no notice. However, the Order went into effect on the 13th. As a consequence of this, many titles to freehold land have been revoked. Even the Teck-Hughes Mine with a plant valued at perhaps \$200,000 and with several hundred thousands of dollars in ore blocked out and producing at the rate of about \$1,000 every twenty-four hours was among the properties listed for forfeiture. It was only thirty minutes before the hour set on October 28th, that the Government was induced to withhold the property from staking. Nevertheless, forfeiture had occurred on the 13th, and the Teck-Hughes is now technically Crown Land. This, of course, is now being rectified and in due time no doubt the title will be re-established in the name of the Teck-Hughes Mining Company. The Little Pet mine, near the Dome Mines in Porcupine was forfeited and did not even get a release. It was forfeited for a matter of a few dollars, yet is equipped with a small milling plant of its own. Various other instances of this nature may be cited.

## Contrary to British Law.

The question now being raised in all seriousness is that having to do with the application of a confiscation law. The point is raised as to whether such is really permissible under British law. The matter of enforcing collection of taxes finds general support all over the North, but carrying this to a point of confiscation with no avenue left by which title may be redeemed is thought to be stretching authority beyond the point intended by the framers of such a law. The procedure in regard to real estate on which taxes are owing, is to list such property subject to sale as against the levies due. The sale of such property is carried out subject to the former holder redeeming title if within thirteen months he pays the taxes due plus the expense caused by his neglect. Such procedure is regarded as being reasonably fair to all concerned.

## Prospectors Discouraged.

So different is this attitude from that of former Governments, that mining men of Northern Ontario are scarcely able to believe their senses. The effect upon outside investors and capitalists will damage Ontario in their eyes. These interests who spend many thousand of dollars yearly in helping develop the mineral resources of this country and who had formerly held the laws of the province in very high regard, now find deeds which they carry have been revoked,—due to the non-payment of a certain provincial tax which they declare they knew nothing about and amounting to only \$2 per claim each year. Not a few prospectors have openly declared they are through with mining in this country so long as such state of affairs is permitted to exist. These men are numbered among those who are not given to complaining habitually.

## Pioneer Suffers.

An instance of the manner in which pioneers have been penalized may be cited in the case of E. J. Morrison, of Haileybury. Mr. Morrison is a citizen of

moderate means, having a small dairy business in the town of Haileybury. Some years ago, he lent his support to the general activity in the Kirkland Lake district, acquired a mining claim on which he performed the necessary assessment work at a cost of some \$1,200 from money saved from his little business. Mr. Morrison knew nothing about the Provincial tax of \$2 a year on the claim and as a consequence the Government confiscated his ground. No offer of relief has been made.

The situation as it exists was not altogether unforeseen at the time of the ascendancy to power of the present administration. Indeed such fears were openly expressed prior to the selection of a cabinet by Premier Drury. This journal appealed at that time for mining representation, but the appeal fell upon deaf ears.

Hon. Mr. Mills, who was appointed as Minister of Mines, was formerly a locomotive engineer. There has been no effort at any time to discredit his ability in connection with matters about which he possesses knowledge. At the same time, on no occasion does it appear to have been possible to point to any reasonable hope of the judicious administration of the mining laws of the Province by one not familiar with the industry.

**Hoped in Vain.**

It is true that for a time critics grew silent, on the strength of the hope that not being familiar with the mining industry, the new administration would at least avoid meddling with the Mining Act. This hope has long since become dissipated and mining interests are now standing in fear with the question on their lips: "What Next?"

Finally, this danger appears to lie ahead. It is feared the new administration is contemplating a further so-called revision of the Mining Act. To the extent of the changes contemplated, ego may in a large degree constitute the answer. The spectacle of an amateur, already accused of creating chaos in Ontario's mining laws is causing some uneasiness, and the Minister would seem to be well-advised to go slowly. It may be expected that mining men and prospectors will submit an appeal to the Premier to discuss this matter seriously with his lieutenant.

Meanwhile, capital, much needed foreign capital, is hesitant, and in the meantime prospectors profess to be discouraged.

**Possible Remedies.**

In conclusion, there are two suggestions that might be made with the view of preventing further chaos. First, is this:—It would be a wise procedure for the Ontario Department of Mines to hold periodical conferences of its staff of Mining Recorders from the various mining divisions, and with these gentlemen, together with the Mining Commissioner, hold a joint conference and obtain expressions of opinion and general discussion before enacting legislation calculated to alter the existing laws. The second suggestion is this:—To establish a Mining Court, giving the Mining Commissioner powers equal to a County Court Judge, armed with the authority to deal in a similar manner with patented mining lands as is now vested in that official when dealing with unpatented lands. The verdict rendered in all such cases would be the result of deliberations between men fully acquainted with the mining industry and the meaning of the Mines

Act. It would stabilize administration, remove the worry and responsibility from the political representative at the head of the Department, and would shield prospectors and mining men from such mistakes as have recently been committed.

## Northern Ontario Letter

### THE SILVER MINES. The Cobalt Field.

At the time of writing, shortage of electric power continues to constitute the chief problem of the mines in the Cobalt district. Like in the majority of such instances, however, the situation is exaggerated, and pessimistic views gain ground rapidly.

Last week's reference to this, was made clear when it was stated that by eliminating all non-essential work, it is believed the power situation will not become any more satisfactory than as at present.

It is now announced the Mining Corporation of Canada, the largest individual power consumer in the Cobalt district, has been able to reduce its power consumption to the extent of 700 h.p. without interfering with the usual operation of the mine. This has been made possible by reason of summer operations having resulted in storing up a large surplus of tailings, which makes it possible to close down sand-pumping operations for the winter. This company could go still further, if necessary, and close the old Buffalo mill for the winter and thus further reduce its power consumption. Not only this, but by utilizing its auxiliary steam-driven equipment, the mine itself could be operated without hydro-electric energy. This would leave it necessary only to draw sufficient electricity to operate the mill. Such steps, of course, may not be necessary, but are mentioned in order to show the lengths to which the company could go and still continue production. This summary should discount pessimism.

A moderate amount of rain is officially reported by the Meteorological station at Haileybury, during the third week of November. This rain has fallen on top of several inches of snow, and has created a condition which would quickly alter the power situation should a reasonable amount of additional rain fall.

A discovery of importance has been made at the 385-ft. level of the Chambers-Ferland mine. Special arrangements had been made to drive a long cross-cut through that part of the property lying between the Nipissing and the LaRose. A lease was secured to carry this work on through a shaft on the Right of Way mine, the object being to carry the cross-cut some 500 feet so as to connect up with the main workings on the Chambers-Ferland. This work had progressed not more than 150 feet when ore was encountered. A feature of the find is that at the present point of operation the cross-cut is traversing a layer of slate formation. Good milling values have been found over a width of 22 feet. The average over 4½ feet is 28½ ounces to the ton, while the lowest over the entire 22 feet is five ounces per ton. It is now planned to sink a winze to the underlying conglomerate formation which is estimated to lie not more than ten feet below the cross-cut. It is believed a high-grade vein occurs in the conglomerate, the values encountered in the slate indicating this.

Reports were in circulation early in the past week to the effect that the Temiskaming mine was curtailing operations. Inquiry revealed the fact that only a few carpenters had been laid off and that the Temiskaming is operating both mine and mill as usual. Mr. Gordon Dickson, manager of the Blue Diamond Coal property in Alberta, paid an official visit during the past few days to the Temiskaming mine.

A small force of men are at work on the O'Donald property, in Lorrain, formerly known as the Lang-Caswell. What appear to be the more important veins

are being examined, and a pump was shipped this week for the purpose of de-watering part of the underground workings. This is one of the properties which became forfeited by reason of the application of the Order-in-Council of Oct. 13th, which declared all patented mining claims forfeited to the Crown, on which certain provincial taxes of some \$2 per claim had not been paid. The property was re-staked by J. C. O'Donald, of Haileybury.

It is now intimated unofficially that the Department of Mines is contemplating action to re-establish title to properties forfeited under the recent Order, at least in such cases where a hardship appears to have been imposed.

### The Elk Lake District.

The work of erecting camp buildings for the accommodation of additional men is proceeding on the property of the Cane Silver Mine. Returns have not yet been received from the shipment of high-grade ore recently made, but it is understood the ore contained an average of at least 500 ounces to the ton. It has not yet been determined to what extent operations will be carried on this winter, and the question of installing a small mining plant has not yet been definitely decided upon.

The Regent Silver Mines is continuing operations, and has made preparations to carry on work throughout the winter. It is planned to make a shipment of ore some time early in the new year.

Additional machinery is being taken into the property of the Gold Nugget Products Company, situated in the southern part of the township of Henwood on the Elk Lake branch of the T. & N. O. Ry. The property was first opened up some two or three years ago by Mr. Stone, of Toronto, and was subsequently purchased by A. R. C. Smith and his associates. Among the products from the property is a good-grade pumice stone. It is also reported a granite outcrop on the property has been found to be of commercial value, the grade being such as is required in the manufacture of tombstones, etc. The representative of the "Journal" has not yet had an opportunity to investigate the accuracy of the report, which comes unofficially. The company's address is Kenabecq, Ont.

Financial arrangements are under way with a view toward opening the Paragon-Hitchecock property. Former work met with encouraging results, and encouraged the control to make another effort to develop the property.

In a general way, the lower quotations for silver have not had much adverse effect on the activity in the silver-mining areas. The fact is kept in mind that before the war and for some time after its commencement, the operators considered themselves fortunate when receiving around 60 cents an ounce. They are pointing to the fact that the price now is averaging around 80 cents an ounce, with the cost of supplies used in connection with mining gradually declining.

### Ore Bullion Shipments.

During the week ended Nov. 19th, only two Cobalt companies shipped ore, the following being a summary:—

Shipper	Cars	Pds.
Dominion Reduction . . . . .	1	83,000
O'Brien . . . . .	1	64,890
Totals . . . . .	2	147,890

During the corresponding period the Mining Corporation sent out a large shipment of bullion, made up of 97 bars containing 100,201 fine ounces.

## THE GOLD MINES.

### The Porcupine Field.

The gold mines of the Porcupine district are rushing operations to the fullest possible capacity permissible with the available supply of hydro-electric power. Not only this, but all the auxiliary equipment available is being employed so as to take advantage of the improvement in the supply of labor.

An instance of the determination of the companies to enlarge the scope of operations may be found at the Dome Mines, where a large number of miners have been engaged to work with hand-steel. Not content with operating to the full limit of the power supply, the company has decided to speed up work beyond this point, and has placed not far under a hundred miners underground with hand-steel.

A serious break has occurred in the big underground crusher at the Dome, and temporary shift has to be made to make up the deficiency. It is understood some little time is expected to elapse before the new part may be secured, and the question of installing two small crushers as a temporary measure is being considered. In the meantime, an endeavor is being made to break the ore as fine as possible by overcharges when blasting.

On Dec. 1st., the Hollinger Consolidated will disburse a dividend of 1 p.c., amounting to \$246,000. This is the 8th dividend to be paid so far during the current year and is expected to be followed by another on Dec. 28th, making a total of 9 p.c. or \$2,214,000 for the calendar year.

Total dividends from the silver and gold mines in the district of Temiskaming, made up of mines at Cobalt, Porcupine and Kirland Lake, will amount to well over \$7,000,000 for 1920. This approximates the average paid yearly for the past fifteen years and is pointed to as a highly favorable achievement in view of labor shortage and power shortage caused by low water. The 1920 achievement exceeds by over \$600,000 the record made in 1919. This increase was due to the Dome having resumed dividend disbursements at the interim rate of 2 p.c. at intervals of about three months, as well as the Hollinger having paid 8 p.c. and 1 p.c. more expected as compared with 7 p.c. last year. Such an increase having taken place at the gold mines during a period when economic conditions were generally unfavorable is pointed to as an indication of further increases during the coming year.

Work on the Porcupine Crown and the Thompson-Krist mines, now operated by the Northerown Company, is proceeding at a rate somewhat below normal. The mill is permitted to operate only intermittently, owing to the shortage of electric power. As regards the intimation made some months ago in the "Journal" relative to a capital increase being under consideration, nothing has recently been heard. It is believed, however, such a measure may be adopted just as soon as the opportune time appears to have arrived. With the present power shortage, the time is not regarded as being opportune, but with the arrival of Spring, everything should be working in favor of gold mining.

### The Kirkland Lake Area.

Mill construction at the Wright-Hargreaves mine is now in its final stages, and the machinery will soon be ready to turn over. Chemical supplies have been placed on order and with an improvement in the hydro-electric supply the company should join the producers early in the New Year.

The case involving the re-staking of the Teck-Hughes

property was heard last week in Haileybury, the stakers claiming \$20,000. The defense put up was based on the fact that a special Order-in-Council passed in Toronto just before the hour of forfeiture precluded any right of any prospector to restake the property. The case was heard before Mining Commissioner T. E. Godson, K.C., the decision being reserved.

Shaft sinking on the Lake Shore mine is now well below the 500-ft. level. A station will be cut at a depth of 600 ft., and the shaft will then be continued to a depth of 800 feet. The scheme of development will be to open up two operating levels, one at the 600 and one at the 800-ft. level. This is expected to add greatly to the volume of known ore and may reasonably lead to a decision to increase milling facilities.

### Shiningtree Area.

The court has dismissed the injunction in the Wasapika dispute which was referred to in last week's "Journal," and dissolution of the Wasapika Gold Mines, Ltd., will now proceed in accordance with the Ontario Company's Act. This company is being absorbed by the Wasapika Consolidated.

### Boston Field Creek.

Development work on the Miller Independence Mine, at Boston Creek, has been quietly but steadily progressing during the past few months, the pace of operation being considerably greater than at any previous time in the history of the enterprise.

Chief attention is being devoted to the systematic exploration of the 500-ft. level where work is in progress at three points, and where a plan of diamond drilling is being formulated. This program is to first thoroughly explore in a lateral direction all of the formations in several areas not yet penetrated by cross-cuts, and then to test their value at depth possibly down to about one thousand feet.

In the main north cross-cut at the 500-ft. level, a vein was encountered at a point 250 feet from the main shaft. Subsequent development has shown this to have characteristics very similar to those of the hanging-wall vein in the faulted zone at the second level in the "D" or telluride shaft. This vein is being followed, the present face of the drift being at a point almost directly beneath where the "D" shaft was started. It is intended to continue its exploration and development right to the northern boundary. Should this vein prove by further development, as seems probable, to be identical with the hanging-wall vein at the upper level, indications would seem to point to a combined straightening-up and fault-displacement of all the formation for about 300 feet northward below the plane of movement. In continuing the drift on the hanging-wall vein, to the boundary, not only is the rock formation being proved by actual examination but facilities are also being created simultaneously for subsequent exploration of the telluride and all other veins scattered throughout the property, by means of diamond drills.

The Miller Independence, in common with the mines of Cobalt and Kirkland Lake, draws its electric power from power plants on the Montreal River. Last summer, however, as a precautionary measure against possible contingencies, two of the old steam-boilers in use prior to the installation of the hydro-electric system, were thoroughly overhauled, re-tubed and put into efficient repair. The company also engaged wood-cutters during the past few months, and as a consequence is in a position to utilize this auxiliary plant and upon the hydro-electric power supply.

## British Columbia Letter

### Prince Rupert, B.C.

On his return from the Premier Mine, Salmon River District, Portland Canal, Mr. H. A. Guess, vice-president of the American Smelting & Refining Co., is quoted as saying that the development of the Premier mining property has disclosed actual ore, and the possibility of a greater tonnage than has yet been proved, that comes up to the most optimistic expectations. He referred to the plans being made to ship over the snow during the winter and stated that the muddy condition of the road during the Summer made the transport of ore to the Coast during that period impracticable. Two caterpillar tractors and sleds are the transportation facilities provided for use as soon as the trail hardens. The water power plant at the Premier will be in operation in less than a month, permitting the utilization of larger compressors and more rapid progress in the development and exploratory work now underway. The Cyanide Mill will be complete and in operation early next year.

### Trail, B.C.

Ore receipts at the Trail Smelter of the Consolidated Mining & Smelting Co. for the last ten days of the month of October, totalled 12,125 tons of ore and concentrates.

### Hedley, B.C.

Official announcement has been made of the closing down of the Nickel Plate Mine of the Hedley Gold Mining Company. Most of the employees have been discharged, only enough being retained to put the plant in such a shape that it will be ready for the resumption of operations when the time comes. The circumstances leading to this action are reviewed by the management in a statement given publicity in British Columbia. It is explained that during the war the mine was continued on a producing basis because it was felt that the gold was needed and after the Armistice it was thought that economic conditions would so improve that it would be possible to pay dividends on the capital invested. This anticipation has not been realized, as the management puts it: "We have been disappointed in this conclusion and find that we cannot earn reasonable dividends under existing conditions and maintain our reserves of ore." It is added that the shut-down is but temporary, that it will last probably for one year, and that the mine and plant will be in good condition to resume work when times improve. It is felt that under pre-war conditions or even 20 per cent thereof, "we can earn good dividends." That it had been hoped that the Government would do something to encourage the production of gold and that the Company has been disappointed in this, too, also is set out.

G. P. James, General Superintendent of the Company, does not speak as optimistically as the statement reads. He asserts that it is absolutely out of the question for the plant to be worked at a fair profit until prices of supplies, etc., come down to within 20 per cent of pre-war conditions. It was not expected that wages would drop to that extent and personally he did not think that material would decline sufficiently within a year to permit the re-opening of the Mine and the Mill. It might be two years or more before this happened: in fact the shut-down was for an indefinite period.

That the closing of the Nickel Plate is to be regretted

by reason of the effect on the mining industry of the Province as a whole, cannot be gainsaid. One of the reliable producers over a long period of years, a mine the output of which in gold amounted to approximately 35,000 ozs. in 1917 and 1918 and little less in 1919, it has contributed substantially to the annual production of British Columbia. Not only is this true but there is the purely local aspect. The prosperous little town of Hedley has received a blow that it is hard to see how it can sustain and survive. The miners are leaving their families there while they go out and look for work to tide over the winter, but that they will move away as the breadwinners adjust themselves to the changed conditions is a foregone conclusion.

### Vancouver, B.C.

Fifty gold bars, valued at over \$500,000, have been shipped from the Dominion Assay Office of this City to Ottawa, the Canadian Capital. This represents the takings of the year up to the present date. The 1920 season is produced by officials to have been unsatisfactory in point of the gold production of British Columbia and the Yukon. Dredging operations have been interfered with by water shortage and both lode and placer mining has been affected by high costs. The closing of the Nickel Plate Mines is the culminating incident of a period which appears to have been marked by a constant decline. The resumption of shipments on the part of the Rossland Mines of the Consolidated Mining & Smelting Co., however, furnishes the silver, or should golden be used in this instance, lining to the cloud. Bullion is beginning to reach the Vancouver Office from Trail as a result.

### Victoria, B.C.

Dr. J. E. Dutcher, who has just returned from Cape Prince of Wales, where he has been with the Lost River Tin Mining Company in the capacity of medical attendant, reports that work is being undertaken on rather a large scale on this property. While it has been under development for some seventeen years only recently have considerable operations been initiated for the opening of the deposits. The shaft now is down 300 feet. In sinking it was necessary first to penetrate the tundra and afterwards the glacial ice, which is some feet thick. Incidentally Dr. Dutcher furnishes a side light on life in the far north when he says that supplies brought to the mine last October are still in use and that the eggs lately have been taking on rather too high a flavour. Eskimo labour, he states, is unsatisfactory. Those employed in the mine work spasmodically and lately have been becoming more than ever independent because of the high prices to be obtained for the skins of fur-bearing animals. As a fox skin brings the Eskimos from \$35 to \$40 and as some of them trap as many as from 75 to 80 in a season it is not hard to understand their disinclination to the work of the miner.

Referring to placer mining in Alaska, Milton B. Roper, of Nome, states that the production has fallen off chiefly owing to the high cost of transportation. Freight is \$19 a ton, lighterage \$13 a ton, and wharfage \$1.50 a ton. Coal in the yard is \$46 a ton, which makes gold mining practically prohibitive. Mr. Roper, who is interested in dredging, says that operations of this character are going ahead on a large scale where conditions are suitable. Among the miners and prospectors of the north, interest is being manifested in the possibilities of placer mining on the Siberian Coast.

There is a well established idea that there are possibilities on the land across the Behring Sea and Mr. Roper believes that, if restrictions now preventing the export of gold from Siberia except in small quantities, are removed there will be a considerable exodus of miners to that country. Mr. Roper's business in British Columbia is to inspect certain placer grounds situated in the vicinity of Kamloops and elsewhere along the Fraser River and its northeastern tributaries with the object of instituting dredging operations. He expresses the opinion that there are good openings in this country and that, if good ground is found, it will be more satisfactory than Alaskan work because there will be practically an all-year working season.

While the copper market remains in the doldrums the Consolidated Mining and Smelting Co. proceeds with the development of its Vancouver Island properties. On the Sunloch Group, Jordon River, there is diamond drilling in progress at present. At Quatsino Sound considerable exploratory and development work still is underway. It is the opinion of those in touch with the work that both these properties will become large producers and that it is likely they will be put on a shipping basis as soon as more stable conditions prevail in respect of the world's copper requirements. It may be said, incidentally in this connection, that the Company is experiencing no difficulty at present in finding the labour needed for the work in hand. This changed condition is common to the mining camps of the entire Province.

**Prince George, B.C.**

The Cariboo District of British Columbia looks forward to an early revival of the placer mining industry. Barkerville has gone through a long period of extensive prospecting and hydraulicking by mining operators whose success has varied. Since the discovery on William Creek in the days of the Cariboo Gold excitement large sums of money have been spent in deep diggings between Quesnel and Barkerville by companies attempting to recover the gold from the gravels far below the creeks. The tremendous water pressure and difficulties of transportation have prevented any great success and attention now is being turned to a hunt for the Mother Lode which fed the rich placers of William and other adjacent Creeks. New York interests are said to have been favourably impressed by reports of engineers on the Barkerville field and are expected to commence dredging operations in that section. The Imperial Group of Claims, Proserpine Mountain, upon which a shaft has been sunk 21 feet, is reported to have shown up a vein carrying values averaging \$17 to the ton.

**THE COLLIERIES.**

The transfer of an area of 3,000 acres of coal bearing land situated in the Cedar District, Vancouver Island, for a figure aggregating a quarter of a million dollars is authentically reported. A number of British Columbia businessmen are the owners and, while the identity of the buyers has not been disclosed it is understood that they are undertaking to commence development with a view to the opening up of the coal seams and the establishment of a colliery without loss of time. The land carries bituminous coal of the same quality as that produced by other Vancouver Island coal mines.

Once more the City of Vancouver has taken umbrage over the cost of coal to the consumer. The Mayor of that City has taken the lead in protesting. Inquiries made by him are said to have led to the establishment of the fact that lignite can be imported to the Pacific Coast from the Province of Alberta and sold cheaper than is the bituminous coal of Vancouver Island and the interior British Columbia coal fields. The investigation now is in progress. The retail dealers have filed a statement of their case. They point first to their investment in Vancouver which runs to about \$2,000,000 and dwell on the unfairness of the municipality entering into the business in competition with them. They then show their costs to be \$13.41 per ton net, made up as follows: Price at the mines per ton net, \$8.93; towing per ton net, 67 cents; unloading scows, 50 cents; wear and tear on sacks, 25 cents per ton net; screening and sacking 50 cents per net ton. wharfage or average rent per ton, 20 cents; overhead, 75 cents per net ton; cartage and packing, \$1.50 per net ton. Their selling prices are \$15.00 per ton for lump and \$14 per ton for nut coal. The quality of the Alberta coal in comparison with that of this Province is attacked and it is asserted that the City would have to figure on selling run-of-the-mine coal at \$11.36 at the cheapest while run-of-the-mine coal is sold by them at \$11.50, so that there would be a saving of only 14 cents a ton for an inferior quality of fuel.

The production of the Vancouver Island, (B.C.) Collieries for the month of October shows a marked increase. It is apparent that all the Companies are speeding up their output in order to meet the increased domestic and bunker demands. Perhaps the most remarkable advance is in the case of the Cassidy Collieries of the Granby Consolidated Mining & Smelting Co. the production of which has jumped from 16,477 to 21,703 tons.

Following are the figures for the Island Collieries for the past month :

	Tons.
Canadian Western Fuel Co., Nanaimo, B.C.	60,582
Canadian Collieries (D) Ltd., Comox . . . .	43,390
Canadian Collieries, South Wellington . . . .	9,062
Canadian Collieries, Extension . . . . .	17,593
Pacific Coast Coal Mines Ltd., S. Wellington	7,610
Nanoose Wellington Collieries, Nanoose Bay	6,460
Granby Consolidated M. & S. Co., Cassidy . .	21,703
<hr/>	
Total . . . . .	166,400

The production of the Crow's Nest Pass Coal Field, B.C. for the month of October was as follows:

	Tons.
Crow's Nest Pass Coal Co., Coal Creek . . . .	22,058
Crow's Nest Pass Coal Co., Michel . . . . .	11,504
Corbin Coal & Coke Co., Corbin . . . . .	14,678
<hr/>	
Total . . . . .	48,240

**VANCOUVER MEETING OF THE CANADIAN INSTITUTE OF M. & M. FEBRUARY 1921.**

It has been decided to hold the Annual Meeting of the British Columbia Division of the Canadian Institute of Mining and Metallurgy in Vancouver sometime in February 1921. An organising meeting has already been held, and definite particulars as to date will be shortly announced.

### LABOR AND WAGE CONDITIONS AT THE NOVA SCOTIA COLLIERIES.

The terms of agreement proposed by the leading coal companies of Nova Scotia, (see page 955 of last week's issue) were discussed by the Wage Scale Committee of the United Mine Workers in Truro during the week ending the 20th November.

Many of the delegates to the Convention were definitely instructed by their locals to reject the agreement, which to this extent tied the hands of the Committee, and it has been decided to take a referendum vote of the members of the Union.

The President and Secretary of the Union were subjected to much criticism by the delegates, although there was a strong minority that supported their action at the Montreal Conference, and expressed the opinion that the men's representatives at Montreal had made the best bargain possible under the circumstances.

The extreme step of a strike is unlikely to be taken, the possibility of success being remote, higher wages not being a condition in the power of the operators to grant, even if attempted. The ability of the international funds to finance a strike in Nova Scotia has been very plainly stated by the international officers to be doubtful, seeing that in two States in the Union, West Virginia and Alabama, the U. M. W. of A. is engaged in a bitter fight that will test its resources to their utmost extent. In West Virginia, what is described by "Coal Age" as the "most critical situation in the country" now exists as the outcome of the attempt by the U. M. W. to unionize one of the last-remaining open-shop mining districts in the United States. The striking miners are now living in open tents, and the final outcome of the struggle, to again quote "Coal Age" will "depend upon human endurance." In Nova Scotia, the only principle now at stake is a question of wages. The international leaders and the local representatives in Nova Scotia have admitted the non-effect of the recommendations of the Royal Commission, and the continued force and existence of the agreement of January 1920. The conditions of trade, of coal-selling prices and of commodity prices, are admitted to have undergone a complete change since the Royal Commission made its award in the Summer, and, in any case, even under the different conditions of two months ago, it was apparent to those who were in touch with the facts that the recommendations of the Royal Commission contained suggestions that were impossible of fulfillment in practice, no matter what inclination to accept them might exist on either side. The miners definitely and very deliberately refused these recommendations.

Speaking to the delegates at Truro, the President of the Nova Scotia district said that it cost from \$4.60 to \$5.60 per ton to produce coal in Nova Scotia. In the United States, he stated, the men produce upwards of three tons per day per man employed. An increase of 27 per cent to them adds 40 cents per ton to the cost. In Nova Scotia an increase of 27 per cent would make the cost of coal \$1.25 per ton higher. Thirty-five per cent of the miners in the United States are day-paid workers, but in Nova Scotia from 65 to 70 per cent are day-paid hands.

The figures given by this union official are approximately correct, and it may be added that the production per man employed in Nova Scotia does not reach two tons per man per day, consequent upon the disproportionate number of day-paid workers.

The Federal Trade Commission in the United States has recently published the figures of cost and sales realization for 535 identical operators in general competitive regions in the United States, which shows an f.o.b. mine cost of coal of \$2.69 in June and \$2.72 in May 1920, or a mine cost of from two to three dollars per ton below that of the Nova Scotia collieries. It is interesting to note, also, from the standpoint of earning ability, that these mines worked only 17 days in May and 19 days in June, whereas the collieries in Nova Scotia worked every day, except holidays and Sundays.

The miners in Nova Scotia are naturally chagrined and disappointed, having for some months calculated on receiving a wage increase that was not an economic possibility even at the peak of currency inflation and coal value—as expressed in a fluctuating paper medium—and not having realized that the aspect of business has completely changed, and that with great rapidity. Actually, the miners are doing very well to hold what they have, and it is also very much to be doubted whether the limitation of the Nova Scotia coal markets which will result from the wage increase proffered—under duress—by the operators, and the resulting unemployment, will be found as profitable in gross earnings, as increased individual production at existing rates of wages.

At the time of writing, the action of the miners is overshadowed, and to some extent presumably sought to be forestalled, by a strike of the railwaymen of the Dominion Iron & Steel Company, and impending similar action by the railway employees of the Nova Scotia Steel Company. The railwaymen employed on the steel plants are demanding the application of the McAdoo award to their wages to the same extent that it was applied to the wages of the employees of the Sydney & Louisburg Railway, a railway line operated by the Dominion Coal Company. The railway employees within the steel plants proper have never been regarded as entitled to the status of main-line employees, their work including only shunting and switching operations connected with the internal operation of the plants. The railwaymen gave the Company only seven hours notice of intention to strike, but by the help of officials and volunteers it is hoped to save the blast-furnaces, coke-ovens, and other continuous-process equipment from the disastrous consequence that will follow a cessation of all movement of coal, coke and ore in the plant without opportunity to bank furnaces and arrange for a lay-off.

In view of the serious slackness of orders at the Sydney plant, the closing-down of the Scotia plant, and the likelihood of a curtailment of operations at the Dominion plant through lack of demand for plates, rails and other main products of the plant, the action of the railwaymen seems very ill-advised.

The General Manager of the Sydney Plant, Mr. E. P. Merrill, has issued the following statement, which sufficiently discloses the difficulties under which the Dominion Company is laboring. Under a condition of steel demand, which if not soon bettered, will advise the drastic curtailment of steel-ingot production at the Sydney plant, the policy of the railwaymen seems to have been hastily conceived, and decided upon in ignorance of the Steel Company's position. Mr. Merrill states.

"The public should know that there is an economic situation controlling the number of hours of work and the wages paid at the steel works at the present

time. The plant was not designed nor is it equipped to operate on the basis of an eight-hour day at cost that permits of reaching markets open to us.

"Our strongest competition is from the United States, where steel companies, prior to the war, accumulated large surpluses not subject to abnormal taxation, and which enabled them to install every known improvement and labor-saving device which made for lower costs and increased output. We have certain natural advantages in our geographical location, but we must have co-operation of employees and stockholders while we are building up our plant and our markets.

"For several months, in a declining market, we have sought business in all parts of the world, even offering rails in exchange for certain grades of ore and finished products to foreign governments on credits. Nothing has been left undone in an effort to keep all departments in operation, for we appreciate the need for employment and we know the value of maintaining our organization intact.

"The sooner the employees of the Dominion Steel and Dominion Coal Companies come to a realization of the honesty of our purpose to establish a permanent all-the-year-around industry in Cape Breton, the sooner will they participate in the benefits.

"It must be evident to the most unthinking that we will never approximate or establish such a condition as long as our men blindly follow advices of outsiders as to how our business shall be managed.

"The McAdoo schedule and the Chicago award may be all right when they can be passed along in increased passenger fares and freight rates, but we are in no such position.

"We looked upon our men as loyal employees and good citizens and it is disappointing to us that by their action they left us without means to protect our property."

The blast furnace of the Nova Scotia Steel & Coal Co. at Sydney Mines, and the open-hearth plant there, have been closed down, and the works at New Glasgow will be operated on cold metal until trade conditions warrant the resumption of steel-ingot production at Sydney Mines. Some 400 men will be displaced.

The production of the Glace Bay collieries of the Dominion Coal Company on the 18th November totalled 13,152 tons, this being the best individual day's output since January 1918.

**BASE METALS BEING USED IN EUROPEAN COINAGES.**

Samuel Montagu & Company's circular of 4th Nov. states that the mintage of base metal, other than copper or nickel, still prevails in Germany. Up to the end of August Mks. 53,300,000 of aluminium coins had been minted. Other coins minted up to the same date were iron coins, Mks 71,800,000, and zinc Mks. 56,800,000; so that in all about Mks. 181,200,000 of these coins of small denomination have been struck.

The "Times" Paris correspondent stated that the dies and metal for the new tokens, which are to replace the much-soiled 50c., 1 f. and 2 f. notes, are now ready, and the mint is only waiting the authority of the Chamber of Commerce of France, which is responsible for their issue.

**PEELE'S Mining Engineers' Handbook**

The Ultimate Book for Every Engineer Whose Work Brings Him in Touch With Any Phase of Mining.

"PEELE" is at once reliable, thorough and practical--the one complete, up-to-the minute source of all mining engineering facts.

One-Volume Edition—2375 pages, 4¼ by 7—flexibly bound—\$7.00 postpaid.

Two-Volume Edition—Vol. I—1225 pages—Vol. II—1216 pages—flexibly bound—\$8.00 postpaid.

# Asbestos Mining in Australia

By HARTWELL CONDER.

(From Chemical Engineering & Mining Review,  
Melbourne).

The last five years have seen a development in a branch of mining which bids fair to win a permanent place as an economic producer. Asbestos has been known to exist in Australia since the days of early exploration. The demand, however, until recently, was almost solely for long fibre high-grade material, and nature had so arranged the distribution in Australia that the high-quality fibre—of wonderful length and texture—was located in the remote and sun-scoured vicinities of Marble Bar, in W.A., while the supplies within easy reach comprised fibre good enough in texture and tensile strength, but of average length well below the half-inch limit.

The introduction of asbestos sheeting has changed all that. It was found that by the addition of asbestos fibre to cement a product was obtained with the durability and other advantages of stone or slate, and yet with sufficient elasticity to withstand the ordinary rough usages of daily life. At first the rejected products of the Canadian mills were garnered and sold at low cost for this purpose, but the demand steadily increased, and freights and prices rose, so that it became of special interest to the Australian manufacturers to develop the supplies to be found at home. There is no lack of supplies, but considerable caution is necessary before expenditure is incurred in developing them. There are several forms of so-called asbestos. Mineralogically, true asbestos is a variety of hornblende; the commercial asbestos of Canada and Australia is a different mineral, and is known as chrysotile—almost pure hydrated silicate of magnesia. In composition it is identical with serpentine, with which it is invariably associated. When the vast intrusive masses of granite rocks commenced to cool, the more basic elements segregated along the margin to form distinctive rocks, such as gabbros, dolerites and others, grouped broadly under the name of ultra-basic rocks. Subjected to heat and the action of heated water vapor these rocks became altered—they lost iron and other elements and became hydrated, and serpentine is the name given to the final product. A soft, green, greasy rock, it is as widely distributed as the granites themselves; as a rule it does not carry minerals of economic value; chromite and magnetite accompany it, and in Tasmania it is the mother rock of the very valuable and extremely scarce osmiridium. In addition, it is the source of our supplies of asbestos.

The asbestos occurs in two forms. The first is found in the joints and selvages of the rock where in all probability local faulting has taken place. The fibres are parallel to the place of the faulting, and may be over a foot in length, but they are coarse in texture and lacking in tensile strength. This class of fibre is known as picrolite or slip fibre, and is of little use for sheeting or similar purposes.

In the second form the mineral occurs in narrow veins or seams running through the solid rock, and the fibres are all arranged transversely to the seams. Where exposed to the sunlight even the smallest seam stands out distinct, like a ribbon of silk along the face of the rock. The fibres may be teased apart to a flossy mass,

and under the microscope the fine strands that compose this mass are seen to be bundles of finer and finer strands beyond the limits of even microscopic vision. It is this fine subdivision which gives the silky sheen when the light shines upon it, and which allows the better quality material to be spun into yarn and used for cloth.

Some interest has been shown lately in the manner in which this structure arises, and in the Transactions of the American Institute of Mining Engineers, Mr. Taber advances the theory that the fibres grow longitudinally as the crevice they form in opens. This theory does not appeal to the writer. Serpentine invariably shows the clearest signs of intense crushing and contortion. In the asbestos quarries both in Tasmania and in New South Wales local fault planes with slickensides occur at every angle and of every dimension. It is one of the main difficulties of working the ore, since at any point a good patch of ore may be cut off completely by a "head" coming either from the side or from below. With movements such as this taking place, cracks would develop in certain portions of the rock, to be instantly filled by the mobile solutions which were permeating the whole mass. It did not follow that chrysotile then formed from the solutions. In many places the rock is creviced through and through, but the crevices are filled with a green amorphous mineral with no sign of fibrous structure. The quality of the solution, and probably the rate of cooling, were determining factors, and when these were favorable the fibrous structure arose, even as the foliated structure of mica develops in the cooling granite itself.

The first treatment plant in Australia was erected under the writer's supervision near Beaconsfield, Tasmania, for the Durabestos Company, of Sydney. The asbestos occurs there in a serpentine belt lying between pre-silurian slates and Devonian granites. The geology has been described recently in Tasmanian Geological Survey Report No. 8, by A. McI. Reid. The plant was erected with considerable doubts as to the extent of ore available, but supplies were imperative, and this was then the source that offered most promise. There were many outcrops on the property, showing good fibre, but some considerable prospecting work had been done previously, and this work had shown that the ore bodies were of limited extent. It was realised that if the surface shows were attacked one by one and worked out singly, the property would soon be brought to a standstill. Effort was made, therefore, to open out a face where the fibre seemed most plentiful, and to carry this face right into the hillside, in order to expose other ore bodies at depth as the surface shows "petered out." It was hoped, too, that some system might be found to regulate the occurrences. The results were disappointing. No sign of system or method could be traced. The ore occurred in a hopelessly haphazard and erratic fashion. After some months working it became obvious that the hillside could not be taken in a face and that the ore bodies must be followed. This meant that the mine was doomed, and search was commenced for other supplies.

 Entirely Without  
 Charge.***

The most promising and most accessible source proved to be in the New England district of N.S.W., on the western fall of the dividing range. From the granite mountains that form this range with Glen Innes perched high upon it, a stretch of broken, hilly country extends for over 50 miles till it merges into the western plains. The geology of this part of the country was dealt with by Dr. W. N. Benson, and the results of his work are published in the proceedings of the Linnean Society of N.S.W. He has shown that a great fault line extends in a direction about N.W., from a point about 20 miles N. of Tamworth, almost to Warialda, 100 miles away. The line passes about 12 miles east of Manilla and Barraba, and goes right through Bingara. Granite lies some distance away on the eastern side with a complex variety of rocks known as the eastern series stretching from it towards the fault line. Along the major portion of the fault line itself serpentines, gabbros, and other basic rocks are developed on the eastern side, and the serpentine in many places carries chrysotile asbestos.

The locality where the asbestos is most strongly developed is at Woodsreef, about 10 miles east of Barraba, and at that place quarries have been opened up and dressing plants erected by Messrs. Wunderlich and Messrs. James Hardie and Co., of Sydney. Messrs. Wunderlich had been interested in the Durabestos Co., which operated in Tasmania, and finally took over full control of this company. Their operations are briefly described here.

In the main features there is a close resemblance between the occurrence of the ore at Beaconsfield, Tasmania, and Woodsreef, N.S.W. Serpentine does not yield fertile soil, and its outcrop is marked by the stunted gum timber that battles for life upon it. Chromatite and magnetite are associated with it in both localities, some of the chromite patches having proved payable at Woodsreef. At both places the distribution of the fibre veins in the mother rock is most irregular and liable to sudden and total extinction, but the work done at Woodsreef leads to the conclusion that the distribution here is on a larger scale and of greater frequency. Weighed carefully in the light of the experience gathered in Tasmania, the mine here seemed to warrant a larger plant and to promise a good many years of profitable life. It would, however, prove a stumbling block to the engineer who aims at figuring out his ore reserves to the third figure in decimals. So far no practicable method of blocking out asbestos ore has been advanced. Even the diamond drill is useless, since the fibre fluffs up and chokes the bit.

To safeguard the position as far as possible, on Messrs. Wunderlich's property over a dozen quarries have been opened up, and these have been connected by tram with the mill. The mill itself is driven by a powerful Diesel engine, the fuel problem not being a simple one in these distant hills. The milling process is based on the Canadian practice, and depends first on crushing the rock with breaker and rolls to the size of peas. This product is then passed into a disintegrator, which pulverises the brittle rock to sand and beats out the fibre into fluff. From this machine the product is passed over shaking screens, at the lower end of which the mouth of a suction tube is brought down close to the surface. The fluff is caught up by the air current, carried away, and deposited in collecting bins. The process is not quite as simple as it sounds, since it is easy

both to lose fibre and to carry over an excess of useless sand, while the dust problem is always present. Fortunately, the soft serpentine dust appears to be free from the pernicious effects of the angular quartz particles, but care is taken to carry it off with fans, and keep the building as clear as possible. The disintegrating machine also is open to improvement. It is most difficult to devise a machine which will reduce the rock rapidly without damaging the fibre, and without excessive wear and tear. In Canada, where there was an excess of short fibre, the machines employed were most severe on the fibre; the ore was rich and a certain loss was compensated by large capacity and better quality product. With poorer ore in Australia the loss of fibre is a serious matter. A machine built in Sydney is installed in the present plant, and it is hoped it will prove successful.

The plant has been made, as far as possible, self-acting. The tram by which the ore is delivered to the bins curves round, so that there is a straight run through as the trucks are emptied. The mill is located so that a good gradient with the load is secured from nearly all the quarries. The tailings are passed out by conveyor, so that as little "shovel work" as possible is entailed.

The enterprise has brought fresh life and activity to a little way back township hidden among the hills which had already in the past had a brief experience of mining vitality from the alluvial gold that was worked there. Gold is still won in the vicinity, and there is talk of real lodes and large plants, but it is the asbestos that offers the immediate revival. How long such revival will last and how great a benefit it will bring to this part of the country must for the present remain unknown. This asbestos industry has, however, come to stay, and it is clear that the demand for the product will increase day by day as its merits become better known to architects and builders. It does not follow that every natural occurrence of asbestos has commercial value, but the stage has been reached when such occurrences are fully deserving of careful investigation, to decide whether in quantity and quality they may not prove profitable to the investigator, and useful to the men who are turning Australian minerals into Australian goods.

### NEW COBALT DEPOSIT.

#### A Queensland Discovery.

The development of new uses of metallic cobalt in recent years has established a demand for this commodity, which a few years ago was a metal of comparatively small account. In the circumstances it becomes important to put on record any discoveries of new occurrences that give any promise of development to meet the world's requirements, and in this connection a report by the Queensland Government geologist recently received at the Imperial Mineral Resources Bureau concerning a high-grade deposit near Selwyn, in the Cloncurry district of Queensland, is of special interest.

The locality is approximately 19 miles south of Selwyn, the nearest railway station, which is 71 miles from Cloncurry. By track it is about 5 3/4 miles south of Mount Dore (located on Queensland four-mile map sheet 120) and one to two miles west of the Mort River.

The cobalt ore occurs at the contact of diorite (apparently a dyke about five chains wide) and schists,

the latter belonging to the Cloncurry series of supposed Silurian age. The schists have a strike of 5 degrees west of north and dip easterly at angles of 74 degrees to 80 degrees. They form noticeable outcrops on the area.

It is estimated that in prospecting the lode between 130 tons and 140 tons of ore have been raised, of which 92 tons represent ore in paddocks; 30 tons of the latter are approximately of 25 per cent. grade and the balance 10 per cent. to 12 per cent. grade. The lode is regular in its trend, following almost a straight line for at least 300 ft. It is very desirable, says the Government geologist, that the whole of the diorite contact should be prospected, particularly the eastern contact, on account of copper carbonates, scheelite and cobalt ores having been already found along it.

### VANCOUVER BRANCH, C. I. M. M.

At a recent meeting of the Vancouver Branch of the C. I. M. M., it was decided to hold a luncheon early in November. This luncheon will be the first of a series of luncheons to be held during the Winter by this branch. It is proposed to make the meetings interesting, and have them prove a means of getting the members of the Vancouver branch together in a social way.

### 1921 MINING CONVENTION, PORTLAND, OR.

Reports are coming from Portland, Ore., that the Chambers of Commerce are even now talking of the International Mining Convention which is to be held there during the coming Spring. Plans and ways and means are being discussed, and it proposed to give the visiting delegates an interesting time. Vancouver will soon start some publicity work in connection with the coming convention, and the British Columbia Chamber of Mines proposes to take a most active part.

J. A. RICHARDS,  
Acting Chief Inspector of Mines, Alberta.

**BOOK REVIEW.**

The Efficient Purchase and Utilization of Mine Supplies: Stronck & Billyard. First Edition. John Wiley & Sons, New York. 5 by 7½ inches. Cloth Boards. 97 pp. No index. \$1.25.

This little book, written by two mining engineers, deals with two subjects that are not usually conjoined in mine operation, because the office of Purchasing Agent does not, generally, carry with it any supervision over the efficient utilization of the supplies that he purchases in his capacity as agent for his employers. The combination of clerical and purchasing ability with a practical knowledge of the use and upkeep of mine material is not often found, and in choosing a purchasing agent, consideration of the desirability of such dual equipment in the person selected might not be out of place.

The book gives a clear idea of the clerical equipment necessary, and lays properly great stress on the desirability of written requisitions and receipts for all material issued, although it is noted that the competent executive will know where to draw the line between useless red tape and proper system.

The treatment of the question of utilization of mine supplies contains useful hints, particularly with regard to hand-tools, the storage of oils and lubricants, timber preservation, treatment of pipelines, prevention of corrosion in iron and steel, fuel consumption, etc.

A department regarded as necessary by the authors, but only occasionally found at mines, is for testing materials received. In such items as oils and lubricants, wire-ropes, horse-feed, to mention a few typical things, some equipment for testing is necessary to check up the firms supplying material, nor is it necessary to assume that only large concerns can afford such equipment.

Another matter touched upon by the writers is that warehouses should be designed with track connections, handling devices and bin arrangements of substantial and permanent construction, designed to assist the economical storage and subsequent distribution of material.

**HANDBOOK OF ORE DRESSING.** Equipment and Practice. A. W. Allen, First Edition 1920. 7½ by 5 inches. 242 pages with Index. Limp leatherette backs. McGraw-Hill Co., New York.

This handbook is written by the author of "Mill & Cyanide Handbook", published by C. Griffin & Co., London, and previously reviewed in the "Canadian Mining Journal."

It deals with the various stages in the mechanical handling and preparation of an ore for metallurgical treatment. Amalgamation, concentration, flotation, chemical solution and smelting, are considered as essentially metallurgical processes, and as outside the scope of this treatise.

The introduction (from which we note the author's footnotes, the original presence of which is indicated in the text, have been omitted) discusses interestingly the proper definition of the term "ore-dressing" and its distinction from metallurgical extraction. We recollect that a legal question touching the application of taxation to mines in Northern Ontario turned on this distinction.

The treatise appears to be what its writer sets forth as his aim, namely, "a handy and practical vademecum for millmen and engineers." A bibliography is appended, and illustrations are numerous. Many statistical tables are also included.

**MINERALOGY**, by E. H. Kraus, Professor of Mineralogy and Crystallography, University of Michigan, and W. F. Hunt, associate Professor of Mineralogy and Petrography, University of Michigan. Published by McGraw-Hill Book Co., New York.

This book is written for the purpose of helping the student to grasp the fundamentals of the science of mineralogy. It is obviously intended to be used as a handbook in a laboratory where specimens of the minerals are available for study and which is equipped with simple apparatus for easily applied tests. It should serve as a useful text-book for elementary classes in mineralogy. It deals specifically with 150 common minerals, but should help to give the student a good groundwork for the study of any other minerals as well as assist him in determining the 150 described in the text.

The authors have advisedly laid stress on the physical properties of minerals. It is by the easily determined physical properties that most minerals are identified. The less easily understood subject of crystallography is however given prominence because of the highly distinctive character of the crystallization of minerals.

As the ordinary student in our colleges knows little about crystallography or the optical properties of crystals, the authors have necessarily presented these subjects at some length. They have endeavored to simplify these matters for the student by using large numbers of illustrations, including numerous excellent photographs of minerals and crystal models. The information given in the text, when used in conjunction with laboratory study of crystals and crystal models should make easy the acquirement of the rudiments of crystallography and its application in the identifying of minerals.

For the determination of minerals simple blow-pipe tests are in many cases used to advantage. The authors of this book have presented an excellent description of blow-pipe methods that require only simple apparatus and a few reagents.

In the descriptions of minerals, the authors have chosen a logical arrangement and grouping that commends itself to the reader and should help the student to keep in his mind. Chief attention has been devoted to characteristics which are useful in identifying minerals, mention is made of the economic uses and value of the various minerals and some of the districts in which ores are mixed are noted.

The ways in which minerals have been formed are dealt with in one chapter. Some description is given also of the common rocks. The student is also given some idea of the methods of utilizing the polarizing microscope for the examination of minerals.

To assist in the determination of the common minerals a very complete set of tables is presented. With these tables the student can utilize readily determinable physical properties in identifying specimens. Just how satisfactory these tables are for the purpose can be determined only by frequent use. Knowing the authors I would expect these tables to be the result of long experience and to have been well tested and found very satisfactory.

The book differs in many respects from the ordinary text-books on mineralogy. It is not a mere descriptive text or a dissertation on the science of mineralogy; but rather a book with a purpose: to give the student a grasp of fundamentals of the subjects and to arouse his interest in minerals and ores and in the industries in which they play a large part.—R. E. H.

# THE MARSH HOIST

IS MADE THE RIGHT SIZE and TYPE  
FOR YOUR MINE

Let our Engineering Specialists assist you in selecting and designing your Hoist

Hoists Illustrated herewith are also Built for Electric Power

We will send you, if you wish, photos of many other types of Mine Hoists.

Double Drum, for two Compartment Mines, or for Tailrope Haulage.

Made in 7 Sizes, from 10 H. P. to 50 H. P.  
Built to your order, and to your liking.

Single Drum Heavy Duty Type 50 H. P., 40" Dia. Drum.

All Steel Gears, Machine cut, Reversing Links, so load may be lowered either by Steam or by the brake. Made also with 48" drum.

Single Drum, Light Duty Type, made Reversing or not, as desired. Above Hoist has friction drive, but made also with Drum keyed fast to shaft.

**MARSH ENGINEERING WORKS, LIMITED,** Established 1846 **BELLEVILLE, ONTARIO**  
Sales Agents:—*MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver*

**MINE GASES AND VENTILATION.**—Text-book for students of Mining, Mining Engineers and Candidates preparing for Mining Examinations. J. T. Beard, Second Edition. 5½ by 8 inches. Limp leatherette backs. 433 pages with index. McGraw-Hill Co., New York, \$4.00.

Mr. Beard's connection with the International Correspondence Schools, and with "Mines and Minerals" is well-known to coal-mining students. As Senior Associate Editor of "Coal Age". Mr. Beard prepared a series of study courses in coal mining with the intention of their inclusion and later publication as a pocket book. The present volume is issued in request to many applications for immediate publication, and it is, as stated in the preface, a very handy volume for mining students, dealing simply with one of the subjects in a coal-mining course that usually gives most worry to the aspirant to a certificate of competency and official position.

The volume treats on the physical phenomena of atmospheric air, heat, mine gases, mine explosions, mine rescue-work and appliances, the theory and practice of ventilation, mine lamps and lighting, and contains an addenda of useful tables.

The volume is, of course, written from the standpoint of United States practice, which in many respects connected with mine explosives, the use of electricity in mines, mine illumination and the use of explosives, permits practices that are not allowed in Canadian or European collieries.

Mr. Beard's viewpoint, is however, in advance of the practice of his country.

## MINERAL RIGHTS OF ESQUIMALT AND NANAIMO RAILWAY BELT, B.C.

For some months negotiations have been in progress between the British Columbia Department of Mines and the representatives of the Esquimalt and Nanaimo Railway. Co. for the settlement of the unsatisfactory condition now prevailing as to the administration of the minerals within what is known as the Railway Belt on Vancouver Island, an area of 3,396.9 square miles. In this section the Company owns the surface and the base metals and the Government the gold and silver and there are the Railway Company's regulations and the Provincial Mineral Act to be complied with before title to the minerals can be obtained or even recorded effectively. The result has been the retarding of mining development in that region. After extended discussion, and exchange of views, the Government has made a proposition to the Company which may be summarized as follows:

"That, as regards the mineral rights within the E. & N. Railway Belt remaining unalienated, the Government is prepared practically to go into partnership with the Railway Company.

"The district to become fully under the operation of the Mineral Act as far as underground mineral rights are concerned; that such mineral rights be administered by the government; that the cost of such administration be entirely borne by the government and that the gross receipts of all revenue received by the government from and on account of such mineral rights, including taxes, etc., be divided equally between the government and the railway company."

**TORONTO NOTES.**

Dr. W. L. Goodwin, formerly Dean of the Faculty of Applied Science at Queens University, Kingston, has arrived in Toronto. Dr. Goodwin has been requested to act as principal and has accepted the task in connection with the establishment by the Ontario Department of Mines, of schools of instruction at the various mining centres. It is expected that the schools will be at Belleville, Madoc, Cobalt, Porcupine, Fort William and Sault Ste. Marie.

Oil boring operations will be carried on all winter in Alberta and Saskatchewan by ten rigs of Imperial Oil, Limited, according to an announcement by President A. W. McQueen, who has just returned to Toronto from the West, where he completed arrangements for the continuance of operations. This will embrace all the rigs of the company now operating in the West, with the exception of the two that were in the Fort Norman territory of the far north, where the weather is too severe for winter work. No further announcement has been made as to results in the latter section as work was closed down for the winter some time ago. The continuance of boring in the more southerly regions may bring announcement of success in other places in the course of the winter months. In any case the company's program in the West is being prosecuted with vigor.

**Thompson Powder Co., Limited.**

The mining industry generally will be interested in learning of the progress that is being made at the plant of the Thompson Powder Company, Limited, manufacturers of high explosives at Deseronto, Ont. A new magazine has been erected which will hold several carloads of the finished product and one of the buildings is in readiness for the reception of over fifty tons of raw material, which will at once be hauled to the power house. Other buildings have been remodelled and site cleaned up. The Hydro line will be strung during November. Motors and other machinery have been ordered and it is expected that before long the plant will be in active operation. The company are the manufacturers of "Thompsonite" an explosive which, it is claimed, throws off no noxious fumes and does not require thawing in the coldest weather. It is claimed, also, that the inventor has perfected a powder which is stronger by at least fifteen per cent than any explosive now in use in Canada. The powder is said not to be affected by water, does not leak or crystallise out and does not contain nitro-glycerine, making it safe to handle and manufacture.

**JOPLIN DISTRICT ROCK DRILLING CONTEST.**

Down in Baxter Springs, Kansas, in the Joplin District, they have an annual Fall Festival at which the drawing card and most exciting event is a rock drilling prize contest, which, as a true criterion of men and machines, closely approaches the ideal contest. The contest was held this year on October 20th.

Teams are required by the rules of this contest to set up tripods; connect hose to drill; drill hole clear through rock; tear down drill; disconnect hose; loosen bolts; and place hose, steel, drill, and tripod back in position where found.

The rock used last year was a block of Carthage marble five feet square, marked off into twelve square spaces, one space being reserved for each drilling team, while this year a block of concrete, six feet thick and filled with boulders, was used.

Miles and Vickery, who carried off the first prize

last year with the Waugh Turbro drill, were just one minute behind Abbott and Mitchell, the team that won the first prize this year. Both teams operated the Waugh Turbro drill, as did also Santon and Cox winners of the third prize in this year's contest.

The drilling time for the first three teams including setting up, tearing down, etc., was as follows: First, 4 minutes 26½ seconds; Second, 4 minutes, 27½ seconds; Third, 5 minutes 4½ seconds. The nearest competitor of the three winning teams, operating another make of drill, completed their hole in 7 minutes 4½ seconds. Last year the winning time in this contest was 5 minutes and 16 seconds.

That the Waugh Turbro drill should have won the first and second prizes in the Baxter Springs contest last year, and first, second and third prizes in this year's contest is considered a remarkable achievement in the Joplin district where the Turbro ever since its introduction has enjoyed great popularity.

**COAL PRICES.**

Toronto, November 25.—Local dealers report that there are indications of a recession in anthracite prices. Business is exceedingly dull. The storms of the past week resulted in a still greater shortage of cars and there has been a considerable reduction in motive power on the railroads. Bituminous mine run is quoted at from \$9.25 to \$10.50 with good grade slack at \$9.50. Smokeless is quoted at from \$10 to \$10.75. Bituminous lump continues to be scarce and hard coal is ruling at from \$8 to \$14.

**Montreal.**

Boston News Bureau states drop in bituminous prices in United States has been a collapse of the spot market rather than any serious reduction in contract prices. This is what would be expected, as unconscionable increases which took place in United States coal during the Summer were for "spot" coal; the mines, by some process best known to themselves, managing to hold back on contract deliveries and avail themselves of spot coal prices. Prices for good grade bituminous steam are stated to vary from \$4.25 to \$6.00 per ton, at the pitmouth an average of \$5.00 being representative.

Tendency to substitute bituminous for anthracite is noticeable in the New England States, and it is further stated that large demand for anthracite from the Middle West which was simultaneous with high wages there is now falling off, and that bituminous coal is being once more generally used. The status of anthracite as a "luxury" fuel, but not an indispensable one where bituminous coal is available, is becoming established.

Statistics just compiled indicate that the British Columbia Department of Mines, in carrying out the policy enunciated by the Mineral Survey & Development Act of extending assistance in the construction of roads and trails to mining properties favorably reported upon by government engineers, has built and maintained, between the years 1917 and 1920 inclusive, a total of 3,901.95 of such roads and trails in different parts of the Province. These figures are interesting as showing that the mining industry has not been dormant in the Canadian West in recent years and that considerable work has been done towards the opening up of new mineralized areas.

The ancient Greek and Roman both recognized the primary principle of grinding as crushing a smaller, softer object with a heavier, harder one. These super-men endowed with their marvelous physique, hurled huge boulders against smaller and softer stone. With this slow method, they reduced such minerals as quartz and limestone to powder form.

This first recognized grinding principle, improved and marshalled into commercial force by modern engineering science, is the basis of the Hardinge Conical Mill. When one considers that an 8-ft Hardinge Ball Mill can grind more in a day than a legion of early Greeks and Romans could in a week, the part modern engineering science has played is very impressive.

The Mill contains 3600 steel balls of various sizes which strike the material being ground at an average of 90,000 times a minute exerting a reduction force of approximately 360,000ft. lbs. of energy. Due to the conical shape of the Hardinge Mill, coarse material, on entering immediately gravitates to the point of greatest diameter. There it comes in contact with the largest balls traveling at the highest speed and striking with the greatest impact. As the particles are gradually broken they flow toward the narrower end meeting the smaller and lighter balls. The material undergoing reduction reaches the required degree of fineness and the discharge end simultaneously.

Among the materials being ground successfully and economically in Hardinge Mills are: Gold, Silver, Copper, Lead, Zinc, Tungsten, Iron, Graphite, Chrome, Manganese, Molybdenum Ores, Phosphate Rock, Limestone, Feldspar, Talc, Silica, Fullers' Earth, Glass, Clay, Graphite, Chemicals, Colors, Brass, Ashes, Sulphur, Slags, Mattes, Lead Skimmings, Zinc Skimmings, Aluminum Dross, Copper Skimmings, Iron Borings, Brass Turnings, and Steel Turnings.

*We have prepared a series of booklets giving complete data on grinding various materials. Send your requirements to us and we will be glad to give you complete information without obligation.*

# Hardinge Conical Mills

## Port Arthur Notes

By J. J. O'CONNOR.

The recent announcement of Thos. W. Gibson, Deputy Minister of Mines, that Mining Schools for prospectors would be opened at suitable mining centres during the coming Winter, has been received throughout Northern Ontario with general satisfaction, by all classes interested in the development of the immense area of unprospected territory, of which we know so little.

In the light of the mineral development that has taken place in Northern Ontario during the past ten years, there is no more inviting field for the intelligent well informed prospector, than is afforded in the unprospected areas of Northern Ontario. The vast triangular expanse of country, bounded on the south by the settlements of agriculturists, and the cities of Port Arthur and Fort William, on the east by Lake Nepigon, on the north by the Canadian National Railway, thousands of square miles in extent, is practically untrodden and unknown to the prospector. Similar extensive tracts of promising stretches of country lie east of Lake Nepigon, almost wholly unprospected. While north of the Canadian National Railway, (Transcontinental) we know no more of today, than we did in the days of the pioneer fur-traders.

These virgin fields are beckoning the well equipped prospector, offering opportunities of gaining splendid rewards for their time and labour.

The Hon. Mr. Mills, Minister of Mines, is to be highly commended for affording facilities that will be within the reach of all interested, to fully equip themselves at a season when their ordinary field work is restricted. It is to be hoped that many will avail themselves of this splendid opportunity, and that the pack-sack, the pick and the frying-pan, may be familiar sights on the trails and portages of the North, during the coming summer.

It has long been felt that a Mining Commissioner, familiar with, and competent to direct publicity, covering the mineral areas of Northern Ontario, would be of substantial advantage to this section, in making known its possibilities, to the investing public. The advantage the Province of Manitoba has received from the employment of an official of this character, is acknowledged by all mining men, and furnishes a good precedent for Ontario to follow.

The steamer J. Frater Taylor, of the Algoma Central Steamship Line, cleared for Buffalo, on the 16th instant, with the last cargo of pyrites for the season. This cargo completes a total shipment of slightly over 100,000 tons for the season of 1920, from the Northern Pyrites Mines, at Northpines, Ontario.

**SILVER-GALENA MINE**—For sale limited number One Dollar shares in Yukon Silver-Lead Mining Company, incorporated under laws Yukon Territory, operating Lookout Mountain Claim in Mayo District of Yukon Territory, Canada, has option on five claims adjoining. Capitalised for \$250,000. Bona fide opportunity. Geo. F. Johnson, 817 South El Molino Ave., Pasadena Calif.

## Blasting Supplies Of Uniform Quality Despite the Weather

The C. X. L. trade mark is the buying guide of the men who have the most difficult blasting problems to solve. These men rely on C. X. L. Blasting Supplies because of their known dependability.

## C. X. L. Blasting Supplies

Consistently maintain their high standard of quality.

C. X. L. Supplies include:—

Electric Blasting Caps, Safety Fuse, Electric Squibs, Cap Crimpers, Delay Electric Fuses, Thawing Cans, Blasting Caps and Tamping Bags.

C. X. L. Technical Service is always at your disposal, to help solve your blasting problems.

## EDITORIAL

### Mines Regulation in Canada

In this issue is published a comparison of the statutory mining regulations of the provinces of Canada, copied from the November issue of the "Labor Gazette." The comparison has been carefully made, and should be useful for purposes of reference and annotation, as mining laws are constantly being changed and added to.

The provincial laws as they exist today—and ignoring purely local regulations and the so-called "Special Rules," which are a rather important part of all mines' regulation—are compared with a standard of uniformity and excellence, prepared by a Commission on Uniformity of Labor Laws, appointed as a sequel to the Industrial Conference of September 1919.

Insofar as the Commission has confined its recommendations to statutory regulation of mines, considered from the standpoint of the well-being of the workmen, the standard adopted is not out of line with actual practice and the trend of modern thought, but in some respects the functions of the provincial officers, to whose hands the statutory regulation of mines is entrusted, seem to have been encroached upon.

For example, it is suggested that in case of disagreement following upon the report of a dangerous condition by a mine inspector, the matter may be referred to a board of arbitration consisting of a judge, and representatives of the interested parties.

This, to our mind, reveals a misapprehension of the duties and the status of the government inspectors of mines. These officers of the law are considered in most British courts to represent the directly delegated authority of the statute law, and it is not by courtesy or by custom, but by legal right that these men are designated as "His Majesty's Inspectors of Mines." Loose thinking of this kind recently led to a mine inspector in Nova Scotia being placed on trial for manslaughter, the inference being that he shared the responsibility of the mine officials. To our mind, the inspector of mines cannot delegate his authority, nor allow of its

abatement. He has one duty only, and one responsibility only rests upon him, which is to administer the law. The only tribunal of reference he can admit is his superior in office, the Minister of Mines, who represents the court of final appeal.

Another recommendation to which exception is taken is that providing for administration of first-aid and mine-rescue work by the Workmen's Compensation Board of such provinces as have established this authority. If this recommendation were confined to medical aid and the generally recognized scope of first-aid and accident prevention, little exception could be taken to it, but the inclusion of mine-rescue work, (a much misunderstood term) introduces a highly technical branch of the mining engineer's duties that in most well-regulated mine administrations is specifically dealt with by statute. The selection of such appliances as oxygen breathing-apparatus, fire-fighting devices, gas detectors, illuminating devices, signalling apparatus; the direction of rescue work, the supervision of men and materials; the formulation of rules of procedure, the training of men, and many other things that might be mentioned, come within the duties of the mine management and the mines inspectorate, and are certainly foreign to accepted conceptions of the duties of a Workmen's Compensation Board. The concluding paragraph of the Report of the Commission states: "The *administration* of first-aid and mine-rescue work is in no case entirely *within the hands* of the Workmen's Compensation Board."

Unless we entirely misconceive the viewpoint of the provincial departments of mines, and misinterpret both the intent of the workmen's compensation acts and the mines regulation acts of the several provinces, it will never be so.

The uniformity of mines regulation is not undesirable so far as this governs the social status of the mine-workers, but it is neither desirable or possible that uniformity should be attempted—for the mere sake of

uniformity—in technical regulations, as these advance with time and with the progress of technical invention. So far, the most effective spur to changes in the mining regulations of the various provinces of Canada, has been a spirit of emulation, and no literature is so avidly read by mining men as that which compares accident rates arising from mining in the provinces as they appear in the annual reports of the inspectors of mines. Nothing, moreover, is more instantly objected to than any attempt at unfair comparison, or slur upon the good name of any province, in regard to its mining accident rate, which we take to be a first-class indication of a commendable spirit of emulation in the good work of lessening accidents.

There could be little objection to the provision of funds for the purchase of first-aid and mine-rescue appliances; these having hitherto been provided at the expense of the mine owners, and, since the passage of compensation acts, possibly to be regarded as a fair charge against compensation assessments held by the compensation boards. This is the meaning we would give to the Commission's recommendation in Clause 14, but it is inconceivable that the "administration" of first-aid and mine-rescue work should in any case "be entirely in the hands of the Workmen's Compensation Board."

---

#### THE PUBLICATION OF TECHNICAL BOOKS.

We are reminded by a well-known New York publishing house, John Wiley & Sons, that the prices of technical books are advancing, and that they will not join the downward movement of general commodities. Since 1914 the costs of manufacturing books has advanced 132 per cent, and is still going up. Printers are now asking for a further forty per cent wage increase. The war caused a slump in the demand for certain classes of technical books, and in some instances necessitated the withholding of publication of books well advanced towards issue. The renewed demand has depleted the stock of books, and a general increase in the price of new issues will be required in technical books, as it has been required in novels and other books.

Of the making of books, the Preacher said, there is no end, and this is an ancient dictum that may be fittingly applied to the technical book of today, often out-of-date in its references before it reaches the public because of the rapid advance of human knowledge and recorded experimentation.

The publication of technical works has always ranked as one of the most honorable of professions, and it is fitting in this connection to note that the firm of Charles Griffin & Co., of London, has issued a centenary volume, with a foreword by Lord Moulton, F.R.S., to mark its completion of one hundred years of service to the technical professions. The list of publications mentioned in this volume, beginning with Rankine's

classics in 1858, is actually a catalogue of British engineering and technological progress and the names of those who laid the foundations of progress.

Canada has not yet developed a publishing house that is equipped to produce technical works on a scale to compete with the large firms of London and New York, and it is hardly to be expected that such should be the case, but it is possibly not the happiest of omens that our large publishing houses have so far specialized in volumes of fiction or ephemeral literature. Notable among the few British book-publishing houses that has established a Canadian branch is MacMillan's, but perhaps the day is coming when such firms as Isaac Pitman & Sons, Griffin & Co., or some of the better-known New York houses may see fit to set up shop in Canada, or better still that some of our Canadian houses may develop a substantial technical-book business.

In one particular, that of elementary and high-school books, there is much need for preparation of manuals on distinctively Canadian subjects. For example there is no competent text-book on Canadian industries, on the association of regional geography and geology with industry and population, no understandable manual on Canadian minerals and mining, and no book that attempts to apply to Canadian life the principles—and not the dry-as-dust facts and figures—that animate the geologist, the geographer, the historian, the forester and the scientific agriculturist. Our school literature is largely clipped and borrowed material, and it is distinguished by the minimum of originality and the maximum of compilation.

Really worth-while school text-books of the nature above outlined cannot, of course, be originated by the individual provinces. They will have to be assured of a Dominion-wide circulation, and will probably have to originate outside existing educational authorities.

---

#### CANADA AS A PRODUCER OF PETROLEUM.

In the issue of the 19th November, exception was taken in these columns to an opinion of the "Petroleum Times," of London, which stated "it must not be imagined that Canada has the slightest hopes of ever becoming a great oil-producing country." It is pleasing to note that in the latest issue of our informative contemporary which is to hand, there appears a geological sketch-map of Western Canada illustrative of the oil occurrences and prospecting boreholes, and containing a note on the Fort Norman oil strike, and the interesting statement that the new oil-field "is probably of great extent and may be one of the largest in the world."

We congratulate "Petroleum Times" on its quick publication of accurate information regarding the successful prospecting of the Imperial Oil Company, based upon Dr. Bosworth's researches, and its evident ap-

preciation of the real importance of the Fort Norman oil-flow, which follows so soon upon a previously expressed adverse opinion. The statement of Mr. Camsell, the Deputy Minister of Mines, that "Canada is a continental area, only partially prospected," is in these days being amply demonstrated.

#### *THE INTEREST OF THE COAL PRODUCER IN COAL DISTRIBUTION.*

Our British Columbia correspondent gives some particulars of the cost of marketing domestic coal on the Pacific Coast that are fairly typical of the customs of the coal trade in general.

The price at the mines to dealers is given as \$8.93 per net ton, which seems high. The cost of mining coal in Vancouver Island is, however, quite high. Except in some favored localities, the Island coals are characterised by a high percentage of discard in the preparation process at the mines, running in some cases from 25 to 30 percent. The seams are also disturbed by rolls, and the work of development is extremely costly. The difficulties under which mining is carried on in some Vancouver Island districts are indeed such as would dishearten those accustomed to continuous, regular coal seams.

The process of getting the coal to market in Vancouver includes the following operations, towing and unloading scows, screening and sacking, cartage and packing. These total a cost of \$4.37, or about half the mine cost of the coal, and they represent largely the cost of inefficient and superfluous handling. Customers demand screened lump coal, and to supply this demand, runmine is screened, leaving a residue of slack of little value. Ordinary runmine should be good enough for most domestic purposes. Sacking is another practice that is only necessary where coal has to be delivered in extremely small quantities. The items of towing, unloading scows, wharf rent and overhead charges, indicate that much could be saved by bringing coal cargoes to Vancouver in larger bulk, and unloading by modern devices.

The suggestion that Alberta coal should be brought to Vancouver and sold by the city in a municipal yard is not one that commends itself to many, but it does indicate that the effect of large areas of coal that can be very cheaply mined is commencing to be felt, and Vancouver people should not overlook the fact that some day their city is likely to be a point of much importance in the export of Alberta coal by water. The obvious remedy for any inefficiency that may exist as a result of competition among Vancouver Island mines in the Vancouver domestic trade, is the consolidation of the sales organizations, a concentration of the freighting, discharging and marketing arrangements; and the absorption of the business of the retailers by the coal companies.

Even on their own showing, the retail dealers in coal in Vancouver take a profit on \$1.20 per ton on lump coal. It is safe to say that no coal company in Vancouver Island ever made such a profit over any representative period, after deduction of all legitimate charges. It is also safe to say that a coal company would consider itself justified in spending many thousands of dollars to effect a producing-cost saving of ten cents per ton, and they should not contemplate—without some consideration of its repercussion on their own interests—a charge of \$1.50 per ton for "cartage and packing" of domestic coal. He may not deserve it, but the coal producer will always be blamed by the ultimate customer for the high cost of coal, and the necessity for action in self-defence is quite clearly indicated.

#### *LOW FATALITY RATE IN BRITISH COAL MINES.*

In pleasing contradistinction to the many difficulties that at this time beset British coal-mining is the fatal accident record, which in 1919, for the first time in its history, showed a ratio of mortality from accidents per thousand persons employed that fell below unity, the figure being 0.94 per 1,000 persons. The number of persons who lost their lives by explosions of fire damp and coal dust, was 27, out of 1,191,313 employed, or 0.03 per thousand, a record that was only bettered in 1917, when only 20 deaths occurred from these causes.

Twelve of the deaths from explosions occurred in Scotland, where the use of naked lights is common. In the English mines, the practice may be said to be virtually extinct.

Another notable fact is that not a single person was killed in Great Britain in 1919 through breakage of ropes and chains in shafts, and only six fatalities are attributed to the use of electrical plant underground.

As compared with our friends in the United States, British mining engineers pay a high price in restrictions on output and in increased cost of production because of the operation of regulations forbidding naked lights, naked power wires, black powder, underground trolley-haulages, and other practices that are permitted in the coal mines of the United States, but while this journal shares in the innate dislike of coal miners to any appearance of congratulation upon freedom from fatalities, it can hardly be doubted that the very favorable record of the British coal-mines is to a large extent due to observance of the Coal Mines Regulation Act.

The owners and managers of British coal mines have been accused of carelessness in regard to the safety of employees, and it has been freely stated that the after-war conditions of the collieries was poor. The accident record does not bear out any such ideas, and altogether the achievement is one that reflects credit on all concerned, and particularly on the mines inspectorate.

# The Mayo Silver Area, Yukon Territory

By GEO. F. JOHNSON, Vancouver.

The Mayo area in the Stewart River district of Yukon Territory, Canada, has attracted considerable attention within the last few years and more particularly recently, by reason of the extremely rich and promising lode-deposits of Silver-Galena Ore, which have been located in considerable numbers, extending over an area of fifty miles.

The writer, who has just returned from making a personal inspection of the Mayo District, submits the following brief report, which may be of interest to your readers.

The town of Mayo is situated on the Stewart River, about 180 miles from its mouth. The Stewart River flows into the Yukon and is easily accessible. Navigation opens early in May and usually remains open until middle of October. During the open season the White Pass and Yukon Route run regular passenger steamers there as the needs justify. During winter months, Mayo is served by a regular freight and passenger-stage from Dawson, Yukon Territory.

From Mayo good wagon roads radiate to nearly all of the important operations, which include those on Lookout Mountain, (Spur of Mount Haldane) Silver King, Galena Hill, Rambler Hill, Mount Cameron, Mount Hinton and Keno Hill, which is in the Gustavson Range.

Previous to 1914 little prospecting for other than gold was done in the ordinary type area, but the opening up of the extremely rich silver deposit of the Silver King mine on Galena Creek, stimulated interest in lode deposits and since then vigorous prospecting has been going on, with the result that several most promising prospects have been discovered and are being developed.

The Silver King mine produced from a "pocket" approximately half a million dollars in Silver, with comparatively little effort or expenditure.

The next prospect to be developed, was that on the Lookout Claim, on Lookout Mountain, at an elevation of 3,500 feet.

This claim, with four adjoining ones, are under option to the Yukon Territory, for the purpose of developing this property.

Development work on the one claim has been going on for two years and results are 1,200 feet of adits and shafts, with a total depth of 450 feet on the original "discovery vein."

The country rock on this claim is gneissoid quartzite and quartz mica-schist. Greyish granite-porphyr and greenstone schists also occur.

The hanging-wall is usually well defined and marked by gouge.

The ore is of a disseminated character, the galena occurring in small streaks and masses. There are several zones in which this occurs, permitting of sorting a shipping grade of ore.

The vein follows a well defined but slightly irregular fracture in a gneissoid quartzite and quartz mica-schist, striking from 120 degrees to 150 degrees magnetic and dipping from 45 to 50 degrees to the north east.

The width of the vein varies from 6 to 33 feet, its length and depth being undetermined. The workings are entirely within the oxidized zone.

Dr. W. E. Cockfield, Dominion Geologist, in his

1918 report says that, in addition to the vein on Lookout claim, two and possibly three other veins as yet undeveloped, occur on the adjoining claim. From the outcroppings they were traced, by means of float, a distance of over 2,000 feet.

The development work on the Lookout claim proves the vein to have streaks of carbonates to 12 inches in width, carrying very high but somewhat erratic values in silver.

A sample shipment of 27 tons of ore sent to the Trail Smelter gave returns of 95.6 oz, silver and 59.4% lead.

A sample of 1800 pounds from discovery tunnel, gave 125 oz, silver and 62% lead.

The efforts of the Yukon Silver-Lead Mining Co, have had entirely the object of proving depth of vein, but since the wonderfully rich surface enrichment recently discovered on Keno Hill, the management intend seeing if their property is not similarly enriched.

I have purposely given extended data about Lookout claim, for the reason that this was the only property which has been systematically developed and the district generally has been depending somewhat on this property to prove geology, etc.

Rambler Hill, situated about six miles east of Lake McQuestion, has some very promising properties with similar formation to that on Lookout claim.

The workings are at an elevation of about 5,000 feet and are entirely above timber line. The owners of property have outlined considerable work for this winter.

Mount Cameron, which is about 45 miles in a direct line from Mayo, has three claims upon which some development work has been done and it is claimed that in the adit the vein has a banded appearance, with alternating streaks of galena and sphalerite, the galena occurring in streaks from 2 to 6 inches wide. The general geology of the district is similar to that of Keno Hill and Lookout mountain.

The size of the outcroppings and the fact that streaks of pure galena carrying high values in silver occur, indicate that the property may have considerable value, but much development work is necessary to prove this.

Development work on this property has been retarded by reason of the fact it was the most inaccessible, but road conditions are now improved.

Keno Hill is one of the Gustavus Range of mountains lying between the head of Lightning and Christal Creeks, at an elevation of about 6500 feet. It is about 42 miles from Mayo. Discovery and location was made in July 1919. Six of the original claims were taken under option by the Yukon Gold Company (the Guggenheims). There was three main shewings of mineral on one claim and two on the other. Development has opened up nine separate leads on these claims.

Values on discovery vein of 150 ounces silver from a series of samples, were obtained by the owners. Grab samples taken from the dump on one of the claims, ran from 100 to 1000 ounces silver.

The veins on some of the claims opened up shew a width of 15 feet of solid galena, the values in silver being phenomenally high.

The results of the development work done by the Yukon Gold Co. up until July proved sufficiently satisfactory for the management to authorize the statement that they will spend half a million dollars on

further development this winter. They have let contracts to haul 3000 tons of ore from mines to Keno Hill to Mayo this winter.

Dr. W. E. Cockfield in his 1919 report on Keno Hill says in part, "On a number of other claims minerals have been reported, and it seems probable that mineralization has taken place over a wide area. It seems probable that further prospecting will add greatly to the area around Keno Hill where mineral has been discovered. The prospects already discovered all contain a high grade ore, which will stand mining and shipping even under adverse conditions and many of them could be worked by hand methods of mining."

The writer in July, saw ample proof of the truth of the above prediction, for hundreds of tons of pure silver-galena ore was stacked up in piles awaiting shipment, nearly all of which had been mined without the aid of power, merely by the use of pick and shovel.

Many other properties than those being developed by the Yukon Gold Co. have similar showings.

Mining engineers and experts who have visited the Mayo District are practically unanimous in their verdict that the present showing justifies the belief it will develop into a big camp.

The Mayo district is fortunate in having considerable winter and timber available from which power can be developed for operating.

The few properties mentioned above, do not by any means give an idea of the number located which have good showings, to do so would take too much space. The area is large and intensely mineralized. Its greatest need is intelligent prospecting and development.

The distances by the present wagon roads from Mayo to the best known properties are as follows, Lookout Mountain 29 miles, Silver King 29 miles, Keno Hill 42 miles, Rambler Hill 45 miles, Mount Cameron 65 miles. These roads also serve the other properties which are being developed.

The open season on navigation on the Yukon and Stewart Rivers is of ample length to enable the necessary supplies to be shipped in, and the result of operations to be shipped to the smelters, in Canada or the United States.

Unlike most cold sections where considerable snow is encountered, which closes down operations, these conditions are an advantage here. The cold does not materially affect adit or stoping operations and the small fall of snow is necessary to decrease hauling expenses. Mostly all of the freighting is done during the winter season, with sleighs drawn by teams, over a hard-packed snow trail or road.

It is the intention this winter to put motor-trucks and tractors in competition with horse-drawn vehicles to demonstrate which is the most economical method.

My opinion is that the Mayo area will astonish the mining world by its richness. Have been a resident of Yukon since 1898 and shall be pleased to give information to anyone genuinely interested.

#### **MAYO DISTRICT, YUKON, ANXIOUS TO BE KNOWN.**

The preparations of one of the largest mining companies in the Yukon to ship something like three thousand tons of silver bearing ore from the Mayo district this season is attracting the attention of nearly every Yukoner, and inspiring prospectors of the territory to greater activity than they have exerted for years.

Nothing so stimulates the prospector as the opening of a paying property. That the one company now

operating on Keno Hill has a paying property in its central group, at least for the present winter and possibly for several years, is admitted. The needful thing now to prove that property permanent is to prove depth.

To obtain depth, much earnest work is required. Diamond drilling and the sinking of shafts will tell the tale. It is understood that this work soon will be done by more than one now interested in the field, and there always is the possibility of others taking similar steps. Not only those directly interested in the mining game, but also those in other pursuits in the territory hope to see the prospecting pushed to a conclusion as rapidly as possible.

The federal government and the local government can do much to assist in encouraging the prospector, and much can be done toward hastening development by getting more genuine hard rock miners into the country. Men who are not miners and who are placing their funds in the Mayo region as grubstakes to assist the prospectors now there deserve every credit, and should share the returns as compensation for taking a portion of the early burden upon their shoulders. However, when it comes to proving the existence of veins and deposits, the trained and experienced miner is invaluable. Now that Yukon has such an attractive field mineralized over a large area, one essential thing is to make known the inducements of the region to men who affect the mining game and are eager for new chances.—"Dawson Weekly News."

#### **DEATH OF A PIONEER OF NOVA SCOTIA COAL MINING.**

With the death of Robert Belloni there passes a pioneer of coal mining in Nova Scotia. Mr. Belloni, who has recently died in New York at an age exceeding ninety years, formed in 1864, with his brothers Charles and Augustus, and his brother-in-law Havermeyer, the "Blockhouse Coal Company" and opened a mine at Morien, Cape Breton Island, where he built a shipping pier at the pitmouth and loaded coal direct from the pit-tub into the vessel. Passing through many vicissitudes, the original company was reorganized as the Blockhouse Coal & Railway Co., and finally as the Blockhouse Mining Company. Since passing out of the hands of the Belloni family the mine and areas have been successively known as the Gowrie & Blockhouse Coal Co., and the North Atlantic Collieries, and are now owned by the Dominion Coal Company, which, it is understood, proposes re-opening of the property.

Mr. Belloni was a man of broad vision, and his plans forecasted some of the undertakings that have since been carried out by those who followed him. He had a railway route surveyed to Louisburg, and employed two eminent mining engineers, Prof. Lesley and Benjamin Smith Lyman, whose reports were among the first bringing the Nova Scotia fields to the attention of the outside world, and rank prominently in the early bibliography of the Cape Breton coalfields.

In 1864 the production of coal in Nova Scotia was less than 600,000 tons, and it included, moreover, the entire Canadian production. The span of Mr. Belloni's life and his connection with coal mining in Canada has covered the rise of the coal industry in Nova Scotia, and has been long enough to see the beginning of a coal industry in the West that will shortly leave the eastern coalfields far behind.

For the particulars of dates and other information in the foregoing note, the Editor is indebted to Mr. C. M. Odell, of the Dominion Coal Company.

# Flotation in the Mill Flow-Sheet

A Few General Remarks on the Milling of Ores That Involves the Use of the Flotation Process.

By P. E. PETERSON (Member).<sup>2</sup>

The sulphide minerals now recovered by the flotation process will practically all pass through a 60-mesh standard Tyler screen. A typical screen-analysis of flotation concentrate shows:

**Flotation-Concentrate Screen-Analysis.**

Heads—8.31 per cent. Cu.

Mesh.	Total Weight.	p.c.	Cumulative Weight.	p.c.	Assay p.c.Cu.	Total p.c. Contents.
40	3		3		..	..
60	6		9		6.40	7.0
80	6		15		6.48	4.9
100	3		18		..	..
150	13		31		7.68	17.5
200	19		50		8.52	19.6
200 (minus)	50		100		8.48	51.0

Thus, it is seen that the flotation process is applicable to the recovery of such minerals as are crushed through a minus 80-mesh, and, in general, is adapted only to the treatment of the so-called mill slimes.

In the crushing of ores to the various sizes required for the separation of minerals, there is always a part of the product that must be classed as slimes. For instance, the product from a Blake rock-crusher showed 40 per cent of the material on a 1-inch square opening; and 5 per cent of the total product passed through an 80-mesh screen. In the following cumulative screen-analysis of the ball-mill discharge, it is to be noted that 64.7 per cent is minus 80-mesh.

Screen-analysis of the ball-mill discharge.

40-mesh	6.8 per cent
80-mesh	35.3 "
100-mesh	46.0 "
200-mesh	62.3 "

On account of the physical properties of the sulphide minerals, they are invariably crushed finer, and to a greater extent, than the usual associated gangue minerals. Thus in many instances, an ore that is ground quite coarse will have over half of its valuable constituents in the fines. In order to illustrate this point the following screen-analysis is given :

**Flotation-heads screen-analysis.**

Heads—1.38 per cent Cu.

Mesh.	Total Weight.	p.c.	Cumulative Weight.	p.c.	Assay p.c.Cu.	Total p.c. Contents.
20	5.9		5.9		1.00	4.2
40	13.0		18.9		1.06	9.8
60	15.5		34.4		1.30	14.4
80	9.6		44.0		1.36	10.5
100	7.0		51.0		1.52	7.5
150	11.0		62.0		1.58	12.4

200	6.2	68.2	1.56	6.9
200 (minus)	31.8	100.0	1.52	34.3

All the sulphide minerals that are minus 80-mesh can be recovered effectively by the flotation process.

In the evolution of the art of ore-dressing (which, one might say, had its origin in the simple separation by hand-picking), treatment of the fines has, up to quite recently, been carried on as an adjunct to the principal operation of coarse concentration by gravity. The introduction of the flotation process has, in many cases, modified the entire plan of operation, wherein coarse concentration was dispensed with entirely and the ores were crushed with a view to producing an all-slime product, suitable for flotation. The treatment of an ore entirely by flotation, involving as it does the all-slimes of the ore, can be done in a mill arranged

Sectional View of Petersen Flotation Cell in Operation.

with a simple flow-sheet. But this simplicity in mill-design is often obtained at the expense of higher crushing costs, and for this reason, gravity concentration is still considered an essential feature to be included in the design of modern mills.

In the milling of ores, wherein the valuable constituents are included with the sulphides, and it is desirable to recover all the sulphide minerals, a cust-

<sup>1</sup> Presented at a meeting of the North Coast Branch, C.I.M. & M., Stewart, B.C., Aug. 31, 1920.

<sup>2</sup> Superintendent of Concentration, Granby Consolidated Mining, Smelting and Power Co., Ltd., Anyox, B.C.

omary flow-sheet is one in which the crushing is done in stages, and the minerals separated by means of jigs and tables at the largest permissible sizes necessary for making a clean product, the slimes from each of these operations being separated by means of hydraulic classifiers and thickened in Dorr thickener tanks, to be subsequently treated by flotation. Each ore requires variation in the flow-sheet, but, in general, most ores require crushing through 20-mesh to completely free any appreciable quantity of the sulphide minerals.

Stage-crushing, with its complicated flow-sheet, is of doubtful advantage, unless it is possible to reject a certain proportion of coarse tailing. While it is true that a small saving can be made in the crushing costs by the recovery of a coarse concentrate and in some cases a slightly reduced smelter-treatment charge is obtained, these advantages are more than offset by the complicated mill flow-sheet. From the writer's observations of the size of mineral crystals in various ores, he feels safe in stating that in not many instances is it possible to reject a clean tailing coarser than 20-mesh.

The logical place for flotation in a mill flow-sheet is at the beginning of the separating process. That is, the first concentrate should be from flotation, and the values from the slime-portion of the ore removed, so that the tailing from flotation can be divided after classification into two products, viz., fines or slimes to be rejected as tailing, and the coarse products or sands to be the feed for concentrating tables, these tables making a clean concentrate, a middling to be re-ground and re-treated, and a barren coarse tailing to be rejected. This flow-sheet is simple and has been obvious to millmen for some time. The arrangement of a flow-sheet in this manner has been the practice of the millmen in the south-west for some time. However, they have been limited to the coarseness of their grinding, owing to the inability of the flotation machines to treat a product much coarser than that passing through 48-mesh screens. It has long been realized by the writer that a flotation machine that could successfully treat coarsely ground ores would be a valuable factor in simplifying and reducing the costs of the milling process. Numerous experimental machines have been constructed and tried out, and eventually a machine was developed that has proved satisfactory. This flotation cell embodies the principles of the ordinary hydraulic classifier and of pneumatic flotation. It is automatic in operation, the water-level being maintained at the desired level by means of an overflow tailing discharge. The banking of the pulp is prevented by a continual discharge through a spigot at the spigot at the bottom of the cell. Air is introduced through a hose-type of air-grate, inside of which is a spiral copper-wire coil to prevent the hose from collapsing. The hose is coiled into the flotation tank in such a manner as to leave spaces of approximately one inch between the coils, so as to allow free movement of the pulp. This Peterson cell has been in successful operation at Anyox for a period of two years.

There is no question, but that the type of flow-sheet described will be applicable in some modified form to the treatment of the gold and silver ores of the Alice Arm and Stewart districts. However, from experiments conducted at Anyox, the writer is of the opinion that flotation and gravity concentration, with the cyaniding of the tailings, and possibly the concentrates, will ultimately be the processes used for the recovery of the gold and silver.

## SMASHING "SMELTERS" STOCK.

ALEXANDER GRAY, Montreal.

Speculators have been trying to shake public confidence in Consolidated Mining & Smelting stock.

The "bears" have it that conditions do not warrant the market price and that dividends may be suspended.

As the incident was to be expected, because "bears" fatten upon misfortune—and speculatively are not an unmixed evil—it is not inopportune to direct attention to the fact that this company is somewhat beyond the ken of the dolorous.

Whatever the immediate course of share markets may be, the Consolidated Company has become an outstanding feature of Canadian mining industrialism. Its capital expenditure is about ended; its mines are unexcelled; its metallurgical problems have been solved—and the control rests with a directorate that is vitally interested in the development of British Columbia as a whole.

Undoubtedly there have been periods since the Armistice and metal markets were disrupted when the company did not earn the dividend. That did not deter the administration and management from the financing of plants, the development of power and mines—and from the quest for more mines. Dividends were maintained, for shareholders were patient throughout lean years, and the directors felt assured that the accumulating assets and earning capacity counted for more than temporary industrial reverses. The mining position became so strong, the metallurgy of the complex ores predominating, had to be perfected—and that goal having been reached, plant extensions were completed with all the greater confidence.

At any time, the Consolidated Company of late could dispose of its Sullivan Mine for a sum greatly in excess of its entire capital liabilities. The company, however, has no intention of selling a property with sufficient ore in sight to feed a mill for fifty years at the rate of one thousand tons per day—especially when it is understood that the metalliferous contents of those ores are being recovered in increasing quantities. Within this year, owing to the metallurgical advances due to flotation, the Sullivan moved higher in the list of the world's largest mines—and there are other properties held by the company which reinforce the optimism of the Board. If Sullivan ores did not appeal to American metal market masters when their refractory nature was unquestioned, that objection having been surmounted—half a century of activity at least being assured from that source—the vagaries of share markets need not disconcert shareholders familiar with the affairs of the company.

On the other hand, the attempt to unsettle sentiment toward "Smelters" securities is a national offence. Without Trail outlays and perfected metallurgy, British Columbia mineral resources might be relegated to future decades, whereas recent developments give to those resources a very much more profitable status. There is nothing exotic about Trail. It is as much of an institution as the contemporary metallurgical works of magnitude elsewhere. Through the medium of its expansive programme the Pacific Coast province has been given fresh impetus—and only now is this into effect. Consolidated zinc, despite high costs, onerous freights and slow metal markets, is going to Europe and the Orient. Consolidated products in more varied forms and greater quantities will remedy merely momentary influences. Trail is on the map—to stay there.

# Legislation Relating to the Regulation of Mines in Canada

## A Comparison of the Various Provincial Laws on the Subject.

(From November "Labor Gazette".)

This article is the fourth and last of the series examining and comparing the laws in force in the several provinces of Canada on the subjects covered by the Dominion-Provincial Commission on Uniformity of Labour Laws which met at Ottawa in April 1920.

This Commission found that many minor provisions in the various Acts throughout Canada were made necessary by local conditions and that concerning these no real uniformity was possible. They therefore directed their attention to those principles of a general character which are applicable to all provinces, and recommended that uniform standards be adopted as follows:—(1) A minimum age of 14 years for boys working above ground, and 16 years for those below ground; (2) A minimum age of 18 years for those in charge of power machinery for moving material and 21 years for those in charge of such machinery for moving persons; (3) The adoption of the 8-hour day; (4) The semi-monthly payment of wages and the prohibition of such payment in hotels and the cashing of pay cheques on licensed premises; (5) Legislation providing for miners' liens; (6) No deduction to be made from wages except sums for powder, coal, oil, rent and such doctor's and hospital fees as may be approved by the Workmen's Compensation Board, and supplies necessary to the carrying on of work; the prohibition of deductions for payment of any debt due by the employee without his written consent given individually or by collective agreement; (7) Where certificates of competency are required, examinations to be conducted by a board composed of a government inspector, a mine manager and a working miner; (8) All candidates for certificates as mine managers, pit-bosses, etc., to have at least five years' mining experience, to produce evidence of ability, sobriety and good conduct, and to be at least 23 years of age; (9) Mine inspectors to be holders of mine managers' certificates, with at least seven years' mining experience in the class of mine concerned. (10) Without limiting the powers of inspectors, an inspector to have power to enter, inspect and examine any mine or any part thereof at all reasonable times by day or night, to examine into ventilation and safety, and to give notice in writing of any thing which he considers dangerous and defective and of its immediate remedy; if disagreement follows, the defect to be referred to a board of arbitration consisting of a judge and representatives of the interested parties, the decision of the tribunal to be final; (11) All mines to be adequately ventilated and examined before the entry of the workmen, a report of such examination to be entered in a book which shall be always available to any employee of the mine; (12) The health of employees in mining camps to be fully protected and laws on this subject unified as far as possible; (13) Present laws regarding special investigations to be continued and extended to the other provinces; (14) Provision for first aid and mine rescue work to be made by the Workmen's Compensation Board of each province and special provisions to be made in those provinces where no such board exists.

The present article deals only with those sections in

the mining laws which refer to the subjects covered by the Commission's report.

### Application.

Inspection and regulation of mines is provided for by law in the Territory of the Yukon and in all Canadian provinces except New Brunswick and Prince Edward Island. Nova Scotia and British Columbia have each two Acts the one referring to coal and the other to metalliferous mines. In the former province the Coal Mines Act applies also to mines of stratified ironstone, shale and fire clay. The Ontario law covers all mines, including those of coal and salt and all oil and gas wells. The Mining Act of Alberta applies to mines of coal, stratified ironstone, shale clay and other minerals, also to all places where coal is extracted by removing the overlying strata. If any question arises, otherwise than in the course of legal proceedings, as to whether any mine comes within the scope of the Act, the Minister of Public Works is empowered to decide. Manitoba excludes stone quarries and all mines where not more than six persons other than the owner are employed underground. Saskatchewan and the Yukon include all mines, and Quebec all mines and quarries.

### Employment of Women and Children.

Quebec, Ontario, Saskatchewan and Alberta forbid the employment of women and girls in mines except for office work. The Metalliferous Mines Act of British Columbia prohibits their employment below ground, and the Coal Mines Act of the same province allows them to perform clerical and domestic duties only. The laws of Nova Scotia, Manitoba and the Yukon have no provisions on this subject.

With regard to boys, Ontario fixes 16 years as the minimum age of employment above ground and 18 years below ground. The Coal Mines Act of British Columbia and the Mines Act of Alberta prohibit work above ground by boys under 14 years of age, and below ground by those under 15 and 16 years respectively. The latter province, however, provides that no child under 16 years may be employed at all unless he holds a school certificate. This rule is in force also in Quebec where the minimum age for employment underground is 15 years and in Nova Scotia and the Yukon, where no boy under 12 years may do any work in a mine. Saskatchewan fixes 14 years as the minimum age for employment in any mining work and the Metalliferous Mines Act of British Columbia forbids work below ground by any boy under 12 years. The Mines Act of Manitoba has no provisions on this subject, but the Children's Act prohibits the employment of any child under the age of 16 years in any dangerous or unwholesome occupation.

### Operation of Power Machinery.

The Territory of the Yukon does not demand any particular qualifications or fix any age limit for persons in charge of hoisting machinery, but all the provinces have made rules in this regard. In Saskatchewan and Alberta and in the metalliferous mines of British Columbia the minimum age for this class of employees is 18 years, while in coal mines in the latter province

no one but a man of 22 years of age or over may be in charge of machinery used to hoist persons, and he must have a medical certificate renewed every six months to the effect that he is physically and mentally fitted to perform his duties. Hoists for moving material may, however, be operated by a person 16 years of age. In the coal mines of Nova Scotia machinery used for conveying persons must be in control of a man 21 years of age or over who holds at least a third-class certificate as a stationary engineer. The Metalliferous Mines Act of this Province fixes 18 years as the minimum age for operators of any machinery used for moving persons. The Ontario law provides that no one under 20 years of age and no person who has not had at least one month's experience may have charge of any machinery used for moving persons, but a lad of 18 years may operate an engine for hoisting material. All operators must, however, be physically and mentally fit for their work. Twenty years is also the minimum age fixed in Quebec for employees in charge of a hoist used to convey persons in a mine.

#### Hours of Labour.

The Territory of the Yukon and all the Canadian provinces except Manitoba and Saskatchewan have limited hours of labour for some or all classes of mine employees. The Yukon has adopted the 8-hour day and the 48-hour week for workers under 16 years of age, while Quebec has fixed the same limit for those under 17 years. Nova Scotia allows employees under 16 years to work 10 hours a day and 54 per week in both coal and metalliferous mines. A week in all cases means the six days from midnight on Saturday until midnight on the following Saturday.

The 8-hour day and 48-hour week for certain adult workmen in mines is enforced by law in Alberta, British Columbia and Ontario. In Alberta it applies to all underground workers and in British Columbia to all workers, both above and below ground, except persons employed in the office, boarding house or bunk house of the mine. In Ontario it governs all underground workers, (except shift bosses, pumpmen, cagetenders, hoistmen, persons engaged solely in surveying or measuring, and workers in a mine where the number of persons working in a shift does not exceed six), in districts that are without county organization, which includes nearly all those parts of Ontario where mining is carried on.

In Ontario the 8 hours must be reckoned from the time the workman arrives at his place of work in the mine to the time he leaves it. In coal and metalliferous mines in British Columbia and in Alberta the period between the time a workman leaves the surface and the time he returns must not exceed 8 hours. In Alberta, it is provided that the time for the raising and lowering of each shift must be arranged by the owner, agent or manager of the mine in such a manner that every workman shall have an opportunity to return to the surface in the specified time. A conspicuous notice of the time so fixed must be posted at the pit head and all arrangements made for the observance of the schedule. The time allowed for the raising and lowering of each shift must not exceed what is reasonably required and must be approved by the Chief Inspector. The owner, agent or manager of a mine must appoint one or more persons to direct at the pit head the raising or lowering of workmen, and a book must be kept in which is entered the time of such raising and lowering, and any cases in which a workman is below

ground for a longer time than is allowed by law, and the cause of his remaining under ground. The workmen may, at their own expense, station one or more persons at the pit head to observe the times of raising and lowering the workmen, and such persons are to be appointed in the same manner as the check weigher and bear the same relations to the owner, agent or manager of the mine.

In all provinces, with the exception of Quebec, overtime may be worked in case of accident or emergency. Nova Scotia and the Yukon, where, as in Quebec, the legal limitation applies to boys only, recognize no other grounds on which longer hours are permissible. In Ontario a Saturday shift may work more than 8 hours for the purpose of avoiding work on Sunday, or for changing shift at the end of the week, or to give any of the men a part holiday or to make necessary repairs. In the event of any grave economic disturbance the Lieutenant-Governor in Council may suspend the 8-hour law for such time as he deems advisable. The Mines Act of Alberta contains a similar provision. This province allows a repairing shift for the purpose of avoiding Sunday labour to commence their work period on Saturday before 24 hours have elapsed since the commencement of their last period, provided that at least 8 hours have passed since its termination. A workman may also remain below ground for more than 8 hours if any exceptional work requires to be done without interruption, in order to avoid serious interference with the ordinary work of the mine. The British Columbia Coal Mines Act provides that where more than two shifts are worked, the outsetter, bottomer or cager, pumpmen, stablemen and engineers in charge of constantly running machinery other than that directly used for the mining of coal at the face, and the fire boss or shift boss in charge, may be relieved at the place of duty, but in no case may any person remain underground for more than 8½ hours except when extra hours are necessitated by the weekly change of shift where more than two shifts are worked. A pumpman or engineer in charge of constantly running machinery may also be below ground for more than 8 hours to deal with anything which requires immediate attention, and which, if neglected, might necessitate the closing of the mine. The overman or manager may enter the mine at any time and remain there in the discharge of his duties. The Metalliferous Mines Act of British Columbia allows overtime in case of accident or emergency only.

#### Wages.

The mining laws of Ontario and Alberta direct the semi-monthly payment of wages, and in British Columbia the Semi-monthly Payment of Wages Act applies to all mines, while the Mineral Survey and Development Act of 1917 makes provision for this method of payment of workmen on mining properties under bond or option. In Nova Scotia all wages except those fixed at a regular monthly rate must be paid weekly in all mines to which the Coal Mines Regulation Act applies. The other provinces make no rulings on this subject.

The Truck Act of British Columbia and the Coal Mines Regulation Act of Nova Scotia direct all wages to be paid in currency, but there are no rules to this effect in the other provinces.

The Coal Mines Regulation Act of Nova Scotia and British Columbia, and the Mines Act of Alberta provide that where the wages of miners depend on the amount

of mineral produced by them, they shall be paid according to the weight of such mineral, which is to be weighed as near the entrance to the pit mouth as is practicable. These three Acts and the Mines Act of Saskatchewan contain sections permitting the employees thus paid to station at their own expense a representative called the check-weigher at the place appointed for the weighing of the mineral. In Nova Scotia the check-weigher is elected by ballot at a meeting of the employees interested, and cannot hold office for more than one year unless re-elected. The British Columbia law does not demand any special qualifications for this position, but the other provinces require that candidates should be working miners with at least three years' experience. In Saskatchewan and Alberta appointees must be residents of the province, and in Nova Scotia they must have certificates and at the time of their appointment be employed in the colliery in which they are to serve. In all cases the check-weigher must be given every facility for the proper discharge of his duties, and Nova Scotia, Saskatchewan and Alberta direct the owner, agent or manager of the mine to provide him with a shelter from the weather and a desk at which to write. The laws of these provinces forbid the check-weigher to impede in any way the working of the mine, or to interfere with the weighing. There need be no delay on account of his absence. If he is guilty of misconduct, the owner, agent or manager of a mine may, on sufficient evidence, have him removed by order of a court of competent jurisdiction, and another check-weigher may be elected or appointed in his place. In Saskatchewan, Alberta and British Columbia the owner, agent or manager of the mine may, at the request of the majority of the miners, make a "pro rata" deduction from the wages of each miner sufficient to meet the wages of the check-weigher, and may then pay him in the same manner as the other employees. Wherever in these four provinces the workmen are paid by order of the Minister or by mutual consent, otherwise than according to the amount of mineral produced by them, they may at their own expense employ one or more persons to check the correctness of the measurements or method according to which payment is made, and the provisions in the Act applying to check-weighers shall apply to such persons.

The Mining Act of Alberta and the Coal Mines Regulation Acts of Nova Scotia and British Columbia permit the owner, agent or manager of any mine to agree with his employees that deductions be made in respect of stones and other material, such deductions to be determined by mutual agreement or by some person or persons appointed by the employers and employees for the purpose. In Nova Scotia and Alberta provision is made that where the representatives of the two parties fail to agree, they or the Minister or Commissioner, may choose a third person to act with them, and a decision of the majority of the three shall be final. In a mine where employers and employees have failed to appoint anyone to determine deductions, the Minister or Commissioner may appoint some person on their behalf.

With regard to other deductions the Alberta law allows any workman to authorize the employer in writing to apply the whole or part of the wages due him to the payment of any debt owing by such workman. The employer may also retain sums due by any employee for coal, oil, rent or other supplies. The Coal Mines Act of Nova Scotia adds to this list check-weigh-

ers' and doctors' fees, church, hospital and society dues, but forbids deductions for school or other rates, except with the written consent of the workman. This prohibition appears also in the Metalliferous Mines Act of this province and is the only reference to deductions from wages found therein.

In 1919, British Columbia passed an amendment to the Coal Mines Regulation Act providing for the appointment of a Board to fix minimum wages for coal miners. The Board consists of one representative each of employers and employees, with the Chief Inspector of Mines as Chairman.

Ontario, the Yukon, both Mining Acts of British Columbia, and the Metalliferous Mines Act of Nova Scotia, forbid the payment of wages in any tavern or place where liquor is sold. The Quebec Act does not contain any reference to this subject, but prohibits the sale of liquor within a radius of seven miles of any mine, and gives the Inspector of Mines control of all licenses in his district. This province also forbids the cashing of pay cheques in any tavern. In many provinces the clauses relating to this subject have been repealed by the temperance laws passed during the last few years. This has been the case in both Alberta and Saskatchewan where the prohibition of payment of wages on licensed premises and cashing of pay cheques in hotels was contained in the Liquor License Acts repealed in 1918 and 1917 respectively. The Ontario Temperance Act of 1916 repealed the Liquor License Act of that province which prohibited the cashing of pay cheques in hotels and the sale of intoxicants within six miles of any mine. Nova Scotia omitted from the 1918 Coal Mines Act the clause which in the old law forbade the payment of miners in hotels, etc. This was presumably done owing to the passing of the Temperance Act of that year, which is a prohibition measure.

In Ontario and the Yukon every person who performs labour for wages in connection with any mine mining claim or mining lands, has a lien thereon. The other provinces have no legislation on this subject.

#### Certificates.

The Coal Mines Regulation Acts of Nova Scotia and British Columbia, and the Mines Acts of Alberta and Saskatchewan contain sections relating to the examination and licensing of workmen.

In Saskatchewan examinations are held from time to time by an inspector of mines, while in the other three provinces they are conducted by a Board of examiners. The Nova Scotia Board consists of the Inspector of Mines with one mining and one mechanical engineer. In Alberta two managers and two working miners, and in British Columbia one representative each of the coal miners and the mine owners act with the Chief Inspector in conducting examinations for certificates.

There is considerable difference in the laws of these four provinces with regard to the classes of workmen for whom certificates are required and the qualifications demanded. Nova Scotia requires certificates of competency for a manager, underground manager, overman, mine examiner and stationary engineer; British Columbia for a manager, overman, shift boss, fire boss, shotlighter, and mine surveyor, and Alberta for a manager, overman and mine examiner. In Nova Scotia a candidate for manager, underground manager, or overman must be a British subject at least 21 years of age, with four years' underground working experience, part of which must

have been at the working face. A candidate for manager must have a certificate of competency as underground manager, or have had at least three years' practical experience and a degree as mining engineer from some approved college or university. A candidate for underground manager must have a certificate of competency as an overman. Those qualifying as first class stationary engineers must be at least 24 years of age and holders of second class certificates. In addition they must have served one year at mechanical work on machinery, or in charge of a hoisting or haulage engine or steam plant, or two years in charge of some other type of engine, or three years at mechanical work in a machine shop. Candidates for second class certificates must be certificated third class engineers with one year's experience, and have reached the age of 21 years, while anyone entering for the third class examination must be 18 years of age and have served six months as a licensed fireman, twelve as engineer, assistant engineer, pumpman, oiler or locomotive engineer, or eighteen months at mechanical work in a machine shop. A British subject, 21 years of age who has had at least three years' practical experience in a coal mine, holds a certificate of competency as a coal miner and has a practical knowledge of gas, explosives, ventilation and timbering, may present himself for examination as a mine examiner. All candidates must give satisfactory evidence of sobriety, experience and general good conduct.

British Columbia requires of a candidate for a mine manager's certificate that he be at least 25 years of age, and have either five years working experience or a degree showing a course in scientific coal mining at an approved university or college, together with four years' practical mining. Any person entering for examination for a certificate as overman must be at least 23 and have five years' experience, while candidates for shift boss, fire boss or shotlighter must have a similar age qualification and three years' practical mining; a certificate in first aid work is required of all applicants.

Both Nova Scotia and British Columbia provide for the holding of examinations for the granting of certificates, as coal miners. In the former province the Commissioner of Public Works and Mines appoints for this purpose local boards of two persons having practical experience as coal miners in Nova Scotia, and one underground manager. In British Columbia the Inspector of mines for the district and one representative each of mine owners and miners from the Board of Examiners. Examinations must be held on at least one day in every sixty at each colliery designated by the Minister. Both provinces require one year's working experience of all candidates, and British Columbia adds the provision that they must be familiar with the English language.

The Alberta law requires that a candidate for manager's certificate shall have at least five years' practical experience either wholly or partly in Canada, or he must hold a diploma showing a course of two years or more in scientific or mining subjects at an approved college or university, together with three years' experience in a coal mine as above. He must also be at least 25 years of age. An applicant for a certificate of overman or examiner must be 23 years of age and have three years' working experience. All candidates must produce evidence of good conduct and sobriety, and also a certificate from a medical practitioner or a re-

cognized ambulance society showing him to be qualified to render first aid, and applicants for certificates of the second and third classes must satisfy the board that they are able to speak and write English. All three provinces direct that a register of all holders of certificates be kept. They also provide that in case complaint is made to the authorities that any holder of a certificate is guilty of incompetence, gross negligence or any offence against the mining law a public inquiry into his conduct may be held, and if the charge is sustained, the Minister may cancel or suspend the certificate of such employee. The British Columbia law permits the granting of a certificate without examination to the holder of a certificate granted in any British Dominion if the standard is equivalent to that required by the Act. Saskatchewan allows the same privilege to holders of satisfactory certificates from the United States, and Alberta extends it to persons from any country where the standard is equivalent to that demanded by the Act. Permission is also given for the granting of provisional certificates.

#### Inspection.

The mining laws of Nova Scotia, Ontario, Manitoba and the Yukon do not contain any reference to qualifications of inspectors. In Quebec these officers must be mining engineers who have practised their profession for at least five years and are possessed of sufficient knowledge of mineralogy and metallurgy for the satisfactory discharge of their duties. The Coal Mines Act of British Columbia and the Mines Act of Alberta and Saskatchewan require all inspectors to be holders of mine manager's certificates, while the the Metalliferous Mines Act in the first named province demands seven years' practical experience in mining. It also confers on the Provincial Mineralogist all the powers of an inspector. This law forbids an inspector to act as manager, agent or lessee of any mining or other corporation, or to make any report on a mine or mining property with the object of promoting its sale. The Alberta law stipulates that inspectors may not act as mining engineers or mine managers within the province while the Coal Mines Act of British Columbia and the Mines Act of Quebec disqualify any person who has any interest directly or indirectly in any time in his district.

In all the Canadian provinces and in the Yukon the inspector may enter the mines in his district at all reasonable hours in the performance of his duties but may not unnecessarily impede the working of the mine. In Nova Scotia and British Columbia he must visit each mine and every part of it at least once a month, but the other provinces and the Yukon do not contain any reference to frequency of inspection. The Yukon and all the provinces except Quebec have sections relating to the powers and duties of inspectors. They may examine into and make inquiry respecting the state and condition of any mine or any part thereof, the ventilation, the sufficiency of any special rules, and all things affecting the safety of the persons employed therein. In coal mines in Nova Scotia and all mines of British Columbia and Alberta the inspector must, after each visit, cause a copy of his report to be posted in a conspicuous place at or near the mine. In the Yukon and all parts of the Dominion, except in Quebec and the coal mines of Nova Scotia, the inspector must give notice in writing to the owner or manager of the mine of anything which he finds to be dangerous or defective and direct that it be remedied within a specified time. The Ontario, Saskatchewan and Alberta Acts and the

Coal Mines Act to British Columbia authorize any inspector to order immediate cessation of work and the departure of all persons from any mine or part of a mine which he considers unsafe, or to direct work to be carried on in such place with any precautions he may deem necessary. The British Columbia Coal Mines Act, the Metalliferous Mines Act of Nova Scotia and the Saskatchewan and Alberta laws provide that, in case of disagreement following such notice, the matter shall be arbitrated by one representative of each of the interested parties and an umpire. In British Columbia this third member of the Board is chosen by the other two, while in Alberta and Saskatchewan a judge acts in that capacity. The Nova Scotia Act names the Commissioner of Mines as umpire.

The Coal Mines Act of British Columbia empowers the inspector on his own initiative, or on written application of any three miners, to examine any employee of a mine in order to ascertain whether he is physically and mentally capable of performing his duties, and if he finds that the incapacity of any workman impairs the efficient working of the mine or endangers the safety of the other persons employed, he may order his removal.

Both Mining Acts of Nova Scotia, the Coal Mines Act of British Columbia and the mining laws of Alberta, Saskatchewan and the Yukon permit the workmen to appoint one or more competent inspectors to examine thoroughly the mine on their behalf and such inspectors must be allowed every facility for the carrying out of their duties.

#### Ventilation and Inspection.

All the Mines Acts except that of Quebec require that every mine shall have adequate ventilation. Saskatchewan fixes a standard of 100 cubic feet and Alberta 200 cubic feet for each person and animal, while the Coal Mines Act of British Columbia demands 100 cubic feet for each man and 300 for each animal. All air must travel free of stagnant water, stables and old workings. The inspector may, if necessary, direct that more air be supplied, and in this event the British Columbia law requires him to post a notice at the mouth of the mine stating the quantity of air which is necessary for health and safety. The Ontario law provides that where the ventilating current is not sufficient, mechanical appliances must be installed and operated, while the Coal Mines Act of Nova Scotia provides for the use of brattice where the natural air current does not suffice to keep working places free of all inflammable or noxious gases. All cross cuts made for width and height between the openings which they connect. The Coal Mines Act of British Columbia directs that where ventilation is provided by a mechanical contrivance the apparatus must be so placed that it will be uninjured by an explosion. This Act and the Saskatchewan and Alberta laws make provision for the division of each mine into districts or splits of not more than 70 men, each district being supplied with its separate current of fresh air, and in the two former provinces every place must be bratticed up to within four yards of the face. In British Columbia and Alberta these rules apply to all mines, but in Saskatchewan they need not be complied with where safety lamps are not necessarily used. In such mines, however, narrow working places must not be driven so far ahead of ventilation that the air becomes visibly foul, and in no case more than 40 yards.

Examination of all working places in a mine is pro-

vided for in the Yukon, Alberta, Saskatchewan and in both Mining Acts of Nova Scotia and British Columbia. The Yukon law and those governing metalliferous mines in Nova Scotia and British Columbia state that all working places must be thoroughly examined by a competent person at least one in every 24 hours, and the British Columbia Act requires the examiner to make a report which is recorded in a book kept for the purpose. The Coal Mines Act of Nova Scotia and British Columbia and the Saskatchewan and Alberta laws make provision for the appointment of stations at the entrance to the mine or to any part of it, and all portions of the mine beyond such stations must be examined before the workmen are permitted to enter. This inspection is to take place at least once in every 24 hours and in British Columbia and Saskatchewan immediately before the commencement of work. The Nova Scotia and Alberta laws stipulate that it must be made within three and four hours respectively of the time the workmen enter the mine. In all cases the examiner must make a report which is recorded in a book. In Alberta and British Columbia a copy of such report must be posted immediately in a conspicuous place, while the other two provinces stipulate that the book bearing the record of examinations shall be open to employees at all reasonable times. The British Columbia law and those of Alberta and Saskatchewan make provision for a more frequent examination of any mine where inflammable gas has been found at any time during the preceding 12 months. If at the time of any examination dangerous gas is found to be present in any mine, Nova Scotia, British Columbia, Saskatchewan, Alberta and the Yukon authorize the withdrawal of all workmen until the danger is over.

#### Health of Employees in Mining Camps.

The question of health of employees in mining camps is in every case dealt with by the Public Health Acts, and all parts of Canada except the Yukon have laws on the subject. In Nova Scotia no person may establish, conduct or maintain a camp without a permit from the Medical Health Officer to the effect that its sanitary conditions are satisfactory. The Superior Board of Health of Quebec may by by-law require the employment of duly qualified practising physicians by proprietors of mining camps employing 25 or more men. In Ontario and British Columbia employers in camps may by regulation be required to retain the services of a qualified medical practitioner, and in addition to provide permanent or temporary hospitals. Houses and premises for the accommodation of workmen are subject to inspection, and the British Columbia law further empowers the inspector to visit all camps in his district during the months of April and May in each year to examine the sanitary conditions and the water supply. The Public Health Act of Alberta provides for the sanitary control of all public places and all houses, temporary or permanent, and regulations covering mining camps have been issued thereunder. The Provincial Board of Health of Manitoba and the Commissioner of Saskatchewan are empowered to make regulations relating to mining camps. Although no mining act appears on the statute books of New Brunswick, the Public Health Act of 1918 protects the health of employees in mining camps, making provision for regulations regarding the inspection of all houses and places connected therewith, and for the erection of permanent or temporary hospitals and the services of duly qualified physicians. A 1919 amendment requires special precautions to be taken against smallpox.

### Special Investigations.

All the mining laws except those of Quebec and Saskatchewan contain clauses authorizing the holding of special investigations. In Alberta and in both classes of mines in Nova Scotia, the Minister or Commissioner may appoint one or more persons possessing legal or special knowledge to act with the inspector in holding an investigation into any accident, or into any matter connected with the working of any mine. The Inspector may make the investigation in the way he considers most effectual, and he has right of entry to any place and power to require production of any document, and to take evidence under oath. He must make a full report of the inquiry which may be made public. The Mining Ordinance of the Yukon authorizes a similar investigation to be made by the inspector unaided. The British Columbia Coal Mines Act empowers the Minister to appoint any person scientific or other qualifications to make a special investigation and report upon any mining operations so far as they relate to the safety of life and property in any mine, such person to have right of entry and access to records. The report of such inquiry may also be made public. Under the laws of Ontario and Manitoba and the Metalliferous Mines Act of British Columbia, the Minister may require the inspector to make a special report of any accident which has caused loss of life or serious personal injury to any person, the first named province giving him power to take evidence on oath and compel attendance of witnesses and production of documents. Under the British Columbia Act, the report of such investigation may be made public.

The Canada Explosives Act provides for an investigation into the cause of any accident from explosion of an explosive occurring in any mine or quarry in provinces whose laws make no provision for such inquiry.

### First Aid and Mine Rescue Work.

The Workmen's Compensation Acts of Nova Scotia, New Brunswick, Alberta and British Columbia provide that employers in any industries may be required to maintain such first aid appliances and service and transportation for injured workmen as the Board may direct. The Coal Mines Act of Nova Scotia also contains a clause to the effect that properly constructed ambulances or stretchers with splints and bandages shall be kept at all mines ready for instant use. The same law empowers the Commissioner of Mines to make any necessary regulations for the purpose of ascertaining the fitness and qualifications of and the granting of certificates to persons skilled in the use of mine rescue apparatus. Alberta requires every applicant for a certificate as manager, overman or mine examiner to produce a certificate in ambulance work from a qualified medical practitioner or a recognized ambulance society.

The Ontario Mining Act directs that a properly constructed stretcher and the first aid service prescribed by the Workmen's Compensation Board, and, where poisonous or dangerous compounds, solutions or gases are used or produced, proper antidotes plainly labelled with explicit directions for use, must be kept in an accessible place. Life lines, and belts in good order are to be kept ready for immediate use. At all blast furnaces, breathing apparatus and portable resuscitating apparatus of approved type with an adequate supply of oxygen and absorbent material must always be maintained. In each working shift one or more workmen

appointed by the Superintendent and trained in the use of this apparatus must be always on duty.

The Mining Act of Alberta authorizes the Lieutenant-Governor in Council to make arrangements for the installation and operation of mine rescue stations and cars, and to make regulations regarding the provision of emergency hospitals and any other matter that he may consider advisable in the interests of safety. This Act directs that properly constructed stretchers with splints and bandages be kept ready for immediate use.

The Ambulance Act of British Columbia requires that any employer of labour directly or indirectly operating any mine, (except those operating under the Coal Mines Act) or any camp, employing more than 30 persons situated more than 6 miles from the office of a physician, shall employ at least one person possessing a certificate of competency to render first aid, and also provide one or more good ambulance boxes. The employer must forward to the Provincial Secretary the name of the person in his camp who is qualified to render first aid and the number of such person's certificate.

The Coal Mines Regulation Act requires the owner, agent or manager of every colliery to establish such number of oxygen helmets or some form of mine rescue apparatus as may be approved by the Minister, and to keep them in workable condition and so placed as to be immediately available when wanted. This Act empowers the Lieutenant-Governor in Council to establish mine rescue stations for the purpose of supplementing, in case of need, the colliery installations of mine rescue apparatus, and also for the training of holders of certificates of competence in the use of such apparatus, and the owner, agent or manager of every mine must see that all physically fit certified officials, and such number of workmen as the Chief Inspector may direct, receive such training. The rescue stations are, subject to the order of an inspector, available in case of emergency for the use of any trained corps of mine rescuers, qualified medical practitioners, or trained first aid corps.

### Conclusion.

From the foregoing account it will be seen that none of the mining laws of the Dominion conforms on all points to the standard set by the report of the Commission on Uniformity of Labour Laws. Two provinces have fixed the minimum age for boys at the age named in the report and five have adopted the 8-hour day either wholly or in part. Two provinces have laid down all the rules regarding payment of wages that the Commission considered desirable, and in one province and the Yukon provision is made for miners' liens. In two provinces examination of candidates for certificates are conducted by a board of three members, but only one province demands the qualifications which the Commission deemed necessary for such candidates. Two provinces give full power to inspectors and arrange for arbitration in case of disagreement. Four provinces provide for adequate ventilation and inspection, and all have some measure of protection for the health of employees in mining camps. Five provinces and the Yukon make some provision for special investigations. The standards laid down by the Commission regarding deductions from wages, qualifications of mining inspectors and the minimum age for workmen in charge of power machinery are not attained by any province. The administration of first aid and mine rescue work is in no case entirely in the hands of the Workmen's Compensation Board.

## Northern Ontario Letter

### The Cobalt Field.

Although at the time of writing, no rain of any importance is reported, yet the comparatively mild weather is having a favorable effect on the hydro-electric power supply. With considerable snow on the ground, and with more or less warmth still in the ground, the flow of water in the innumerable streamlets has increased, and this has at least prevented any further lowering of the water in the main waterway from which the hydro-electric energy is generated.

The Beaver Consolidated, which was the only producing silver mine to curtail operation is preparing to resume work, according to official advice to the Canadian Mining Journal. Advantage was taken of the slack period to make certain repairs to the mill, and the fact that work is now to resume is taken as an indication that the management anticipate the worst may be over in the power situation.

Following negotiations between members of the Temiskaming Mine Managers' Association and members of the Central Council of Workmen of the Cobalt mines, it has been arranged to organize an Employees' Sick Benefit Fund. It has been provided that the men shall each contribute 75 cents a month, this amount being deducted from their pay. The mining companies shall each pay an amount equal to that of their employees. The benefits to be provided will consist of \$2.75 per day for the first 13 weeks of illness, and half that amount for a second period of 13 weeks. In no case will the benefit apply for more than six months in any one year. At death, the dependent of the deceased shall be paid \$250.

In connection with the sick benefit scheme, a vote of the workmen was taken and resulted in a vote of 658, to 120 in favor of the plan. This vote included eleven of the more important operating properties. Incorporation is proceeding and a charter is being applied for at once so as to get the Fund in operation as quickly as possible.

After having been closed about five years, the transfer books of the Bailey-Cobalt Mines, Ltd., have been opened, and holders of stock are now given an opportunity to have it registered in their own name. Litigation involved the Bailey during the years in question, and the purchaser of stock found it impossible to record his holdings. This was one of the points of contention when contentious matters came up for trial, it being claimed by a certain faction of the litigants that control actually lay in different hands than would appear on the strength of the old records of five years ago. It is intimated in semi-official circles that W. J. Wright of Buffalo may be elected to the directorate of the Bailey at the next meeting. As regards the transfer of Bailey-Cobalt shares for stock in the newly incorporated Bailey Silver Mines which now controls the Bailey-Cobalt and the Northern Customs, nothing of a definite nature appears to have been sent out. The basis of transfer is ten of Bailey-Cobalt for one of Bailey Silver Mines.

Officials of the Chambers-Ferland mine of the Aladdin-Cobalt Company have declared it is their belief the recent new discovery of ore at the 385-ft. level may make a new mine out of the property. The extent of the mineralized zone is broadening out accordingly as work proceeds, and by basing calculations on former experience under somewhat similar conditions, the find

is regarded as being among the most important in the history of the mine. The area under exploration and development is largely virgin territory and offers big scope for important results.

A report has just been issued on the Oxford-Cobalt Silver Mines. The statement is conservative throughout, and points out that low silver values have been encountered from time to time, with small sections showing high-grade milling ore. Particular emphasis is placed upon the similarity of the geological conditions as compared with the geological structure in the Beaver-Temiskaming area where large silver deposits have been found. The management is optimistic in regard to the future outlook on the property.

### Gowganda and Elk Lake Areas.

The Sanderson Mines Syndicate is numbered among the new organizations which aims to develop mining property in the Gowganda district. This syndicate is preliminary to the incorporation of a \$3,000,000 company which plans to take over and operate ten mining claims situated in the district, in the townships of Nicol, Haultain, Lawson and Chown. Representing the syndicate is a committee made up of Messrs. W. H. D. Miller, Chas. Ritz, and A. C. Wieland. This committee has added P. K. Brown to their number, and these four together with Stewart Troop will constitute a committee of management for the syndicate. The syndicate has its head office at Room 202, Southam Bldg., 128 Bleury St., Montreal.

Additional camps have been erected on the Cane Silver Mines, situated in the township of Cane. It has not yet been definitely decided as to whether a plant will be installed this winter, although the matter is now under consideration. No statement has so far been issued relation to returns from the recent shipment of about five tons of high-grade ore. The company's mine address is Kenabeek, Ont.

During the week ended Nov. 26th, ore shipments were again low from the Cobalt district, the Bailey and La Rose being the only two shippers, as shown in the following summary:

Shipper	Cars	Pds.
La Rose . . . . .	1	87,289
Bailey . . . . .	1	62,890
Total . . . . .	2	150,179

During the corresponding period, the Mining Corporation was the only bullion shipper, this company sending out 60 bars containing 60,772 fine ounces.

Ore shipments over T. & N. O. Ry., during Oct. 1920:

### SILVER ORE.

#### Cobalt Proper.

Ore shipments over T. & N. O. Ry. during October 1920.	Tons.
1. Coniagas . . . . .	96.08
2. Dominion Reduction . . . . .	76.50
3. Hudson Bay . . . . .	31.87
4. Kerr Lake . . . . .	30.57
5. LaRose . . . . .	43.66
6. Mining Corporation . . . . .	520.17
7. McKinley-Darragh . . . . .	183.64
8. Nipissing . . . . .	554.94
9. O'Brien . . . . .	32.01
10. H. F. Strong . . . . .	30.00
11. Temiskaming . . . . .	139.79
	1,739.23

The above shipments were made to the following Companies:

**Canada.**

Deloro Smelting & Refining Co., Deloro	
Marmora . . . . .	1,390.58

Amboy . . . . .	93.28
	1,739.23

**Price of Silver.**

Oct. 1st. Highest . . . . .	91.500
Oct. 19th. Lowest . . . . .	76.250
Average . . . . .	83.480

**The Kirkland Lake Area.**

The Lake Shore mine set another record in October by treating ore from which an average of \$29.98 per ton was recovered. The report shows a total of 1,570 tons treated and a production of \$47,078. The mill operated 89 per cent of the possible running time. The October output compares with \$40.15 in September and \$35,361 in August. Total output to date from this property amounts to \$1,098,808. The main shaft has reached a depth of about 550 feet, the objective being to establish a main development level at a depth of about 550 feet, the objective being to establish a main development level at a depth of 600 feet and another at the 800-ft. level.

One of the new mining companies which promises to become active in the mining districts during the coming summer is the Thackery Gold Mine. This company has property in the Lebel township section of the Kirkland Lake gold area, as well as holding other groups of claims, in Thackery, Maisonville, and James townships. The company is capitalized at \$2,000,000 made up of 2,000,000 shares of the par value of \$1 each. The company's head office is in Toronto.

**THE GOLD MINES**

**The Porcupine Area.**

Mild weather has extended right up to the end of November, and the flow of water in the rivers is being maintained by an increase in the water flowing from the small streamlets which are fed by slowly melting snow. The power supply is not adequate to operate at full capacity, but the outlook is re-assuring.

This week the Hollinger has disbursed its 8th dividend so far this year, making a total of \$1,968,000 for the period, with another \$246,000 expected Dec. 28th. These figures are especially significant owing to the company having been able to secure less than two-thirds of the required number of workmen.

Attention has recently been directed to the fact that on the Millerton side of the Hollinger Consolidated, and less than the width of one claim from the boundary of the adjoining Moneta property is an ore body which measures 126 feet in width where crosscut at a depth of 55 feet, and with average gold values amounting to \$4.80 to the ton. Forty feet of this averages \$6.30 per ton, while 22 feet assays \$6.50. The enormous width of this ore body would indicate the likelihood of the "glory hole" system of mining being adopted when dealing with it at some future date. This system of mining greatly reduces the cost, and the margin of net profit indicated is large. The large deposit is of more or less significance to the

Moneta property in that its general strike is in that direction.

The question of increasing the capitalization of the Northerown Mines is again being discussed. The large acreage held and the extent of the exploration and development scheme is believed to warrant adding another million shares and thus increasing the capital from \$3,000,000 to \$4,000,000. During the past summer, following the consolidation of the Porcupine Crown and the Thompson-Krist properties, difficulty was experienced in securing enough men. Later on, a shortage of power occurred. The result has been that revenue from milling operations has fallen below expectations. This encourages the belief that a capital increase might be resorted to as a means of preventing any modification of the extensive plan of operation outlined.

A recreation hall is being constructed on the McIntyre-Porcupine mine, the building being 50 by 110 feet, and being entirely modern. The basement will contain the heating plant, lockers, etc. The main floor will have two bowling alleys, two billiard tables and two pool tables. A lunch counter where light refreshments may be obtained will also be found on this floor. The second floor will be given over to a dance hall 50 by 80 feet, and quarters provided for the local G.W.V.A., for their exclusive use.

The McIntyre is also constructing a large store. It will be of modern design, among other things including a refrigerating plant for summer use. The ground floor will consist of a store of two departments, groceries and dry goods. The second floor is to have a large dining room with all the latest appointments and operated on a cost basis for the benefit of the employees of the company.

It is understood the Schumacher Gold Mines will resume full operations in the early spring. The underground workings, which are already down 700 feet will be extended to a depth of at least 1000 feet. The mill will also pressed into service as quickly as possible following a resumption of mining. The Schumacher mill is the fourth largest of its kind in the gold mining districts of this country, having a capacity for treating approximately 200 tons of ore. The company's plan is to dispose of 100,000 treasury shares so as to cover the cost of re-opening. A by-law passed two years ago authorized the sale of 100,000 treasury shares at 45 cents each, but no definite action was taken owing to the time being considered inopportune to start work.

Work is to be resumed early in December on the North Davidson property at Porcupine. Arrangements have been made to do 250 feet of sinking and approximately 1000 feet of drifting. Mr. George Henderson will be in charge of the work.

Arrangements are being made to commence an aggressive program of development and exploration work on the Davidson Consolidated property about the end of January or early in February. The plan includes sinking the main shaft to a depth of 1000 feet.

**Barytes Mining.**

A report has been issued to the shareholders of the Premier Langmuir Mines, Ltd., a company owing property in the township of Langmuir, some twelve miles or so south-east from Porcupine. In the report it is shown that the company has hopes of getting out of the financial difficulties which formerly developed. The scheme to extricate the company completely from this handicap is to sell five-year bonds,

bearing 8 p. c., these bonds to be exchangeable at the end of five years for shares in the company at the rate of 10 cents per share, or a case refund of the amount subscribed, and the property to be offered as security. Up to the present about \$20,000 has been subscribed for bonds and the most pressing liabilities have been retired. It is stated in the report that: "Unless sufficient money comes in to meet the requirements of the company, your property will go into the hands of a receiver and be sold, which will mean that your stock will be worthless. The property then will belong to either the bondholders or someone else who might buy it."

It is announced that J. H. Dunsmore, of the Toronto Testing Laboratory, Ltd., made an examination of the property and made the following report:—

"We have made an examination of the Premier Langmuir mine, including buildings and equipment, and find same to be in very favorable condition.

"The barytes ore is located in a vein running through an immense body of rock characteristic of the Porcupine district. We estimate that there is about 150,000 tons of barytes available, with good prospects of locating a further supply.....

"The equipment is adequate for the purpose intended and is satisfactorily installed, and at small expense could be put in operating condition. The Stroud Air Pulverizing Machine will not produce a marketable product, but we find that this machine in conjunction with a suitable bolting machine, will give you a marketable product containing a high percentage of pure barium-sulphate. The buildings and equipment installed in their present location could not be duplicated for less than \$75,000.

"The present plant with a capacity of two tons an hour and equipped with a suitable bolting machine, and working on one shift for the year round, should yield a profit of about \$100,000 a year, with ore selling around \$35 per ton. The price of ground barytes to-day is around \$45 per ton.

"Under proper management and with suitable bolting equipment, in our opinion, this mine could be made to produce a marketable product of good commercial value."

**MINE EXPLOSION AFTER TEMPORARY SHUTDOWN.**

A despatch from Jasper, Alabama, states that preceding a mine explosion near that place men went into the mine in the morning "when operations were resumed following a shut-down of more than a week, and when the first squad of workmen had progressed about a half mile underground, a terrific blast occurred. Rescuing parties were immediately organized and fought their way into the wrecked mine, removing the dead and injured."

How often has it been exemplified that the self-sacrificing heroism of the miner is greater than his realisation of the necessity of explosion prevention? The tale of the explosion of a coal mine that has been temporarily closed down has been all too often told. If half the wit, and half the willingness to rescue the victims of mine explosions were expended on their prevention it would be better. The man who will dare death to rescue a fellow-workman is also too often the same man that will use a naked light underground, and fight for the privilege.

**PEELE'S Mining Engineers' Handbook**

The Ultimate Book for Every Engineer Whose Work Brings Him in Touch With Any Phase of Mining.

"PEELE" is at once reliable, thorough and practical---the one complete, up-to-the minute source of all mining engineering facts.

One-Volume Edition—2375 pages, 4 1/4 by 7—flexibly bound—\$7.00 postpaid.

Two-Volume Edition—Vol. I—1225 pages—Vol. II—1216 pages—flexibly bound—\$8.00 postpaid.

### LABOR AND WAGE CONDITIONS AT THE NOVA SCOTIA COLLIERIES.

Since the Wage Scale Committee of the United Mine Workers refused to accept the responsibility of accepting the agreement to which the executive officers of the union are parties, and decided to refer the issue to a referendum of the members of the union, there have been no developments. Although much opposition to the so-called Montreal agreement has been voiced, the unqualified recommendation of the international officers in its favor, and the growing feeling that the Secretary of the Union did not indulge in hyperbole when he said "the last cent had been wrung from the operators," indicate that there will be no stoppage of work at this time at the collieries.

The referendum is to be taken on December 14th.

The strike of the railwaymen at the Sydney Steel Plant and at Sydney Mines still continues.

At Sydney, the Steel Company has endeavored to maintain men at work in those operations requiring a minimum of transportation, such as the work of the Nail Mill, but the number of men for whom work can be found under the existing conditions is daily growing less. The seven hour ultimatum of the railwaymen threatened the equipment of the plant with disaster, and although, by the help of scratch crews of officials and others, the blast-furnaces, open-hearths and coke-ovens were cooled off gradually, yet the Company has issued a statement indicating that the No. 4 Blast Furnace may sustain a burst in the crucible portion as a result of expansion of the limestone in the furnace, which under the enforced stoppage of movement of coal and coke, it was not possible to flux off in the available time.

The railwaymen claim the status of passenger and freight line employees, and ask for adjudication of the dispute by the Adjustment Board provided for railway disputes, but the Department of Labor does not consider the employees on the steel plants to come within the category of railwaymen, and suggests a Board of Conciliation, which the strikers refuse.

The employees of the Sydney & Louisburg Railway, a subsidiary of the Dominion Steel Corporation, were given the advances prescribed under the McAdoo schedule during the Summer, and have recently also obtained the further advances under the so-called Chicago award. It is unlikely that any cessation of work will take place on this railroad, or that the operations of the collieries will be interfered with from this cause. At the present time, the strike of the steel railwaymen is causing a lessened demand upon the collieries for cooking coal to the extent of between 2,000 and 3,000 tons daily.

At Sydney Mines, where previously to the action of the railwaymen, the blast furnace and open-hearths had been closed down through trade conditions, the volunteer crews are keeping the collieries in operation, and little inconvenience has resulted from the precipitate strike.

Coal production has improved markedly during the past two weeks. The officials of the Dominion Coal Company look for an output in November of 295,000 tons, which, if obtained, will be the largest single month's production since August 1917. Outputs running over 13,000 tons daily have been obtained on a number of recent occasions. Should the improvement in production continue, the output of the Glace Bay collieries for 1920 may reach 3,250,000 tons, which will

exceed 1918 by 170,000 tons, but will be smaller than any year of the war period, or its immediate predecessors.

The production from the Springhill Mines expected in November is 40,000 tons, a figure that has not been attained since 1909. Indications are that Springhill outputs may reach 420,000 tons in 1920, a figure that has not been approached since 1912.

For the first time since 1916 there is noticeable a strong upward trend to production of coal in Nova Scotia.

With the existing demand for coal, should the United Mine Workers accept the rate of increase proposed by the Montreal agreement, their opportunity for earning large wages has no precedent in Nova Scotia annals.

### VANCOUVER NOTES.

#### Dr. Dolmage Farewelled by Vancouver Branch, C. I. M. & M.

Dr. Victor Dolmage, before leaving Vancouver for Ottawa to take up new duties there, was given a farewell luncheon by the Vancouver Branch of the Institute. Dr. Dolmage has been in charge of petrographic work in the Vancouver Office of the Survey, for two years, or since the office there was opened.

The luncheon, presided over by Dean Brock, was attended by members of the Institute and friends of Dr. Dolmage. Dean Brock said he regretted that Dr. Dolmage was leaving because his work has been of public benefit. Dr. McKenzie also spoke, referring to his first meeting with Dr. Dolmage in the field in Queen Charlotte Islands.

In reply Dr. Dolmage said there were three types of mining men to which the Vancouver office sought to help, namely, the mining engineer, in regard to branches of science in which he might not have specialised; the prospector, to whom great assistance could be rendered—and they were always an interesting type of men to help;—the small investor, to whom advice as regards a particular property was a delicate matter, but who could always be advised regarding the securing of proper reports from reliable parties. It had been his experience, Dr. Dolmage believed, to be of assistance to all these types. He would like to see the mines owned by Canadians, and not altogether by New York or Spokane people.

#### To Hold Monthly Meetings.

The Vancouver Branch is to hold a luncheon on the first Wednesday in each month beginning in December. The aim of these luncheons is to create greater interest in the Institute.

#### The February Meeting of the Institute.

Attention is being concentrated upon making the 2nd. Annual Vancouver Meeting a successful one, and it is hoped that any members of the Institute from the East who may plan on being within reach of Vancouver in February will endeavor to be present at the meetings. The invitation is extended to members of the American Institute of Mining Engineers also.

#### B. C. Chamber of Mines Popular.

The rooms of the B. C. Chamber of Mines, and the mineral exhibit there, attracts much attention, and visitors during one month, selected at random from the register, include well-known mining men from White Horse, Yukon, Prince Rupert, Ontario, Alberta, Quebec, Los Angeles, Arkansas, Arizona, England, and all the camps in the province itself.

**EXTENDED  
Service  
To Our  
Advertisers.**

Realizing the Development which is bound to take place in trade between Canada and the United Kingdom, the

**Industrial & Educational Publishing Co., Limited** will open its own office in England early in January.

Mr. C. H. Armstrong, Jr., who will be in charge, has investigated trade conditions in Canada from coast to coast.

Any advertiser or subscriber who is anxious to make connections as a representative of firms in the United Kingdom, is invited to communicate with Mr. Armstrong, Canadian Mining Journal Gardenvale P. Q.

**This Service will be  
Entirely Without  
Charge.**

### HIGH ASSAY VALUES REPORTED FROM PAIN-KILLER LAKE ORE.

La Santa Lucia Gold Mines, one of the group of Cartwright Gold Fields in the Painkiller Lake gold mining district, is attracting considerable notice just now by reason of the excellent showing made by numerous assays of ore taken from an exceedingly promising vein.

This vein which has been opened up for a distance of one hundred feet has an average width of eighteen inches and carries free gold for the entire length.

Recently ten bags containing six hundred pounds of ore picked up promiscuously from the vein were shipped to the Provincial Testing Laboratory at Cobalt and the report gave \$84.15 in Gold and 7.43 oz. of Silver, proving that the main vein contains ore of a very high grade.

Numerous samples have been taken and indicate that the values are consistent.

It has been known for some time that gold was plentiful on these properties and a six and a half pound sample of ore tested recently at the Kingston School of Mining averaged \$1,374 per ton in Gold and 9.6 ounces in Silver.

No less than seven veins have been opened up, all carrying visible gold and the veins vary in width from twelve inches up to three and four feet.

A contract has been let for diamond drilling to a depth of 2,000 ft, and if results justify, further operations will be carried on. Simultaneously with the diamond drilling surface work will be prosecuted with vigor.

Main Vein of La Santa Lucia Gold Mines from which sample tested at Government Laboratory was taken.

The camp is now well advanced in the way of equipment and working staff and work is proceeding rapidly. The main shaft is down 100 feet.

The Cartwright Gold Fields and La Santa Lucia Gold Mines control 520 acres around Painkiller Lake and it is fully expected that this camp will be the scene of great activity in the Spring of 1921 for the excellent results obtained are encouraging many other properties in the vicinity to consider operations.

Vein seven feet wide, on Cartwright Goldfields Property carrying high assay values.

### GOLD INDUSTRY PROBLEMS.

ALEXANDER GRAY, Montreal.

Doubtful as it is whether American gold producers will accomplish their avowed purpose to push to passage the bill by which they would be bonused and encouraged that much to increase their output, it is manifest that more of the yellow metal will not be forthcoming unless operating conditions are altered, whether by the more plentiful supply of efficient labor, the lower cost of materials and metallurgical essentials, or by the modifications of taxation.

Artificial stimulants, however effective, are not included in Bankers' creed. Banks are jealous of their prerogatives when it comes to the gold standard. The market for gold is theirs. Special legislation that would tax gold used in the ornamental arts and the jewelry trade in general, meets with the objection that an open market is preferable. What premium there is upon the metal by reason of international exchange cannot be denied to those who are producing it—or whose grade of ore is such that they can produce it—that concession really is undeniable—and it does not assist low grade properties.

Were it not for this premium fewer gold mines would be working. In many instances the premium has provided something for shareholders who otherwise would be subjected to war-time conditions which still obtain. How close is the margin of profit at established gold fields is revealed in the October figures for the Witwatersrand where 26 mines milled 1,196,100 tons valued at £2,057,256, for an average profit of \$2 per ton. In the eastern section of the Witwatersrand, 11 mines milled 591,000 tons valued at £1,531,881, for an average profit of about \$6.50 per ton. All told, in October, 37 mines of the Witwatersrand milled 1,795,100 tons valued at £3,589,137, and were it not for the 11 mines of the eastern section the return available for dividends would not furnish enthusiasm enough to attract capital

to gold mining. A dozen mines were operated at a loss. Others reported a profit per ton of 25 cents to \$1.00.

Calculating the value of the refined gold at £5, 17 shillings and 6 pence, the October output was at the rate of £43,069,644 per annum, without which exchange would be more demoralized than it is. Of course, as the Bankers contend, this gold is to be had by those who can buy it, and is available when they want it. American producers have talked of a Gold Bank for their own purposes, and yet the last word would rest with Threadneedle and Wall streets. Possibly a tax on gold diverted to jewelry could be allocated for the relief of lower grade properties. There, again, the special provision might prove obnoxious as a precedent.

Less taxation and the co-operation of labor really are the surest remedies for all precious metal mines. Once the equilibrium of international exchange is nearer to normal, the premium upon gold will not be so remunerative. It is what will happen meanwhile toward a lower level of working costs that gold producers are thinking about. Certainly shareholders are weary of being penalized by combined adverse circumstances beyond their control. Their capital is nearly "frozen"—their millions are too inactive to arouse further interest in mineral resources.

#### BOOK REVIEW.

Geology of the Non-metallic Mineral Deposits other than Silicates. Vol. I. Principles of Salt Deposition. Amadeus W. Grabau. First Edition, 9¼ by 6¼ inches by one inch; 435 pages with Index. McGraw-Hill Co., New York. Cloth Boards.

This book is really a hand-book of salt geology, if the term is used in a sufficiently broad sense to include nitrates, borates, phosphates and similar deposits. Consideration is chiefly given to modern deposits, now forming, or but recently formed, and line of study that it is hoped may lead to successful elucidation of the origin of older deposits.

A list of the chapter headings will give the best idea of the volume, which covers a world-wide range, and is extensively illustrated by maps, tables and photographs.

After reviewing the chemistry of salts and the physical characteristics of non-metallic salts, the chapters deal with the sea as a source of saline deposits, the condition of deposition of sea salts in nature, including salt secretion by organisms; sea-margin deposits of salt, salt deposits from evaporation of a cut-off portion of the sea; salts of terrestrial origin, connate salts, their origin and mode of concentration: salts leached from older deposits, and from decomposition products of older rocks; concentration of salt by plants. Similar arrangement is followed in discussing nitrates and phosphates. Salt deposits of mineral springs and fumaroles, or circulating ground water, and of igneous origin are dealt with. The concluding chapter discusses the conditions under which salt deposits formed in former geological periods.

Canadian references are not numerous, but include the Laramie lakes on the South Saskatchewan border, and notes on J. W. Dawson's theory of the origin of the Nova Scotia gypsums and the occurrence of gypsum in dolomites overlying the salts at Goderich, attributed to alteration of limestones by acid sulphate waters.

Canadian phosphates are referred to in the second volume, which is not yet published. T. Sterry Hunt

is quoted a number of times in connection with Canadian salt deposits.

The volume is well indexed, and has been carefully edited.

#### ASBESTOS PRODUCTION, GRADING & PRICES.

New York advices still forecast higher prices for all grades of asbestos fibre.

The following interesting table of the production of asbestos rock, the resulting tonnage of various grades of asbestos fibre and the increase in values during the past eleven years, is compiled by the Asbestos & Mineral Corporation of New York, and published by permission.

In explanation of the statistics it is stated that a classification of the selling price has been adopted which divides the Crude into two grades, and the Mill Stock, or fibre, into three grades. The crude is hand-cobbed, and the fibre recovered by mechanical grading after crushing, no two mines grading alike.

Fibres are divided into three classes, namely, Mill Stock No. 1, long or spinning fibre; Mill Stock No. 2, shingle and magnesia stocks; Mill Stock No. 3, paper stock and "short fibres".

The tables show the striking advance in the selling-prices of Canadian fibre, which is altogether out of proportion to the tonnage of fibre produced, this not having responded to the brisk demand and high prices in any very striking manner.

As was pointed out by the Superintendent of Mines for the Province of Quebec in the Report for 1919, the tonnage of asbestos fibre in 1919 was 4.6 per cent below that of 1918, but because of increased selling prices, the value was 21.2 per cent greater.

Tables of Production and Values of Asbestos produced in Quebec 1909-1919 (compiled by Asbestos & Mineral Corporation, N.Y.)

# MINE CARS ROLLER BEARING Steel or Wood

We make any type of Mine Car desired by the buyer. We also design and build special cars, if none of the standard types will suit. We have been designing and building cars for a quarter of a century. Our designers know their business, and are at your service free of charge.

Let our Engineering Department help you reduce your costs and increase your output and general efficiency.

**END DUMP QUARRY CAR.** With dust-proof self-oiling bearings This is only one of our many types of End Dump Cars.

If you use Wood Cars we can supply you with the wheels, Axles, Boxes etc., so you may build your own cars. You will save money by so doing.

These are only two of the many styles of Mine Cars we offer. Let us know the type of car you prefer, and we will give you attractive prices.

**HEAVY BUILT PUSH CAR**

A good general purpose car for any kind of heavy work. Heavy steel frame work decked with 2½ in. or 3 in. planking. Self-oiling babbitted boxes. Made for any gauge of track, and any required weight to suit the load.

Marsh Engineering Works, Limited, - Belleville, Ontario

ESTABLISHED 1846

Sales Agents: MUSSENS LIMITED, Montreal, Toronto, Winnipeg and Vancouver

## PORT ARTHUR NOTES.

By J. J. O'CONNOR.

Members of the Port Arthur and Fort William Boards of Trade, had a conference with the Hon. Harry Mills, Minister of Mines, in the Mayor's office Fort William, on Nov. 27th. The subject under discussion was the advisability of the Province granting a bounty on the mining and marketing of iron ore, without restriction.

The Hon. Mr. Mills stated that as a Minister of the Crown he would not advise against the granting of a bounty, but as an individual giving his personal opinion, he did not think the granting of a bounty would result in a solution of the iron ore problem of this Province, that something more was required, more preparation for the securing of additional knowledge of the various ranges, as to quantity, grade and variety of the ores, and the various forms of treatment to which they would be amenable. He made certain suggestions that he thought could be worked out to advantage. These suggestions amounted to a complete survey of the whole situation regarding the iron ranges of Northern Ontario, and the best methods to be adopted for their development and use in the furnaces of the Province.

The Hon. Minister's suggestion to have such a survey made is a good one. Aside from the question of a bounty or no bounty, it is clearly in the interests of Ontario to have the fullest and most complete knowledge of its iron-ore resources, and there is no more direct or efficient manner of arriving at that knowledge, than by such survey by competent men.

This policy has been advocated by mining engineers who are familiar with the iron ranges, and their requirements.

Captain H. E. Knobel, who has had a wide and intimate association with the iron ranges of Northern Ontario, estimates that such a survey could be made by a party of five live men, under a competent directing head, in one summer season. He, and many others, are strongly of the opinion that when such survey is undertaken, it should be in the hands of, and under the direction of, experienced iron-ore operators, men who have had actual commercial experience in the beneficiation of iron ores, such as may be found on the iron ranges of Minnesota, where beneficiation has been carried to the highest efficiency yet attained. No survey of this kind would be of value, unless it were carried out by men with the capacity and experience to enable them to forge the necessary link between the technical and commercial end of the iron-ore problem. Either our iron ores are of value, or they are of no value. If they have value, that value is immediate and present. If of no value, the suggested survey would demonstrate that feature, and end the matter. If, on the other hand, it proves their value and availability for our own use, no time should be lost in their exploitation.

The Hon. Mr. Mills would be well advised to proceed at once with preparations for the survey under the right auspices, so that the work may be undertaken in the Spring of 1921.

**FOR SALE**—1—only C. G. E. 150 HP 720 RPM Form E. 550 Volt 1 phase 60 cycle INDUCTION MOTOR complete with paper pulley 21" face x 24" dia. and CR 1034 Form HI Starting Compensator.

1—Only, Canadian RAND Company, Class "R.P. 2" Cross Compound belt driven AIR COMPRESSOR including 55 feet of 18" double leather pulley. Price for lot \$5000.00. Apply Consumers Glass Company Limited Montreal, P. Que.

**OPERATION & ADMINISTRATION:** Business Executive and Mine Accountant with many years technical and engineering experience. One year as Manager and two and a half as Assistant. Open for engagement. Apply Box 22, Canadian Mining Journal, Gardenvale, P. Que.

**SILVER-GALENA MINE**—For sale limited number One Dollar shares in Yukon Silver-Lead Mining Company, incorporated under laws Yukon Territory, operating Lookout Mountain Claim in Mayo District of Yukon Territory, Canada, has option on five claims adjoining. Capitalised for \$250,000. Bona fide opportunity. Geo. F. Johnson, 817 South El Molino Ave., Pasadena Calif.

## EDITORIAL

### “The Extension of the Institute’s Scope of Usefulness”

The Annual Meeting of the American Mining Congress at Denver has received much deserved publicity in the trade journals of the United States. This organization, which had its birth in Denver, had last year an income of \$150,000, comparing with only \$5,000 in 1910. It has become a political power of first rank, and a perusal of the text of the numerous resolutions adopted will sufficiently indicate how large a proportion of the deliberations of this Congress deal with applied politics, or what is usually termed legislation. No doubt this phase of the work of the Mining Congress is at this time brought into unusually sharp relief because of the manner in which the mining industry has been controlled by governments under war-measures enactments, and because of the unconscionable length of time occupied by bureaucratic control in accomplishing much-to-be desired death. Out of twenty-five resolutions adopted, there was only one, namely that relating to Minerals Separation Ltd., that it is possible to regard as non-political, and even this lone exception was a resolution asking for government action.

The American Mining Congress is, we gather, an organization of persons financially interested in mining, representing exclusively the corporate aspect of mining affairs, but numbering among its members men of wide technical experience. Such organization appears to fill a necessary part in the domestic economy of our neighbors, one that has a necessary corollary in Canada. The crowded programme of the Denver Meeting, and the multiplicity of political matters which were crystallized into formal resolutions, and others that presumably were not so crystallized, although discussed; is evidence of the absorption, exclusive of all other matters, that would result from frank adoption by the Canadian Institute of Mining and Metallurgy of such duties as come within the scope of the Mining Congress’s charter.

The Ontario Mining Association was formed for much the same purpose as the American Mining Con-

gress, and is functioning along much the same lines, but within smaller limits, and being frankly an operators’ organization, it can with propriety advocate the interest of the operator and the purely commercial side of the mining industry, as is evident from the statement presented by the Association to the Tariff Committee.

The desirability of the Canadian Institute of Mining and Metallurgy adopting a more aggressive political stand, and the augmentation of its revenues to enable it to employ in its service men of high executive and technical standing, was freely urged at the last Annual Meeting in Toronto by gentlemen who were prominent in the counsels of the American Mining Congress at Denver. The need for an organization to represent the business interests of Canadian mining is great, and just how far Canadian mine operators can find it possible to work with the American Mining Congress it is difficult to state, as in some matters, such as those connected with tariffs on the so-called “war minerals”, the interests of the Canadian and United States operator are opposed.

The endeavors of a technical society to advise the Government in connection with legislation is fraught with difficulty, but it is a service that up till now the Canadian Institute of Mining and Metallurgy has performed with commendable discretion, probably because it has been realised that its political advice was tempered by a realisation of its honorable traditions and professional ethics.

It is possible that at forthcoming meetings of the Institute there will be discussions that will reveal differing conceptions among the members of the Institute as to its functions. One section of thought will regard the traditional policy of the Institute as negative and timid, and will press for out and out political aggressiveness such as is being displayed by the American Mining Congress. Others will continue to regard a judicious admixture of technical wisdom and business acumen as a golden mean, not

to be departed from without injury to the future of the Institute; in which, of course, every member is genuinely interested, no matter what his views as to its functions.

The mining industry in the United States is large beyond all historical precedence. The value of the mineral products of the United States in 1918 totalled five and a half billion dollars. National records do not disclose any previous approach to such stupendous figures, and it is patent that the American Institution of Mining Engineers could not, without injury to either interest, any longer attempt to supervise the technique and also the business of mining in the United States. The load is too great and the divergence of interests is too great. In Canada, however, we have not yet attained to such eminence in production, nor to such divergence of interests, and in considering the work of the American Mining Congress some thought should be given to its juvenility.

This journal does not desire to express a decided opinion on what course the Canadian Institute of Mining and Metallurgy should pursue, except to voice the belief that the Institute should receive the fullest and the most unstinted support from its members. The sum of individual endeavor will be the measure of united achievement, and the far from satisfactory financial outlook for many branches of Canadian mining render it more than ever necessary that the Institute should be increasingly active.

We would, however, call the attention of the members of the Institute to the work of the American Mining Congress, to the wide extent and difficult character of the field it has undertaken to cultivate, and suggest that thought might be usefully devoted to the problems of the Canadian Institute in advance of the coming meetings of 1921, which it is understood will include a meeting of the British Columbia Division in February, the Annual Meeting of the Institute at Ottawa in March, and the Annual Meeting of the Mining Society of Nova Scotia (really the eastern meeting of the Institute) in May.

In this connection a careful perusal of the speech of the President, Mr. O. E. S. Whiteside, at the Winnipeg Meeting\* is recommended. Mr. Whiteside's subject was "The Extension of the Institute's Scope of Usefulness" and there will be pretty general agreement with his concluding words, namely: "Inaction on our part, or an attitude of mere complacency with the position and reputation for good work we have won, with no desire to improve it, would be fatal and uncondonable. I need scarcely say that there is little likelihood of the Institute falling into that grave error."

Nevertheless it may.

### EFFICIENCY AN OFFENSE.

The United States Government has won its suit against the Lehigh Valley Railroad, a so-called anthracite trust road, for violation of the anti-combine law, enacted in the days before the war, when the efficacy of unified control was not so recognised as it later became under the compulsion of national danger.

If there is one fact more patent than another in connection with the problem of coal supply in North America it is the deficiency of transportation and the notorious inefficiency and waste—not to mention profiteering—connected with the distribution of coal. The source of coal supply is more than adequate, except as regards anthracite, nor has the capacity of the coal mines of either the United States or Canada for output been at any time intensively tested. It is the complaint of the coal miner at the face that his coal is never taken away from the working place fast enough, a complaint that is not always justified. It is the just complaint of the coal operator that the railways have never been so equipped as to take away coal from the mines at all seasons as fast as it is consigned to them for delivery. Under these circumstances it has for a long time been evident that ownership by the coal operator of the means of coal distribution would lead to maximum efficiency. Efficiency in the production of coal is marked up to the yard limit of the colliery, but beyond that point the reserve is not infrequently true. No combination could logically obtain greater efficiency in coal production and coal distribution than one which places under centralised control both inter-related operations. Greater efficiency spells cheaper selling prices, and the classic exemplification of the benefits that follow centralised control of production and distribution together was the history of Standard Oil. The success and stability of United States steel rests on similar grounds. The operation of the anthracite mines have in recent years been marked by greater stability, more vision and truer conservation (using the term to imply maximum utilisation of resources) than has the operation of the bituminous collieries in the United States.

In Canada, in connection with the mooted British Empire Steel Corporation, much stress was laid upon a centralised control of production and transportation. This factor was not unduly emphasised, but it is singular that logical combinations which are welcomed in Canada should be regarded as inimical to the public weal in the United States. The term "restraint of trade" is used in the United States, and elsewhere, as though it were synonymous with "restriction of competition" the words "trade" and "competition" being assumed to have identical meanings. The assumption is not an accurate one. During the war period it was recognised by governments—if their actions are to be accounted an expression of their convictions—that the fullest amplification of trade could

Note: See C. M. J. page 896, issue 5th Nov, 1920.

be secured only by the extinction of competition, which was the effect sought to be achieved by control of key industries.

Is it not just possible that the elimination of competition—useless, wasteful competition—is required before efficiency, and consequent maximum cheapness, of production can be achieved, and that the principle expressed by the Sherman Law is untrue in fact and disastrous in operation?

#### *IT PAYS CANADA TO PRODUCE NEW GOLD.*

A correspondent to the "Mining and Scientific Press" states rather epigrammatically that the price of gold today is \$20.67, its value being \$45 per ounce, "the price marked on gold coins being a mask to hide the value."

This is, of course, not precisely a correct statement. In those countries where the statement might be considered correctly made, the gold coin is not in circulation, for quite obvious reasons. The paper "equivalent" of the gold coin is a sham, partially or wholly corresponding with the extent to which it is backed by gold bullion, stamped as coinage or unstamped. The discount on the paper equivalent of any country expresses the view of financiers as to what are the chances of that country ever paying its debts in gold, and when. When the Hollinger Mine, for example, ships gold to New York, it receives, under present circumstances a substantial premium on the shipment, expressed in terms of the Canadian paper dollar, but that premium is only a gain, more or less apparent, if spent in Canada. The more gold our gold mines can export to the United States, the smaller will become the premium, but in such event no one in Canada would grumble, the gold miners least of all, because the purchasing value of our paper dollar in Canada would buy more labor and more material than it does today. Intensive production of gold, whatever may be its effect in the United States, is obviously one of the best directions in which Canadians can expend their national energies. It approaches the dignity of a national duty.

#### *WHAT CONSTITUTES A NON-ESSENTIAL IMPORT.*

The annual addresses of the officers of the Bank of Montreal in presenting the Annual Statement of the institution review the industrial situation in the several Provinces tersely, with deletion of all non-essential statements, and supply an annual corrective of a less restrained literature with which newspaper readers are familiar. Sir Frederick Williams-Taylor cannot be accused of exaggeration in his references to mining in Quebec. "With the exception of asbestos, there is little mining done in the Province. Asbestos shipments show an increase, and prices have advanced." That is all. Similarly, throughout the

whole of the references to mining in the Provinces, the relatively small attention attracted by mining is reflected by the extent of the bankers' mention.

There is no desire to criticise or be captious in this connection, but merely to take an opportunity to look at the mining industry through other eyes, a not unprofitable proceeding at times, particularly when the other man is in a position to view all Canada's economic features from the elevated and impartial stand of the banker, a pinnacle of judicial observation that but few can hope to attain.

Sir Frederick made one statement which it would be interesting, and no doubt profitable to have enlarged, namely; "What is wanted (to correct trade balances) 'is rigid economies in the purchase of non-essentials, 'with an increase in our own exports.'"

A definition of what constitutes a non-essential, from the mineral producers' point of view, is much to be desired.

Is a mineral product essential when it can be produced at home, in lieu of importation from outside, under circumstances where home production entails a higher apparent outlay in money to the individual? To the state, and to the general mass of people that compose the state, the individual saving may actually be a collective loss. A definition of "essential" from this point of view would be welcomed. It would throw needed light on the tariff debate. The poverty of our natural resources, opposed to the plenitude of the resources of our neighbors, is the condition that necessitates a protective import tariff in Canada. How far does cheapness constitute essentiality? Nothing, of course, is cheap that can be done without, but is anything really cheap that can be produced at home and is bought abroad, if purchasing abroad depopulates Canada, drains its finances, chokes its volume of production and depreciates its currency?

#### *THE FLYING GEOLOGIST.*

A newspaper item intimates that airplanes may be used to take Dominion geologists from Peace River Landing to Fort Norman next Summer, thereby avoiding much arduous foot-travel. It was pointed out in an April issue by Mr. R. E. Hore that the presence of numerous lakes in Northern Canada might assist in providing alighting places if the seaplane type of machine were used. Canada has many aviators, with wide experience, who can give the best of advice as to the feasibility of the proposal, and, should the yield of oil in the Mackenzie Basin fulfill its present promise, much expenditure in mapping an air-route and providing intermediate stations will be fully justified. If the dirigible type of lighter-than-air machine were used, Canadian helium might be employed!

If the proposal is approved by the Air Board, its practical usefulness in many directions requires little emphasis.

## CORRESPONDENCE.

## DEPARTMENT OF COLONIZATION, MINES AND FISHERIES.

Bureau of Mines.

Quebec, December 7th, 1920.

The Editor,

Canadian Mining Journal.

Dear Sir,—

The Canadian Mining Journal in its issue of December 3rd, reproduces an article of the "Labour Gazette" comparing legislation relating to the regulation of Mines in Canada.—As regards the Province of Quebec I find some inaccuracies, which probably have arisen from the fact that the "digester" may have consulted copies of the old Mining Laws of Quebec, instead of up to date copies with changes and amendments.—For instance I note that the writer says:—"The Yukon and all the provinces **except Quebec** have sections relating to the powers and duties of inspectors.—..... In the Yukon and all parts of the Dominion, **except in Quebec** and the coal mines of Nova Scotia, the inspector must give notice in writing to the owner or manager of the mine of anything which he finds to be dangerous or defective, and direct that it be remedied within a specified time".

The following quotations of articles of the Quebec Mining Law, refute the above statements and show that the phrase "except Quebec" is *de trop*.

**Article 2189.**—"Every inspector, constable or peace officer in a mining division, may, at any time, enter upon private or public lands that are being mined in the said division, and examine the pits, shafts, tunnels, subterranean passages or other mining works or excavations constructed or commenced in any manner whatsoever, and require from the proprietors of such pits, shafts, tunnels, and other mining works, and from their employees, all the facilities and assistance necessary for that purpose.

**Article 2114.**—"Regulations may be made by the Lieutenant Governor in Council, respecting the sanitary condition and safety of the work in mines, so as to protect the life and health of the workmen therein employed.

"Such regulations, after their publication in the Quebec Official Gazette, shall become law, and a copy of the same shall be posted up in the most conspicuous places of the mine in conformity with the instructions of the mining inspector."

**Article 2214a.**—"It shall be the duty of the inspector to make such inspections of mines, quarries, and ore-mills for the reduction of minerals, as may be necessary to ensure the observance of all regulations made under article 2214.—The inspector shall have power, further, to order in writing any owner of a mine or his agents, to have remedied, within a certain lapse of time, specified by the inspector, any state of affairs, or any practices which he may consider bad or dangerous in the operation of any mine, quarry or mill for reducing mineral.

"Any failure to obey such notice within the time specified shall be an offence, punishable by the penalties provided by article 2207".

Very truly yours,

THEO. DENIS,

Superintendent of Mines  
for the Province of Quebec.

## OBITUARY.

## Peter Christianson, Sydney Mines.

Mr. Peter Christianson died at his home at Sydney Mines on November 27th after a year's illness. Mr. Christianson was a sailor on a Norwegian sailing-vessel which touched at Sydney Mines when he was about eighteen years. This vessel was a "coffin-ship", which the young man thought it advisable to leave. When the ship sailed out of Sydney Harbor it did not have one particular member of its former crew aboard. Mr. Christianson who was ignorant of the English language, found work at the collieries at Sydney Mines, and by dint of perseverance learnt English and rose to be Assistant General Superintendent of the Dominion Coal Company. He was a student of the International Correspondence School of Scranton, and his rise from an unlettered sailor to a high official position was deservedly one of the favorite quotations in the I. C. S. advertisements. Mr. Christianson left the service of the Dominion Coal Company in 1910 and went with Mr. Charles Fergie to the Yellowhead Pass coal-fields, where he contracted from exposure the sickness which shortened his life. He returned to Cape Breton, and at the time when his failing health rendered it necessary for him to relinquish active work, he was Manager of the Jubilee Colliery of the Nova Scotia Steel Company.

Peter Christianson was a man of sterling character. Quiet and retiring, but very thorough and loyal, he had many friends. During his work as a colliery official he had to deal with many dangerous underground situations and always proved himself to be a dependable man. Mr. Christianson at all times retained the confidence and respect of the workmen, a fact that was noticeable during the troubled times of the strikes in Cape Breton during 1909 and 1910.

Among those who regret Mr. Christianson's death, and who regarded his self-reliant and shortened life with admiration, the Editor desires to be numbered.

## OIL SHALES. USEFUL PUBLICATION BY COLORADO SCHOOL OF MINES.

The October issue of the Quarterly of the Colorado School of Mines contains a comprehensive article by Dr. Victor C. Alderson, the President of this Institution, upon the Oil Shale Industry in Scotland and England. The information in this article was obtained by Dr. Alderson during a visit in the Summer of this year.

Dr. Alderson notes in his introduction that recent literature on oil shales in Great Britain is exceedingly scarce. He states that the English oil-shales which exist in large quantities are commercially worthless until some method of desulphurizing the oil they yield is discovered.

A Supplement to Dr. Alderson's paper contains a directory of oil-shales retorts, the information being given by the makers. These retorting systems include the Anderson retort, Balcom process, Bishop continuous process, Chew process, Colorado continuous retort, Day, Erickson, and Galloupe processes, Jenson stage-education process, Johns retort, Porter process, Randall rotary-retort and process, Scott process, Seaman rotary-retort process, Louis Simpson retort and process (172 O'Connor St. Ottawa), Stallman-Wells process, Wallace process and Wingett process, together with other processes listed, but not described.

A Bibliography of publications on Oil Shales is also appended.

**STATEMENT OF THE ONTARIO MINING ASSOCIATION BEFORE THE COMMITTEE OF THE CABINET ENQUIRING INTO THE EFFECT OF THE CUSTOMS TARIFF IN CANADA.**

The Ontario Mining Association, through its Secretary, Mr. B. Neilly, presented to the Cabinet Committee on Tariff Enquiry at its sitting in Toronto, on the 6th December, a statement of the views of the mining industry, the text of which is given below.

The only question put by the Committee was in regard to the Wedge furnace, the Chairman remarking that the action taken by the Customs Board was rather the fault of the Tariff than of its interpretation by the Board, and intimated that the section would be amended to avoid future ambiguity.

The Chairman stated that the mining industry need not expect representation on the Customs Board.

**The Statement.**

This Association has within its membership, with some two or three exceptions, all the producing mines in Ontario, and can therefore speak with reasonable assurance on behalf of the Mining industry in this Province.

It is not our desire to enter into a discussion on the relative merits of protection, as against free trade, nor do we wish to make any general statement with reference to the present tariff. Unlike those engaged in Agriculture, who sell their products largely in the home markets, we sell ours almost exclusively in foreign markets, and absolutely at prices set by the law of supply and demand. In other words we cannot add the amount of customs duties to our selling prices, but on the other hand we must add the amounts so paid, to our cost of production.

The production from Canadian Mines in 1918 was valued at \$211,301,897, and we presume it is hardly necessary to draw to your attention the fact that this amount is **new wealth in Canada**. The mining industry does not draw its raw material from another industry, and by a process of manufacture increase that value, but it takes raw material that without beneficiation is worthless, and turns that latent resource into something of value to mankind.

Measurable quantities of minerals can be found in nearly every substance that goes to form the earth's crust. But all such mineral is worthless unless the cost of mining, concentrating and refining that metal, is less than the selling price of the metal so recovered. **Cost of production must determine in every case whether or not an ore body is of economic importance**, and as we succeed in reducing costs of production, the volume of ore that can be treated at a profit, increases by leaps and bounds, and while the profit per ton to the operating company may be small the gross value of that production represents just that much new wealth to Canada.

To illustrate this point more specifically, let us assume that in a certain mine, the cost of production is \$5.00 per ton. That means that all ore in this particular mine running less than \$5.00 per ton, must be left in the ground, because it is for the time being without value. Next let us assume that for any reason, the cost of production in this mine is reduced to \$4.50 per ton. Immediately the tonnage averaging between \$4.50 and \$5.00 per ton has economic value,

and while the mining company then makes a maximum profit of 50c. per ton on this new available tonnage, Canada makes \$4.50 per ton, or nine times as much, as the maximum profit that may be obtained by the Mine Operator.

It is apparent then that anything the Government can do to decrease operating costs will vastly increase the value of Canada's mineral wealth. We submit, having regard for the financial requirements of the Country, that it is the duty of the Government, in the interest of all Canadians, to use every facility at its disposal to reduce this operating cost, and, for example, to add, if possible, the above mentioned \$4.50 ore to our immediately available wealth. One way that decrease might be brought about is by way of lowering the duties imposed on machinery and supplies imported, of necessity, from foreign countries.

Nevertheless we as an industry, do appreciate the heavy liabilities imposed upon Canada by reason of the part she played in the Great War. We know that your Government must obtain revenue, and mining operators as a class, are proud of the fact that we have never sought to dodge our fair and even generous portion of the common obligation.

**Under the circumstances as above outlined we are inclined to leave with you the problem, of finding the critical point of Canada's advantage, with respect to the duties to be imposed on the industry's foreign needs.**

**Interpretation of Tariff Schedules Criticised.**

While then we have refrained from adversely criticising the Tariff proper, we would nevertheless voice our objections in the strongest possible language, to the way in which that Act has been interpreted, by your Customs Board. With no change in the Act, as it affected the Mining Industry, your Board have varied their rulings time after time, on the same class of article. Through lack of knowledge and experience, or because of absolute indifference to reason, time and again have they drawn an arbitrary line in interpreting some certain section of the Act, where no such decision could be supported by a fair interpretation of the Act itself.

Illustrating this charge of unfairness or incompetence, let us take the experience of one of our members. Before finally deciding on the adoption of a certain kind of roasting apparatus, they asked for a ruling of the Customs Board as to whether or not a certain kind of fire-brick liner not made in Canada, would be permitted to enter Canada duty free. They were advised in due course that they were included in the free list and the Company installed this particular equipment on the above understanding. Until 1915 they continued to import these liners free of duty, but suddenly they were advised, that under tariff item No. 282, they were dutiable at a rate of 22½ per cent. The Company naturally protested and referred the Board to their original ruling, which all things considered was not unlike an agreement, but without avail, and they perforce continue to pay duty. It is apparent, we submit, that injustice is being done.

As another illustration, of, shall we say lack of confidence on the part of the Board, one of our members imported a Wedge furnace. Under tariff item No. 462 it was admitted, quite properly, duty free. When they later were forced to renew certain parts of the furnace these parts were declared dutiable at 27½ per cent, and protests were unavailing. Surely

such action on the part of the Board is without justification.

In 1917 mining operators asked, that grinding machinery when used for fine grinding in cyanide solution, should be admitted free under Article 460. The Commissioner of Customs in his file No. 92065, November 16, 1917, advised, that stamp battery parts where used for fine grinding in cyanide solution, should be admitted free. Some time prior to this, tube mills when used for the same purpose, had been added to the free list. On July 9, 1918, the Customs Board issued, without warning and so far as we know, without reason, a ruling effective at once, that tube-mill parts and ball-mill parts whether used for fine grinding in cyanide solution or not, should be rated for duty under tariff item 453.

You will note that under the same Act they are first dutiable, next declared free, and later again made dutiable. The uncertainty that such action engenders tends to confusion and makes it almost impossible to estimate costs accurately, and we have already pointed out that the costs of production is the main factor in determining whether or not an ore body is of economic importance. Moreover it illustrates well our point that inexperience or lack of knowledge, pertaining to this Industry, has led the Board into error in imposing duty, later in relieving the Industry from that duty and latterly in again imposing it.

These unsatisfactory interpretations of the present Act, were discussed at a full meeting of the Association, in August of this year, and the following resolution was passed unanimously:

“Resolved that the Dominion Government, should be asked to appoint to the Custom Board, at least one member thoroughly familiar with the requirements of the Mining Industry.”

We ask that this request be granted in the hope that friction may be eliminated, so far as the administration of this Act affects the mining industry, and so that costs of equipment may be estimated accurately, and the operators enabled more definitely, and prior to the making of heavy expenditures, to ascertain whether or not, the ore under consideration is worth developing.

We ask that the onus of proof of manufacture in Canada, be placed on the manufacturer, where under a system of protection it properly belongs.

#### **Mining the Pioneer Industry.**

We further ask that when you undertake to review the present Act, that you will give careful consideration to the fact, that mining as a basic industry is doing more to open up the present unproductive areas in Canada than any other industry. It is risking capital and effort at all times, in the hope that the reward will be the great prize of the successful mining company, and merely suggesting that it, as an industry, is perhaps properly entitled to the same consideration as Agriculture, the Press Association and the Textile Industry, (see items 441, 442 and 468), we will close, by offering our whole hearted co-operation, in gathering and presenting any statistical details in connection with the mining industry, that in your estimation, might be useful in arriving at a scientific decision with respect to the points we have enumerated.

#### **COMPLETION. OF. A. LARGE. MINE-PUMPING INSTALLATION IN SOUTH AFRICA.**

..The S. A. Mining & Engineering Journal for October 23rd contains an account of a new pumping layout of the Randfontein Central group of mines. Under the superseded arrangement from 3½ to 4 million gallons of water per day were required to be pumped, which necessitated the employment of over 100 units, mainly electrically-driven three-throw units with a capacity of 12,000 gallons per hour against 750 ft. head. Twenty-seven pumping stations and pumps were in use. The pumping cost in 1919 was equivalent to 2.15 shillings per ton crushed.

The new arrangement contains only four units, these being Sulzer pumps, designed to deliver from each pump 84,000 gallons per hour against a head of 2,500 ft. Each pumping set consists of one five-stage right-hand suction pump, and one eight-stage left-hand pressure pump. The pumps are coupled in series, and driven by an electric motor arranged between the pumps on a cast-iron baseplate common to pumps and motors. Motors are 1,750 h.p., 1,470 revs. per minute. Delivery is through three 10-inch rising mains taken from the pumping station to the shaft at an angle of 50 degrees, and thence to surface.

The weight of the metal in the discharge columns is 270 tons, and expansion joints are provided at two points, which permits of two permanent points of support unaffected by expansion and contraction. The water temperature is 72 degrees F. (the original article states this temperature as being 720 degrees, but presumably this is a typographical error) and the shaft temperature 52 degrees, so that when pumping ceases some contraction takes place.

The net result of the new installation has been to replace 80 pumps by four, and 22 pump stations by one. Reserve capacity of the pumping plant has been increased and one hundred percent, and all the old plant above the 2,500 ft. level has been cut out. Running staff consists of one foreman and three shiftmen per 24 hours. A saving of over four shillings per ton of rock to the mill collecting-bins is estimated by the new installation, which has been in successful operation for five months. No parts have been replaced up to the present, and the only noticeable wear and tear is on the end of the blades of the first-stage guide-wheel.

These particulars are contained in a paper read before the S. A. Institution of Engineers by Mr. G. H. Beatty, General Manager of the Randfontein Central.

---

#### **New Westminster, B.C.**

It has been announced that the Acetate Products, Ltd., a newly incorporated concern, will commence construction of plant immediately for the manufacture of wood alcohol, acetate of lime and charcoal. The raw material will be alder wood from the Fraser River Valley of which there is an abundance.

---

#### **Edmonton, Alberta.**

The existence of an extensive field of high-grade salt at Port McMurray has been definitely established by drillers operating under the direction of the Provincial Government of Alberta. The drill has been driven through thirty feet of pure salt at a depth of 650 feet.

# Detail Study of Forces in the Marcus Conveyor

JOHN S. WATTS, New Glasgow.

The writer came across a case where it was proposed to use a Marcus Conveyor, to deliver onto either one or both, of two picking belts, the general arrangement being as indicated in Figure 1. The gate shown on the delivery end of the conveyor, was supposed to be arranged to guide the coal to either side, while closing off the other side, or, if set in the central position, would allow a feed to both belts.

The arrangement was condemned by the writer, as being one that would cut down the delivery capacity of the conveyor, when the gate was set to close off one side, as shown in figure 1, if not stop it almost entirely. A study of the forces which act upon the material being carried, will show that an obstruction such as that of the gate, will retard the travel to a serious degree.

As the action of these forces seem to be generally only very superficially understood, a study of them at some length should be helpful to those who are or propose to be users of the Marcus conveyor.

Figure 1.

The law upon which all shaking, knocking, or vibrating conveyors depend for their successful operation, is the law that the friction of a body at rest is greater than that of the same body in motion, all other conditions being the same. This law is well known, but it is not always appreciated that the difference is not great, and a very small obstacle will neutralise the small force available and prevent the forward motion of the material during the backward stroke of the conveyor.

To get a clear idea of the action, we will study in

detail the forces acting during one cycle, starting with the conveyor at the commencement of its forward stroke. The material resting on the conveyor, will travel with the conveyor, providing that the frictional force, existing between the material and the conveyor, is sufficient to overcome the force of inertia in the material. Bear in mind that the friction during the forward movement is that of the material at rest, because the material travelling as it does, with the conveyor, is at rest, relatively to the conveyor.

Should the force of inertia, in the material, be greater than the effect of the friction, the material will slip relatively to the conveyor, or in other words will not gain the same velocity as the conveyor.

Whether this slipping will occur or not, depends upon the rate of acceleration given to the conveyor, as the inertia of the material varies with the rate of its acceleration, and with the mass of the material. The force of acceleration "R" required to give a velocity "V" is given by the formula

$$R = \frac{WV}{T}$$

Where W is weight in pounds.

V is final velocity in feet per second.

g is acceleration due to gravity, 32.16.

T is time in seconds taken to acquire velocity V.

The force "R" is provided, or rather is transmitted by, the friction of the material, which will be "W. x f." where "f" is the co-efficient of friction at rest, from which it follows that "R" must be less than "W. x f."

To find the maximum velocity attainable, we combine the above formulae,

$$WV = W. x f.$$

$$V = \frac{gT}{f}$$

The maximum acceleration will be equal to the maximum velocity attained in one second as given by the above formula, which becomes,

$$V = g x f$$

A theoretically perfect machine would have a uniform acceleration during the whole of the forward stroke, reaching its maximum speed at the end of the stroke. During the return stroke, the material gives out the energy acquired during the forward stroke, in overcoming the friction (of motion), and will slide forward relatively to the conveyor, until this energy is expended, which should not occur before the return stroke is completed.

As the friction is independent of the velocity, the rate of acceleration whether uniform or varying, would not, if the conveyor had a perfectly smooth surface, have any effect upon the sliding of the material on the conveyor. But in actual practice there are always slight inequalities such as joints in the plates, perforated screen plates, etc., which make it preferable to get the conveyor back quickly while the energy in the material is high enough to overcome any small obstruction. Therefore we have a quick acceleration at the beginning of the return stroke as the most desirable.

The most efficient motion, as described above may be shown graphically as in figure 2, the velocities being indicated by the heights of the vertical lines, and the divisions on the horizontal line representing equal periods of time. The vertical heights above the horizontal line are velocities in the forward direction and these below in the backward.

This theoretical motion is not practicable, as it involves a reversal at the end of the stroke, from a maximum velocity forward to a maximum velocity backward, instantly, which would throw too great a strain on the mechanism, even if otherwise possible of attainment.

The actual motion of a Marcus conveyor, can be laid out graphically on the same basis as in figure 2, and will serve as an indication of how close we are to the most efficient motion.

Figure 2.

First, we lay out a diagram of the propulsion mechanism, as in figure 3, to scale. Circle "A" represents the path of the crank pin on the pulley shaft, and is divided into ten equal parts, each of which parts will represent equal intervals of time, assuming that the pulley revolves at a uniform speed during a revolution. This assumption is not strictly correct, but is near enough to the truth for all practical purposes, as the pulley should be made heavy enough to hold the variation of speed during one revolution, to within two and one half per cent.

Circle "b" represents the path of the crank pin on the connecting rod crank shaft, and taking length ab,

Figure 3.

equal to the length of the drag-link, we lay off the points on circle "b", from those on circle "a", thus arriving at the position of crank pin "b" at equal intervals of time.

With the length of the connecting-rod as radius, from the points on circle "b", describe arcs, cutting the center line as shown in figure 3 the marks on the upper side of the line referring to the forward stroke and those on the lower side, the return stroke. The

distance between each of these points will be, to scale, the travel of the conveyor, during one-tenth of a revolution of the pulley shaft.

We now proceed to lay out the curve of velocities, as shown in figure 4, the divisions on the horizontal line representing equal periods of time, those from 0 to 5, being on the forward stroke, and from 5 to 10, on the return stroke.

Raising verticals at each point, we mark on each the velocity at that point calculated as follows. Assuming that the pulley-shaft makes sixty revolutions per minute, each division will be one-tenth of a second, and the velocity at point I will be twice the distance from 0 to 1, in feet, multiplied by ten; this will also equal the acceleration during this period. From the length between points 1 and 2, deduct the travel due to the velocity at point I, and twice this amount multiplied by ten will be the acceleration during this period. This acceleration added to the velocity at point I, will give the velocity at point 2, and repeating this process we get the velocities at each point, in feet per second.

We can now find out what will be the theoretical movement of the material. and, referring to figure 4, so long as the acceleration is not more than V as shown above, the material will travel with the conveyor, up to that point where the velocity of the conveyor is at its maximum, and then commence to slide at a uniformly decreasing velocity, relative to the earth's surface, until either one of two things occur.

First, it continues to travel forward, at a continuously decreasing velocity, during the backward stroke, and during a part of the forward stroke following, until the decreasing velocity of the material and the increasing velocity of the conveyor, become equal, when the conveyor begins once more to accelerate the material.

Second, if the energy in the material is dissipated by the friction before the conveyor has completed its backward stroke, the material comes to rest, and is carried backward by the conveyor until the return stroke is completed, when the cycle is repeated.

These two results are shown graphically in the straight lines on figure 4, the full line indicating the first, and the dotted line the second condition.

The rate of de-celeration, or loss of velocity per second, is found by the same formula as we used to find the maximum acceleration during the forward stroke, namely,

$$R = \frac{WV}{gT}$$

"V" in this case being the actual maximum velocity, as found in figure 4, "R" being the available energy

in the material to overcome the force of de-celeration, which is the friction of the material in motion.

$$\frac{W V}{g}$$

The formula becomes  $W \times f' = g T$   
 where  $f' =$  co-efficient of friction of motion

$T =$  time required to bring the material to rest

Cancelling and transposing, we get

$$V$$

$$T = f' g$$

Measuring off this time "T", from the point of maximum velocity in figure 4, and drawing the straight line as shown, where this line intersects the velocity curve of the conveyor, is the point at which the conveyor again begins to accelerate the material, under the conditions outlined in the first case above.

If, however, the second case applies, the result will be as shown by the dotted line.

We can now determine the mean velocity of the material, by taking the mean height to the velocity line during one cycle, for case one, where the motion is continuously forward.

For case two, the effective travel will be found by taking the mean velocity, during the time the material is travelling forward, that is from point 0 to 8, and multiplying this by the time 8 seconds, will give the forward movement. From this must be deducted the backward movement during the time 8 to 10, found in the same manner, and the difference will be the net forward movement.

Figure 4.

Obviously the state of affairs outlined in case 2, is a very inefficient one, and is shown only to emphasise the effect of poor design. The mean velocity in both cases is shown in the figure by horizontal lines.

Knowing the mean velocity of the material, it is a simple matter to multiply this velocity by the area of the stream of material, and so calculate the theoretical delivery of the conveyor. For a plain conveyor with a smooth surface the actual delivery will closely approximate the theoretical, provided that the feed to the

Figure 5.

conveyor is uniform, and that the co-efficients of friction used in the calculations are correct.

Generally however, the question is complicated by reason of the conveyor being used as a screen, and fitted with perforated plates, the exact effect of which upon the travel of the material, is very difficult to determine, and must be always largely a matter of experience. There are nevertheless, certain calculations which can be made to ensure that the obstruction will not entirely kill the velocity, and this point will be taken up now.

Referring to figure 5, the material is shown fallen partly into a hole in the screen plate, and the problem is to determine whether the energy in the material is sufficient, at the maximum velocity, to raise the piece out of this hole, or over an obstruction of a given height.

The energy is found by the formula

$$E = \frac{W V^2}{2 g}$$

where "V" is the maximum velocity of the material relative to the conveyor, that is the maximum total velocity shown in figure 4, taking both above and below the horizontal line.

The energy required to raise a body a height "h" in feet, is, neglecting friction,  $E = W \times h$

The available energy is  $\frac{W \times V^2}{2 g}$

$$2 g$$

Therefore  $W \times h = \frac{W \times V^2}{2 g}$

$$h = \frac{V^2}{2 g}$$

It should be remembered that if an obstruction is allowed, approaching this height, the piece meeting this obstruction will be in the worst position, when it stops just at this obstruction, and this is just where it will stop, unless it happens to meet it when its velocity is at about the maximum. A particle thus held at an obstruction will stay there until the conveyor completes a cycle, as it can pass only when the maximum velocity is reached. On the other hand if the material is coming in a continuous steady stream, and the obstructions are not frequent, the material which is behind the piece at the obstruction will exert some of its energy in assisting the obstructed piece

over, at the expense, of course, of the velocity of the whole stream.

Returning now to the type of obstruction, by deflecting-gates, as shown in figure 1. The forces acting in this case are, that while the acceleration force is in the direction 1, the travel of the material is compelled to be along the line "m", see figure 6.

The force due to the energy is therefore, divided into two resultant forces "m" and "n", of which "m" is the only one effective. Not only is the resultant "n" wasted, but it still further reduces the effective force "m" by reason of the additional friction which it induces. The actual delivery is cut down still more by reason of the travel of the piece being in a diagonal line, the effective longitudinal travel being less than the actual travel. There will also be a tendency to jam the pieces together sideways, still further increasing the friction to be overcome.

To show approximately what would happen under

Figure 6.

these circumstances, will be simpler using an actual example, and for simplicity we will first calculate the results for the straight part of the conveyor, by the method outlined above, using coal as the material to be conveyed, and taking the stroke of the conveyor as twelve inches, at sixty revolutions per minute.

From figure 4, we find that the maximum acceleration is between points 1 and 2, and is at the rate of 1.7 feet per second. Taking .25 as the co-efficient of friction, and working out the formulae

$$V = f \times 32.16 = 8.04$$

we have a factor of safety of nearly 5. Probably the conveyor could be run faster, but would be likely to set up injurious vibrations in the structure of the building.

The material will begin to slide forward at a point between 3 and 4, figure 4, and will start with a maximum velocity of 3.3 feet per second, using the formula  $T = V$  and assuming  $f'$  at .2, we get

$$f' g$$

$$T = 1.7$$

$$.06 \times 32.16 = 1 \text{ second.}$$

As the divisions represent each one tenth of a second, we join the point of maximum velocity to a point ten divisions (one second) from it, and thus indicate the velocity of the material during the backward stroke.

Taking out the average velocity as already explained, we get the answer as being 2.3 feet per second.

To determine the maximum height of any obstruction, such as dead plates over screens etc., we use the formula given above, namely

$$h = \frac{V^2}{2 \times g}$$

$$2 \times 32.16$$

Taking the maximum velocity from figure 4, at  $4\frac{1}{4}$  feet per second, we get  $h = 4\frac{1}{4} \times 4\frac{1}{4} = .28$  feet or say 3", neglecting friction.

$$2 \times 32.16$$

The friction will reduce this height by about 80 p.c. so that the maximum height will be about  $\frac{1}{4}$ ", but as this would hold up every piece about half the time, such a height should be avoided if at all possible.

Coming now to the case shown in figure 6, and assuming an angle of the gate with the conveyor of 45 degrees, the force carrying the material along will be split into two resultants each equal to .7 of the total force.

The distance that the material would travel longitudinally, is therefore reduced to .7, and as the travel is to be at 45 degrees diagonally, the net longitudinal travel will be only .49 of that on the straight part. The re-action of the gate, is .7 of the total force and a co-efficient of friction of .25, will account for  $.7 \times .25$  equals .175 of the total force, leaving only .525 of the original force as effective to produce movement, which multiplied by .7 results in an actual gain longitudinally of only .36 of the travel of the material on the rest of the conveyor. With a continuous stream, this would cause a congestion at the end of the conveyor, probably sufficient to entirely stop the flow.

#### VANCOUVER MEETING OF C. I. M. & M. FEBRUARY, 1921.

##### A Programme of Topical Discussions.

The program for the Annual Meeting of the C. I. M. M. in Vancouver, on February 9th, 10th and 11th next has been tentatively arranged. It is planned to have six sessions, one each in the morning and afternoon of the three days. At these sessions certain subjects will be introduced by men especially conversant with them, and discussion of these subjects is also being arranged.

By this method it is hoped to present matter of more general interest to the mining fraternity than if a series of specialized technical papers are read; to have a larger number take active part in the discussion, and to make the meeting correspondingly more profitable and interesting to all attending.

The six subjects decided upon, to each of which a session of about two hours will be devoted, are:

1. General Business and a Review of Mining in B. C. for the year 1920.
2. Fuel Supply.
3. Metallurgy—The Treatment of Complex Ores.
4. The Non-metallic minerals of British Columbia.
5. Geology and Mining.
6. The Relation of the C. I. M. M. to the Federal and Provincial Governments.

For each session a chairman and a leader of the discussion are being appointed.

The Executive Committee preparing for this meeting consists of:

H. Mortimer-Lamb, Chairman, R. W. Brock, E. A. Haggen, J. D. MacKenzie, F. E. Payson, P. W. Racey, S. J. Schofield and Nicol Thompson.

# Relation of Standardization to Mine Management

By CHAS. A. MITKE, Chairman, General Committee.

Standardization, Metal Mines Section, American Mining Congress. (Author of "Standardization of Mining Methods," Published by the Engineering & Mining Journal, 1919.)

It has been well said that "great economies in any business of production result from careful and thoughtful attention to details, and mining is no exception to this rule. On the contrary, successful mining is one of the greatest embodiments of the principle. Just as the difference between the careful manager and the careless one is apt to be the difference between profit and loss, so the difference between standardization and non-standardization is very frequently the difference between good and bad management."

Estimates show that in metal mining over 50 per cent of the total cost of production is chargeable to labor, therefore, the proper directing and systematizing of the activities of labor, to eliminate the waste of human efforts, is a very important factor in the standardization of mining operations.

In mines where only a few men are employed and a small tonnage produced, the entire supervision can be accurately directed by one general foreman, and the question of standardization does not enter largely into the daily work. However, where great tonnages must be produced at a low cost, and where the entire supervision of all details by one man is utterly out of the question, but of necessity rests in the hands of a large organization; then the standardization of all operations not only becomes very desirable but absolutely essential.

The need for a scientific investigation of mining practices or mining methods, with a view to alleviating present conditions, (as regards high production costs), which have been brought about largely through high cost of supplies, increased advances in wages, and loss of efficiency due to the unemployment of unskilled or raw labor, has made itself felt throughout the entire mining industry, not only in the United States but also in Europe.

In one large camp in this country, wages, which in 1914 ran from \$3.75 to \$4.25, now range from \$5.65 to \$6.40 per 8-hour shift. Taxes, supplies, freight rates, etc., are also considerably higher than they were several years ago, with no immediate prospect of reduction. Moreover, inevitably, the grade of the ore in many properties will decrease as the years go by. This necessitates the mining of much larger tonnages in order to maintain the ultimate output at the same level.

It would also appear, as one writer states, that "whatever may be our desires or regrets, the present high wage level will endure at least for a sufficiently long period to warrant formation of a constructive plan to meet it."

"Therefore, the only remaining alternative for the mine management is to make the workers so efficient that their daily performances will warrant the maintenance of the present wage scales."

This can only be accomplished in the following manner:—

First:—Americanization, which merely begins with the teaching of the English language.

Second:—Education of employees (from heads of department right through the entire organization down

to the miners and muckers) in the most efficient method of performing the daily task.

Third:—By establishing a standard program for all operations, in order that human efforts may be utilized to the greatest advantage.

Fourth:—By furnishing the men with standard equipment, in order to facilitate routine work and make their efforts more productive.

Fifth:—In order to encourage the miner to put forth his best efforts in attaining maximum production, an incentive over and above day's pay, should be offered by the management.

Another most important factor in developing a scientific organization is the "setting of standards for work done." A very vital question is—what constitutes a day's work? What was assumed to be a day's work five years ago cannot be adopted as standard today. The wage system, whether contract or bonus, must be based on actual knowledge and justice. Nothing is more discouraging to a workman, or productive of more ill feeling and discontent, than to have the standard bonus or contract rate cut, because he has performed his work exceptionally well and made a greater footage than the rating engineer ever anticipated could be made under the schedule. Cutting the bonus after it is once established, is responsible for the great feeling of distrust which many men show towards working under any system other than day's pay.

In order to achieve a universal success, time and thought must be devoted to an intensive study of the details of mining. Each operation must be divided into its component parts, and standardization applied to each unit. Experimentation is also a very necessary part of the program and should be encouraged and fostered by the mine management. The workers must be trained to perform their tasks efficiently and intelligently and labor-saving devices and equipment substituted for hand labor wherever possible.

Unskilled labor should be supplanted as far as possible by mechanical means. This should not be interpreted as meaning a loss of employment to many who are now engaged in this class of work. There is plenty of work for all and the performance by machinery of work which requires little or no intelligence, will release thousands of men who can be trained for better paying jobs.

Until recently, the systematization of metal mining operations was considered impracticable, particularly those operations carried on underground, from which natural circumstances have, to a large extent, excluded the light of publicity. The reserves of many of the larger mines have also been so rich and extensive that economy has not played as important part, perhaps, as it should. The ever present possibility of "sweetening the ore," or, in other words, bringing the daily output up to expectations by the addition of higher grade (kept in reserve for such purpose), has often faded over situations which, otherwise, might possibly have disclosed unsystematized methods and careless supervision on the part of underground bosses, to whom quantity plus quality at the moment, meant everything,

regardless of the disastrous effect their methods might have upon the future life of the mine.

Moreover, underground operations are to a large extent shrouded in obscurity, and the intimate details are known only to a few, whose business it is to make daily visits to the working places. The larger number of the employees are frequently ignorant men, whose main interest in their work is to get out the number of cars required by the boss, and to whom ore and waste are of very little interest, except as they add to the required tonnage.

The needs of the manufacturing industry, and the keen competition encountered, have developed a host of experts, and production engineers, who have delved into the intricacies of the different branches and brought to light innumerable operations which lend themselves well to the adoption of standard methods.

Unfortunately, in the mining industry, no sweeping changes can be effected, which, in the course of a short period of time, might be expected to revolutionize the industry at large, and produce the same gratifying results as have been obtained in industrial plants. This fact, in itself, has acted as a deterrent in the standardization of mining operations, and while, in individual cases, alert, wide-awake operators have made considerable progress along these lines, the industry as a whole does not reflect the same systematization of operations that may be found in manufacturing plants.

It is generally conceded that mining is a profession which should require a highly specialized training, but as a rule sufficient emphasis is not placed upon the practical application of such technical knowledge. Too much dependency is placed upon practical experience alone, and too little on scientific principles. Far be it from the writer to discredit practical knowledge. The mining industry in the past owes much to its practical men, but what it now requires is practical knowledge superimposed on a scientific basis, or in other words, the attention of men who have added years of practical experience to their specialized or scientific training.

The metallurgical branch of the profession has been the subject of much thought and study, and considerable research is continually being carried on in this branch of the profession. Contributions have also been made to the mining branch, but in the main these have consisted rather of descriptions of practices already in use in certain localities, than in the nature of original research work.

An X-ray analyses of mining operations as a whole, frequently disclose out of date methods which would not for an instant be tolerated in surface plants. What large factory owner, for instance would permit one of his operators to spend two-thirds of his day away from his machine, hunting parts, supplies, lubricating oils, etc.? There, the output is based on machine production for each man, and the amount he can turn out is calculated to a nicety, and it is the imperative duty of the shop foreman to see that everything required is present and the machine in good order before the man starts to work. It is, however, a very common occurrence underground, for a first-class drill machine operator to spend a large portion of his time walking through drifts and tunnels in search of sharp steel, or the right kind of steel to fit his machine, repair parts, oil cans, or returning defective machines to the tool house and carrying new ones to take their place.

In the factory, fatigue studies have been made, cover-

ing every action from the steps taken in performing certain duties, to the movements made by each hand of the individual worker in handling manufactured parts. In mining, however, it has come to be an unwritten law that so long as the machine man drills a round of holes (special allowance being made for unusually hard ground), he has performed his daily task, regardless of the fact that (like Taylor's handler of pig iron), providing his operations are studied and systematized, he might be made to double his performance with comparatively little additional effort to himself. This has been demonstrated in a number of instances, yet, as a whole, it still continues to be the general practice to consider one round of holes a day's work. The responsibility for this lies largely with the mine management. Formerly, in a great many instances, atmospheric conditions of working places, were such that men could not work consistently during an eight hour shift, and in many cases it grew to be the practice for men to work a certain period and then seek a better atmosphere in the mine where they cooled off and rested for an equal period of time. Also, in years past, the ventilation of mines was so bad that no blasting could be allowed during the shift, and consequently, after the miner drilled his round of holes, he would merely while away the remainder of the shift until quitting time, and fire the shots when leaving the mine. With the improvement that has already been made in metal mine ventilation, it has been demonstrated in exceptionally well ventilated mines that shots can be fired at any time during the shift without inconveniencing the men, and as a matter of fact, in one large mine, which is exceptionally well ventilated, there is a shot fired every minute during the shift, with little or no resulting delay to the underground force. Now that every effort is being made to attain underground working atmospheres as nearly as possible approximating those on surface, this custom, of considering one round of holes a shift's work, (regardless of its depth), which is really nothing more than habit, must be overcome if mining operations are to be placed on an equal footing with those on surface.

This is but one example of the lack of systematization in mining operations. Much benefit could also be obtained by the devotion of careful thought and study to the question of explosives, their use and handling; the correct placing of machine drill holes; handling of timber, both underground and on surface, where much unnecessary labor is involved in handling and re-handling each piece as it comes from the cars, the writer having observed as many as twelve men employed at the same time in handling one stick of timber.

The distribution and care of underground supplies is another subject which would react most favorably to research.

The standardization of equipment and supplies is closely linked with the systematization of operations, and of necessity the one must be studied along with the other.

The industry, at the present time is burdened with a multiplicity of machine drills, of varying types, sizes and weights, the difference in weight in some instances not being more than one to two pounds. The production of these machines follows each other with such rapidity that in an effort to stock up with the best equipment available on the market, many machines in good condition must be scrapped, and as parts are not interchangeable, a considerable investment in such supplies, must continually be charged off to profit and

loss. The development of these machines is, of course, carried on by the manufacturer to meet the needs of the industry, but unfortunately, these needs are often the individual ideas of various operators rather than the combined views of the majority. What may appeal to one does not appeal to the other, and consequently the necessity for purchasing and trying out this variety of types becomes an ever-increasing burden on the operator.

During the past seven years the necessity for drifting machine, permitting the use of water and air through machine and steel, became so evident to practically every purchaser of rock drills, that as a result, the manufacturers evolved the water Leyner. The self-rotating water stoper, which is now nearing perfection, is also the result of the combined needs of the mining industry, and many other improvements in drilling machines are possible, providing some research work is devoted to the subject of finding out just what specifications would meet the needs of the majority for the different types of machines, such as jackhammers, drifters, and stopers.

The chucks on all machines must become standard, so as to permit the interchange of different makes of steel. The lack in efficiency and the loss of time incurred at present through miners supplying themselves with steel which does not fit the machine they are using at the time, is such that this change has become an absolute necessity.

The sizes and types of steel should also receive attention. There are individual cases, where companies have standardized on the  $\frac{1}{4}$  hollow octogon for all stoping and raising and find this type of steel satisfactory for all their needs. Other companies are achieving excellent results with the 1" hollow round. Research would bring to light many facts which might tend to prove that one or the other of these two was the more satisfactory.

The same is true of hose fittings, and various parts and supplies for machines.

Underground power shovels to supplant manual labor in mucking and shovelling, should receive attention, in order to avoid the creation of the multiplicity of slightly varying types, similar to that which at present exists among rock drills. It is inevitable that mechanical equipment must supercede hand labor underground to a large extent, if we are to overcome the scarcity of labor—both skilled and unskilled—and increase the tonnage per man shift, (at the same time maintaining the normal grade of the ore), which is the principal means of combatting the present high cost of production. Shovelling or mucking is one of the most important items which comprise underground operations.

Care and attention might profitably be devoted to underground transportation, the grade of tracks, weight of rail, etc. Also the possibility of standardizing on a few sizes and types of mine cars, rather than on the unusually large number now on the market, and the various methods of haulage, compressed air, electric, and steam.

The ventilation of metal mines is a subject of the utmost importance. Without good air no man can live, much less work, and upon the condition of the working-place depends very largely the efficiency of the worker. Much of the trouble resulting from bad air in metal mines at the present day comes from the deficiency of ventilation in dead ends in drifts and stopes. The ventilation of such working places can greatly be

improved by resorting to systematized methods in regard to the use of certain types of small blowers and ventilating pipe, care and attention being devoted to the manner in which these are located and operated. The prevention of dust in mines necessitating frequent blasting during the shift, is another means of raising the efficiency of the miners. In the past, bad air, rock dust, and heated atmospheres were looked on as necessary evils, which could not be overcome, and the man who could not put up with a certain amount of such discomfort was rather contemptuously referred to as one who "could not stand the gaff." Today, such conditions are unnecessary, and the adoption and use of standard equipment and standard methods will provide the men with a working atmosphere to themselves. The systematic testing of mine air and the adoption of a standard atmosphere is one of the pressing needs of the industry.

Fire fighting equipment and systematized rules for combatting outbreaks in the mine are also of the utmost importance, as the profit and loss accounts of many companies show large sums charged off to disasters of this kind, which might possibly have been averted through the keeping in stock of a standard line of fire fighting equipment.

There are many other subjects in the mining industry, to which standardization can be applied, such for instance as cost accounting. Frequent discrepancies in the manner of keeping costs are encountered, even in properties owned by the same company. For instance, one mine will charge off the work of preparing an orebody for stoping, to development work or to a separate fund which has been laid aside for such purpose. Their production costs may then appear quite low, for the reason that this large sum which should necessarily be added to the stoping cost, as it all goes against the ultimate profits, is omitted, while other companies include development costs, but exclude overhead and supervision, and so forth.

The estimation of ore reserves is another matter for research, equitable taxation, and many other items, all come under the head of subjects to which standardization might be applied.

An objection frequently raised against standardization is that it regards progress, and that having once decided on a standard, there is no possibility of change and old standards must be adhered to even though newer methods have been developed which have out-classed the old. In this connection it may be well to quote from an authority on this subject who well describes the functions of a standard, in the following words:—

"A standard is simply a carefully thought out method of performing a function, or carefully drawn specifications covering an implement, or some article of stores or of product. The idea of perfection is not involved in standardization. The standard method of doing anything is simply the best method that can be devised at the time the standard is drawn.... Improvements in standards are wanted and adopted whenever and wherever they are found. There is absolutely nothing in standardization to preclude innovation. But to protect standards from changes which are not in the direction of improvements, certain safeguards are erected. These safeguards protect standards from change for the sake of change. All that is demanded... is that a proposed change in a standard must be scrutinized as carefully as the standard was scrutinized prior to its adoption. Standards adopted and protected in this way produce the best that is known at any one

time. Standardization practiced in this way is a constant invitation to experimentation and improvement."\*

The standardization of mine equipment and mine operations in the various branches, are of vital interest to the mine manager who is responsible for the ultimate cost of the product. In order to work out these problems, to accumulate the correct data upon which to base conclusions, and finally to introduce standard methods, it is absolutely necessary that the mine manager effect this change through the medium of his organization, composed of heads of departments, foremen, bosses and engineers. Their intelligent co-operation is therefore an essential part of the program. These are the men who represent the company, or mine management, and interpret the policies and desires of the company to the great mass of employees. They are also intimately acquainted and associated with the multiplicity of operations, which combined, form the activities of the mine. If their interest and enthusiasm is directed towards a study and systematization of the details which form the various groups of operations, then through the standardization of many small tasks, which by themselves may not appear important, under the careful supervision of the mine management, larger economies will result which, in turn, will ultimately have the desired effect of reducing the production costs.

### A MONTREAL LETTER.

ALEXANDER GRAY

#### The Opportunity of the Gold Mines.

Evidence accumulates that gold-mining is about to have its turn, when multiple costs become less onerous.

Labor is more affirmative toward employment underground where ventilation is sanitary and housing accommodations at surface are what they should be.

It is not difficult to discern why this is so. The lower price of silver and temporary shortage of power have caused at least two Cobalt companies to suspend operations. No doubt others are not pressing production. This, and the number of men laid off elsewhere, has afforded a long-deferred measure of relief to operating gold mines, which are also assisted by reductions in provisions and supplies.

The resultant benefits to producing companies may not be manifest to a great extent in the yearly output—but crews are larger and the efficiencies are greater.

Such mines as the Hollinger, Dome, McIntyre and Lake Shore, therefore, are freer to proceed with development and increase the tonnage milled without unnecessarily encroaching upon their ore reserves.

Before properties removed from the milling stage—and "prospects"—however inviting, pursue other than make-haste-slowly policies they must have reasonable assurance as to the quantity and grade of ore, co-operative labor, and working capital. Once the labor problem is solved, if capital is attracted upon equitable terms the proving of tonnage at a number of properties is foreseen. Not "every prospect pleases", consequently the first order of business is to avoid a recurrence of speculation in the cheaper class of shares. It is desirable to have crushing mines regenerate interest that waned, rather than to have a crush

of shares of the 10-20-30 variety traded in. Of course the resumption of normal conditions will be taken by the more venturesome as a signal to start the printing presses; yet the integrity of the respective gold fields is at stake, and confidence ought to be maintained if the requisite capital is to be obtained. Competent Mining Engineers—not the catch-penny species—should have the say-so.

#### Profits Tax to Go?

Mines, as perishable assets, are particularly susceptible to Profits Taxation, so mining companies unambiguously will welcome the seemingly semi-official announcement that the special War-time surtax will be discontinued.

Without questioning the necessity for extraordinary revenue when the Western World was crazy, it is equally admissible that precious metal mines were adversely affected by the superimposed levy. For that matter, metal mines already were heavily burdened with direct and indirect taxes and costs, and not all of them by any means were enabled to benefit by War prices for their products. Silver, copper and zinc mining companies—and certain non-metallic producers—had a period of exceptional prosperity. Gold and Nickel mines did not share in this to any great extent, in fact the former were harrassed in every direction and the latter refrained from profiteering. Operating costs and taxes throughout were so onerous as to be almost intolerable.

It has not been indicated whether or not there will be some other medium of raising revenue substituted for the irksome National Profits Tax. If such is to be enacted, the hope is that due consideration will be shown for Mineral Industries. Those industries are loath to seek or to expect exemption from equitable assessments. They are going to play a larger part in the impending struggle for trade, and they deserve more encouragement than they have received in official quarters.

Contrary to the impression prevailing in what should be well-informed circles, all mines are not "holes in the ground with Liars on top." They are foundation stones in our economic structure, and without them parts of Canada might be pastorally beatific, but elsewhere there might be "nobody home".

Mining made the States from the Rockies to the Pacific, until it was discovered, there were soils and climate for semi-tropical and temperate zone fruits. The "lumber-jack" and prospector—not Mining Stock Exchanges—gave Northern Ontario its impetus. Is it possible to have highly-placed politicians in power who will recognize the true relationship of the pick to the plough? Before Comstock, Nevada had little excepting the cactus and the coyote. The Aztecs could have had Mexico to themselves were it not for its minerals. California placers and the Motherlode established the Golden State. Central City and Leadville preceded cattle-ranching in Colorado. The corollary need not be carried further.

Before the Mining & Metallurgical Club of the University of Toronto, Mr. James McEvoy said that in the event of serious labor trouble in the American coal fields, or of strained international relations between the United States and Canada, Canadian industry would inevitably suffer from an inadequate supply of coal unless some provision for such an emergency is started at the present time. Should such an emergency occur in Ontario, from an industrial standpoint the effects would be appalling, he said.

**NOTES FROM NOVA SCOTIA AND NEW-FOUNDLAND COLLIERIES.**

Progress is being made at the Hiawatha Coal Mining Company's mine near Morien, Cape Breton. Some 6,000 tons of coal has been raised and stocked. Deepening of the loading ground for vessels is being effected by dredging, and sufficient draft for schooners and small steamers will be available by the Spring. Some cargoes have already been shipped to Halifax by barges.

The November production of the Dominion Coal Company in the Cape Breton district exceeded expectations, reaching 296,367 tons, the largest month's output since August 1917.

Individual colliery production was as follows:

Mine.	Tons.
No. 1	31,383
No. 2	47,440
No. 4	26,996
No. 5	9,665
No. 6	25,413
No. 9	24,193
No. 10	11,707
No. 11	14,778
No. 12	13,902
No. 14	21,881
No. 15	9,863
No. 16	12,905
No. 17	3,539
No. 21	17,323
No. 22	18,544
No. 24	6,835
<b>Total</b>	<b>296,367</b>

A slight underground blaze occurred near the electric-pumping station in the No. 9 Colliery of the Dominion Coal Company, but was fortunately discovered and extinguished before it had made headway. Overheating of the controller is stated to have caused the fire.

Extensive additions are being made to the equipment of the Springhill Collieries, including a new bankhead recently completed. A new hoisting engine, and additions to the boiler equipment are also in progress. As was noted in last week's issue, production is being well maintained at these collieries.

The coal production of the Nova Scotia Steel Company at Sydney Mines in November reached the high figure of 55,304 tons, the best month's output of coal since December 1916. Individual colliery production was as follows:

	Tons.
Florence Mine	18,892
Princess Mine	16,789
Jubilee Mine	14,402
Scotia Mine	5,221
<b>Total</b>	<b>55,304</b>

The development of a new colliery near Bonar Head is progressing satisfactorily.

The Newfoundland Government is proceeding to develop the coal seams along the Codroy Valley, on the West Coast. A road is being opened up from the first mine opening to the nearest railway point, about three

miles distant, and it is proposed to use five-ton motor trucks to take the coal from the mine to the railway, as a first means of transportation.

Systematic examination of the Carboniferous basin at St. Georges, situated further to the northward on the West Coast and not far east of Grand Lakè, is being undertaken with a view to further mine openings.

**Labor, Wages, Production and Disposals.**

No new developments have taken place in the labor situation. Production is being increased, largely as a result of unemployment in other industries. The action of the miners union with regard to the so-called Montreal Agreement will be decided by a referendum on the 14th December. In the meantime the question is the subject of hot debate in the locals and in the newspapers of Nova Scotia. The ex-President of the United Mine Workers, Mr. John P. White has expressed unqualified approval of acceptance of the agreement, stating in a letter to the Nova Scotia District that "industrial conditions are becoming very serious in many sections of the United States, and the chances are that they may affect our wage standards before we anticipate." Mr. White presses for acceptance of the agreement "because, from what I know of the situation, everything was secured that could be under the circumstances."

The railwaymen employed in inter-departmental transportation at the Sydney steel plant and at the collieries and steel plant of the N. S. S. & C. Co. at Sydney Mines are still on strike, about 40 men at Sydney Mines and 120 at Sydney being on strike. Full operation of the collieries at Sydney Mines is being found possible, and at Sydney the plant is working in departments other than those occupied in steel production. The Dominion Steel Company takes the stand that no strike is in existence, and that the men in the railway department of the steel plant who have absented themselves from work are no longer employees.

The non-use of coal for the coke-ovens and other metallurgical requirements at the Sydney Plant releases between 3,000 and 4,000 tons of coal daily for shipment to outside points, and this, combined with the larger production of coal now found possible, leaves no further excuse for the embargo on coal exports, seeing that the St. Lawrence route is closed. Although no public announcement has been made by the Railway Commissioners it is understood the embargo has actually been lifted.

It is likely that Nova Scotia coal will appear on the Montreal market in 1921. Enquiry among firms who formerly used Nova Scotia coal for steam-raising purposes discloses that there is a general tendency in the St. Lawrence market to welcome back the Canadian product, the temporary deprivation having shown up the relative quality of Nova Scotia coal to great advantage in comparison with imported coal. By next Summer, however, it may be taken for granted that the prices asked for imported coal in Quebec Province will be very much less than recently current prices and less than prices now ruling. Canadian coal should also be helped by the discount on Canadian funds, now almost as great as it ever was and seemingly little likely to materially decline, and by the increased railway rates. This presumes, of course, that freighting rates from Nova Scotia to Montreal will decline a little, and that marked reductions will be

possible in the pit-mouth costs of Nova Scotia coal. Nova Scotia coal operators are likely to hesitate to bank coal heavily during the present Winter, in view of the general uncertainty of the industrial outlook.

It was pointed out to the Railway Commission during the Summer, and previous to the imposition of the embargo on coal exports, that such a procedure could only be justified if the Government was in a position to guarantee full work for the collieries in supplying domestic needs during the coming Winter and the Summer of 1921. It was further emphasised that the amount of coal available for next Summer's domestic requirements could only be obtained by full work of the collieries during the Winter, and that the capital outlay and risk of banking out large tonnages of coal was only justified by contracts given at this time for next season's railway and other requirements controlled by the Railway Commission.

It is very doubtful if the additional quantity of coal made available for domestic requirements by the operation of the coal embargo has justified its imposition. The embargo has certainly entailed great monetary losses on the coal companies, and has acted as a deterrent to production, or perhaps it would be more correct to say, has acted as a deterrent to capital expenditures intended to enlarge future production.

### British Columbia Letter

The incorporation of a \$15,000,000 company for the establishment, presumably near the City of Vancouver, B.C., of an Iron and Steel Industry; the announcement that British mining engineers have been quietly making a survey of the iron ore resources of the Province on behalf of British capital; and the further assertion that the Rothert Process Steel Company, of Seattle, Wn., proposes the construction at or near Seattle of an electric furnace and auxiliary plant at a cost of between \$300,000 and \$400,000 are the outstanding happenings of the past ten days in British Columbia.

For years the idea of actively developing the iron ores, Magnetite, Hematite, and Limonite, of the Pacific Northwest has been simmering in the minds of local promoters who at intervals have busied themselves in bringing the possibilities of such an industry to the attention of British and American financiers. Heretofore they have had no pronounced success but now, it would appear, there is a prospect that something will be done.

It is said authoritatively that the \$15,000,000 Company is a British Company, that all the capital is being subscribed in England, and that, as a result of favorable reports from competent engineers, the work of launching the industry will go forward without delay, the \$3 a ton bounty on pig iron produced in the Province from provincial ores having been guaranteed.

A similar project, it seems, is contemplated by another group of British capitalists. It was on the latter's behalf that Walter Dennis Rock, a steel expert of England and a mining engineer of prominence, was in this Province. He was quietly pursuing his researches, and it is said with satisfactory results, when stricken with an illness resulting in his almost instant death. Prior to his tragically sudden demise he had arranged for the shipment to England of a carload of Pacific Coast coal and the understanding is that, if this

## PEELE'S Mining Engineers' Handbook

The Ultimate Book for Every Engineer Whose Work Brings Him in Touch With Any Phase of Mining.

“PEELE” is at once reliable, thorough and practical---the one complete, up-to-the minute source of all mining engineering facts.

One-Volume Edition—2375 pages, 4¼ by 7—flexibly bound—\$7.00 postpaid.

Two-Volume Edition—Vol. I—1225 pages—Vol. II—1216 pages—flexibly bound—\$8.00 postpaid.

upon test proved to be satisfactory coking coal. Mr. Rock's recommendation would have been that conditions in every respect were suitable. The British Government retained Mr. Rock during the war in connection with experiments then continuously carried on in connection with the by-products of coal.

The Rotherft Company's enterprise cannot be said to have been definitely decided upon, if it is the intention to use the iron ores of British Columbia, because it is impossible to say what attitude a Provincial Government would take on the export of its mineral for refinement outside the Country. It is known that the Oliver Government, which now is before the electors seeking further endorsement, discourages such a practice, but it is possible that another administration will be returned to power in which event the promoters of the Seattle plant might be able to come to an arrangement for the export of the material necessary to keep their plant in operation.

#### Princess Royal Island.

Considerable excitement has been created by recent discoveries on Princess Royal Island. There has been quite a bit of staking and reports are to the effect that some of the claims have as good showings as those of the now well-known Surf Inlet Mine, one of the largest gold producers of the Province. Development on some of these new properties will go forward throughout the winter. Where this is impossible work will be started in the Spring so that it will be next Summer before it is known whether the sanguine expectations of the prospectors are to be realized.

#### Alice Arm.

The Moose Group Mining Company Ltd., of Vancouver, B.C., has done much work in the opening up of its properties and in the construction of a permanent camp. During the summer a trail has been constructed, winter quarters built, and exploration and development pushed forward, the latter being by means of open cuts and the driving of tunnels. There are two veins so far proved, one intersecting the other. The main vein has a width of 20 feet. The upper tunnel is in 40 feet with the face in ore averaging about 25-oz. silver per ton. By extending the tunnel 80 feet further the two veins will be opened out at the point of intersection. On November 1, the lower tunnel was in 21 feet and the vein now is being cross-cut, with a showing of from 8 to 10 feet on ore on the downward extension of the ore-body. The main vein has a strike approximately east and west and the smaller vein strikes east and north. The dip is northerly. There is a difference of 310 feet in the elevation of the two tunnels. The main vein outcrops near the south end of the property. The veins occur in the so-called andesite braccia characteristic of the upper Kitsault section of Alice Arm. The mineralization shows grey copper with which the high silver values are associated; a little galena, and a considerable amount of manganese.

#### Rossland, B.C.

There is little mining activity as yet in the Rossland Camp, once the leading metalliferous mining centre of the Province. Few men are employed on the properties of the Consolidated Mining & Smelting Co. and there are some leasers engaged at the Velvet Mine. While the plans of the Company's proposed large concentrating mill are complete and although the site for

the plant is chosen, the work has not begun, doubtless owing to the decision of the Company to wait to see whether building costs will fall and perhaps also to permit the metal market to become more stable. Rossland's future depends on this Mill. When it is in operation the mines of the historic camp once more will become superlatively active and residents of the town are impatiently waiting for the Company to take definite action.

#### Hazelton, B.C.

The Silver Standard Mine of the Omineca District has been closed down for an indefinite period, the reasons given being excessive freight costs, high cost of all material, and the steadily declining value of metals. There is no disguising the fact that this a blow to the Hazelton district of Northern British Columbia because this is one of its most promising mining properties, its development has been progressing with satisfactory indications and there was reason for the hope that it soon would be placed on a permanent producing basis.

#### Sandon, B.C.

At the Noble Five Mine, near Sandon, a new bunkhouse has been under construction for some months and now is complete. It cost \$20,000, is electric lighted, steam heated, and fitted with shower baths provided with hot and cold water. There also are a reading room and a steam-heated drying room. The accommodation provided is for 55 men. Undoubtedly, it is the most modern bunkhouse in the Interior, in fact it seems slander to refer to it as a "bunkhouse"; much more appropriate would be the "miners' residence".

#### Moyie, B.C.

The Society Girl Mine again is among the shipping mines of the Interior. Leasers have uncovered some very rich ore and intend to continue work all winter. After working little over three months they have taken out \$3,000 worth of ore. The news of this development has been received with enthusiasm by people of the district, who have of late been plunged more or less in gloom owing to the common report that the mine of Moyie have played out never again to figure as producers of importance. Their confidence has been revived and predictions now are freely made that Moyie will come back.

#### Golden, B.C.

Much is expected of the Bunyan silver-lead property situated on Bunyan Mountain near Lake Windermere. A crew of from 100 to 150 men is to be employed as soon as weather conditions permit next spring in further development. For their accommodation bunkhouses, etc., are to be built with all possible dispatch, preparations already being underway. This property recently was taken over from the owners on lease and bond after having remained dormant for 19 years. The showings having satisfied the new operators, a 600 foot tram was installed, connecting the working tunnel and the new ore bunkers. Powerful motor trucks have been imported to transport the ore from the bunkers to the nearest rail point and an early shipment is to be made to the Trail Smelter.

Mining continues active in the Windermere District. Australian interests have opened the Isaac Mine at Birscoe and the same people have re-opened the Nip-

and-Tuck. From the latter a considerable tonnage of high grade ore has been packed down from the Mine for shipment. It is expected to return about \$150 a ton.

The Paradise Mine still is producing. It is the most consistent producer of the District.

**Trail, B.C.**

The Consolidated Mining & Smelting Co., of Trail, received shipments of ore during the week ending November 7th aggregating 11,149 tons. Ore came for the first time this year from the White Bear, Rossland; the Horn Silver, Similkameen; and the Knob Hill, of Republic Wn. This brings the shipments for the year up to the date indicated up to 307,771 tons, so that the \$300,000 mark is well passed.

**Poplar Creek.**

Ores of the Poplar Creek region are being tested by the Tacoma (Wn.) smelter. Returns have gone as high as 62½ pounds of arsenic to the ton. Without considering the gold values this makes the material of commercial value.

**Squamash, B.C.**

The districts traversed by the Pacific Great Eastern Railway are being subjected to intensive prospecting and reports are being to come to hand of results. For instance what is known as the Soda Mining and Products Co., of Vancouver, has been formed to develop and exploit the carbonate of sodium contained in many of the lakes found in the vicinity of this new railroad. One lake sixty miles in extent has been found to contain not less than 7 per cent pure carbonate of sodium. The necessary plant is being installed for its treatment. Every cubic foot of the lake contains over four pounds of carbonate of soda, and evaporation is a rapid and simple process.

**EATING WITH FOREIGN KNIVES**

The editor of "The Canadian Mining Journal" complains that food eaten by Canadians "is cooked by Pennsylvania coal in a stove made from United States ore and served on a platter that came from Europe, or Japan maybe. It is eaten with a Sheffield or Connecticut blade, and the platter is washed with soap from Chicago."

We do not think the situation is as black as painted. Would it not be better to say, for example, that the food is eaten with spoons and forks, rather than knives, plated with Ontario silver on base metal made up of Canadian copper, British Columbian zinc, and Ontario nickel? Furthermore, the food, even if partly foreign, is paid for with Ontario gold or with credit secured by the export of Quebec pulpwood or Saskatchewan wheat.

With the domestic population profitably employed, it is no disgrace to purchase what someone else can produce more cheaply, provided the supply is adequate. In the case of coal we admit, it is not. "Engineering & Mining Journal."

NOTE:—Our comment has suffered in quotation. The "food" referred to was New Zealand butter and lamb, the consumption of which by the exclusive use of spoons and forks is not recommended.

If our contemporary considers that "it is no disgrace to purchase what someone else can produce more cheaply" why does the United States maintain a high protective tariff?—Ed.

**TORONTO MINING QUOTATIONS.**

Following are the average quotations for active gold, silver, and oil stocks on the Standard Mining Exchange, for week ending 4th December, 1920.

### MINE HOISTS

Either Steam or Electric, Made any size you want up to 50 H.P., and with any diameter Drum up to 48".

Note—In Electric Hoists we can supply any size up to 150 H.P.

## We Also Make

**Gasoline Hoists,** direct connected to Motor, gear drive, with Motor mounted on same bed as Hoist.

**Belt Hoists.** Belt driven off your line shaft, or from the pulley of a Gasoline or Electric Motor. Made any size you want.

**Winches.** Hand power, for light lifting. Made in a variety of sizes and styles.

# HOISTS - CARS - CAGES

YOUR COMPLETE HOISTING EQUIPMENT

WE CAN SUPPLY YOU WITH ANY KIND OF HOIST, CAR OR CAGE YOU WANT, BUILT TO YOUR ORDER, AND EXACTLY TO YOUR LIKING

LET US SEND YOU PHOTOS AND CATALOG SHOWING MANY OTHER STYLES OF HOISTS, CARS AND CAGES.

### MINE CAGES

Made to your order, to suit you and your shaft, strong, safe, reliable. The Safety Device will positively hold the cage and protect the lives of your workmen in case of accident.

### END DUMP MINE CAR

All steel frame and body, roller bearing wheels. Made with any size body, and for any gauge track. This is only one of the many types of Cars we make. We build any kind you want.

**MARSH ENGINEERING WORKS, LIMITED,** Established 1846 **BELLEVILLE, ONTARIO**

### THE SILVER MINES.

#### The Cobalt Field.

In view of the weakness in quotations for silver, the operators in the Cobalt district are confronted with problems quite similar to those which in recent years beset the gold miners. There is no longer the feeling of security that, in spite of high costs, the margin of net profit is satisfactory. This does not apply seriously to the leading producers which are still able to produce at or under fifty cents an ounce, but it does fall with full force upon mines of second class rating.

Reflecting the changed condition, the Mining Corporation of Canada has announced that in view of the unfavorable hydro-electric power situation as well as the low price of silver it will not disburse the regular dividend for the current quarter. The indications are said to point toward net earnings being below dividend requirements. The announcement has caused more or less pessimism, entirely out of proportion to the seriousness of the situation. The fact is that economic conditions are improving rapidly and that in the future there are reasons to believe the cost of production will decline and the desired margin of profit again established.

The Northern Ontario correspondent of the Journal has made an effort to find an explanation for the slump in quotations for silver, which seems to be contrary to what the excess demand over present supply would indicate. What appears to be one logical cause is the defeat of the present United States government. Should

this change in administration bring with it opposition to the continued operation of the Pittman Act, which authorizes the United States to buy its domestic output at one dollar an ounce, it is possible the leading metal authorities may even now be discounting such action. This would account to a large extent for the recession in quotations, and taken together with the exceedingly hard times in the Far East, especially in China, may constitute a full explanation of the unexpected downward turn in the price of silver. At any rate, this appears to be about the most logical explanation at this time.

President J. P. Bickel has made the following announcement relative to the decision of the directors of the Temiskaming Mining Company to suspend operations until next spring:—

"It has been decided by the directors to close the mine at the end of November, the contingent causes for this step being the shortage of power and present low price of silver.

"The scheme of development undertaken by the Company in the early part of this year included opening up for commercial working a considerable tonnage of low grade ore, the mining and milling of which would leave a good margin of profit at the higher price of silver then ruling. The reduction in market value to present low level has left no encouragement for continuing the development and breaking out of ore that, under existing conditions, would prove unprofitable. For the past two months the mill has been running on broken ore in stopes which it is necessary to select to obtain a payable grade thereby unduly depreciating the value of the remainder.

"To increase the recovery an oil flotation plant has

been added to the mill, one unit with a capacity of 125 tons per day being practically completed and a second unit for treating accumulated tailings being in course of erection.

"The shortage of power allows no possibility of working profitably on a reduced tonnage basis even with the additional revenue from oil flotation, and the Company are therefore compelled to stop operations until Spring. Owing to the difficulty of treating accumulations during the winter, the whole of the tailings plant cannot be operated. On the resumption of work in the mine, when sufficient power is available, both units will be ready, thereby ensuring greater profit than if the tailings treatment were carried on alone."

The date for the usual declaration of a regular dividend of 3 per cent on the McKinley-Darragh payable January 1st has passed, and it is believed this company may also have decided to fortify its financial position during the winter months, pending an adjustment of its operation to the changed economic conditions, and the lowered price of silver.

On the Chambers-Ferland a station has been opened up in the exploration cross-cut recently driven along the 385-ft. level and a winze is to be put down into the conglomerate formation. The cross-cut lies in a layer of slate, and the conglomerate is believed to lie not more than ten or fifteen feet below the cross-cut. The good milling values encountered in stringers extending up into the slate are taken to indicate the presence of high-grade ore in the underlying conglomerate. The next week or so will determine the accuracy of this belief.

Announcement is made that the Casey-Cobalt Company, holders of property in the township of Casey, some twelve miles north-east from New Liskeard will sell their assets. The property is equipped with considerable machinery, but has not been operated in recent years.

No further developments have been reported this week in relation to the manner in which the Ontario Department of Mines will deal with the recent Order-in-Council which certain portions of the press have criticised as being confiscatory as applied to patented mining claims. It has been officially stated that certain phases of the situation have been placed before the Government's legal adviser for consideration.

At the time of writing, mild weather continues in Northern Ontario, the settlers in some of the districts having been able to continue plowing their land during the first week of December. This mild weather is beneficial to the power situation in the mining districts, and if followed by a reasonable amount of rain would soon make it possible to increase general operations to full capacity, and would thereby provide employment for another 1,000 men at least.

#### Ore and Bullion Shipments.

During the week ended Dec. 3rd, two Cobalt companies shipped ore, the following being a summary:—

Shipper	Cars	Pds.
Temiskaming . . . . .	1	109,624
O'Brien . . . . .	1	64,000
Totals . . . . .	2	173,624

During the corresponding period, the Nipissing and the Mining Corporation were both heavy bullion shippers, the Nipissing alone sending out over a quarter of a million ounces and the Mining Corporation also

sending out a large consignment as shown in the following summary:—

Shipper	Bars	Ounces
Nipissing . . . . .	193	250,865
Mining Corp. . . . .	60	60,772
Totals . . . . .	253	311,637

#### THE GOLD MINES.

##### The Porcupine Field.

Conditions which are proving to be adverse to the base metal industry, and also unfavorable for silver mining, are having just the opposite effect on the mining of gold. The general depression in all parts of the world, which has set in on this continent, is operating in favor of gold mining. Given adequate hydro-electric power, there is nothing to prevent the mines from carrying on all branches of work at full blast.

Just what such an improvement signifies in connection with the gold mining industry is difficult to summarize, and readers of the Journal will be presented with a more or less detailed statistical review a little later in the month. Figures will be presented showing the extent of the probable growth of the production and prosperity of the gold mines during the coming year or two.

It is intimated in usually well informed circles that the intention of the directorate of the Dome Mines is not to increase the present rate of dividend disbursement of 10 per cent annually, but, instead, to make a certain annual "capital return" to the shareholders. For instance, it is intimated the return of \$2 a share may be possible before the end of the New Year, in addition to the dividends of 10 per cent. This would make \$3 a share in all or equal to 30 per cent on the issued capital. The plan to make a capital return is said to be for the purpose of shielding the enterprise from too heavy taxation, such a return being exempt from taxes. The par value of the shares would thereby be reduced to \$8 per share instead of \$10 as at present. The company may pursue such a policy from year to year until the complete return of the par value.

A large amount of coal has been transported to the Porcupine district, and in the case of the Hollinger reserve of power will in this way be made available. Although no official statement has been made as to the extent of the auxiliary power which may be developed, it is understood the total will amount to close to ten per cent of full requirements at present capacity. This will greatly relieve the hydro-electric power shortage. As to the power shortage, there seems to be no doubt but that the situation has been exaggerated in certain quarters, and the depression caused has been far greater than may be warranted by the facts.

Plans to resume work at an early date on the North Davidson, and the prospects of similar action on the Davidson Consolidated about the middle of Winter, offers promise of the north-east part of Tisdale township becoming reasonably active again. These properties have usually been regarded as prospective. On the Davidson Consolidated a large amount of work has been done and a report recently issued would appear to give reason for a more or less optimistic view with regard to its future. Should success eventually be achieved, a comparatively large area would be given added prospective merit. The Davidson Consolidated lies some three or four miles north-east of the McIntyre mine.

## The Indian Crushes no more —

Like the horse-drawn vehicle, the Indian has been eclipsed by modern science. Though this historic American may entirely disappear, many of his creations will probably live for centuries. Take, for instance, his feather like canoe and his famous corn flour.

When grinding materials, the Indian used the same grinding principles as did the early Greeks and Romans; reducing a softer material by crushing it with one that was harder and heavier. This identical principle, marshalled into a commercial force by modern engineering science is the basis of the stage reducing action occurring in the Conical Mill.

One Hardinge Mill contains as many as 3600 steel balls of various sizes which strike the material being ground at an average of 90,000 times a minute exerting a reduction force of approximately 360,000 ft. lbs. of energy. Compare this mighty crushing force with the two lb. blows of the Indian and you can readily see what an appreciable part modern engineering has played in commercializing this gigantic power.

The reduction action of The Hardinge Mill is automatic. The feed and discharge is continuous. The scope of Hardinge grinding is wide including both wet and dry.

Our engineering staff will be glad to have you submit your grinding problems to them for solution. Their many years of specialized experience is at your disposal without incurring any obligation.

# Hardinge Conical Mills

The present influx of men, and the possibility of a surplus of workers during the coming Summer is taken as an indication that the promising areas lying north-west, west, and south-west of the producing Porcupine area may receive considerable attention from prospectors, beginning with next spring. The theory which carries most in connection with exploring for new deposits is that the best place to search for prospective mines is in the vicinity of proven mines. The area lying almost on every side of the producing area of Porcupine constitutes an ideal field, and one in which aggressive exploration work may reasonably lead to valuable discoveries.

#### The Kirkland Lake Field.

Construction work on the Wright-Hargreaves mine has been about completed and within a very short time

the big new mill will be in readiness for operation. The date of opening, however, will be regulated by the power situation, the Kirkland Lake field receiving its energy over a transmission line from Cobalt and therefore suffering a similar shortage to that existing in the silver camp. At the time of writing a little rain is reported and the weather predictions offer promise of relief. Should a heavy fall of rain occur, the large amount of soft snow lying in the woods would be quickly washed down into the rivers and would likely provide ample power throughout the Winter. The new mill on the Wright-Hargreaves mine will be equal in size to the fourth largest of its kind in Northern Ontario, being only exceeded in size by the Hollinger, Dome and McIntyre. The plant is a model of construction, and the equipment of the most modern design.

### The Price of Silver and other Commodities

The collapse of the price of silver to below sixty cents per ounce in New York, is a most serious blow to silver producers in Canada. During the war period, and for some time after the close of hostilities, it looked as if the return of silver to whatever may turn out to be its post-war normal level would be a gradual process reflecting the restoration of the gold standard, and it appears probable that the price of silver has now fallen below its intrinsic value, as has also fallen the price of other commodities, such as copper, sugar, lead and tin. The price of a number of commodities seems not only to be scraping bottom, but to have gone below bottom, if that term is used to express cost of production.

Various explanations are offered for the slump in silver value. One is that sixteen major governments in Europe have discontinued the use of silver in coinage, and are offering the metal for sale that is thereby released.

The factor that is probably most responsible for the lack of demand for silver is the desperate state of political affairs, the poverty, hunger and disease, and the entirely miserable condition of a territory that stretches from the Carpathians to the Sea of Okhotsk and from Ceylon to Archangel. The condition of China in particular is one of famine, and that great absorber of silver is now desirous to part with silver for bread.

The London "Financier" contains the first of a series of articles on the complexities of China's silver currency, which, as it throws some light on the silver market, is reproduced in part in this issue.

The writer of this article, Mr. T. Bowen Partington, speaks Chinese languages, and is said to have a unique knowledge of his subject. In view of what has happened this week to the price of silver there seems some incongruity in Mr. Partington's insistence on China's great need of silver, and his statement that the world's available supplies of silver metal are "getting scarcer and dearer every day."

So far as China is concerned, and that country is one of the most important in the world when the price of silver is in question, the situation appears to approximate to national bankruptcy occasioned by calamitous famine, and aggravated by political disunion. Under such circumstances, the sale rather than the purchase of silver is indicated.

India's financial position is weak, and political disunion is again an unsettling factor.

Turkestan and European and Asiatic Russia seem likely to slip back into a dark age, and political peace with material prosperity are not in sight.

One hopeful feature about the Chinese situation is the formation of the Chinese Loan Consortium, a combination of interests representing the United States, Great Britain, France and Japan, formed for the assistance of China's internal development in communication and industry. As this Consortium has the approval of the Governments of the countries named, very substantial assistance to China will be forthcoming, and a combined effort will replace international rivalries. This development is a cheering one, and should in particular help the silver market to recover.

The position of silver resembles that of many other commodities, including articles of clothing and food, that are now being offered below the cost of production, even if that production cost is reckoned upon pre-war figures. This condition has come about despite an actual shortage of many commodities, and arises from sheer inability of nations to pay their way.

The world is nowadays so small that the sickness of one nation weakens all other nations, and while it is flattering to national pride to have currencies at a high premium, if that premium becomes too high it opposes an insuperable barrier to trade, and extension of credits and even barter may have to be resorted to on a scale not yet apprehended. The reported decision of Bolshevik financiers to abolish money has been greeted with much derision, but its

real meaning may be that over large parts of the world barter is replacing international coinages and currencies.

Reduction of silver production must necessarily follow a continuance of existing quotation levels, and the silver mines will have to follow the same procedure of curtailment and conservation of liquid assets that has been adopted by miners of copper, zinc, lead and tin. As is the case with steel, wheat, cotton and other staples there exists a lack of demand concurrently with an actual physical shortage. The likelihood of an abrupt upturn of demand is therefore not a distant thing, but it all depends on the Old World and the Far East.

The participation of Canadian delegates in the councils of European nations is therefore a proper proceeding, and the sooner it is found possible for the United States also to take similar action the better it will be for the world at large and for North American commercial prosperity. Mr. Rowell at Geneva told no less than the truth when he said that Canadian lives had been sacrificed to European stupidity, but the harshness of truth will not alter the fact that if Europe is sick Canada and the United States will suffer, and that assistance extended to Europe is also self-help at home in North America.

#### **METALLIFEROUS PRODUCTION OF ONTARIO.**

The figures issued by the Ontario Bureau of Mines showing the metalliferous production of the Province for the first nine months of 1920 are pleasant reading, and show that the production for the whole year 1920 will be much larger in quantity and in value of the minerals marketed than the figures of the first quarter promised.

Silver, to the end of September, more than held its own, notwithstanding that at the end of March it was 800,000 ounces below the record of 1919. Later developments will tend to restrict production during the closing quarter, but, when the year's figures are complete they will prove relatively satisfactory.

Gold production in Ontario has features that permit of much optimism, and an increase of 58,000 ounces over the corresponding period of 1919, when compared with the record of other gold-producing countries, is a matter for genuine congratulation. Commodity prices are decreasing, labor is becoming more available and more efficient, and the need of Canada for new gold is clamant and insistent. Production of gold in the concluding quarter of the year should give 1920 a further lead over 1919. The conditions seem propitious, and expansion of gold production in Ontario seems a very probable feature of the coming months.

The imposing increase in the yield of platinum metals, nickel oxide and cobalt oxide, is a result of refining in Canada, and is so satisfactory that there will be general agreement that a little more of this kind of thing would be very welcome.

It is not unworthy of note, moreover, that the nine months figures show an increase in copper production of over 500,000 pounds, which, in view of the depressed condition of copper demand, is again satisfactory.

The comparison between the amount of iron ore mined in Ontario and that used at Ontario blast-furnaces is not pleasing, but it has at least this feature of satisfaction for Ontario that it is the only province of Canada that is at this time even attempting to utilize domestic iron ores. While nearly ten per cent of the iron-ore used in Ontario was of domestic origin, the figure for all Canada is about four per cent. That is to say, Ontario is doing more than twice as well as any other province in smelting domestic ore.

The total value of Ontario's mineral production for nine months exceeds that of 1919 by some eight million dollars, and indications are that Ontario will bulk even larger in the total figures of the Dominion for 1920 than was the case in 1919.

#### **"INDUSTRIAL LEADERSHIP AND THE MANAGER."**

Our contemporary, "Mining and Scientific Press" contains no more interesting feature than its correspondence columns, which, thanks to the magnetic personality of the Editor, are able to attract thoughtful communications from men who have really something to say.

A recent issue contains two strikingly constricted viewpoints from Northern Ontario — a circumstance that provokes to breach of the last Commandment — namely, from Mr. C. V. Corless of Coniston, and Mr. F. J. Bourne of Cobalt, dealing with labor's share of produced wealth and the human factor in management.

Mr. Bourne expresses a viewpoint that has unfortunately only too often become the settled conviction of managing executives who have found their attempts at understanding and conciliation interpreted by labor unions as signs of weakness, and it is not possible to deny that in recent times some aspects of trades unionism have borne all the earmarks of selfishness usually attributed to employing capitalists. The short memories of labor unionists, and their quick ingratitude is pointed out by Mr. Bourne, who instances Lloyd George and the Welsh miners as an example. Ingratitude is a characteristic of labor union politics because it is a characteristic of mob psychology, and must be expressed in all forms of democratic leadership. No persons suffer so severely from the ingratitude of labor unions as their own chosen leaders, and it is an old story that men kick down the ladder up which they have climbed. The well-meaning executive often emerges from his attempts at conciliation a chagrined and disillusioned man, ground between the clamant demands of his subordinates and the unyielding, non-understanding attitude of his directorate. Mr.

Bourne's conclusion is that labor can only be bargained with on terms of equal strength. "The solution is for all the employers to organise and meet organised labor on its own ground."

Whether this is a solution or not would form matter for much debate, but it must be admitted that it foreshadows a great danger, for it is a course that at once divides the citizens of a democratically governed country into two irreconcilable camps, and emphasises the principle that guides the O.B.U., namely that any member of a labor union "who enters into relations, or bargains, or receives any favor from the bosses, is a traitor to the working class."

A line-up of organised labor and the representatives of employing capital was seen at Ottawa some fourteen months ago, and it was neither a helpful nor an edifying spectacle.

The experienced executive knows that the last thing he should invite is a crisis, or any situation that forces either party to a dispute to fight on the issue of a principle. The development of crises are by all means to be prevented, as is, we earnestly believe, any attempt to line up the battle array of those who work for wages, and those who work for interest and profits upon invested capital.

Mr. Corless proposes another way, that of the leaven and the lump. He supports Mr. Sam. Lewisohn's plea for executives that will act as a buffer between capital and labor, men that can mediate between the greed and mulishness that too often are characteristics shared pretty equally by the employee and the directorate. Taken in the mass the ideality and humaneness of the employer will not be found to rank higher than that of his employees, especially when conveyed through the chilling and dehumanizing channels of corporation procedure.

Mr. Corless believes that the world war closed an epoch of mechanical development of industrialism, but that in the epoch on which we are entering, "the development and application of the sciences that deal with human beings and their organization into industrial and other social groups—economics, civics, ethics, sociology, psychology, industrial organization, history, and the like—will receive steadily increasing attention." It is a propitious horoscope, and a thoroughly modern exemplification of the ancient advice to do justly, love mercy and walk with humility.

The saving grace of Mr. Corless's method is its appeal to the individual, as opposed to the agitation of a mob whether that mob be named capitalistic or proletarian. He combats the pernicious theory that brains are the monopoly of the industrial leader, and in this attitude Mr. Corless will have the support of many executives who have had occasion to measure their brains against the labor leader. "Probably the most profound problem in industry," states Mr.

Corless, "arises from the search for a method of organization that will result in enlisting in its service the highest degree of brain-power—intelligence, goodwill and will-power—of all those engaged in it." Such an organization can only come about through the contact of individual minds. The closest contact between the minds of the workers and the minds of the employers is found in the mind of the humane and understanding executive. May his tribe increase. So far, in the annals of recent Canadian industrialism, the name of our sage of Coniston leads all the rest.

#### NICKEL AND COPPER.

The poor market for nickel and copper is seriously felt at Sudbury. The producers were placed in an unenviable position when the war ended suddenly with large stocks of metals in the hands of the several governments. The absorption of these stocks was slow and the general slowing down in industries this fall has added to the metal sellers difficulties. Under the circumstances it is not surprising that production is being cut down.

In the United States several well known copper mines have been closed down and others are operating with much reduced forces. Until there is a general quickening of manufacturing again we may expect little activity in nickel and copper mining centers.—R. E. H.

#### COAL AND IRON PREPONDERATE IN MINERAL PRODUCTION IN GREAT BRITAIN.

The value of minerals raised in the United Kingdom during 1919 (at \$4.87 to the pound) was approximately \$1,634,720,000. The value of the coal raised was \$1,530,000,000, or 93.7 per cent of the total mineral production value.

The value of the iron ore raised in the United Kingdom in 1919 was \$36,176,000.

If the production of coal and iron-ore is added they account for 96 per cent of the total.

The preponderance of the production of coal and iron is the measure of Great Britain's economic stability.

The coal and iron production of Canada contributes between 30 and 32 per cent to our total mineral production value. The question obtrudes itself, to what extent is this lamentably insignificant percentage a measure of economic instability?

Britain imports no coal. Canada imports more than she mines. To the extent that such importations are unnecessary, they are also unwise. Great Britain's coal production is 4.5 tons per capita. Canada's is 1.5 tons per capita. Reams might be written to explain away this divergence, for which excellent reasons exist, but nothing will avail in extenuation of the fact that **Canada does not mine half the coal that she should and could mine at this particular time.**

## CORRESPONDENCE.

Sir,—

To claim that the Mines Act of Ontario formerly held place with the most satisfactory mining law of any province or state, and to at the same time accuse the same law, when enforced, with being discouraging to prospectors and investors, is something only those used to receive special privileges are able to understand.

The law that swivel chair prospectors are so strongly objecting to, has been on the statute books since 1907 and had the Bureau of Mines done its duty to the Province, by collecting this tax when due, Mr. E. J. Morrison of Haileybury would no doubt have paid his tax and remained in possession of his property and so would Teck-Hughes and others. To imply, that a law enacted by the Legislature was not intended to be applied, is in effect claiming that the express will of the peoples representatives in Parliament is not to be considered the rule by which the officials and members of the Government should be guided, or the people governed. A mining act, that states what is to be required to be done in order to secure title and hold mineral land and is enforced in every respect, is after all the best security to title for both prospectors and investors.

Personally, I consider that the Hon. H. Mills has made a good beginning and wish to recommend, for his next considerations, Sections 183a and 192 The Mining Act of Ontario.

The limitations imposed upon the prospector, in the number of claims he can stake during the year for himself and others covers an area sufficiently large to include within that area any one of the following Northern Ontario mines,—The Dome, Dome-Lake, Dome Extension, Davidson, La-Rose, Peterson-Lake Schumacher, Teck-Hughes, Temiskaming, Tough-Oakes.

I would think, that if the above mentioned companies can get along with less than 360 acres each surely the prospector and his grubstaking partner can.

L. O. HEDLUND.

Gowganda, Dec. 7th, 1920.

### The Bonusing of Iron -Ore Mining in Ontario.

Port Arthur, Ont., December 11th, 1920.

Editor, Canadian Mining Journal,

Sir:—

In your issue of December 3rd, 1920, there was an article by Mr. J. J. O'Connor commenting favorably on the Conference of members of the Port Arthur and Fort William Boards of Trade, and the Hon. Harry Mills, Minister of Mines, on November 27th.

As the writer was one of the delegates mentioned, I would like to take up the reasons which called for this Conference, and the procedure advocated by the Minister of Mines for the development of the iron resources of Northern Ontario.

About a week before this Conference was called, the Minister of Mines, in an address to the Convention of the Municipalities held in Fort William, made the statement that he did not think a bonus was the most efficient plan for the working out of the problem. In his opinion electric smelting was a solution of the treatment of our low-grade iron ores. Electrical power at \$10.00 or \$12.00 H.P. per annum would, he claimed, compete with coal at present prices, and this procedure would really be the more efficient plan for the problem

in hand. When asked where the \$10.00 or \$12.00 power was to come from, Mr. Mills was at a loss for an answer to the question, and apparently did not care to enter into any discussion on the matter.

When the Board of Trade delegates met him, he stated that while as Minister of Mines he would not advise against a bonus, his personal opinion was strongly against the granting of a bonus in any form, and he thought some other plan could be worked out that would be more efficient and more permanent than a bonus of iron ores for a more or less extended term of years. The writer asked if he was referring to electrical smelting as mentioned in his address at the Conference. I also pointed out that in a conference with American engineers in 1914, I took up the question of electrical smelting with these men, who were responsible consulting engineers for large iron companies. Their reply was a question, "What is power worth in Canada?" As Quebec then had the cheapest power in the Dominion I gave them \$12.00 as being about the average cost of production in that Province. Their summing up was as follows:—When you can produce power at this time for \$4.00 instead of \$12.00, then you can consider electrical furnaces as an active factor in competition. With care I repeated this opinion to Mr. Mills, pointing out that our foremost experts declare we would want power at one-third the actual cost of production at any time, to compete with the present-day smelters.

That ended the discussion as far as electrical smelting was concerned.

The Minister then stated that he had what he considered the most efficient plan for the solution of the problem: that is a re-survey of, diamond-drilling and testing of all our iron ranges, this work to be carried on by a commission of experts who would teach us how to mine, diamond drill, smelt, treat, refine and market our ores. When the storm of commendation had passed over, one of the delegates from the Fort William Board of Trade, who had introduced himself as an engineer with practical experience in furnaces, made the suggestion that the Minister go even farther with his program, that markets should be established so that the farmer could market his ton of ore at the same time he brought in his load of wood, or a few sacks of potatoes. As the Zulus in Central Africa and the natives in the interior of India still carry their ores to the furnaces in baskets and rolls of matting, this gentleman showed that he, at least, was in favour of being progressive. I endeavoured to point out to the Minister that a survey such as he suggested would take twenty-five years to complete, and at the end of that time we would be standing exactly where we are now, but my comment was ridiculed, and the Conference was ended at that point, after the Minister being assured by the Presidents that he would have the solid backing of the Boards of Trade of both Cities.

In defense of my statement, I would like to point out just what tedious operations such surveys, drilling operations, and testing of various ores really amounts to. In 1901, I had charge of a section of the large exploring party, organized by the well known consulting engineers, Prof. Pumpelly and Prof. Smyth. This work was carried on by these men in the seasons of 1901 and 1902, and operations were confined to limited distance of Lake shipping in the Thunder Bay and the Rainy River Districts. On my section of the party I

had two expert cruisers, and our work during the season of 1901 was confined to the examination of about six square miles of territory. This occupied the whole season from the latter part of May, to the middle of October. This was a mere preliminary examination, to decide whether the iron range explored was worth acquiring from the Crown, or otherwise. No detail work was done at all and it was estimated at the time that the five square miles which were surveyed and purchased from the Crown, would take an engineer and three cruisers approximately five months to work out the details of the survey before making plans for diamond drilling. Lest we be accused of not being among the live men mentioned by your correspondent, I might mention that Messrs. Pumpelly and Smyth gave their entire approval to the method in which the work was being carried on and they still take my reports at par.

The United States Steel Corporation spent nearly two years in diamond drilling on the Atikokan Iron Range, and several months additional in the mining and treating of large-scale roasting tests.

J. D. Gilchrist of Denver, Colorado, spent the whole of the summer seasons of 1918 and 1919 in examinations and taking out samples varying from 100 to 1000 pounds for concentration tests of our low-grade ores. After spending the winter months of the same years on the working out of these tests on a laboratory scale, he advised me that he had found three ranges which he **hoped** could be treated with the one type of concentration plant, but he could not be sure of this until a suitable pilot plant had been erected and a commercial size test had been obtained.

Dwight Woodbridge, who was the founder of a testing plant in Duluth, Minnesota, had practically unlimited capital, expert help of every description, and the entire confidence of the Hayden Stone Company who had spent a quarter of a century in working out the problem of concentrating low-grade ores. Yet, over three years in time was taken up, and the plant had to be remodelled a number of times to devise the best method of concentrating the low-grade ores on one range alone.

As I have mentioned in a former letter to your Journal,\* I have visited personally over 1000 lineal miles of iron ranges in Northern Ontario, all within shipping distance of Lake ports; of this 1000 miles I considered that there were at least 100 miles which were worthy of the close detailed survey that would precede any plan of diamond drilling. The performance of all this work mentioned should give the varriest layman some little idea of the problem ahead of the Minister of Mines in carrying out his suggestions. As we have admittedly no visible ore-bodies of high-grade ore between the boundaries of Manitoba and Quebec but what need beneficiation in some form, beneficiation would seem to be our principal problem. (This does not mean that no high-grade ore bodies would be found on these ranges, on the contrary I am firmly of the opinion that merchantable grades of ore will be found, but the search for these will necessarily be costly and may take years to carry out.) Therefore, as I have estimated we have within a radius of 100 miles of the Twin Ports at least 300,000,000 tons of ore which might be concentrated commercially by some

method or other. I would consider that if the Minister of Mines carries out his plan and teaches us how to mine, diamond drill, treat, market, etc., the ores in all this territory, of course erecting pilot plants as needed for the concentration tests of these ores, that when I mention twenty-five years as the time limit needed, I might still be a year or two under the mark.

As we have in the Thunder Bay District greatly diversified types of low-grade ores, the problem of concentration or other forms of beneficiation must be worked out by the operators on practically each range individually, and it is our opinion, and the opinion of the majority of our Canadian engineers, that a reasonable bonus, given over an extended term of years, would be the most attractive inducement to investors and producers of iron ores.

A direct vindication of the request of the Mining Committees of Northern Ontario for a bonus, is the mooted establishment of a 15,000,000 dollar steel plant in the Province of British Columbia. This has been undertaken after a careful survey of the situation by Mr. Sloan, the Minister of Mines; and it was owing solely to his recommendation and indefatigable efforts that the project for the establishing of a large iron and steel industry, in what is really a somewhat isolated Province in that respect, has taken definite shape. Owing to this isolation it was deemed a better plan to have this bonus given to the producer of pig iron, as he must necessarily equip steel works to use up his own product.

The problem for the Provinces of Manitoba, Saskatchewan, Alberta, and the North Western Territories could be worked out on somewhat similar lines. Sault Ste. Marie markets heavy iron and steel at Pittsburg prices, plus the duty. Duluth steel plants market their product at Pittsburg prices, plus the freight from eastern plants. All heavy iron and steel landed at the Twin Ports of Port Arthur and Fort William cost approximately 8 p.c. of purchase price from Sault Ste. Marie or Duluth, and over 20 p.c. from the eastern steel plants for freight alone. It is also admitted by the United States purchasers of heavy iron and steel that Duluth can manufacture practically at the same cost as Pittsburg. Let the Western Provinces combine in giving a bonus of from 3 to 3½ p.c. on actual capital invested, extending over a term of from 20 to 30 years to aid in the establishment of steel plants where iron, coal and power meet, at the Canadian Head of the Great Lakes. These plants could be bound to sell to the Western Provinces at Duluth prices, minus the freight from eastern plants to the Head of the Lakes, thus effecting a saving of from 8 to 20 p.c. Assembling and finishing plants could be erected at various points in the west to further cut down the westerly freight in all directions, in threshing outfits, farm implements, etc., and the districts where this material is marketed would also be greatly benefitted. The Provincial Government of Ontario and the Federal Government could combine in giving a reasonable bounty on iron ore, extending over a term of at least 15 years payable strictly to the operator of the mine. Do this and the annual import of nearly \$200,000,000 worth of iron and steel products from the United States will dwindle more rapidly than did the production of iron ore in Ontario, and Tariff critics in the western Provinces will have less to complain of in defense of the claims of the agriculturist.

\*See issue 21 May, 1920, page 424.

## CHINA AND SILVER.

### Complexity of the Chinese Currency.

In the London "Financier" of 22nd November, Mr. T. Bowen Partington, a business man of Hong Kong, possessing an intimate knowledge of Chinese methods, mentality and languages, writes the following article. It is interesting to Canadian producers of silver, in the current market conditions, because it maintains that a great scarcity of silver exists, and that China's first requirement for banking stability is large silver reserves:

Mr. Partington states:

The question of Chinese currency is an extraordinarily complex one, to-day more so than ever before. Most people in England only know that the country is on "a silver basis," and that the various trading centres on the seaboard have each its own particular brand of local currency dollar. If that were all the position would be comparatively simple, but this slender knowledge does not even touch the fringe of the problem. The trouble is that China is a very large country, containing many provinces and dependencies, each under a semi-independent administration and with commercial customs and standard which differ widely from one another.

#### No Recognized Medium of Exchange.

There is no common medium of exchange that is recognized throughout its wide domains, for in the Celestial Empire or Republic the Government has little or nothing to do with business.

There is the tael, of course, but the tael is not a piece of money at all, it is a weight—nominally an ounce of silver. Now an ounce in Tientsin is not necessarily an ounce in Hankow or in Canton, neither does it follow that a tael minted in Peking is equal in fineness to one minted in Shanghai. In fact, there are no fewer than three distinct kinds of tael put out by the central Chinese Government, viz., the kuping, which is the standard tael of the public Treasury; the tsaoping or Government standard for taxes in some of the provinces, and the haikwan or Customs tael.

The standard of each locality is that particular tael in which wholesale transactions are conducted and in which exchange on other centres is quoted. Sometimes it is merely a nominal unit and may take the form of sycee or ingots, which are usually equivalent to 50 taels. These sycee ingots, or "shoes," are fantastically shaped silver castings of standard fineness, and are employed almost exclusively between banks and bullion dealers, being usually stamped by the banker or money changer with his individual "chop," which is accepted by the other parties to the transaction as a kind of endorsement as to weight and fineness.

Most banks doing their business in China import their own silver and turn out their own sycee "shoes" with their own particular earmark or guarantee; and all clearing transactions are done in these shoes as a matter of course. As for the different brands of taels in the various provinces of China it is sufficient to add that there are close upon 70 well recognised varieties, although the majority are not in circulation to any great extent.

#### Variety of Dollars.

The chaotic condition of Chinese currency has, if anything, been aggravated by the introduction of the various kinds of dollars—Spanish, Mexican and local currency—and to master the intricacies of this particular angle of the currency problem is a study in itself. The old Spanish "Carolus" dollar was introduced into the treaty ports from the Philippine Islands during the 18th century, and continued in common use until the middle of the 19th, when the Mexican dollar made its appearance and commenced gradually to crowd out the Spanish coin.

The Mexican dollar has retained its popularity to this day, and in spite of the existence of other competing coins, both native and foreign, is in every-day circulation. Chinese attempts at various times to oust the Mexican dollar with a locally minted coin have met with scant success, as the merchants seem to have acquired the ineradicable habit of treating native money by weight and fineness and not by count. The "Yuan" dollar (bearing the superscription of the late President Yuan Shi Kai), which was approved by the young Republic as a universal standard coin, has not so far proved a success.

The multiplicity and diversity of provincial taels, to say nothing of the many different dollars on the coast, has had its due effect, and before the Chinese mercantile community will consent to accept a common medium of circulation much water will flow down the Yang-tse-kiang. Perhaps, with the

gradual growth of China's railroad system, one or the other dollar may acquire national ascendancy; in any case, it is a matter of slow evolution and gradual education.

All we know is that the unification of China's silver currency upon a definite standard basis is of the utmost importance, and until it is achieved it is futile to hope that China will join the ranks of the "gold" countries.

#### Paper Money.

In passing we may allude to China's paper currency. Like many other countries, she has had her experience of unrestricted paper issues; indeed, it is an ancient evil which various dynasties and regimes have had to confront and have sought to remedy. In this the inherent love of the Chinaman for the silver and his distrust of paper money proved of considerable assistance to the authorities in their efforts to remedy the situation.

Down to the sixties of last century everything was going well, and the superabundant paper issues were being gradually called in and redeemed. Then the great Taiping rebellion broke out, and at once the financial situation took a turn for the worse. The Governments, both central and provincial, needed money—lots of it—and so, like the Bolshevik presses of the present time, the printing presses of Peking and in the new provincial capitals, started working overtime turning out flat money.

For the moment the needs of the emergency were met, but by the time the rebellion had been repressed, the country was flooded with an irredeemable paper currency which circulated at a terrible discount, something like 97 to 98 per cent. Ultimately, of course, like the Assignats of the French Revolution and the American Confederate currency notes, it was withdrawn altogether, and in due time forgotten. Nevertheless, their Taiping experience did not deter subsequent Chinese Governments from playing with fire and repeating that disastrous performance.

#### The Bank of China Needs Heavy Silver Reserves.

It was not until 1911, shortly before the fall of the Imperial dynasty, that the Peking authorities made a strong move towards swinging the position back to something like normal. They entered into negotiations with an international group of foreign banks for a loan of 50,000,000 dollars, with the avowed object of getting rid of the troublesome paper issues, but before the transaction could be closed the revolution broke out and shortly afterwards the dynasty fell.

Since that time the authorities have been issuing large quantities of "military notes," and until these have been called in there will be trouble in the land. Still, the Republican authorities mean well. Since they assumed sway a number of measures have been taken which promise well for the future, such as the establishment of the Bank of China, the Bank of Communications, and others whose declared policy includes the redemption of those military notes and others put out by the various Provincial Governments of recent years.

Doubtless the authorities mean well, but we know what place is paved with good intentions, and with the best will in the world we do not foresee an end to China's financial difficulties arising from the glut of paper currency. About the only true and lasting remedy would seem to lie in the creation by those Government banks of heavy silver reserves of such proportions as would inspire confidence among the public, especially the mercantile community.

Inevitably the accumulation in the hands of the banks of such a vast quantity of metal would constitute an additional big drain upon an already over-taxed silver market, and would automatically drive up the price to the levels which might baffle even the boldest of prophets. Again and again we are forced back upon the original aspect of the problem: How and in what manner is Great Britain to settle her adverse trade balance with China seeing that the world's available supplies of silver metal are getting scarcer and dearer every every day.

## A Montreal Letter

By ALEX. GRAY.

### SILVER MARKET CONDITIONS.

Silver has slumped to below sixty cents. More of the Ontario mines are about to cut down or to curtail production. To have the metal at 59¼ cents—half a cent below the average price in 1913—leaves the mines in general no alternative other than to go slow, stop—or hold their production until the market rights itself.

At the moment "silver is demoralized on Chinese and Eastern selling". Millions are starving and trade throughout the East is in a state of collapse, hence the cancellation of orders placed in the European markets—and the liquidation of silver holdings. So, between the shortage of power and the Asiatic debacle—which began with Japan—the penalties of inflation, speculation and liquidation are acutely in evidence.

The onward sweep of the wave of so-called deflation cannot be stemmed instantaneously. Throughout the Orient funds are inadequate with which to buy silver. Really the holdings of silver have to be jettisoned to secure funds in Europe—and that has intensified the situation in our metal market. Having paid the Orient for its wares in silver, the demand for silks, rubber, hides, tea, rice and vegetable oils being at the minimum, it follows the Orient must have emergency funds.

Silver being the medium of exchange, notwithstanding the admitted fact that production of the metal "has been coming on to the market for the last six months at less than half the pre-war amount"—and that consumption in Europe and on this Continent has increased—the break in the price was inevitable. Speaking of this, the "New York Evening Post" devoted its last weekly financial review to the discussion of the subject, and had this to say: "The present break is the more remarkable since world production of the metal now is only about 70 per cent. of pre-war; since one third of this production, or the total mined in the United States, is automatically taken out of the market, so long as the price is below \$1, by the provisions of the Pittman Act and since consumption in moving-picture films has increased greatly." Of course, should the Harding administration repeal the Pittman Act,—which seems improbable—silver might not recover from its fall—and that would not mend matters in the Ontario North Country. So, "marking time" may be a remedy. It is so considered by copper producers, most of whom cannot make copper for the current price—and none of whom would attempt to do it were it not for Flotation practice.

#### Hollinger 1920 Gross Income.

According to the Ontario Department of Mines report for the nine months ended September 30th., Hollinger Consolidated Gold Mines had then produced gold to the value of \$4,620,800. Taking that as the ratio, the production for the year would be about \$6,160,000—were it not for the shortage of power which has occurred. From mining and milling operations, the chances are this company, therefore, will not come within half a million dollars of the 1919 result; yet it would seem as though the income from investments, rents and the premium upon gold will more than make up the deficiency on actual operations at the properties. It has been ascertained, for example, that the Hollinger Consolidated gross income for the ten months ended November 3rd., was \$5,989,313. Out of that \$2,789,199 was expended, leaving \$3,200,113, or 13.08 per cent. on the issued capital. Over and above that, the November and December results are a substantial addition. So the Hollinger treasury, after paying 9 per cent. in dividends, ought to reflect the prosperity of the company despite handicaps.

#### SILVER AND GOLD IN ONTARIO TO END 1920 VALUED AT \$445,000,000.

To the end of September, it has been officially announced by the Department of Mines, Ontario had produced metallics to the spot value of \$597,851,488. Of that grand aggregate, about \$210,000,000 came from the remarkable silver-cobalt-nicolite Mines of Cobalt and other districts, whose twenty-eight-year record almost excuses the myriad ventures promoted in the hope and expectation that they would become part of that achievement. By the end of this year those silver mines will have yielded something like 310,000,000 ounces, besides the cobalt, nickel and arsenical contents. Out of the profits they have distributed about \$80,000,000 in dividends—and several of them are still vigorously in the running. Spread over the entire period since McKinley and Darragh, and Fred. La Rose stumbled across something they knew nothing about, the Silver Industry of Ontario has provided \$7,500,000 per annum to date—and "the end is not yet".

Next in the Order of Merit—even if imaginery decorations are permitted in the Dominion—is the nickel industry. As a matter of fact—and to be exact—although not in the spectacular precious-metal-class the nickel copper industry takes precedence, for the grand total value of its production at the expiry of 1920 will be about \$234,000,000. Adding to this the hypothetical valuation of the rare metals accredited to this section of Ontario's mineral industries, the figures rise to between \$235,000,000 and \$236,000,000—and some of the more important nickel mines seem to be perennially youthful in that ore reserves display a degree of resiliency surprising even to their directorates. Anyhow, nickel, copper, silver, cobalt, and a minor factor of rare metals, have bequeathed no less than \$445,000,000 to the wealth of nations, or will have bequeathed that much on January 1st.

Yet mining industrialism is a species of "monster; of such hideous mien, that to be hated needs but to be seen!" The story of Cobalt and the Montreal River Districts is punctuated with harrowing experiences. Hardly less is this so of the earlier chapters in the history of the nickel country. As a sequel, the discovery of Porcupine and the Kirkland Lake areas will serve to demonstrate the potentialities of real mines despite paroxysms. Public incredulity, bush fires, and the Great War, attended the development of the Ontario gold industry, notwithstanding which the total gold production on January 1st. will have amounted to about \$70,000,000—and at least there is as much more assured in known ore reserves—possibly the more venturesome would place the value of the gold ore reserves at around \$100,000,000.

For distinguished proportions, Nipissing dividends have earned pre-eminence. That company's profit-sharing has amounted to about \$23,000,000—and, with the cash on hand, the most exacting shareholders cannot grumble. Hollinger Gold Mines have yielded over \$13,500,000 in dividends, have perhaps the strongest treasury position of any company operating in the precious metal districts, and have well on toward twice their capital liabilities in their proved ore reserves. They have paid over 70 per cent. of the dividends credited to all the Ontario gold mines—the Dome and McIntyre Mines coming next with about 10 per cent. of the total.

# Metalliferous Production of Ontario First Nine Months of 1920

Returns received by the Ontario Department of Mines from the metalliferous mines, smelters and refining works of the Province for the nine months ending September 30th, 1920, are tabulated below,

out the disabilities under which gold mining has been carried on are gradually being removed, the power situation alone excepted. Details of gold production are presented herewith :

## ONTARIO'S METALLIFEROUS PRODUCTION, FIRST NINE MONTHS — 1920.

Product.		Quantity		Value \$.	
		1920	1919	1920	1919
Gold . . . . .	ounces	424,297	366,288	8,735,768	7,574,586

<b>Total . . . . .</b>				<b>35,920,418</b>	<b>27,875,713</b>

\* Copper in matte form was valued at 14 cents and nickel at 25 cents per pound in both years. Total matte produced was 44,922 tons, of which 31,800 tons were exported. For further details see heading "Nickel-Copper."

\*\* Shipments of iron ore totalled 89,931 short tons valued at \$445,355. The figures in the table cover shipments to points other than Ontario blast furnaces.

\*\*\* Total output of pig iron from both domestic and imported ore was 512,559 tons worth \$14,480,794. Figures in the table represent proportional product from Ontario ore.

and for purposes of comparison the quantities and values are given for the corresponding period in 1919. Tons throughout are short tons of 2,000 lbs.

### GENERAL REMARKS.

Although the aggregate production of mines, smelters and refineries in the Province of Ontario for the 9 months ending September 30th, shows an increased valuation of over six million dollars as compared with the 1919 figures, developments during the past two months have been such that a proportional increase for the full year cannot be expected. Rain-fall was so scanty during the late summer and fall that the power plants supplying Cobalt, Porcupine and Kirkland Lake have been unable to meet the requirements. A power shortage setting in now may be prolonged. Furthermore, the wholesale prices of commodities have declined abruptly, and industry and commerce are feeling the effects of this inevitable aftermath of the war. Labour, however, is becoming more plentiful, and the cost of production is declining. Such circumstances are specially advantageous to the gold mining industry, which has had to carry on during the war period under difficult conditions.

### GOLD.

Ontario's gold output for the first three quarters of the year was 424,297 fine ounces worth \$8,735,768, an increase of \$1,161,182 or 15 1-3 per cent over the corresponding period in 1919. During the period 977,475 tons of ore were milled, distributed as follows: Porcupine, 903,945 tons, Kirkland Lake 69,328 tons, and Miscellaneous, 4,242 tons. As already pointed

### Porcupine

Hollinger . . . . .	\$4,620,800
McIntyre . . . . .	1,603,376
Dome Mines . . . . .	1,515,086
Northerown . . . . .	70,406
Porcupine Crown . . . . .	70,962
Dome Lake . . . . .	46,809
Davidson . . . . .	11,210
<b>Total . . . . .</b>	<b>\$7,938,649</b>

### Kirkland Lake

Lake Shore . . . . .	\$ 371,359
Kirkland Lake . . . . .	215,558
Teck-Hughes . . . . .	182,152
<b>Total . . . . .</b>	<b>\$ 769,069</b>
Miscellaneous Mines . . . . .	23,904
Recovery from Nickel — copper refining . . . . .	4,146

**Grand total . . . . . \$8,735,768**

Miscellaneous mines include the production by Argonaut Gold, Limited, in the township of Gauthier, Contact Bay Mines, Limited, near Dryden, and W. E. Stone of Mine Centre. In addition to gold output 71,990 ounces of silver were produced, worth \$80,420. The 150-ton mill of the Wright-Hargreaves mine at Kirkland Lake is nearing completion.

### SILVER COBALT.

Silver production increased from 7,475,396 to 7,831,132 ounces during the period as compared with 1919. With the exception of 32,073 ounces recovered

from nickel-copper refining and 71,990 ounces from gold refining operations, the output came from Cobalt, Gowganda and outlying areas. Power shortage and a rapid decline in the price of silver will have their effect on the output for the last quarter of the year. The average price of silver was \$1.33 per fine ounce in January and 94 cents for September, with an average of \$1.09 for the 9 months' period. On December 1 the price dropped to 69 3/4 cents for foreign silver on the New York market. Mines shipping over a half million ounces are given in order: Nipissing, Mining Corporation, O'Brien, Coniagas and Kerr Lake.

**Refineries:** During the period 426 tons of ore, 2,654 tons of concentrates and 2,117 tons of residues were treated in southern Ontario refineries for a recovery of 2,406,880 ounces of silver in addition to arsenic, nickel, cobalt and compounds of the two last mentioned metals. A small output at Welland of nickel and cobalt compounds is reported by Ontario Smelters and Refiners, Limited, successors to Metals Chemical, Limited. Copper sulphate was marketed to the extent of 98,918 lbs., the metallic equivalent being included in the total copper production. Silver producers were paid for 18,202 lbs. of copper recovered in United States refineries. A considerable increase is noted in the price of cobalt, but more recently the general slump in prices of metals has seriously affected the business of silver-cobalt refineries. The output of 203,953 lbs. of metallic nickel and 20,711 lbs. of nickel oxide from silver-cobalt ores is small as compared with the product of Canadian nickel-copper refineries.

#### NICKEL COPPER.

During the period 925,378 tons of ore were raised at the Creighton, Murray, Garson Levaek, Bruce, Victoria No. 1 and Worthington mines. Ore smelted at Copper Cliff, Coniston and Nickelton totalled 809,022 tons, from which 44,922 tons of bessemer matte were produced. To the United States and Wales 31,800 tons of matte were exported, while 12,531 tons were treated in Canadian refineries at Port Colborne, Ontario, and Deschenes, Quebec.

At the beginning of the year smelting of nickel-copper ores was back again to a pre-war basis after the greatly curtailed production in the early part of 1919, which followed an abnormally large output in 1918. Although production has increased from 30,942 tons of bessemer matte for the first 9 months of 1919 to 44,922 tons for the corresponding period in 1920, conditions since Sept. 30th have considerably reduced this rate of production. The present market for both nickel and copper is dull and stocks have accumulated. In consequence the International Nickel Company of Canada were obliged to curtail operations both at Copper Cliff and Port Colborne on Nov. 1st to the extent of 25 per cent, which reduces the output to 3,000 tons per month of bessemer matte and 400 tons of refined nickel.

In the bulletin for the half year ending June 30th it was stated that nickel-copper matte was in process of treatment at the new refinery of the British America Nickel Corporation at Deschenes. Electrolytic nickel and copper were produced during the latter part of the nine months' period. The International company markets a considerable part of the nickel in the form of oxide.

#### IRON ORE AND PIG IRON

During the period 135,023 short tons of ore were mined by the Algoma Steel Corporation and Moose

Mountain, Ltd. Of this total 84,463 tons (nodulized) were shipped to Ontario blast furnaces. Shipments of briquettes produced from magnetite ore were 5,468 tons worth \$47,120.

The furnaces of the Standard Iron Company at Deseronto, Midland Iron and Steel Company and Parry Sound Iron Company have not been in blast since June, August and October respectively in 1919. Four stacks were operated by the Algoma Steel Corporation at Sault Ste. Marie, two by the Steel Company of Canada at Hamilton, and one by Canadian Furnace Company at Port Colborne. Of a total of 1,036,229 tons of ore smelted only 99,916 tons or 9.64 per cent was of Ontario origin. In steel making 252,797 tons of pig iron product were used. The total steel output at Sault Ste. Marie and Hamilton was 525,084 tons worth \$19,253,470.

#### RETIREMENT OF THE DIRECTOR OF MINES AT OTTAWA.

It is announced from Ottawa that Dr. Eugene Haanel, who has been director of the Mines Branch since 1907, when that department was first constituted, has retired in compliance with the regulations of the Superannuation Act. Previous to appointment to the position of Director, Dr. Haanel was Superintendent of Mines in the Department of the Interior, from 1901 to 1907. Dr. Haanel, during his incumbency, took much interest in the application of electricity to the reduction of iron ores. Interest in electric smelting of ferrous metals in America may be said to date from the time of the Canadian Commission's tour in Europe in 1904, and the historical introduction to Rodenhauser's and vom Baur's "Electric Furnaces in the Iron & Steel Industry," the German edition of which appeared in 1911, states that when the invention of the Stassano, Heroult and Kjellin furnaces first drew the attention of the iron industry "an important contributing factor was a report by Dr. Haanel, chief of a commission of experts sent by the Canadian Government to Europe to study the electric furnace."

Dr. Haanel has also devoted much attention to the utilisation of the peat deposits of Canada, and in general has adapted his knowledge of technical progress in Northern Europe to Canadian conditions, which are in many respects strikingly similar.

#### U. S. BITUMINOUS COAL SHIPPED TO CANADA.

A calculation based on figures given in "Saward's Journal of New York shows that in 1919, during the first nine months of the year, there was shipped from the United States to Canada approximately 8,670,000 tons of bituminous coal at average prices ranging from \$3.61 to \$4.33 per ton, and averaging over the whole period \$3.68 per ton.

For the corresponding period of 1920, there was shipped 9,700,000 tons, at prices ranging from \$4.22 to \$6.72 per ton, and averaging \$5.67 per ton.

Canada's importations of bituminous coal therefore, in the period named, were greater in 1920 by one million tons, and cost two dollars per ton more. During the quarter ending September 30th, importations cost about \$12,000,000 per month.

PRODUCTION OF STEEL IN CANADA DURING  
THE FIRST NINE MONTHS OF 1920.

The total production of steel (including ingots and direct steel castings) in Canada during the first nine months of 1920 according to statistics collected by the Mines Branch of the Department of Mines, Ottawa, was 945,282 short tons, or an average of 105,931 tons per month as compared with a total production during the corresponding period in 1919 of 770,053 tons and

an average monthly production throughout the whole of 1919 of 86,157 tons.

The production of steel during the nine months included: 901,188 tons of ingots and 44,094 tons of direct castings. The production in electric furnaces was 18,323 tons and in open-hearth, converter, crucible, or other furnaces 926,959 tons.

MONTHLY PRODUCTION OF STEEL IN CANADA.  
(Including Ingots and Direct Castings).  
(In Short Tons).

PRODUCTION OF PIG IRON IN CANADA DURING  
THE FIRST NINE MONTHS OF 1920.

The total production of pig-iron in Canada during the first nine months of 1920, according to statistics collected by the Mines Branch of the Department of Mines, Ottawa, was 806,488 short tons (800,608 tons made in blast furnaces and 5,880 tons made in electric furnaces from scrap steel) as compared with a production during the first nine months of 1919 of 710,114 short tons. The average monthly production of pig iron during the first nine months of 1920 was 89,610 tons as compared with an average monthly production throughout 1919 of 76,482 tons.

The blast furnace plants active during the first nine months were those at Sydney and North Sydney, N.S.

Hamilton, Port Colborne, and Sault Ste. Marie, Ontario.

The blast furnace plants at Midland, Parry Sound, Deseronto, and Port Arthur, Ontario were idle throughout the period.

At the end of September 10 stacks were active and 8 idle.

Pig iron was made from scrap iron and steel at four electric furnace plants located at Hull, Montreal and Shawinigan Falls, Quebec, and Orillia, Ontario.

The monthly production of pig-iron in short tons since 1916 has been as follows:—

	1916.	1917.	1918.	1919.	1920.*
January . . . . .	.....	89,187	74,239	103,963	81,494

\* Subject to revision.

# Mineral Production of Ontario in 1919

Statistical Report of the Ontario Bureau of Mines.

Part one of Vol. 29 of the Reports of the Ontario Department of Mines contains a statistical review of the mining industry in Ontario in 1919, tabulations and dissections of mining accidents and their contributory causes, and descriptions of the operating mines in the Province.

It contains also the Second Report of the Joint Peat Committee made by the Secretary, Mr. B. F. Haanel, a Report upon a geological reconnaissance into the District of Patricia, by Mr. E. M. Burwash, a Report by Cyril W. Knight on the Windy Lake and other nickel areas, and the note upon Haileyburian intrusive rocks by Dr. Middler and Mr. Knight which appeared in this Journal in the issue of August 13th. Certain typographical changes have been made in it.

The "format" of the Report is all that could be desired, and it may be noted that the Ontario Department of Mines furnishes information on dividends and financial aspects of the mining industry, and with regard to mining incorporations and other matters connected with the business side of mining that is not given in any other annual report of the various provinces of Canada.

Part Four, of the 1919 Annual Report dealing with the Kirkland Lake gold area, by A. G. Burrows and P. E. Hopkins, which it is noted by the Deputy Minister is considered by the Department as one of the most important of its recent publications, is still to be issued. Part Six, also yet to be issued is a description of the pelecypod fossils of the Lorraine and Upper Ordovician formations in the neighborhood of Toronto.

## Statistics of the Industry.

Compared with the aggregate value of mineral production in 1918, namely \$80,308,872, the peak of Ontario's achievement to date, the production of 1919, which was valued at \$58,883,916, represents a decrease of 26.7 per cent. The obvious explanation, as the Report states, is the stoppage of the war.

Summarised statistics are as follow for 1919:

	Metallics	Non-Metallics	Total
Value.. . . . .	\$41,590,759	\$17,293,157	\$58,883,916
No. of Employees.. . . .	9,254	7,974	17,228
Wages.. . . . .	12,798,799	7,680,036	20,478,835

Annual production for 1913, the war years and 1919, compares in value as follows:

	Metallics	Non-Metallics	Total
1913 . . . . .	\$37,507,935	\$15,724,376	\$53,232,311
1914.. . . . .	33,345,291	12,950,668	46,295,959
1915 . . . . .	44,109,679	10,136,000	54,245,679
1916 . . . . .	55,002,918	10,300,904	65,303,822
1917 . . . . .	56,831,857	15,261,975	72,093,832
1919 . . . . .	41,590,759	17,293,157	58,883,972
1920 (Nine months).			

The value of a number of selected metals produced in Ontario from the commencement of their mining is given in the Report as follows:

	To 31st Dec. 1919
Silver . . . . .	\$197,931,902
Nickel.. . . . .	149,931,762
Gold.. . . . .	61,316,572
Copper.. . . . .	53,656,767
Iron Ore . . . . .	9,350,276
Cobalt and compounds . . . . .	7,205,834
Platinum . . . . .	1,500,000

## Gold Production.

Sixty-six per cent of the Canadian gold output in 1919 came from Ontario, and by her contribution of 505,964 ozs., worth \$10,451,709 Canada takes third rank in the six leading gold-producing British Dominions, and was the only one to report an increase in production during 1919.

## Silver Production.

The high average price of silver during 1919, namely \$1.11 per oz. aided by the exchange premium, gave a great impetus to silver production, permitting the working of low-grade ore, the re-opening of abandoned mines and stopes and the re-treatment by flotation of tailing dumps having a silver content as low as four ounces per ton. "Despite these aids" states the Report, the silver output continued to decline with the natural waning of the camp as the deposits are being worked out."

## Nickel and Copper.

The completion of the new smelter of the British America Nickel Corporation at Nickelton was the most important event in Ontario metallurgy in 1919. The following description of the plant and its operations is taken from the Report:

On January 17th, 1920, the new smelter of the British America Nickel Corporation at Nickelton was blown in, and on January 21st the first converter went into commission. Ore is being raised from the Murray mine in which diamond drill borings have disclosed over 16,000,000 tons, of smelting ore. The inclined shaft is down 1,100 feet, and eight levels have been established, on five of which electric locomotives are used.

In the Nickelton smelter, which is situated one mile from the Murray mine, there are two blast furnaces and three Pierce-Smith basic-lined converters in operation. Another blast furnace and converter have been ordered. The most noteworthy features of operation are described in a letter dated June 24th, 1920, by W. A. Carlyle, Managing Director, as follows:

In the blower room are four turbo-blowers, each driven by steam turbines, 3,600 r.p.m., Rateau-Battu-Smoot design, made by the Dominion Bridge Co. Limited, Montreal.\* There are two blowers of 30,000 cu. ft. free air each at 36 oz. for blast furnaces and two of 36,000 cu. ft. each, 12 pound pressure, for supplying air to converters, the steam turbines for the latter being 2,200 h.p. The air stabilizers and governors first supplied were not successful, but new ones just installed, using monel metal in certain parts are operating well and this unique blower plant now promises to be most satisfactory. Each turbine has its surface condenser complete in every detail. A 300 k.w. motor-generator set supplies D.C. power to the locomotives, cranes and converters in the smelter building and a duplicate will soon be placed.

The ore consists of eruptive rock (norite), impregnated with pyrrhotite and some chalcopyrite, containing about 25 per cent. SiO<sub>2</sub>, 35 per cent. Fe., and 18 per cent. S., etc., and the metallurgical process is to smelt this ore direct without roasting and to convert the low-grade matte containing 10 to 12 per cent. copper and nickel to the usual 80 per cent. matte, which is granulated and sent to the refinery. Converter slag, averaging about 16 per cent. SiO<sub>2</sub>, is the only flux used in the blast furnace, which easily smelts 1,000 tons of ore and flux per day and has done 1,148, taking about 10 per cent. coke in the charge. At each end of each furnace is a 20' by 30' settler having at one end two tapholes and two syphon exists for matte, the latter a new device, permitting most successfully the drawing off of matte from near the top of settler, thus avoiding break-aways.

In the converters low-grade matte is fluxed with fine ore

and some blast furnace molten slag, gravel or sand being used for end fluxing when a completed charge of 60 to 110 tons of 80 per cent. matte is poured and granulated. The converter slag is partly poured into the settlers and partly into beds, where after being broken up by hand or explosives it is loaded by steam loco-cranes and sent to the smelter bins. There is no trouble in producing slag containing only 14 to 15.5 per cent.  $\text{SiO}_2$ , making a good iron flux for the blast furnace. The Garr gun is used for charging the fine ore or gravel. There are large dust flues and chambers, with a brick stack 300 feet high and 25 feet internal diameter.

The electrolytic refinery is situated on the Ottawa river, at Deschenes, Quebec, where cheap electric power is available. Mr. Carlyle's description follows:

The matte passes through two Wedge roasters with 8 hearths, thence to leaching department where part of the copper is leached out and sent to the copper electrolytic depositing house.

The leached matte is then smelted with fluxes in a specially designed electric furnace using 24" carbon electrodes, and nickel-copper anodes, weighing 200 pounds, are cast in moulds on a revolving table. This furnace has proved a signal success. These anodes go to nickel house where the nickel is electrically plated out by the Hybinette process, to cathodes being then either cut up or remelted in a Rennerfelt electric furnace and poured into ingots or granulated to shot. The slimes containing platinum, palladium, gold, iridium, etc., will be refined in the precious metals department. The capacity of the present plant is 15,000,000 pounds nickel and 9,000,000 pounds copper per annum, but at comparatively small expenditure can be greatly increased.

A report for the half year ending June 30th, 1920, showed that 1,185 tons of Bessemer matte had been produced at the smelter. All this matte had been shipped to the refinery and was in process of treatment.

#### Iron Ore. — Beneficiation.

Reference is made to the proved value of blast-furnace slag as a road material, and the use of basic slag as a fertilizer, and attention is drawn to the slight recognition so far accorded to these by-products of the iron plants of the Province.

Attention is also drawn to the growing use of beneficiated ores in 15 states, and the subjection of 8,000,000 tons of ore annually to some form of concentration. The work of Mr. James W. Moffatt of Toronto,\*\* and of Dr. Stansfield of McGill University is referred to, and it is pointed out that Ontario only requires the evolution of a commercially practical process to make large tonnages of low-grade iron ores available for use in domestic furnaces.

#### By-Product Coke.

Reference is made to the modern by-product ovens used by the Ontario steel companies, and to the new benzol plant of the Steel Company of Canada, now in operation, and designed to produce 100,000 gallons of motor-fuel per month.

The Semet-Solvat Company has leased a property from the Toronto Harbor Commission with the intention of erecting by-product ovens so soon as the cost of building will permit, and it is stated that the British Foundation Ovens, Ltd. proposes the erection of retort ovens in the neighborhood of Hamilton and Toronto, presumably for preparation of coke for domestic uses, in substitution for anthracite.

#### Structural Materials.

The increase in production of non-metallies in the Province is largely attributable to the partial recovery of building, although, as the Report points out, after

\*See page 796, issue of 1st Oct. 1920. "Utilization of Ontario Iron Ores". by R. E. Hore..

allowing for increased costs of materials, the 1919 expenditures for building did not represent in the Province more than one-half the figures of 1912 and 1913,

Reference is made to the "Super Cement" being made at St. Mary's, a product that is receiving much advertising in England, and is stated to be stronger than Portland cement and possessing waterproof and oilproof characteristics.

The following reference is made to the Port Colborne plant of the Canada Cement Company, where the recovery of potash from flue-dust is to be undertaken.

During the year a potash recovery plant was under construction at the Port Colborne works of this company for the purpose of extracting or washing out flue-dust containing potash salts from gases passing through the kiln stacks. Volatilized potash in the gases is dissolved by passing through spray chambers. The resulting sludge is put through thickeners and filters, and the brine evaporated in condensers. The quantity of potash ( $\text{K}_2\text{O}$ ) recoverable is about 1 ton per 1,000 tons of cement manufactured. In design the new plant contains many desirable features found in installations in the United States, and it is expected to be in operation by July, 1920. From the 12 potash recovery installations operated in the United States in 1918, there was a production of 1,549 short tons of potash ( $\text{K}_2\text{O}$ ), valued at \$603,617.

The production of felspar, fluorspar, graphite, talc, actinolite, gypsum, iron pyrites, mica, natural gas, peat, apatite (for phosphate), quartz (silica), salt, and other minerals is fully dealt with, but the diverse particulars will not permit of useful summarisation.

#### Mineral Revenues.

Sales of mining lands, lease rentals, royalties on sand and gravel, miners' licenses, natural gas tax and assay charges brought in a revenue of \$137,541, and the Mining Tax Act yielded \$624,951, made up as follows.

Acreage tax . . . . .	\$33,126.34
Natural Gas tax . . . . .	38,797.71
Profits Tax . . . . .	533,027.15

The Profits Tax was made of contributions from the mines derived as follows:

Gold Mines . . . . .	\$ 59,257.28
Silver Mines . . . . .	143,292.58
Nickel-Copper . . . . .	346,521.31
Miscellaneous . . . . .	3,955.48

The large proportion of the tax contributed by the nickel-copper companies is noticeable, the amount paid by the International Nickel Company being \$300,923.51, or 54 per cent of the total amount collected.

#### Mining Accidents.

Fatalities were 39 in 1919, compared with 32 in 1918. Although the fullest particulars are given of the accidents, the inclusion of metallurgical operations and the very diversified character of the industry, does not allow the drawing of deductions, except that the rate of accidents appears to be greater in the Winter than in the Summer, and that fatalities appear to be more numerous in the metallurgical operations than in mining work proper. The number of shaft accidents seems large. The rate of fatalities per thousand employees was 3.00 in 1919, comparing with 2.10 in 1918 and 2.02 in 1917, a rate that compares very favorably with the record of other mining provinces and countries.

# Northern Ontario Letter

## THE SILVER MINES.

### The Cobalt Field.

The end of the second week of December finds the mining companies in the Cobalt district growing uneasy over the steady recession in quotations for commercial bar silver. The price which the metal now commands is very little above the average cost of producing, and in the case of some of the smaller mines, the balance is on the wrong side.

A factor of outstanding importance, of course, is the steady decline in commodity prices. This is bound to reduce the cost of mining. So far, however, no cut has been made in the rate of pay to the mine workers, and up to the present these men have not volunteered any suggestion that they would prefer to work at lower pay rather than have the mines close.

Although the situation is disquieting, yet the fact remains that the mines of the Cobalt field contain many millions of ounces of silver in ore reserves, the ore is sufficiently high grade to compare with the richest in the world, and sooner or later the silver mining industry of Cobalt is bound to settle down into a steady stride and on a basis of profitable operation.

After having been closed for a short time due to shortage of hydro-electric power as well as desiring to make certain repairs to the mill, the Beaver Consolidated is again in operation. This is interpreted as an expression of confidence in regard to the future, relative to both power supply and the price of silver.

The McKinley-Darragh has issued a financial statement, summarised as follows:

Cash on hand . . . . .	\$ 69,070.80
Bullion on hand at smelters and ore at mine	244,307.75
	<hr/>
	\$313,378.55
Less Bills payable . . . . .	\$ 65,000.00
	<hr/>
Cash assets . . . . .	\$248,378.55

These cash assets are equal to more than 11 cents on each of the company's issued shares. Factors of outstanding importance, and of special significance to the stability of the mining industry of Northern Ontario are found in the report just issued by the Ontario Department of Mines showing the metal output of these mines during the first nine months of 1920. The report is such as should cause a general wave of optimism as not only does it show the North's gold output to be the heaviest in the history of the Province, but it also shows that the silver output for the nine months under review actually increased 355,747 ounces over the first nine months of 1919 and the value of the production for this year so far recorded shows an increase of \$536,868.

Not only this, but the cobalt oxide produced in Cobalt more than doubled during the period as compared with last year, and altogether the report of metal output shows a total increase of more than eight million dollars.

This achievement is regarded as extremely remarkable owing to such having been accomplished at a time when the economic conditions were so adverse to silver, gold and nickel mining.

Coming just now when a good deal of pessimism seems to be abroad, the official figures should have a stabilizing influence and bring the public to realize that the physical condition of the leading mines and the general outlook for the mining industry of North-

ern Ontario was never better and the mines were never before confronted with prospects of such magnitude as that found now on every hand.

Labor shortage during the past summer, followed by shortage of electric power late in the fall gave rise to pessimism entirely out of proportion to all reason. The labor supply is now abundant and the power shortage at worst is entirely temporary. Bearing these facts in mind the opinion seems now to be likely to take quick form that in regard to the mining industry there is now greater occasion for optimism than ever before in the history of the North.

The re-treatment of sand tailings from Cobalt Lake has been discontinued in the Buffalo mill of the Mining Corporation. This has reduced hydro-electro power consumption to the extent of between 400 and 500 h. p. In the meantime, part of the plant is working on fines from the main plant of the Mining Corporation. This reduction in work has released about thirty men.

In all parts of the mining districts a surplus of labor is reported, and the suggestion is being made in circles in close touch with the situation that the workmen should consider some plan to encourage as little curtailment of work as possible. To do this, it would be necessary to volunteer a reduction in wages.

The Kerr Lake Mining Company is stated to be making good progress in the development of its property in the state of Utah. About 100 tons of silver-lead ore is being treated daily, and the company is stated to have paid about \$50,000 in royalties, this amount applying on the ultimate purchase price of \$250,000. The company's silver production at Cobalt has been reduced due to power shortage and is now about 40,000 ounces monthly.

Voting has been completed at the Cobalt mines on the question of adopting a scheme to establish an Employes' Sick Benefit Fund. The last two mines to be heard from were the McKinley-Darragh and the Peterson Lake. The former voted 65 for and only 3 against. The Peterson Lake voted 14 for and 11 against. This makes the total vote 871 of which 737 were in favor of the scheme and with only 134 opposed to it. Accordingly, arrangements will be made to carry the scheme into operation as quickly as possible.

A small shipment of ore has been made from the property of the Regent Mines, near Elk Lake, for testing purposes. The shaft has been put down about thirty feet, and encouraging results obtain to that depth.

Concerning silver mining in general, the present quotations necessitate a general reduction in operating costs. The price of the metal has now declined to almost pre-war levels and suggests no other remedy than a general cut in expenditure.

## THE GOLD MINES.

### The Porcupine Field.

In the gold mining districts, power shortage is preventing the full benefit which might otherwise result from the present abundant supply of workmen. Restricted operations on this account preclude the possibility of reducing operating costs for the time being. In spite of this, however, a very satisfactory showing is being made, and the margin of net profit is quite satisfactory.

Up to the beginning of December, the Dome Mines had produced over \$1,800,000 and the indications appear to be that an output of close to \$2,000,000 will

be made for the full year. As regards the future, the power shortage threatens to cause a reduction in milling operations, although it is stated the development of the mine will not be interrupted. The slack period in the mill at worst will be completely relieved in the spring when the break-up of ice takes place in the lakes and rivers.

Production from the Hollinger Consolidated Mines will approximate \$6,000,000 for the current calendar year, according to official figures now available. This has been accomplished when able to operate at not more than two-thirds capacity. The causes contributing to the reduced scope of work was made up of a shortage of workmen during the first nine months, and by a serious power shortage during the last quarter. In spite of this, the company has just declared its ninth dividend of 1 p.c. payable December 31st to shareholders of record December 15th. This will call for the disbursement of \$246,000 and makes a total of \$2,214,000 paid this year. It seems to reflect the confidence with which the directors of the company view the future. Just now, the Hollinger is rushing large quantities of coal in full trainloads to the mine, so as to use its auxiliary plant to fullest capacity throughout the period of power shortage, and added assurance is thus provided that dividends during the coming year promise to even exceed the magnificent record of 1920.

Gold production from the north for the first nine months of 1920 increased fifteen p.c. over the corresponding period of 1919. The output came from twelve mines, seven of which are in the Porcupine field, three in Kirkland Lake, one in Gauthier townships near Larder Lake and one in the Rainy River district.

During the coming year, at least three more important producers should be added to the list, namely, the Wright-Hargreaves, Tough-Oakes and Ontario-Kirkland, all three of which are situated in the Kirkland Lake district.

**Kirkland Lake Area.**

Unofficial reports tend to indicate a movement intended to merge the Teck-Hughes with the Orr Gold Mines. Officials of these companies have been in conference, but have not made any public announcement as regards progress made. It is learned, however, that promising headway toward this end has been made. A merger between the Teck-Hughes and Orr would be beneficial to both companies, as it would increase the tonnage of ore available for treatment in the mill already operating on the Teck-Hughes. In regard to the latter property, it is stated the current year's operations have resulted in a substantial profit, and the outlook for the future is brighter than ever before.

For the current calendar year, the production of gold from the lake shore mine will approximate half a million dollars. In addition to this, considerable development work has been done, including sinking the main shaft from the 400-ft. level to a depth of 600 feet. The Company will enter the new year with extensive plans in view, among which will be continuing the shaft to a depth of 800 feet, as well as driving cross-cuts at the 600 and 800-ft. levels for the purpose of determining the extent of the ore deposits at these horizons. Following this work, the question of enlarging the mill will be taken under consideration. For these reasons the year 1921 promises to be one of probable big expansion of this rich mine.

Output from the Kirkland Lake Mine of the Beaver Company will exceed \$300,000 for the current year. This company is in excellent shape and can now proceed with the return of capital advanced by the parent company, the Beaver Consolidated.

Altogether, the Teck-Hughes, Kirkland Lake and Lake Shore mines will produce approximately \$1,060,068 for the current year, and with promise of the production being doubled during the coming year, owing to the present producers adding to the scope of their operations as well as the addition of the Wright-Hargreaves, Tough-Oakes and Ontario-Kirkland to the producing list.

**Larder Lake.**

The Goldfields, Ltd., of Larder Lake, one of the companies understood to be controlled by the Associated Goldfields, concerning which considerable newspaper criticism has been heard recently, will hold a meeting on December 15th to consider the special interests of the shareholders of Goldfields Ltd. Associated Goldfields is said to be proceeding with a reorganization intending to increase its authorized capital from 5,000,000 to 30,000,000 shares. The plan is to issue four shares of the new for one of the old, and thus leave an extra 10,000,000 shares in the treasury. The suggestion has been made in the press that it is understood the Ontario Government would be willing to appoint engineers to make a report on the property provided they are urged to do so by the stockholders. The Government, however, presumably would hesitate to take such action without first being urged by those financially interested.

**Ore and Bullion Shipments.**

During the week ending December 10th, four shipments of ore were made from the Cobalt district, aggregating 219,056 pounds.

Following is a summary :

Company	Cars	Pds.
La Rose .. . . . . .	1	86,793
Dominion Reduction .. . . .	1	63,000
Kerr Lake .. . . . . .	1	59,715
H. F. Strong .. . . . . .	Odd lot	9,548
Total .. . . . . .		219,056

During the corresponding period, the Nipissing mine was a heavy shipper of bullion, sending out 76 bars containing 100,068 ounces. This makes a total of 360,933 ounces shipped from the Nipissing so far this month.

**PERSONALS.**

Mr. John T. Stirling, Chief Inspector of Mines of Alberta, is in Toronto on his way back to Edmonton. He has been overseas for some months on account of ill health.

Mr. Chas. Camsell, Deputy Minister of Mines, was in Toronto Saturday and addressed the Toronto branch of the Canadian Institute of Mining and Metallurgy.

Mr. Geo. Guess, professor of metallurgy at the University of Toronto has been chosen chairman of the Toronto branch of the C. I. M. M., for the coming year. Mr. J. P. MacGregor has been reelected as Secretary of the Branch.

## British Columbia Letter

Stewart, B.C.

Now that the winter has settled down on the north country, word may be expected soon of considerable shipments of high grade ore from the Premier Mine, Salmon River, Portland Canal. Preparations were made during the Summer to transport quantities of such material over the snow trail as soon as the latter had hardened. The Premier, however, is not depending on this ore for its future but on its reserves of lower grade which have been under development and for the treatment of which the necessary plant is under construction.

There is no doubt that the closing down of development on the Big Missouri had a dampening effect, but those who have been through the district and who are competent to talk, assert that the Portland Canal Mining Division has but started along the road of mineral production, that the Premier will be one mine among many, and that last season there were a number of prospects staked on both the British Columbia and the Alaska sides of the boundary sufficiently promising to warrant extreme optimism.

The Spider Group of Mineral Claims, which is being opened up by the Algonquin Development Company, is a property of which much is predicted. Work is being continued throughout the winter. Commodious quarters have been provided for the men, who are being well taken care of in every respect and it is planned to commence shipment of ore over the snow early in the New Year.

Kaslo, B. C.

There is a revival of mining in the Slocan, the richest silver-lead camp of British Columbia. For months all the large producers have been closed down, with the exception of the Silversmith Mines Ltd. (old Slocan Star), because of the refusal of the operators to meet the demands of the men with respect to wages, accommodation, etc. They regarded the requirements of their employees, as expressed through an organization known as the One Big Union, as extravagant and refused to take them seriously. A strike was called. There is no doubt that it was effective for the mines were forced to inactivity. Ever since mid-summer the mine managements have held to their guns and now it appears that they have been successful. When the strike was first declared work was plentiful as the lumber camps were able to absorb practically all able-bodied men who wanted employment. These camps now, in many instances, are closed down. There also is an influx of labor from the prairies province. The mines, therefore, are well provided with men and the old-established properties again are being put on a producing basis. The Noble Five Mine at Cody has taken on a crew of between 65 and 70 men; the McAllister has obtained all the men required to carry on work planned; the Rambler-Cariboo has a full crew; the Rosebery-Surprise Mining Co. has re-opened the Surprise Mine at Sandon as well as the Bosun Mine at New Denver. The concentrators of the Rambler-Cariboo and the Noble Five are in operation. It seems, therefore, that the strike is definitely broken and that the output of this section of the Province from this date on will begin to climb. There is no hope, however, that the loss of time experienced can be made up this year, and it would

appear certain that the silver production of the Province, as a result, will show a decline as compared with the previous year when the official statistics are compiled.

Nelson, B. C.

At the International Mining Convention held at Nelson, B.C., during the Summer it was resolved that the Dominion Government should be asked to make provision for the prospecting and mining of base minerals on Indian reservations in this Province. As a result of the joint action of the Federal and the Provincial Governments it is permissible at present to mine the precious metals on such reservations. This privilege is considered of little value in British Columbia, because gold and silver are seldom found entirely apart from other minerals. Delegates to the Convention, consequently, decided to ask the Ottawa authorities to broaden the regulations to such an extent that they might be of value to the mining industry. Judging, however, from the reply received from Ottawa the prospectors and miners of the Province are as far as ever away from their object. In the first place it is pointed out that the Dominion Department of Mines has no control over the minerals found within Indian reservations, but that they come under the jurisdiction of the Superintendent General of Indian Affairs. And, secondly, it is set out that "under the provisions of the Indian Act the base metals can only be disposed of by this department upon a surrender being obtained from the Indians, and where the base metals are found in conjunction with gold and silver authorized to be mined by the regulations... this department cannot dispose of the same until surrendered by the Indians."

Taxation on mining companies was a subject dealt with by Hon. Wm. Sloan, Minister of Mines, in a recent address delivered at Nelson, B.C. He made the important announcement that the justice and equity of representations made by mining men had been recognized and that "it would be recommended for favorable consideration that the depletion of mines be allowed as a deduction from revenue in ascertaining the taxable income."

Continuing he said:

"Our policy in all branches of Provincial endeavor is to increase production. While there must be income to meet obligations and to provide for the development of natural resources and the opening up of the country, the Government's course is so shaped that no industry will be overburdened, but that all enterprise that gives employment and increases our wealth and stability will be encouraged and stimulated."

Ainsworth, B. C.

No. 1 Mine, Ainsworth Group, owned by the Consolidated Mining and Smelting Co., has been leased by a number of competent mining men who propose mining and shipping ore without loss of time. This mine formerly was an important producer. Some great stopes have been chambered out. The property is situated high up the mountain back of Ainsworth. Both tramway and compressor are included in the lease. Last year No. 1 shipped 235 tons to the smelter and this year it has contributed 336 tons to the Train plant.

The Florence Mining Co., is pursuing an aggressive policy in the development of its property situated on Princess Creek, a few hundred feet from Kootenay Lake. This mine has been operating steadily during the past two years and is one of the few silver-lead producers of the Province with such a record. R. H. Hewer, general superintendent, believes that it is to prove one of the deep mines of the Kootenay. While ore has been extracted constantly since the opening of the property, being shipped by tram to the hopper of the concentrating mill whence the concentrates are transported to the loading trestle at the lake edge, the proving of ore reserves and general exploration has been systematically carried out with good results, according to Mr. Hewer. He states that the Florence has been found to possess one of the big vein systems of the district, including seven large veins, three being parallel fissure-veins and four cross-fissure veins. These veins are in limestone formation and are of a very friable rock. The Company has acquired permission to utilize the natural power of Woodberry Creek and it is planned to construct a plant on this Creek in the Spring, thus obviating the possibility of being inconvenienced through shortage of water for the generation of power. It also is proposed driving a new main tunnel from a point near the lake some 500 feet below the present No. 5 Level. Assuming that the theory that the ore is to be found at depth proves correct this work will open up an extensive new stopping area.

#### Trail, B. C.

Ore receipts in gross tons received at the Trail Smelter of the Consolidated Mining & Smelting Co., during the week ending November 30th last were 12,561, bringing the total for the year to 239,183 tons. Of the former the Company's mines aggregated 11,150 tons, while the Canada Copper Co., Allenby, which recently commenced operations, contributed 362 tons. The Josie Mine, Rosslund, shipped 531 tons and the North Star, Kimberley, 250 tons.

#### Grand Forks.

The Copper Mountain Mine of the Canada Copper Company now is on a permanent shipping basis. The new mill has been in operation for some weeks and is reported to be giving satisfaction. Some minor adjustments had to be made after the test runs but these have been effected and now the ore is coming from the mine daily in carloads, is being concentrated at Allenby, and thence shipped to the Trail Smelter. The last reports were that 50 carloads of concentrates were being shipped from Allenby every day which means that approximately 800 tons of ore is going through the Mill in the same period.

It is announced that a Dominion charter has been granted the Canada Copper Co. and that the Company's head-office will be situated at Toronto. The capitalization is \$10,000,000 and authorization is given to take over the Canadian Copper Corporation Ltd. carrying on business in British Columbia.

#### Vancouver, B. C.

Those in charge of development on the Emancipation Mine are very sanguine in their references to the outlook. Dr. E. T. Hodge, who recently returned from the property, declares that some of the richest gold-bearing quartz of British Columbia has been uncovered,

ed, assay returns having been obtained which are rivalled only by the Engineer Mine of the Atlin District.

Reference has been made to the incorporation of the Coast Range Steel Ltd., an organization said to be backed by British capital to the extent of \$15,000,000, and whose plans are to establish in British Columbia an iron and steel industry capable of taking care of all the requirements of north western America and as well of securing a large share of the foreign trans-Pacific trade. It was said, too, that another British syndicate has had its engineers in the field in this Province investigating its natural resources with a view to starting a similar enterprise. A third announcement has been made in this connection which is of interest. It is that the Industrial Department of the Provincial Government has undertaken to loan \$250,000 to finance the amalgamation of the Port Moody, Eburne, and Tudhope Electric Plants, the new company to be known as the B. C. Steel Works Ltd. No official confirmation, however, is available of the assistance said to be promised by the B. C. Government.

#### Victoria, B. C.

Because of the weakness of the copper market the Britannia Mining & Smelting Co., has materially reduced its staff both at the mine and smelter. It is stated that the shipment of concentrates will cease until conditions improve and that in the meantime the development of the property will be proceeded with. The Granby Mining, Smelting & Power Co., has been similarly affected. The output is being substantially reduced, a large number of the employees having been discharged.

The prospectors of British Columbia now are strongly organized and they are moving towards the establishment of closer relations with the Provincial Department of Mines. They are anxious to obtain action on a number of matters of concern to them, chief among which is cheap powder. It is contended that the miners should obtain explosives on the same basis as it is supplied to the farmers for stumping purposes. The farmers get it through the Government and the Farmers' Institutes at cost plus transportation charges. The Prospectors' Association believe that a similar arrangement is feasible in connection with the mining industry. They also desire some uniform policy in respect of mine-road construction in the various districts, in regard to Winter lectures by resident mining engineers for the benefit of prospectors, and relative to the establishment of exhibits of minerals in the various provincial centres. There is a probability that a conference will take place before the next session of the Provincial Legislature between authorized delegates from the Prospectors' Associations and the Minister of Mines for a discussion of these questions and with a view to reaching a basis for close co-operation in the formulation of advanced and generally beneficial legislation.

**GOLD-BEARING ROCKS IN THE WESTERN AUSTRALIAN DESERT.**

Valuable Report issued by the Geological Survey, Perth, W. A.

Notable among the publications of the geological surveys of the British Dominions are those of Australasia, and in particular those of New Zealand. These publications, which rival in excellence of contents and format those of our own Survey, apart from their scientific value are interesting because of the vivid contrasts they reveal between the necessary outfits and the surroundings of geological survey parties in Canada and in the Antipodes.

An exceptionally interesting report to hand is one issued by the Geological Survey of Western Australia describing a geological reconnaissance of the country between Laverton and the South Australian Border, including part of the Mount Margaret Goldfield, near south latitude 26 degrees. In this instance the word reconnaissance is used with exactitude, as a great part of the territory traversed was waterless desert, with occasional "soaks" and desert vegetation consisting largely of spinifex. The country contains roving black fellows, and some delay was occasioned to the expedition by an attack of the aborigines in which one of the party was seriously injured. The pack animals were camels. The location of water-holes was carefully observed by the party and a chapter is devoted to notes on this all-important matter in desert travel.

A characteristic topographical feature of the West Australian desert is the "breakaway", and much space is devoted to explanation of the probable origin of these raised "table-tops". The feature is due to an indurated surface capping over unconsolidated material. When through animal agencies, or wind and water, the indurated capping is broken through, the unconsolidated strata below is, after undergoing breaking down by weather agencies, finally "exported" by the wind, and eventually rolled into great ridges, leaving the insolated "breakaway" ranges like coastal cliffs in appearance.

The area of possibly auriferous rock discovered appears to be small, but it is stated there are good grounds for believing that it extends further than it was possible for the exploring party to penetrate. The rock samples brought back were found to be only slightly gold-bearing.

At one point the expedition noted an extensive and definite boulder bed about fifteen feet in thickness, of glacial origin. Mr. A. Gibb Maitland considers this important discovery to be of more than local significance. The precise position in the geological time-scale of this deposit cannot be fixed definitely, but Mr. Maitland suggests it may be of late Mesozoic or Tertiary age.

The petrology of the rocks observed is very carefully worked out, and numerous microphotos of specimens are included in the Report. A correlation of the specimens brought back by the expedition is given with those from other localities in Central Australia, and from the Western Australian Goldfields. The rocks brought back by the survey party include acid porphyries, granites, granulites and gneisses, greenstones, basic plutonic and dyke rocks, and rocks of clastic and sedimentary origin. About half the volume is occupied by the petrological matter.

The Report is issued by Minister of Mines, Perth, West Australia.

# The Marsh Mine Hoist

## EITHER STEAM OR ELECTRIC

Is built to your liking—to suit you and your Mine

We can supply you with just the size and style Hoist you need for your mine, whether it be large or small.

We make all sizes and styles from the little Hand Power Winch to the massive Hoist shown in the illustration.

They all receive just the same careful workmanship and thorough inspection in our shops. The Marsh standard of excellence must be maintained, no matter how small the order.

Our skilled designers are at your service to assist you in choosing or designing just the Hoist that will do your work to the very best advantage.

Take advantage of our offer and profit by our experience so you may be sure of getting the best Hoist value possible for your money.

The Marsh Hoist has a reputation for being thoroughly dependable. Our designers know their work well, and so design the several parts as to give the maximum of strength and endurance.

50 H.P. Steam Hoist, with Friction Drive, and Reversing Mechanism. This particular Hoist has a 40 in. dia. drum, but we supply any diameter up to 48 in.

### NOTES FROM THE NOVA SCOTIA COLLIERIES.

#### Labor and Wages.

The vote of the union members taken on the question of the acceptance of the Montreal agreement approves of its acceptance. The matter has been one of very hot debate, and the advice of the leaders to accept the terms agreed upon at Montreal met with severe criticism, especially from the mainland collieries. The alternative of a strike met with no sincere advocacy, because the inopportuneness of a strike for higher wages under conditions of widespread unemployment and tumbling values of commodities and securities was too plainly evident.

#### Lifting of the Export Embargo.

The Board of Railway Commissioners has ordered a conditional lifting of the export embargo, and it is unlikely that such a measure will again be invoked. The ideas of Government with regard to the coal industry seem to be limited to the imposition of control of prices and limitation of distribution. It never seems to have occurred to anyone at Ottawa that what the coal industry needs is financial aid, more skilled miners and governmental solicitude for extension of coal markets. Up till now the Nova Scotia coal mines have been utterly neglected when coal could be cheaply imported from the United States, and treated as the reserved property of the national railways when coal was scarce and dear across the line. No consistent policy of guaranteeing government purchase of domestic-mined coal, or of preference for Canadian coal in governmental uses has ever been adopted. If the policy of the government is to buy coal in the cheapest

market, regardless of its origin, it can not grumble if the public do likewise, and if such a policy is persisted in, it makes the variest buncombe of all arguments for a policy of national protection. The imposition of an embargo on exports in times when export trade is profitable carries with it an obligation to guarantee a domestic market when export is unprofitable, and when the pressure of foreign importation is great. Coal production is as truly a crop as wheat. Unless the seed of preparation, development, expenditure and human energy is sown, and due allowance made for the factor of growth and the lapse of time, no production can be looked for. The popular idea that a coal mine resembles a reservoir which can be tapped at need is all wrong. The production of coal five years from now will depend upon the work done in 1920, and not all the King's horses or all the King's men can produce coal in times of scarcity if the plans were neglected, or prevented, in the years that preceded scarcity.

#### WATER-WHEELS IN B. C. MINES.

The Improved Kincaid Water-Wheels and Governors are the latest in water-power machinery. This equipment is of Canadian manufacture, being manufactured in Vancouver, British Columbia by the Canadian Water Wheel Company, Limited. Mr. John Kincaid, the designer of this water-wheel, is in charge of the factory, and every machine passes under his personal supervision. Several of these wheels have been in use at the Premier Mine, and just recently orders for two more wheels have been received from the same people, which speaks well for the results obtained from these machines.

**COAL MINING IN SPITSBERGEN.**

The Scottish Spitsbergen Syndicate sent two expeditions to Spitsbergen, the second of which recently returned and reported. The expedition, including distinguished geologists, miners, borers and assistants numbered about fifty persons.

Coal seams are noted, containing coking coal of good quality. The seams are not thick, varying from 2 ft. 3 ins. to 4 ft. One proved area in the Ebba Valley is estimated to contain up to 16½ million tons of accessible coal, and another area is estimated to contain 90 million tons. There is said to be an absence of folding and faulting.

There are now stated to be ten working coal mines in Spitsbergen, and over one thousand miners and mine officials and their wives are wintering in Spitsbergen this season.

Some idea of the necessity for coal in Europe may be gleaned from the statement that Spitsbergen coal is finding a ready sale at from fifty to sixty dollars a ton. The community has postal service, a newspaper, hospital and other conveniences, and is connected by wireless stations with various points on the European mainland.

## EDITORIAL

### British Empire Steel Corporation Ltd.

The formation of British Empire Steel Corporation, Ltd., will not, it is understood, now proceed to final consummation as originally projected. The most important clause in the agreement for consolidation which was approved by the directorates and shareholders of the Dominion Steel Corporation and the Nova Scotia Steel and Coal Company, was the provision, in Canadian funds, of twenty-five million dollars of new working capital. It was also part of the agreement that twenty million dollars of the new money was to be devoted to the development of the coal, iron-ore and limestone mines and quarries, and the steel-making and transportation operations of the two companies named in Nova Scotia.

The raising of the required sum, and its transference to Canada, has proved too difficult except at a ruinous discount in underwriting costs and exchange, and, also, the complexion of business has so changed since the project was mooted in the Spring as to make the flotation of stock issues in Britain more difficult than previously.

The attitude of the Street towards the securities of the constituent companies of the proposed consolidation has been as paradoxical and as little related to facts as that attitude usually is. When the idea was first mooted it was used to "bear" the securities, and when it was evident that the project was about to fail of fulfillment, it was again regarded as a reason for selling the securities affected. It is difficult to see how both views can be accurate. One thing which is quite certain at this time is that the securities of the coal and steel companies concerned, both senior and junior securities, are selling far below their intrinsic value when the physical assets are reckoned up.

The proximate reason for the consolidation which was projected was the necessity, arising from technical reasons, for the operation of the coal and iron-ore areas of the Dominion Steel Corporation and the Nova Scotia Steel and Coal Company under single management. This primary and compelling reason still exists, but it has been much emphasized in the

meantime by the advantages that have actually been experienced from close co-operation of the managements of the Dominion and Scotia companies, and reciprocal agreements with regard to the mining of abutting and intervening areas that have already led to increased production, lessened expenditures and the testing of areas that had been held out of operation by the exigencies of lease interference. The chief reason why the coal and iron-ore properties of the Dominion and Scotia companies can be best worked under single management is that their division was an initial error. The system under which the coal areas of these two companies have been divided up has had the effect of sundering that which nature intended should remain one. The separation of the coal areas has lessened their value, and consolidation would increase their value. What is true of the coal areas in Cape Breton is equally true of the iron-ore areas at Wabana. The merged value of the properties of the Dominion and Scotia companies—to their shareholders and to the public and the Province of Nova Scotia—is greater than their sum when separately calculated.

The "Canadian Mining Journal" has taken the view from the first mention of the consolidation of the Dominion and Scotia properties; held the view before consolidation was mooted, and still maintains, that the proposal was above everything a measure of necessity and self-defence.

We objected to unrestrained statements which intimated that the British Empire Steel Corporation would become a serious rival to the United States Steel Corporation, and would be able to compete with the world in sales of coal and steel products. The actual sentiment which probably inspired the glowing cables that came to this side from London, respecting the prospects of the proposed amalgamation, was a feeling that only through consolidation of conflicting interests and consequent economies could the coal of Nova Scotia, and the steel products made with the help of that coal, hope to enter the markets of the world.

No matter what the course of the consolidation pro-

posals may be, the fact remains, and will always remain, that the fullest and most profitable results from the properties and plants of the Dominion and Scotia companies will be missed and will remain unattainable until they are operated under single management.

So far as the interest of the Province of Nova Scotia is concerned, its Legislatures have already made it clear that no diminution of the productivity and profitableness of the coal areas owned by the Province will be allowed to occur through existing lease divisions, and power has been taken to make such corrections in lease allotments as may be found necessary to bring about thoroughly workmanlike and technically correct exploitation of the remaining unworked portion of the coal fields.

Our comment has touched only one side of the proposed merger, namely the consolidation of the Dominion and Scotia companies, because it is the essential aspect. The larger proposals, which included transportation and shipbuilding interests, were made possible only by the basis provided by the coal and steel companies in Nova Scotia. The advisability of extending the scope of the consolidation involves a matter of opinion, and this journal will not venture an opinion thereon as it is outside the scope of mining activities, and essentially a financial consideration. The considerations however that counsel consolidation of the coal and steel operations are not matters of opinion, but questions of fact. That this is so evident from the co-operation between the directorates and management of the Dominion and Scotia companies now existent. We would assume therefore that a consolidation of the two companies is a certainty of the future. There are other considerations, irrelevant to the main issue in the eyes of the mining engineer, but considered important in other respects, which may delay the actual event, but it must ultimately take place.

If the modified project, which is intimated may result from the abandonment of the original proposals, should include such users of steel products as the Halifax Shipyards and the nail factories in the Maritime Provinces, it would be a logical proceeding, and in line with a number of similar combinations that have taken place in Great Britain since the Armistice. All these projects have been the result of attempts to utilize the heat of coal fuel, and its by-products, by disposition of major operations of steel manufacture so that coke-oven gases, blast-furnace gases, producer gases and every other product of the combustion of coal shall be utilized to the last pound of recoverable chemical compounds, and the last heat unit.

At this time, with the steel market depressed and demand suppressed, the excellence of coal as an asset, and as a backlog to associated steel enterprises is manifest.

### CHANGED CONDITIONS FAVOR GOLD MINING.

The tide has turned strongly in favor of gold mining and we may confidently look forward now to the expansion of the industry. Northern Ontario has, during a very unfavorable period of high prices, given substantial evidence of its coming greatness as a source of gold. The war and the conditions that it brought would have killed any but a well-founded gold industry. In spite of high costs much progress has been made and now under more favorable circumstances exploration and development should soon begin again. It will be some time before the work is well under way; but the improvement is already noticeable.

One factor which will obscure for the immediate future the great change in conditions is the shortage of power at the producing gold mines. An unusually dry fall has left the mines short of water for their power plants and it is impossible just now to take full advantage of the situation. Labor is plentiful and increased efficiency is to be expected; but the lack of water will seriously interfere with production and will prevent the operators from laying aside their troubles for a few months yet.

During the past week there has been some rain in the basins drained by the rivers that furnish power for the mines. This has given some additional water and is welcomed; but is regarded merely as a temporary relief. A real January thaw that will turn the quiet streams into torrents is much to be desired. It may come when there is abundance of snow; but until it does the production of gold will not increase with the speed that it otherwise would.—R. E. H.

### CHRISTMAS, 1920.

The Editor takes a second opportunity to wish the readers of the "Canadian Mining Journal" a very Happy Christmas.

In our issue of a year ago it was observed that Canada was a good land and a vast one, well-known to the Canadian miner, who usually has seen it first. The goodness of the land is even more apparent than it was last Christmas. Within the year that has passed Canada's known possessions in gold, silver, petroleum, zinc and coal have been notably enlarged. New processes have added to the value of our minerals.

Compared with Europe and Asia our country is indeed a happy one. Neither civic disturbance or physical calamity has visited us. Our statesmen have upheld Canada's place among the nations of the world, and, because of paradoxical happenings and the unintentional functioning of the dead hand of precedent, Canada has been required to represent and interpret North America to a badly wounded civilization across the seas.

There are some drawbacks to national complacency, that need not be catalogued at this time, but, on the whole, there is no country in the world where the Christmas season brings more real basis for happiness than in Canada.

The "Journal" extends to its readers its heartiest seasonable greetings.

*PLATINUM METALS IN CANADA.*

This issue contains a description of the occurrence of platinum metals in Canada, being a chapter devoted to Canada in a recently published monograph of the platinum metals of the British Empire, the latest of a series of monographs prepared under the direction of the Mineral Resources Committee of the Imperial Institute. The platinum monograph is the work of Prof. A. D. Lumb, and is published by John Murray, London.

The monograph is interesting at this time in view of the larger quantity of platinum metals extracted in Canadian refineries revealed by the latest figures issued by the Ontario Bureau of Mines, and as containing some information — which we do not remember having seen previously published — of the platinum metals recovered from the matte of the Mond Nickel Company treated in Britain during the years 1915 to 1918.

*THE ANTHRACITIC COALS OF THE WEST.*

The Secretary of the Admiralty has stated in the British House of Commons that the Admiralty has not purchased a large anthracite property in British Columbia, and had no intention of doing so. There are some difficulties in the way, even if the Admiralty did intend a purchase, chief among which is that there is no anthracite in British Columbia. There are in the western coalfield, within the vicinity of the Rocky Mountains, a number of deposits of metamorphosed bituminous coal seams, having anthracitic characteristics, but the existence of the true anthracite has not been yet reported in Canada. The Groundhog Mountain field, which is the one referred to by the Secretary of the Admiralty, is described by Mr. D. B. Dowling as an important area situated on the headwaters of the Skeena, Naas and Stikine Rivers. The sediments which contain the coal seams rest on volcanic rocks, of probable Jurassic age. The coal-bearing rocks are much faulted, and by subsequent erosion the field has possibly been divided into a number of small separate blocks. The original area outlined by prospectors, and included in surveyed lines, is nearly 170 square miles. The coal, states Mr. Dowling, is all semi-anthracite, and "in some instances is classed as anthracite". The anthracitic qualities, like all the gradations in the quality of the coals of the great western fields, are presumably the result of heat and pressure upon the original coal material. The mother material was probably the same in the case of the sub-bituminous, bituminous and steam coals of the west, and the characteristics of the mineral as mined today are the result of different degrees of heat and pressure. In the case of true anthracite there is good reason to believe that the original material differed from the material from which bituminous coal was formed.

The University of Alberta proposes to undertake microscopic examination of the western coals, and if this investigation is carried out upon a scale that will include all the coals of the west, it should throw much light upon the original substance of the coal seams and the forces which have given them their characteristics.

**THE PELYCYPODA OF THE STRATA AROUND TORONTO.**

Part Six of the 29th Annual Report of the Ontario Department of Mines contains a description of the pelycypod fauna found in great abundance in strata near Toronto, and particularly in the brick shales. The Report, which contains fine plates illustrating some 54 fossil shells, and technical descriptions of a much larger number, is the work of Beatrice Helen Stewart, and a prefatory note is made by Dr. W. A. Parks, whose assistance in the carrying on of the work and the preparation of the final text is acknowledged by the author. The present volume arose out of investigations commenced with the hope of more definitely fixing the stratigraphical relationship of the paleozoic rocks in the vicinity of Toronto, but the abundance of pelycypods observed was so marked that it was thought well to present first an account of this preponderating group, and to leave the question of correlation until more extensive data had been obtained.

While no definite attempt is made at correlation, the author suggests that the Toronto pelycypod fauna represent in general a horizon comparable with the Pulaski fauna of New York State, (of general Cincinnati age) on the one hand, and the Maysville of the Ohio Valley on the other, but with a stronger commingling of Maysville forms.

The Ontario Department of Mines is to be congratulated on undertaking investigations of what may at this time be regarded as purely scientific interest, but may at any time be found to have economic value.

**NEW TYPE OF IRON DEPOSIT IN ALBERTA.**

A despatch from Edmonton states that in the Peace River country, where there is much iron "a solid bed of pig-iron, the depth of which is not known" has been discovered. Possibly this is the stock-yard of Gehenna, the product of Beelzebub's own private blast-furnace? The depth of the deposit is not known, but perhaps, like some fabled veins of precious metals it goes down to the original tap-hole. Dr. Allan mentioned the iron deposits of the Peace River Country at the Winnipeg Meeting of the Institute, but he omitted to mention this interesting and novel type of a differentiated magma.

**PERSONALS.**

Mr. H. H. Claudet who for some years has been in charge of the Ottawa Branch of the General Engineering Co. of New York, will, on the 1st of January, take over the office and laboratory at Ottawa and carry on the business independently.

Mr. R. M. Wolvin, President of the Dominion Steel Corporation will sail for England on the 23rd December in connection with the affairs of the British Empire Steel Corporation. Mr. D. H. McDougall, the President of the Nova Scotia Steel & Coal Company will leave for England on the 28th December in connection with the same matter.

# The Platinum Metals in Canada

By A. D. Lumb.

(Abstracted from a Monograph of the Mineral Resources Committee of the Imperial, Institute, London).

The occurrence of platinum in Canada was first observed in 1862, in the course of gold-mining operations on the Rivière-du-Loup and the Rivière-des-Plantes in the province of Quebec.

Since that time platinum has been found in a number of localities associated with auriferous gravels, but the crude metal has only been obtained commercially from the Similkameen district in British Columbia. These deposits first attracted attention in 1885. All the workings are alluvial, although the platinum has in several cases been traced to its parent source.

*Alberta.*—Platinum and gold in minute grains, closely intermixed, are found in the North Saskatchewan River, near Edmonton. In 1918 certain platinum occurrences were examined by the Munitions Resources Commission, visits being paid to Fort Saskatchewan and the Peace River district, in Alberta. These deposits, however, proved to be disappointing. In the former locality, which was carefully tested by drilling, the values of the samples obtained averaged less than 10 cents in gold and platinum per c. yd. of gravel.

*British Columbia.*—Platinum, associated with gold, which is the dominant metal, occurs in the Tulameen River and its tributaries, the principal of which is Slate Creek, others being Cedar Eagle, Bear and Granite Creeks. The metal is present in small rounded grains, or pellets. Chromite is often found intergrown with the platinum, olivine and pyroxene usually occurring in association. The heavy minerals remaining with platinum in the concentrate are titaniferous magnetite, chromite and native copper. The platinum is sometimes magnetic, probably due to the covering of the grains by small particles of magnetite.

The following analysis, according to G. C. Hoffmann is representative of an average sample of crude platinum from the Tulameen River:

	Per cent.
Platinum . . . . .	72.07
Palladium . . . . .	0.19
Rhodium . . . . .	2.57
Iridium . . . . .	1.14
Osmiridium . . . . .	10.51
Copper . . . . .	3.39
Iron . . . . .	8.59
Gangue (Chromite) . . . . .	1.69

Owing to the presence of osmiridium in considerable proportion, the ore is classed as "hard metal," and on that account fetches a high price. Many of the richer placers have become exhausted, and work is now carried on by a few individuals, principally Chinese, who work during the summer months only. In some cases high benches, 50 to 100 ft. above the creek bottom, are being worked. Much of the platinum and gold is of a coarse texture, with a rough surface, and the latter is sometimes found imbedded in quartz. Nuggets are sometimes found encrusted with chromite, and are thus liable to be overlooked. The deposits are therefore not of great age, and the metals have not been transported long distances from their sources.

Kemp is of opinion that the platinum is derived from pyroxenite dykes cutting through peridotites, which outcrop on Olivine and Grasshopper Mountains.

It is of interest to note that some diamonds and rubies have been discovered with the platinum in the Tulameen deposits. They are of good quality, but of small size, and occur in a matrix of dunite. American capital dominates the platinum industry in the district. In 1918, at the request of the Imperial Munitions Board, special investigations in this area were undertaken by members of the Geological Survey, and several prospecting bores were put down to bedrock. Full reports of the work done are not yet available, but it is understood that the results are considered to be promising, and to warrant further examination of the district.

Platinum was in 1918 discovered at Franklin Camp, near Grand Forks, B. C., in the "Black Lead," so-called, which is a mixture of augite, 75.13 per cent.; orthoclase and microcline, 17.06 per cent.; hornblende, 1.47 per cent.; and magnetite, 6.06 per cent., as determined by microscopic measurements on a typical specimen, with accessory minerals, chalcopyrite, bornite and apatite. A sample of chalcopyrite assayed 0.38 oz. crude platinum per ton. Samples of the "Black Lead" assayed from 0.02 to 0.17 oz. per ton.

At Burnt Basin, on the Mother Lode claim, an auriferous quartz vein carries platinum, in amounts varying from a trace to 0.25 oz. per ton. The quartz also contains chalcopyrite, pyrite, galena, sphalerite and molybdenite. Native platinum in small quantities has been found associated with gold in the following localities: Tranquille River, Fraser River, Rock Creek, Yale District, North Thompson and Clearwater Rivers. It has also been reported to occur in a dyke across the Kootenay River upon the Granite Poorman Mining Company's property a few miles from Nelson. At Siwash Creek, in the Tulameen district, small flakes of platinum, associated with chromite, often occur in shear zones in granite. Dredging for gold and platinum is being carried on, on the Peace River, North British Columbia.

According to J. B. Hobson the heavy concentrate produced on the Consolidated Caribo hydraulic mine at Quesnel, contains, besides gold and silver, platinum, palladium and osmiridium, one analysis giving a total value of \$3,873 per ton. The gold and silver being non-amalgamable are probably included in particles of pyrite and galena, whilst the platinum metals are found as minute grains or are enclosed in particles of chromite and magnetite. A system of "under-currents" is being installed to properly dress this concentrate.

In 1917 the recorded output of crude platinum from the placer gravels of the Tulameen district in British Columbia was 57 oz., that for 1918 being 39 oz. For the five years preceding 1892, this district produced on an average of over 1,500 oz. per year.

*Manitoba.*—Samples of gold ore containing platinum have been obtained in the Star Lake district of south-eastern Manitoba. Analyses of the samples from dif-

ferent auriferous reefs were made by the Department of Mines in 1917, and yielded platinum varying in amount from a trace to 0.1 oz. per ton. In addition to gold and platinum, the veins carry small quantities of galena, zinc blende, pyrite, chalcopyrite and arsenopyrite in a gangue consisting mainly of quartz.

Platinum is reported to occur in auriferous quartz veins in several mines and prospects in Le Pas district; a picked sample of ore from the mine of the Northern Manitoba and Development Company, assayed \$49 gold and \$17 platinum per ton. McCafferty's Prospect, about 5 miles away, contains platinumiferous quartz.

*Nova Scotia.*—According to E. R. Faribault in *Summary Report*, 1918, Part F, of the Canadian Department of Mines, platinum has been found, mostly in traces, in some of the old gold districts of Halifax county and, lately, in the tungsten concentrates of the Moose River mines. So far, all occurrences are in quartz veins in the lower quartzite and slate formation of the gold-bearing series of the Atlantic coast. The platinumiferous mineral is supposed to be sperrylite, with which is associated arsenopyrite.

*Ontario.*—Sudbury is one of the few places where platinum is profitably extracted from deposits *in situ*. The metal, which was first discovered in this region in 1889, is found mostly in combination with arsenic, as sperrylite associated mainly with chalcopyrite in the well-known copper and nickel-bearing deposits of the district.

The origin of the ore-bodies has not yet been settled. They are either marginal deposits in, or off-shoot deposits to, a norite laccolith, which has intruded sedimentary rocks, the ores consisting principally of chalcopyrite, pyrrhotite, and pentlandite. Metallic platinum, gold, silver and palladium occur in the ore, the last also, probably, as an arsenide. The highest platinum content is associated with the highest copper content; the highest palladium with the highest nickel. According to Roberts and Longyear the mean analysis of rocks of from sixteen drill holes gave an average ore content of: copper, 1.11 per cent.; nickel, 1.95 per cent.; silver, 0.223 oz.; gold, 0.022 oz.; and metallic platinum, 0.0068 oz. per ton. The ore is principally worked for its nickel and copper content and yields a large proportion of the world's supply of nickel. The ore is first smelted at the mines, and a portion of the low-grade matte so produced is then shipped to South Wales for final treatment, the remainder being sent to the recently-constructed refinery of the International Nickel Company, at Port Colborne, Ontario, and to the United States. It was stated in 1903 that this matte contained on the average 1.25 oz. of the platinum metals per ton of nickel content of the matte, of which about 80 per cent. was extracted. The Victoria Mine, owned by the Mond Nickel Co., is stated to carry a high percentage of the precious metals, as is also the Vermilion Mine, although in the latter case the ore body is very small. In 1917 the total output of copper-nickel ore from these deposits amounted to 1,506,828 tons, of which the Canadian Copper Co. raised 1,139,629 tons, the Mond Nickel Co. 361,335 tons, and the Alexo Mining Co. 5,864 tons. The nickel content of the ore of the Canadian Copper Co. was about 2.5 times that of the copper, whilst the ore mined by the other two companies contained the two metals in approximately equal proportions. The matte produced by the Alexo

Mining Co. is smelted by the Mond Nickel Co. According to the report of the Royal Ontario Nickel Commission, the matte produced by the Canadian Copper Co. in 1916 was estimated to contain 4,640 oz. platinum and 8,460 oz. palladium, corresponding to 0.10 oz. platinum and 0.15 oz. palladium per ton of matte, the International Nickel Co. recovering in that year 1,093 oz. platinum and 257 oz. allied metals. This company is now reported to have improved its methods of recovery. In 1918 the total matte shipment by the Canadian Copper Co. is stated to have contained, among other precious metals, 8,677 oz. platinum and 13,016 oz. palladium.

According to information supplied by the Mond Nickel Co., their nickel residues derived from the refining of the matte are taken over by Johnson, Matthey and Co., Ltd. During the years 1915-18 the residues disposed of were estimated to contain the following amounts of platinum metals:

	(In oz. troy).			
	1915	1916	1917	1918
Platinum . . . . .	3,078	3,782	4,913	4,465
Palladium . . . . .	5,474	—	—	—
Iridium and Rhodium . . . . .	973	—	—	—

Messrs. Johnson, Matthey and Co., Ltd., have kindly supplied the following figures of platinum-extraction from these residues:

	Oz. troy.
1916 . . . . .	3,722
1917 . . . . .	4,719
1918 . . . . .	4,958

The British America Nickel Corporation, who are developing some large deposits in the same district, are also erecting a refinery near Hull on the Ottawa River. It is stated that they will employ the Hybinette process of electrolytic refining, and expect to obtain a high recovery of the precious metals.

With gradual improvements in the refining process, and with the refining of the whole of the matte produced, instead of a portion only, as at present, it seems probable that the production of platinum metals by the three nickel companies may in time exceed 10,000 oz. per annum.

The 1919 report of the Ontario Bureau of Mines shows that in 1918 the International Nickel Co. treated 62,250 tons of matte for 650 fine oz. of platinum, 787 oz. of platinum, and 473 oz. of metals of the rhodium group. This cannot be used as a basis of calculation, as the proportions are not constant.

On the Quinn claims, near the Croesus Mine, Munro Township, is auriferous quartz containing platinum. Five assays gave a platinum content of value ranging from \$180 to 1,800 per ton (with platinum at from \$40 to \$50 per oz.). The Abro Mine in the Timiskaming district in 1915 shipped between 5,000 and 6,000 tons of ore, containing 0.03 oz. of palladium and platinum per ton. The ore consists of pyrrhotite, chalcopyrite and pentlandite, in a gangue of altered peridotite and serpentine.

*Yukon Territory.*—Platinum occurs associated with gold in small quantities in most of the tributaries of the Yukon River, notably at the mouth of the Hootalinqua River, and in the River Lewis.

*Newfoundland.*

Chromite derived from the serpentinized area in the region of Mount Cormack, situated in the central part of the island, has been found to contain small quantities of platinum.

# The Kirkland Lake Gold Area

## "Interesting and Important Description."

Part Four of the 29th Annual Report of the Ontario Department of Mines for 1919, just issued, is a report on the Kirkland Lake Gold Area, by A. G. Burrows and P. E. Hopkins, being a second report by these officers of the Bureau of Mines and supplementary to one published in 1914.

The Report is summarised in a preface by Dr. W. S. Miller, who names the work as being "One of the most interesting and important descriptions of a Canadian mining area that has been published for some years, at least." Dr. Miller's preface is as follows:

"The authors, A. G. Burrows and P. E. Hopkins, of the Geological Staff of the Ontario Department of Mines, have had wide experience in the pre-Cambrian gold and silver areas of the Province.

"The Kirkland Lake Area can be classed as Ontario's fourth most important metal-producing area, being preceded, in order of seniority, by Sudbury, Cobalt and Porcupine. The development of the area was retarded during the period of the war, systematic work having been begun only about a year previous to the outbreak of the great conflict. To the end of the year 1919 the output of gold, with some silver, had a value of nearly \$3,000,000.

"Exploration in the Kirkland Lake Area has shown that there are three principal zones of mineralization, or, to use a more definite term, of metallization. The main or central zone extends in a northeast-southwest direction along the southern expansion of Kirkland lake for a distance of over two and a quarter miles. The southern zone is distant about three-quarters of a mile from the main zone and the northern about two miles. The gold production up to the present has come from the central zone.

"According to the authors, the central zone shows a major fracturing along which are situated the principal mines. This fracturing crosses all the rocks in the zone, including feldspar-porphry, syenite, lamprophyre and conglomerate. In addition to the major fracture there are branch or minor fractures now represented by branch veins or lodes.

"The fracture zone, where examined, usually contains several fault planes which often form the boundaries of ore bodies. The fault planes along which the ore deposits have been formed dip to the south, generally at angles of 80 deg. to 85 deg. At several mines development has been carried on with regard to two prominent fault planes, called footwall and hanging-wall planes. These planes are from a few feet to 40 feet or more apart, ore occurring sometimes over the whole width, or, as is more common, near one wall or the other, depending on subsidiary slip or fault planes. Ore has also been found beyond the recognizable fault planes or so-called vein boundaries. Mineral-bearing solutions with accompanying vapours have filled fissures and more or less replaced the rock in the fracture zone. The quantity of vein quartz in the ore deposits is

relatively small as compared with the mineralized porphyry or other rocks that make up the ore bodies.

"The minerals in the ore bodies, other than the primary constituents of the rocks, are quartz, of two or more ages, calcite, ankerite, sericite, chlorite, iron pyrites, copper pyrites, small quantities of galena and zinc blende, molybdenite, graphite and barite. The ore minerals are native gold with the tellurides, calaverite, kalgoorlite and hessite. Other tellurides are altaite, coloradoite and tetradyomite.

"The authors say that the gold deposits at Kirkland lake in their mineral constituents resemble those of the Sierra Nevada, Cal., and that it is probable that they were not formed at as high temperatures as those of Porcupine, Ont. Granite, syenite and porphyry in the Kirkland Lake Area are believed to represent different facies of one magma. While the gold-bearing deposits were formed subsequent to the intrusion of the porphyry, they are believed to be genetically connected with this rock."

The map which accompanies the Report, in addition to a number of maps and sections that are bound in the volume, is on a scale of 600 ft. to the inch, and is almost two feet square. The mapping has been very carefully done, and Dr. Miller's characterisation of the Report is not overdrawn.

A natural-size colored reproduction of high-grade gold ore in red porphyry and syenite, typical of the Kirkland Lake area, adds to the general typographical excellence of the Report, and is as fine an example of color printing as one could desire to see.

The authors state that Kirkland Lake is second among Ontario's gold camps in importance, and rapidly developing. "It is characterised by the richness of its ore." It is part of a large mineralized region that extends roughly from Matachewan in the southwest to Larder Lake and beyond into Quebec Province in the east. In places the older gold-bearing rocks are covered by deposits of newer formations, conglomerate, greywacke, and slate of the Cobalt series that have not been removed by erosion, and "consequently cover possible gold deposits."

In regard to the main mineralized belt which runs through Kirkland Lake, the significant statement is made that operations at the Kirkland Lake mine in October 1920 have indicated promising ore at a depth of 900 ft., where the same general mineralization has been encountered.

The operating properties are each described in detail, and flow-sheets are given, with much information on capitalization, ore yields, distances driven underground, etc. This detailed and interesting information is very full. The illustrations are well chosen and of much interest to the student of geology, apart from local significance.

The Report shows evidence of much conscientious and thorough work, and has been well edited and printed. It will doubtless be very welcome to those who are engaged in mining in the district,

# Notes on Steel Plate Picking Belts

By JOHN S. WATTS, New Glasgow, N.S.

The following are a few random notes, on the designing, and operation of steel plate picking belts, and contain pointers, derived from a fairly long experience with these machines, which should be useful to the designer and operator.

In designing the floor, the weight of the picking belt, in the absence of more precise information, may be taken as 350 pounds per foot of length, plus 150 pounds per lineal for the weight of the coal, or a total of 500 pounds, per foot of length, for a belt five feet wide.

Good average practise is to run these belts at forty-five feet per minute, and, at this speed, the delivery of coal, with a steady continuous feed to the belt, would be 170 tons per hour, allowing that the stream of coal will average six inches thick. The actual delivery attained will, however, be usually rather less than this, as it is scarcely possible to attain a steady feed to the belt.

Fig. 1 (top) and 2.

A higher delivery can be got by allowing the stream to run thicker, but anything over six inches will prevent proper picking out of the refuse from the coal.

Frequently the belts are fitted with a hinged loading jib, which can be raised or lowered, to deliver the coal into cars below, or into a hopper above, the picking belt floor level. The maximum inclination up which the coal can be conveyed, may be taken as eighteen degrees, but depends largely upon the class of coal being handled. If necessary the angle may be increased by rivetting angles to the plates of the belt, about every four feet, to prevent the coal sliding backward.

A common but unsatisfactory way to fit the links, is to have them all made with single eyes at both ends, and spaced alternately out and in, with long pins passing thro both links, as indicated in figure 1.

This method is unsatisfactory, for the following reasons, first, when it becomes necessary to take out a plate to tighten up the belt, two plates must be removed. Second, the long pins are apt to bend under the pull of the sprockets; are difficult to assemble, as the four holes are never exactly in line; and are so much additional weight to be hauled without any corresponding gain in carrying capacity. The sprocket can only mesh with every alternate link, making the wear on the teeth twice as rapid as it would be if every link meshed with a tooth.

The better method, is to make the links with a double eye at one end and a single eye at the other end, as indicated in figure 2. In this design the pins need only be long enough to pass thro the double eye, are light, easily assembled, and dismantled, and all the plates are alike. As the links are all on the same center lines, the sprocket can have teeth to mesh with every link.

The fit of the chain on the sprocket, with the single eye link, is much inferior to that of the double eye link, and in actual operation the belt fitted with single eye links, has to be kept very tight to prevent the links from jumping the sprocket teeth. A study of figure 3, will show the advantage of this latter type is that the teeth of the sprocket being central, permits the sprocket being reversed when the teeth are worn, thus doubling the useful life of the sprocket.

For handling iron ore or similar material in large heavy lumps, the plates should be reinforced, and a

FIGURE 3

handy way to do this, is to use two plates with a 2" strip of hardwood between them.

When handling very heavy material, it will pay to have belt run entirely on rollers, both on the conveying and return sides. The rollers should be kept inside of the width of the plates, so as not to increase the distance which the pickers have to reach over to pick out the refuse.

### Horse Power Required for Steel Plate Picking Belts.

There has been, so far as I know, no data published, either in the technical journals, or in the catalogs of the makers, upon which to base an estimate of the horse power required for driving the machinery in a colliery bankhead, and I am therefore giving the following figures, based on actual experience, which will serve to give as close an approximation, as the varying conditions will permit, to the actual power required to drive a steel plate picking belt, the error being, if anything, more likely to be over than under the actual amount.

Taking as our basis, the following dimensions, which are in this district, (Nova Scotia) at any rate, practically standard, that is, a width of plate of five feet, and a pitch of links of six inches, the weight per foot of the moving parts, will be about 160 pounds, that is the weight of the plates, links and pins, per lineal foot of

belt. One half of this is on the upper or conveying side, and the other eighty pounds is in the return side. Allowing that the coal on the belt will average about six inches deep, and allowing for voids will weigh forty pounds per cubic foot, we will have per lineal foot of belt, a weight of coal equal to  $5 \times 1 \frac{1}{2} \times 40 = 100$  pounds.

The upper or conveying side of the belt is usually supported on rollers spaced about two feet centers, the plates between the rollers dragging on the flanges of the guard angles, and the pull required to move this upper side is made up as to one half sliding friction between the plates and guard angles and the other half the friction of the roller spindles in their bearings.

The co-efficient of sliding friction for steel on steel, un-lubricating, being .4, and that of the roller spindle bearings .2, the co-efficient of friction for the upper side as a whole may be taken as .3.

The return side of the belt is usually entirely supported by the rollers spaced about four feet apart, and the friction is that due to the load on the roller spindles, the co-efficient of friction being about .2.

The pull required for the loaded side will be . . . . .  $(100+80) \times .3 = 54$

The pull required for the return side will be . . . . .  $80 \times .2 = 16$

Total pull required will be . . . . .  $70$

The usual speed of the belt is 45 feet per minute, and the horse power required at the sprockets, per lineal foot of length of the belt, will be

$$H. P. = \frac{70 \times 45}{33000} = .096$$

Multiplying this figure by the length of the belt, center to center of sprocket shafts, will give the power required at the sprockets, and this amount must be added about 5 p.c., to overcome the friction of the driving gears, bearings, etcetra. For a picking belt of average length (about fifty feet), the total horse power may be taken as about 1 HP per foot of length.

The method of arriving at this figure has been given to enable the reader to make any required modifications made necessary by variations from the standard practise, as given above.

The co-efficients of friction used, are those incurred in starting up the machine from rest, loaded, and may be taken as the maximum under normal conditions. But in wet exposed places, where the bearings may become frozen in extreme cold weather, it is desirable to provide for a momentary over-load of one hundred per cent to start the belt.

When the picking belt is fitted with hinge loading jib, and this is used to load the coal into a storage hopper, above the level of the belt, the extra horse power required when the loading jib is inclined upwards, will be,

$$HP = \frac{w \times h}{33000}$$

Where w= weight of coal delivered in pounds per minute and h= height to which coal is raised in feet.

As the weight of coal delivered, is usually specified in tons per hour, it may be preferable to have the formulæ to use this latter figure and calling

W=weight of coal delivered in tons per hour, the formula becomes

$$\frac{W \times h \times 200}{33000 \times 60} = \frac{W \times h}{990}$$

or, approximately, one-thousandth of a horse power for each ton per hour, raised one foot.

**DEPUTY MINISTER OF MINES ADDRESSES TORONTO BRANCH, C. I. M. & M.**

**Oil discovery is one of great importance.**

Mr. Chas. Camsell, Deputy Minister of Mines, in addressing a meeting of the Toronto branch of the Canadian Institute of Mining and Metallurgy on Saturday last, said that he regarded the discovery of oil at Fort Norman this fall as the most important mineral discovery made in Canada in recent years. Mr. Camsell speaks not only with the authority of Deputy Minister of Mines, but as a geologist who worked many months in the Mackenzie River basin. He knows that there are evidences of oil in many parts of that area, and is confident that further exploration will prove the existence of important oil fields. The well at Fort Norman has been so successful that there is sure now to be vigorous exploration of the promising fields.

The Fort Norman well is reported to have been flowing when capped at the rate of 1,200 to 1,500 barrels per day. It is oil of superior grade.

The oil was found in the Upper Devonian formation. As the Devonian formations are of great extent in the area the territory to be explored is very large. There is every chance that large numbers of wells as good as that at Fort Norman will soon be drilled. The success of the pioneers will attract attention of oil men from all parts of the world.

The Mackenzie oil field is too far away to be a factor in production for some years at least. If exploration proves the presence of large quantities of oil, however, methods will be devised for bringing the oil to market.

Fort Norman is near the Arctic circle, nine hundred miles beyond the end of steel. It is known, however, that the Mackenzie river is navigable for several hundred miles. An extension of the railroad to Slave Lake would made Fort Norman easy of access. The shipping of oil is a problem that is already arousing comment, and feasible routes for pipe lines are being compared.

**Three sea planes for Mackenzie exploration.**

Mr. Chas. Camsell confirms the report that arrangements are being made to use airplanes to convey geologists to their distant fields of work next summer. It has been in some cases possible to do only about six weeks work in distant territories in a summer, the greater part of the field season being taken up in reaching and returning from the far northern areas being explored. It is hoped that by utilizing airplanes of the type used in the trans-continent flight, the geologists will this summer be able to use their time to great advantage.

The planes used will be of the boat type, and of a size to permit the carrying of five men. It should be possible with these sea planes to make Fort Norman easily in a day from the rail end.—R. E. H.

# Northern Ontario Letter

## THE SILVER MINES.

### The Cobalt Field.

A strengthening in the demand for silver during the third week of December has given rise to a more optimistic view of the mining industry in the Cobalt district. An improved power supply as a result of half an inch of rain falling at the beginning of the week has also improved the power situation. Added to this, is an abundant supply of labor for all branches of work.

Wages continue at the highest level in the history of these mines, and up to the present no reductions have taken place. It is learned, however, from the Central Council of Workmen that in order to keep all the mines in operation the men are favorably disposed to negotiate with a view to meeting the operators on reasonable grounds. On this matter, the mine workers have appeared to adopt a most sensible view and it is felt that accordingly as the cost of living recedes the men will be generally agreeable to also accept a reduction in wages.

In connection with the silver situation, one of the most interesting developments is an announcement from Mexico City declaring about one-third of the silver and copper mines of Mexico have been closed down owing to the low price of the metal. It is announced that the cost of mining silver in that country is close to 80 cents an ounce, and the government is taking steps to do what it can to relieve the situation. It is said that about 500,000 workers are threatened with being thrown out of employment, according to a statement issued by the Treasury Department. It is announced relief may be given in the form of presidential decree reducing freight rates and federal taxes and annulling laws restricting the importation of material such as steel, powder, acids and tools.

As compared with the situation in Mexico, the mines of the Cobalt district are about on an equal basis insofar as operating costs are concerned. The leading mines of Cobalt are able to produce their silver at under 60 cents an ounce, but a number of the smaller properties, like many of the Mexican mines, find costs up around 80 cents per ounce. By narrowing down operations and selecting the richer part of their ore, these small mines have continued to operate.

Official announcement is made to the Journal that the Kerr Lake mine will curtail production for the time being. Development work, however, will be continued, and employment thereby provided for as many of the company's employees as possible. The development work will include further work to determine the extent of the three veins of high grade ore opened up at surface last fall and which have not yet been developed underground. Recent reports indicated a general closing down at the Kerr Lake, but manager H. A. Kee, who has just returned from a trip to the head office in New York, corrected the wrong impression.

Announcement is made that the Dominion Reduction plant will curtail operations this week. The plant has been operated chiefly on ore coming from the Kerr Lake mine, and the discontinuance of production from the latter property renders it necessary for the Dominion Reduction to curtail.

A winze is being put down on the Chambers-Ferland property on the vein recently encountered in the cross-cut at the 385-ft. level. The work is several feet below

the floor of the cross-cut and is expected to reach the conglomerate formation this week. The silver so far discovered is continued in small veinlets which extend up into the layer of slate formation in which the cross-cut was passing. These veinlets are believed to be offshoots of a high-grade deposit lying in the conglomerate, and for that reason the present work is considered to be important.

Work has just been commenced on the Haileybury Frontier property in South Lorrain where an effort is to be made to mine the cobalt metal which occurs in large veins. The enterprise has been undertaken by Horace F. Strong, of Haileybury, together with associates of Buffalo. The property lies in the vicinity of the Keeley Silver Mines and it is believed more or less silver may be recovered as a by-product during the course of producing the cobalt metal.

Production of silver from the Nipissing mine for the month of November showed a substantial increase over the October output. This achievement is all the more significant in view of the low price of silver which prevailed, it being kept in mind that the increase for November is shown in dollars and not in the number of ounces produced, the comparison being \$184,578 produced in October and \$190,219 in November.

Hugh Park, manager, makes the following statement to the President and Directors of the Nipissing Company:—

"During the month of November the company mined ore of an estimated value of \$190,219 and shipped bullion and residue from Nipissing and customs ore of an estimated net value of \$232,526. The silver value of the month's production was estimated at 69 cents per ounce as compared with 82 cents in October.

"No new veins of importance were found during the month. Production was obtained from the older stopes, assisted to some extent by development work being done on several small veins on both sides of the Lake.

"The low grade mill treated 6,000 tons. The high grade plant treated 192 tons. The refinery shipped 250,067 fine ounces of bullion. The following is an estimate of production for the month:—

Washing plant . . . . .	\$ 64,130
Low grade mill . . . . .	91,749
Residue . . . . .	34,340
<b>Total . . . . .</b>	<b>\$190,219</b>

As regard the present situation at the Nipissing, the company has shipped 360,933 ounces of bullion, already in December. Also, a dividend of five per cent plus a bonus of equal amount has been declared payable January 20th to shareholders of record Dec. 31st. This double disbursement will call for the distribution of \$600,000.

### Ore and Bullion Shipments.

During the week ended Dec. 17th, two Cobalt companies shipped three cars containing approximately 217,666 pounds of ore. The Coniagas was the heaviest shipper, as shown in the following summary:—

Shipper	Cars	Pds.
Coniagas . . . . .	2	141,393
Bailey . . . . .	1	76,273
<b>Totals . . . . .</b>	<b>3</b>	<b>217,666</b>

During the corresponding period, and including Saturday the 18th, the Nipissing and Mining Corporation were again very heavy shippers of bullion, sending out an aggregate of 252 bars containing 299,852 ounces of silver and divided as follows:—

Shipper	Bars	Ounces
Nipissing . . . . .	153	200,283
Mining Corporation . . . . .	98	99,569
Totals . . . . .	252	299,852

### THE GOLD MINES. The Porcupine District.

Gold miners in the Porcupine field are finding no difficulty in getting all the workmen they require. It is now possible to retain the services of efficient men, and in this way a favorable reflection on mining costs is indicated for the early future.

It is clear, however, that throughout the present winter, costs may not decline to any important extent, the reason being that the operating companies are obliged to go to much added expense in providing auxiliary power. Coal is pouring in and general activity is assured throughout the winter in spite of the hydro-electric shortage.

Preliminary estimates indicate a production of more than 10 million dollars from the three leading Porcupine mines during the year just drawing to a close. This is made up approximately as follows \$6,000,000 from the Hollinger, \$2,050,000 from the McIntyre and about \$2,000,000 from the Dome. In addition to this production, the companies have received upwards of \$1,000,000 in premium on United States funds for which they sold their gold.

Development work on the new orebody on the McIntyre which is believed to be the eastward continuation of the No. 84 vein of the Hollinger is steadily adding to the proven worth of the McIntyre mine. This orebody has a higher average gold content than vein No. 5 which has formerly been the chief source of production from this property. These favorable results are accepted as indicating new possibilities on the Plenaurum property which adjoins the McIntyre on the east, and which is under option to the McIntyre company. In the meantime, the mill on the McIntyre is treating an average of about 500 tons of ore daily and producing about \$170,000 a month. A feature in connection with the company's plans to utilize auxiliary power as much as possible during the winter is a report this week that coal is to be secured from the Blue Diamond coal property at Brule, Alberta, which property is owned jointly by the McIntyre and the Temiskaming Mining Co.

In a statement just sent out by the Clifton-Porcupine Mines, the shareholders are informed as follows:—"Under the financial conditions which have prevailed during the last few months, it has been found impossible to dispose of treasury stock in sufficient quantity to provide the funds to carry on development on an adequate basis. The underwriters of our stocks have carried on an extensive advertising and selling campaign at a considerable loss to themselves in an endeavor to market the stock and provide adequate funds for our treasury. The result, however, has been disappointing.

"Your directors have accordingly deemed it advisable to suspend all operations at the mine for the present, conserving the funds still in the treasury until such time as it is found expedient to resume work. The adverse operating conditions with which gold mines have had to contend during recent years are rapidly being overcome. The labor shortage, which was the biggest handicap, no longer exists. Costs of material are declining. We are accordingly encouraged to be-

lieve that the time is not far distant when money will be more easily obtained for the development of gold mining properties. The results of work so far done give us reason to believe that the Clifton property can be made a profitable gold producer with the expenditure of a further reasonable amount of time and money. It is the intention of the Directors to seize on the first favorable opportunity to complete the financing of the company and proceed with the development of the property."

Employment of hand steel at the Dome Mines has proved to be exceptionally costly and has been discontinued to a large extent. Some of the imported Cornish miners have been engaged on machines and their work is said to be less efficient than the experienced drill runners in this country.

### The Kirkland Lake District.

Production from the three producing mines of the Kirkland Lake district will exceed \$1,000,000 for the year just drawing to a close. Of this the Lake Shore will account for about \$500,000; the Kirkland Lake for about \$300,000 and the Teck-Hughes about \$260,000. Added to this is the big new mill of the Wright-Hargreaves which will be ready to open early in the new year, and with the Tough-Oakes likely to open in the spring. By late summer the Ontario-Kirkland mill will also be ready for operation, and the coming year promises to see the production from this field almost doubled.

Concerning the Boston Creek district, the following summarizes work being done at the leading property:—

An interesting find of almost pure chalcopyrite has just been made in the West cross-cut at the 500-ft. level of the main shaft of the Miller Independence mine. The mineral occurs in the form of a small solid vein lying alongside a vein of calcite. Assays in bulk show 32.48 p.c. copper together with \$2.80 in gold and 1.3 ounces of silver per ton of ore.

This discovery is of particular interest not only because of the comparatively high copper content as well as gold and silver value (pure chalcopyrite assaying 34.6 p.c. copper), but also because it co-relates operation underground to the west at the 500-ft. level with the presence of a copper-bearing vein at the surface in the western party of the property. This vein on surface can be traced in a north-westerly direction through the neighboring properties as far west as the old Patricia mine. Assays on surface, however, have seldom exceeded 3 and 4 p.c. and it is thereby evident the mineralization is increasing with depth.

Work has been resumed on what was the first inclined shaft started, and which is located almost in the middle of the property. This shaft was originally thought to be following the dip of the vein on which it was started, but was subsequently found to flatten to such an extent as to give the impression that it almost followed the strike, and further work here was abandoned. The ore here is rich in both free gold and tellurides and the intention is to clean out the accumulation of rock originally broken and lying in place, then to do some further exploratory work and, with the information thus gained, to follow the ore to depth in the direction of the greatest "dip." A small hoist has already been installed and the work is progressing well.

During the holiday season a small laboratory crushing and testing plant will be installed which will consist of a Sturtevant Crusher, a set of rolls and a small concentrating table. The function of this plant will be to deal with samples of larger bulk than those merely intended for assay.

## British Columbia Letter

The standardization of equipment used in coal mines for rescue purposes, which was proposed by Hon. Wm. Sloan, Minister of Mines for British Columbia, in correspondence with the United States Bureau of Mines, probably will be discussed at a conference held next Summer during the Annual International Mine Rescue and First Aid Meet.

There has been no decision as yet regarding the date or the place at which this Meet will take place, but it is expected to be arranged for the early part of September somewhere in the Middle States. The suggested Conference will be attended by representatives both of the operators and the miners associated with the coal mining industry. They will come from the United States and Canada. Mr. Sloan, who stands as sponsor of the idea, is likely to be present with one or more officials of his department.

Discussion will centre, not so much on the possibility of fixing on a single type of Mine Rescue Apparatus, as on the possibility of establishing a standard, acceptable internationally, for the training of men in the use of such Apparatus. That it is out of the question to take any instrument and arbitrarily say it is the last word and must be used to the exclusion of all other types is admitted. Action of that kind would mean the throttling of competition and the strifling of the ambitions of those who are constantly striving to improve the protective machines used by miners who venture into deadly underground air to rescue their fellowmen. It is not that end that the Conference has in view, but the exchanging of ideas in the hope that it may be possible to adopt in America a simple formula, recognized in collieries wherever situated on the continent, for the training of men in mine rescue work.

Mr. Sloan feels that an improvement along these lines can be arrived at. He does not presume to say definitely what, in his opinion, should be done but, broadly, his views are those outlined. He is confident, as also are the officials of the United States Bureau of Mines, that much good will come from the contemplated informal round-table discussion.

David Brown has resigned his position as Manager of the Reserve Mine of the Canadian Western Fuel Co. in order to accept a leading and active part in the development of new coal fields situated north of the City of Kamloops.

Recent oil discoveries in the Mackenzie River basin, Northwestern Canada, have caused considerable stir throughout the Dominion. The first party of what is likely to develop into a rush of oil prospectors into this region, has been passed through the hands of the Royal Northwest Mounted Police. The northern patrols of this organization has been charged with seeing that no one goes through their lines who is not experienced in northern travel and who lacks the equipment necessary to life during the winter. The attention of frontiersmen at present is centred on the Great Slave Lake and Fort Norman section where oil has actually, according to authentic reports, been found in commercial quantities.

But this part of the Canadian Northwest is not the only district attractive to oil hunters. There is a report that a representative of the Imperial Oil Co. has made application for the lease of approximately 10,000 acres of land situated near the confluence of

the Pouce Coupé and Peace Rivers, where indications are impressive. Development is planned for next season in this locality and, as a result, others are looking to the same region.

The Dominion Government has passed an order-in-council limiting the amount of oil land that may be held by lease to 640 acres. Whether this was passed before or after the Imperial Oil Co's application already referred to is not known. If the regulation became law before the Company's action the alienation of 10,000 acres in one swoop is out of the question and the chances of the individual prospector are improved.

That the incorporation of the Mackenzie River Petroleum Co. Ltd., has been decided upon is announced. This concern will ask for power for the production and storage of oil and natural gas and for authority to transport and market the same. It also will require of the Dominion Government the power required to construct a pipe line from a point near the mouth of Rat River near its junction with the Peel, a tributary of the Mackenzie River. The project, it is understood, contemplates the carrying of the pipe line through Alaska to tidewater at St. Michel, or somewhere in that vicinity.

## A Montreal Letter

By ALEXANDER GRAY  
Flotation Recovery of Coal Fines.

How flotation has progressed since physicists, chemists—and lawyers—busied themselves with the "phenomena of froths!"

Less than twenty years ago economists began to think about the wastage of minerals. Prior to that sapient mining men waived whatever was problematical, accepted losses in recovery, preferred the "simple life."

About the time John Ballot, a through-going, courteous Cape Colonial, was in continuous session with Henry Livingstone. Sulman, in London not Germany, when flotation was deemed too nebulous for financiers to consider. I have vivid recollection of an effort to induce Old Country coal owners to adopt modern practice in the cleaning and classification of their coals.

A plain-spoken Pennsylvanian, whose jigs and washing apparatus were in use at 1,100 plants in the "Keystone," "Buckeye," and adjoining States, thought he could learn something by visiting English, Scottish and Welsh collieries. He told me what his mechanism had accomplished. I told him to "pick out the dirtiest coal country" in the United Kingdom.

When he returned to London, after being to Scotland, Staffordshire, and elsewhere, his report was: "I've seen more of waste and of slavery than I thought would ever be permitted — women and children in the mines and on picking belts — coal that can be saved going to waste heaps, and obsolete machinery we began to discard in the States a quarter of a century ago."

To the best of my recollection, one washer of German origin, had been installed in Staffordshire! The response of several coal owners to the suggestion that too much coal was going to waste, was "We've got all the coal business we can handle, and we don't have to clean our coal." When we gave the Manager of the "dirtiest" colliery a demonstration, and presented him with a coking product from what was going to his heaps, in reality, 25 per cent of the total tonnage raised was going to those heaps. He was incredulous, but he also declined to pay us a shilling a ton for all we saved

of what was then being wasted. He was calmly, very much so, and rather than supplicate Mr. Lloyd George, then in the Home Office, to take up the matter of "slavery" and waste as a national economy, the Pennsylvanian practical genius betook himself to Tamaqua.

Ludicrous hardly expresses our feelings when the Scot saw the 4 and 6 per cent. ash classifications we handed to him as examples of what he was putting to waste and he dubiously declared he had his "doots."

In the meanwhile, altered conditions have arisen in every "black country" — coal has become a necessitous luxury — and flotation, the "visionary" ideal of the earlier years of this country, promises to effect a more radical departure than the Pennsylvanian proposed. If scrap heaps and garbage piles are no longer despicable, why not the millions of tons of "waste," discarded as such by coal operators? The Mineral Separation Scientists having effected notable savings with sulphide ores, evidently sought new mining "worlds to conquer"; for the latest technical journals from London contain the following account of the company meeting held there on November 24, the remarks being those of Chairman Francis L. Gibbs:

"We have come to an agreement with the Powell Duffryn Company, of South Wales, under which they have granted to us an option over all the waste heaps and current waste belonging to them in the Aberdare Valley, and the option provides that this material may be treated on a large scale under a half joint account arrangement between the Powell Duffryn Company and ourselves. A pilot plant on a commercial scale has been erected at Aberaman for carrying out exhaustive tests on this material. The cost of this plant and the testing work are being equally borne by the Powell Duffryn Company and ourselves. The quantity of material under option to us under this arrangement is very large, and we anticipate that this enterprise will eventually become a very important one.

Plants are in the course of erection under agreement with the Ashington Coal Company in Durham, and at the Kirkby works of the Midland Coal Products, Ltd., and a plant of considerable size will also in the near future be erected at the East Bristol Collieries. In addition to these, numerous other collieries are in negotiation with us for the erection of plants. One of the most important agreements which we have completed is with the Skinningrove Iron Company for the treatment of their coking coal. The decision to put in this plant was arrived at by that company after extensive experiments had been carried out in our London laboratory and at their works in the North of England.

#### Options on Millions of Tons.

We are also engaged in the examination of many large waste heaps in various parts of the country, and some of these show promise of a large business on sound commercial lines being developed. The waste coal heaps over which we have acquired options amount to several millions of tons, and negotiations are now being conducted for further quantities of this material. Systematic and thorough sampling of the heaps is essential in every case, and our engineers are already engaged upon this important work. We anticipate that it will not be long now before we shall be in a position to form an estimate of the commercial value of what we have under examination, and although, of course, we must expect that some of this raw material will not contain sufficient coal to treat profitably, we have good reason to suppose that many of these heaps will prove to be very profitable.

"Our coal business is also gaining ground abroad. In France a pilot plant with a capacity of 100 tons in 24 hours, is almost completed at the Noeux property of Vicoigne and Noeux, the great French colliery owners. This agreement was made by Minerals et Metaux, our agents in France. In Spain a new company in which we hold a large interest has been formed, and, as is subsequently mentioned in my speech, is making very satisfactory progress. In China the Chinese Engineering and Mining Company is about to instal a plant of 250 tons daily capacity, and one of our engineers is now on his way to China in order to take charge of the erection and subsequent operations of this plant. All these plants at home and abroad which I have referred to will at a later date, it is anticipated, be replaced by plants having a very much larger capacity.

The foregoing represents a short summary of our coal business to date, and I may add that we have been, and are being, approached by very many of the large colliery owners in Great Britain, and that we have important proposals for the adoption of our coal-washing methods before us from the Brazilian Government and from collieries in South Africa, India, Japan and elsewhere. Our coal business may therefore, even at this early stage, be safely said to have become established."

#### In the Sump.

"The Canada Copper plant at Allenby, B.C., has shut down." Metal markets have collapsed.

Casualty stations are being crowded.

The "Bannister" route-gravity incline or whatever those who are heading for the sump may choose to term it, is expeditions, if magnified.

Those who craved deflation are getting it with variations. No stabilizer having been invented to keep prices in the upper air when those who went on strike against the high cost of everything declined to "pay, pay, pay," only associated Bankers complacently affirm that "the earth and the fullness thereof" are here in form and substance.

Part of which is sedative, but most of which is otherwise.

The process has all the attributes of the "refinement of cruelty." With rare exceptions metals cannot be produced for current market prices. Inventories will not be carried by banking accommodations. With the holiday season over, surplus stocks it is thought, will have to be jettisoned. There is more emergent selling — and only emergent buying — yet the farmers will have it that speculators have forced down staples until it is unprofitable to raise them.

"Vengeance is mine," says the Liquidator. The era of inflation has been rudely ended. Even creditor nations tobogganed things, the "bannister" being inadequate for what was toppling.

"Wages will be the last to fall," was the forecast of Judge Gary. That was some time ago. Unemployment has intervened. "Take it or leave it," wage is being proffered those who do not wish to remain idle.

There is one certain element: The bargain hunter is alert. He seeks plums and usually takes the ripe ones. Canada, however, distraught in some respects, has the greatest nickel and asbestos mines; the largest gold mine; the biggest lead-zinc mine, and one or two more coming along; an abundance of iron and coal on our eastern shore and more coal than can be availed of in the West, — to say nothing of its silver mines, — so, with solvent banks and the sinews of industrial warfare, "we should worry!"

# SAFETY MINE CAGES MADE TO FIT YOUR SHAFT

We build these Cages to suit you and your workman. They are Safe, Strong and Reliable.

CONFORMING TO ALL  
GOVERNMENTAL RULES  
AND REGULATIONS

Showing Cage with One Set of Doors only. Note the door fastening — absolutely safe and strong enough for hard usage. Note also the hand holds for the passengers, to steady them in the swift descent.

Showing Cage with Two Sets of doors, and rails in floor for Ore Car. Note the Safety Device—simple, effective, strong and dependable. It works every time, protecting lives and property in case of accident.

Cage with Two Sets of Doors, opened to show the door latches, etc. Note also the top doors—useful for carrying long timbers, or for escape of the passengers in case the cable breaks

The Dogs cannot fail to grip the timbers and hold the cage.

## DECLINE OF FATALITY RATE IN BRITISH COAL MINES.

The following diagram is reproduced from Part II of the Annual Mines and Quarries Report of the Home Office in Great Britain.

It shows the average quinquennial death-rates from various causes of accident in and about the mines, regulated under the Coal Mines Act, from 1873 to 1917, and the annual death-rate for the years 1918 and 1919.

The curves provide a first-class argument for stringent regulation and inspection of coal mines, and are moreover a tribute to the management of the coal mines. They provide also an excellent refutation of the charges made against colliery management before the Sankey Commission. In considering this record, it should be remembered that a modern colliery, having large air-courses, extensive workings, high-velocity ventilation currents, great depth and intensified underground traffic, and containing large numbers of workers, provides a much greater scope for disastrous explosion than the mines of the period from 1873 to the beginning of the Twentieth Century, which were relatively small, unpopulated, shallow, and in many cases provided with an atmosphere sluggish and barely able to support combustion. The curves on the diagram relate to the following:—A =

explosions of firedamp and coal dust; B = falls of ground; C = shaft accidents; D = miscellaneous underground; E = accidents from all causes underground; F = surface accidents; G = general death-rate under- and above-ground.

**TORONTO MINING QUOTATIONS.**

**COAL PRICES.**

**Toronto.**—Demand is slack and little business is being done. Following prices are representative, smokeless \$9.50 to \$10.00; slack, \$8.50 to \$8.75; lump, \$9.00 to \$10.00. Anthracite is \$8 to \$12 at the mines.

**Montreal.**—Bituminous is offered at \$14.50 at the coal yards, to which carting costs are to be added. Anthracite is selling at \$18.75 delivered to customers. Bituminous prices are likely to decline, and some deliveries are being obtained on contracts made last Spring, but which have remained unfulfilled owing to the preference of the mines to do business at higher prices obtainable. The treatment of Canadian buyers by the mines in the United States indicates that these so-called "contracts" have little real binding power. Pool prices at the mines range from as low as \$3.00 to \$5.00, the average being around \$3.75. Saward's Journal, of New York, states that some operators are closing down rather than sell coal at the prices it will command at present, and that "operators have been able to keep going by shipping heavily on contracts when "spot" orders were not forthcoming." Truly the conception of what constitutes a contract must differ across the line from the Canadian idea.

**COPPER DEPOSITS IN WESTERN IDAHO.**

We are in receipt of a copy of a Report of the "Copper Deposits of the Seven Devils and Adjacent Districts," published by the Bureau of Mines & Geology of Idaho in co-operation with the U. S. Geological Survey. Prof. Francis A. Thomson, of the University of Idaho at Moscow, is Secretary of the Bureau, and the Report in question is Bulletin No. 1.

The Seven Devils Quadrangle in the Snake River Copper Belt was examined in the Summer of 1919, up to which date no topographic mapping had been undertaken in the quadrangle by the U. S. Geological Survey. The work is stated to have been unique in that triangulation and level control, topographic and geological mapping were all done for the first time in the district, and in one season.

The country examined is said to possess the most rugged relief in the United States, a fall of 7,500 feet in less than six miles, the last 2,000 feet of the fall almost vertical, being mentioned as typical of the district, of which the Snake River Canyon is a prominent and most scenic feature.

The ore deposits are classifiable under four heads, namely, mineralized shear zones, fissure veins, disseminated deposits of large size, and contact metamorphic deposits, from which last-named type the copper so far produced by the district has come.

The origin of the ores and their petrological characteristics are fully described and illustrated by microphotographs. Gold and silver are associated with the copper ores.

One of the deposits, the Red Ledge occurrence, described as a typical disseminated sulphide ore-body, of low-grade but very large dimensions, is remotely and difficultly situated. The genesis of this ore-body is given much consideration, and to those who are interested in ore bodies in Canada, of similar nature, this first Bulletin of the Idaho Bureau of Mines, apart from its definite economic importance to Idaho, appears to have importance of a wider character; and, with the courtesy that is a pleasant characteristic of the professional relations of mining scientists in North America, will doubtless be forwarded to any reader in Canada who desires to peruse it.

## EDITORIAL

### Coal Production During 1920 Highest in Canadian History

While the statistics of coal output in Canada during 1920 are only available in very approximate form, they indicate a production of between 14 and 14½ million long tons. This is a million tons larger than the record production of 1913 and the only slightly smaller production of 1918.

A recovery of almost two million tons from the disappointingly small production of 1919, and a betterment of the best previous years by a million tons, is the most unreservedly satisfactory feature of mining in Canada during 1920. Canada's coal supply has been the weakest part of her economic structure, and the most malignant menace to her national independence.

The improvement in coal production is more interesting as a psychological reflex than as an achievement in production. In the last-named regard it is indeed nothing to crack about, the actual production being disproportionately small compared with the country's ability to produce coal. As an index to the general attitude of Canada towards coal supply it has much interest because it indicates the inculcation of a coal conscience in our population.

Canada has had some broad hints in regard to her coal insufficiency. Periodic panics reflected in coal selling prices, fuel controllerships, rationing of coal, official appeals to Washington, cavillings and heart-burnings, ill-considered restrictions on coal exports may be mentioned, but probably the broadest hint is a nineteen percent discount on the Canadian dollar in New York, to which our importations—quite unnecessary importations—of coal are a major contributory cause.

In the period from 1914 to 1920, seven years, Canada produced from her own mines twenty million tons less than their capacity, and by doing so increased her adverse trade balance by two hundred million dollars, and greatly increased the price of coal to the consumer in the Dominion.

The war and its aftermath has had a revealing effect upon the regional use and distribution of Canadian

coals. When Sir George Foster called his first coal conference in 1917 it was amusingly plain that the use of western coal was regarded by western people as a temerarious experiment, and it was a little difficult for the men who came from the bituminous coal-fields of British Columbia and Nova Scotia to understand the trepidation with which the use of bituminous coal for domestic purposes was regarded by those who had learned to depend utterly upon anthracite as a domestic fuel. The recent meeting of the Canadian Institute of Mining and Metallurgy disclosed the gratifying fact that in Winnipeg and district in 1920 no less than eighty percent of the fuel requirements were being supplied from the western mines. The extension of the radius of consumption of western coal during 1920 was so great, and so contradictory of some previously held opinions that it is fair to assume the ultimate radius of distribution and use of western coal has not been reached.

In reviewing the outputs of the three main coal districts of Canada, namely, British Columbia, the Prairie Provinces and the Maritime Provinces, it is evident that Alberta's contribution is chiefly to be thanked for the good showing of 1920, and it is further evident that Alberta has now definitely assumed the lead in coal production among the provinces.

There is one serious drawback to Alberta coal mining, as now practised, namely, a too great preponderance of small mines. The waste of capital, the over-extension of supervision and corporate organizations, the spoiling of the coal areas by letting in water and making many holes in the cover, and the general uneconomy of such methods is strikingly reminiscent of Nova Scotia before the formation of the Dominion Coal Company. It is evident that Alberta is passing through a formative period in regard to its coal trade, and that before really important progress can be made it will be necessary for the coal areas to get into the hands of large companies.

We believe the record of the western coal trade in 1920 is definite confirmation of a statement tentatively

put forward by the Editor at the Toronto Meeting of the Institute in the Spring, namely, that West of Fort William, Canada can be self-supplying in coal fuel.

In Nova Scotia, production, while notably improved, still lags some two million tons below the output capacity of 1913, and as yet the St. Lawrence markets are being supplied from the United States. It seems a reasonable ambition for the coal trade in Nova Scotia to supply all the coal required by the Maritime Provinces, Quebec, and a portion of Eastern Ontario.

The cost of living in Canada, the success of manufactures, the movement of crops and the markets of the farmers, the rate of exchange and the general freedom of our national functions depend more upon the tonnage of bituminous coal available and its selling price than upon any other economic fact. If the large users of coal, and the government of Canada, ever undertook to study the prime importance of coal, solicitude and fostering care would supersede the traditional neglect that has been the fate of the coal industry in Canada since its dawning in the early years of last century. We have a coal industry in Canada that antedates the discovery that anthracite would burn. Canada exported coal when Chicago was a swamp, and before the Mississippi had been mapped. During all that period we have looked to the United States for coal supply first, and to Canadian coal mines have given secondary and contemptuous consideration.

If the 1920 figures indicate a new attitude towards coal mining in the Dominion it will also indicate that Canada intends to write a new and better industrial record than that of the past.

#### DEPRESSION IN THE CANADIAN STEEL TRADE.

The Steel trade in Canada is badly depressed as the year closes. This is particularly so in regard to pig-iron and steel ingot production. In the fabrication trades, such as the car-works, structural steel mills, foundries, etc., the depression is not so marked. The lowering of steel prices in the United States, and the better transportation service now being given by the railways, has rather tended to assist the secondary iron and steel industries in Canada, but it is having a very different effect on primary steel and iron producers in the Dominion.

The blast-furnace and open-hearths of the Nova Scotia Steel and Coal Company at Sydney Mines are closed down. At Sydney, only one blast furnace is operating, and while some hindrance to operations proceeds from the strike of the railwaymen on the Steel Plant, the lack of orders is actually the major cause of the slackness of work. The Plate Mill is working to finish up some orders of small dimensions, and there is a prospect of rail orders, but the outlook for business is not good.

The Welland Works of the Electric Steel & Metals Company has definitely ceased operations. The Steel

Company of Canada, and the Algoma Steel Company have both found it necessary to curtail producing operations drastically.

The shipbuilding companies, with one or two exceptions, have no business in prospect when present orders are filled, and those shipbuilding yards that possessed least of the elements of permanence have already closed down or gone into liquidation.

The condition of affairs is very similar to that which existed in the coal trade in the Spring of 1919. At that time there was an apparent lack of demand, but actually there was a world shortage of coal. The lack of demand for steel today does not arise from over-production, but from purchasing inability, and also, to a very large extent, is attributable to an abstention from buying by large users of steel on this continent in expectation of lower prices. In Europe two factors are working together to present an appearance of over-production which is essentially misleading. These are the recovery of the steel producing capacity of Germany and Belgium, and the poverty of Europe generally. Actually, we believe, the world is very very short of steel of all descriptions, and is especially short of steel railway rails.

So far as America is concerned, the long-continued cessation of immigration, and the measures now being taken to restrict immigration — which we believe will be later regarded as ill-advised and the result of immature consideration — are likely to act as restraints on production, which, added to the losses in population which the world has suffered in recent years, by war, famine, pestilence and the decrease of the birth-rate, will before long manifest itself in unmistakable fashion. The fact that there has been a large drop in the prices, and in the demand for such things as wheat, sugar, steel and cotton, does not do away with the fact that the world is lacking a full supply of these commodities, and that the hands to produce these supplies in the near future are lacking, because some are dead and others will not be born.

When the steel market revives, it will do so with over-night suddenness, and the demand will be found to be insistent and large and requiring a long period of time to satisfy.

#### THE COMING ACTIVITIES OF THE CANADIAN INSTITUTE OF MINING & METALLURGY.

During the next few months the Canadian Institute of Mining and Metallurgy has a programme of great activity. When the meetings in prospect are over, and the meeting of October 25th in Winnipeg is included, it will be apparent that the Institute can justly claim to cover Canada thoroughly and representatively. At Winnipeg, the Institute was officially welcomed by the Attorney-General on behalf of the Premier of Manitoba, and in the deliberations of the Meeting, it was found that the Institute provided an influential and respected medium through which the needs of the

newly-born mining industry of Manitoba could put its needs before the Federal Government—and, what is more to the point—get them attended to.

The Annual General Meeting of the Institute is to be held in Ottawa, and, has been usual in former meetings in the Dominion Capital, the presence of the members of the Institute there will doubtless receive official cognisance. While no programme of the Ottawa meeting is yet available, the efficiency of the Ottawa Branch is traditional, and with the presence of loyal and long-tried supporters of the Institute in high places there, the members will look forward to the Ottawa gathering with pleasurable anticipation.

The Mining Society of Nova Scotia intends to hold its Annual Meeting in Halifax, probably in April, and it is the desire of the members of the Mining Society, who are also members of the Institute, to have the Halifax Meeting looked upon as the Eastern Meeting of the Institute; as the Vancouver Meeting was regarded as the Western Meeting, and as the Winnipeg Meeting served to display the banner of the Institute in the midst of the embattled farmers in the Middle West—first cousins of the miner and sons of the soil like the miner, with some of the miner's little peculiarities of clannishness.

Halifax is the seat of government in Nova Scotia, one of the oldest Capitals of the Dominion, and since the Canadian Mining Institute—as it was then—held a memorable and festive function in that City, much has happened. Halifax is no longer somnolent, and should it ever occur to anyone to write a true account of Halifax's wartime experiences, there would be in that volume much to astonish and much to enthuse the people of Canada. The Mining Society of Nova Scotia was moved from Halifax in 1914, and no meeting has since been held in that City. The interval has been longer than was intended, but this has partly been due to the war. It is quite certain that Halifax will welcome the idea of holding an Eastern Meeting of the Institute in Canada, and that the Local Government will join in that welcome.

The last annual meeting of the Mining Society of Nova Scotia, held in Glace Bay, was marked by technical papers of unusual excellence, papers that were re-produced in the mining journals of the whole world, and added not only to the excellence of the Annual Transactions of the Institute, but gave it wide advertisement. Papers of equal excellence may be looked for at the next meeting, and it is hoped by the Council of the Mining Society of Nova Scotia that a large attendance of Institute members and officers will be present from Montreal, Ottawa and Toronto.

An Institute that can within half a year compass successful meetings attended by representative mining men in the Far West, the Middle West, Ottawa and the Far East of Canada, and hope to receive the official welcome of the government at each centre, is justified in its existence, in pride in its achievements and in desire to still further extend its influence and widen

its membership.

This statement perhaps may be objected to as slightly previous and as assuming that the Ottawa and Halifax Meetings of the Institute will be entirely successful. We will, however, persist in venturing the assumption.

---

### SCIENTIFIC HONORS.

It is traditional in learned and technical societies of national repute and long standing to award medals and other insignia of honor to members who have distinguished themselves in professional duties or have added some notable contribution to technical literature. The Canadian Mining Institute has not as yet considered itself in a position to make such awards, but possibly the time has arrived when their institution should be considered. The members of the Institute include some wealthy men, and include also men of sufficient technical distinction to enable discriminating adjudication of such awards were they available. We commend this suggestion to the consideration of those members of the Institute who have found mining lucrative and wish to leave a permanent memorial of their membership.

When titular honors are denied to scientific achievement by our legislators, who apparently are unable to distinguish between achievement and notoriety, some mark of appreciation should be available by which scientists and technologists in Canada can be honored at home. There are men living and moving amongst us today whose names will be spoken by our children as we speak of Logan and Dawson, of Van Horne and Strathcona, but the country that bore them does not know their fame.

---

### NEW SECRETARY FOR THE INSTITUTE.

The "Journal" learns unofficially that Mr. Geo. C. Mackenzie, formerly Secretary of the Munitions Resources Commission at Ottawa, and up till recently President of the Electric Steel & Metals Company of Welland, Ont., has been appointed Secretary of the Canadian Institute of Mining & Metallurgy, and will commence his duties at headquarters in Montreal with the week beginning the 3rd January.

The "Journal" believes Mr. Mackenzie to be admirably fitted for the position he has taken. His task is not an easy one, but it will have the inspiration of being one of over-growing importance and prestige. It will not be possible to suit everybody in the Institute. That would test the capacity of a sublimated archangel, but the members individually and as a whole are loyal hard-working men who have traditionally supported the Secretary, their differences of opinion arising from a common desire to make the Institute larger in numbers and more successful in its policies.

We tender our good wishes to the new Secretary,

and shall be happy to assist the progress of the Institute by every means that is open to us. Mr. MacKenzie is just in time to engage in a very busy six months, as we have elsewhere noted.

### PROTECTIVE TARIFF AND THE COST OF LIVING.

The Freetrader affirms that tariffs on imported manufactured goods restrict the growth of primary industries by raising the costs of livelihood of the workers.

Put in another way, the argument is that the whole evil of import tariffs resides in the high rate of wages necessitated by the tariff impost, which forbids the full use of labor in the production of basic raw materials. This is to predicate that the first desideratum for the production of such commodities as wheat, potatoes, coal and iron-ore is cheap labor.

Actually, however, it is not the cheapness of labor, but its abundance and its quality that determines the cost of producing primary materials. Relative to the United States, we have always had cheap labor in Canada, but the condition has not been one that advanced our productivity as a nation, but the reverse, for the higher wages paid in the United States have for generations drained Canada of its young people, and have diverted year after year the tide of European emigration to the country of our neighbors. Now whether the high wages paid in the United States were and are a result of protective tariffs there may be much debate, but high wages and protection have endured so long together in the United States that they are inseparable in the public mind. So ingrained is this sentiment that any proposal to reduce import tariffs on manufactured goods is regarded as a threat against wages and employment—and, apart from effect of specific action to reduce import tariff—the psychological effect on a working population is to induce alarm and a desire to leave a threatened territory. In some respects it may even be that this state of mind brings about the very effects that are dreaded, but, whether this be so or not, tariff charges are unsettling, and not lightly to be courted.

While the effect of high wages may be negated by high living costs, there is nevertheless a decided satisfaction in the receipt of a high wage, for its usual accompaniment is a more luxurious standard of living. This is a feature that should not be overlooked by a country that is in the market for labor.

In Canada, at any time when protective tariffs have been at their highest, they never reached the point of effectiveness in raising living costs, and thereby necessitating high remuneration of labor, that the causes arising out of the war have done. If import tariffs have had any real effect on living costs and

wages during the past few years, that effect has been in the direction of lowering prices by American importers in an attempt to offset the influence of the heavy discount on Canadian funds in New York. The discount on our dollar has been a much more potent deterrent to imports into Canada from the United States than any item on our tariff schedule. Similarly no import tariff of any outside country has been such a deterrent to Canadian exports as the existing discount of all other currencies in favor of Canada—with the sole exception of the United States. There is no doubt about the demand for Canadian goods, but the drawback is the price that we ask for exported goods. Are we to lower our import tariffs with the expectation that by reason of consequent lowered living costs we shall be able to compete in European markets?

Such a course might be suggested, were it not that the economic weight of the United States would find no barrier against it in Canada, and—except in those few instances where a superior combination of location and materials in Canada dictated an opposite course, manufacturing in North America would concentrate around the great central coalfield of the United States.

The policy of protective tariffs in Canada has been adopted to help out our national deficiencies. As a nation Canadians have been the victims of hypnotism arising from constant iteration of the vastness of our natural resources, but, compared with the country of the United States, Canada presents vast extents which are chiefly remarkable for the paucity of their natural resources. Canada's problem consists in the intensification of the utilisation of domestic resources of inferior grade and difficult location, in competition with resources of the United States which are ideally located and of excellent grade, and the chief compulsion to adopt protective tariffs in Canada comes from the necessity to offset the economic deficiencies under which we labor in the attempt to perpetuate and consolidate our political independence in North America.

To be quite frank about this matter, is it not fairly evident that Canada can only avoid political absorption by the United States by achieving economic independence? There is no question of annexation sentiment, emanating from one side or the other, implied in this statement. It is a statement of the inexorable trend of economic conditions, which always gives political power to those nations that possess (or utilise, which is an equivalent thing) essential raw materials.

Our problem, therefore, is to maintain high wages in Canada, a high standard of living, and that extent of tariff protection that shall put us in the best bargaining position, and shall best avail to protect Canadian nationality and Canadian political independence. If tariffs should cause high living costs and high wages is that—for Canada—essentially an evil thing?

From "Iron & Steel of Canada".

# Coal Mining in Nova Scotia During 1920

(By the Editor)

Last year's review of the coal trade of Nova Scotia (issue Jan. 7th 1920), forecasted that with uninterrupted work and no major accidents or delays, the output of coal in 1920 might reach 5,750,000 or even 6,000,000 tons. The year has seen no material interruptions to steady work, and has fortunately been free from disasters, yet the output will probably not be found to exceed 5,600,000 tons. The reason why production has not been greater is to be found in the still continuing shortage—or lessened number—of men employed in cutting coal at the working face. The number of men employed in the non-productive and auxiliary operations of handling the coal to pit-mouth and preparing it for market, and on the surface, is in excess of the number required to give an economical balancing of the working forces as a whole.

A calculation of the number of men employed in 1916 at the coal face, and the number now so employed, would disclose that the percentage of reduction in output is identical with the percentage of reduction in the number of faceworkers. Until the number of faceworkers is restored to the figures of 1916 it will be found impossible to restore production to the previous maximum. The questions of the provision of equipment, or of the condition of the existing equipment, does not bear on production in Nova Scotia, as in all cases the equipment is greater and better than it has ever been, and at no time during the year has any difficulty ever been experienced in taking away all the coal that could be produced by the workers at the coal face.

The question of pit-room is probably not quite so satisfactory, as the continued and unrelieved shortage of face-workers since 1916 has restricted the amount of development work. It is an axiom in coal-mining that arrears of development work can only be overtaken with great difficulty, if at all.

The year 1920, has however been quite remarkable for the amount of underground development, and for the work done in testing virgin seams, both by drilling and by surface openings and prospect pits. The knowledge of the coal operators of their areas is probably wider and more accurate at the end of 1920 than at any previous time, particularly in regard to submarine workings. The course of certain undersea disturbances, and the "lay" of the submarine coal seams is more accurately known now than ever before. It is understood that the Geological Survey has detailed a paleontologist to study the fossils of the Sydney district, and that some microscopic examination of the coal seams is contemplated. Some work on topography is also likely to be undertaken, supplementing that done by Dr. A. O. Hayes before he left the service of the Survey. There is probably not in all Canada an industrial area of such importance as the Sydney coal-field that has received less attention in recent years from the Geological Survey. A thorough topographical survey, accompanied by much-needed revision of the geological sheets, on a scale as elaborate as that of the Nanaimo, Vancouver Island, sheets, would be of much assistance to the mining engineers in Nova Scotia, and is years overdue. A new topographical sheet of the Pictou district was issued by the Geological Survey during the year, and has proved very welcome.

The Government of Alberta, through the staff of the University of Edmonton, is undertaking a comprehensive study of the origin and occurrence of the Alberta coals and of their combustion qualities. Some of the best equipped scientists in Canada have been retained by Alberta for this work, and it is not without interest to Nova Scotia to know that one or two of these gentlemen obtained their initial coal experience there.

## Trend of Production.

The trend of production is shown by the table following :

	Output (Long tons)	Percentage of decline from 1913	Percentage of Cape Breton Production
1913 . . . . .	7,263,485	.....	81½%
1914 . . . . .	6,650,031	8½%	81½%
1915 . . . . .	6,709,951	7½%	82½%
1916 . . . . .	6,171,434	15%	81½%
1917 . . . . .	5,665,477	22%	77%
1918 . . . . .	5,211,000	28%	77%
1919 . . . . .	5,160,000	29%	75%
1920 . . . . .	5,600,000 est.	23%	75%

This table discloses that a definite upturn in production is under way, and that the shortage of skilled miners, so often referred to, in this and previous annual reviews, has chiefly affected Cape Breton Island.

The production of the leading operators, with a rough approximation of the aggregate output of the smaller companies which probably errs on the conservative side, compares with 1919 as under:

	1919	1920
	(Long Tons)	
Dominion Coal Company		
Cape Breton Collieries . . . . .	3,087,638	3,250,000
Springhill Mines . . . . .	393,441	420,000
Nova Scotia Steel & Coal Co.	552,044	625,000
Acadia Coal Company . . . . .	407,326	502,000
Intercolonial Coal Mining Co.	184,417	160,000
Inverness Railway & Collieries	138,388	186,000
Other Operators . . . . .	395,749	457,000
	<hr/>	<hr/>
	5,160,000	5,600,000

## Dominion Coal Company.

As was pointed out in the 1919 Review, the Dominion Coal Company's Cape Breton production has suffered not only from a greater disturbance of the balance of the working force than any other company experienced—arising from the large number of men that enlisted from Cape Breton Island—but the shortage of miners has coincided with an impairment of the capacity of the mines for output that was known to be impending in 1913, but which the conditions of the war period did not permit to be offset by the necessary new undertakings. When men were available in 1914 and 1915, expenditures could not be undertaken because of trade depression; and later, when money was available, men were not, and deliveries of machinery and construction materials had to defer to munitions priorities.

During the past two years, however, the Dominion Coal Company has accomplished many improvements, some of which are as follows. The underground haulage and pumping systems of No. 2 and 9 collieries have

been remodelled, electrically operated endless haulages having been substituted for a rather clumsy combination of compressed-air locomotives and several auxiliary haulages that necessitated many shifts of the load. Concentration and electrification of the pumping arrangements has also been completed.

A new shaft is being sunk between Nos. 1 and 2 collieries, close to the shore, which will serve as an intermediary shaft for the winning of the Phalen Seam in this vicinity and seawards, and will also materially shorten the distances that the workmen have to walk to work. Centralized pumping operations are also projected in this area.

A new colliery on the Emery Seam, No. 24, has been developed during the year and is now producing between 300 and 400 tons daily. No 17 Colliery has also become a producer during 1920, although partially developed and equipped in 1914.

Additional openings are understood to be projected upon the lower seams in the land area of the Glace Bay district during 1921.

The Morien shafts were unwatered, and some machinery installed there, but intensive development of this property which has large tributary sea areas—has been deferred. Production from the Cape Breton collieries is now close upon 300,000 tons monthly, and it is probable that the output in 1921 may reach 3,750,000 tons.

#### **Nova Scotia Steel & Coal Company.**

A satisfactory recovery in outputs was made by the Scotia collieries in 1920, and production is now at the rate of 60,000 tons monthly. A new colliery is being opened in the Bonar Point district that is expected to be a substantial producer in the Spring of 1921. Very satisfactory results are understood to have been obtained from the testing operations on the Stubbert Seam in the Point Aconi district.

It is possible that this Company may increase its production in 1921 almost to the pre-war figure of 750,000 tons.

#### **Other Cape Breton Companies.**

The Hiawatha Mine, in the Morien District, at False Bay Beach is a new producer, under the direction of Messrs. V. McFadden and Cavvichi. It is understood this property may put out up to 300 tons a day by the Spring.

The Indian Cove Coal Co. (which is the successor of the Sydney Coal Co. has developed an output which will exceed 57,000 tons in 1920, comparing with an average for many previous years of about 5,000 tons annually.

The Inverness Railway & Collieries Ltd., shows a marked improvement over the figures of 1919. A new seam overlying the Seven Foot seam that has been very extensively worked seawards, has been proven, and should trade conditions be favorable, a still further increase in outputs may be looked for in 1920.

Other small companies operating include the Anglo Company at New Campbellton, the Bras d'Or Coal Co. near North Sydney, and a small mine operated by Glace Bay interests in the same neighborhood, all of which show larger production than in 1919.

#### **Mainland Collieries.**

The Acadia Coal Company has achieved, relatively to its position, the most substantial increase in coal output of any Nova Scotia Company. This Company, which is now controlled by the Scotia Company, is mining coal from ten separate mines. Technically, its

management is of unusual excellence, and the property, which is potentially one of the best in Nova Scotia, is doing very well, and should do better, with fair luck. The writer forecasted a year ago that Acadia might reach the output of 1913, namely, 539,000 tons, and it has not fallen far short of this estimate.

The Acadia Coal has acquired the mine of the Milford Mining Company at Thorburn, near New Glasgow.

As was also noted last year, the Springhill Mines in 1919 had the unique distinction of producing more than they did in 1913, but 1920 figures have bettered by 30,000 tons. A possible production of 450,000 tons in 1920 was forecasted, but production suffered from some heavy roof-falls in the main slope of the most important mine at Springhill. Even with this drawback the 1920 output at Springhill is the best since 1908.

#### **The Export Embargo.**

A reminder of the supreme importance of the coal mines of Nova Scotia to eastern Canada was given during the Summer by the unwelcome imposition of an embargo on coal export from Nova Scotia, other than to Newfoundland and the United States. It appears to occur to Ottawa every little while that the coal mines of Nova Scotia are the only ones between the Atlantic and the Middle West, a distance of 1,900 miles, constituting Canada's sole source of coal supply in six provinces, but so far governmental solicitude for the coal production of Nova Scotia has been expressed in terms of price restriction and control of distribution.

The embargo on export coal was not well conceived, and particularly in the case of the small operators, it deterred them from undertaking expenditures to develop output. What the coal industry of Nova Scotia needs is definite encouragement, and guarantees from government-directed enterprises that a policy of using Canadian coal, to the point of maximum avoidance of the use of imported coal, will be followed. If such guarantees are not now given, the rectitude of government interference in times of scarcity can not be upheld, and, so long as government and public utilities in Canada do not use Canadian coal when it is available, no platform of national protection can be anything but a hollow sham. The government can not with propriety advise the public to buy and produce at home should it continue to buy—as was done in the past—United States coal because it was cheaper than Canadian. The world has lately learned that "cheapness" is not a condition that can be expressed in currency values. There are very few things that are "cheap" if bought abroad, when home production is possible, and coal is most assuredly one of those commodities that is dear at any price if brought from the outside, and cheap at any price, if produced in preference at home.

#### **St. Lawrence Market.**

The resumption of St. Lawrence shipments that was anticipated in last year's review did not materialise, and, despite the export embargo only a negligible quantity of Nova Scotia coal was shipped to Montreal and St. Lawrence ports. In 1921, it is quite probable that a substantial beginning towards a restoration of this temporarily lost market will be attempted. The former customers of Nova Scotia coal companies are anxiously awaiting the re-appearance of Nova Scotia coal on the Montreal market. It should receive a sympathetic consideration if the public realise that

Nova Scotia's five years exclusion from Montreal market was entirely a war casualty, occasioned by heavy enlistments of miners, and by the taking of the coal-freighting fleet for munitions transportation by the Admiralty. For years, the ships that should have carried Nova Scotia coal to Montreal were carrying munitions to East Africa, Salonica and the Admiralty alone knows where else.

**Consolidations of Mining Properties.**

The much to be desired consolidation of the mining companies, which this journal has urged for many years, came nearer consummation in 1920 than at any time since the formation of the Dominion Coal Company. The reconstruction of the original structure of the General Mining Association only now requires a union of the mining operations of the Dominion Steel Corporation and the Nova Scotia Steel Company. This is a foreordained inevitable event of the future, and the sooner it takes place the better for Nova Scotia. In the 1919 Review, we ventured to assert that "only by consolidation of interests can the scattered, and in many instances financially weak coal companies of Nova Scotia hope to weather the future." The patent advantages that have already followed co-operation between the two large coal companies provide the strongest argument for their actual union. The general favor which consolidation of coal-mining interests has received from the public in Nova Scotia during the past two years is the most hopeful sign of the times to the provincial coal trade.

**Output Prospects for 1921.**

A study of the position of the several companies indicates an output capacity in 1921 of 6½ million tons, but a forecast of the actual production is more difficult to make than has been the case since 1914, because there is not the same assurance of insistent demand and uninterrupted outlet for the coal that has existed for the past six years.

**Labor and Wages.**

The year has seen almost continuous negotiations between the United Mine Workers and the coal companies for increased wages. The agreement of January last, which gave the miners a substantial increase in wages, was barely signed when a new demand was made for a further increase, accompanied by request for alterations in working conditions, which, had they been granted, would have been found to be far more onerous than the wage increase asked, their general tendency being to restrict production and to attempt to fix as a permanent feature the very uneconomical arrangement of the working forces and certain conditions which had resulted from war exigencies.

A Royal Commission was appointed to consider the whole question of wages and working conditions at the mines in Nova Scotia and New Brunswick. No person with first hand acquaintance with coal mining was appointed on this Commission, and its recommendations were of an impracticable character. The Union summarily rejected the Commission's recommendations, and after protracted negotiations — which have been fully reported in the "Journal" — an agreement was come to between the Executive of the United Mine Workers in Nova Scotia and representative operators which has since been ratified by the individual vote of the union members. This agreement grants an increase in wages, effective 1st November, of 55 cents per day to day-paid workmen, and a ten

per cent increase on contract tonnage rates. There was very determined opposition to the ratification of this agreement from the Mainland and Inverness Districts, but the Sydney District gave a large vote in its favor which carried the Province. There is reason to hope a settlement of the wages question has been obtained that will last for at least a year, if it should turn out that the coal operators can pay the high rate of wages the agreement calls for. There is every likelihood that the Nova Scotia collieries will have to mine coal in 1921, not to satisfy an insistent demand for coal more or less regardless of price, but on a strictly competitive basis, and, so far as the consumption of coal for steel-making purposes is concerned, there are good grounds for belief that present wages costs are higher than will permit the coal to be used in steel processes with any substantial hope of successful competition with steel and steel products made in competitive countries. It may be that the demand and price of coal for export business will enable the coal companies that are associated with steel enterprises to concentrate upon coal production for commercial sale rather than for consumption in steel manufacture, but there are many considerations that make this undesirable, and, as we have stated previously, it is to be doubted whether the higher wages which the miners have gained, accompanied by the unemployment that will result from them, will be found to be better than more steady work at lower rates of remuneration.

**ADVANCE FIGURES OF CANADIAN COAL PRODUCTION DURING 1920.**

The very approximate figures of 1920 coal production available at the time of writing show a comparison with 1918 and 1919 as follows:

	LONG TONS.		
	1918	1919	1920
Nova Scotia & New Brunswick . . . .	5,450,000	5,330,000	5,650,000
Alberta & Saskatchewan . . . . .	5,650,000	4,800,000	6,100,000
British Columbia . . . . .	2,290,000	2,170,000	2,700,000
	13,390,000	12,300,000	14,450,000

A comparison with production in 1913 and since is as under:

	Long Tons
1913 . . . . .	13,400,000
1914 . . . . .	12,200,000
1915 . . . . .	11,850,000
1916 . . . . .	12,930,000
1917 . . . . .	12,550,000
1918 . . . . .	13,360,000
1919 . . . . .	12,590,000
1920 . . . . . (est.)	14,450,000

The foregoing figures are transposed, in round numbers, from the short ton statistics of the Mines Branch, Ottawa. Strict accuracy is difficult, as some of the provinces have fiscal years that do not coincide with the calendar year, and there is a difference between output and production (very marked in British Columbia because of the large reject in the coal as mined in some districts). Also, while the provinces generally use the long ton in statistics, and the coal operators almost invariably do so, the Ottawa figures are given in short tons.

# Coal Production in British Columbia During 1919

ROBERT DUNN, Victoria, B.C.

An increase in coal production will be shown by the collieries of all the coal fields of British Columbia for 1920 in comparison with the previous year. A conservative estimate places the output at 2,787,384 tons the figures for 1919 being 2,267,541 tons, an improvement of 518,843 tons.

On Vancouver Island there has been a notable advance. The big producers, viz., Canadian Western Fuel Co. and the Canadian Collieries (D) Ltd., have more than maintained the pace set in 1919. While the Island Field has lost the "Jingle Pot" Mine, which ceased operation early in the year, the adverse effect of this has been fully taken care of by the speeding up of the regular producers and by the marked development of the production of the Granby Mining & Smelting Co's Collieries at Cassidy. The output of the Island will aggregate approximately 1,783,800 tons as compared with about 1,700,000 tons in 1919.

There also will be an improvement in the Nicola-Princeton Field where the production of 1920 is expected to total 151,584 tons as compared with 150,705 tons in the previous year.

The outstanding advance, however, is in the Crow's Nest Pass District, Eastern British Columbia. The aggregate for 1920 is placed at 852,000 tons in round figures as compared with 562,000 tons in 1919. The explanation, of course, is that in 1919 there was a three month strike at Fernie, materially reducing the output of the principal colliery of the District, the Crow's Nest Pass Coal Co.

It must not be assumed that the past year has been altogether free of labour trouble in the Crow's Nest Pass District. There have been disputes; in fact for some months there has been more or less open warfare between two labor organizations, namely the United Mine Workers of America and the so-called One Big Union. In this section the authority of the Dominion Government exercised for the purpose of preserving industrial peace in order that production might be maintained during and immediately after the war, still exists. W. H. Armstrong, as Director of Coal Operations, still is in control and it has been possible by virtue of the mediatory service of his department, to keep the mines, fairly consistently, on a producing basis throughout the year. This, therefore, accounts for the fact that the mines of Coal Creek and Michel will show an output for 1920 of about 686,000 as against 480,000 tons last year while the Corbin Coal & Coke Co. will have a production of something like 166,000 tons as against 82,000 tons last year.

To revert to the conditions on Vancouver Island it is interesting to note that the Canadian Collieries (D) Ltd. has conclusively demonstrated its ascendancy with a total (estimated) of 746,000 tons. The nearest to this production is that of the Canadian Western Fuel Co. Ltd., the long established collieries of Nanaimo, B.C., with about 459,000 tons. Reference has been made to the showing of the Cassidy Collieries of the Granby Company. This industry was in its infancy in 1919 and it is only necessary to state that its product for 1920 will aggregate something like 210,000 tons to indicate that it has grown into a business of importance in the course of the past twelve months. The Pacific

Coast Coal Mines Ltd., with 99,800 tons, also has commenced to climb while the Nanoose-Wellington Collieries Ltd., Nanoose Bay, has done well with 45,000 tons approximately to its credit.

With regard to the Nicola-Princeton District the chief producer is the Middlesboro Collieries with a total of about 95,000 tons. Then comes the Fleming Coal Co. with 30,000 tons, the Princeton Coal & Land Co. with 19,000 tons, and the Coalmont Coal Co. with some 7,584 tons. The latter Company was re-organized recently and is developing its holdings so that it may be expected to take a more important part in the colliery activities of the section from this date forth. Several million tons of coal are being developed. An aerial tramway is being installed between the Mine and Coalmont on the Kettle Valley Ry. A screening plant is being installed and a tipple constructed at the railway.

A new field is being opened up by the Chu Chua Coal Mining Syndicate. It is situated on the Indian reserve a short distance south of Chu Chua Station, and not far from the City of Kamloops. This coal is of excellent quality and, although the seam, now under development is somewhat narrow, some three feet in width, this is expected to improve as the work continues. The Kamloops Natural Gas, Oil and Coal Co. Ltd. also is doing some diamond drilling in the coal measures at Coal Hill, situated a short distance from Kamloops.

The Tolkwa Collieries, located near the Grand Trunk Pacific Ry. in northern British Columbia, has not done much this year, its production, as far as can be judged at present, being about 1,300 tons. A short distance from this property a new seam is being opened up which contains high grade coal, some of which soon will be marketed. It seems probable that the immediate future will see extended development of the coal areas of this District. The ever-increasing price of fuel oil and its scarcity in the world's markets is causing renewed interest in all the promising coal fields of the north. The Telkwa, Morice River, Peace River and Groundhog fields have attracted interest this year and large scale development may be expected before long. Undoubtedly those areas contain large quantities of good grade coal and but for the admitted transportation difficulties they now would be in the productive class.

## JOHN L. LEWIS RE-ELECTED PRESIDENT OF UNITED MINE WORKERS.

The recent elections for office in the United Mine Workers of America are regarded as a decided victory for the conservatives among the members of that union. John L. Lewis was re-elected President, defeating Robert H. Harlan by the largest majority ever received by a candidate for the presidency. The Vice-President, Phillip Murray, was also re-elected, defeating Alexander Howat. The Secretary, William Green was re-elected by acclamation. Harlan and Howat were understood to represent the radical portion of the membership. Harlan represented the international officers of the U. M. W. of America in Montreal at the meetings in January 1918 when the coal operators of Nova Scotia agreed to recognise the U. M. W. in Nova Scotia.

## Northern Ontario Letter

### THE GOLD MINES. The Porcupine District.

The silver and gold of Northern Ontario, in receiving around 18 p.c. premium on United States funds during the fourth week of December, are realizing at the rate of about \$4,140,000 a year on the aggregate output of something like \$23,000,000. This premium is "net" to the producing companies and amounts to more than fifty per cent as much as the average yearly dividend disbursements.

During 1920, the net revenue in premium to the precious metal mines of the Temiskaming district has exceeded \$2,250,000, the average premium having been well above 10 p.c. This alone constitutes a fair rate of interest on the capital involved. In the case of the Hollinger it has amounted to nearly 3 p.c. on the Company's total issued capital, and at the present high point is at the rate of between 5 and 6 p.c. This amount added to comparatively large earnings has appeared to place the Hollinger in a position where dividends are expected at the rate of 1 p.c. every four weeks, beginning with the first of the New Year. At worst, it is believed, this rate will not be delayed longer than spring.

Shortage of hydro-electric power in the Porcupine district is serious. The condition, however, is entirely temporary. Careful investors are taking advantage of the present temporary depression to accumulate a large amount of the share capital of the producing companies. These interests are found to be disregarding the present power shortage, and are basing their analysis on conditions under which the mines will operate at full capacity. To figure what may be expected at the Hollinger, Dome, McIntyre-Porcupine, Northerown, Porcupine V. N. T., Schmaeher, and so on, with the return to a full power supply and with operations at full blast, the present quotations which are based on present curtailed earnings show clearly the inducement to invest. The mines have large ore reserves. They are equipped with most modern mining and milling plants, and the supply of labor is now abundant. It seems reasonable, therefore, to estimate the earning power of these mines by the end of 1921 at an average of at least fifty per cent higher than at the present time.

Further reports are current with regard to a possible consolidation of the Northerown mines with the Porcupine V. N. T. This report received support this month when a brief examination of the holdings of the Northerown was made by Major J. McIntosh Bell for the Porcupine V. N. T. Company.

In the meantime, the Northerown continues aggressive operations. Two new veins have been cut at the 500-ft. level on the Thompson-Krist side of the property. The veins lie within about twenty feet of each other. One is about five feet in width and the other about ten feet. No official announcement has so far been made relative to the gold content of the veins, although it is understood to be fairly low. Plans have been arranged to carry on considerable exploration work on the new veins.

A narrowing down in milling operations is expected to mark the first quarter of 1921 at the Dome Mines, and perhaps also at the McIntyre. Power shortage conveys at least a threat of this. Any hardship ex-

perienced will not extend beyond May 1st, at the longest, and the mines appear to be confronted with exceptionally favorable conditions after that date.

One feature of the change to more favorable economic conditions is expected to consist of quite general activity on many of the outlying gold prospects. Although the producing mines of the Porcupine district are located in a comparatively small area, yet interesting deposits have been found over an extensive stretch of country and gives rise to the belief that further exploration work might lead to a broadening out of the producing zone.

Recently, the Hollinger Consolidated has been able to produce about \$20,000 daily. The tonnage going to the mill has reached as high as 2,400 tons daily. It has not been stated whether or not the management hopes to maintain this record throughout the winter, but it is regarded as reasonably certain that the coming summer will witness this mine operating at full capacity of not far under 3,500 tons daily for the first time in its history.

### Kirkland Lake Field

During the month of November the Lake Shore mine again increased its output, the report just submitted to the president and directors by Manager R. C. Coffey, showing 1,810 tons of ore treated and resulting in a recovery of \$49,340, the average production amounting to \$27.25 per ton and the mill working at full capacity of 60 1-3 tons every twenty-four hours.

The November production compares with \$47,078 in October, \$40,151 in September, and \$35,261 in August. The total production from this mine since starting up its mill in March, 1918, has reached an aggregate of \$1,148,148.

A feature of the official statement just issued is that although the mill has generally been rated a capacity of 60 tons daily, and has usually averaged between 50 and 55 tons per month, yet the November operations exceeded the 60-ton mark, and with the mill operating only 94.44 per cent of the possible running time.

The work of sinking the main shaft to deeper levels is proceeding satisfactorily, a depth of 564 feet having been reached at the end of November, indicating the likelihood of the 600-ft. level being established by the end of December.

### Larder Lake Area

Application was made for letters patent to incorporate the Canadian Associated Gold Fields, Ltd., with an authorized capital of \$30,000,000, made up of 30,000,000 shares of the par value of \$1 each. This concern proposes to take over the Associated Goldfields, of Larder Lake, the plan being to pay the Associated 20,000,000 shares, with about 2,000,000 shares to satisfy the Goldfields, Ltd., and the balance of around 8,000,000 shares to be retained in the treasury, to be sold to the public.

The Northern Ontario correspondent of the Journal referred in the past to this concern, and received quite pointed criticism for doing so. However, the information submitted in the Journal was entirely correct, the only unfortunate phase being that it was interpreted as reflecting adversely upon the reputation of a mining engineer who recently made an independent examination. Such reflection was not intended. As regards the enterprise the opinion is being freely expressed in mining circles that it is quite unfortunate that such a promotion (having a larger authorized capital than any precious-metal mining company in the Dominion) should not be supported by reports on

its property by mining engineers who are known to the mining profession of this country.

### THE SILVER MINES.

Operators in the Cobalt field are confident of being able to compete with other silver producing mines and survive the adverse influence of the return to low quotations for the metal. With copper mining which supplies a large part of the world's silver output as a by-product almost at a stand-still in the United States and with further information coming from Mexico indicative of additional curtailment in that country, the downward tendency in silver quotations is believed to have run its full course.

Workmen in the Cobalt district appear to take a very reasonable attitude and it seems likely to expect a gradual reduction in wages, at least in proportion to the decline in the cost of living. Mine workers generally express the belief that it would be better to accept a little lower pay and keep the mines all operating, rather than to endeavor to demand the present high rate with the threat of curtailment of work.

The Nipissing Company is in a strong position, its latest financial statement having shown more than \$4,600,000. In this respect, the Nipissing is the leader in this part of Northern Ontario, even leading the Hollinger Consolidated. Current premium on United States funds is adding at the rate of around \$500,000 a year to the company's net income. Recent bullion shipments from this property have been exceptionally heavy, the total for the first half of December amounting to 561,216 ozs. It is learned, also, that representatives of the Nipissing are making an examination of the old Norwalk property in the Michipicoten district. The underground workings are now being de-watered.

A new company, known as the Ruby Co-operative Cobalt Mines, has been incorporated for the purpose of taking over and operating the old Ruby Silver Mines, situated in the south-eastern part of the township of Bucke, in the Cobalt district. The company has an authorized capitalization of \$1,500,000, made up of 1,500,000 shares of the par value of \$1 each. Of this, 750,000 will be distributed among the members of the original syndicate, and the balance of 750,000 shares left in the treasury to finance subsequent work. Clifford H. Moore, of Cobalt, is president of the Company, with the following directors: Dr. E. W. Mitchell, Dr. E. F. Armstrong, of Cobalt; Kenneth McDonald and B. Hartly, of Haileybury.

The annual report of the Coniagas mine will be placed in the mail this week, and shows a very successful period for the fiscal year ended August 31st. During the period the Company paid \$500,000 in dividends.

### Elk Lake and Gowganda Area

The idea to provide railway facilities for the Gowganda silver area is being rejuvenated by the promoters who planned the construction of a light narrow-gauge line last year. The present plan differs from that of last year, in that a standard-gauge road is now favored, with 56 lb. rails. Mining interests do not appear to be very enthusiastic about the project, after having been disappointed last year. The fear is expressed that the scheme may only serve to discourage the Government from building a macadam road, and perhaps in the end fail to succeed in providing rail transportation.

Information coming to Elk Lake conveys the report that power shortage is being experienced at the plant of the Miller Lake-O'Brien mine, and the indications

point toward closing the mill early in the New Year. The mine has considerable auxiliary equipment, however, and the development of the mine will continue throughout the winter. With the advent of power in the spring, everything will be in readiness to proceed with production at full blast.

### TORONTO MINING QUOTATIONS.

The following are the closing quotations for active gold, silver and oil stocks on the Standard Mining Exchange on December 27th 1920.

	Silver.	Ask.	Bid.
Adanae Silver Mines, Ltd. . . . .	21 <sup>1</sup> / <sub>8</sub>		2

Antimony . . . . .	73 <sup>3</sup> / <sub>4</sub>

## British Columbia Letter

### Stewart, B.C.

At the Premier Mine, Salmon River, Portland Canal, the winter's work is in progress. Supplies for the mill are being taken in over the snow, sixty-five horses being used. Ore is being taken by the same means to tidewater for shipment to the smelter. The mill is about three-quarters complete. The force of workmen numbers approximately 200. Two five-ton Holt tractors now are being used over part of the trail. The installation of the hydro-electric power plant is finished.

### Anyox, B.C.

There has been some uncertainty of late as to the permanence of work at the Anyox Camp, Granby Mining & Smelting & Power Co. Following the laying off of some 400 men and the announcement by the management that, unless the employees were prepared to accept a reduction in wages of about 75 cents a day, it would be necessary to practically cease operations, news has been awaited as to the attitude of labor. Nothing has developed, work is continuing, and the assumption is that the men have recognized the force of the Company's position and have acquiesced in the "cut" proposed.

### Alice Arm, B.C.

The Dolly Varden Mine Railway, connecting the Company's wharves with the mine property, has closed down for the winter. This was rendered necessary because of recent heavy snowfalls. A. J. T. Taylor, president of the company, is satisfied with the season's operations. The production of over one million ounces of silver since September, 1919, is not a bad showing in his opinion. Besides development work has given, he says, gratifying results. Work is being continued at the mine, during the winter, between 65 and 100 men being employed, and Mr. Taylor hopes that it will be possible to maintain production at a high level next year. High grade ore has been sacked and shipped to the Tacoma (Wn.) Smelter and the lower grade has been going to the Granby Company's Smelter, Anyox, for treatment.

### Trail, B.C.

For the first week in December the ore receipts at the Trail Smelter of the Consolidated Mining & Smelting Co. totalled 12,502 tons. During the week ending December 14 the smelter receipts were 9,093 tons, bringing the total for the year up to 360,778 tons. Recent new shippers are the Silver Cup, of the Lardeau, and the Society Girl, at Moyie.

A considerable number of men employed in and around the Trail Smelter have been discharged and S. G. Blaylock, manager for the Canadian Consolidated Mining & Smelting Co., states that only necessary construction will be continued. The operation of the smelter will not be affected. This means that the proposed new mill for the handling of the ores of the Rossland Camp will not be commenced this winter and that other contemplated works will be deferred.

### Cranbrook, B.C.

That over 30 uncommon minerals have been sampled and forwarded to the Department of Mines, at Ottawa, for analysis and intensive study within the last few months, from Eastern British Columbia, as one result of his collecting tours, is the statement of W. D. Thomlinson, the New Denver mineralogist.

Mr. Thomlinson commenced his work of field research for the laboratories of the Department of Mines just before the war, and during the war the work was suspended. It was resumed in the past summer.

One of the minerals forwarded Mr. Thomlinson believes to be stream tin—he did not himself have the opportunity to test it. If this belief proves to be well founded, a tin area has been discovered.

Barium sulphate or heavy spar, which has an important commercial use, is another of these undeveloped resources. It is being found in association with lead and zinc ores, but is usually mistaken for a form of limestone. Some considerable deposits of this have been brought to light.

One of the most important finds is of a rare clay, adapted to a very exclusive use, of which previously only one deposit has been worked commercially on this continent. Indications point to a deposit of commercial dimensions near Merritt, and two such deposits near Princeton.

In the Lardeau a curious alloy has been found, its elements being gold, silver and mercury. The latter may have possibly escaped from early milling operations, but if not, the alloy is a natural product not previously known to science, and Mr. Thomlinson will, in that case, endow it with the name of "Lardeauite." Native quicksilver, acting on a natural alloy of gold and silver known as electrum, and found in only a few places in the world, may have produced the new rarity.

After being thoroughly tested and classified, Mr. Thomlinson says, the samples will be shown at various great exhibitions, beginning with the chemical exhibition in New York next season, where experts from all the world will assemble. The commercial world is looking for deposits of many economic substances to exploit, and will certainly look into some of these new finds, he suggests.

If prospectors could acquire familiarity with some of these uncommon minerals that the world wants, in addition to their knowledge of the ordinary ores, Mr. Thomlinson states, important developments in the lines of new industries would certainly be brought about in the course of time.

In the meantime, they will be serving their own interests by providing him with samples of all finds that are at all out of the ordinary run.

### Allenby, B.C.

The closing down of the Canada Copper Company operations both at the Mine, Copper Mountain, and at Allenby Mill so soon after the commencement of work has had a depressing effect not only in the district immediately affected but throughout the province. It is appreciated that, with copper priced as at present, it is difficult for an industry in British Columbia, faced as it is with high costs, to produce copper at a profit. In the case of the Granby Consolidated at Anyox, where the smelter is being kept active, the men have agreed to a reduction in their wages amounting all round to about 75 cents a day. Another company which appears to be carrying on is the Tidewater Copper Co., Sidney Inlet, West Coast of Vancouver Island, which just recently shipped 400 tons of concentrates to the Tacoma (Wn.) Smelter. It is stated that shipments will be made once a month from this date and that, because of the economical water-wheel method of generating power, it will be possible to produce copper at a cost permitting a margin even under existing market conditions. The owners of this property

are credited with having sunk \$650,000 into development and new equipment within the past twelve or fourteen months, with results that assure its maintenance indefinitely as a shipper. With the other provincial companies hit as they are, not excepting the Canadian Consolidated Mining & Smelting Co., of Trail, it is refreshing to find one concern that is able to carry on despite adverse markets.

#### Princeton, B.C.

The Princetown Mining and Development Co., Ltd., have completed the installation of their plant and will recommence the work of development. This property is situated east of the town of Princeton. Three tunnels have been driven and a considerable body of concentrating copper-silver ore has been disclosed.

#### Greenwood, B.C.

The old Providence Mine is to be re-opened. An Ingersoll compressor has been purchased and is being installed. The mine is being pumped out and will be ready for mining when conditions are satisfactory.

#### Nelson, B.C.

Government purchase at a price of 80 cents per ounce of all silver offering, known to be the product of native ores, and increased silver coinage, are advocated by Robert R. Hedley, the well known mining man, as a means of assuring a market for Canadian silver, stabilizing the metal markets generally, and maintaining mines in operation through the present period of slump in metals, thus reducing the threatened unemployment.

Mr. Hedley, who was the manager of Hall Mines, Ltd., for 10 years, during the period it operated the Nelson smelter, has been spending a fortnight in the Slocan and arrived in the city a day or two ago.

In the case of Kootenay mining, Mr. Hedley pointed out in an interview yesterday, the price of silver is one of the principal governing factors, as silver constitutes the chief value in the majority of Kootenay ores. A stable price, therefore, for Canadian-produced silver would be an anchor that would assure the continuance in operation of many Kootenay mines.

That the Dominion Government would not be taking any undue risk in thus purchasing silver beyond its present normal consumption, is Mr. Hedley's considered opinion. "It can be demonstrated," he said on this point, "that when world conditions return to or approach normal, 80 cents an ounce for silver will be a reasonable minimum price. The United States is purchasing its own domestic production of silver and storing it at 99½ cents an ounce, removing it from the world's market, and as long as that drain continues, it is probable that the law of supply and demand will compel a price for silver higher than 80 cents."

The world's silver production for 1920, he stated, was provisionally estimated to be 30,000,000 ounces less than the production in 1913.

India, the world's heavy purchaser, which for generations had absorbed as high as 200,000,000 ounces annually, will probably not be credited with more than 10,000,000 ounces this year. If the price of silver in the early part of the year was the reason for restricting the Indian purchases, India will probably purchase extensively at prices below \$1.00 an ounce.

Mexico is not at present a large producer of silver, and what she produces will largely go into her coinage. The United States and Mexico together contribute the bulk of the world's supply, and three-quarters of this comes as a by-product of mining for copper, lead and gold, now curtailed to far below normal.

"From these facts it can be argued," said Mr. Hedley, "that Canada can with advantage coin such silver as she may produce in the next two years at 80 cents per ounce. The production in the two years will not total more than 30,000,000 ounces, and of that, it is probable that the world's market will absorb the larger part, and at a price better than 80 cents."

Canada's silver coinage in circulation at the end of 1919 amounted to \$27,084,148, Mr. Hedley stated, as compared with \$14,327,662 in 1910. In the 10 years ending with 1919, the Canadian mint coined silver to the amount of \$15,233,505.

#### Vancouver, B.C.

Judgment has been given against W. Pollard Grant, Vancouver lawyer, in his suit for a declaration that he holds legal title to a one-fifth interest in the Engineer Mine of the Atlin District, B.C. This is a step towards clearing up the estate of the late Captain Alexander so that a transfer of the Atlin property can take place. As soon as a clear title can be delivered it is expected that the Alexander Mine will be sold for a substantial figure, that development will be initiated without delay, and that the work will mean much for the advancement of that part of the north country.

Lorne Campbell, president of the Kootenay Light & Power Co., and former Minister of Mines, does not view the present situation in respect of mining and other industrial endeavor in a pessimistic way. He says: "The passing of the mushroom industries and of those businesses built up on the effects and causes of the war will give legitimate businesses a chance to carry on upon a sound business basis. Peace time conditions have returned and the reconstruction of business on a peace time basis is now under way. The general deflation resulting from the arrival of this period means that industries will require less capital to finance manufacturing and other producing concerns. The net result will be a reduction in the cost of living and credit conditions will return to a more normal basis." Mr. Campbell spoke optimistically of mining prospects in the Kootenays now that labor is available and referred to the activity in coal development and production in the Province of Alberta.

Mr. Glenville A. Collins, mining engineer of Seattle Wn. has taken over the management of the Drum Lummon Mines, Ltd., vice Mr. W. Porteous Sloan. This property is situated near Hartley Bay, Douglas Channel, B.C.

#### PERSONALS.

Dr. S. L. Walker, Prof. W. A. Parks, Prof. A. L. Parsons and Mr. Ellis Thompson of the staff of the University of Toronto are attending the meeting of the Mineralogical Society in Chicago, this week.

Mr. H. P. De Pencier is in Toronto on his way from New York to the Dome mine.

Mr. Ocha Potter has been appointed superintendent of the Ahweek mine, Michigan.

Mr. Brigham, manager of Hollinger Consolidated Mines is in Toronto.

F. M. Sylvester, of Vancouver, B.C., formerly of Spokane, Washington, is now president of the Moose Group Mining Co., which has mining property situated in the neighborhood of Alice Arm on Observatory Inlet, of which P. W. Racey, formerly of Rossland, B.C., is in charge. Mr. Sylvester was for some years general manager for the Granby Consolidated Mining, Smelting, and Power Co.

# A Miner's Yearly and Daily Output of Coal

By W. W. ADAMS, Mine Statistician, United States  
Bureau of Mines.

The present world-wide demand for increased production in all branches of essential industry involves a matter of vital concern to persons engaged in the mining industry, namely, the productive capacity of the individual mine employee. This applies particularly to coal-mining, upon which other industries so largely depend.

The folded and faulted conditions of the coal beds in some countries, as well as the thinness and depth of the seams, the adaptability to the beds of available mining machines and equipment are factors which cannot be overlooked in determining what increase in individual output may be looked for in any given country. This subject, while of fundamental importance, can only be referred to in a paper of this length, the primary object here being merely to present a comparative statement of individual output under prevailing conditions.

The quantity of coal produced by a miner does not accurately indicate the miner's capacity as a workman, not only because of the natural conditions referred to above that limit his annual output, but also because of human factors which may possibly, however, be controlled, such as the demand for coal, the car supply, use of labor-saving machinery, number of days worked during the year, accidents in the mine, etc. It will, however, be an aid in answering the important question as to how and where the immediate need for coal throughout the world may best be supplied, if we examine the output of the miners in the important coal-producing countries over a period of years.

Complete official information for recent years is, for several countries, lacking, particularly for France, Austria, and Prussia, but partial data from unofficial sources may be used to show the individual output of the miners in these countries.

An examination of the available and in most instances official sources of information for the principal coal mining countries (covering generally the 18-year period beginning with 1901) shows that the largest production per man during any year was 1,134 short tons, which represents the average production for each underground employee in the coal mines of the United States during 1918. The closest competitor of this country was New South Wales where each underground worker in 1918 produced 814 tons. British Columbia ranked third with 790 tons and Nova Scotia was fourth with 718 tons. The smallest individual output for recent years was that of Japan in 1917, where an average of 155 tons was mined by the underground employees, although in 1901 India showed an average of only 122 tons, the latter figure being the smallest during any year for the countries under consideration. During the 18-year period New South Wales and Nova Scotia have each averaged practically the same amount (718 and 715 tons respectively). The individual output for Great Britain was until 1910 above that of Prussia, but in 1911 Prussia passed the British record and has maintained the lead since that time. France has shown but little change in the miner's yearly production, averaging 302 tons prior to the War. Within the past three years, however, the daily output of the French miner has decreased although there has been an increase

in his wages. In Austria the annual output has averaged 296 ton per man during the past 18 years. Following Austria comes Belgium with an average of 236 tons during the 18-year period. The man-production in Belgium remained 250 tons until 1914 when it dropped to 200 tons and showed only a slight increase during the 5 years of the World War. The underground workers of India have shown an almost steady increase in annual output, the quantity having risen from 122 tons in 1901 to 203 tons in 1918, averaging 178 tons during the entire period. In Japan the average output over a 17-year period was 174 tons. The following paragraphs will show more in detail the situation in the various countries.

## United States.

In producing around 600 million short tons of coal each year the United States employs about 600,000 underground workers. In 1901 these underground employees produced an average of 729 tons per man. Eighteen years later the quantity had increased to 1,134 tons, the greatest on record for this or any other country. At the beginning of this period one-fourth of the bituminous coal was mined by machines while at the end of the period the quantity of machine-mined coal was about 56 per cent of the total bituminous production. Again, the high average thickness of the coal seams and the comparatively regular and uniform position of the coal beds (except in the State of Washington and the anthracite field of Pennsylvania) greatly facilitate the work of the miner in getting out the coal. About 85 per cent of the bituminous coal is mined from seams between 3 and 10 feet thick, and only 4 per cent from seams below three feet in thickness. Seams less than 2 feet thick do not produce as much as 1 per cent of the total production. Nor is coal mined at as great depths in this country as is the case in some of the foreign fields.

The underground workers in the United States do not include any women or girls.

Not only the annual but also the daily output of coal per underground worker is greater in the United States than elsewhere, and the former holds true notwithstanding the fact that the working year is usually shorter in this than in most other countries. For the years under consideration the mines were operated from 95 to 258 days. The records show that each underground worker in 1901 averaged 3.37 tons a day and increased his daily output to 4.40 tons in 1918. The closest competitor of the United States for which the number of working days is shown is New South Wales where the daily output per employee is only slightly below that in the United States.

## New South Wales.

As a producer of coal New South Wales occupies a very low position among the countries here considered, its yearly output being about 10 million short tons, but in quantity of coal produced annually by each underground worker the country is second only to the United States. The individual production has increased from 689 tons in 1901 to 814 tons in 1918 and the annual output for 18 years has averaged 718 tons. About 12,000 underground workers are employed.

The length of the working year is not given in the

official reports except for the principal mines since 1909 which shows that the miners are employed from 168 to 238 days. Applying these figures to the entire Colony it appears that the daily production of the underground worker increased from 3.32 in 1909 to 4.07 tons in 1918, thus indicating that New South Wales ranks as a close second to the United States in the daily as well as the annual output of coal per man. Approximately one-fourth of the annual production is machine-mined.

Most of the coal (over 65 per cent) is obtained from the mines in the northern district of the colony where the seams range in thickness from about 7 to 20 feet with a probable average of about 12 feet. In the southern district most of the coal is mined from the Bulli seam which averages between 6 and 7 feet in thickness. Among the underground employees only 3 per cent are below 16 years of age. No women or girls are employed underground.

#### **Nova Scotia.**

Nova Scotia employs about 10,000 underground workers to produce between 6,000,000 and 7,000,000 tons of coal each year. With an average annual production since 1901 of 715 tons by each underground employee, the province ranks third among the countries now being considered, being slightly below New South Wales and considerably above British Columbia.

Prior to 1906 the individual output was above that in New South Wales, but in that year the Australian colony took the lead which, except in four instances, it has maintained down to the present time. Since 1901 the operating time of the coal mines has varied from 203 to 299 days, usually being about 280 days during the year. The daily output of the underground worker has varied from 2.45 tons to 3.35 tons with an average of 2.68 tons throughout the 18-year period. This in the daily as well as the annual output of coal by the individual worker, Nova Scotia occupies a position below the United States and New South Wales but above all other countries whose reports show the length of time the mines are operated. Of the total output of coal in 1911 at least one-fourth was machine-mined. In 1916 not less than 44 per cent was mined by machine.

The coal seams of Pictou county are of greater thickness than those in other parts of the province but produce only about one-tenth of the coal, while the seams of Cape Breton county, from which nearly three-fourths of the annual production is obtained are between 4½ and 7½ ft. thick.

#### **British Columbia.**

With about 4,000 underground employees each year, British Columbia produces between 2½ and 3 million tons of coal and thus contributes approximately one-fourth to the total production of coal in the Dominion of Canada. The total production is hardly to be compared with that of many other countries, yet British Columbia ranks fourth in the annual output per worker, being exceeded only by the United States, New South Wales and Nova Scotia. The individual output is about 1½ times that of Great Britain. The lowest annual tonnage was 494 tons in 1911 when labor troubles caused the mines of the East Kootenay district to suspend operations from April to November, while the maximum output was 790 tons in 1918, showing an 18-year average of 611 tons. The number of operating days is not given in the official reports, and therefore, the daily output of the workers cannot be stated. Of the underground workers less than 3 per cent are boys (ages not given) and approximately 9 per cent

are Japanese and Chinese. About 60 per cent of the coal production is from the mines of the Coast District, although here the usual output per worker is considerably below that in the East Kootenay district. No Orientals are employed underground in the latter district, but in the Coast district they at times comprise one-tenth of the underground workers.

The coal seams vary in thickness between wide limits, but it is probable that the average thickness of the seams of the entire province is about 9 feet. Information as to the quantity of machine-mined coal is not available.

#### **Great Britain.**

Coal mining in Great Britain gives employment to between 800,000 and 900,000 underground workers each year and the annual production is around 300 million short tons. During the war the production was somewhat less. The output of coal averaged 400 tons for each underground employee in 1901 and increased to 419 tons in 1906, but since the latter year there has been a decline in the individual output which continued down to 1918 when the output per man was only 337 tons. The decrease is also noticeable in the daily output of coal per man which has also receded from its high record of 1.55 tons in 1905 to 1.19 tons in 1918, the lowest during the last eighteen years.

The decrease in the annual production of the British miner is beyond doubt, due to the lower daily output per man rather than to a reduction in the number of working days to the year. In fact, the lowest annual output per man has been during the years of the greatest number of working days, and this in spite of an annual increase in the use of coal-cutting machines. The working year has fluctuated between 261 and 295 days, being above 270 days each year since 1910.

Coal-cutting machines are coming into more general use in the coal-mining industry of Great Britain. In 1901 only 345 machines were used with which about 2 per cent of the entire output was produced. In 1918 the number of mining machines had increased to 4,041 and the quantity of machine-mined coal was over 11 per cent of the total production for that year.

While the coal seams vary in thickness from about 1 foot to 30 feet, it is perhaps safe to say that the seams throughout the Kingdom have an average thickness of about 5 feet. About 7 per cent of the underground employees are boys below 16 years of age. No women or girls work underground at the mines.

#### **Prussia.**

Among the coal-mining nations of the world Germany ranks third, occupying a position considerably below that of Great Britain and very much above that of France. Over 90 per cent of the coal production is from the mines of Prussia and the figures for that Kingdom are here used as representative of the Empire as a whole, for which complete and comparable statistics are not available. While varying considerably from year to year, the annual coal production of Prussia is roughly speaking 160 million short tons, although in 1913 it almost reached the 200 million mark. Normally about 440,000 underground workers are employed. For these employees the record shows an annual production ranging from 352 to 459 tons per man. The individual output in Prussia surpassed that in Great Britain for the first time in 1911. This is due, however, largely to the greater number of days during which the miners in Germany are employed. The number of working days to the year, always high, has shown an almost constant increase, being 293 days in 1901 and 303 in

Year	United States	New South Wales	Nova Scotia	British Columbia	Great Britain	Prussia (steinkohle)	France	Austria (steinkohle)	Belgium	Japan	India
1901	729	689	719	623	400	357	304	250	248	176	122
1902	699	656	837	593	405	352	278	248	255	181	125

Annual and Daily Production of Miners. (Accompanying article by W. W. Adams).

1914 the latest year for which the working time is shown. The daily output by the Prussian miner was until 1911 less than that of the miner of the United Kingdom, but from that year until 1914 the individual output of the miners in the two countries has been practically identical. The daily production in Prussia has ranged from 1.22 to 1.32 per man. No women or girls are employed underground.

About 65 per cent of the coal production of Prussia is obtained from the Dortmund district which includes the coal basins of the Lower Rhine and Westphalia, and here also are employed about 65 per cent of the underground workers. The Dortmund district, however, does not produce the largest tonnage per man, being surpassed by Upper Silesia both in the annual and daily output of coal per man, and this notwithstanding the fact that the miners of Upper Silesia usually work a somewhat smaller number of days than do the miners in the other districts of Prussia.

#### France

Among the European countries France ranks third with its annual production of 40 million tons of coal, and thus normally occupies a position below Prussia but considerably above Belgium. The output has, of course, been greatly reduced since the destruction of the mines in the northern part of the country.

The quantity of coal produced annually by the French miner does not vary much from year to year, the amount being 278 in 1902 and 307 in 1913, with an average of 302 tons over a 13-year period. Later figures cannot be given because of lack of information as to the number of employees and number of days of operation. The daily output of the miner in France is usually a fraction over one ton, but in 1917 and 1918 it fell below this figure in spite of an increase in the average wages paid to the underground workers in those years.

The mine workers are usually employed about 300 days during the year. No women are employed underground, but about 6 per cent of the underground workers are boys between 16 and 18 years of age, and 6 per cent below 16 years. The average thickness of the coal seams is probably somewhat less than 3 feet 3 inches, which indicates an average thickness slightly above that in Belgium. About two-thirds of the coal produced prior to the war, was from the Valenciennes coal basin in the departments of Pas-de Calais and the Nord. In this field, however, the daily output per worker, while equal to or above that in most of the other coal fields of France, is slightly below the individual production in the coal basin of Le Creusot et Blanzay which furnishes only 6 per cent of the annual output of coal.

#### Austria.

Excluding the lignite industry, the coal mines of Austria employ about 52,000 men underground and the annual production is around 17 million short tons. The official reports do not segregate the employees underground from those on the surface except in connection with the statistics of wages and hours of labor, and the totals thus given do not exactly agree with the number of employees reported in connection with the output of coal. However, this segregation has been used to determine the production per underground worker, and on this basis it may be seen that the annual output has ranged from 250 tons to 351 tons per man. The daily output varied from 1 to 1.21 tons per man until 1912, since which time no information is available as to the

number of days the men have been employed during the year.

During the 12-year period beginning with 1901, the working year of the Austrian miners did not change materially, having varied only between 268 and 279 days per year. No women or girls are employed underground, but about 11 per cent of the underground workers are boys presumably below 16 years of age.

Nearly two-thirds of the coal of Austria is obtained from the provinces of Moravia, Silesia and Galicia, the coal seams in Upper Silesia being a continuation of those of Prussia and Russia. An average of about 2 ft. 8 in. obtains in the Ostrau-Karwin district which is the principal coal-mining district of Silesia. About one-third of the yearly output is from the mines of Bohemia where the main seam of the Klado-Rahonitz basin has a thickness of 20 to 36 feet.

#### Belgium.

Prior to the World War, the Belgium coal mines employed in round numbers 105,000 men in the underground workings and produced about 25 million short tons of coal. With the beginning of hostilities, there was a sudden reduction both in the output of coal and the number of men employed. This situation became worse as the war progressed so that in 1918 there were only about three-fourth the usual number of employees and the production was less than two-thirds normal. The yearly output per underground worker had averaged about 250 tons during the 13 pre-war years, but fell to 200 tons in 1914, and remained thereabouts throughout the war.

That the reduction in the annual individual output was mainly due, however, to a shorter working year is shown by the fact that the daily output of the miners was only slightly below normal, being about .74 tons during the war, as against .83 prior thereto.

Under normal conditions the miners in Belgium worked nearly 300 days each year, but in 1914 the number of working days fell to 263 and the following year it was 241. In 1917 the working time rose to 296 days, but the following year it fell back to 288 days.

Mining operations in Belgium are carried on under great natural disadvantages. The coal seams are thin, averaging only 26 inches for the entire country. Moreover, the contorted and folded conditions of the seams and the great depth at which they lie render mining extremely difficult and greatly reduce the productive capacity of the individual miner.

The number of woman employed underground in the coal mines of Belgium was 120 in 1901 and only 3 in 1912, since which year none have been employed. Boys between 14 and 16 years old usually comprise about 4½ per cent of the underground workers, and prior to 1914 about 2 per cent of the underground employees were boys between 12 and 14 years of age, but since 1914 the employment of children of the latter age appears to have ceased.

Nearly three-fourths of the coal production is from the Province of Hainaut, where the deepest mines are situated, and there the individual tonnage is lower than that in Namur. However, the Province of Hainaut includes the Mons district where the coal seams (average 22 inches) are thinner than in other parts of Belgium, while the Province of Namur, although producing only 4 per cent of the coal production, contains the thickest seams (average 28 inches) in the Kingdom.

#### Japan.

Since 1901 the coal production of Japan has trebled in quantity, being slightly less than 10 million tons

in that year and reaching a total of 29,000,000 tons in 1917. The reports of the Japanese Bureau of Mines do not usually segregate workers underground from those on the surface, but based upon the segregation in the annual report for 1917 it may be seen that the underground employees have increased from around 56,000 in 1901 to 187,000 in 1917. The greatest annual increase in the number of employees underground was in 1907 when nearly 30,000 more men were employed than in the preceding year. The average annual output per underground worker has varied from 145 tons to 213 tons, the average for the 17-year period being 174 tons.

In 1907 Japan gave way to India in the annual output per worker, owing to the fact that India has shown an almost constant increase, while in Japan the individual output has remained practically unchanged.

The individual daily production of coal in Japan has ranged from .72 tons to .94 tons per man, showing an average of 0.76 tons for the entire period. The working year has varied from 201 to 251 days. In 1917 about one-fourth of the underground employees were women and girls. More than four-fifths of the workers underground, both men and women, were over 20 years of age; about one-sixth were between the ages of 15 and 20 years; and only a little more than 1 per cent below 15 years of age.

About three-fourths of the coal produced is obtained from the mines of the Island of Kyushu, and especially from the Chikuho coal field in the northern part of the island where the coal seams vary in thickness from 4 to 33 feet, with a probable average thickness above 10 feet. The Chikuho coal field supplies about two-thirds of the production of the island of Kyushu, and about one-half of the output of the whole empire. One-tenth of the annual production of coal is contributed by the mines of Hokkaido (Yezo) Island where the Ishikari coal field produces nearly all of the coal. The seams of this field have even a greater thickness than those in the Chikuho coal field, and the field will doubtless increase in importance as transportation facilities improve.

#### India.

The coal mines of India which are regulated by the India Mines Act, have an annual production of about 20 million tons and employ about 95,000 men in underground work. In the production per man underground, India occupies a position below Belgium on the one hand and above Japan on the other. In this regard India gained the ascendancy over Japan in 1907 and an annual increase since that year has widened the margin of India's lead. The daily output of the Indian miners cannot be stated because the official reports do not show the number of days the mines are worked. Practically 85 per cent of the coal production is obtained from the coal fields of Bengal where the average thickness of the seams is approximately 9 feet. About 40 per cent of the underground mine workers are women. Something less than 1 per cent are boys and girls below 12 years of age.—Reports of Investigations, U. S. Bureau of Mines.

#### U. S. GEOLOGICAL SURVEY SEARCHING FOR ASBESTOS IN THE WESTERN STATES.

The Press Bulletin of the U. S. Geological Survey remarks that the United States now obtains most of its high-grade, long-fibre asbestos from Canada, but geologists of the Survey hope that large deposits which will yield material of good quality may yet be found in the Western States, especially in Arizona, where asbestos of unusually long fibre and silky texture has been discovered.

gists of the Survey hope that large deposits which will yield material of good quality may yet be found in the Western States, especially in Arizona, where asbestos of unusually long fibre and silky texture has been discovered.

In the Apache and San Carlos Indian reservations in Arizona, asbestos is found associated with rocks of the Apache group, which is made up of several formations. The principal deposits are in the Salt River region, where the Apache group is represented chiefly by beds of quartzite and limestone, which are at many places invaded by diabase. Throughout this area much diabase has been injected into beds of limestone, and the asbestos is found near the contact of the limestone with the diabase. Places where the limestone has been broken by the diabase have been particularly favorable for the formation of asbestos. The asbestos is invariably associated with serpentine, and although serpentine occurs at many places without asbestos, serpentine "float" fragments of it that lie loose on the surface, having been washed out from its outcrop, are a valuable aid to the prospector for asbestos. In this region asbestos itself is also generally found as float for a considerable distance below its outcrop.

#### THE ASBESTOS MARKETS.

The strike of the asbestos miners at the King Beaver Mines at Thetford was brought to an end on the 15th of November by the men going back to work at the old wage rate of \$4.00 per day, instead of the \$4.50 per day asked.

There have been a number of accidents in the Thetford mines through collapsing of the sides of the asbestos quarries, probably connected with the unusually mild and damp weather, and the lack of really hard frost.

The Quebec correspondent of the Canadian Institute of Mining & Metallurgy's "Bulletin" states that demand from the United States for asbestos is not as keen as it was in the Summer, especially as regards mill-stock qualities. The European demand is very satisfactory, however, and asbestos mining is less affected by the commercial depression than any other branch of mining in the Province.

New York market letters prophesy higher prices for most grades of asbestos in 1921, but this will of course turn on the general state of manufacturing, and much will depend on the condition of the motor industry. Asbestos is used in such varied ways as to enter into most staple industries, which is a guarantee of its continued demand, and indicates that the briskness of demand will fluctuate with general manufacturing activity in the United States. While high-grade asbestos is much sought after, probably the most encouraging feature of the business at this time is the extension of uses for short fibre material and material that formerly was regarded as waste and unsaleable.

"Asbestos," of Philadelphia, states in regard to the market for Canadian asbestos: "We see no immediate sign of overproduction in Canada, especially of crude and long fibre. We do, however, see marked increase in the use of Rhodesian, African and Arizona fibre, with several new contenders showing on the horizon. The questions as to whether or no there is a demand for yarns and cloths made of blue and brown asbestos must in honesty be answered in the negative. There is no 'demand' true enough, but spinners are turning more and more regularly to blue and brown and are gradu-

**Books For Your Library**

**Ore Mining Methods**

*Second Edition.*

By **WALTER R. CRANE, Ph.D.**,  
Dean of the School of Mines and Metallurgy,  
and Professor of Mining, The Pennsylvania State College.

Deals authoritatively and in a practical manner with the methods of support in extraction of ore, stoping and mining in narrow and wide veins, bedded and massive deposits, including stull and square-set, filling and caving methods, and open-cut work.

Every mining engineer should have a copy of this standard book, for constant reference. "CRANE" has 272 pages, 6 by 9 inches—83 graphic illustrations—the price, \$4.00

*A New Edition, Issued Oct., 1919.*

**Technical Methods of Ore Analysis**

*Eighth Edition, Revised and Enlarged.*

By **ALBERT H. LOW**,  
Formerly Chief Assayer, U.S. Mint,  
Denver, Colo.

A number of new methods for Molybdenum, Potassium, Tungsten and Uranium have been placed in the Appendix of this up-to-the-minute edition.

With "LOW" in your possession, you will find your hardest problems quickly and correctly solved.

"LOW" has 388 pages, based on actual experience—the price, \$3.75.

Magnesia Carbonate, Powdered .	15c to	20c lb.
85% Magnesia Pipe and Boiler Covering . . . . .	10% to	20% off.

**A Montreal Letter**  
ALEXANDER GRAY.

**Oil Shale Plans Proceeding.**

"Amid encircling gloom", while constructive forces are eradicating economic ills we know of, and destructive elements in share and commodity markets are anticipating dire happenings which may not occur, it is an auspicious event to have the Anglo-Persian oil interests, through the D'Arcy exploration Company, complete the foundation of the first unit in which the New Brunswick oil shales will be treated. Some weeks ago this was foreshadowed in "The Canadian Mining Journal". It was then intimated a plant was being ordered. Not only has that fact been verified, but the foundation work being finished, the expectation is the New Year will number among its achievements the successful inauguration of a Canadian oil-shale industry, backed by influential interests and conducted by experts. It has been "a long, long way to Tipperary," for Messrs Lodge and Mackenzie who exploited the qualities and extent of these New Brunswick shales—and, again it is not Canadians who "carry on."

**Efficiency as a Remedy.**

At least one large mine has the proof that the do-as-little-as-possible period is over. In one month of late, with the same number of men employed, there was an improved efficiency of 40 per cent., and less grumbling than had been noted for six years.

There being more applicants than vacancies, notwithstanding this property has been notoriously short-handed, the operating conditions leave no room for

**STEEL SKIPS**

For use on Mine Tipples. Made any size to suit your work, and if desired, with double bottom, and rivets countersunk and flush on the inside, to facilitate easy dumping. Roller bearing wheels also, if desired, with dust excluding, oil retaining hubs. These Skips are made to suit your slope and Tipple.

**MINE HOIST, for Heavy Duty.** 50 H.P. Reversing Steam Engine, 40 in. dia. Drum. All gears cast steel, machine cut. Will lift two and a quarter tons at a speed of 400 feet per minute. This is a sample only of the many styles and sizes of Mine Hoists we make. We can build you any kind you want, either Steam, Electric, Gasoline or Belt Power.

# MARSH MINE EQUIPMENT

OUR ENGINEERING STAFF ARE EXPERTS IN DESIGNING THE BEST KIND OF MINE EQUIPMENT. IT WILL PAY YOU TO MAKE USE OF THEIR SERVICES, FOR WHICH WE MAKE NO CHARGE

THE MARSH HOIST & OTHER MINE EQUIPMENT, ARE RECOGNISED AS THE BEST, BUT WE ARE CONSTANTLY STRIVING TO MAKE THEM STILL BETTER.

**END DUMP CAR, for Mines or Quarries.** Particularly adapted for use on Tipples. Door opens by engaging with latch on Tipple framework. Roller bearing wheels, if desired, dust-proof and self-oiling. Note the wide opening of the door for discharging large stones.

**MARSH ENGINEERING WORKS, LIMITED,** Established 1846 **BELLEVILLE, Ontario, Canada**  
 Sales Agents: *MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver*

“slackers.” Rather than be deprived of their livelihood by those eagerly seeking employment, men who have been reactionary to an almost intolerable extent have voluntarily concluded their best interests rest with their employers.

Mr. MATTHEW LODGE OF MONCTON, N.B.

Nor is this spirit confined to one producing company. Others are having the same experience. For a change, a pick-and-choose policy is possible. Where wage concessions are impending, as at Cobalt, it is a reassuring sign of the times to have miners conciliatory, for they are well aware that metal markets are askew.

Uncertainty of tenure is proving an incentive to increased production per man. In the matter of wage schedules, perhaps their revision downward must harmonize with living requirements still none too lenient and yet in the altered circumstances it is co-operation which will make easier whatever readjustments are necessary.

Were it not for the shortage of power—a shortage, it is claimed, that might not have been so acute had foresight been exercised about the conservation of water—gold outputting immediately would be accelerated. Hand-drilling has been tried and found wanting for other than those carried on the pay-sheet at cost plus. So long as exchange on New York, which is the settlement basis, affords a premium, gold mines have an extra to bank. Silver exported carries a corresponding premium—but that premium no longer is handsomely poised upon peak prices for the metal.

In all other directions producers are awaiting the restoration of Peace Markets and resumption of buying big enough to go around. Give essential economies, precious metal mines can make “Snug Harbor” with their increased production. Special and base metals are not so fortunately situated—pending the provision of international credits and broader industrial movements. All of which goes to show how adventitious is the willingness of labor to assist in the solution of serious problems—largely their own.

# Ore Cars

We carry in stock and can make prompt shipment of strongly built, light running, steel mine cars in the following sizes:

14 and 16 cubic feet capacity with C I R C O Roller Bearings.

14 cubic feet capacity with Hyatt Roller Bearings.

Kindly state gauge of track when writing for quotations

## VANCOUVER MEETING OF THE INSTITUTE, FEBRUARY 9th TO 11th, 1921.

The provisional programme of the February meeting of the British Columbia Division of the Institute is as follows:

**WEDNESDAY, 9th.**—Morning session. Business and election of officers. Reviews of mining in the province by the Provincial Mineralogist and the Resident Engineers of the Department of Mines.

**Afternoon Session.**—Symposium of Fuel Supply, cost, distribution and substitutes. A lecture will be given in the evening.

**THURSDAY, 10th.**—Morning Session. Topic, "Metallurgical Problems of British Columbia."

**Afternoon.**—Topic, "Non-metallic minerals of British Columbia." Smoker in the evening, the feature of which will be a play by the Players' Club of the British Columbia University.

**FRIDAY, 11th.**—Morning Session. Discussion of Special Geological Problems affecting mining in British Columbia.

**Afternoon.**—Discussion on the Relation of the Institute to the Federal and Provincial Governments. Evening: Annual Dinner.

The Branch is offering two prizes for the best papers by students in the third and fourth years of the mining course at the University of British Columbia, one paper to be on a mining subject and the other on a metallurgical subject, the papers to be presented at one of the sessions of the meeting.

# The Big Tug of "LITTLE TUGGER"

- Air Compressors
- Air, Steam and Electric Hoists
- Condensers
- Rock Crushers
- Rock Drills
- Mining Machinery
- Pneumatic Tools
- Pulp and Paper Machinery
- Pumps — Steam, Centrifugal, Vacuum and Pneumatic
- Rubber Machinery
- Steel Plate and Structural Steel Work
- Waterwheels, Turbines, ect.

Little Tuggers are simple, sturdy one-man portable hoists. They will operate on either steam or air and can be fastened anywhere and in any position without special fittings. In the mine, shipyard and industrial plant, on the contract job or in the yard spotting cars—wherever there are any hoisting or hauling jobs—is the place for Little Tuggers. Years ago cars were pulled, pushed, or barred and cussed around by hand, or drawn by horses. Then came the big unwieldy steam engine and boiler, and now this hauling and switching of cars and odd handling and hoisting jobs are done by Little Tuggers far quicker and much cheaper.

Help your men to get over the habit of dropping their work to "lend a hand." Do it with Little Tuggers. Bulletin 433

- The Helium Sources of the British Empire, by D. J. McLennan and others.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

**Fuel Testing Laboratory.**—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

**Ore-Dressing Laboratory.**—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

**Chemical Laboratory.**—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

**Ceramic Laboratory.**—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

**Structural Materials Laboratory.**—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

### GEOLOGICAL SURVEY

#### Recent Publications

- Summary Report. The annual Summary Report of the Geological Survey is now printed in parts. Applicants should therefore, state what particular geologist's report is required, or what subjects they are interested in.
- Memoir 105. Amisk-Athapuskow Lake district, by E. L. Bruce.
- Memoir 108. The Mackenzie River basin, by Charles Camsell and Wyatt Malcolm.
- Memoir 110. Preliminary report on the economic geology of Hazelton district, British Columbia, by J. J. O'Neill.
- Memoir 111. The Silurian geology and faunas of Ontario peninsula and Manitoulin and adjacent islands, by M. Y. Williams.
- Memoir 113. Geology and mineral deposits on a part of Amherst township, Quebec, by M. E. Wilson.
- Memoir 114. Road material surveys in the city and district of Montreal, Quebec, by Henri Gauthier.
- Memoir 115. Geology of Matachewan district, Northern Ontario, by H. C. Cooke.
- Memoir 116. Investigations in the gas and oil fields of Alberta, Saskatchewan and Manitoba, by D. B. Dowling, S. E. Slipper and F. H. McLearn.
- Memoir 117. Geology and ore deposits of Ainsworth mining camp, British Columbia, by S. J. Schofield.
- Museum Bulletin 30. Gabbros of East Sooke and Rocky Point, by H. C. Cooke.
- Map 164A. St. John, New Brunswick. Topography.
- Map 183A. Harricanaw-Turgeon basin; Abitibi, Timiskaming and Pontiac, Que. Geology.
- Map 185A. Sandon (Slocan and Ainsworth Mining Divisions). Topography.
- Map 1584. Blairmore, Alberta. Geology.
- Map 1691. Buckingham, Hull and Labelle counties, Quebec. Geology.
- Map 1705. Thetford-Black Lake area, Quebec. Topography.
- Map 1707. New Glasgow, Pictou county, N.S. Topography.
- Map 1712. Foothills of Souther. Alberta, St. Mary river to Higwood river. Geology.
- Map 1724. Sheep River, Alberta. Geology.
- Map 1726. Athapuskow Lake region. Geology.
- Map 1739. Portions of Bristol, Onslow, McNab, Fitzroy and Torbolton townships, Quebec and Ontario. Geology.
- Map 1742. Ainsworth, Kootenay district, B.C. Geology.
- Map 1793. Matachewan, Timiskaming district, Ontario. Geology.
- Applicants for publications not listed above should mention the precise area concerning which information is desired.
- The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.
- Communications should be addressed to The Director, Geological Survey, Ottawa.

PROVINCE OF ONTARIO  
DEPARTMENT OF MINES.

HON. H. MILLS. Minister of Mines.

# Ontario's Mining Lands

---

Ontario, with its 407,262 square miles, contains many millions of acres in which the geological formations are favorable for the occurrence of minerals, 70 per cent of the area being underlain by rocks of pre-Cambrian age. The phenomenally rich silver mines of Cobalt occur in these rocks; so also do the far-famed nickel-copper deposits of Sudbury, the gold of Porcupine and Kirkland Lake, and the iron ore of Magpie and Moose Mountain Mines.

Practically all metals and economic minerals (with the exception of coal and tin) are found in Ontario:—actinolite, apatite, arsenic, asbestos, cobalt, corundum, feldspar, fluor-spar, graphite, gypsum, iron pyrites, lead, mica, molybdenite, natural gas, palladium, petroleum, platinum, quartz, salt, talc and zinc. This Province has the largest deposits on the continent of talc, feldspar, mica and graphite.

Building materials, such as ornamental marble, limestone, sandstone, granite, trap, sand and gravel, meet every demand. Lime, Portland cement, brick and tile are largely manufactured.

Ontario in 1919 produced 38 per cent. of the total mineral output of Canada. Returns show the output of the mines and mineralogical works of the Province for the year 1919 to be worth \$58,583,916, of which the metallic production was \$41,590,759.

Dividends and bonuses paid to the end of 1919 amounted to \$15,545,238 for gold mining companies, and \$78,335,943 for silver mining companies, or a total of \$93,881,181.

The prospector can go almost anywhere in the mineral regions in his canoe; the climate is invigorating and healthy, and there is plenty of wood and good water. Hydro-electric power is abundant, and many undeveloped water-powers remain to be harnessed. A miner's license costs \$5.00 per annum, and entitles the holder to stake out in any or every mining division three claims of 40 acres each. After performing 240 days' assessment work on a claim, patent may be obtained from the Crown on payment of \$2.50 or \$3.00 per acre, depending on location in unsurveyed or surveyed territory.

For list of publications, illustrated reports, geological maps and mining laws, apply to

**Thos. W. Gibson,**

Deputy Minister of Mines,

Toronto, Canada

## Hose Which Resists Wear

WE have records of Goodyear Air Drill Hose giving from 18 months' to 2 years' service—though the life of most air drill and pneumatic tool hose is comparatively short.

Dragged over rocks and steel girders, beaten by ore and building materials, the cover on air drill or pneumatic tool hose is greatly responsible for the life of the hose.

The extra heavy cover of white rubber, tough as a tire tread, with which Goodyear has fitted Air Drill and Pneumatic Tool Hose resists wear to a remarkable degree.

Inside this hard-wearing cover is a

special, oil-resisting inner tube, and a fabric of such strength that Goodyear Hose is very much lighter than ordinary hose of the same strength.

In the same painstaking way, Goodyear has solved each individual hose problem—whether for steam, water, air, acids, or other substances. The creation of hose which would successfully withstand the strain of *present* industrial conditions was the task Goodyear scientists faced and solved. The hose problems in your plant can be greatly reduced with the help of Goodyear data and a Goodyear trained man. This service is without charge. Just phone, wire or write the nearest branch or Goodyear Mechanical Goods Service Station.

The Goodyear Tire & Rubber Co.  
of Canada, Limited

Branches—Halifax, St. John, Quebec, Montreal, Ottawa,  
Toronto, Hamilton, London, Winnipeg, Regina,  
Saskatoon, Calgary, Edmonton, Vancouver.

## Why Waste Coal When It Costs So Much?

**THE COCHRANE METERING HEATER TELLS HOW  
MUCH YOU ARE GETTING FOR YOUR MONEY.**

How many pounds of coal do you use to produce a thousand pounds of steam? 200, 150, 100 or less. A Cochrane Metering Heater will tell how many pounds of water are evaporated per pound of coal, and it will instantly show any improvement in evaporation due to better fuel, better methods of firing, better condition of heating surfaces (removal of soot and scale), better condition of boiler setting (stopping up air leaks), etc.

## THE NEED FOR MINE LABOR IN CANADA.

A typical utterance about the labor situation in Canada is noted in a financial letter emanating from the United States, which states: "Shortage of labor has been very evident in Canada, and there is unquestioned need for immigration, particularly for the type of settler who will colonize the land and aid in the development of Canada's agricultural possibilities."

The monotonous iteration of the need in Canada for agricultural laborers is irritating to those who know that an equally important requirement of Canada is labor for the mines, particularly as there is good reason to believe that the immigration authorities do not favor the incoming of that class of worker who is adapted to mine employment. As Mr. Balmer Neilly phrased it in his address to the visiting members of British Chambers of Commerce when these gentlemen were recently entertained at Haileybury, we need immigration from countries "where the people are not socially above handling a pick and shovel".

One of the interesting features ascertainable from a perusal of W. S. Smith's recent "Study in Canadian Immigration" is the very small number of immigrants classed as miners and mine laborers that have entered Canada in recent years. It might be mentioned that the actual number of these men who were permanent recruits to mining work was even smaller than the immigration statistics would indicate, because it is a curious fact, rather incompatible with the complainings of agricultural advocates, that many of these men become farmers. It is a distinguishing characteristic of some of the unlettered European laborers who are not hampered by social aloofness from pick and shovel that they lust after a piece of land of their own, and graduation from the mine to the farm is a not unusual course in their evolution to full Canadian citizenship.

We submit that the mine laborer is as essential to Canada as the domestic servant or the farm laborer, and that his entrance into the country should be favored by the immigration authorities as positively as the other two classes of workers are favored.

At the same time, large scale importation of workers for our mines should involve as great responsibility for their housing and Canadianization as has usually been assumed to rest upon those who have originated large immigration of farm laborers and domestic servants. It is not for the profit of the mine-owners that additional labor is so much required

at our mines, but because the products of the earth are just as essential when developed by mining as when developed by agriculture. There is no real difference between farming and mining, for both are primarily productive and share the distinction of bringing something out of nothing that is usually considered to be the chief glory of agriculture.

The immigration authorities should enlarge their conception of essential industries to include mining, and should view the question of admission of mine labor not only from a critical viewpoint, but from a deliberately helpful viewpoint, as they do the admission of farm hands.

## THE "EXTREME AGRICULTURIST". . . .

It is not easy in Canada to get a viewpoint upon the tariff issue that is free from political, economic or sectional bias, and therefore the opinion of a detached observer is of value to clarify the issue now so widely debated in Canada.

The following summary from a United States source is sufficiently detached to be impartial, and is quoted as being so.

"The strength of the opposition to a protective tariff comes from the agricultural party which is probably not sufficiently strong to carry an anti-protection program. One factor, however, which may have more influence than party alignment or other considerations is the present condition of Canadian exchange. The depreciation of the Canadian dollar in New York is felt by all parts of Canada and by all interests. It is a situation which seemingly hurts the pocket of every class of consumer. For this reason, alone, there is a feeling that many voters, whose fundamental belief is for free trade, will support a tariff program until conditions in the country's foreign trade have changed for the better. The probability is in favor of the continuance of a protective tariff with its degree of moderation pending upon the strength of the extreme agricultural group."

This sizes up the battle array succinctly.

The "extreme agricultural group" has stated that every industry that cannot adapt itself to Canadian environment is thereby proved unfit to survive, and to the extent that it is artificially sustained by protective duties it is parasitical.

It is further argued that the primary industry in

Canada is agriculture, that the protective duties have made it secondary, and have put manufacturing into an artificial and therefore essentially false position of priority.

These statements are plausible, and contain, as all plausible statements do, a certain amount of truth.

We would submit that agriculture is only the primary industry in the early stages of human development, and that it saw its completest exposition in the dawn of history. It is also the primary industry in undeveloped and partially civilized countries such as China, Bulgaria and Russia.

There is the special consideration in Canada that our frontiers march for four thousand miles with that country which has shown to the world the greatest combined development of agriculture and industry yet seen on earth.

A policy which would place agriculture in Canada in the preferred and entirely dominant position that the "extreme agriculturist" desires, and would regard all stimulation of manufacturers as an incitement to parasitical growth, would end by making Canada the "farm-laborer," the agricultural helot for the 105 million people to the south, who are perfectly willing to have forced upon them the profitable duty of providing us with boots, clothes, iron and steel, coal, and the vast array of the products of industrial arts for which our friends are so justly famous.

We believe that argument upon the relative status of agriculture and manufacturing industries is as futile as discussion of the relative glory of the sun and the moon, for they are complementary one to the other, and no evidence has been put forward to prove that the increased cost of household and other commodities caused by the tariff (which the agriculturist pays in common with all other citizens) has been greater than the increased purchasing capacity of the industrial community that the tariff has created.

The western farmer asks to be relieved of all tariffs that benefit the industrialist, and suggests that an income tax should be levied to make up for the lost customs revenues; intimating in making this suggestion that the farmer in all probability will be unable to pay income tax by reason of the chronic deficiency of his income. If the industrialist is to be doomed to extinction as a biological offense, because of that inadaptability to environment that forbids survival, it might be asked what will be the source of income taxes? Income tax is only possible where incomes exist.

The agriculturalist of the extreme variety also announces that any industry that cannot survive unaided at this time is in advance of the country's requirements. No industry can survive that does not fill a demand, and Canadian industries cannot be said to causelessly exist. If this is admitted, the debate is merely as to which side of the Canadian

border the industrialist shall reside. The conclusion the "extreme agriculturist" has arrived at then, is that it is immaterial to him which side of the line the goods he consumes are made so long as they are tax free, which, being interpreted, means so long as they are cheap. Unfortunately there is no guarantee of cheapness where there is no competition, and when the role of manufacturer is deliberately relinquished to sources that are outside the country and unamenable to our laws.

Canada has certain definite agricultural limitations that forbid the enthronement of this single industry to the exclusion of all other activities in Canada. It will always be necessary to supplement the production of the soil in vegetable growth, by the products of the mines, and these cannot be developed to perfection—and in many instances cannot be developed at all—without an industrial community, and without the evolution of industries which will manufacture and export articles that are primarily the product of the mine.

The western farmer cultivates a greater acreage of land, of greater virgin productivity than can possibly be allotted to an individual in a later and more developed stage of our national growth. He decreases year by year the fertility of the virgin soil, and thus reaps the benefit of a condition that is bound up with the youthfulness of the Canadian nation. Should he grumble at paying a just portion of the cost of fostering those other parallel activities of a well-rounded body politic that are not less essential to our political survival than agriculture?

#### REPORTED DISCOVERIES OF COAL IN ONTARIO.

From time to time, reports appear of the discovery of coal in Ontario, and the latest of these relates to a discovery of what is stated to appear to be anthracite near Shelburne, Ontario. A farmer, boring an artesian well, reports that at a depth of 100 feet, the drill encountered a hard black substance, the deposit being 25 feet in thickness. Property values are said to have jumped in the neighborhood, which is on the Owen Sound Branch of the C. P. Railway, northwest of Toronto about sixty miles.

Reference to the geological map shows that Shelburne lies approximately where undisturbed Silurian sediments pass conformably beneath the Devonian sediments that form the triangle of the Sarnia Peninsula. The finding of anthracite in strata of this age would be surprising. Fissile bituminous shales occur in this locality, and the occurrence reported may be of this character. There is no hope, from accepted geological standards, of the discovery of coal in any portion of Ontario, with the exception of the beds of inferior lignite reported by the Geological Survey as existing in inaccessible portions of the James Bay slope.

Recently, the "Journal" was asked to give an opinion on the advisability of boring for coal near King-

ston, Ontario. This last-named locality, like the Sarnia Peninsula, forms part of what the Canadian Geological Survey calls the St. Lawrence Lowlands. Kingston lies somewhat nearer the contact with the crystalline rocks, and is therefore rather more hopeless, from a coal-finding point of view, than Shelburne.

There would be every justification for an increase in property values in the vicinity of an occurrence of coal in Ontario, or Quebec, but the probability of such a discovery—apart from a few localised and valueless carbonized inclusions of vegetable drift—is so small in Ontario and Quebec as to be entirely negligible.

The substance known as anthraxolite has several times given rise to rumors of coal finds in Ontario, and on a number of occasions the Ontario Bureau of Mines has given a full explanation of the futility of looking for coal in Ontario.

#### ASSOCIATED GOLDFIELDS MINING CO.

Those who are interested in the mining news of Northern Ontario, a category that includes a large proportion of the readers of the "Canadian Mining Journal," cannot have failed to observe the very divergent opinions that prevail as to the merits of the shares of Associated Goldfields Mining Company from a dividend-earning point of view. Our advertising columns, in the issue of April 23rd, contained the report of the annual meeting of the Company, and the statement of the President to the shareholders. Two important statements were made by Mr. G. A. Mac Kay, namely that Dr. H. C. Cooke, late of the Canadian Geological Survey has been appointed as the Company's geological adviser, and that "the discovery and development of gold-bearing bodies has exceeded their (the Directors') most optimistic expectations." The shareholders manifested their confidence in the President and the Board of Directors by unanimously re-electing them to office.

In the meantime nothing of a positive nature has transpired with regard to the estimated gold-content of the area controlled by Associated Goldfields, but several negative factors have remained unrelieved, to wit; the Company discouraged the Ontario Government, in undertaking an expert examination of the property as a preliminary to the construction of a railway along the Kirkland Lake-Swastika route, which the Government was urged to undertake; the widely published desire of a group of shareholders for the detailed report of a mining engineer upon the property, accompanied by assay plans, has not been forthcoming, and the definite aspersions which are being cast upon the size and gold-content of the high-grade lenses and the low-grade ore-bodies, referred to in the annual report, have not been confuted.

The conduct of the affairs of the Associated Goldfields is distinctly the business of its shareholders and the only excuse that the "Journal" can give for re-

ferring to this much debated matter is, if the statements in the Company's annual report are correct, it should be a simple and easy matter to demonstrate their accuracy. At the same time, and while admitting that this paper may be accused of poking into private business, there is an aspect of the public welfare that justifies this recapitulation of the facts as they present themselves to a spectator. If the enterprise of Associated Goldfields, one of the largest and most ambitious yet projected in Ontario, should prove disappointing, it will adversely affect the gold-mining industry of Canada at large. As to possible loss or gain to individual shareholders, this is not a matter of public concern, being distinctly and entirely their own business.

#### THE PROJECTION OF TRADES UNIONISM INTO POLITICS.

Commenting on the threatened coal strike in Britain, and the probability of mutual accommodation of interests, the "Mining Journal" of London says:

"Troublesome as Trades Unions have become, and opposed as their methods are to traditional individual independence which the Englishman loves and values, there can be no doubt that they have gradually contributed largely to establish an industrial conscience in dealing with the livelihood of the working classes. The temptation at present is to project trades unionism into the political sphere, wherein the pursuit of theories emanating from the teaching of Carl Marx—entirely new theories of State organisation and relationships—are being constructed, based not on individualism, but on Communism, and practical men find themselves involved in the many curious contradictions such as those which the Labor Party has exhibited in the last few months, and the end of which is admirably exhibited by the gradual declination of the Central Russian Soviet."

#### THE GOAD OF NECESSITY.

In the dead forgotten days, when people went to church, it used to be said that it was a good thing for a congregation to be in debt for their edifice or other undertakings, because it gave them an incentive for work, and it is well established that the more fashionable and richer a religious society becomes, so it declines in missionary effort and altruism.

A parallel case in nations is suggested by a despatch from George Renwick describing the "amazing evidence of strength and recuperative power" in the German textile industry. Simultaneous despatches record long hours of work and heavy coal production in the Ruhr district. It may well be that the debt which Germany has incurred may have a similarly

disciplinary and salutary reaction upon this nation to that which stirred the French nation to quick repayment of the Prussian indemnity after 1871. It would of course be arguing against human nature to infer that the martial spirit of the German has suffered a mortal blow, any more than defeat in 1870 quenched the spirit of the French.

In industry it is well known that periods of greatest productivity follow periods of unemployment and what are popularly known as hard times, and conversely it is known that production is small following prolonged periods of effort and much accumulation of monetary savings, or even a temporary condition of comparative wealth among people unaccustomed to this condition.

During the recent war the actual participants in the fighting were, as unfortunately they always are in war, the young and the virile, not only in body, but in spirit, and the best of the race in intellect and all the human virtues. Those who remained behind were necessarily mediocre, from causes natural and physical, and not necessarily reflecting on their virtues as good citizens. Those who have survived the tempest of war bear the marks of its fury, in body and oftentimes in spirit. Those who remained behind have not always welcomed the men who have returned from the valley of the shadow of death, because it has meant a crowding of their temporary freedom, a diminution of their emoluments, and a disturbing sense of their secondary worth in the rough and tumble of life.

Where the fury of war has reduced nations of men to masterless beggars, and has destroyed all the conventions of civilization, leaving nothing but the elemental passions of hunger and the mere desire for survival, the formation of soldiers' and workers' committees has been but an indication of general and abyssmal despair, and a seizure of power by those who possessed arms and physical strength. Theirs has been a combination of destruction, and the result has been an earthly hell.

In those countries where, despite the sickening losses of relatives and friends, the effect of war has been to cause a fictitious material prosperity, the result has been a lassitude and a general desire for ease and less exertion, a condition that only financial stringency will remove.

In countries like Germany, where the result of the war has been to destroy foolish visions of material power and archaic conceptions of sovereignty, without crushing the spirit of the people, or inflicting physical destruction upon cities and industrial works, the effect appears likely to be a spur to greater national effort, and, while Germany not unnaturally kicks against the goad, it may well compel her to a greater destiny.

If one truth is more emergent from the war it is

that nations and peoples cannot be suppressed.

It may be that Germany will ultimately benefit from the debt she has incurred. If it should be that she is spurred to greater productivity per head of her population that is the case in Canada, we shall surely be defeated in industry, regardless of our victory in arms.

In such opposition to the babel of Russia as is to be expected from our origins and achievements, the people of Canada may be expected to continue a combination of soldiers and workers, not for destruction, but for construction; but, with the best of intentions, it does not seem likely that we shall achieve the maximum of production in Canada except under the painful and urgent goad of necessity. There are signs that this is a condition not imminent, but approaching.

### SOME THINGS THAT MIGHT BE DONE.

R. E. HORE

There has been evident of late an increasing interest in iron ores of Canada and suggestions are made that a policy should be adopted that would result in greater utilization of our iron deposits.

There are many ways of helping the establishment of such an industry. The most obvious way is to grant a bonus on production of iron ore in Canada. There are many, however, who will not be in favor of such action by governments. It would be much better if the industry could be established without such aid.

In a recent number of the "Journal" I have drawn attention to a process for treating Canadian ores that seems to warrant investigation. Would it not seem reasonable to ask the Ontario Government to look into the inventor's claims and determine whether something might be done to utilize the process, which appears to be one of great merit?

Another matter that seems to the writer to warrant investigation is that of the feasibility of utilizing the iron ore of the Belcher Islands. These are administered by the Federal Government and it would appear in the interests of Canada that the Federal Government should endeavor to find out what the possibilities of the Belcher Islands deposits are. The information now available may not be sufficient to convince the people of the country that the Belcher Island ore deposits are of great importance; but there is good reason to believe that they are worthy of investigation. Some reports that have been printed do not give a very favorable impression; but there are unprinted reports that show that important iron deposits have been found on the Islands. It would seem that the Department of the Interior would be well warranted in having investigation made as to the iron ore resources there and possible methods of turning them to account.

It may be argued that these matters can well be left to private interests. There is much in that argument, for there is little doubt that someday private interests will develop all our resources. The point I would bring out here is that if our governments are really desirous of assisting, in the establishment of iron mining industries in this country there are many ways in which they can help to hasten the day when importation of iron ore from the United States will be unnecessary.

# Annual Report of the Mines Branch of Alberta, 1919

The Annual Report of the Mines Branch of Alberta, recently to hand, is a well-printed volume, containing very full and detailed statistics of the coal industry. The Report shows evidences of a well-organized system of reports, and much painstaking office work carried out under the direction of Mr. John. T. Stirling, the Inspector of Mines, who, the "Journal" regrets to state, has been compelled, by ill-health, to take leave of absence from his duties. Those who have watched the careful foundation that is being laid for statistical recording of what will some day be Canada's largest mineral industry, will wish Mr. Stirling speedy recuperation.

Items culled from the prefatory remarks of the Inspector that are of interest are as follows:

Miners' lamps in use include 2,424 Wolfe safety lamps, 2,372 portable electric lamps of Edison type, 550 of Wico type and 35 Ceag lamps. The increase in the number of electric lamps is accorded favorable comment by the Inspector.

There are three mine-rescue cars and six mine-rescue stations in the Province under a provincial officer. From March 1st 1919, the administration of all mine-rescue and first-aid work has been under the Workmen's Compensation Board.

The mines of the Province number 276 collieries, one copper-ore mine and two shale mines.

At the close of 1919, there were employed in the mining industry 12,027 persons, being an increase of 1,818 over the number employed in December 1918.

It is noted that, notwithstanding the increased consumption of coal in Western Canada during the last few years, development in the industry has been carried on to such an extent that the amount necessary to supply all requirements is only fifty per cent of the possible production. The increase has been from 346,649 tons in 1901 for the whole of the North-West Territories) to 6,148,620 tons for Alberta alone in 1918.

The Report states that "notwithstanding the large increase that has taken place in the production in Alberta during the past few years, there were approximately 2½ million tons imported from the United States during 1919 into territory which should undoubtedly be supplied entirely with Canadian coal. This would mean, therefore, that the possible market in Canada for coal produced in the Provinces of Alberta and Saskatchewan is from 7,500,000 to 8,000,000 tons per year."

"During the month of December 1919, 780,832 tons were produced in Alberta alone, which means that the mines in operation are capable of producing over nine million tons of coal per year with the present labor, development, equipment and plant. It will, therefore, be seen that we are in a position to produce over four million tons per year more than we apparently can find market for at the present time."

The working forces at the collieries show the following division of labor, namely:—

Surfacemen, including supervision . . . . .	3,611
Underground labor, including supervision . . . . .	3,232
Miners and helpers . . . . .	5,184

12,027

These figures disclose a healthy balance between non-producers and producers underground, but the surfacemen are extraordinarily numerous.

The consumption of blasting power is heavy, showing a yield of about 4.2 tons per pound of powder used in the domestic and anthracite fields, and 8.7 tons per pound of powder in the bituminous mines. Over 440 tons of powder of various grades was used in blasting coal in 1919. A circumstance worth noting is that in the domestic mines, which show an extremely heavy use of powder, 80 per cent was black powder. In the bituminous mines, only "permitted explosives" are used, and the tons produced per pound of powder show that blasting was not unduly indulged in.

Electricity was used at 42 mines in 1919, and 35 electrically driven coal-cutting machines were in use. No accidents connected with the use of electricity were reported during the year.

Coal-cutting machines using compressed air numbered 200, the tonnage of coal mined by electric and compressed air machines being respectively 526,744 tons and 928,722 tons.

The number of fatal accidents during 1919 was 21, comparing with an annual average of 21 during the four years period 1915 to 1918 inclusive. Three of the fatal accidents occurred above ground and 18 below ground.

The Report of the Superintendent of Mine-Rescue and First-Aid work states that the equipment comprises thirty oxygen breathing-apparatus, 25 of which are of "Proto" type and 5 of the "Gibbs" type. Twelve smoke helmets are also carried by the cars. Training in mine-rescue work has been given to 1,201 men, and 910 men have taken first-aid instruction. No calls were made on any of the cars or stations during the year.

The Report contains a list of coal mines in the Province giving particulars of names of operator, address, location, character of coal, and dates of opening, abandonment or re-opening of mine.

### AN EXPRESSION OF SYMPATHY.

The "Journal" desires to express sympathy with the editor and proprietor of the "Maritime Mining Record," the Hon. Robt. Drummond, in the loss of his wife, who died in Scotland while on a visit. In his bereavements under circumstances that have turned a long-anticipated visit into an occasion of sorrow, Mr. Drummond will receive the sympathy of Nova Scotian friends scattered throughout Canada.

Much real Christianity at the present time is very unconventional and not at all inclined to advertise itself. But there must be a fund of lofty idealism and calm heroism among our people; it would be absurd to suppose that our best men were all killed in the war. Eight hundred thousand of them have been killed; but if 'the blood of the martyrs is the seed of the Church,' we may be confident that those who gave their lives for England will not be found to have died in vain.—Dean Inge.

# The Lightning River Gold Mines, Ltd.

By J. A. McRAE.

Interest has again been attracted to the Lightning River Gold Area, on account of the decision of the Lightning River Gold Mines Co., Ltd., to resume operations on their property in that field, and the determination of this concern to develop its property in spite of the serious handicap of difficult transportation.

Mr. J. W. Lucy, president of the Company, announces to the "Journal," that arrangements have been completed to carry on operations throughout the coming winter, and toward this end, a force of men will leave Haileybury during the first or second week in October.

twenty-five miles east from the Munro township gold area, and about sixty-five miles due east from the Porcupine field.

A report issued a year or so ago by the Ontario Bureau of Mines, was such as to encourage prospectors and mining men to turn their attention to the Lightning River field, while the results achieved by the Lightning River Gold Mines Co. on their property has since supported the favorable government report.

At the time the first work was being done, supplies were taken in to the new district over a road some 30 miles long, from Matheson, on the main line of the T. & N. O. Ry. The excessive cost of transporting

The original discoverers in the Lightning Gold Area. From left to right: L. B. Hovey, G. E. Martin, R. Howey W. Cochenour.

Special car party of Shareholders visiting the property, in July.

Dr. Lucy, standing on the vein system, 220 ft. wide,  $\frac{3}{8}$ ths. mile long, in Egan Township.

Site where Shaft now being Sunk on Sesekina property. Vein 5 ft. wide

The Lightning River Gold Area is situated in the township of Holloway, in Ontario, at a point about twelve miles south of Upper Lake Abitibi and less than ten miles from the inter-provincial boundary of Ontario and Quebec. The district is reached by boat route from LaReine, on the National Transcontinental Railway, as well as over a six mile trail, the entire trip entailing about eight hours travel under favorable conditions. The district is situated about thirty miles north-east in a straight line from Kirkland Lake,

supplies over this route discouraged aggressive work, and in time led to the selection of the present more favorable water route.

The plan now adopted, and which is calculated to reduce the transportation difficulty, is to ship equipment and the entire winter's supply of material by boat over Lake Abitibi and up the Lightning River to a point within six miles of the property. From here, a dog team will be employed to haul the material over

the first snow trail. Ample provision has been made to eliminate the necessity of wasting time during the winter months in transporting equipment over the long route by sleighs.

As regards the physical condition of the Lightning River property, this paragraph from the latest report of J. W. Morrison, consulting engineer for the company, and under date of Aug. 4th may be presented:

"A general examination of the interesting geological features of the property was made, and many pannings taken from different sections along the old discovery vein resulted in good tails of gold. Free gold was found in samples from the dump, and pannings taken from the rhyolite body, south of the vein, panned gold. In fact, any oxidized or altered section along this rhyolite body carries gold in good quantities. Additional float has been found to the eastward, confirming my opinion that a series of trenches should be cut in this locality, and an effort made to

Egan High Falls on the Watabeg River.

locate the vein. This should precede diamond drilling, and would probably give us information that would assist us in placing our holes."

Attention is directed toward the work and the property of the Lightning River Gold Mines Co., not for the reason of the extent of its operations, but due to the confidence shown and the determination to overcome the obstacles met with. It is to such effort on the part of pioneers that this great new land of Northern Ontario has to rely for speedy development, and which enterprise is deserving of a full measure of encouragement.

Not only has this company acquired the discovery group of claims in the Lightning River Gold Area, namely: the Howie-Willan-Couchenor group, but has also taken over a promising group of claims in the township of Egan as well as a group in the township of Maisonville in the Sesekinika Lake area. About this latter property, the Company consulting engineer says.

"The formation is to a large extent greenstone, with some sedimentary rocks, probably of the Cobalt series, and later intrusions of diabase and lamprophyre. The geology is rather complicated and needs careful study.

"The most important vein is in the greenstone near a dike of diabase. It is a highly shattered zone from two to six feet in width with a filling of quartz. The altered vein rock as well as the quartz, carry liberal quantities of mineral, such as pyrite, galena, sphalerite, stibnite and small quantities of another mineral which may or may not be telluride of gold. It, however, seems to be associated with gold, as all sample containing it give high gold values. Free gold is also in evidence, and hand samples taken from the vein gave very high results.

"The development so far has been confined to shooting along the top of the vein over a distance of 50 to 60 feet. Some good samples have evidently been taken from this section of ground, and the showings warrant sinking, which, I understand, had already begun. On its westerly strike, the vein enters a diabase dike, and I feel there is a possibility of finding good ore about the contact. In fact, these conditions are somewhat similar to the famous Croesus Mine in Munro township.

"As a prospect the property looks very promising, and other properties near by, which are working on a small scale, give evidence of having merit. During the past few years, gold has been found at many points in that district, and there is evidently an enrichment at some point which is awaiting development. I like the appearance of the property as a whole, and its location in respect to transportation is most favorable."

At the time of writing, a report is not available on the Company's Egan township property. However, a view of a waterfall on the Watabeg river is shown in connection with this summary, which is located about three miles from the Company's Egan property. This power has been secured by the Lightning River Gold Mines Co., and is estimated as capable of generating from 450 to 500 h.p. when harnessed.

#### COAL PRICES.

Toronto, Oct. 15.—The price range of hard coal is \$5 to \$9.50, American funds, depending on the quality or from \$12.00 to \$14.00 Toronto, Canadian funds. Conditions have somewhat changed. A month ago anything could be sold at the market prices but today the buyers are discriminating.

The car supply during the past week has been fairly good and transportation seems to be improving. Although a lot of coal has been offered, the erroneous impression seems to be abroad that all the problems connected with the coal supply have been solved, with the result that wholesalers has curtailed their shipments into Toronto. The effects of this will be felt later on. Smokeless coal is selling at from \$13.50 to \$14.50.

**HOLLINGER INTERIM REPORT ANALYZED.**

ALEXANDER GRAY

The Hollinger Gold Mines Report for the January 1, September 8 period shows a daily average for the 252 days, of 1838 tons milled, or 463,176 tons in all. If that average is maintained until the end of the year then the Company will have milled 672,708 tons in 1920, a decrease of 39,174 tons when compared with 1919. This is accounted for largely by the fact that the average number of men employed this year was 1070, whereas the 1919 average was 1263. In view of this, the aggregate results contain a tribute to the administration and management. They are summarized as follows :

	1920.	1919.
Total income . . . . .	\$4,866,597	\$4,839,845
Expenditure . . . . .	2,285,223	2,431,636
Net profit . . . . .	2,581,373	2,408,209
Exp. for plants . . . . .	116,346	242,149
Divs. paid . . . . .	1,476,000	1,230,000
Average No. of men employed:		
Mine . . . . .	666	832
Mill . . . . .	138	145
General . . . . .	266	286
Total . . . . .	1,070	1,263
Ave. tons per day broken..	2,037	2,159
Milled . . . . .	1,838	1,902

Close analysis of these items is made somewhat difficult in the absence of the actual tonnage treated, and the dissociation of total revenue from strictly mining and milling operations. If as it is claimed, the premium on gold which is disposed of to Ottawa on the basis of New York Funds, yielded about \$600,000 taking the daily milling average at 1838 tons, as stated, this premium amounted to about \$1.29 per ton. That being so, this extraordinary source of revenue neutralized the added cost of labor and assisted toward the payment of surtaxes. It is the first absolute evidence that gold mining has derived compensating benefit from exchange for adverse operating conditions. Including this premium and assuming that 463,176 tons were milled to September 8th, the average total profit per ton was \$5.573. With the total expenditure of \$2,285,223, applying that upon 463,176 tons, it would appear that the total of the average cost per ton milled, was \$4.93. Combining this cost and profit, as estimated, the grade of ore milled would figure out as \$10.50. If the premium on gold, however, enters into the totals as given—and they do no doubt—then the grade of ore milled was about \$9.21—which was \$0.52 less than the average for the whole of 1919.

While for the purposes of an interim report it is usually not considered necessary to detail the extraneous sources of contributory income, such as interest on bank balances and other liquid assets, these are in the case of Hollinger quite considerable, and will without doubt add to the satisfactory revenue showing for the entire year, when this is completed.

Approximate as these figures necessarily are, they serve to illustrate Hollinger doings. In 69 per cent. of the operating year, therefore, the net profit was 10.49 per cent, on issued capital, while the grade of ore was lower than was reported for all of 1919. Obviously labor conditions were the sole deterrents. The management acquitted itself in a manner that is most favorably impressive in the circumstances. How grievous are the handicaps is apparent, and it also is

understood that the sinking of the large Central Shaft was retarded by the inability or indisposition of three contractors to make adequate footage. Should the rate of total income as recorded be maintained until the end of the year, the grand total will be about \$6,375,000, compared with 7,063,099 in 1919. Without the premium on the gold, the contrast would be more disappointing. It would be apt to be downright discouraging, were it not for the positive knowledge that the Hollinger Mines are standing up to every test. Recent exploratory drilling—at a slight angle of dip—not vertically, was reassuring. The object was to feel out the southwestern extension of the main Hollinger series of veins. The drill intersected what looks like the extension of the exceptional No. 1 Vein, at a lateral distance of several hundred feet from the present working face. Naturally those most concerned are chary about committing themselves upon one intersection. The width of at least one ore body is understood to have been 11 feet, and the values noted better than an ounce.

**TORONTO NOTES**

An interesting visitor to Toronto this week was Col. Donald McGregor, the "grand old man" of the Yukon. Col. McGregor, who has not been in Toronto for thirty years, is on his way to his native county Glengarry, to see his aged sister and to superintend the erection of a memorial tablet at the village of St. Andrews, six miles north of Cornwall, to Simon Fraser, the discoverer of the great salmon river in British Columbia bearing his name. He is the only man living who saw the discoverer, and although ripe in years, is active and enjoys travel. He carries a cane presented to him by Mayor Gale, of Vancouver, for his services in president over the Children's Day exercises on the occasion of Greater Vancouver's peace day celebration on August 4th, of last year.

A well-know Northern Ontario mining man passed away at his home in Toronto this week in the person of Michael Lewis Foley, one of the promoters of the Foley-O'Brien Mine. Although ailing for nine months, Mr. Foley was not confined to his bed until the last ten days. He was born at Durham 51 years ago and went into Northern Ontario about 1905, during the construction of the Temiskaming and Northern Ontario Railway. He is survived by his wife and four daughters.

The purchase of the Blue Diamond Coal Mines, comprising 3,400 acres near Brule, Alberta, for \$450,000, and the Canadian Coalfields, Limited, owning 8,320 acres, for \$1,500,000, was ratified at the annual meeting of the McIntyre-Porcupine Mine and at the special general meeting of the Temiskaming Mining Company. Of the total purchase price \$600,000 has already been paid and the remaining \$1,000,000 is payable in 15 years from the earnings of the Canadian Coalfields Limited. The Blue Diamond mines are now producing at a profit, over 400 tons daily and by August 1921, it is expected, with the new machinery already ordered, the daily output will be 2,000 tons for which there is a ready market. The ratification means that McIntyre and Temiskaming each hold a half interest in both coal companies. The old board of directors on McIntyre was re-elected, with the exception of Sir Henry M. Pellat, who was replaced by Mr. Joseph Errington.

# Coal Production in Britain

**A Typical Instance. Production decreased thirty per cent. Workers increased seven per cent. Wages doubled and per ton cost of coal trebled.**

BY THE EDITOR

Bolckow Vaughan's annual meeting elicited some figures regarding this company's Durham coal mines which go far to explain the stand pat of attitude of the British Government in the coal mines question.

Comparing 1914 with 1920, it will be seen that there is an increase in the number of men employed, a decrease in the tonnage of coal produced, a doubling of wages paid, a trebling of the ton cost of coal and no reduction in the quantity of coal consumed for colliery and domestic purposes. The figures, condensed and re-arranged from the remarks of the Chairman, are as follows:

	1914	1920
Number of workmen . . . . .	8,844	9,487
Annual wages . . . . .	£735,236	£1,589,036
Average annual wage . . . . .	£83. 2s. 8d.	£167. 10s. 6d.
Tons raised . . . . .	2,320,410	1,616,233
Tons saleable . . . . .	2,137,832	1,426,135
Boiler and domestic coal . . . . .	182,578	190,098
Percent of output consumed . . . . .	7.9%	12%
Tons raised per man . . . . .	262	170
Wages cost per ton raised . . . . .	6s. 4.04d.	19s. 8d.

It would be interesting to know the number of men employed in actually mining coal in 1920 as compared with those so employed in 1914. The presumption is that it is this class of workers must have been decreased, otherwise the great falling off in output is not explainable. Neither is it easy to conceive of a balancing of the working forces that would permit of a drop in production of 30 percent with the workers increased by 7¼ percent.

The steadily mounting cost of overhead expense is illustrated by the item of boiler and domestic coal, which is not decreased by reason of the decreased output, and naturally has its percentage to the total production much increased. A slightly less than eight percent consumption of the coal produced for power raising and workmen's coal indicates a fair amount of economy in this inescapable item of colliery cost, but twelve per cent is a deplorably large proportion of the coal produced to be allotted to "company's consumption".

The tons raised per man, allowing only five working days weekly, only works out to 0.65 tons per man per day, which by comparison with transatlantic standards is a shockingly low rate of production.

The increase in cost per ton, and the increase in the rate of wages, while sufficiently serious, is merely incidental and secondary to the decreased output of coal.

No stronger arguments than the foregoing figures are needed to support the contention of the British Government that any future increases in wages must be contingent on an increased production of coal, which is what the "datum line" proposal really boils down to.

To illustrate the handicap under which the British coal operator now labors, as compared with the United States producer of coal, the following comparison is submitted as being approximately typical of the relative difference.

	Bulckow Vaughan's 1920 figures.	Typical United States bituminous colliery.
Coal production . . . . . tons	1,600,000	1,600,000
Company's consumption . . . . . "	190,000	144,000
Saleable coal . . . . . "	1,410,000	1,456,000
Tons raised per man "	170*	650*
Workmen required . . . . .	9,500	2,500
Wages cost per ton . . . . .	\$5.00	\$2.00

\* On basis of 260 working days a year.

This comparison, which is only given as a rough approximation, indicates that the United States producer can obtain the same tonnage of coal with less than one-third the number of workers required at a British colliery; that a lower percentage of the total production is required in the United States for boiler and domestic uses, which gives a correspondingly higher tonnage for profitable sale; and that the total cost of coal production per ton is probably in the United States less than one-third of what it is in Britain.

Add to all these advantages of the United States producer the exchange premium on U. S. funds, the infinitely greater tonnage of coal available in the United States, and its better physical quality, it would seem to be high time that British miners turned their thoughts from irresponsible discussions of the disposal of a hypothetical surplus from the controlled mining of coal in Britain, and from fine-spun theories that have been so fantastically intermingled with the thinking of the leaders of the British miners, to a consideration of the disastrous array of facts that analysis of the foregoing figures will reveal.

The leaders of the British miners have been leading them on a merry dance to commercial ruin, and the disposition of these men to meet the Government on a basis which will take primary cognisance of production, would indicate that some inkling of impending bankruptcy of the coal-mining industry has come home to them. Not inaccurately has Sir Robert Horne stated that the continued combination of increased wages and decreased production can end only in irredeemable ruin.

Whether the leaders who have misled their followers can explain their mistakes to the miners is another question.

## METAL QUOTATIONS

Fair prices for Ingot Metals in Montreal, Oct. 13th, 1920. (In less than carload lots).

	Cents per lb.
Copper, electro . . . . .	22¾
Copper, casting . . . . .	22¼
Tin . . . . .	51
Lead . . . . .	8½
Zinc . . . . .	9½
Aluminum . . . . .	35
Antimony . . . . .	8½

# Wage Conditions at the Nova Scotia Collieries

Coal Costs Cause Deferment of Steel Plant Extensions.

The situation with regard to miners' wages at the collieries in Nova Scotia and New Brunswick has arrived at an impasse. The findings of the Royal Commission, which are regarded by those who have carefully counted the cost of putting them into effect, as so favorable to the miners as to be financially impossible of accomplishment by the operators, have been rejected by the vote of the union members in every essential particular except the wage increase of approximately one dollar per day. The operators take the ground that the recommendations of the Royal Commission must be accepted or rejected as a whole, and that if the union cannot accept the Commission's findings, the award of the McKinnon Conciliation Board stands. The Wage Scale Committee of the Union requested the operators to meet them at Truro on the 12th October to discuss a modified acceptance of the recommendations of the Royal Commission, but the larger companies have definitely refused.

The attitude of the operators was not unexpected, and is indeed an unavoidable one. The operators entered into an agreement with the union at the beginning of 1920, after negotiations of the most protracted character, during which every individual wage-rate was taken under review and adjusted to the satisfaction of the representatives of the workmen. The agreement contained a clause which provided for a quarterly revision of wage rates to conform with increases in the cost of living, and this clause was stated by the miners' leaders at the time of signing the agreement to be a most advantageous and satisfactory provision from the standpoint of the workmen. Thus the machinery existed for any adjustment of wages that increases in living costs might indicate as necessary.

When in the early part of 1918, largely at the earnest request of the Minister of Labor, the operators agreed to recognise the jurisdiction of the United Mine Workers in Nova Scotia, it was agreed, both by the Nova Scotia executive and by the Indianapolis officials present at the Montreal conference, that at no time should the rate of wages in the United States, or the incidence of increases given to the miners in the United States be made the basis for similar demands in Nova Scotia. The agreement on this point read as follows:

"After having had the assurance of the Executive of the Amalgamated Mine Workers of Nova Scotia, and the representatives of the Federation of Labor, confirming the statement made in Montreal by Mr. Harlin of the United Mine Workers of America, that the desire of the A. M. W. of Nova Scotia does not arise from any intention to make the wage rates and working conditions of Nova Scotia conform to those obtaining in other districts of the U. M. W. of America, and that local districts will receive complete autonomy, and also that the limitations of Nova Scotia in regard to outside competition in the sale of coal are recognized by the incoming U. M. W. of America, and will always be borne in mind in the future, the operators agree to the extension of the U. M. W. of America into Nova Scotia, if that should be the desire of the majority of the mine workers."

The leaders of the U. M. W. in Nova Scotia, following the demand which the bituminous mine-workers in

the United States made early in 1920 for a 27 per cent increase in wages, announced their intention to follow this lead, and made a similar demand as from the first of May 1920. If this demand was made because of happenings in the United States it was ruled out of court on two points, namely the foregoing clause in the 1918 understanding, and by virtue of the agreement of January 1st 1920.

If the demand were based on increases in the cost of living, then recourse should have been had to the provision incorporated in the January 1920 agreement, which was admitted by the miners' leaders to be all that was required.

Notwithstanding the clear violation of two signed agreements, the operators in Nova Scotia, actuated by a desire to preserve harmonious relations, consented to submit the points at issue to a Royal Commission. At the time the Minister of Labor made it clear that he considered the appointment of such a Commission was unnecessary, and made the acquiescence of the operators a prerequisite to the appointment of a body that was in fact superogatory to the undischarged McKinnon Conciliation Board.

The Royal Commission reported, and, notwithstanding the onerous burden which acceptance of their findings would place on the operators, they signified willingness to accept and carry out the recommendations.

It is, therefore, not over-stating matters to record that the operators have carried their policy of conciliation to great lengths, and have manifested a forbearance of most unusual nature.

## Steel Manufacture Prejudiced by Unsettled Conditions at Collieries.

The attitude which the coal companies have now taken, while fully justified by the foregoing history, is, however, a direct result of the readjustment now taking place in commodity prices, and in particular is a result of the trend of the steel market. Mr. Wolvin, the President of the Dominion Steel Corporation, has stated that an increase in the cost of finished steel of four dollars per ton of steel, and this is by no means an over-statement. The cost of coal production is already so high in Nova Scotia as to place the coal mines of the Province at a desperate disadvantage, and the further increase in steel costs which appears eminent would definitely rule out Nova Scotia from markets that are now an important outlet for steel products. It is not too much to state — as has been previously stated by the "Journal" — that the chief pre-occupation of steel manufacturers in Nova Scotia is, and has been for a number of years, their increasing fuel costs. From an operating standpoint, the whole steel industry of Nova Scotia is based on the availability of moderately priced fuel. The closely adjacent occurrence of a large deposit of iron-ore is incidental, for iron-ore is always taken to the coal. The iron-ore of Wabana is a great asset to the companies that own it, but it is no asset to Nova Scotia if coal costs there advance to a prohibitive figure. Wabana ore can be smelted in Britain with equal facility, and it should be remembered that while the greatest stimulus that ever was given to the coal trade of Nova Scotia came from the steel industry, that industry is primarily a by-pro-

duct of the presence of coal. Coal that is not available at a moderate price is, for the purposes of the steel industry, non-existent.

As a direct result of the small production and high cost of coal production in Nova Scotia, and of the uncertainty as to increase of production or reduction of the per-ton cost of coal the Dominion Steel Corporation has announced its intention to defer projected capital extensions at the collieries and steel works.

The situation in Nova Scotia is analogous to that in Britain, and in the case of both countries, the only hope for continuance of wage rates even approximating to those now existing lies in greater per capita production of coal. In both countries the miners have been asked to accept a wage award that would definitely tie up the increased rate of earnings to an increased production of coal. It is of course fairly obvious that the only revenue of a coal mine comes from coal, and that if little coal is produced little revenue will be available to pay wages with, but it is a point that is persistently obscured by irrelevant argument. The miners of Nova Scotia know full well where the trouble lies, and they know also that they themselves are the only persons that can bring about that re-establishment of the balance of the working forces at the collieries that must precede increased coal production and per-ton costs that will permit the coal companies to stay in business. The wage question is secondary to production. More coal means more money for all hands. Less coal means less money for all hands, and no money for some people.

#### **"NEW MONEY" AWAITS MORE LABOR: LESS TAXATION.**

ALEXANDER GRAY, Montreal.

"Unless one has unlimited capital — and things are at a standstill here so far as new money is concerned — for the outlook industrially is rotten — there is danger of getting bogged also in Canada in a slough of labor, taxation and transport."

As a reflex of London technical opinion, the foregoing merits reproduction. The writer is eminent in his profession as a mining engineer; he has been to Canada where he passed upon various new propositions in outlying districts, and he is as keen as his kind in quest of opportunities for profitable operations. Probably he overstates the London situation, because the Burma Corporation recently obtained another million sterling; but that enterprise has the backing of the influential Mining Corporation, represented in Canada by Mr. J. B. Tyrrell. He exaggerates difficulties of "transport" — since discoveries provide their own transportation — if they are not behind Beyond. As to the "slough of labor and taxation": that is a double-barreled deterrent — and the sooner the matter is remedied, the sooner will the "outlook" hereabouts be less "rotten." So long as the mines are surtaxed and labor is inadequate, while supplies are mostly, constructive capital will decline to be "bogged"—and "things" mining will remain at a "standstill," notwithstanding the clamor for more of the precious and special metals. Double and treble taxation, as at present, plus manifold operating handicaps, veto initiative. What adversely affects gold mining the world over, is accentuated in Canada, where there is no "cheap" labor and official solicitude is scantily bestowed. Even where "native" labor is available, as in South Africa and Mexico, the supply

is unsatisfactory, hence the urgency of the petitions for increased gold production.

Were it not for the premium upon gold, owing to existing disparities in international exchange, half of the gold mines would shut down, or their operations would be sacrificial. Politicians contend that the premium upon gold neutralizes the abnormal taxation and costs. That is only a half truth — and the argument is reversed by cost sheets and curtailed outputs. Insufficiently and inefficiently manned, mulcted for materials, factors of economy have to be ignored or flouted. Nor are the gold mines deriving as much from the premium upon their gold as are their contemporaries elsewhere. Take the New Modderfontein, at the Witwatersrand, for example. It is the second largest gold mine in the world. In the year ended June 30, it earned a net profit of £1,518,187 and paid dividends of 82½ per cent. Of that profit, £464,657 came from the premium upon gold. The proportion of unearned profit, as it were, was 31.11 per cent. Of the total revenue of £2,555,466, the receipts from the premium represented 18.18 per cent. of the gross. This percentage is a third or so more than any of the Ontario gold mines realized on account of the premium. Of course ten or twelve per cent added to the value of the total of the bullion when refined, is a very welcome solace; yet it is impermanent, and operating companies would rather have normal conditions and ample labor. Were the companies enabled to import labor—mostly unskilled—the greater tonnage milled automatically would effect economies in costs. Then the modification of surtaxes would be incentive for speeding up production. Until practical remedies are forthcoming Canada cannot set the pace in increased outputting of the yellow metal. Lower-grade mines find it impossible to prosecute development and work for the Government, machine men and "muckers."

In the language of the lawgivers: "An Emergency Exists." No "new money" is being risked in an economic muskeg.

#### **CANTEENS AND SCIENTIFIC FEEDING FOR MINERS.**

A paper on this subject was read by Mr. Wm. Maurice, of Sheffield, at a meeting at the University College, Nottingham, of the Midland Counties Institution of Engineers. There could be no doubt as to the importance of scientific feeding, observed Mr. Maurice. It seemed to be a self-evident proposition that the provision of suitable food would have a readily recognisable effect upon the day's output. Such provision should include the supply of energy for the whole shift, say two meals, otherwise the treatment was only going half-way and would produce less than half its possible advantage. The first meal would be taken at the canteen before starting work. The second should be taken at the proper physiological time, but the workman would take it with him on leaving the canteen. Both should be hot meals, and the underground meal should therefore be contained in food-carriers of the thermos-flask type. The meals should be charged for at cost, to preserve the respect of the workers, and to remove any suspicion of charity or personal interest. No great capital outlay was necessarily involved in the scheme, and the cost per meal to the workers, even today, need not exceed a few pence. He considered the subject was worthy of careful consideration and experimental test.

## British Columbia Letter

### THE METAL MINES.

#### Atlin, B.C.

The question of ownership to the Engineer Group of Mineral Claims, Atlin District, will be brought before the Courts for decision. Because the property is valued at considerably more than \$1,000,000, being rated as one of the most promising of the lode gold mines of the Province, the suit will be followed with more than usual interest. The section has other unusual features. In the first place the original stakers will seek to establish their right to title. Precisely what their position is cannot be stated at present but it is understood that it will be alleged that the late Capt. Alexander, the accepted owner during his lifetime and whose heirs will be the defendants, occupied the ground before it had become vacated. S. S. Taylor, a distinguished lawyer of Vancouver City, will represent them. In addition to this claim one will be presented to the Courts by W. Pollard Grant, another lawyer resident of Vancouver, for a one-fifth interest in the property. For some weeks agents of the plaintiffs have been busily engaged in scrutinizing records at Atlin and it is stated that some sensational evidence will be adduced in the course of the forthcoming trial which is expected to be opened about the 20th of October.

#### Stewart, B.C.

The first signs of Winter have appeared in the Portland Canal Mining Division. Snow now mantles the mountains, Jack Frost has touched the atmosphere with his icy finger, and the prospectors are beginning to seek the shelter of the permanent camps. The season has been notable in two respects, viz., the number of new discoveries that have been recorded and the extent of the work done on promising prospects. It would appear, from reports received from operators who have come south recently, that this northeastern section of British Columbia now may fairly be considered on its feet as a mineral producer and that it may reasonably be expected in the course of a few years at any rate to take a leading part among the productive mining regions of the Province.

It perhaps is but natural that those asked to explain conditions in this Country should dwell first on the Premier Mine. Almost enough, it would seem, has been said about this property. There is no doubt that it is outstanding. Equally true is it that much high grade ore has been taken out but whether the prediction that 3,000 tons of ore will be brought to the Coast and thence to the Smelter this Winter, the returns on which will aggregate \$1,000,000, will prove justified may be open to some question. However a large quantity of ore, carrying high silver values, will be brought out over the snow. It should be remembered, that the owners of the Premier based their hopes for its future, not so much on its high grade ore, as on its large quantities of the lower grades which are to be treated in the Concentrating Mill now in course of construction.

Notwithstanding that development on the Big Missouri Mine has ceased for the time—and here let it be borne in mind that some of the old timers stubbornly adhere to belief in this property—the prac-

tical miners, and the prospectors, retain their optimism. The announcement of one adverse report on one prospective mine has not dampened their ardor nor stayed the energy displayed in their work and their confidence in its result. They point, not alone to the Premier, but as well to the Spider Group, the latter being one of the holdings of the Algonican Syndicate, and to many other prospects which so far have shown promising indications and which are likely to be shipping soon. In regard to the Spider it is said that a vein running between two and three feet in width has been struck that contains high values in silver; that the tunnel now is at the 600 foot level; and that the formation is augite porphyrites and the mineralization principally argentine with lesser amounts of freibergite in quartz.

Among the many other prospects on which special reports have been received are the Divide Group, Salmon River, owned by the Mahood Mines Ltd. This was located only last year and only a small amount of work has been done but some rather remarkable assays have been obtained and, if the showing continues at depth, there is no doubt that more will be heard of this property. From the Silver Tip some very high grade ore will be shipped, this having been taken from stringers bearing, in parts, the native silver. The Hercules Group is to be the scene of activity throughout the Winter according to General R. G. Edward Leckie, who is acting for the holding Company. It is hoped that considerable useful development will be accomplished in the next few months. From the Alaska side of the Salmon River comes the news that the New Alaska is likely to be worked during the winter.

As to new discoveries it would appear that the policy of the Provincial Government in grub-staking returned soldiers has not been without result in the Portland Canal area. In the vicinity of Tide Lake, about twelve miles from Long Lake, it is reported that such parties have uncovered a number of narrow high-grade veins of silver bearing mineral, some of the samples from which assay as high as \$700 to the ton.

George Clothier, government mining engineer, recently returned from an inspection of the Bear River region, which suffered most from the effects of the heavy rains of the Summer, bridges being washed away, trails damaged, and the commonly used avenues of transportation generally made impassible, and his report is being awaited with interest. While the storms referred to interfered with development, repairs were carried out by the Province without delay, and much work has been done on many of the properties of the Marmot River, Bitter Creek, etc.

One of the well-known mining operators of the District sums up the situation well when he says:

"There has been more legitimate mining done here this season than ever before, and there will be some shippers when properties now under development are opened up. What is wanted badly is sampling works, where inspectors could take small quantities of ore and make enough to go on with. There is no boom and we don't want it and the mining population do not care much what tradesmen and transient workmen say about the country. They have never been out in the hills and look at things from their own viewpoint."

### Prince Rupert, B.C.

The Graham Island Oil Development Co., has been organized for the exploration and development of lands, believed to be oil bearing, situated on Graham Island of the Queen Charlotte Group. The Company claims to have four sections covered by oil leases, staked before the war, and comprising 2,560 acres. It is planned to commence drilling as soon as financial arrangements are completed.

Arrangements have been made for the shipment by the Canadian Robert Dollar, when she arrives from the Orient, or 1,000 tons of blister copper from An-yox, the British Columbia smelter centre of the Granby Consolidated Mining and Smelting Co., to New York. Officials of the Granby Company state that this will be the first shipment of this metal from the Province by water and explain the change in transportation plans by the assertion that recent increases in railway freight rates have made the maritime charges so much lower that the difference cannot be overlooked. With the Panama Canal open the factor of the time also appears to favor the freighter, at any rate under present conditions, as it is stated that a car of copper would be delivered at the Long Island refinery in sixty days while by the water route it will reach there in forty five days. The Company ships from 1200 to 1500 tons of blister copper a month.

### Hazelton, B.C.

The Cascade Group of Mineral Claims on Hudson Bay Mountain is being extensively developed, a contract having been awarded for the continuance of the tunnel for a further one hundred feet in depth. The theory is that the main ore body, which appears to dip heavily, will be struck within that distance. If the owners' hopes are realized the property will be one of the steady shippers of the Province within a short period.

One of the properties inspected by John D. Gallo-way, Resident Mining Engineer, headquarters Hazelton B. C., during the Summer is the Mica Property owned by what is known as the Mica Syndicate of Tete Juane Cache B. C. and Calgary, Alberta, the holdings of which are situated on Mica Mountain, eastern B. C. There are five claims and the main showings are on Reliance Mountain. Some adjoining Crown Granted Claims are owned by New York Interests. Work was started by the Syndicate, under S. E. Beveridge, in May of this year and consisted chiefly in the construction of roads and the building of quarters for mine officers and men. The dominating rock of Mica Mountain is described as a coarse-grained garnetiferous mica-schist, which has been classified by the Geological Survey as highly metamorphosed sedimentary material and provisionally placed in the Shuswap Group of the Pre-Cambrian. The schists are intruded by granite rocks varying from normal granodiorite to pegmatite and these pegmatite dykes contain the mica, which is of the muscovite variety. The mica is transparent and in thin flakes almost white with a slight greenish tint. On the surface mica was found a bit rusty but is expected to become much clearer with depth. There are crystals of "books" ranging from 4 x 4 inches to 12 x 12 and still larger are found. These are said to be

abundant. They have a thickness of one-half to two inches and, having an excellent basal cleavage, are easily split into as fine flakes as may be desired.

### Trail, B.C.

The attitude of the management of the Consolidated Mining and Smelting Company with respect to protection against metal imports was forcibly presented to the Canadian Tariff Commission which recently toured this Province. P. P. Warren, president of the Company, complained of the removal of the 7½ per cent war tax, asserting that, in the confident belief that this impost would remain in force, the Company had made investments of a substantial character. Over \$250,000 had been expended in developing flourspar deposits and commitments of equal amount had been assumed in the construction of a rod mill and other additions to the plant at Trail. He declared that there was no protection against Great Britain or the United States and, while competition from the latter source was not keen at present owing to properties having been overworked and little development having been done during the war, under normal conditions the competition for the Canadian market would be active. The United States duty was \$1.50 per ton and he felt that Canada should have at least the same protection.

The Company's output in lead was 100 tons, about equal to the Canadian consumption. Until 1919 the Canadian tariff was the normal 15 per cent plus the 7½ war tax as against a United States rate of 25 per cent. Last year the whole was removed and a specific duty of one per cent per pound imposed.

The lead producer in this Country was seriously menaced by lead produced in Spain, offered here as a British product. The United States has protection of two cents per pound and notwithstanding was faced with competition from Mexico, Germany and Spain via England. The exchange situation presented another difficulty in competing with foreign countries.

Answering Sir Henry Drayton, chairman of the Commission and Canadian Minister of Finance, it was stated by Mr. Warren that the industries were overburdened with taxes. The Province took ten per cent of their gross income, less certain deductions, which did not include depreciation of mine property or take into account money borrowed by the Company outside the Province. His Company had paid in 1919 in taxes \$150,000, over 16 per cent of the net income. Half a million of the ten per cent dividends had been taken from reserve funds.

The increase in railway freight rates Mr. Warren contended was a great contribution to the railways because no corresponding increase in selling price could be made.

The Trail Board of Trade submitted to the Commission a memorandum emphasizing the importance to the Trail Smelting Industry of adequate protection. While there were only between 2,000 and 2,500 men actually employed at the smelter it was argued that at least 20,000 people were dependent on the successful operation of the plant. Many of the large and small mines of the interior of the Province were dependent upon it. Reference was made to the notable part played by the Company during the war in supplying the zinc requirements of the Empire for which purpose a large plant had been installed at enormous expense. An extended account was given of the

Company's diversified mining activities and its enlargements and improvements at the smelting centre. That protection against outside competition was essential if this industry was to grow, if the work it is doing in the development of the mineral resources of the Country is to continue, was the point clearly brought to the attention of the Commissioners.

Receipts at the Trail Smelter for the week ending September 21 totalled 8810 tons, bringing the aggregate for the year up to 238,991 tons. During Company's diversified mining activities and its contributing mines. These were the Yankee Girl, which is being opened up by the Mining Corporation of Canada, and the Ruth and Skyline, of Ainsworth.

#### Nelson, B.C.

Satisfactory reports are received from the Spokane Group of the Bayonne District which is under development and at which there recently was constructed an arrastra for experiment. Some 15 tons of ore have been run through and, while a good concentrate is made, comparatively little of the free gold is saved on the plate. It is asserted by the management that there is a large quantity of ore in sight, its value being estimated at \$100,000, if an economic method of transportation could be secured. To remove this difficulty it is understood to be the intention to ask the Provincial Government to construct a 15-mile pack trail on a wagonroad grade down Canyon Creek to Kootenay Lake. It is stated that such a road would serve to open up a considerable section of the Bayonne.

The West Kootenay Power and Light Co. has completed and tested out the power line extending from the City of Greenwood to the Copper Mountain Mines of the Canada Copper Co. This makes one of the longest transmissions in Western Canada, the distance from Bonnington Falls, the source of the power, to Copper Mountain being 190 miles. The extension is a single 110,000 volt line of H. Frame construction and the distance from Greenwood to Copper Mountain is 108 miles. The Company's intention is to operate this line at 60,000 volts until power requirements necessitate going to a higher voltage. At Greenwood the line is fed by duplicate 60,000 volt transmission lines from the generating stations at Bonnington Falls.

#### Invermere, B.C.

Somewhat novel methods are being adopted in the opening up of the Bunyan Mine by Captain E. J. Fader, manager of the Silver Ores Incorporated of New York. Recently a match was applied to four leads connecting with a charge of several tons of 60 per cent dynamite embedded in the face of Bunyan Mountain. This was the culminating point of many weeks of hard work, consisting of tunnelling, driving and other underground operations, and the results, judging from reports, appear to have justified the effort. It is said that the face of the mountain for over 100 feet longitudinally, for 30 feet or more in width, and for a depth of over 30 feet was loosened. It is estimated that some 10,000 tons of ore was thrown up and that the face of the ledge has been so exposed that it will be possible to continue operations by quarrying. This property is situated about seven miles from the town of Wilmer and

has an elevation of 1500 feet above Windermere Lake.

#### Silverton, B.C.

The statement of the Standard Silver-Lead Mining Co., operating the Standard Mine, near Silverton, Slocan District, shows a cash surplus of \$367,996 as on July 31st last as compared with \$341,825 as on March 31, 1920 and \$298,010 on December 31, 1919. Profit for June of this year was \$10,952; May showed a loss of \$4,340 while April had a net gain of \$18,959. Nothing is being done at this time on company account owing to unsatisfactory labor conditions. The old Wellington Camp is being prospected but nothing official is given out as to results.

#### Revelstoke, B.C.

The Bernière Mines, situated near Scott Creek, Camborne, are being opened up and a contract has just been let for the construction of cabins, a blacksmith shop, etc., it being the intention to continue work this winter.

The Beatrice Mines, of the same District, are shipping silver-lead ore to the Trail Smelter.

#### Victoria, B.C.

Among the recently incorporated British Columbia Companies is the Lowox Steel Company, with an authorized capital of \$500,000 and head office in Victoria. Its business is described as steel makers, colliery owners, and operators and along other lines of the iron and steel manufacturing industry.

Dr. V. Dolmage, of the Canadian Geological Survey, has returned after a summer's field work which has resulted in the obtaining of the information necessary to complete the geological map of the west coast of Vancouver Island.

He found fossils at Malksope Inlet of an interesting character scientifically. The impressions of sea shells of these rocks confirm the conviction that the whole of the northwestern continent, as it is now known, dates back to a very early period in geological history. The shells give evidence of several periods of submersion by the sea, and may enable the dates of the glacial periods to be determined with more accuracy than has hitherto been possible.

Dr. Dolmage's survey started at Ucluelet Arm and embraced Calyoquot Sound, Sidney Inlet, Hesquiut Harbor, Kyuquot Sound, and Quatsino Sound. At Sechart he examined mercury deposits of the commercial value of which no opinion is expressed. He also covered the ground on which the Tidewater Copper Co. is operating at Sidney Inlet and at Nootka Sound encountered deposits of Magnetite. Copper is common, he states, at Kokshittle Arm and some gold deposits have been discovered on the shores of Kennedy Lake.

Dr. C. H. Clapp and Dr. G. N. Dawson already have completed the geological survey of the southern and northern sections of the west coast of the Island.

#### Vancouver, B.C.

The re-definition of the Alaska-Canada Boundary Line, particularly in the Portland Canal and Salmon and Unuk River Regions, made considerable progress during the past Summer. J. D. Craig, head of the Canadian party, has returned and states that he worked in North and Westward from the town of Stewart while United States surveyors, led by Jesse

Hill, worked south by the Unuk River. The duty of these parties was to clearly indicate the boundary by means of monuments and by the cutting of timber where there is timber. It is stated that some miners and prospectors have made the mistake of staking in American territory and recording the same with Canadian officials and that the error has been as frequently made conversely.

---

### THE COLLIERIES.

An amendment passed at the last Session of the Provincial Legislature to the Semi-Monthly Payment of Wages Act, providing for twenty-six pay days per annum in connection with the coal mining industry and that these pay days shall fall on a Saturday, became effective on the 1st of October last.

The original Semi-Monthly Payment of Wages Act of British Columbia applied to lumbering, fishing, and mining. It established the principle of a payment twice every month to the workers in connection with the industries enumerated.

The amendment referred to is effective only in respect of coal mines and, while it has met with opposition in some quarters, it is the opinion of Hon. Wm. Sloan, Minister of Mines, who is responsible for it, that the sentiment in its favor among those benefitted is so unanimous that it will be generally accepted as a satisfactory step towards the general improvement of working conditions.

A tie-up of the coal mining industry of eastern British Columbia and of the Province of Alberta threatened during the past two weeks but, from last reports, the crisis appears to have been successfully passed. There are two union organizations in these fields, viz., the O.B.S. and the U.M.W. of A. The One Big Union called a strike to force the elimination of the "check-off" system, whereby payment of the miners' U.M.W. of A. dues is taken from their pay envelopes, while at the same time the U.M.W. of A. demanded of the Operators that their recent contract be re-opened to permit of an increase of \$1.50 per day to be given day-wage men, thus placing the latter, as it was argued, on an equal footing with miners of the mid-competitive field in the United States, who lately were granted an additional advance. The situation was dealt with by Senator Robertson, Canadian Minister of Labor, who happened to be in Alberta with the Canadian Tariff Commission; W. H. Armstrong, director of Coal Operations for the Canadian West; and other government officials. While the O.B.U. strike was ordered and a percentage of the miners left work it would seem that the mediation endeavors of the government representatives have been, on the whole, successful. None of the mines was at any time completely closed down and the latest reports are to the effect that the industry soon will be in a normal condition. At Coal Creek and in other sections of British Columbia the mines are working as usual. The claims made of a defeat for the leaders of the O.B.U. movement seem to be justified but what adjustment has been made, if any, between the Operators and the U.M.W. of A. in respect of the latter's demands on behalf of the day-wage men, cannot be stated at present.

Senator Robertson, Minister of Labor, made the interesting statement while in Calgary recently that

during the first seven months of this year there were produced in Alberta coal fields more than one million tons of coal in excess of the 1919 production and that quite substantial reserves of both bituminous and lignite coal have been accumulated during the Summer.

Discussing the situation in England and its bearing on Canada, the Minister said: "There is no danger that Canadian miners will strike in sympathy with a walkout in England. At present they are working under an agreement by which they would have to get the consent of the International Union Headquarters in Indianapolis before they could strike. The International Union would never let them go out in sympathy with the British miners, though they might allow the miners to refuse to mine coal for export to Great Britain—coal which would be used to ease the situation there."

---

An acute coal shortage is reported in Australia and New Zealand, the condition being attributed to the "go slow" policy of the miners of those countries. It is suggested as a probability that the collieries of British Columbia will be called on to fill orders from the consumers of the Antipodes.

---

In the increase in freight rates permitted the Railways of Canada by the Board of Railway Commissioners coal is one of the articles of universal consumption on which the full rate advance is not permitted. The Board of Trade of Nelson, B. C. has asked that coke be placed in the same class, arguing that coke is a much used domestic fuel and that in the British Columbia interior the coke product of the ovens of the Crow's Nest Pass Coal Co. is essential in the maintenance of the important smelting industry of the Consolidated Mining and Smelting Co. at Trail.

---

The municipal authorities of the City of Vancouver have adopted regulations for the protection of the coal consumer against being short-weighted in his purchase. One of the most striking of these is that a purchaser, who may be doubtful as to whether he is getting a full ton when a ton has been ordered, is given the privilege of sending the coal to the nearest scales to be weighed. If his suspicions prove well founded the dealer must pay the expense but should it be shown that he was wrong the expense of carting and weighing is added to the first cost. Another interesting provision is that the dealer who sells coal in small quantities must carry in his vehicle scales, properly tested, and capable of weighing such quantities as he is engaged in selling.

---

The City of Prince Rupert B. C., Pacific Coast Terminal of the Grand Trunk Pacific Railway, is asking the Dominion Government to construct large coal bunkers at that port, the contention being that the result would be a saving of at least \$1.00 a ton to the consumers, large and small, of the northwestern section of the Province.

---

E. Floyd has resigned his position as manager of the Nanoose-Wellington Collieries Ltd., Nanoose Bay, Vancouver Island.

## Northern Ontario Letter

### THE SILVER MINES.

#### The Cobalt Field.

The labor shortage in Cobalt has become acute during the past few weeks, and all the leading mines are experiencing considerable difficulty in securing underground workers. Surface men are fairly plentiful, but muckers, trammers and even machine runners are scarce. In some instance the shortage amounts to more than 25 per cent of requirements.

A movement is under way to encourage the Ontario Government to look into the situation with a view toward taking steps to induce men to seek employment at the precious-metal mines. Figures presented, and based upon the opinion of employers, goes to show that at least 1,500 men could be quickly absorbed in the silver and gold mines of Northern Ontario, and that about 2,500 could be absorbed by early next summer. It is felt that any effort the government may make, would not only benefit the mining industry, but would encourage men to enter this district to the extent of several thousand, some to find employment in the pulp and paper industry and some in agricultural pursuits.

A fourth vein has been encountered on the surface at the Kerr Lake mine, in close proximity and running parallel to the three high-grade veins reported in these columns a week ago. The annual report of the Kerr Lake shows that during the fiscal year ended August 31st, produced 956,049 ounces of silver, and 42,654 pounds of cobalt. The cost of production amounted to 56.04 cents an ounce. The output continues at present at the rate of over 50,000 ounces monthly, any increase above this amount depending on the question of the extent of the new high-grade deposits just being opened up.

In the arrangement between the Peterson Lake and the Dominion Reduction Company, it is learned the Dominion Reduction first takes off the actual cost of treating the old tailings pile, and receives an additional bonus of 35 cents on each ton treated. Of any remaining net profit, the Peterson Lake gets two-thirds while the Dominion Reduction Company gets one-third.

Negotiations under way in connection with the Victory Silver Mines, formerly the Hylands property, offer fair promise of this property being operated this fall. It lies a short way south of the Adanac.

The Mining Corporation has suspended operations on its property in the township of Butt, in the district of Nipissing, on which exploration work was carried on during the summer in an effort to determine the extent of the deposits of radium-bearing ore. It has been found that while radium-bearing ore occurs in patches, it is too erratic to be of commercial value.

In regard to the tailings pile being treated at Cobalt by the Mining Corporation, a misunderstanding has gone abroad that this material contains about five ounces of silver to the ton. The correct figures approximate four ounces to the ton, the misunderstanding having arisen due to the five-ounce point having been reached on a small part of the pile.

The shareholders of the Temiskaming Mining Corporation Company at a meeting on Oct. 7th, ratified a deal in which the company joins the McIntyre-Porcupine in the purchase of the Black Diamond Coal

mine in Alberta for \$600,000 and another large coal property in that vicinity for \$1,500,000. J. P. Bickell, president of the Temiskaming and the McIntyre, brought the deal to a head.

An interesting decision has just been rendered against J. P. Bickell & Co., of Toronto, in favor of Mr. Barthelmes, a former client of the Bickell firm. Barthelmes was a client of the Bickell firm, and was trading in the New York stock market. At the time J. P. Bickell retired from his brokerage business, Barthelmes had a balance due him of \$62,455, and Bickell claimed this balance was in Canadian funds. Barthelmes sued to recover the American exchange on this account and after a two day trial before Mr. Justice Middleton, he has received a judgment against Bickell for \$10,105 and costs, a stay of ten days being specified. This is important as showing that the Canadian broker is obliged to pay his clients any exchange which he receives on his transactions.

Deals are being negotiated on three properties in the South Lorrain silver area. The Forneri property is said to have been optioned by R. T. Shillington and his associates with the object in view of mining the cobalt metal which occurs on the property, as well as carrying on exploration work for silver. James Harkness is said to have about completed a similar deal on the Haileybury Silver as well as on the Haileybury Frontier. These properties all lie not far from the Keeley Silver Mines.

In the meantime, the Keeley is making good progress and is expected to have its mill ready for operation by the end of November.

Although the price of silver has declined to below 90 cents an ounce this week, the Canadian producers, in receiving payment in New York funds and thus getting the current premium, are in reality being paid an amount about equal to the American producers who market their products under the terms of the Pittman Act and which calls for 99½ cents an ounce.

Mining Commissioner T. E. Godson, K.C., will hold his regular monthly sittings at the Court House, at Haileybury on October 12th. A total of six mining disputes are on the list, the following being an official summary:

Babayan vs. Summers, regarding claim L. S. 147, and being an application under section 81 of the Mining Act.

Darróch vs. McDonald, being an application for an interest in mining claim No. L. S. 464.

Lieut. M. L. Bouzan vs. R. M. Devlin, an application under section 81 of the Mining Act in respect of mining claim L. 3096, 3097 and 3098.

Giroux vs. Blanchfield, a dispute in respect of mining claim T. 19001 situated in the Gillies Limit.

Giroux vs. Billington, a dispute in respect of mining claim T. 19007 situated in the Gillies Limit.

O'Neill vs. Brooks, being an application in respect of mining claim C. 1397.

Returned soldiers who recently lost their interests in mining claims, owing to a misunderstanding among mining recorders as to the intent of an order issued late in 1919 by the Minister of Mines, are to be given full protection of their property up until the beginning of 1921. This will probably mean that applications recorded in the meantime, will be thrown out, and the former holders fully re-instated.

In his regular monthly report to the president and

## ELECTRIC STEEL & ENGINEERING, LTD.

WELLAND - ONTARIO

directors of the Nipissing Mining Co., Hugh Park, manager, says that during the month of Sept. the company mined ore of an estimated value of \$225,100 and shipped bullion and residue from Nipissing and custom ores of an estimated net value of \$658,296.

"The amount of exploration and development work done during the month was very much less than normal, due to the scarcity of underground labor. There are enough men for surface work and the running of the mill but it is impossible to keep up our regular force of muckers and machine men. The great demand and the high wages paid by the pulp and lumber companies in this district are making it increasingly difficult to operate the Cobalt mines economically.

Stopping of vein 109 in the 96 tunnel workings, is proceeding satisfactorily. The vein is high grade and is fully coming up to expectations.

The high grade mill treated 211 tons and the low grade mill put through 6,753 tons. The refinery shipped 598,940 ounces of bullion valued at \$561,319. Residue shipments amounted to 622 tons, valued at \$96,976.

Estimated production for the month is as follows:—

Low grade mill.. . . . .	\$120,541
Washing Plant .. . . . .	104,559

Total . . . . . \$225,100

The price of silver is estimated at 91 cents, which is 3½ cents less per ounce than last month's production estimate.

During the week ended Oct. 9, six Cobalt companies shipped an aggregate of eleven cars containing approximately 864,025 pounds of ore. The Nipissing was the leader with nearly a quarter of a million pounds, and with the Mining Corporation a close second.

Following is a summary:—

Shipper	Cars	Pds.
Nipissing . . . . .	3	240,660
Mining Corporation . . . . .	3	233,487
Coniagas . . . . .	2	131,549
Dominion Reduction . . . . .	1	88,000
McKinley-Darragh. . . . .	1	85,592
Temiskaming . . . . .	1	84,737
Totals . . . . .	11	864,025

During the corresponding period, the Mining Corporation was the only bullion shipper, sending out 98 bars containing 100,799.60 fine ounces.

**THE GOLD MINES.**

**The Porcupine District.**

Labor shortage continues to retard progress at the gold mines, but in spite of this handicap, a remarkably good showing is being made. The Hollinger Gold Mines Report (which is elsewhere analyzed in this issue by Mr. Alexander Gray) is the subject of much congratulatory comment.

The Porcupine V. N. T. Mines is waiting for more money before deciding to resume operations. An executive staff has been gathered together, and the date of opening is deferred only until such time as the underwriters take up the second block of 200,000 shares. The underwriting arrangement involves 600,000 shares, some 200,000 of which were taken up at 15 cents a share, and with the second block of 200,000 shares due to be taken on in a few months at 30 cents each. It is learned the underwriters may take

up this second block a little ahead of time, in which case operations might resume within the next month or so.

At the annual meeting of the McIntyre-Porcupine held in Toronto, Oct. 7th, the General Manager R. J. Ennis, spoke optimistically in reference to the new ore-body recently encountered south of vein No. 5, and it is quite evident the potentialities of the mine have been greatly added to.

Following a discovery of gold on a group of claims in the township of Jamieson, situated west and north-west of Porcupine, interest has again been renewed in that district where prospectors some years ago met with considerable encouragement.

Diamond drilling operations are under way on the Porcupine-Miracle property situated about twelve miles south-east from Porcupine, and a large vein is reported to have been cut. The average mineral content of the vein has not been announced.

Arrangements have been made to resume operations on the Premier-Langmuir barite mine, situated south of Night Hawk Lake, in the township of Langmuir. A force of men have been placed at preliminary work and it is planned to overhaul and remodel the mill. The vein is about six feet in width, the barite being of high grade quality. A peculiar occurrence is the presence of native silver, in patches along one wall of the vein. An effort will be made to recover this metal as a by-product.

On the Clifton-Porcupine, where underground operations were discontinued on May 15th, diamond drilling is being done, and a report recently issued to the shareholders states the property is in condition to continue development when deemed advisable.

The diamond drilling is expected to give exact information as to the contact area north of the existing workings and to disclose the most advantageous direction for future work.

Official announcement is made to the Journal that the Argonaut mine at Beaverhouse Lake, east of Kirkland Lake, has opened up its main ore shoot at the 200-ft. level to a length of 250 feet, showing a width of about five feet. About 40 men are on the pay-roll, and arrangements are to be made as soon as possible to continue the shaft to a depth of 500 feet.

**PLATINUM CONTINUED SCARCE IN 1919.**

The United States is still dependent on foreign countries for its supply of platinum. The small output of crude platinum from domestic mines increased from 647 ounces in 1918 to 824 ounces in 1919, but the total quantity of refined platinum and allied metals recovered from foreign and domestic ores by domestic refiners decreased from 59,753 ounces in 1918 to 45,109 ounces in 1919. Only 11,759 ounces of refined platinum was derived from domestic ores in 1919. On the other hand, the imports of platinum and allied metals increased from 56,753 ounces in 1918 to 68,054 ounces in 1919, nearly half of which came from Colombia. The estimated world's production increased from 62,283 ounces in 1918; the lowest recorded output, to 67,180 ounces in 1919, but was still far below that of preceding years.

Returned soldier prospecting parties, grub-staked by the Government, have recorded promising copper prospects on Mount Diadem, near Jervis Inlet, lower mainland of B. C.

# Why the Marsh Hoist is a Good Hoist

We take pride in our work, and are always trying to do still better work.

The specialists in the office, and the specialists in the shops are all on the alert to make improvements.

For a quarter of a century we have been making Hoists, and constantly striving to make a better Hoist.

We put Brains and Honest Endeavor into each Hoist, and try to make each Hoist a little better than the last.

We spend a lot of real money each year in the unending effort to make the Marsh Hoist and other equipment better than ever.

**A MARSH HOIST**

Above is a sample of one of our Heavy Duty Steam Hoists. We make these from 10 H. P. up to 50 H. P., and with one or two Drums.

We also make Hoists for  
**ELECTRIC POWER**      **BELT DRIVE**  
**GASOLINE POWER**      **HAND POWER**

Our skilled engineering staff have to be paid good salaries. It is a big expense item, and there are many other costly items charged to the same account. But we do not begrudge the money. "The game is worth candle."

We are still trying to make a better Hoist than ever before. Give us a trial, you will be pleased with the result, for the Marsh Hoist you get will be the best Hoist we ever built.

We don't stand still—we constantly improve.

The Marsh Hoist has won a place in the front ranks, and must not only maintain its position, but must forge still farther ahead.

Sales Agents: **MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver**

## ASSOCIATED GOLDFIELDS AFFAIRS.

ALEXANDER GRAY

It is no secret the character of the Associated Goldfields of Larder Lake is sub judice. Certain owners of shares having considerable amounts tied up, exercised their right to investigate the status of their mines. They are "Missourians"—and properly so.

Therefore, it would be unbecoming for anyone deliberately to prejudice the case. Dr MacKay, the President, is entitled to an impartial opinion. Shareholders who entrusted their money with him, also deserve a judicial decree.

As usual, it is rather late for such an inquiry as is now proceeding. After developing a water power, erecting and equipping a mill, and prosecuting work underground to a point where the President intimated the value of the ore indicated to the shallow depth attained exceeds that of any gold mine on this mundane sphere: it is almost ludicrous to have it announced that the merits or demerits of the mines are questioned. Ordinarily the treasury surplus of a million or more should be concrete evidence of the sanity of the management and shareholders, reinforced by the fact that every share sold to a confiding, public is pooled. Then there was an Advisory Committee whose province it was to counsel with the administration while more shares were being disposed of. Furthermore there has been talk of a railway, a 10,000-ton mill—all of which was productive of speculative inebriation.

Singularly enough the collection box was passed without much pulpit oratory or publicity. Provincial

geologists were admonitory. Otherwise mild persuasion swelled the lists of subscribers—and "still the wonder grew" that the greater masses did not arise and empty their horns of plenty into the coffers of the company concerned. Perhaps the larger public was ungrateful. If the nominal capital be increased, as is proposed, the roster of the pooled may yet make Ponzi appear to be a "piker"—and Sheldon a mere "shoe-string" Not that the record shows malfeasance on the part of the responsible directors. Doubtless they are culpable in that they have ignored essentials vital to the proposition. It was their duty to obtain the more competent judgment of recognized engineers. Failing that they are censurable—and it devolves upon the shareholders to husband what cash there is on hand, if the Mines do not measure up to Dr. MacKay's story.

To infer that the Associated Goldfields properties, reckoning only to the 500 foot vertical attained, has ore to the value of \$159,000,000—or a tenth of that fully demonstrated—courted the inquiry in progress. A year or so ago, Mr. Hopkins of the Provincial Geological Staff distinctly stated that the proposition called for detailed mining, which involves accurate sampling and thorough development before venturing upon estimates of ore reserves. Mr. Hopkins dwelt upon the unrelated enrichments, as distinct from the mass of very low grade ore. It may be that development along the contact will disclose a substantial tonnage of profitable grade, but that awaits demonstration. Associated Goldfields must have another character witness, or abstain from further appeal to the public.

**SOME NOTES ON THE PORCUPINE GOLD MINES.**

R. E. HORE

**Hollinger Gold Mines.**

The performance disclosed by the interim report is one of great merit, when the labor conditions are taken into account.

This mine has developed numerous ore-bodies and it has not been necessary yet to do any deep mining. Exploration work has been done at some depth below the present stoping levels and deeper development work will doubtless be soon undertaken in order to keep far ahead of the ore breakers. It is understood that the management intends soon to deepen the central shaft which is now 850 ft. deep. There are so many working places on levels above this that no pressing need exists for deeper development at this time.

**McIntyre**

The development of the McIntyre at depth continues to give results that contrast greatly with those obtained in the early days of the Company's operations. The reports of drill-hole exploration and of the mine openings at the lower levels are of a nature that speak well for the company's future. At present it suffers like the other companies from shortage of labor; but its smaller plant is being operated at nearer full capacity than its big neighbor. The company is making good progress and is assured of a long profitable life.

**Dome**

The exercising of the option on Dome Extension by Dome Mines is generally regarded as a very important step forward in the making of a great mine at the Dome. The resources of the companies being now combined, the development of the Dome Extension property at depth is assured. It is understood that the results thus far obtained are such that the purchase of the Extension property greatly increases the possibilities of a long and profitable life for the Dome.

Work was suspended for some time at the Dome mine during the war, and the record of production during the war period and since is not a fair indication of the mine's capacity. With the additional property now taken over and with capacity operation of the mine and plant, the magnitude of the enterprise will become more obvious.

**Murray-Mogridge**

It was announced some weeks ago that the final payment on the Murray-Mogridge gold property at Bourkes station on the L. & N. O. Ry. had been paid. Publicity has been recently given to some reports on this property which show that it is one of much promise. It is now stated that J. R. L. Starr and W. I. Banfield of Toronto have joined the board of directors of the company, Mr. Starr has been for some time president of one of the producing silver mines at Cobalt, Mr. Banfield is a successful manufacturer.

Recently the Ontario Bureau of Mines has undertaken to make a geological examination of the Bourkes area, Mr. C. W. Knight, Assistant Provincial Geologist, is now at Bourkes in charge of this work.

From the caption "Aluminum, Automobiles and Arkansas" which is to be found in a recent press bulletin of the United States Geological Survey, it is a fair assumption that somebody is attracted by "alliterations artful aid."

**TORONTO MINING STOCKS.**

# And Nevada Con. Takes Six More

Another "Crushing Victory" for Hardinge Mills is recorded by the fourth repeat order just received from the Nevada Consolidated Copper Company.

2-8' Conical Ball Mills . . . . .	December 1915
2-8' " " " " . . . . .	July 1916
2-8' " " " " . . . . .	August 1916
6-8' " " " " . . . . .	June 1917
6-8' CONICAL BALL MILLS	JUNE 1920

Total Installation — 18 Hardinge Conical Mills.

The first repeat order was the result of a direct competitive test.

The last repeat order (just placed) is the result of another competitive test under different conditions.

It is the proven superiority of Hardinge Conical Mills—as demonstrated at the Nevada Consolidated and scores of other plants—that has made them the standard equipment for preliminary and fine grinding in plants all over the world.

Our "Grinding Data" leaflets give specific figures and information that will enable you to judge just what Hardinge Mills can do for you. We will be glad to send them.

*Books For Your Library*

**Ore Mining Methods**

*Second Edition.*

By **WALTER R. CRANE, Ph.D.**,  
*Dean of the School of Mines and Metallurgy,  
 and Professor of Mining, The Penn-  
 sylvania State College.*

Deals authoritatively and in a practical manner with the methods of support in extraction of ore, stoping and mining in narrow and wide veins, bedded and massive deposits, including stull and square-set, filling and caving methods, and open-cut work.

Every mining engineer should have a copy of this standard book, for constant reference. "CRANE" has 272 pages, 6 by 9 inches—83 graphic illustrations—the price, \$3.50

*A New Edition, Issued Oct., 1919.*

**Technical Methods  
 of Ore Analysis**

*Eighth Edition, Revised and Enlarged.*

By **ALBERT H. LOW**,  
*Formerly Chief Assayer, U.S. Mint,  
 Denver, Colo.*

A number of new methods for Molybdenum, Potassium, Tungsten and Uranium have been placed in the Appendix of this up-to-the-minute edition.

With "LOW" in your possession, you will find your hardest problems quickly and correctly solved.

"LOW" has 388 pages, based on actual experience—the price, \$3.25.

# PROVINCE OF QUEBEC

## MINES BRANCH

Department of Colonization, Mines and Fisheries

*The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.*

**The Mining Law gives absolute security of Title and is very favourable to the Prospector.**

**MINERS' CERTIFICATES.** First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

**WORKING CONDITIONS.** During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

**SIX MONTHS AFTER STAKING.** At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

**MINING LICENSE.** The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

**MINING CONCESSION.** Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

**PROVINCIAL LABORATORY.** Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE J. E. PERRAULT,  
MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

# BRITISH COLUMBIA

## The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$75,722,603; Lode Gold, \$100,272,431; Silver, \$50,432,304; Lead, \$43,821,106; Copper, \$153,680,965; Zinc, \$16,818,487; Coal and Coke, \$199,123,323; Building Stone, Brick, Cement, etc., \$29,991,757; Miscellaneous Minerals, \$786,918; making its mineral production to the end of 1919 show an

### Aggregate Value of \$670,649,894

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462; for the year 1917, \$37,010,392; for the year 1918, \$41,782,474; for the year 1919, \$33,296,313.

### Production During last ten years, \$322,829,310

Lode-mining has only been in progress for about twenty-five years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with Mining Reports and Maps, may be obtained gratis by addressing

THE HON. THE MINISTER OF MINES  
VICTORIA, British Columbia.

## *Blasting Supplies*

The success of your blasting operations depend to a great extent on the quality of the materials you use.

To give satisfactory results, blasting materials of every descriptions must be up to the very highest standard in every respect.

C. X. L. blasting supplies are all up to this standard. They have won their popularity from their efficiency and the results consumers have with them.

C. X. L. Explosives have a known dependability. Every line assures the user entire satisfaction.

### *C. X. L. Supplies include:*

Electric Blasting Cups	Safety Fuses
Electric Squibs	Cap Crimpers
Delay Electric Fuses	Thawing Cans
Blasting Mats	Blasting Caps
Tamping Bags	

"C. X. L." on your blasting supplies is your guide to the best.

## To Manufacturers

Valuable economic minerals, of  
which the people of this country  
as a rule have little knowledge,  
are distributed in various sections  
served by the Canadian National  
Railways. The field of utility for  
these minerals is constantly expand-  
ing and entering more and more  
into the realm of manufacture.

Information on this subject can be  
obtained by writing:—
