THE  
CANADIAN MINING JOURNAL  
1920

Index To Vol. 41

Published Weekly by the Industrial & Educational Publishing Co. Ltd.  
at the Garden City Press, Gardenvale, Quebec

Of South America,—Miller & Singewald.....	48
Oredressing, Handbook of,—A. W. Allen.....	982
Prospectors' Field Book,—von Bernewitz.....	445
Useful Minerals,—McLeod.....	960
Miners' Diseases	
Fatigue of Visual Organs in Coal Miners—Stassen.....	351
Miners' Diseases,—Court.....	351
Miners' Nystagmus,—Sir J. Court.....	371
Mines & Copper Handbook,—Weed.....	675
Mines & Speculative Investor,—Gallard.....	616
Modern Tunnelling,—Brunton & Davis.....	816
Purchase of Mine Supplies,—Stronck & Billyard.....	982
Skinner's Manual & Year Book.....	302
Study in Canadian Immigration—Smith.....	658
Technical Writing,—Rickard.....	447
The Kent Coalfields,—Ritchie.....	204

## CORRESPONDENCE

A "Perfect" Concentration Process,—M. J. Patterson.....	675
Bonusing of Iron-Ore in Ontario,—J. E. Marks.....	424, 1032
British Columbia Tech. Assoc.—R. Snodgrass.....	540
Canada's Alleged Antonomy,—Phillip Thompson.....	308
Canadians on the London Market,—A. Gray.....	715
Fine Arts vs. Styracosaurus Albertensis,—T. C. Denis.....	495
Flotation Saved The Situation,—A. Gray.....	940
Gowganda Railway.....	193, 252, 754
Investor or Speculator,—A. Gray.....	232
Mines Act,—L. O. Hedlund.....	1032
Mines Regulation in Canada,—Theo. C. Denis.....	1012
Mining News of Newfoundland,—F. B. Macdonald.....	731
Norite Occurrences,—A. P. Coleman.....	966
Peace River Formations,—G. M. Pontoon.....	346
Petroleum Hysteria of E. & M. Journal "Philamerica".....	308
Qualifications for M. E. Degree,—Prof. H. E. T. Haultain.....	411
Smashing Smelter's Stock,—A. Gray.....	993
The Asbestos Industry,—B. Marcuse.....	754
The Government of Canada,—N. Rankin.....	325
The Search for Petroleum,—G. M. Pontoon.....	715
Tin Deposits in Virginia A Reply,—M. Haney.....	938

## OBITUARIES

Allen J. A. M.....	318
Belloni Robert.....	991
Brown, R. H.....	134, 251
Carter, E. H.....	315
Casey, John.....	55
Christianson, Peter.....	1012
Conner, Major F. C.....	816
Cooke, Ben.....	739
Cooke, Henry.....	757
Dunsmuir, Hon. James.....	475, 532
Ellis, Dr. W. H.....	699
Gwillim, Prof. J. C.....	699
Iddings, Joseph Paxon.....	803
Jennings, H.....	259
Kyle, Capt. D.....	134
Lapworth, Prof. C.....	334
Lindsay, G. G. S.....	461
MacArthur, John Stewart.....	688
Macoun, John.....	630
Macnaughton, James Percy.....	966
O'Shea, L. T.....	426
Rogers, Elias.....	307
Wood E. F.....	307

## Accidents

Decrease in British Columbia for 1919.....	84
"Imprisoned Underground",—George Huston.....	84
Prevention Association of, Nova Scotia.....	328
With Breathing Apparatus, Black Diamond Mine, Wash.....	755
After Treatment of Injured Workmen,—Ed.....	772
Air-drill, New Type.....	790
Airplanes for Prospecting,—Ed.....	324, 1011
Alberta	
Athabaska Oil Sands.....	333
Coal Mining Commission.....	6, 83
Mineral Resources of.....	546, 901
Mines Department's Reports.....	841
"Anchadura".....	809
Anthracite Coals of Canadian West,—Ed.....	1051
Anthracite Supply Available to Canada.....	266
Appropriate Leasing Units,—Ed.....	919
Armenian Mandate,—Ed.....	2
Arsenic in Canada, 1919.....	30

## Asbestos

Australia,—Hartwell Conder.....	979
British Uses.....	960
Industry,—Ed.....	691
Market Conditions.....	666, 781, 698, 722, 1006, 1079
Quebec Production and Notes.....	4, 27, 221, 417, 635, 866, 940
Western States.....	1079
Assessment Appeal by Porcupine Companies.....	177
Associated Goldfields.....	675, 761, 839, 855, 920
Belcher Islands Iron-Ore Deposit.....	299
Bentonite.....	560
Blasting Coal on Night Shift,—Ed.....	170
Briquetting Lignite.....	217
Brittain C. J. Vice-President of Fairbanks-Morse.....	534
British Coal Strike,—Ed.....	711, 712, 858, 943
British Columbia	
Ainsworth Camp, Geology of.....	506
Coal Production, 1919 —Robert Dunn.....	1070
Coal Trade with Japan.....	52, 256
Dolly Varden Mine, B. C. Acts Disallowed by Ottawa.....	339
Engineering Status Legislation.....	98, 278, 541
Fatalities Decrease in 1919.....	84
Geological Survey, Salaries Question.....	202, 293
McGregor James, Appointed Chief Inspector.....	417
Mineral Production, Reviews.....	13, 623
Molybdenum Mine Litigation,—Alice Arm.....	786
Steel Industry Projected.....	446, 467
Stewart District Silver Ores,—V. Dolmage.....	454
Tetrahedrite Occurrences, East Kootenay.....	799
Weekly Letter.....	See Each Issue.
British Empire Steel Corporation.....	364, 493, 431, 433, 595, 1049
British Labour and Polish Freedom,—Ed.....	674
Breathing Apparatus	
• Fatalities at Black Diamond Mine—J. M. McGregor.....	697, 755
Industrial Use & Limitations of,—A. C. Fieldner.....	92
Precautions in Using.....	756
Proper Use of,—Ed.....	729
Standardization of.....	794, 899
Triple Fatality in Use of—Ed.....	613
Camsell Charles.....	496, 752
Canadian Institute of Chemistry.....	341, 458
Canadian Institute of Mining & Metallurgy	
Change of Name.....	500
Editorials.....	206, 238, 285, 306, 1009, 1064
Geological Survey Salaries.....	184
Meetings.....	55, 86, 131, 163, 207, 785, 863, 895, 1018
New Secretary,—Ed.....	1065
Resignation of Secretary.....	500
Secretary Emeritus,—Ed.....	577
Second Industrial Conference.....	690
Second Western Meeting,—Ed.....	877
Canada's Complex Economic Problems Surveyed,—A. Gray.....	944
Cartoons.....	265, 319, 398, 923
Coal	
Alcohol from.....	72
Alberta Production.....	216
Britain's Production.....	785, 845, 884
British Coal Mining Fatalities Decreased.....	1061
British Coal Strike Terms.....	941
British Columbia Production.....	14, 1070
Canada's Supply,—F. W. Gray.....	228
Canadian Production.....	12, 783, 1069
Canadian Situation,—Eds. 409, 451, 539, 614, 751, 651, 693, 1063	
Cassidy Colliery,—Vancouver Is.....	172, 739
Discovery in Ontario Reported,—Ed.....	838
Export Embargo on.....	680, 693
Increased Freight Rates on,—Ed.....	752
In Spitzbergen.....	1048
Interest of Coal Producer in Distribution.....	989
Marketing Problems of Western Coal.....	902
Microscopic Investigation of.....	94
Microscopic Selection,—Ed.....	859
Mining Tradition of The Empire,—Sir J. Cadman.....	542
Miner's Yearly and Daily Output,—W. W. Adams.....	1075
Nova Scotia Production.....	24, 661, 1067
Powdered Western Coal.....	900
Prices.....	See Issues from August-December
Situation in Canada,—S. J. Cook.....	783
Steam Tests of Western Coal.....	901
Supply Statistics,—Ottawa.....	771
Tantalus Colliery,—Yukon.....	65
Temperature in Kent Coalfield.....	342
Transportation,—M. A. McInnes.....	218
Transportation & Distribution.....	614, 694
United States Production of.....	660
Virgin Coal Areas in Rocky Mountains.....	763
Western Coalfields and Canadian National Development	
F. W. Gray.....	899, 921

World Production of Coal.....	373, 660	German Coal King, A.—Ed.....	596
Coast Erosion in Sydney Coalfields,—F. W. Gray.....	433	Goad of Necessity,—Ed.....	839
Cobalt Production in Canada,—1919.....	30	Gold	
Cobalt Deposit in Queensland.....	981	Argonaut Gold Mine,—C. W. Knight, Geol. Report.....	950
Commodities, The Permanency of High Prices in,—Ed.....	53	Associated Goldfields Affairs.....	855
Compressed-Air in Mining,—F. A. McLean.....	326	Bendigo Goldfields, Australia.....	590
Concentrator, Legal Definition of.....	100	Ben Nevis Gold Area,—C. W. Knight, Geol. Report.....	950
Conveying Systems,—John S. Watts.....	502	Davidson Consolidated Gold Mines Ltd.....	760
Chromite Production in Quebec, 1919.....	5	Decline of Gold Production in United States Continues.....	760
Chromite Production in Canada, 1919.....	27	Gold-Bearing Rocks in Western Australian Desert.....	1046
Copper		Gold Deposits at Herb Lake, Man.....	904
Canadian Production, 1919.....	27	Gold and Credit,—Ed.....	188
Consolidated Company asks Increased Tariff Protection.....	819	Gold and Silver in Northern Ont.....	565, 826
Copper Lake Deposit, Manitoba.....	904	Gold and Silver in Ontario to end of 1920.....	1035
Deep Mining in Michigan.....	147	High Assay Values Reported from Painkiller Lake Ore.....	1005
Dominion Royalties on.....	898, 943	Hollinger Mines,—A. Gray.....	774, 844
Flin Flon Ore Body.....	904	Increased Production in Canada a Clear Necessity,—Ed.....	793
Quebec Production, 1919.....	4	Industry Problems,—A. Gray.....	1005
United States Industry, 1919.....	670	In Nova Scotia, 1919.....	314
Western Idaho Deposits.....	1062	Interest in Gold Mining Quickens.....	662
Core Drilling in a Glacier.....	789	It pays Canada to produce Gold—Ed.....	1011
Corporation Baiting,—Ed.....	691, 750	Kirkland Lake Area.....	1054
Crucible, graphite,—R. F. Maffre.....	33	Kirkland Lake Proprietary Ltd., 1919.....	929
Cyanide, Canadian,—W. S. Landis.....	220	Lessened Production in The Yukon.....	731
Cyanide, in Canada,—J. A. McRae.....	743	Lightning River Mines,—J. A. McRae.....	842
Dalhousie University, Empire's Steel's Donation to.....	595	Lost Placers in Ontario,—Dr. Coleman.....	221, 752
Daylight Saving,—Ed.....	814	Matachewen Gold Area,—A. G. Burrows, Geol. Report.....	505, 950
Deep Boreholes.....	371	McIntyre-Porcupine Mines,—J. A. McRae.....	862
Deep Mining Difficulties.....	766	Ontario's Producers.....	148
Despised Profession, A,—Ed.....	29	Physical Condition of Hollinger Mine.....	957
Department of Mines, Its Work.....	310	Porcupine Gold Mines, Some Notes.....	856
Diamond Drilling at the Hollinger.....	775	Porcupine Gold Companies' Assessment Appeal.....	177
Diversified Industries are Essential,—Ed.....	559	Premium on.....	682
Dominion Crucible Company,—R. F. Maffre.....	33	Production in Canada, 1919,—Ed.....	27, 576
Dominion Coal Company.....	132, 471	Production in Nova Scotia,—Ed.....	307
Dominion Steel Company.....	373, 507, 726	Production in Ontario, Ed.....	493, 730
Echoes of The Winnipeg Meeting,—Ed.....	920	Production of The World.....	577, 760, 879
Efficiency as an Offence,—Ed.....	1010	Rainy Lake Area in Ontario,—J. J. O'Connor.....	85
Electric location of metallic Lodes.....	766	Review of Production in Northern Ontario,—J. A. McRae.....	123
Electrification of Railways.....	374		526, 6, 699, 565, 419.....
Employees' Sick Benefit Fund at Cobalt.....	109	Rice Lake District, Manitoba.....	139
"En Passant",—Eds.....	31, 54, 98, 133, 152, 815	Shining Tree Area Developments.....	38
Engineering Institute of Canada, Annual Meeting, 1919.....	66	Upper Harricana Area, Quebec.....	5
Engineering Status Legislation		Wasapika Mine,—R. S. Hore.....	468, 481, 510
An Equal Chance,—Ed.....	264	West Shining Tree Area,—P. E. Hopkins, Geol. Report.....	418, 950
Engineers and The Mining Industry,—R. E. Hore.....	154	Granby Consolidated Changes Its Western Management.....	480
Engineers and The Public.....	117	Gowganda Light Railway,—Ed.....	516
In Quebec, A letter by Theo. Denis.....	278	Graphite	
James McEvoy at the C. M. I. Meeting.....	211	Artificial.....	577
Joint Committee of Technical Organizations.....	148	Concentration of Ores, Past & Present,—R. C. Rowe.....	676
Ontario Advisory Council on.....	318	Crucibles,—R. F. Maffre.....	33
Opposition in British Columbia.....	99	Dressing Graphite Ore, C. Spearman (3rd. and 4th. Articles).....	32, 498
Precis of B. C. Draft Bill.....	278	In Canada, Ed.....	615
Status of The Engineer.....	168	Mining & Preparation for Crucible Use.....	541
Legislation Prescribing the Status & Practice of Engineers.....	263	Monograph, Mines Branch.....	636
Explosives		Production in Canada, 1919.....	30
New British List of Permitted.....	86	Gypsum	
Report of Dept. of Mines for 1919.....	349	Demand for Plaster in Cuba.....	587
Extreme Agriculturist The,—Ed.....	837	Exports resumed from Cape Breton.....	872
Feldspar, Uses in United States for Canadian.....	806	Its Use in Non-Conducting Roofing Slab.....	587
Financing of Mining Enterprises, The R. E. Hore.....	116	Harnessing Australia's Greatest River,—Ed.....	614
Fine Arts vs. Styracosaurus Albertensis,—Ed.....	472	Haulages, Inclined, Calculations on,—John S. Watts.....	347
Fireboss, The,—Ed.....	964	Helium Sources in The British Empire.....	618
Flin-Flon Deposits to be developed,—Ed.....	205, 453	Holbrook Elmer A. appointed Asst. Director.....	578
Flotation in the Mill Flow-Sheet,—P. E. Peterson.....	992	Hookworm Infection in a Chinese Mine,—Ed.....	878
Flying Geologist, The,—Ed.....	1011	Housing Provision by Mining Companies,—Ed.....	749
Forests of Canada in Serious Condition,—F. J. D. Barnjum.....	77	Huff Electrostatic Separator.....	353
Fuel Weakness, "Canada's Political Embarrassment".....	745	Hydraulic Stowing	
Gabrielle Mines, Report on.....	701	Primary Considerations in,—C. A. J. Hendry.....	56
Gauzes for Miners' Lamps, Relative Safety of,—Ed.....	614, 617	Suggested Applition to Underseas Coal Workings,—W. Herd.....	412
Gauzes for Safety Lamps,—James Ashworth.....	366	Idaho University offers Research Fellowships.....	487
Geological Society of America, Boston Meeting.....	81	Industrial Conferences,—Ed.....	306, 575, 690
Geological Survey, Canada		Industrial Leadership and The Manager,—Ed.....	813, 1030
C. M. I. Letters of Protest.....	182	International Nickel Company.....	215, 666, 930, 452,
Commissioner's Statement Regarding Resignations.....	62	International Mining Convention.....	253, 337, 654
In British Columbia,—Ed.....	286	Investors in Mines, Safeguarding of,—Ed.....	151, 187, 205, 265, 949,
New Survey of Cobalt,—Ed.....	540		633, 191
Part Played in Development of B. C.....	293	Institution of Mining & Metallurgy (Eng.) Awards of.....	138
Reply to Civil Service Commission,—L. Reinecke.....	91	Iron and Steel State Works in Queensland, Australia.....	610
Resignation from,—Ed.....	30, 53, 97, 321	Iron Ore	
San Francisco Opinion.....	166	Belcher Islands.....	299, 722
Undertakes Study of Palæobotany in Sydney Coalfields.....	491	Bounties in Ontario,—Ed.....	238, 424, 880, 404
"Where Common Sense Fails".....	65	Canada as a Producer of.....	798
Recent Reports on Gold & Silver Areas of North, Ont.....	950	Canadian Iron Ores, Some things that might be done.....	840
Geological Survey Resignations in United States.....	62, 314, 404	Deposits at Indian Head, Port au Port, Nfd.....	927
		Dominion Iron and Steel drill for.....	344
		Economic Survey of Ontario, Deposits Urged.....	37

Iron Ore—J. J. O'Connor	213, 301, 490, 610	Nickel	
Iron Ores in Ontario, The Utilization of,—R. E. Hore	796	Coinage (C. M. I. Discussion and Paper)	221
Low-Grade Ores Suitable for Beneficiation	490	Creighton Mines	215
Production in Canada, 1919	27	Nickel Areas in Sudbury, Origin of,—Ed.	675
Putting Canadian Iron Ore on the Map	683	Nickel and Copper,—Ed.	711, 1031
Reserve Areas in British Columbia	446	Nickel and Copper Discovery, Lac du Bonnet, Man.	629
Use of Ontario Ores for Canadian Furnaces	906	Nickel-Ores Mining in Sudbury Dist.,—W. L. Wotherspoon	118
Wabana Slopes, Newfoundland	241, 679	Nickel-Oxide Production in Ontario	497
Labor		Port Colborne Refinery	224
Shortage at Canadian Mines,—Ed.	151, 559, 576	Production in Canada, 1919	27
Situation in Canada, Notes on,—Ed.	153	Rare Metals in Sudbury Nickel-Ores	140, 501
Turnover in Industrial Plants,—A. W. Macdonald	427	Nipissing Mining Company,—J. A. McRae	483
Lady Geologists in Canada	872	Nova Scotia	
Lead		Accident Prevention Association	329
Canadian Production, 1919	27	Coal Production in 1919	24
Lead and Zinc Deposits of Gaspesia	102	General Production in, 1919	70
Price Again Reduced	830	Importance of Cheap Power in Industrial Life of,—Col. Cantley	437
Lenin on Intellectuals and the Engineer,—Ed.	634	Labour and Wage Conditions at the Collieries, 846, 866, 977.	1003
Lenin's Idea of a Stable Government,—Ed.	634	Notes (See each issue)	
Le Roy, the late Capt., A Memorial to,—Ed.	306	Nova Scotia Coal and Montreal,—Ed.	237
Limestone and Phosphate Resources of New Zealand	114	Report on Metalliferous Mines	314
Limitations of Gov. Assistance to a Mining Enterprise.—Ed.	614	Royal Commission Report on Wages and Working Conditions at the Collieries	782
Limonite Deposits at White River, B. C.	19	Nova Scotia Mining Society	
Lindsay G. G. S., the late,—Ed.	453	Annual Meeting, Glace Bay	256, 302, 328, 383
Longwall Mining and Conservation,—J. H. Cunningham	476	Presidential Address,—Col. Cantley	437
Lubricants, The Uses of Graphite, Talk and Mica in Solid,	874	Nystagamus Miners	343, 351, 363
Magnesite		O. B. U. in the Alberta Coal Mines,—Ed.	794
New Use for,	681	O. B. U. Some Firsthand Definitions of the Theory of,—Ed.	673
Production in Canada, 1919	27	One man to cut Coal but Two men to Handle It,—Ed.	576
Production in Quebec, 1919	5	One Pitfall Avoided,—Ed.	576
Magnetites		Occurrence of Gold in the Rand Banket,—Ed.	963
Modern Smelting Plant near New York	874	Oil	
Smelting in British Columbia	5	America and Great Britain's Policy	473
Mandy Mine	304, 906	Anglo-Dominion Company to develop Athabaska Field	333
Manitoba		British control of Oil Resources	350
Bear River District	905	British and Colonial Petroleum Resources,—H. B. Milne	716
Dauphin Oil District	256	British Policy defended by Sir John Cadman	525
Flin-Flon Mine	904, 909	Canadian Exploration and Prospects	330
Gold Deposits at Herb Lake District	904	Canadian Oil-Shale Industry Looming	926
The Mining Industry,—R. C. Wallace	8, 299, 860	Contribution of Oil Geol. to Success in Drilling,—F. G. Clapp	744
Mineral Deposits at Copper Lake	904	Dauphin District in Manitoba	256, 463
Non-Metallic Deposits of,—D. C. McArthur	906	Dominion Royalties on,	898
Norite of The Sudbury Type in,—R. J. Colony	967	Dover Oil Field, Ontario	872
Rice Lake District	139, 159, 905	Economics and Politics	474
Manufacturing in Western Canada	711, 728	Imperial Oil Company's Program	481
Marcus Conveyor, Detail Study of Forces in,—J. S. Watts	1015	MacKenzie River Basin	722
Mayo Silver Area, Yukon,—George F. Johnson	990	Oil at Fort Norman,—Ed.	877
McGill Summer School of Mines, Trail, B. C.	479	Oil Propaganda,—Ed.	344, 473
McGill University Establishes Engineering Physics,—Ed.	857	Oil Propaganda, Sir Auckland Geddes on,—Ed.	452
Measurements of Geological Time	480	Oil-Shale Development soon Needed	574
Mechanical Loading Devices for Underground Work	100	Oil Shales, Useful Publication by Colorado School of Mines	1012
Metal Quotations (See each issue)		Oil vs. Coal,—Ed.	730
Miller Dr. W. G. Honored by the Geol. Society	3	Pearson Company engages Dominion Geologists	36
Mines Act Administration in Ontario,—Ed.	965	Possibilities in James Bay Region	82, 219
Mines Dept. of Canada, Its Organization and Work	310	Possibilities in Western Canada—D. A. B. Dowling	219
Mines in Canada—Legislation for Regulation of,	987, 994	Prof. Gwillim's Report on B. C. Prospects	154
Mine Fatalities, Lower Percentage in B. C.—Ed.	76	Resources of Canada,—D. A. B. Dowling	287
Mine Fires, Theory and Practice of Fighting,—F. E. Notebaert	393	Search for Petroleum,—E. H. Cunningham Craig	668
Mine Illumination, Choice of,—Ed.	343	World's Output, 1919	545
Mine Inspectors, Selection of,—Ed.	98	Ontario	
Mine Official, Some Necessary Characteristics of the efficient,—J. R. McNeill	622	Claim Recording Fees Reduced	337
Mine Rescue and First-Aid Work Competition	787	Deposits of Goudreau-Magpie-Hawk Area, Michipicoten	156
Mine Taxation and Mine Accounts,—Ed.	857	Govt. Assists in Marketing Ore,—Ed.	538
Mine Timber, Conservation and Drawing,—P. T. Prendergast	389	Nickel Oxide Production in,	497
Mineral Industry in 1919,—	1, 12, 364	Mineral Production	211, 1039, 1036
Mineral Production in Canada 1919, Review,—J. Mc Leish	27, 189	Minerals of Hastings Co. Ont.	563
Mineral Products of Canada as a Factor in Export Trade,—Ed.	195	Mines Development, Causes and Results,—Ed.	237
Minerals Separation Company	534	Mining Association of,	713, 796, 1013
Mineral Statistics,—Ed.	559	Mining Law, Administration of,	971

(Concluded from page 460.)

gether with clay stowed from bottom digging. An examination of these blinded cross cuts and room ends, in which stoppings are built, does not reveal any perceptible short circuiting of air; nevertheless there can be no question but that a loss is occurring in many such places. In the face of such a situation it is an interesting problem, considering the cost involved, to know just how far to go in order to remedy the difficulty.

In a paper written by Mr. Tonge and read before the Manchester Geological and Mining Society in 1906, he speaks of a case where 105,000 cu. ft. of air per minute delivered at the fan resulted in only 73,000 cu. ft. per minute reaching the working districts, a loss of 31 per cent; 9,800 cu. ft. per minute were accounted for as being unavoidably lost at certain doors, but the balance of the loss, 23,000 cu. ft., could not be found although diligently hunted for, as he puts it. He does not state the water gauge under which the above loss was made, but does say that assuming a 20 per cent air loss with 1 in. water gauge, a loss of 44 per cent would occur with a 5 in. water gauge. It looks as though the loss that would be unavoidable in Princess colliery, due to the abnormally high water gauge required to give the necessary air, will necessitate an attempt to ventilate this colliery by means of underground booster fans in series, in addition to a surface installation. With workings situated as far from the air-shafts as at Princess, and having a limited cross-section of intake, and return air-ways, there seems to be no other remedy in order that the required volume may be obtained at a pressure sufficiently low to ensure against abnormal leakage, and other consequent difficulties that would arise. The nature of such an installation will be more or less new to Cape Breton mines, but this method is resorted to in other places, as at Hulton Collieries, England, where

three underground units, working in series through one down-cast and one up-cast shaft, supply air to three mines.

The pumping problem at Princess colliery is comparatively simple. The old workings to the dip of the shaft are practically dry, and what little water is made from the pit to the face is handled by six small pumps, lifting about 50 gallons per minute, from one to the other, and discharging into the sump at the bottom. At this point a Jeansville pump with a capacity of 500 gallons per minute is located.

This pump was installed in 1902, taking the place of the original Cornish pumping plant erected when the shaft was sunk. It discharges about 300,000 gallons during a 14 hour shift, this being the rise water let into the lodgment through the barrier from the old Queen pit workings, together with the small quantity mentioned before as coming from below.

A new duplicate motor driven installation is now under consideration to take the place of the "Jeansville", as the cost of maintenance on this old pump is becoming too heavy.

In conclusion, the author feels that, while much has been written here which undoubtedly is reiterating ordinary mining practice, as we know it under general conditions in Cape Breton for the past decade, yet a description of operations at Princess colliery from the beginning up to the present was permissible, inasmuch as this mine has been a pioneer in submarine working, and furthermore will in all probability continue to be the pioneer in deep mining for some years to come. Any out of the ordinary phases of operations encountered during development, and there are a few, mentioned here, must be of more or less interest to the profession at the present time.

#### WORK OF THE GEOLOGICAL SURVEY IN THE MACKENZIE RIVER BASIN.

The Geological Survey has sent four field parties to investigate further the oil and other mineral resources of the Mackenzie river region. The parties are in charge of Dr. D. B. Dowling, Dr. G. S. Hume, Dr. M. Y. Williams and Mr. E. J. Whittaker.

Dr. Dowling will make a detailed examination of the succession and fold structure of the Devonian sediments in the Fort Norman district, where oil was obtained last August by the Imperial Oil Company, and where much additional drilling will no doubt be done this year. He will follow closely the results of drilling in order that this information may be applied to advantage in the similar underground exploration which is likely to be undertaken in other parts of the Mackenzie basin.

Dr. Williams, Dr. Hume and Mr. Whittaker will begin a systematic mapping and study of the geological formations on each side of the Mackenzie between Great Slave Lake and Fort Norman, with a view to supplying maps and information regarding the depth and form of the oil-carrying rock formations. As the Mackenzie river is the great highway through the region, it seems most likely that future prospecting for petroleum will extend southward along it.

Dr. Williams and Dr. Hume will jointly explore the country on either side of the Mackenzie, from Fort Simpson downstream. Mr. Whittaker will devote his attention similarly to the section from Great Slave lake downstream.

The Topographical Surveys Branch of the Department of the Interior will co-operate in this work by

making a careful survey of the Mackenzie river from Great Slave lake downstream, controlled at intervals of about 150 miles by astronomical stations.

The foregoing information has been given for publication in the "Journal" by the courtesy of the Director of the Geological Survey.

#### IMPERIAL OIL COMPANY'S PLANS.

On his return from Edmonton, Mr. A. M. McQueen, vice-president of the Imperial Oil Company, gave the following statement to the Toronto "Globe":—

"We hope to arrive this year at the stage at all our locations in Alberta and Saskatchewan that will either prove or disprove the existence of oil in commercial quantities. We are drilling thirteen wells outside of the far north, with four at Fort Norman and one at Great Slave Lake, in addition."

Mr. McQueen said that the company's airplanes had been much delayed in their service to Fort Norman through accidents at the outset and now, by reason of the risks, the company was fitting pontoons to each plane in case of necessity of descending on water. One plane had been left at Fort Simpson to be repaired after the first flight toward the north, and the other recently left Peace River, carrying a geologist and a surveyor for the company. The necessity for carrying pontoons reduced the man-carrying power of the planes considerably.

Mr. McQueen said that the number of prospectors going to the Fort Norman field was not as great as had been expected, but there was now a considerable traffic by the water route.

# The Study of the Fuel Problem of Canada

A Suggestion in Response to the Open Letter of the  
President of the Canadian Institute of  
Mining and Metallurgy.

By the Editor, from the June "Bulletin".

THE President of the Institute has invited individual expressions of opinion on three inter-related difficulties that accompany the current stage of national development.

The general problem is complicated by world conditions, the future variation or duration of which no man can forecast. These are, in the main, results of social changes, racial movements, war, and the abolition of old conceptions of time and distance by invention.

Some of the causes of adverse exchange, railway deficits, and shortage of material supplies, are ascribable to these indeterminate factors, but this phase is without bounds, and certainly incompressible into a letter to the BULLETIN. It is mentioned merely to indicate the temporary character of many of our national difficulties, and to lend weight to an assumption that is here ventured, namely, that much of present Canadian financial disability is due to an arrested development, and to a capital expenditure that was made in expectation of an increase in population and wealth that has not materialised. The war has been the principal cause of this arrestation.

The writer, not being either a railwayman or a financier, but only a coalman, inclines to the belief that the difficulties of the railways and of our trade exchanges are temporary only, except insofar as they arise from fuel insufficiency.

This, unfortunately, is an inherent disability of Canada's geographical and national status, but it has been, and will be, a major factor in permanence of railway deficits and in weakness of our exchanges.

A consideration of the President's letter will reveal that, although he has covered the whole ground of national economic independence, population, incidence of business between East and West, and taxation and exchanges, the burden of his presentation is a disclosure of the difficulty Canada is meeting in making herself an independent manufacturing and commercial entity, while retaining national self-government, *in face of an insufficiency of fuel at moderate cost at points of necessary maximum use, in our present stage of development.*

Therefore, it is fair to assume that the most fruitful line of enquiry will be directed towards remedying this admitted fuel insufficiency.

Canada has slowly awakened to the menace of her fuel problem, but at this time is probably more alert to its dangers than ever before.

Long consideration of the problem, and much thinking aloud, has strengthened the writer's belief that no palliation of this country's difficulty is quickly possible, and that relief can only come as a result of the concentration of a number of our best minds upon the problem for a long period.

The course of the enquiry of the parliamentary fuel committee has shown how difficult it is for non-technical men to wrest the essentials of a problem that is in large part technical out of the smother of irrelevant considerations that attend this period of transition and unrest. The assistance of the Institute and other technical

bodies in Canada has not been asked by this Committee. The evidence of witnesses has been conflicting, and will be found incapable of being assessed except by engineers of ripened experience. Snap judgments, temporary considerations, personal fads, bias of various kinds, arising from local, provincial and technical affiliations and governmental exigencies, all enter into and vitiate any enquiry into the fuel supply of Canada, *if that enquiry is temporary in its purview.*

The Fuel Controller, Mr. C. A. Magrath, in his final report in 1919, summarised excellently the things that need to be done to assist our fuel insufficiency, but he was unable to suggest the agency through which his recommendations should be carried out further than to recommend that the technical problems involved should be referred to the Honorary Advisory Council.

This body has, in the meantime, made real progress in investigating possible improvements in methods of utilizing lignite and peat, and, under a recent Act of Parliament, will doubtless make more rapid progress.

The fuel problem of Canada is, however, at least as much one of economic and political independence as of technical research.

But for our national frontiers we should have no fuel problem.

Technical research is therefore only one consideration.

The federal interest in the fuel question is complex, and we have not yet evolved in Canada what may be termed the pure federalist, that is to say, a school of thought free from fiscal doctrinism, from provincial affiliations, and from national predilections entirely absolved from any other interest than that of Canada. How can we obtain a symposium of minds that will give us this single viewpoint?

The problem of fuel supply is inherent in Canada's organism. It is perpetual in its duration and in large measure ineradicable. No single remedy will serve. Many things, many men, must be considered, competently, judicially and maturely.

How can such continued study be given?

Some of the questions relating to our fuel problem which urgently need to be studied, may be mentioned, merely to indicate how great is the field for consideration, and how foolish it would be to attempt a snap judgment, or to recommend any one "cure-all". These questions are, in part:

a. *Extent of Reserves.*

This question is of importance (so far as coal is concerned) only in the two most extensively-worked fields of Vancouver Island and Nova Scotia. In both fields the time has arrived, and gone by, when scientific search should be instituted for hidden coalfields, and for a recapitulation of calculations on the basis of economically recoverable coal.

b. *Use of inferior coals and oilshales, peats and hydroelectric power.*

c. *Economies in use of bituminous coal.*

## The Mineral Industry in 1919

The most important tendency of the year 1919 in regard to the mineral industry of Canada is the interest taken by American capitalists in our mineral deposits. Our trade relations with the United States have attained large dimensions, having increased from \$559,000,000 in 1913 to \$1,227,896,000 for the year ending March last. This increased intimacy, combined with the immensely wealthy status of the United States today and the discount on the Canadian dollar that makes purchases in Canada so advantageous to the United States buyer, is causing a projection of United States capital and business organizations into Canada that is without parallel in the history of the two countries. United States interests, moreover, have not been debarred from extra-territorial investments, as United Kingdom interests have been until very recently. For good or for evil it is certain that a large proportion of the war profits of the United States are being invested in Canada, and the mineral industry is receiving a good share of this investment.

Compared with 1918—a truly wonderful year—the production in Canada of the so-called “war minerals” such as copper, nickel, chrome, and in a lesser degree of zinc, lead, asbestos, will show a decline in 1919—but by no means such a decline as might have been reasonably expected under the circumstances. At the close of the year it has become evident that the arts of peace will cause a legitimate and salutary demand for metals such as nickel, copper, zinc and lead, and minerals like asbestos, with which Canada is generously—and in some instances preponderantly supplied.

Gold mining has been hampered by labor shortage, and the difficulties of mining gold when the only remnant of the gold standard of monetary values is the fixed price of the metal itself. Some relief to the gild miners seems overdue. No tampering with the selling price of gold itself is possible without disaster, but relief from taxation and possibly some assistance in the form of a bonus may commend itself to government. The recommendations of the committee recently appointed by the Canadian Mining Institute to study this puzzling subject will be awaited with much interest.

Silver is today of much greater value than “the stones in Jerusalem” and is indeed of greater selling value than it has ever been since it was first appraised

by Solomon the King. Silver at \$1.33 per oz. means great prosperity for our silver mines, and it has the effect in practice of making lean ores rich—temporarily so, at all events. There is also the comforting probability—comforting to Cobalt, that is—that the prevailing high selling price of silver is not an ephemeral thing, but bids fair to continue until the world’s credits once more inspire confidence. The high favor in which silver is held seems to be a reflex of the virtual disappearance of gold coin as a medium of ordinary commerce, and will presumably continue until the days return when gold coin circulates as it used to before the Germans let loose the wrath of men and the foolishness of kings.

The most disappointing thing about the year’s mineral record in the coal production, which, notwithstanding all the lessons of the war, despite a premium of 10 per cent on New York funds, and the recent warnings of the Fuel Controller, actually showed a decline of 2½ million tons from the miserably inadequate figures of 1918. All cause for congratulation on the progress of Canada’s mineral industry is offset by our failure to produce a reasonable modicum of our consumption of coal, and by a continuance of the expensive, demoralizing and totally unnecessary luxury of importing United States coal at an annually increasing rate.

It is reported the Canadian Manufacturers’ Association has appointed a committee to enquire into the possibility of decreasing our coal importations by increasing Canadian production. This influential body could not have undertaken a more necessary duty, nor one likely to prove more beneficial to Canada if the subject is enquired into by competent persons. We would add that the supplying of Canada’s coal needs for her own coal mines or from the coalfields of the United States is not altogether a matter of relative delivered cost of coal; it is not—as has been asserted—a purely economic matter. The matter has some economic bearings—in its effect on Canada’s exchange credit and internal employment for example—but its importance lies chiefly in the fact that a country which unnecessarily depends upon a neighbor for an indispensable necessity of life and national growth may find itself in the humiliating position of a beggar, if indeed Canada is not already in that position.

In 1917 the Dominion Coal Company alone had a programme of seven millions tons per year. Twelve years later the whole province of Nova Scotia can produce but a little more than five million tons.

Alberta has more coal than any single state in the American union, and far more coal than the rest of Canada put together. Yet it is accounted a matter for congratulation when that province produces six million tons in one year, and even that really unscientific production has not been maintained.

It cannot be demonstrated that either Nova Scotia or Alberta have ever supplied coal to that portion of Canada which comes within their proper sphere of distribution. There has never been in Canada any concrete exemplification of the desire of any government to expand the use of Canadian coal in Canada because it was a Canadian product.

Protective tariff have their uses, but we need something more than an expedient which merely serves to lessen some of the economic advantages possessed by the United States in the matter of coal importation into Canada.

We need an active interest in the national aspects

of coal supply by our government—provincial and federal—some appreciation of the fact that if we do not develop our coal resources sufficiently at least to put us in a position of respectable national independence and defence there may some day be no necessity for these same governments, who will have been superceded by their economic—and therefore logically and ultimately—their political masters.

Until our domestic coal supply to some extent approximates to our industrial importance, our national fabric of finance and industry is an inverted pyramid, resting upon a development of our coal resources that is perilously inadequate—and so entirely inexcusable, because so entirely unnecessary.

The further utilisation of Canada's water-powers, the use of peat as a fuel, the use of the Souris lignites in gas-producers and other possible aids to the solution of one fuel problem are all matters of proper and even hopeful enquiry, but they can at their best be only partial aids, and the solution to the fuel problem will be found in the adequate development and the extension of the zones of distribution of the bituminous coals of Nova Scotia, Alberta and British Columbia.

## The Armenian Mandate

Our esteemed contemporary, the "Engineering and Mining Journal" has had two editorials dealing with the proposal that the United States should take upon itself the mandatory supervision of Armenia. A convincingly large number of perfectly good reasons are given why the United States should not mix itself in that delightful hodgepodge of racial complexity and religious differences which centre around a region where tradition says that Noah undertook his preliminary post-diluvian prospecting. Our contemporary properly assesses the great difficulty of holding "the turbulent mountainous country of the Armenian republic and the wild republics between it and Russia." It is intimated that Britain has reaped such rewards from this war that she ought herself to assume the duty that the United States is counselled to avoid. The "Engineering and Mining Journal" says: "The situation is clearly nothing less than the result of a diplomatic move made by France and England—England, who as a result of this war has extended her flag over German Africa, Persia, Palestine and Mesopotamia, and much besides."

Why "England"? Living alongside us, a New York journal should know that there is a place called Canada which did its share in the war — and did it right early. And there are other nations, the Scots, the Irish, the Welsh, who are not properly included in the territorial term of England; and there is Australia, New Zealand, South Africa, India, and many many other places who sent their men to the ends of the

earth to fight for England. Yes, but not more for England than for their own birthplaces. Does the belief still survive in New York that "England" is a grasping imperialistic entity, gifted with diabolical diplomatic ingenuity, who entered the war for what she could get out of it? It does not yet appear to have been understood in some circles that when Canadians fought in Palestine, Australians in Gallipoli and Mesopotamia, South Africans in German Africa, and New Zealanders on the Suez Canal, that a world miracle had taken place, and that "England" territorially considered, became but one nation among many.

The plea that the United States should avoid European entanglement because such entanglement may mean heavy responsibility, is unworthy of a nation that boasts itself today richer in money, greater in population and less impoverished and decimated by the recent war than any country that took part in it.

If the plea is entered that such responsibility should not be undertaken because the rewards are incommensurate, it conflicts with the oft repeated statement that the United States did not enter the war with any desire for territorial aggrandisement, but to make the world safe for democracy.

If the mandatory expedient is now found unsuitable, it might be enquired who suggested it?

As to the sacrifices made by the British peoples, we do not recollect that they are in the habit of advertising their losses, but they have been enumerated in moving words by citizens of the United States who

lived and worked, and in some cases, died, alongside our men.

We do not think the "Engineering and Mining Journal" is quite fair in its appraisal of British aims, nor in its appraisal of the feeling of the majority of the citizens of the United States, who after all were a unit with Canada in the fight that ended in 1918, and can be trusted to assume that proportionate share of the burdens of world reconstruction—in some large European countries not even commenced—which will fall upon the shoulders of a populous, wealthy and idealistic people that counts itself not the least of the Christian democracies of the modern world.

#### DR. W. G. MILLER HONORED BY GEOLOGICAL SOCIETY.

Dr. W. G. Miller's many friends will be glad to hear of his election as Second Vice-President of the Geological Society of America at the Society's Annual Meeting held in Boston recently. Dr. Miller's reputation is one that is steadily growing, and his newest honor, combined with his selection as Canada's representative on the Imperial Mineral Resources Bureau, emphasize that the good opinion of Dr. Miller held by the mining profession in Canada, has now become an international one.

The Editor wishes the readers of the Canadian Mining Journal a happy and prosperous New Year.

If any of our friends and advertisers issue pocket-diaries, such as we remember in pre-war times, the Editor will be glad to receive one.

#### PERSONALS

Mr. E. P. Mathewson, who was in Toronto for some time as general manager of the British America Nickel Corporation, is now practising in New York as consulting metallurgist. His address is 42 Broadway. Mr. Mathewson is one of the leaders in his profession. He contributed largely to the success of the Anaconda Copper Co., by his work in Montana when he was in charge of the metallurgical works of the big company.

Mr. J. B. Tyrrell of Toronto is in London, England. He expects to return about the end of January.

Mr. F. C. Sutherland of Toronto has returned from London, England.

Mr. C. H. Hitchcock of Sudbury is spending the holiday season at Los Angeles.

Major Pelletier of the Overseas Development Company is at the Gabrielle Mine, Rice Lake District, Manitoba, making arrangements for the resumption of operations.

Mr. R. E. Hore has returned to Toronto after examining gold properties in the Rice Lake district.

#### Port Arthur Notes

Instructions have been received by the Mining Recorders throughout the northern districts of Ontario, from the Hon. Harry Mills, Minister of Mines, to extend for another year the relief against loss of forfeiture of rights, in the case of men interested in mining claims, who enlisted at home, or overseas. This relief has been continued from year to year since 1917, and now extends, in the case of men who have not yet obtained their discharge, until January, 1921.

The fact that we have no private assayers here is found to work great inconvenience, expense and hardship on prosecutors. The nearest assay office is at Winnipeg. It takes a week to get results from there. From Toronto, or Cobalt, it takes ten days. Express charges are high, and often prohibitory to the prospector. This tends to make samples too small to be representative or fair. Port Arthur is the centre of a vast and varied mineral field, extending for several miles, east, west and north.

A branch of the Provincial Assay Office here would not only be a boon in itself, but would immediately create a large volume of business. Prospectors that would not send samples to far distant points, at considerable expense, would gladly take them to such an office, hundreds of assays would be made, where none are made now, and the country would get the benefits of results. The equipment and housing would cost very little. It is more than probable that from the first the office would be self supporting. The list of economic minerals is long: iron, gold, silver, sulphur, molybdenum, zinc and copper, marls and clays.

The reported perfecting of a process for the manufacture of molybdenum high-speed steel, by Prof. John Oliver Arnold of Sheffield University, Eng., has caused considerable interest here, where several well known and valuable deposits of molybdenite are owned. These deposits are at Loon, and in Connee township, near Port Arthur, at Jackfish, and at Long Lake, on the Canadian National Railway.

#### New Incorporations

Among the new mining companies recently incorporated are the following: Premier Gold Mining and Exploration Co., New Liskeard, Ont., with an authorized capital of \$2,000,000, the incorporators being J. W. Elliott, A. A. Sproul, F. W. Ferguson; Federal Mining Co., Limited, Port Arthur, with an authorized capital of \$40,000, the incorporators being F. S. Wiley, C. F. Gibbs and E. M. Turville; the Wachman Mining and Milling Co., Ltd., Dryden, Ont., with an authorized capital of \$500,000, the incorporators being H. P. Cooke, R. H. Moore; the Iowa Canadian Mining Co., Limited, of Dryden, Ont., with an authorized capital of \$40,000, the incorporators being H. P. Cooke, H. V. Cooke and R. H. Moore; the International Pyrite Company, Toronto, with an authorized capital of \$1,000,000, the incorporators being C. A. Smith, A. H. Pace and J. G. Adair.

#### Princeton, B. C.

It is announced that the mining camp at Copper Mountain and the Mill Camp at Allenby of the Canada Copper Corporation will be closed down temporarily. Work at the mine and the mill is reported to have reached the point where little more can be accomplished before the completion of the railway from Allenby to the mine site.

# The Mining Industry in the Province of Quebec in 1919

By THEO. C. DENIS.

Superintendent of Mines of the Province of Quebec.

Although it is too early to give definite figures of output regarding the mineral production of the Province of Quebec during the year which is coming to a close, everything points to an appreciable decrease as compared with 1918. From all appearances the diminution will bring the total value of the production to the vicinity of 16 million dollars instead of the 18 $\frac{3}{4}$  millions of the previous year.

Practically all the items which appeared in the list of production for 1918 will show decreases, with the exception of some of the structural materials. Several of these decreases will be very appreciable, particularly in the case of the so-called "war materials", such as pyrites, molybdenite, chromite, magnesite, quartz and silica, which all found applications in the manufacture of war materials. However on the whole it is believed that the Quebec Mineral Industry has felt the effects of after-war conditions less than most other parts of North America. The industrial and social unrest, which is now so marked throughout the world has been much less noticeable in our province, than perhaps anywhere else in Canada. There have been no general strikes, no undue exigencies on the part of labour. Troubles such as those which paralyzed, for various periods, the economic and industrial life in many parts of the world have not disturbed the comparative equanimity of the Quebec population. It is not easy to determine why the Province is freer of troubles during the critical period of readjustment to pre-war conditions, but one of the reasons is certainly the fact that the people of Quebec appear to have confidence in the judgment and the advice of the "directing" classes, and they seem to remain indifferent to the insinuations, and often plausible, urgings of theorists who have panaceas to bring about the advent of utopian conditions and of the millenium.

## Asbestos.

Reviewing the principal ones of our mineral products, it is gratifying to note that Asbestos has not suffered from the cessation of hostilities, and that the figure of production for 1919, will not be greatly inferior to those for 1918, which was a most prosperous year, as the value of the asbestos shipped was nine million dollars. The value of the production for the first six months of 1919 was \$4,471,359. Asbestos alone, for the last few years, has represented nearly half of our total yearly production, and all points to a continued prosperity, for the uses of this mineral are taking greater extension, and the mines are in excellent condition. With depth the contents of asbestos in the rock seem to increase rather than diminish; in 1918, the yield of asbestos per ton of rock mined was 117.3 lb., whereas in 1917 it had been 108.7 lb. Large reserves of serpentine have been blocked out, and on the whole the future of asbestos mining in the Province is very reassuring.

In the report of Mining Operations for 1918 mention was made of a discovery of asbestos in Gaboury township, east of Ville-Marie, in the district of Temiscamingue. A short examination of the occurrence was made by an officer of the Quebec Mines Branch, and it was found that there is the possibility of the existence of quite an important development of serpentine rock which in several places is asbestos bearing. The contact was followed for more than half a mile and it is probable that the serpentine extends over a length of a mile and a half or more, whereas the width could not be determined, the serpentine underlying a wide depression, of half a mile between the banks. Of course this can only be regarded as a potentiality, as it is some eight or nine miles from a highway and some 25 miles from Ville-Marie on Lake Temiscamingue.

## Copper-Sulphur Ores.

The production of copper-sulphur ores, which item takes second place in our list of "Products of the Mines", did not fare as well. With the signing of the armistice the strenuousness of manufacture of explosives greatly relaxed, and Spanish pyrites reappeared on the United States market. The Eastern Township mines which produce ores used in the manufacture of sulphuric acid, the cinder of which is subsequently treated for the extraction of copper, keenly felt the reaction. The Eustis mine stopped hoisting in April, and was closed during the

A Typical Vein Formation Near Lac de Montigny, Showing Interbanded Quartz With Schist and Granite. Total Width Mineralized Zone is Over 80 Feet.

greater part of the year. However the concentrating mill was kept running, at less than half capacity, on the old dumps. At the other mines, the Weedon, the Huntingdon, activities were greatly diminished.

#### Magnesite.

The Quebec magnesite industry, which obtained such a good start during the war, the production having advanced from a value of \$2240 in 1914 to \$1,016,764 in 1918, has had a much smaller year in 1919, as compared with the previous one. The operating companies took advantage of the quietness of the market to get ready to produce the dead-burned magnesite at lower costs. The Scottish Canadian Magnesite Company is completing a sintering plant at their Calumet quarry, and have stopped clinkering their product at the cement works at Hull. The latter makeshift entailed a haul of 70 miles for the crude magnesite, of two tons of the raw stone to produce one ton of dead-burned. In the future the dead-burned magnesite will be shipped from the quarry. The sintering plant, comprising crushers, ball mills, rotary kilns and accessories is built for a daily production of 70 tons a day of dead-burned. The North American Magnesite Company is also installing a 40 ton plant, at Calumet, which will be ready in three or four months. In the meantime they are continuing to produce dead-burned magnesite at the Montreal works of the Canada Cement Company.

The Quebec Magnesite has given eminent satisfaction to all the users, of which the list is very long. They comprise, among numerous others, the Carnegie Steel Co., Bethlehem Steel Company; Jones and Laughlin; Algoma Steel Company; Steel Company of Canada. It is regrettable that the U. S. House of Representatives has lately passed a bill imposing duties on magnesite entering into the United States, as follows:—crude magnesite  $\frac{1}{2}$ c. per lb; calcined and dead-burned  $\frac{3}{4}$ c. per lb; brick  $\frac{3}{4}$ c. per lb; and 10% **ad valorem**. Although this tariff is not yet effective, owing to the U. S. Senate having postponed indefinitely the consideration of the bill, the measure hangs like a Damoclean sword over the Quebec magnesite industry.

#### Molybdenite.

The molybdenite production, in 1919, was only a small fraction of the previous year's. This substance which appears to have been strictly a "war-mineral" has keenly felt the effects of the cessation of hostilities. The molybdenum market is taking a long time to readjust itself to peace conditions. However, in the last two or three months, there has been a revival of interest shown in this metal, the rumor being that it had found new applications in the automobile industry.

#### Chromite.

The chromite industry has suffered much less than was anticipated. Three companies have operated during the greater part of the year, and have produced ore, improved their mining plants and methods and developed considerable ore reserves.

#### Upper Harricana Gold Area.

Prospecting and development work was carried on actively on the gold deposits of the Upper Harricana region in the Abitibi district. A small production of gold is reported. The field is very promising, and should, in time, become an important factor. Unfortunately

gold mining under the present conditions, is not attractive to investors. Unlike all metals and other commodities, the price of gold remains fixed at \$20.67 an ounce, while the cost of its production has increased to such an extent, owing to the raise in the cost of labour and supplies, that the margin of profit has considerably narrowed.

#### Zinc.

The Zinc Company, Ltd., opened their mine in Montauban, Portneuf county, throughout the year. They also reopened their oxide plant which had been closed down for a year and a half.

Further development work was done by the Federal Zinc and Lead Company, on their property in the region of the head-waters of the Cascapedia river. This field, which shows all the signs of becoming an important producer of lead and zinc, has been handicapped by the lack of transportation facilities. It is situated some fifty miles from the railway, and the only connection is a lumber road, which at certain seasons is quite impassable. This being remedied by the construction of a road, on which the company has a large gang of men working at present, which will be used for hauling ore by tractor. The Federal Zinc and Lead Company will erect a concentrator and a small lead furnace plant in the spring, and it is expected that shipments of ore and of pig-lead will begin within a year.

#### Building Materials.

There has been a slight revival of activity in the production of building materials, but the figures for 1919, while showing an improvement as compared with the previous year, will still be below normal. This is due to the fact that the high price of labour and of supplies has greatly restrained building operations. However the need of new constructions, especially dwelling, is becoming acute, and although the cost of building may be forty per cent higher than before the war, it may be forecast that a period of great building activity is setting in and will continue for some time.

\*See description of this area in issue 15th Oct. 1919 p. 765, by Prof. A. Mailhot.

#### SMELTING OF MAGNETITES.

Those who were present at a discussion on smelting British Columbia magnetites which took place at the concluding session of the C. M. I. meeting in Vancouver recently, may be interested in the following brief, but sufficient letter:

The Editor of Mining and Scientific Press

Sir—In your issue of December 6 is a communication from F. H. Mason in which he says that "the bulk of the accessible ore on the Pacific Coast is magnetite, which cannot be reduced by ordinary blast-furnace practice without an addition of more reducible iron ore".

This is so diametrically opposed to the fact of furnace practice that it cannot be permitted to pass without denial.

DWIGHT E. WOODBRIDGE.

Duluth, December 8.

# A Historical Review of the Silver and Gold Production of Northern Ontario

By J. A. McREA, Cobalt.

## A Comparison of Gold and Silver Fields.

For the reason that silver was first produced in Cobalt in 1904, and that up to that time the province of Ontario had not been an important producer, it is perhaps well to deal only with Ontario's precious metal history beginning with 1904.

Thus, in dealing with the fifteen years just ended, these facts stand out conspicuously:—In 1904 the province of Ontario was not an important producer of precious metal. The output of gold and silver up to that time was a little or no consideration among the industries of the Province. The discovery of silver in Cobalt rapidly elevated the silver mining industry to one of first class importance and by 1911 the Cobalt camp reached the maximum output of 31,507,791 ounces during the year. Up to that time the gold output was decidedly small and in 1911 amounted to only \$42,625.

It is a remarkable fact that in 1912, which year marked the downward trend in the production of silver in the province, the gold mining industry came into prominence by exceeding the million dollar mark for the first time in Ontario's history. Since that time, the decline in silver and gold mines amounts to approximately \$25,000,000 a year.

During the part fifteen years the silver mines of Northern Ontario have produced approximately 303,724,172 fine ounces of silver valued at \$181,570,561. The gold mines have produced 2,872,680 fine ounces valued at \$59,389,508. The combined production of gold and silver from this district, during the fifteen years just ended amounts to 306,596,852 fine ounces valued at \$240,960,069.

In analyzing the present status of the precious metal mining industry in brief, I will turn first to the Cobalt and Gowganda districts and deal with the silver mines.

### The Silver Mines.

During the year 1919 a total of 34 mines contributed to the silver output. Of these 30 were Cobalt companies, three Gowganda and one South Lorrain. The heaviest producer was the Nipissing with a record of close to 3,000,000 fine ounces. The total output of silver from the silver mines may be estimated at approximately 11,000,000 ounces for the year just ended, and having a value of about \$12,210,000 owing to the product being marketed at an average of over \$1.11 an ounce. For the purpose of comparison a table of figures is presented herewith. In reference to these figures it should be pointed out that the last summer's labor strike caused a total suspension of operations for 47 days at all the mines added to which was several weeks of lost time in putting the mines in shape to resume. This resulted in reducing the year's production by perhaps 2,000,000 ounces or about \$2,400,000.

## THE SILVER OUTPUT OF COBALT.

Year	Average Price of Silver	Ounces	Value
1904	57.2	206,875	111,887
1905	60.4	2,451,356	1,360,503
1906	66.8	5,401,766	3,667,551
1907	67.5	10,023,311	6,155,391
1908	52.9	19,437,375	9,133,378
1909	51.5	25,897,825	12,461,576
1910	53.5	30,645,181	15,478,047
1911	53.3	31,507,791	15,953,847
1912	60.8	30,243,859	17,408,935
1913	57.8	29,681,975	16,553,981
1914	54.8	25,162,841	12,765,461
1915	49.69	24,746,534	12,135,816
1916	65.66	19,915,090	12,643,175
1917	31.41	19,401,893	16,131,013
1918	96.78	18,000,000	17,400,000
1919	111.29	11,000,000	12,210,000
Grand Totals		303,724,172	\$181,570,561

In the order of their importance, the present producing silver mines are the following, it being kept in mind that some of the mines are producing almost an equal amount of silver and that they are difficult to classify with exactness:—

Nipissing Mining Corporation, Kerr Lake, O'Brien, Coniagas, McKinley-Darragh, Miller Lake O'Brien, Temiskaming, Beaver, Crown Reserve, La Rose, Tretthewey, Hudson Bay, etc. Other properties from which a limited amount of silver was produced during the year includes the Peterson Lake, Silver Cliff, Foster-Cobalt, Adanae, Chambers-Ferland, Right of Way, Edwards and Wright, Pittsburgh-Lorrain, Keeley, Reeves-Dobie, etc. A number of other properties were opened up during the year, including the Nipissing Extension (formerly the Farah property) and the Lumsden.

Everything considered, there is more activity at present in the silver area of Cobalt as well as Gowganda and Elk Lake than for a good many years. That production during 1920 will be well maintained appears to be quite certain; particularly so provided the current high quotations for silver continue.

### Outstanding Developments.

Developments of importance during the year include the followings:—During the first half of 1919 the Nipissing encountered an exceedingly rich shoot of ore in the "Little Silver" vein. At the Beaver Consolidated, considerable high grade ore was encountered, as well as a large amount of mill rock, and the management has decided to begin at surface and work the mine all over again. On the rawn Reserve a high grade discovery was made early in December which promises to yield about \$140,000 in addition to current production from mill rock. The Temiskaming also encountered a number of high grade ore shoots. These developments among others helped to strengthen the physical condition of the camp as a whole.

**Important Transactions.**

During the year the Mining Corporation of Canada purchased a controlling interest in the Buffalo Mines. The Northern Customs Concentrator Company purchased that part of the Chamber-Ferland Mine lying east of the railway. The Northern Customs also secured a lease on the Silver Cliff and operated the property successfully. The Mining Corporation during the last quarter of the year purchased a lease on the Foster-Cobalt property. The Lumsden mine was purchased by C. L. Campbell of Montreal and arrangements are being made to develop it. The old Farah property was taken over by the Nipissing Extension and is being worked. In the Gowganda field the Castle property of the Trethewey Company produced encouraging quantities of high grade ore.

**THE GOLD MINES**

**On the Eve of the Gold-Mining Era in Northern Ontario**

Everywhere in Ontario where gold mining has reached important proportions there is manifest a degree of optimism greater than ever before in the North.

As a result of the magnitude of the developments recorded, enthusiasm, well justified and permanent has been created. The year 1919 has marked the period of readjustment. In that time the gold mining industry has regained its pre-war status, even exceeding it. The output for 1919 is estimated at \$10,500,000, which is the highest record in Ontario's history.

And now, as 1920 comes in, and it is found that the gold mines in the aggregate have ore reserves amounting to around \$100,000,000 actually in sight and with untold millions in potentialities; the careful observer is compelled to confess to a genuine thrill at the immensity of the gold mining industry.

From the forest fastness in which ten years go it was not known that commercial gold ore bodies occurred, there is at present being produced a steady stream of yellow metal, now estimated at at least a million dollars every thirty days and steadily increasing in volume. According to the trend of developments the year 1920 is expected to result in something like \$14,000,000 being produced, and this record to be still further increased before the maximum is reached.

The producing gold mines of Northern Ontario include the following:—Hollinger, Dome, McIntyre, Lake Shore, Kirkland Lake, Teck-Hughes, Dome Lake, Davidson and Argonaut. The dividend payers include the following: Hollinger, Dome, McIntyre, and Lake Shore.

In addition to the above producing mines, the following is a fairly complete list of the other gold mining operations:—Wright-Hargreaves, Ontario-Kirkland, Canadian-Kirkland, Clifton-Porcupine, Associated Gold-fields, Miller Independence, Kennedy-Boston, Peerless, Boston-McCrea, Bourke's Mines, Murray-Mogridge, Gold Reef, Keora, Big Dyke, Northwoods, Gold Centre, Skead Gold Mines, Catherine Gold Mines, Matachewan Gold Mines, Nelson property, Robb-Clemens, etc. This summary is not inclusive of the West Shining Tree district where considerable activity is taking place.

The dividend record of the gold as well as the silver producing mines follows, and offer some idea of the

magnitude of the net profits being realized. It will be noted that with total production of \$240,960,069 in gold and silver produced during the past 15 years, upwards of \$100,000,000 has been paid in dividends. Of the total production the silver mines accounted for \$181,570,561 while the gold mine produced \$59,389,508. By the middle of the current year the total output of gold and silver from the Northern Ontario mines will have exceeded a quarter of a billion dollars. The dividend record follows:—

**THE SILVER MINES.**

Company	During 1919	Total
Nipissing Mining Co.....	\$1,800,000	\$20,340,000
Coniagas.....	300,000	9,540,000

<b>Grand Totals.....</b>	<b>\$7,343,883</b>	<b>\$101,087,368</b>

In addition to the foregoing, the following dividends were declared in December, payable during the opening month of 1920, and which figures bring the grand total up to \$102, 135,013 in dividends from silver and gold mines:—

Dividends declared in Dec. 1919, payable in January 1920:—

Nipissing.....	10 %	\$600,000
Temiskaming.....	4	100,000
Dome Mines.....	2½	100,000
McKinley - Darragh.....	3	67,430

# The Position of Manitoba in the Mining Industry

By R. C. WALLACE, Commissioner for Northern Manitoba.

Until the year 1912 agriculture was the only industry in the Province of Manitoba which attracted attention within the Province or without. The Province had been settled by a population which was attracted in the first instance by the magnificent soils of the Red River Valley and which later scattered into Southern Manitoba and into Northwestern Manitoba where equally rich soils were discovered and cultivated. Because of this resource and because of its strategic position as a distributing centre, the City of Winnipeg had rapidly grown up to serve as a nucleus and stabilising factor to the agricultural industry of the Province and the West. The addition, in 1912, of a very large territory extending to the Sixtieth Parallel of latitude and to the Hudson Bay, attracted the attention of the people in Manitoba to the possibilities of resources other than agriculture. As Manitoba is now constituted it is unlikely that more than two-fifths of the total area will be productive from the point of view of agriculture. The possibilities of the remaining three-fifths are mainly in mineral wealth, more particularly in gold, copper, silver, lead, zinc and iron.

## The Rice Lake District.

Immediately before the extension of the boundaries of the Province, in the latter part of 1911, there was discovered within the older part of the Province and east of Lake Winnipeg, in the district which is now known specifically as the Rice Lake district, quartz veins carrying high values in gold. As this area is not more than a hundred miles distant from Winnipeg, interest became keen, prospecting was active, and many other veins were discovered in the same area. Development work was continued until the outbreak of war but this work was seriously hampered by the transportation difficulties, which are, in Northern Canadian Territory, always serious, but in this particular case more formidable than usual. Notwithstanding this a great deal of work was carried on, machinery was shipped in over the ice in winter, and in all some eight or ten properties were developed to the hundred-foot level. With the outbreak of war work practically ceased. It is true that prospecting went on more or less intermittently during the four years of war and the area extended from Rice Lake to Gold Lake, Long Lake, Long Lake and northwards into the Hay Lake country. In this latter area discoveries were made of a somewhat different type which gave promise of proving up more extensive ore-bodies than can normally be expected where quartz veins are the typical carriers of the gold ores. Since the conclusion of war, however, interest in this area has immediately come back and there are to-day mining companies representing fairly large holdings which are making arrangements for continuation of mining on properties already partially developed or for the underground prospecting of new properties. With this there will be a united effort to obtain some means of transportation which may be available both summer and winter. At the present time practically all the heavy supplies and machinery are sent in over the winter road to

camp. In Summer it is necessary to transport in part over Lake Winnipeg and in part by the Bad Throat River or the Hole River, on either of which several portages have to be encountered. A serious endeavour will be made to obtain from the Government authorities a summer road so that it may be possible without delay to reach the district in either summer or winter and to transport into the district the freight and supplies which under the best of management, cannot be entirely looked after during the winter season. Much interest is being taken in the development work which is now being planned throughout the whole area.

## Northern Manitoba.

In 1914 another area, (in this case within what is strictly known as Northern Manitoba, that is, the new territory added to the Province in 1912) was opened up. The building of the Hudson Bay Railway northeasterly towards the Bay, attracted prospectors into a belt of greenstone lying directly north of The Pass and some sixty miles distant from that centre. On the eastern end of this belt there was discovered at Herb Lake, quartz veins carrying high values in gold. Again in 1915 a discovery was made in the western extremity of the belt within Manitoba and in fact practically on the boundary line of a large low-grade deposit of copper of mixed sulphides of copper, iron and zinc. The significance of this discovery was soon realized and a large amount of money has been spent during the subsequent years in diamond drilling the Flin Flon property with the result that twenty million tons of ore, averaging approximately ten dollars under present prices of silver and copper, has been blocked out. Immediately after the discovery of this property and within a distance of three and a half to four miles, another property was discovered containing a lens of very high-grade copper ore. This was taken over by the Tonopah Mining Company of Nevada, and the Mandy Mine, as it was named, was operated under a subsidiary company and has already produced copper to the value of \$2,500,000. This copper was transported forty miles by team, a hundred and thirty miles by barge and twelve hundred miles by railway to the Trail Smelter at British Columbia. Notwithstanding the heavy expense connected with this method of transportation, the ore, which averages over 18 per cent in copper, returned handsome profits to the operators. On the larger property, the Flin Flon, negotiations are proceeding with an American corporation and it is expected will be concluded in 1920. Owing to the heavy capital expenditure, including the erection of a two-thousand ton smelter on the property, negotiations, as may be expected, proceed somewhat slowly and only after full details have been obtained on the property and on all matters connected with its operation. When the deal is completed a railway will be built from The Pass to the property, seventy-five miles long, and stimulus will be given to the development of all the properties in the district. In the Herb Lake area after the initial discoveries of gold on one property, the Rex, after machinery had been installed ore was milled and bullion to the extent of \$27,500

was extracted before it was necessary to close down owing to untoward labour conditions and the influenza epidemic. Here also, and in the Copper Lake district in the centre of the area, several properties will be developed during the winter. A rather sensational discovery of gold in the Copper Lake area attracted the attention of practically the whole mining world to this mineral belt during last summer.

**Other Mining Activities of Manitoba.**

There are other areas throughout the Province where prospecting has been done and there are places where mining machinery has been erected. In the Star Lake district immediately east of Winnipeg where a certain amount of development for gold was carried out prior to the War, molybdenite and scheelite were discovered during the time of the war and development would have reached the stage of production had not the conclusion of the War seriously affected the prices of molybdenite and tungsten. Immediately north of Lac du Bonnet and some forty miles south of the Rice Lake district there are indications of ore bodies sufficiently rich in copper and in nickel to be operated at a profit. When the Hudson Bay Railway is extended to the Bay a very large territory will be thrown open on the west coast of Hudson Bay as far north as Chesterfield Inlet, to the prospector and mining companies.

**Structural Material.**

For several years before the discovery of the precious metals in Manitoba, the staple structural materials had been mined and had found a ready market. The Manitoba building stone, which is quarried thirty miles east of Winnipeg, is recognized to be one of the

Map of Northern Manitoba Mineral Belt.  
 Tributary to The Pas, Man.  
 Geological Survey.  
 Department of Mines.  
 Ottawa.

 Scale → 1 inch = 6 1/2 miles (Reduced)

superior building stones of Western Canada and has been used practically from Coast to Coast. The gypsum deposits from the north-east shore of Lake Manitoba supply a market of the three Prairie Provinces and there are reserves sufficient for the needs of the next hundred years. A Portland cement industry was established several years ago, the raw materials being obtained from the eastern shores of Lake Manitoba and from the clays in the neighborhood of Winnipeg. The manufacture of brick was an industry of very considerable importance and widely distributed throughout the Province, both surface clays and underlying shales being utilized as raw materials. There is no doubt that during the next few years there will be a very insistent demand for building and structural materials and there is no doubt that these industries, which were naturally severely affected by war-time conditions, will flourish to an extent unknown before the War.

The results of investigation, prospecting and mining during the last seven years are reflected in the changed attitude of the Country in general and of the mining world in particular, to the Province, hitherto unknown to mining men, the Province of Manitoba is now looked upon as one of the great possibilities during years of rapid expansion and exploitation which now face the industrialist and the financial man.

## MANITOBA CORRESPONDENCE

### Transportation

The revival of interest in the Rice Lake district, Manitoba, brings up again the transportation problem. The gold discoveries are in the area east of Lake Winnipeg, a portion of Manitoba that has no railways. At present the only feasible way to take in supplies and machinery is by teaming over the winter roads. There are two routes. The shorter one, by Fort Alexander, has not yet been put in shape for use, but is commonly regarded as the preferable one. The few teams that went to the mines in December hauled supplies from Riverton and Manigotogan.

Riverton is at the north end of a branch line of the C.P.R. on the west side of Lake Winnipeg. From here there is an excellent sleigh road across the lake to Manigotogan via Hecla, about 40 miles. From Manigotogan to Gold Lake there is a road through the forest. This road is about 36 miles long and is good for the greater part. It is unnecessarily long, however, and a better shorter road will probably be cut out when the various parties interested get together.

The road via Fort Alexander to Gold Lake is much shorter than the Manigotogan route. Owing, however, to the unusually heavy early snowfall the muskeg portions have proved a great obstacle, as the muskeg does not freeze readily under the snow. In consequence the road has not been passable for teams during December, although in excellent shape for dog trains. When the Fort Alexander route is in use the

Prospectors at Rice Lake, N. Man.

Canadian National Railway branch line to Victoria Beach will be used to reach the district. A 14-mile winter road connects Mile 69 on the C.N.R. with Fort Alexander, a Hudson Bay port. From the Fort to Gold Lake is 44 miles. Once the muskeg is frozen this should be an excellent winter road.

### Gabrielle

It is expected that development work will soon be resumed at the Gabrielle Mine, Rice Lake. Mr. J. B. Tyrrell of Toronto examined this property a few months ago and reported that the veins examined deserve careful and thorough exploration. He has recommended that the two shafts be deepened to 100 ft. His sampling of surface exposures showed ore of good width and value. Major Pelletier is at present at the property getting necessary information in preparation for the work to be done.

On the Winter Road to Rice Lake, N. Man.

The Gold Pan Mine, Rice Lake, N. Man.

### Gold Pan

The Gold Pan workings have been pumped out and one machine is in operation. Mr. Gordon McTavish, secretary of the operating company, visited the property recently. The Gold Pan has some very rich ore in the vicinity of the shaft. This shaft is 265 ft. deep, and the vein looks well in the lower workings. Development to date has all been close to the shaft.

### Pan Extension

The Pan Extension Gold Mines Co., Ltd., has raised funds which will enable the company to proceed at once with development work on the properties near the Gold Pan Mines. Machinery for shaft sinking has been purchased and arrangements are being made to take in supplies and commence work. Mr. J. A. Borthwick has been appointed superintendent and he will leave Winnipeg shortly for the property, where work on the construction of the necessary camp buildings will be begun as soon as possible.

### Turtle Lake

During the past summer a number of discoveries were made in the vicinity of Turtle Lake, a few miles west of Gold Lake. Arrangements have been made for the development of some of these claims.

### New Companies Formed

The Mammoth Mining Corporation, Ltd., capitalized at \$5,000,000, has applied for a charter for operating in Manitoba mining areas.

The Bonanza Mining Corporation, capitalized at \$2,500,000, has applied for a charter. The applicants are interested in properties in the vicinity of Little Rice Lake.

Panning Gold at Rice Lake.  
"The pure quill."

### The Marigold

The Marigold Gold Mining Co. will begin work shortly on its claims in Rice Lake District. This company has five claims: The Marigold, Gold Fly, Gold Star No. 1, Antique and Ione. Most of the prospecting work so far done has been on the first two claims.

### Northern Manitoba Mining and Development Co.

This company's property consists of five claims adjoining the Rex property in the Herb Lake district, Northern Manitoba. It is 21 miles from mile 82 on the Hudson Bay Railroad. There is a wagon road of 11 miles to the lake. Boats are used for the remaining 10 miles.

"The Cook and the Mate and the Captain bold, and the Crew of the Brooklyn Mine" Rice Lake, Man.

There is a shaft 125 feet deep and the vein is said to continue strong and well defined at that depth. Arrangements have been made for the cutting of wood for fuel and mine timber this winter and mining and milling machinery will be taken in early in 1920. The North Canada Exploration Co. of Winnipeg has undertaken the financing of the company and will equip, develop and manage it. The Exploration Company has agreed to spend \$60,000 on the property.

The directors of the Northern Manitoba Mining Development Co. are: Robert Kerr, president; Major A. Bingham, H. S. Johnson, J. P. Gordon, W. H. Bunting, G. R. Baneroft and C. B. Morgan.

The directors of the North Canada Exploration Co. are: J. F. Caldwell, president; W. F. Hull, Ward Hollands, Capt. George B. Hall, Richard Bingham, T. E. Redman and Robert Kerr. C. W. Chappell is secretary and treasurer.

### RIP VAN W. AWAKENING

The east is awake! The evidence say you? Here it is; fresh from the page of the Canadian Mining Journal, a sane and reputable organ not given to exaggeration or brain storm: "The growing importance of Manitoba is reflected in the rise of the combined curve of the Prairie Provinces and the Yukon, but the scale is too large to show how Manitoba is making up for the falling off in the Yukon gold production." This estimable journal then goes on to say: "We venture to forecast that some day the value of the coal production of Alberta alone will exceed the value of the mineral production of any other single province of Canada, unless maybe, it shall be British Columbia." Thus the west cometh into its own.—Manitoba Free Press.

**COAL OUTPUT DURING 1919.**

By JOHN McLEISH.

(Chief of the Dept. of Mineral Statistics, Ottawa, in the Toronto "Globe").

Canada's coal production during 1919 has probably been about 13,000,000 tons. This is rather disappointing when compared with the 1918 figures, for it shows a reduced output of about 13 per cent. Strikes chiefly, also lack of tonnage for the transportation of coal, thus cutting down the market, together with minor causes, have been responsible for the falling off. Another noteworthy feature of the year's showing is that Alberta, which in 1918 wrested from Nova Scotia the laurels for production, slumped badly during 1919. Indeed at the end of October it had only produced seven-tenths as much as the Province by the sea, and the indications were that this ratio of loss would be pretty well maintained until the end of the year.

This reduction in output is disappointing for the further reason that during the war, and in spite of the fact that thousands of experienced miners were overseas, the production of coal advanced steadily, as the following figures show:

	Tons.
1919 . . . . .	13,637,529
1915 . . . . .	13,267,023
1916 . . . . .	14,483,395
1917 . . . . .	14,046,597
1918 . . . . .	14,979,926

Of course it was the increased production in Alberta that made this possible, the output in that Province having gone from 3,683,015 tons in 1914 to 5,927,816 tons in 1918.

**A Serious Loss.**

The effect of a loss of at least 2,000,000 tons on the year's coal production was a serious matter, and the resulting situation was accentuated by the strike among the bituminous coal miners in the United States. Last year, even with a production of practically 15,000,000 tons, Canada had to import over 21,000,000 tons during the financial year that ended on March 31st, 1919.

The appended tables tell the story of the year's production, and they contrast it with the production for 1918:

**MONTHLY PRODUCTION OF COAL IN CANADA BY PROVINCES, 1919.**

# Mining in British Columbia During 1919

By Our Victoria Correspondent

## A Year of Preparation for the Future

One of the Provincial Government Mining Engineers, in commenting on the progress of the mining industry in British Columbia during 1918, observed that, from the viewpoint of production, it was a period of "marking time," but, if looked at with an eye to the future, "it had been one of the most eventful and encouraging twelvemonths in the history of the Canadian Northwest."

This about sums up the situation. From figures available from the various producing properties for part of the year there can be no doubt that in respect of most of the chief economic metals there has been a distinct shrinkage as regards output. It is possible that the estimates made of the production from the last date on which authentic statistics were to be obtained to the end of the year will be proven at fault. Consequently it is not improbable that final information will not indicate so considerable a decline in the production of gold, silver, copper and lead.

It is unnecessary to more than draw attention in passing to the world's market conditions as compared with those of the previous year as unquestionably having been responsible, in a large degree, for the 1919 results. These, however, were augmented by local occurrences having the effect of retarding production. As to copper, it need only be said that the Phoenix Mines and the Grand Forks Smelter were closed entirely by the Granby Consolidated Mining & Smelting Co. some months ago. To this may be added that the same Company, the largest copper producer of the Province, owing to labor troubles and for other reasons, is estimated to have turned out nearly 10,000,000 lbs. less of the metal at its Anyox plant. When the war ended the Consolidated Mining & Smelting Company had a surplus of lead so that it is not surprising that a material drop in the quantity of the output is indicated. There is some satisfaction, under the circumstances, in being able to show that the East and West Kootenays, evidently, have topped the 1918 mark substantially in regard to the zinc output. It is to be noted, however, that the Sullivan Mines, the greatest single zinc producer of the Province, still is limping along as the result of a strike of its miners and it is possible that this will to some extent upset calculations.

With reference to the precious metals, while the outlook is bright as to silver, the opening of the Salmon River Section of the Portland Canal District, where is situated the Premier Mine, being sure to be felt next year, the returns thus far received do not reflect the general revival of interest in all properties carrying this metal. The chief cause of this is found in the situation in the Slovan Mining Division, where the Standard, which has been shipping only zinc concentrates, to instance one of several properties, has ceased production. The withdrawal of this large producer, and of others of the area, from the actively producing class has not been neutralized in its effect by the contributions of the new northern section, as yet comparatively small, or by those of scattered but numerous small shippers, which are starting in a small way throughout all the mining districts, the incentive, of course, being the high price of silver. Of gold it

is sufficient to say that the handicap confronting those engaged in its production elsewhere applies with equal force in British Columbia, although, notwithstanding high costs, more placer ground is being taken up in the Cariboo and in little prospected parts of the Far North, and there is lode mine development under way of a promising nature in several districts.

Generally 1919 does not appear to have been a record breaker by any means as to production. It has, however, been exceptional in the interest displayed in mining; in the development that has been initiated with splendid results; in the discovery of a new mineralized zone having rare possibilities; and in the encouragement the year's achievements have given all interested in the industry. The fact that the production seems to have dropped is forgotten in contemplation of the sure foundation that is being laid for the future.

## Estimate of Total 1919 Production of B. C. Minerals (Exclusive of Coal)

An estimate of the Mineral Production of the Province of British Columbia for 1919, with that of 1918 for comparative purposes, is subjoined:

	1918	1919	Comparison
Gold oz. ....	180,674	150,050	30,624 (dec.)
Silver oz. ...	3,498,172	3,261,267	236,905 (dec.)
Copper lb. ...	61,485,754	46,546,815	14,936,939 (dec.)
Lead lb. ....	43,899,661	17,804,470	26,095,191 (dec.)
Zinc lb. ....	41,772,916	43,649,700	1,876,784 (inc.)

## Estimate of Mineral Production by Districts

Estimated production for 1919 and comparison with that of 1918 by districts as defined by the Mineral Survey & Development Act:

No. 1: Comprising the Mining Divisions of Bella Coola, Queen Charlotte, Skeena, Portland Canal, Naas River, Atlin, Stikine and Liard. George A. Clothier, Government Mining Engineer.

	1918	1919	Comparisons
Gold (placer)			
Atlin and Liard			
Mng. Divisions			
.....\$	219,000	\$ 189,000	\$ 30,000 (dec.)

Silver oz. ....	415,280	905,685	490,405 (inc.)
Copper lb. ...	30,198,782	20,670,685	9,528,097 (dec.)

No. 2: Comprising the Mining Divisions of Omineca, Quesnel, Cariboo and Peace River. J. D. Galloway, Government Mining Engineer.

	1918	1919	Comparison
Gold oz. ....	5,385	5,700	315 (inc.)
Silver oz. ....	84,125	90,000	5,875 (inc.)
Lead lb. ....	123,568	100,000	23,568 (dec.)
Copper lb. ....	643,843	12,000	631,843 (dec.)
Zinc lb. ....	313,112	300,000	13,112 (dec.)

No. 3: Comprising Mining Divisions of Clinton, Lillooet, Kamloops, Ashcroft, Nicola, Vernon and Yale. R. W. Thomson, Government Mining Engineer.

	1918	1919	Comparison
Gold oz. ....	3,288	3,200	88 (dec.)
Silver oz. ....	negligible	6,600	6,600 (inc.)
Copper lb. ....	531,000	520,000	11,000 (dec.)
Magnesium			
Sulphate tons	150	650	500 (inc.)

No. 4: Comprising Mining Divisions of Grand Forks, Osoyoos, Greenwood and Similkameen. P. B. Freeland, Government Mining Engineer.

	1918	1919	Comparison
Gold oz. ....	53,654	33,000	20,654 (dec.)
Silver oz. ....	227,244	203,000	24,244 (dec.)
Copper lb. ....	9,940,125	3,990,000	5,950,125 (dec.)
Lead lb. ....	47,738	34,500	13,238 (dec.)
Fluorite tons ...	170	650	480 (inc.)
Limestone tons .	2,000	16,300	14,300 (inc.)

No. 5: Comprising the Mining Divisions of Golden, Windermere, Fort Steele, Revelstoke, Lardeau, Ainsworth, Sloean, Sloean City, Trout Lake, Nelson, Arrow Lake and Trail Creek, generally referred to as the East and West Kootenays. A. G. Langley, Government Mining Engineer.

	1918	1919	Comparison
Gold oz. ....	51,020	35,771	15,249 (dec.)
Silver oz. ....	2,650,918	1,945,982	704,936 (dec.)
Lead lb. ....	43,728,355	17,669,970	26,058,385 (dec.)
Copper lb. ....	1,685,299	1,354,130	331,169 (dec.)
Zinc ....	41,459,804	43,349,700	889,896 (inc.)

No. 6: Comprising the Mining Districts of Alberni, Clayoquot, Quatsino, Nanaimo, Victoria, Vancouver and New Westminster.

	1918	1919	Comparison
Gold oz. ....	5,565	3,200	2,355 (dec.)
Silver oz. ....	116,425	110,000	6,425 (dec.)
Copper lb. ...	18,475,013	20,000,000	1,524,987 (inc.)

All of the above for 1919 is production of the Britannia Mines, Ltd., Howe Sound.

Approximately 600 tons of Manganese Ore has been shipped from the "Hill 60" property, near Cowichan Lake, Vancouver Island.

**Coal Production During 1919—Slight Decline—Due to Labor Troubles**

The coal production for the Province of British Columbia for 1919 is expected to show a decline of approximately 94,640 tons, the total for this year being estimated as being approximately 2,412,548 tons, as compared with 2,578,724 tons in 1918. In glancing at the figures which, it should be remembered, are made up of a combination of what is known of the output of the various collieries up to the end of the month of October and an estimate of that of November and December, it will be found that the collieries of Vancouver Island are the only ones which show an increase, with the exception of the Telkwa Colliery, northern British Columbia, the production of which is inconsiderable. This result is the more satisfactory in view of the fact that the larger companies lost considerable time during the Summer for various reasons and that one of the mines of the Canadian Western Fuel Company was closed down for a period. While the increase was not great, about 32,459 tons, it indicates that the trend is upward, forecasting which is commonly believed is imminent, namely, a more intensive development of the coal fields of the Island in the future. The decrease in the production of the Crow's Nest Coal Field, amounting to about 171,722 tons, was expected, as the mines of the Crow's Nest Pass Coal Company were unproductive for a period early in the year as a result of a strike.

Following are the detailed figures:

**Coal Production 1919**

Coal Creek .....	229,615	
Estimated .....	80,000	309,615

American Smelting & Refining Company has become interested in the Premier Gold Mining Co., Salmon River. He speaks, too, of the wonderful showing made by the Taylor Engineering Company on the Dolly Varden Mine, Alice Arm, and of the *immense potentialities* of the Kitsault Valley. Other impressive facts to which attention is drawn are the 25 per cent increase in the production of gold in the district and the remarkable jump in silver output amounting in quantity to 120 per cent and in value to even more comparatively.

**Northwestern District Has Some Remarkably Promising Mines**

Summing up the outstanding features of the mining situation in his District, at the close of 1919, G. A. Clothier, Government Engineer for the Northwestern Mineral Survey District, refers to the far-reaching effects that may be expected from the fact that the

It is the opinion of Mr. Clothier that 1919 has been a crucial year for the mining industry in this Province, and especially for the northwestern section. Prospected areas have been thoroughly examined and investigated by the most competent mining engineers in the profession, many of them representing the

Operating Plant.

#### THE KIRKLAND LAKE DISTRICT OF NORTHERN ONTARIO.

Gold was first discovered in the Kirkland Lake District about eight years ago and since that time aggressive development has brought some properties not only to the producing stage but has also placed them in the dividend paying class. The Tough-Oakes was the first mine in that district to become a pro-

ducer and eventually a dividend payer, but becoming involved in legal complications was forced to suspend operations for some little time. However, last spring work was resumed and carried on with excellent results as to the uncovering of ore bodies until the camp was tied up on account of a strike which continued for eighteen weeks. An amalgamation of the Tough-Oakes, the Burnside and the Sylvanite properties has

Operating Plant.

**Beaver Consolidated Mines, Ltd., Cobalt, Ont.**

been contemplated but as yet a deal has not been perfected. In the meantime other properties have been doing excellent work and the record made by the Lake Shore Mine spells success. The Teck-Hughes, one of the oldest operating mines in the Kirkland Lake district, is also producing regularly. The Kirkland Lake Gold Mining Company, which has one of the finest and most up-to-date plants in the North Country, has

just entered the producing class. Their development, which carries them to a depth of 700 feet, has proven up one of the richest lodes of ore yet discovered. At the Wright-Hargraves, where a great deal of development work has been done, the completion of a 200-ton mill this fall, for which they are now getting the machinery and material in, will bring another producing mine into this camp.

**Kirkland Lake Gold Mining Co., Kirkland Lake, Ont.**

(Continued from Page 15.)

strongest mining and financial companies on the continent. That their verdict has been favorable is shown in the number of properties taken under option and the amount of capital expended in preliminary development work.

Discussing the Portland Canal District, with particular reference to the Salmon River Zone, Mr. Clothier expresses the opinion that it will take at least another season to conclusively prove which of the properties now under development will make the mines. There, however, will be no fact of capital to facilitate the demonstration. The chief cause of the keen interest displayed is attributed to the phenomenal development of the Premier Mine, the results of which confirm the general opinion of Mining Engineers who have examined it, viz., that it will become one of the great gold-silver producers of the continent. The fact that the American Smelting & Refining Company has purchased a 40 per cent interest in it for \$2,000,000, after exhaustive examinations by their engineers, demonstrates the position it has taken in the mining world. This transaction, it is ventured, should assure the complete investigation and development of the entire section. Mr. Clothier proceeds to outline present conditions at the Premier Mine, stating that there is a first class sleigh road to the property from the beach; that further equipment is being added this winter to carry on development on a large scale; that a snow tractor will be tried out for haulage; and that an adequate equipment of teams and sleighs are on the ground ready to move ore as soon as snow conditions permit. All ore is to be extracted from the upper tunnel. Development will be continued in No. 2 Tunnel and a compressor plant installed at the mouth of the Plate Tunnel for its further advancement. This tunnel has been driven 600 feet towards the showing in the upper tunnel and, it is expected, will be continued in the hope of picking up the ore shoot on this level, giving about 600 feet depth.

Mr. Clothier mentions other properties under development in the Salmon River area as follows:

The property of the Bush Mines, Ltd., situated about a mile further up the valley from the Premier. Work consists of two open cuts across a mineralized belt having a width of about 100 feet. Some tunnel work. The cuts demonstrated that there were possibilities of ore shoots on the foot and hanging walls. On the hanging wall there are about six feet of altered greenstone containing small stringers and patches of high grade silver sulphides, the whole averaging low grade.

The Spider Group, on the East Fork of Cascade Creek, bonded first to Messrs. Trite and Wood, owners in the Premier Mine, but who failed to exercise their option, the property reverting to the original owners, Messrs. Hamilton and Larsen, of Stewart, B. C. Some very high grade silver ore was found in a small vein but development has not been extensive enough to warrant predictions. The claims now are under option to W. A. Meloche, representing Belgian capital, and work will commence in the spring. The same investor has options on three other groups, which will be explored when weather permits.

The Mineral Hill Group, in the same section, has been under development all summer and work is being continued this winter. There are several fine showings of high grade ore on the surface and several hun-

dred feet of underground work have been driven under these showings. While the results have not been favorable as far as the uncovering of high grade ore is concerned, the probability of proving a sufficient tonnage of milling grade ore to warrant the installation of a concentrator are good. The property is under bond to Messrs. Welch, Fetter, Carlton and associates of Seattle, Wash.

The E. Pluribus and Laura, of the Big Missouri Group, adjoining Mineral Hill. This property was optioned by Sir D. D. Mann. Nine or ten holes were drilled by diamond drill this summer. A tunnel was driven 30 feet and is being continued. The results of the drilling are not known but it is assumed that they were satisfactory as it is proposed resuming drilling on other portions of the property next year. The Big Missouri has been examined by many engineers and the general opinion is that, with proper metallurgical process for the ore, it would make one of the biggest producers of the country.

The Unicorn Group, lying north of Mineral Hill, has been opened up by considerable surface work. The open cuts show good looking ore.

The 49 Group, in the same district, is under bond to S. Silverman and associates. A good camp has been established, the necessary lumber and material being packed by horse from the beach. A tunnel is being driven diagonally across the big ore showing, cropping on the 49 Claim, which should develop a large tonnage of milling grade ore as well as some shoots of high grade. A new vein on the Occidental Claim is being explored with a tunnel which now is in about 50 feet, showing from a foot to three feet of shipping ore. There is a considerable surface showing north of the latter which has not yet been touched but which should develop a big tonnage of at least milling ore.

It is prophesied by Mr. Clothier that there will be much work done up the Bear River Valley next year. In this connection he mentions the Lakeview property, on Glacier Creek, at which a camp has been built and development is underway; the George Copper Mines Property, at the head of Bear River; the Red Top Group, just across the river from the George, and which has been bonded. It also is predicted that there will be prospecting on the Nass River Slope of the Coast Range, opposite the mineralized zone within which the Premier and other properties are situated. Samples of ore assaying up to 600 ounces in silver were brought in from that country this fall and the prospectors, as soon as they had the ore assayed, bought supplies and returned. They have built winter quarters and are driving a tunnel on the vein.

On Observatory Inlet, the Granby Consolidated Mining & Smelting Co., Ltd., has not had as prosperous a year as heretofore, chiefly because of labor and other troubles. The plant was closed for a portion of the year and as a result the output will fall short of that of 1918 by about 10,000,000 lbs. of copper. The production this year will be about 20,000,000 lbs., compared with over 29,000,000 in 1918. The tonnage mined is approximately 655,000 tons against 857,000 tons last year. This means, with copper at 20c per lb., a shrinkage of about \$2,000,000 in the production for the district this year, which will be made up only partially by the shipments from the Premier and the Dolly Varden and the increase in output of the Belmont Surf Inlet Co. The total decrease will be about \$1,250,000.

### Alice Arm Section

Turning to the Alice Arm Section, it is observed by Mr. Clothier that the development of the Dolly Varden, the returns from the shipments it has made this summer; the ore proven by diamond drilling on the Wolf property, also belonging to the Taylor Mining Company; the opening up of such promising properties as the North Star, Tiger, Toric, Muckateer, Moose, Last Chance, Vanguard, Homestake and others prove conclusively the potentialities of this section.

Credit is given Major A. W. Davies, who has charge of operations for the Taylor Engineering Co., for his aggressiveness in putting the property in shape for shipping. Work was commenced in July and several thousand tons of ore had been shipped by the end of September. To accomplish this the railroad has to be completed for three or four miles, a tramway built from the mine to the railroad, power plant installed, ore bunkers built at the upper and lower terminals of the tram, a big bunk and cook house erected at the mine, and the mine itself put in shape for stoping.

Other properties mentioned are the Last Chance, on Trout Creek, and the Tiger Group, across the Kitsault River from the Dolly Varden, which are being diamond drilled. The Muskateer Group, adjoining the Tiger, which showed some very high grade in an open cut, and on which a contract has been let for 200 feet of tunnel work. The Climax, Moose and North Star Groups, the latter having been under development all summer and from which were shipped 30 tons of ore to the Granby Company's Smelter.

Referring to the Illiance River Section, Alice Arm, the activity of the United Metals Co., the owners of the Silver Bell Group and the Monarch Group, are noted. All are spoken of encouragingly. It is said that on the Silver Star Claims, lying across the creek from the United Metals, a tunnel was started on the vein last season. The vein was crosscut at the mouth of the tunnel, disclosing an exceptionally fine body of ore about 12 feet wide at that point.

In regard to the placer mining operations in the Dease Lake District, an account is given of the work of George Adams, of Atlin, B.C., who secured an option on the holdings of the Thiber Creek Mining Co. Finding the plant in bad shape through dis-use he repaired the flume and cleaned up a considerable area of old bed rock in order to move his sluices up to an advantageous position. He then washed an old piece of bed rock that had been partially cleaned up and which he was given to understand would yield good returns. He was badly disappointed in getting only 40 ozs. but decided to open a new pit on his own judgment of the lay of the bed rock. From this he cleaned up \$14,000. He now is planning extensive repairs and improvements and will take up the enterprise next season on a large scale.

The Atlin District has had a very dull year, owing to the lack of labor and the increased cost of production gold. The total placer yield for 1919 will be approximately \$175,000, compared with \$218,000 last year.

The Granby Company is continuing drilling on the Eestall River Property and the work will be proceeded with next year.

The Belmont Surf Inlet Company have had a very successful year, judging from their output, which will exceed last year's by about \$120,000. This increase is made up of 3,750 ozs. of gold, about 1,000 ozs. silver and 220,000 lbs. copper.

### Middle Interior and Kamloops

An increase in the production of silver and a decline in that of copper, gold and coal is predicted by R. W. Thomson, Government Mining Engineer, in discussing the mining industry of his district comprising the middle interior of the Province with the City of Kamloops as its centre. He looks to the future optimistically, however, for the following reasons:

1st.—Activity in connection with the Snowstorm Group of Mineral Claims in the Highland Valley Section, Ashcroft Mining Division.

2nd.—The Whitewater Limonite occurrences in the Clinton Mining Division.

3rd.—The work in connection with the development of the Aspen Grove Copper Occurrences in the Nicola Mining Division.

4th.—The Ladner Creek Gold Bearing Argillite Belt in the Yale Mining Division.

With reference to the Snowstorm Group it is stated that diamond drill operations were started about the middle of January 1919 by the B. C. Department of Mines. Work was carried on through the summer under contract by the International Diamond Drill Contracting Company of Spokane, Wash., using a machine cutting a seven-eighths inch core. Eight holes were put down at dips varying between 30 and 60 degrees and running in lengths between 400 and 1125 feet, aggregating a total of 5,736 feet. The country rock is of a granitic nature with occasional indications of copper mineralization on the surface, but no particularly large well defined ore bodies showing. Out of the eight holes put down six passed through mineralized zones which indicated bodies of commercial ore not represented on the surface. In all the holes three typical rock formations were passed through which, in the absence of technical classification, are described as follows:

1—Granitic country rock.

2—Dark colored, fairly fine grained porphyritic rock, with white porphyrites. Cores show well defined contact with granitic country rock not represented on the surface to any extent.

3—Mineral bearing rock, grey to dark colored, some places sericitic, mineralized with chalcocite, bornite (erubescite) and in places specular iron. Where mineralized usually carries considerable pale green epidote. Looks like an altered basalt or diabase. This formation is shown by drill holes to be much more extensive than is indicated on the surface.

From the results obtained to date on the Snowstorm Claims the statement is justified that there are very extensive ore bodies going to considerable depths and of commercial value.

### Limonite Deposits on Whitewater River

Wm. M. Brewer's report on the Limonite Ore Deposits of the Taseko (Whitewater) River is quoted to show that there would appear to be a large body of mineral of commercial value available. The importance of this is emphasized inasmuch as the mineral is what British Columbia has needed to flux with the magnetites of the Coast in the ordinary blast furnace. An Iron and Steel Industry, therefore, becomes practical, the only question being the provision of transportation from the deposits to the Pacific Great Eastern Ry. This problem is discussed by Mr. Thomson, using Mr. Brewer's observations as his basis. The Department of Mines intends taking up the whole question of the extent and quality of the deposits as

soon as the weather permits in 1920. The Geological Survey of the Dominion Government is expected to send one of its geologists into the district to investigate and prepare a further report. Other engineers will consider the transportation phase of the situation.

Considerable interest attaches to the Aspen Grove District by reason of the fact that operations now are underway which will determine whether or not all of the numerous low grade copper showings of this vicinity have sufficient body to justify the statement that a real mine can be developed. During the autumn of 1918 options were taken on a large number of claims (approximately seventy-five) by strong financial interests represented by Joseph Errington. During the past summer Mr. Errington has had very thorough geological and petrographical investigations carried out in connection with the geology and rock genesis of the district. As a result it was decided to thoroughly explore the field by diamond drilling and no time was lost in starting. Two drills have arrived for this work, a camp has been erected including an assay office.

Ladner Creek runs south easterly to the Coquihalla River which it joins about sixteen miles above Hope. This creek traverses a series of argillites which are ascribed generally as belonging to the Cache formation. This argillite belt appears to be of considerable width and extends north westerly to Siwash Creek on which the Emigrant Mine is situated. The Emancipation Mine on the north slope of the Coquihalla Valley also is situated on the same belt. Numerous occurrences of quartz either of lenticular or vein conformation are present throughout this whole argillitic formation and a number carry gold values of commercial importance.

The Pioneer Mine, Cadwallader Creek, is mentioned as the only producer of importance in the Lillooet Mining Division. Up to the end of the month of October the recovery was approximately 2450 ounces of gold. This is the property reported recently to have been acquired by the Mining Corporation of Canada. In the same section the Lorne Mine, the Ida May and other properties are under development.

The Iron Mask Mine, Kamloops Mining Division, has been working steadily throughout the year and its production is placed at the same as 1918, namely, half a million pounds of copper. The Lydia Group, Queen Bess Mines Co., Ltd., the Copper King and Camp McLeod Group and the War Colt Group are mentioned as having been developed to a considerable extent, although output was negligible.

Work on the Donohoe Mines, Stump Lake, is mentioned in connection with the Nicola Mining Division. The workings of the Joshua Shaft have been unwatered to below the 400 foot level, exposing considerable bodies of ore ready for stoping. A small shipment of ore has been made and it is the intention of the management to continue shipping the better grade ore, at the same time installing a new concentrating plant. The Mary Reynold Mine in the same section has been opened up by R. R. Hedley, development consisting of: deep open cutting, 60 feet; tunneling, 140 feet; drifting, 74 feet; raising, 30 feet. There has been a shipment of 97 tons and 33 tons are in transit.

#### District No. 4

Commenting on conditions in District No. 4, comprising Mining Divisions of Grand Forks, Greenwood, Osoyoos and the Similkameen, it is stated by P. B.

Freeland, Government Mining Engineer, that there have been no new discoveries of note during the past year, probably because prospectors are scarce and large areas are covered by Crown Granted Mineral Claims. The latter ground has been neglected by reason of the fact that the owners seem to have lost interest and newcomers generally avoid such sections. Some of these, Mr. Freeland observes, are well mineralized and though the ores are somewhat complex, the present facilities for power, transportation and new methods of concentration, might make them attractive to capital, providing an area large enough for operating purposes could be acquired at a reasonable figure. The mining industry as a whole in the District is said to be affected by a "marking time" period, during which experimentation is going on to demonstrate the possibilities of ores which hitherto have been too complex for self smelting.

The Copper Mountain Group of Mineral Claims on Copper Mountain. Canada Copper Co., Ltd., is referred to as one of the largest mines of the section. Approximately twelve million tons of low grade copper-gold ore have been blocked out. Active operation has been delayed because of the strike of workmen employed on the construction of the railway between Copper Mountain and the town of Princeton. The 2,000 ton concentrator at Allenby, B. C., which is to treat the Copper Mountain ores, is practically complete. It is probable that the railway will be finished in the early part of 1920, when the mine will commence operation.

The Granby Consolidated Mining & Smelting Co.'s mines at Phoenix produced 142,546 tons of low grade copper-gold ore from January 1st to June 18th, 1919, when the mine closed down on account of a strike at the coal mines of Fernie, which created a shortage of coke at the smelter. This mine has continued closed up to the present time. The cessation of mining at Phoenix has reduced the output of copper in the district to practically nil, and also cut down the production of gold and silver to a considerable extent. It has been reported that mechanical means may be resorted to in the concentration of the ores remaining in the mines at Phoenix.

One of the year's outstanding events has been the development and construction of the Rock Candy Mine and Mill on Kennedy Creek near the north fork of the Kettle River by the Consolidated Mining & Smelting Co. of Trail, B. C. In the mine the following development was done: Drifting, 170 feet; crosscuts, 25 feet; open cuts, 20 by 15 feet. The mill, built about two miles north of Lynch Creek Station on the Kettle Valley Ry., has a capacity of 100 tons a day. The concentration of fluorite is accomplished by screening and depreciation of material in kilns, heated with oil flares.

Some activity has been manifested on Wallace Mountain, Beaverdell, where several new leads of high grade silver-lead ore were discovered. Further development on the Rob Roy opened up two new leads of high-grade silver ore.

A 75-ton ball mill and oil flotation plant is in course of construction at the Carmi Mine, Carmi.

In spite of the high price of platinum, only a few ounces of the metal have been placed in the Tulameen.

There will be a decline in the production of all minerals except Fluorite.

**District No. 5**

That section of British Columbia most developed as to its mineral resources, and from which comes a very large proportion of the provincial output, is included in what is known as District No. 5. This embraces the East and West Kootenays and many of the best known Mining Divisions. Within its boundaries are the Trail Smelter of the Consolidated Mining & Smelting Company, the Slocan, Rossland, Nelson and other mining centres of note, as well as the Crows Nest Pass Coal Field.

A. G. Langley, Government Mining Engineer, is of the opinion that the production, within the District confined, of gold, silver, and lead will show a decline in 1919 as compared with the previous year. Zinc production has been maintained principally by the Sullivan Mine, the output of which would have been considerably greater had it not been for a strike called by the One Big Union, which resulted in the property closing down on September 12th last, and the "walk out" of over 200 men. The balance of the zinc produced in the District is derived from the mines of the Slocan and Ainsworth Divisions. This is in the form of concentrates from the silver-lead-zinc ores and invariably carries high silver values. As the Trail Smelter has not been accepting zinc ores until quite recently, the bulk of this material has been shipped to the United States, which is possible only on account of the silver content. Since the closing of the Sullivan Mine, the Consolidated Mining & Smelting Co. has been confronted with the alternative of closing down its zinc plant or buying custom zinc. The latter course was chosen and recently, it is reported, zinc ores have been purchased in the Slocan.

The Slocan Mining Division is the largest silver producing area in the Province so that the output of silver can be gauged by its activities. Although information regarding shipments is not yet to hand, it is considered safe to predict that the production will show a decline as against 1918. One of the reasons for this is the depletion of high grade ore in the Standard Mine at Silverton which in past years has been by far the largest shipper. The comparative inactivity at the Galena Farm, Van Roi and Hewitt properties will have its effect as will the fact that the Surprise Mine, the largest shipper in 1918, probably will show a falling off in the value of its output. The Queen Bess is in the same position. These statements, however, are based on surmise, the ore having been sent to the United States and the figures being unavailable at the time of writing. Active development is being carried on at all these properties and it is confidently expected that the lull in production indicated will be of short duration.

There is likely to be a decrease in the production of lead for the same reasons as have been recited in connection with silver.

The principal source of gold production in latter years has been the Rossland Camp. During the year the output has been somewhat curtailed as the Consolidated Mining & Smelting Co. had to confine its attention to the highest grade ore, owing to high costs. To remedy these conditions the Company has decided to install a large concentrator either at Rossland or Trail, the probability being that the former will be the site.

There also will be less copper production as the Rossland Camp is the chief source of supply in this district.

Generally speaking metalliferous mining in District No. 5 has been handicapped by shortage of labor during the first months of the year. Since the advent of winter the conditions have improved in this respect. The only properties that have been troubled with strikes are the Sullivan and the North Star in East Kootenay. The North Star, which employs only a few men in comparison with the Sullivan, was not closed long but the Sullivan still is affected. The slight decreases in the prices of lead, zinc and copper did not have any serious adverse influence while the unprecedented rise in silver not only will enhance the value of the silver-lead deposits not being worked but will tend to renew interest in many of the prospects and old properties which have been lying idle for some years.

The completion of Clarence Cunningham's 150 ton Concentrator at Alamo, the erection of a 100 ton Mill at the Noble Five Mine and the decision of the Consolidated Mining & Smelting Company to install a 1500 ton Concentrator marks an active year in mill construction work and a new era in the metallurgical history of the district. All these mills are designed for the treatment of ores by flotation; the existing mills were designed for water concentration and have had flotation units added.

The fact that the mineral production probably will show a decrease for 1919 is no reason for pessimism as to the new year. With the new mills in operation, and in view of the development which now is being carried out, the outlook is bright for an increase in the output of gold, silver, lead and zinc in 1920. Further, with the Sullivan Mine running at full capacity, and an increase from the Rossland Camp, which conditions may be expected, these increases are certain providing labour trouble does not intervene.

**North Eastern District.**

The North Eastern Mineral Survey District (No. 2), in charge of J. D. Galloway, Government Engineer includes all that vast territory lying off the Coast and to the North. Mr. Galloway predicts that the total production during 1919 will compare favorably with that of the previous year. The output of placer gold will show an increase owing to the greater activity in the Arboon and Quesnel Divisions. The production of Silver Lead and Zinc is mostly from the Silver Standard Mines at Hazelton. This Mine has had a satisfactory year with about the same production as in 1918. The Copper production will be considerably lower than before owing to the Rocher de Boule Mine having been closed down all year.

Mr. Galloway goes on to speak of the activity of the Kitselas Copper Company in the Skeena River Section, considerable progress having been made in the development and the equipping of the Cordillera Mine. The Kleanza Company also is referred to, it being explained that this concern was organized to keep up mining and lumbering at Usk, and that, in this connection, a hydro-electric plant is being developed and a large sawmill erected on Kleanza Creek. The Golden Crown Group has been acquired by the Kleanza Company and a crew of men has been kept constantly at work. Two quartz veins have been stripped. They carry values in gold and copper. These will be further opened by means of drift tunnels but this work will be postponed until power is available. After outlining the accomplishments of the management of the Silver Standard Mine, Hazelton District, during 1919 and

giving its plans for 1920 it is stated that Hudson Bay Mountain properties have been showing up well and that, while there has been no production, this may be looked for shortly. The Skeena Mining & Milling Company, holding the Victory and Coronado Claims, is one of the active companies. It has purchased the machinery for a hydro-electric power plant and for a 50 ton water concentrating mill. The ore consists of galena and zinc blende occurring in a gangue of siliceous rock.

There has been a material advance in mining in the old Cariboo District. The production up to the present has been almost entirely placer gold but the development of claims now taking place give fair promise of lode production. A considerable revival of interest also is taking place in placer mining and a number of new properties have been taken up and are being equipped. The production of placer gold in 1919 will show an increase, it being estimated that about 5500 oz. were recovered. Near the town of Barkerville the most important happening has been the development of the Gold quartz properties on Prosperpine Mountain. If, as is expected, the development proves satisfactory a new area of mining will be opened up in the Cariboo and quartz mining will receive attention where it has been popularly supposed the only possibilities were in placer. The groups of claims now being tested are typical of many quartz showings and if these prove successful others undoubtedly will be developed. The showings on these properties are quartz veins varying in width from a few feet up to twenty feet and carrying small quantities of pyrite, arsenica, pyrites and smaller amount of galena. The main valuable metal content is gold which is apparently associated with the iron sulphides. The distribution of the gold values is quite irregular and much development will be required to determine the average gold tenor of the veins as a whole or in workable portions of the vein. It is apparent that when any considerable body of the quartz is considered the average gold value will be low, but it is expected that it will prove sufficient to mine and mill on a large scale and still leave a margin of profit. In other words low grade mine is the possibility for these properties.

In the Quesnel Section the Lightning Creek Gold Gravels and Drainage Co. has been engaged chiefly in construction, repair work, and Keystone drilling. A new shaft was started in the Fall. It will be sunk through the stream gravels and is for the purpose of opening up the deep channel of Lightning Creek, where drilling has shown good values on bedrock. Shafts have been sunk on this property before but have been lost owing to the heavy water pressure. The plant now is well equipped with pumps to handle a large flow of water and it is hoped that this shaft will be successful in reaching the channel. The equipment of the property of the Placer Mine Ltd., situated on the Fraser River, 12 miles below Quesnel, with a Sanerman scraper was commenced during the summer. During the year a Company was organized by S. J. Marsh to work gravel deposits on the Quesnel River, 10 miles above Quesnel. It is intended to work the ground by means of a scraper and the necessary machinery has been bought but not yet delivered.

As to Harper's Camp it is stated that the International Dredging Company operated its plant, consisting of a drag line scraper, during the Season but the ground being worked as yet is mainly on old tail-

ings. The prospecting of this area by Keystone drilling has been under consideration by the Mines Department for some time and about the end of November work was commenced. If weather permits drilling will be continued throughout the winter. In respect to this area it is explained that a small part of it, lying in the bend of the Horsefly River at Harper's Camp, was very rich placer ground, having produced from \$500,000 to \$1,000,000. The character of the gold found here showed that it had travelled some distance. Therefore it is maintained by many that the small rich area at this point must have a feeding channel. A certain amount of prospecting by means of hand sunk shafts has been done in attempts to find a continuation of the rich ground but without success. For such prospecting Keystone drilling is the most satisfactory method. The work to be done by the Government this winter will be of great assistance to the International Dredging Company in outlining their pay areas and, if successful, the drilling will mean much to the Harper's Camp Section.

#### Southern Coast District.

Wm. M. Brewer, Government Mining Engineer for the southern coast district, observes that the mining industry has made much progress, although production is not so large as heretofore for the reason that owners of metalliferous and coal mining properties today are carrying on development ahead of production in order to demonstrate the producing capacity of the properties. He refers to the Britannia Mine, Howe Sound; the Old Sport, on Elk Lake, Northwestern Vancouver Island; the Indian Chief, Sidney Inlet, about the centre of the West Coast of the Island; and the Sunlook Mine, Jordan River, forty-two miles from Victoria on the Island, as being proven copper mines on which tonnages of positive or actual ore could be measured up that are sufficient both in quantity and grade to guarantee the production of a large tonnage for several years.

As to the Britannia reference is made to the recent extended development work done recently, demonstrating that there are approximately 9,000,000 tons of actual ore in addition to an enormous tonnage of what may be termed probable and possible ore. The positive ore will yield an average of two per cent copper in addition to low gold and silver values.

The Sunlock Mine, Jordan River, has reached the point which it is demonstrated that there is sufficient positive ore in sight to warrant the erection of a five hundred ton concentrating plant which has been designed and work on which will start in the early future. The Consolidated Mining & Smelting Co. of Trail, B. C. has secured a controlling interest in this property and W. M. Archibald, the Company's Chief Consulting Engineer, has been appointed Managing Director with R. H. Stewart as Consulting Engineer.

Fire, which burned down the compressor plant and other buildings interfered with development on the Old Sport Mine but these have been renewed with improved equipment and work now is progressing steadily. A concentrating plant capable of treating 500 tons of ore a day has been designed and construction will start shortly.

Development on the Indian Chief, Sidney Inlet, West Coast of the Island, has resulted in exposing a considerable tonnage of concentrating ore, sufficient being blocked out to guarantee operation continuously of the concentrating mill for some time. On the north side

of the mineral zone, and the mountain, a new ore body has been discovered which proves to be over eighty feet in width, this being demonstrated by a crosscut tunnel. The grade of this ore is high enough to produce a profit if treated by flotation concentration. On the southerly side of the mineralized zone

drifting in the No. 2 Adit has demonstrated that the ore body on that level is maintaining its continuity towards the northerly side and work is being continued by driving to connect the north and south zones, with a view to establish whether they are one or separate bodies.

The foregoing graph can be used to plot the approximate figures for 1919 issued by the Mines Branch at Ottawa, and is re-produced from a former issue of the Canadian Mining Journal for that purpose.

# The Coal Production of Nova Scotia During 1919

By The EDITOR

The following record of annual coal outputs in Nova Scotia shows that 1919 was the sixth consecutive year of falling production of coal, output being now at a discount of thirty per cent from the minimum figures of 1913. It will also be noticed that the lessening of production is more marked in Cape Breton Island than on the mainland, and has also affected the large companies more than the small operators.

the Hub Seam, and No. 8 Colliery on the Harbour Seam, mines with an aggregate output at that time of 1,450 tons daily. Another colliery, No. 5 on the Phalen Seam, is near exhaustion, and will shortly be closed. The older collieries, such as Nos. 1, 2, 4, and 6 on the Phalen Seam, No. 9 on the Harbour Seam, and Nos. 12 and 14 on the Victoria Seam, cannot again hope to produce the outputs of earlier years, when

One has to go back to 1902 to find recorded an annual production of coal in Nova Scotia so low as 1919.

At the close of the year, a slight increase in the capacity of the collieries for output is showing itself, and it would appear probable, with uninterrupted work and no accidents or delays that the production of coal in 1920 might reach 5,750,000 or even 6,000,000 tons.

### Capacity of Mines for Output as impaired.

No quick reversal of the production tendency can be looked for, however, and things will have to go comparatively well at the collieries if last year's production rate is to be maintained. The capacity of the mines for output has been seriously impaired. The shortage of men and the contraction of advance development work which is a necessary consequence of such a prolonged shortage, combined with the almost complete absence of capital expenditure on the collieries during at least the past seven years, has put the operating mines into a condition from which they cannot recover completely except through intensive development continued over a number of years.

### Cape Breton Collieries.

Furthermore, the war period happened to coincide with a time when a number of old collieries were approaching exhaustion, and the effect of the war was to prevent the development of new collieries which otherwise would doubtless have been undertaken about the year 1914. For example, the Dominion Coal Company, since the beginning of 1914, have closed down No. 3 Colliery on the Phalen Seam, No. 7 Colliery on

the coal faces were nearer to the pit-bottom. Nos. 21 and 22 in the Birch Grove District can maintain, but not increase their rate of production. No. 17 Colliery, which had an output capacity of 200 tons daily in 1914, was not operated during the war, and its present capacity is about what it was in 1914, but is capable of course of considerable expansion. A new colliery, Victory No. 24, recently opened on the crop of the Emery Seam, with No. 17 Colliery, provide the two sources from which any large increase of production must come during 1920, with the addition possibly of collieries Nos. 15 and 16 on the Lingan Seam in the Waterford District.

None of the other Cape Breton operators can be looked to for much increase in production during 1920.

### Mainland Collieries.

On the mainland of Nova Scotia, the prospect is better. The Acadia Coal Co., now controlled by the Scotia Company, ought to obtain outputs almost as large as those of 1913. The Joggins Field has also fairly well of late, and although the number of small operations will not survive for any length of time, should there be any trade depression, yet there are a number of small openings in that field which together add very appreciably to the mainland production.

The Springhill Mines of the Dominion Coal Company have maintained their production throughout the war period better than any other group of collieries in Nova Scotia, and have the unique distinction of producing in 1919 more than they did in 1913. These mines, given fair luck, might during 1920 reach a production of 450,000 tons.

Summarising all the probabilities, however, it is to be doubted whether under the most favorable conditions of labour supply and demand the capacity of the collieries during 1920 will exceed six million tons.

#### Coal Problem is World-Wide.

There seems every reason to anticipate a continuance of a brisk demand for coal, because the same conditions which are acting as a deterrent to production in Nova Scotia are also operating in all other coal-producing countries. These include increased cost of production, associated with and proceeding from the general inflation of commodity prices; decreased working hours, and increased physical difficulties of extraction; the impairment of the efficiency of the working forces arising from the permanent effect of enlistments and the wastages of war, and an actual shortage of workmen. There seems some reason however, to expect that the shortage of workmen at the Nova Scotia collieries may increase rather than diminish, because of the probable reversal of emigration among European labourers. So far as supplies of men from the British Isles is concerned, this source of labour recruitment is becoming constantly a less likely one, as working conditions, wages and general comfort of the workmen are now such in Britain as to greatly lessen the attractiveness of other British countries.

The problem of labour supply at the collieries of Nova Scotia seems likely to increase in seriousness.

#### The Effect of the Shorter Working Day.

It is difficult to estimate, except at close quarters, the effect of the lessening of the working day upon production. It is not yet quite apparent what the effect of the shorter day is upon the actual output of coal producers at the working face. It is probably negative, so far as the amount of physical energy expended at the face is concerned, because the actual miners did not in any case work more than from six to eight hours. The effect of the shorter day will really be determined from its operation upon the removal and movement of the coal from the working face, and that it has already caused a marked lowering in production is not to be questioned.

There is one way in which the collieries of Nova Scotia can—probably to a greater extent than is possible in any other way—restore production and costs, and that is by the adoption of multiple shifts. When it is realised that the whole capital outlay and development of the Nova Scotia collieries is utilised only for eight hours out of each twenty-four, and that only for six or less days in a week, it is easily apparent that the industry cannot compete with fields that have three working shifts in each 24 hours for six days a week. Of course, a multiple shift is not possible except with a sufficient supply of workmen, and this is not in sight.

Among events of the year of some importance may be mentioned the following:

#### St. Lawrence Shipments Resumed.

The Dominion Coal Company received back from Admiralty requalification most of its coal freighters, and was able to make a commencement in the restoration of its former Montreal sales by sending some coal up the River in 1919, the first shipments of any note since 1915. This Company has also undertaken such prospecting of the lower seams on its properties during the year.

#### Consolidation of Coal Mining Properties Probable.

The acquisition by the Nova Scotia Steel Company of the control of the Acadia Coal Company is important as being, in the writer's opinion, the first of a series of consolidations of coal-mining interests that must take place if the coal mining industry is not to decline still more disastrously. In making this statement, the writer has no knowledge of, and intends no reference to the foolish crop of rumors that have amalgamated coal and steel companies in every conceivable, and many inconceivable combinations, but is merely expressing a personal conviction of the evolution which the coal trade of Nova Scotia must undergo before it attains real stability, a belief that has been expressed in these columns on a good many occasions. Only by consolidation of interests can the scattered, and in many instances financially weak coal companies of Nova Scotia hope to weather the future.

#### Benefit Society Revived.

The absence of serious accident during the year is a matter for thankfulness. It is also pleasing to know that the Dominion Coal Company's Employees Benefit Society has been revived after a lapse of some months. It is not so pleasing to know that the Society is debarred from all usefulness by the fact that only a portion of the employees of the Company are members of the Society. The financial soundness of these friendly societies cannot be assured unless all the employees, young and unmarried, as well as older and married men, are included, and it is very distinctly unfair that any man should be permitted to enter these societies and partake of their benefits when he has become middle-aged, if this same man was not a member during those years when his liability to sickness is smaller by reason of youth and greater vitality.

#### TORONTO NOTES

(From Our Own Correspondent)

Among the mining men down from the North this week was Major E. H. Birkett, Resident Mine Manager for Nipissing Extension Mines, Limited. He states that he has just completed the work on the No. 2 shaft and has commenced to cut a station at the 75-foot level preparatory to running a drift on the known veins and a cross-cut to the newly discovered veins. He reports that the vein in the No. 2 shaft is very strong and continues the full depth of 100 feet and that within a short distance from the bottom of the shaft the silver contents of the vein matter suddenly increased in value by 19 ounces to the ton over the previous assays.

#### North Davidson Progress

L. G. Harris, General Manager of the North Davidson Mines, Limited, who recently returned to Toronto after having successfully financed his proposition in England, states that the company are getting out plans for a mill which will be built in units and which will be of sufficient capacity to take care of 450 tons of ore a day. Some very successful diamond-drilling work has been done, the power line has been completed into the property and everything is rapidly taking on such shape as will enable the company to make the mine a producing one. The property is located three and a quarter miles north of South Porcupine and one mile from the Davidson.

— Production and Consumption of —  
Coal in Canada —

The foregoing graph is reproduced for comparison of 1919 coal production with former years. Canada produced during 1919 only 12½ million tons, the smallest coal yield since 1911.

# Review of 1919 Mineral Production

By JOHN McLEISH, Chief of the Division of Mineral Statistics, Ottawa, from the Globe Annual Review, Toronto.

"The mining and metal production of Canada will be an important factor in post-war conditions, as an abundance of metals will be required during the building-up stage, and with the influx of labor Canada should be able to supply these from her developed and undeveloped resources." Thus written Dr. S. F. Kirkpatrick, an eminent Canadian metallurgist, in discussing "Metals and Metallurgical Research."

The public records and the investigations of the Canadian Federal and Provincial Departments of Mines clearly show that Canada occupies a pre-eminent place amongst the world's geographic groups as a potential source of vast mineral wealth. Long since the greater production created by the war this country had already become the world's principal source of nickel, asbestos and cobalt, and an important producer of gold, silver, copper, lead, zinc and a number of rare metals. Few countries possess greater coal resources, and the Canadian production of arsenic, chromite, feldspar, graphite, gypsum, mica, magnesite, pyrites, and talc stand high in records of world's production.

During the past four years, under the stimulus created by war's demands, Canada's mineral production had increased from a total value of \$128,863,075 in 1914 to a value of \$211,301,897 in 1918. Notwithstanding that much of the increased value indicated by this record was due to higher prices many metals and minerals reached their highest recorded production in the latter year.

With the close of the war, however, came an almost immediate cessation of demand for nickel, copper, lead, zinc and other metals, with large stocks accumulated. Mining activity in these metals either ceased for the time or was greatly restricted, and the year 1919 will probably be looked back upon as the transition period, or, we trust, the greater part of the transition period between the insatiable demands of war for many products of the mine, and the legitimate requirement of peace industries supplemented by what we are pleased to term the demands of the period of reconstruction.

### Effect of Armistice.

The effect of the armistice was immediate in the complete cessation of demand for many mineral products; the replacement by reconstruction and peace demands has of necessity been slow. Further, both the speed of the change and its methods are being most strongly influenced by the difficulties encountered in adjusting human relations. Production of gold, silver and of coal, would have been much greater during the past year but for an actual shortage of mine labor and the closing down of active operations for several months through strikes.

Definite records of production will not be available till some time after the close of the year, but on a broad survey of the results obtained the total value is estimated at \$167,000,000.

During the past six years the annual totals have been:

	Metallic.	Non-Metallic.	The total value of Production.
1914 .. .. .	\$ 59,386,619	\$69,476,456	\$128,863,075
1915 .. .. .	75,814,841	61,294,330	137,109,171
1916 .. .. .	106,319,365	70,882,169	177,201,534
1917 .. .. .	106,455,147	83,191,674	180,646,821
1918 .. .. .	114,549,152	96,752,745	211,301,897
1919 .. .. .	73,000,000	94,000,000	167,000,000

During the war nickel production was more than doubled; copper production increased by nearly 60 per cent; zinc production increased to five times its former output. Following the armistice the prices of food and of clothing continued to increase; the demand for such products could not abate as could the demand for metals of which accumulated stocks were for a time sufficient to meet current requirements. Silver and iron were two great exceptions, for widely different reasons. As the year advanced, however, stocks are evidently being rapidly absorbed, and the rate of production increased with rising prices.

The value of the production of non-metallic products is largely dominated by that of coal. The output of coal in 1919 was less than that of 1910, but greater in value by over \$22,000,000.

The value of the production of asbestos in 1918 was over \$5,000,000 in excess of its value in 1915, and its output in 1919 has been well maintained.

Notwithstanding the progress that has been achieved in the development of Canada's mineral wealth, there are three great products—probably the most important products—upon which industrial activities is built, viz., coal, iron and petroleum, for which Canada has become dependent in large measures upon foreign sources of supply. The total value of the imports of these products, much of the iron and steel in a manufactured form, and petroleum as refined oils, amounted in 1918 to no less than \$286,115,000. Expressing the imports of petroleum as crude oil, and the iron and steel as pig iron, the total would probably be not less than \$140,000,000. These figures serve to indicate the great possibilities for development of domestic resources, if satisfactory solutions can be obtained for the economic utilization of our Canadian coals, low grade iron ores and oil shales, and they demonstrate the great necessity of intensive prospecting for higher grade iron ores and for oil fields.

### Copper and Nickel.

Copper and nickel followed by gold and silver, are the metals of first importance as wealth-producers in Canada. The nickel is derived from one main source, viz.: The ores of the Sudbury district. The other metals are derived from various sources, though the greater part of the silver is from the Cobalt district.

The production of nickel in 1918 was 92,507,293, of which 2,400,000 pounds were recovered as refined metal, the balance being exported in the form of matte, or mill residues. In 1914, the total production was 45,517,937 pounds. The production during 1919 has been about 43,000,000 pounds, or about one-half of the last war year, and slightly under the rate of production during the three years immediately preceding the war.

About one-fourth of the production during the year has been in the form of refined metal, the refinery of the International Nickel Company at Port Colborne having been in active operation throughout the year. The new nickel refinery of the British-American Nickel Corporation, under construction at Deschenes, near Ottawa, is rapidly approaching completion, and will be placed in operation early in 1920.

The price of nickel has not varied as greatly as that of other metals, either during the war, or subsequently. During 1918 the price in London varied from a maximum of £260 per long ton in May, to £196 per ton at the end of the year. In December, 1919, the London price was from £215 to £220 per ton. New York quotations varied from 45 to 50 cents per pound during 1918, and in December of 1919 were 42 cents per pound for ingots and 45 cents for electrolytic.

The production of copper during 1919 is estimated at \$1,500,000 pounds, or slightly less than 70 per cent. of the previous year's output, which was 118,769,434 pounds. Even at this figure the copper production has been greater than that of 1914, or any previous year, and having in view the fact that the price fell from 26 cents per pound in November of 1918 to less than 15 cents in March, 1919, and the effect of labor difficulties in British Columbia may be viewed as highly satisfactory.

In 1918 the production included 5,800,000 pounds from Quebec; 47,000,000 pounds from Ontario; 2,340,000 pounds from Manitoba; 62,860,000 pounds from British Columbia and a little over 600,000 pounds from the Yukon District. In 1919 the production from Quebec, which is derived from the pyrites ores of the Eastern townships, and that of Ontario from the Sudbury nickel-copper ores has been at slightly less than half the rate of the previous year.

Development operations at Copper Mountain by the Canada Copper Corporation now in progress for several years have proved the existence of 10,000,000 tons of ores, with an additional tonnage probable. A 2,000-ton mill is about completed.

At Rossland active mining has, on the whole, been well maintained. The copper is now being recovered in the electrolytic refinery, as refined metal, and it is proposed to install mills for the production of rolled copper forms. On the coast there has been a good production at Anyox and Britannia, though these operations have not been continued without some interruption because of labor difficulties.

With the continued development of larger ore bodies at Hidden Creek, Britannia and Copper Mountain, improvements in treatment of the Rossland ores, the construction of a smelter in northern Manitoba for the reduction of the ores of the Mandy and other mines, resumption of capacity operations at Sudbury, and with the numerous lesser deposits that are under investigation with the hope of developing into big mines, considerably increased copper production in the immediate future may be confidently anticipated.

#### Gold and Silver.

Gold and zinc are the only metals apparently for which an increased production is recorded in 1919. The value of the gold production is estimated at \$16,275,000, as against \$14,463,689 in 1918. This output however, is still less than that of 1916, when a total value of \$19,234,967 was obtained, and far below the output during the hey-days of the Yukon, when, in 1900, a maximum of \$27,908,153 was produced.

In 1918 the production included \$2,118,325 from the Yukon district, \$3,624,476 from British Columbia, and \$8,516,299 from Ontario, with smaller amounts from Manitob, New Brunswick and Nova Scotia. The Yukon district output was about the same in 1919 as in the previous year. It is less than half the average output of the previous ten years, and one-tenth the output of 1900. British Columbia's production of gold is believed to have been also about the same as in 1918.

Manitoba produced \$139,628 in gold in 1918, and probably a greater value in 1919. Some very spectacular finds made during the past year are attracting considerable attention to the new mining districts in this Province.

Ontario's gold production in 1919 has increased to at least \$10,000,000, derived principally from the Hollinger, Dome and McIntyre mines, with smaller contributions from the Lake Shore, Davidson, Kirkland Lake and others. It is already well known to the reader of Northern Ontario mining news that production would have been larger had more labor been available, that in a number of properties large ore reserves had been developed, and that with decreasing costs of supplies and a greater labor supply a much larger annual production will shortly be obtained. The wide extent of territory over which gold discoveries have been made and new gold camps established give excellent reason for anticipating that this Province will in the near future occupy a much higher position among the gold-producing areas of the world.

#### Lead and Zinc.

Lead and zinc are obtained chiefly from British Columbia sources. Ore shipments materially declined during the early months of the year. Considerable dissatisfaction was manifested by a number of shippers with the prices and purchasing conditions offered by the Trail smelter, the only lead smelter in Western Canada. A special committee of investigation was appointed who were given full access to the books and records of the smelting company. Evidence was also solicited from shippers. The conclusions of the committee were that the rates imposed by the smelter's lead schedule "B", at the time of its going into effect, were reasonable. Many lead shippers, however, sought markets for their lead ore shipments in the United States, and during the first nine months of the year lead ores were exported containing over 10,000,000 pounds of lead.

The production of lead in 1918 was 51,398,002 pounds, of which 47,594,328 pounds were obtained from British Columbia, and the balance chiefly from Ontario and Quebec, with a small production from the Yukon District. Of the total, 32,782,000 pounds were recovered as bullion, the balance being lead contained in ore exported.

Zinc production in 1918 comprising actual recoveries of refined zinc at the Trail refinery and estimated recoveries from ores and concentrates exported was 35,083,175 pounds. Of this amount 2,802,928 pounds were credited to Quebec Province and the balance to British Columbia.

Estimates based upon the quantities of ores shipped from mines and exported would appear to indicate that the lead production in 1919 was but little less, if any, than that of the previous year, and the zinc production

# A MARSH HOIST

## IS MADE THE RIGHT SIZE FOR YOUR MINE

and in either Steam Power or Electric Power

This shows one of our Electric Mine Hoists. We make many other types. Send for our catalogue of Mine Hoists, Cars, Cages, Buckets, etc., and see what we offer you. It will repay you.

From the little 10 Horse Power size for prospectors or small mines to the massive 50 Horse Power size, one of our 7 sizes should be just right for your mine.

We are specialists in the building of Hoisting Machinery of all sorts. For nearly a quarter of a century we have been designing and building Hoists, and have developed a Hoist that we are really proud of—proud because of the record of good work they have done, and are doing in mines, quarries, and other classes of work from one end of Canada to the other.

# BOLINDER'S Heavy Crude Oil Engine

FOR MINING AND INDUSTRIAL PURPOSES

Built by a Firm who Stands Supreme in the Whole World as Oil Engine Experts.

The Bolinder operates on a cost of only  $\frac{1}{2}$  cent per Brake Horse power per hour—an enormous Saving as compared with a Steam plant. A 200 B.H.P. Bolinder (which is equal to a 250 I.H.P. Steam engine) costs only \$1:—per hour at full load.

The Bolinder eliminates firemen and fire hazard.

The Bolinder is the result of 30 years' experience.

**Simple**  
**Reliable**  
**Durable**

A 320 B.H.P. Bolinder Engine directly connected with a Generator.

Representatives:—

Swedish Steel and Importing Co., Limited, Shaughnessy Building, MONTREAL

probably somewhat in excess. The prices of both metals have been considerably less than during the last war year, that of lead having averaged about 5.73 cents (New York) and zinc 7.03 cents in 1919, as compared with 7.4 cents and 8.16 cents respectively in 1918.

The prospects for the future are, however, quite encouraging. The zinc reduction plant at Trail is claimed to be operating on a much more efficient basis; large resources of ore are assured in the Sullivan Mine, and the Consolidated Mining & Smelting Company, which operates both mine and smelter, is currently reported to have successfully arranged for the marketing of its surplus zinc products in Europe.

#### Iron and Steel.

In metalliferous mining different methods naturally exhibit varying conditions. Canada's metallurgical industry in iron and steel has become an important factor in our industrial situation, but has been based very largely upon imported ores, a situation which has not been materially altered by the war. A comparatively small production of beneficiated iron ores continues to be obtained from the siderite deposit at Magpie, and from the magnetites at Moose Mountain.

The total shipments of iron ores from Canadian mines in 1918 were only 211,608 short tons and probably about the same tonnage will have been shipped during 1919, the two properties above mentioned being the principal ones that have been operated.

The production of both pig-iron and steel has been less than in 1918, when the total production of pig-iron was 1,195,551 tons (of 2,000 pounds) and of steel 1,873,708 tons (of 2,000 pounds.)

The estimated production of pig-iron in 1919 is 920,000 tons, a falling off of about 23 per cent, and the production of steel ingots and castings is estimated at 1,020,000 tons, a decrease of about 45 per cent.

In 1918 pig-iron was made in electric furnaces from scrap steel to the extent of 32,031 tons. The corresponding production in 1919 was probably less than 8,000 tons. Electric furnace steel production in 1918 was 119,130 tons. It is doubtful whether the 1919 production reached 15,000 tons.

In Nova Scotia the blast furnace of the Nova Scotia Steel & Coal Co. was closed down toward the end of June and was not reblown until after the middle of November. All furnaces of the Dominion Iron & Steel Co. were closed down in August and remained down until late in October. In Ontario the furnaces were somewhat more active, the Steel Company of Canada at Hamilton having all furnaces in blast at the end of September. The Algoma Steel Corporation had two furnaces active and two closed down, and the Canadian Furnace at Port Colborne was active. The Deseronto furnace was closed down in June, the Midland furnace in August and the Parry Sound furnace in September, all remaining down for the balance of the year.

The coal production in Canada in 1919 is estimated at 12,500,000 short tons. (This product is dealt with more fully on another page.)

#### Other Products.

Among other ores and mineral products for which particular demand was created by the war and by the

production of which Canada was able to contribute important quantities were: Cobalt, molybdenum, arsenic, asbestos, chromite, magnesite, graphite and pyrites. The mining of asbestos has been fairly steady throughout 1919, though that of the other products will show the effects of a lack of market. The exports of molybdenite to the end of August were 56½ tons, valued at \$84,226, and were probably derived almost entirely from the Quyon, or Marsh Mine, near Ottawa. At this time all active production operations had ceased.

In the Black Lake district, Eastern Townships, three firms have continued the production of chromite ores and one mill has been in operation. Six months' exports were 4,669 tons, valued at \$124,505. The estimated shipments for the year will total 8,400 short tons, including 5,750 tons of concentrate averaging 50 per cent., and 2,650 tons of crude ore, averaging 40 per cent. chromic oxide. This production is practically equivalent to about one-half that of the previous year. The operators have been improving their production facilities. Canada's production of pyrites ores had greatly increased during the war, rising from 158,566 tons in 1913, to 416,649 tons in 1917. Nine months' shipments in 1919 were 129,157 tons, as compared with 322,282 tons during the corresponding period of 1918.

# GOOD YEAR

MADE IN CANADA

## EXTRA POWER BELTING

You can find no safer guide in selecting your belting equipment than the experience of others.

In over one thousand of Canada's plants Good-year Extra Power Belting is being used with marked success. Scores of these have written us telling of their experience with Extra Power Belting.

Read this letter from The Dominion Steel Products Co., Limited, of Brantford, a concern noted for its progressive methods. It tells of a belting experience which must impress you.

Price was a minor factor with Dominion Steel Product; but on this alone they made a saving of \$4,000.

Length of service, general efficiency, continuous operation and power saving were the determining factors in their decision to use only Extra Power Belting in their plant.

It may be that your plant is much smaller; that your saving would only be \$400, but even this plus the greater efficiency of Extra Power Belting is too important for you to disregard.

You can easily prove to your own satisfaction that Extra Power would serve you as faithfully as it has the Dominion Steel Products Co.

Phone, wire or write our nearest branch, so that a man carefully trained in belting problems by Goodyear may call on you and present further evidence of the superiority of Extra Power Belting. No obligation other than fair investigation.

## A Despised Profession

As was recently pointed out by the "Journal," the salaries paid to the members of the Canadian Geological Survey are a fair indication of the importance attached in Canada to the science of economic geology, and, rated in terms of monetary remuneration, indicate that geologists are considered of less account than a self-respecting locomotive engineer, and that two geologists are equivalent to one steel-melter or rolling mill attendant.

Quite recently, as will be noticed from a newspaper clipping reproduced elsewhere in this issue, six of the members of the Geological Survey, all but one having a record of ten years or more in the service of the Survey, have accepted more remunerative employment outside.

We do not see what else these men could do. Imagine the indignity of their position. With ten years service in the Survey, a Ph. D. degree, and brilliant technical records, these men are asked to support a family on salaries ranging from \$2,200 to \$2,700 per year. How can these men move in the social circle for which their professional status fits them, or how can they avoid the wounding comparisons that arise between their financial and social limitations and the comparatively affluent circumstances of men of less attainments engaged in commercial life?

We have, on several occasions, pleaded for a more accurate understanding of the true functions of a geologist. We believe that the longer and more concentrated the effort of a geologist upon one selected field the more valuable will be the ultimate results of this effort. Geology, like everything else worth while, is a life work. It is not an occupation for the dilettante, or the superficial man, and if a geologist is to yield full value to the department of the public service by which he is employed, the reward must be sufficient to enable him to look forward to a life of long patient work unembarrassed by trying to maintain a professional and social status entirely incompatible with the salaries that tradition allots to the geologist in Canada.

In this connection, our readers may have noted a piece of very special pleading that has been published

Note:—See issue of 24th Sept., 1919, "The Functions of a Geologist."

in reference to the attractions offered by the Geological Survey of the United States to young men. This article stated: "The Survey offers much to the young man newly graduated with a degree in geology. He is enabled to complete his education in the school of practical experience while earning enough to live comfortably. He gets a variety and breadth of experience such as can be seldom obtained elsewhere; he has the opportunity for building up a valuable acquaintance among influential men actively engaged in the mining industry. The unique opportunities offered by the Survey are so obviously advantageous that there will never be difficulty in recruiting suitable members for its staff. *The problem is not so much to attract the best material as to determine just how much the Survey can afford to pay.*"

If the business of the Geological Survey is to train men under advantageous conditions, and introduce them to mining executives with a view to employment, then the foregoing opinion might be allowed to pass; but if, on the other hand, the Geological Survey is to attract to the public service and to retain the services of the best men, the opinion we have quoted is fundamentally erroneous.

A similar misconception existed for many years regarding the status of the mine surveyor, whose work was considered to be a mere preliminary to a managerial position. The result was that mine surveying was not regarded as a profession worth time or study to cultivate. Bad surveying was a further result, and eventually the lack of qualified men led to a statutory recognition of the status of the mine surveyor, and to more adequate remuneration.

We would transpose the opinion italicized above and state that the problem of the Geological Survey *is not so much to determine how much the Survey can pay, but to attract the best material.*

The steady conscientious accumulation of geological facts by a competent scientist, prolonged over a lifetime of endeavor and concentrated upon one particular field of enquiry, may yield, and often has yielded results of astonishing economic value. Yet, as has often been pointed out, the men whose researches and direction have in the past led to the discovery and de-

velopment of mineral resources of incalculable value, are rewarded with salaries that sound like comic opera, did one not know the tragedy—the word is deliberately selected—of trying to live and discharge family obligations upon these beggarly pittances.

If the salaries of every member of the Geological Survey were doubled, they would still compare unfavorably with the salaries paid by private corporations to men of equal attainments. The position of the geologist is not the same as that of an ordinary civil servant who discharges routine duties, calling for honest service, but little more. The geologist represents an investment, first of the educational expenditures of the country, secondly, of the accumulation of personal and inherited observation of many men at

many periods and in many places. The geologist increases in value with the lapse of years of service, and his personal potentialities are enlarged with his years.

Considering the meagreness of the reward of the geologist in Canada, and the non-appreciation of their services by government and public; the faithfulness of their service, and the integrity of their professional etiquette, has been beyond praise, and, if the country persists in a policy of depreciation of these men, and thereby lowers the prestige and loosens the traditions of this distinguished branch of the public service in Canada, it must not be disappointed if a great part of the usefulness of the Geological Survey is destroyed, and our country is placed at an economic disadvantage.

---

## Misplaced Parsimony

At the Vancouver meeting of the Canadian Mining Institute, Dean Brock of the University of British Columbia, and formerly a member of the Geological Survey, deplored the inadequate attention that had been paid in Canada to the economic geology of our coalfields, and instanced, in contradistinction, the large amount of attention that had been paid by the U. S. Geological Survey to the coalfields of the United States.

As a case in point, little or no attention was paid by the Geological Survey to the revision of the geological maps of the coalfields of Nova Scotia, from the time of the death of the late Hugh Fletcher, whose untimely taking off removed from the chosen scene of his labors a geologist much loved and often remembered in Nova Scotia. Hugh Fletcher's notes were unfinished, and his place has been hard to fill.

During the past three or four summers, after much

pressure from Mining Society of Nova Scotia, a revision of the geological data appertaining to the lower seams of the Sydney Basin was undertaken, and those interested in this imperfectly known territory have been awaiting the new maps and additional data. Now we hear that the member of the Survey charged with this necessary and delayed work has resigned from the Survey, for the totally adequate reason that his salary was not a living wage. Considering the importance of the work, the length of service, and the technical attainments of this member of the Survey—and his case is merely taken as typical of many—the salary paid, under the revised classification, is miserably, even indecently, disproportionate.

We do not recollect to have encountered an instance where parsimony is so out of place, or where the traditional folly of saving at the spigot and wasting at the bung hole is more exactly exemplified.

---

## The Ratification of the Peace Treaty

The concluding paragraph of John Buchan's History of the War will, we believe, commend itself to our readers as a fitting and eloquent comment upon the resumption of international relations that accompanies the ratification of the Peace Treaty.

“When all due praise has been given to gifted leaders, it remains true that the hero of the war was ‘the ordinary man. Victory was won less by genius ‘in the few than by faithfulness in the many. \* \* \*

“The world has suffered a purgation by pity and ‘terror. It has made solemn sacrifice, and the sacri- ‘fice was mainly of the innocent and the young. This

“was true of every side. Most men who fell died for ‘honorable things. Perversities of national policy ‘were changed in the case of the rank and file, both ‘of the Allies and their opponents, into the eternal ‘sanctities—love of country and home, comradeship, ‘loyalty to manly virtues, the indomitable questing ‘of youth. Against such a spirit the gates of death ‘cannot prevail. Innocence does not perish in vain. ‘We may dare to hope that the seed sown in sacri- ‘fice and pain will yet quicken and bear fruit to the ‘amelioration of the world, and in this confidence ‘await the decrees of that Omnipotence to whom a ‘thousand years are as one day.’”

EN PASSANT

The "Engineering & Mining Journal" again betrays a curious inability to understand the status of Canada. In an editorial on the "League of Nations" it remarks that in the case of a dispute "between the United States and England, votes would be admitted from Canada, Australia, New Zealand and South Africa." Most decidedly they would, for each of the peoples so named constitutes a self-supporting, autonomous, sovereign nation, and if this fact is not understood throughout the world, it is only possible to express surprise. Again, it is remarked that "'England', as the price for her approval of the League of Nations, has safeguarded herself by providing for her domination of it by plural voting." As we have previously remarked, this use of the territorial term "England" is puzzling, and discloses a complete misapprehension of the constitution of the self-governing nations that compose the British Empire. The implication that Canada is not a sovereign signatory to the Covenant of the League of Nations is likely to be hotly resented in Canada. As to what reservations the United States Senate may insert should the United States subscribe to the League Covenant, that is distinctly and solely the business of the people of the United States, and it is generally admitted they are a competent nation, but, no dubiety should be longer allowed to exist as to the complete status of sovereign nationhood to which Canada has attained.

By request, we publish in this issue the text of the remarks made by Col. L. W. Marsh, of the Marsh Engineering Works, Belleville, Ont., in support of a Resolution which was adopted by the meeting of the Associated Boards of Trade and Chambers of Commerce held in Toronto towards the end of November.

Those who are familiar with the limitations of the economic utilization of iron ores will recognize the difficulties of competing with the United States ores that are apparent in the brief particulars given by Col. Marsh of the Ontario occurrences, but in urging the compilation of a condensed account of the iron ore resources of the Province, written so as to be understandable by persons not familiar with the technical terms of geology or the intricacies of iron and steel manufacture, we believe the Resolution is well adopted. The Department of Mines Report (Ottawa) No. 217, on the "Iron Ore Occurrences in Canada" is very comprehensive, and, so far as we are able to judge, very complete, but, if we correctly apprehend the purport of Col. Marsh's motion, it voices a desire on the part of business men in Ontario for a summarized and non-technical description of the scattered iron deposits of Ontario, setting forth the relative value of the known deposits and attempting to assess their economic value, and their attractiveness as pro-

fit-yielding investments. Such a compilation should not be difficult, but it might very conceivably lead to criticism of the compiler, as all such summarizations are liable to, if honestly and fearlessly carried out.

Our friend and colleague, Hon. Robert Drummond, the Editor of the "Maritime Mining Record," courteously points out in the January "Bulletin" of the Canadian Mining Institute, a rather slipshod statement of the writer, made in "Saward's Journal" to the effect that the royalty revenue of the Province of Nova Scotia derived from the coal sales of that province, had "fallen by \$300,000 annually." What we meant to convey, of course, was that the decline from the maximum royalty yield of 1913 had in the years 1918 and 1919 approached the sum of \$300,000 in each year.

To be explicit, the coal sales in the fiscal year of the Mines Department of Nova Scotia in 1913, yielded in royalties the sum of \$799,200. The royalties for the fiscal year 1919, based on an output of about 5,005,000 tons will probably be in the vicinity of \$500,000, or equivalent to a decline as compared with 1913 of \$300,000. The equivalent decline in 1918 was about \$280,000 for that year. That is to say, the aggregate loss in royalties to the Province attributable to the decline from the figures of 1913, calculated over the period 1914 to 1919 inclusive, approximates \$945,000.

Mr. Drummond, who is the doyen of the mining profession in Nova Scotia, has, in spite of years beyond the Psalmist's estimate, managed to maintain his youthfulness, and that salutary grace of youth, an indomitable optimism. He is a firm believer in the future of the coal mining industry in Nova Scotia, and in this we thoroughly agree with his views, but, so far as the immediate future of the maritime coal trade is concerned, optimism is hard to reconcile with the influences that are now affecting the industry, and will continue to affect it for several years to come.

# The Graphite Industry

## III—Oredressing: Graphite Ore.—General Outline.

By CHAS. SPEARMAN.\*

The separation of flake graphite from its gangue presents problems comparable to that of the separation of its dimorphous form, the diamond, from its gangue; the separation of asbestos from its gangue, etc. In each of the above cases the desired content of the rock is sought free from the surrounding gangue and in its natural physical form, or as nearly so as possible, and therefore the operation of freeing the gangue must be such as not to interfere with the integrity of the commercial product, for, the reduction of the flake, the fracturing of the precious stone or the disintegration of the fibre, etc., are factors which greatly reduce in value the respective minerals.

In the separation and concentration of graphite from its gangue the ideal condition is attained when the flake, as a whole, is completely separated from the surrounding gangue and recovered by concentration, in the physical condition in which it is found in nature, unless market specifications deem otherwise. The first step in the operation is not at all easily accomplished commercially but when a fair degree of proficiency is attained the subsequent step of recovering the naked flake by concentration methods is a relatively simple matter; in fact, the treatment of graphite ore is more of an ore dressing problem than it is a concentration problem.

For various reasons it is advantageous to effect the complete operation of the separation of the flake from the gangue, prior to the concentration step, instead of adopting the widespread practice of doing more or less of it after the operation of concentration, under the guise of "refining" "finishing" etc., which necessitates an auxiliary ore-dressing unit.

Prior to the commercial application of the art of flotation to graphite ore, the average graphite separation and concentration plant was very crude and inefficient, so much so that it is doubtful if a single one of them ever showed a working profit. The ore was first dried "bone dry" in a suitable kiln in preparation for the dry rolls. This drying of the ore was a heavy burden at the best and was necessary to prevent "pancaking" of the reduced ore on the roll faces. After crushing, the ore went to a series of preliminary or "heavy duty" rolls and when the desired mesh was attained the product then went to a series of secondary or finer rolls usually of the flour mill type. Screening was resorted to between each of the sets of fine rolls with the object of removing the flake graphite as oversize. Some mills of this type were equipped with as many as ten sets of rolls and their corresponding screens so that most of the flake was broken and practically worn out before the end of the circuit was reached.

\*Note:

This is the third article by Mr. Spearman on graphite mining and preparation. See issue February 12th 1919, page 87, and issue August 6th 1919, page 586.

The action of the various screens was to remove the oversize naked flake, with adhering gangue in situ, mica, free gangue, etc. This oversize was collected and went to the "refining" or "finishing" ore-dressing unit which consisted of more fine rolls and French buhr stones which disintegrated the brittle gangue present and incidentally more of the flake. This product was then screened so as to remove the undersize—the oversize being the commercial flake. Very often dry tables of various makes were placed at convenient intervals in the circuit in order to lessen the burden on the screens and rolls in an endeavor to rescue more flake. The dust laden atmosphere attending this whole operation from the drier to the "refining unit was almost intolerable.

The final flake graphite resulting from the application of the above ore-dressing practice was thin flattened, polished and the natural physical structure of the original flake was rendered discontinuous due to intimate fracturing caused by flattening, deformation or squeezing by rolls, and the discrete particles were held loosely together. The ordinary handling of this "broken backed" "lifeless" product usually created an abnormal quantity of the lower grade flake.

In a more recent practice, the separation of the flake from the surrounding gangue is a much more simple matter than the above described and having a much higher degree of efficiency. The preliminary drying of the ore is eliminated. After crushing, the ore is fed to any type of wet crushing mill such as a ball mill. The load and feed of the mill is so adjusted as to insure quite a free discharge so as to exclude the liberated flake from the zone of disintegration as soon as possible. This action is sometimes accelerated by the addition of a small quantity of oil ahead of the ball mill on the principle of the well known Macquestin tube section.

The pulp from the ball mill is conducted to a mixer, then to an \*Alderson hydraulic classifier from which most of the ganguebound flake is returned as oversize for retreatment while the free or naked flake for the most part follows the undersize to a Spearman concentrator.

After concentration the flake is dried and graded and that portion of it with adhering gangue in situ is removed. This low grade product usually comprises about from 3%—10% of the whole concentrate, depending upon the initial treatment, and is retreated as classifier oversize, while the remainder of the flake after the removal of the dust products classifies as No. 1 crucible stock.

By the older practice all the flake had to be subjected to the attrition of "refining" in order to attempt to properly separate the gangue from a small portion of the whole, which was a wasteful practice as much of the good flake was rendered low grade thereby.

\*W. P. Alderson, Manager, Timmins Graphite Mines, Westport, Ont.

The flake resulting from this newer method of separation of the gangue from the flake, may be described as coherent, thick, "bold" "rugged" that is, having rough edges and surfaces and is much higher in carbon than flake from the roll treatment on account of having no powdered gangue impressed into the relatively loosely coherent mass of minute flakes which constituted the so-called flake, and the specific gravity of a unit volume, under like conditions, is much higher than that of the flake resulting from the older practice.

The special advantages of the above described wet method of separation as applied to graphite ore are:

a. Low initial cost of installation.

b. Low cost of operation:—

elimination of preliminary drying.  
low power consumption.  
low maintenance cost.  
low labour cost.

c. Much better grade of marketable products.

d. Greater quantity of the better grade of concentrate.

e. Better grade of low grade products.

f. Smaller quantity of low grade products.

g. One ore dressing unit instead of at least two.

h. Simplicity; short circuit.

i. Elimination of the dust nuisance.

## The Dominion Crucible Co.—A New Canadian Industry

By R. F. MAFFRE

There have been many radical changes in the industrial life of Canada as a result of the World War. The imperative demand for munitions in enormous quantities caused a metamorphosis of the factories and workshops of the nation, and the spur of necessity augmented the efforts of invention in the endeavor to provide articles hitherto required only in small quantities or not at all.

The manufacture of plumbago crucibles was one of the "key" industries concerned in the making of munitions. As a result of the unprecedented demand for crucibles to supply the needs of those engaged in the manufacture of brass cartridge and shell cases and copper driving-bands for shells, the crucible-makers of the United States and Great Britain were literally

The Dominion Copper Products Company of Montreal, was faced with the problem of obtaining crucibles, and, after considering the situation, decided to make its own crucibles. The Dominion Crucible Co. was, therefore, incorporated in October, 1916, and a plant was erected at St. John's, P. Q. Much of the machinery required had to be specially made, and this occasioned considerable delay in the completion of the plant. Owing to the shortage of ocean tonnage, lengthy delays were experienced in getting clay from England and plumbago from Ceylon and Madagascar, so that it was June, 1917, before an output was secured. From this time until the cessation of hostilities, and the consequent cancellation of orders for munitions, the entire output was absorbed by the Dominion Copper Products at its large plant at Lachine, P. Q. The amount of this output was 1,268,000 numbers, equivalent to a melting capacity of approximately 38,500 tons of metal.

The return of peace-time conditions placed this output at the disposal of the trade in general, and Canadian-made crucibles were on the market for the first time, as, previous to the war, all the plumbago crucibles used in Canada were imported, mainly from the United States.

The crucible plant at St. John's P. Q., is capable of producing crucibles in sufficient quantities to take care of all the requirements of the Canadian trade. Crucibles range in size from the jeweller's crucible, with its capacity of a few ounces, to the tilting-furnace crucible, holding 1,800 pounds of metal. The chief ingredients of the paste from which crucibles are formed are plumbago and clay. The requisite qualities in a good clay crucible are—great plasticity, good bonding powers; low vitrification point; high fusion point; great strength when air dried and also when burned. As regards plumbago, different conditions of various grades are made, but in general it may be said that the resulting blend must have a high carbon content and a fibrous structure that will stand reduction in size by grinding without being destroyed

General View of Factory of Dominion Crucible Co.,  
St. John's, P. Q.

swamped with orders, and stocks dwindled to the vanishing point. Correspondingly, the prices soared, and consumers paid four and five times the pre-war prices, considering themselves fortunate in securing crucibles at all.

in the individual particles. For this reason, amorphous plumbago is unsuitable on account of its granular structure. No Canadian clay has been found that is suitable for crucibles, but while a portion of the plumbago used, of special quality, must be imported, this material is found in large quantities in Canada.

The making of crucibles is a branch of the oldest art in the world, the art of pottery, and the machine on which the crucibles are formed is an evolution of

important matter to the metal trade, and there is considerable natural hesitation on the part of users to abandon goods in this line with which they are familiar in favour of a new line of goods of unknown qualities. Notwithstanding this, the "Dominion" crucibles, stoppers and nozzles are gradually establishing the fact that they can successfully compete in quality with imported goods but the future development of the industry will undoubtedly depend on being granted a sufficient protection against the foreign

Pugging Machine, showing orifice and cutting-board in foreground. Crucibles are drying on racks preparatory to firing.

Top of Kilns, which extend from Basement. Firing is done on a lower floor.

Crucible-forming Machine, showing mould and forming tool in position.

In foreground is the Mixer. In rear are seen the Burr-Mill and sifter.

the potter's wheel of Biblical times. After the crucibles have been sufficiently dried they are burned in a specially designed muffle kiln which permits of their being subjected to an intense heat without coming in contact with the flames, smoke and gases of the fires.

This company is also making plumbago stoppers and nozzles for steel ladles and has supplied these to the majority of the steel plants in Canada, with the most satisfactory results. These articles were previously imported from the United States.

The quality of crucibles, stoppers and nozzles is an

manufacturer to at least compensate it for the duty it is obliged to pay on the imported material employed.

Every new Canadian industry is an asset to the community at large, and it is hoped that the Dominion Crucible Company will receive sufficient encouragement to warrant a continuance of its efforts to establish this industry on a permanent footing.

The personnel of the Dominion Crucible Company is as follows: H. H. Vaughan, President; W. F. Angus, Vice-President; F. W. Evens, Secy.-Treas.; S. J. Kaufman, Works Manager, and R. F. Maffre, Accountant.

# An Underground Loading Pocket Adapted For Heavy Ores

JOHN S. WATTS, New Glasgow, N.S.

The drawings accompanying this article, show a highly successful underground loading pocket, installed last year, in the submarine iron mine of the Nova Scotia Steel & Coal Co. at Wabana, Newfoundland.

The product of this mine is a hard iron ore, and is mined in large lumps, frequently in cubes measuring three feet each way, and weighing over two tons each.

These heavy pieces make it a difficult proposition to control the loading by any of the ordinary varieties of gates. The design shown in the drawings is the result of much thought, and has proved successful, beyond all expectation.

The original intention was to break the larger pieces of ore, in the mine allowing no piece with any dimension of over two feet to get into the pocket.

This limit has, since, been raised to three feet, as it was found, by experience, that that size gave no trouble, and, as a matter of fact, larger pieces even than three feet have been passed through the gate without sticking.

The method of operation, is, to bring the ore from the working faces, in small ears, to the tipples shown in the drawing, above the pocket. The tipples empty the cars by upsetting them, and return the ear to its upright position by gravity.

The centres of gravity of the ear and tipples, are so arranged, relatively to the centre of suspension of the tipples, that the full ear causes the tipples to turn over, and when the ear is empty, the tipples return by gravity to its original position, which is as it is shown in the drawing.

The empty car is then pushed off, and replaced by a loaded ear, and the operation is repeated. The movements of the tipples are controlled by a hand brake, not shown on these drawings.

As may be seen from the drawing, the bottom of the pocket is of concrete, strongly reinforced, with worn rails, to stand the shock of the dumping of the ore. Also it will be observed that at all places, where the movement of the ore would cause abrasion of the concrete, the surfaces have been lined with rails.

In the bottom of the pocket, places have been provided for six chutes and control gates, but only three chutes have been fitted and have proved sufficient.

These chutes empty the ore from the pocket into a sixteen-ton capacity car, which ear carries the ore up to the deckhead on the surface.

It has been found that one of these cars can be loaded to capacity with sixteen tons of ore in less than thirty seconds, and it probably would be done in less time, were it not for the fact that the ears cannot be unloaded as quickly, and the two operations are performed simultaneously, the hoisting being done in balance.

The main improvement in this pocket, over the old one, is, that the control gate rises through the stream of ore to shut it off; instead of pushing down into the ore, as is the more common method.

It is obvious that there is nothing to prevent this door closing, except the weight of the ore on top of the door, and the friction of the ore against the gate. This merely involves applying sufficient power to overcome the resistance, and then perfect control is attained.

With the downward closing door, however, a lump of ore will get stuck under the door, and make it impossible to get it closed until this lump is got out of the way, by which time the car will be overloaded, and ore piled up on the floor around the car, to be later shovelled out of the way.

It is somewhat of a mystery to me why this type of door is not more generally used, as while it needs more careful designing and manufacture, to avoid the danger of its getting jammed by fines or dirt accumulating in the guides; its perfect control and reliability under the roughest of treatment well repays the small extra cost.

In fairness to all, the writer should state that he thought when designing this gate, that he had invented something new, but discovered afterwards, that the idea of making the gate come up through the stream of ore, had been used by others, previously. Particulars of two doors on this principle, are published in "The

Underground Loading Pocket

Handbook of Mining Machinery," published by "Mines and Minerals." Neither of these doors, however, are subject to the severe treatment, that the one described has to withstand.

The gates are operated by the 6-inch push and pull, air hoists shown on the drawing, so that power is available for both opening and closing the gate.

To make certain of having ample power to operate the gates, provision was made for fitting either one, two or three air hoists to each. Actual operating experience has proved that two six-inch hoists, with 60 lbs. air pressure, will effectively operate the gate under all conditions of service.

To take care of the possibility of the gates falling open, in the event of accidental failure of the compressed air supply, the gates are fitted with eye bolts at the upper end, and provision made for connecting rope blocks and tackle, to operate the doors by hand. This is, the writer believes, a very remote possibility, as if the air supply should fail, the doors would still remain closed, unless the pocket was nearly empty, and in that case little damage would be done even if the door did open by reason of its own weight.

The details of construction of the chutes and gates are quite clear, and require no further elucidation.

### THE "QUALITY OF MARITIME PROVINCES COAL"

In view of a threatened coal shortage in this country this winter, Canadian importers have speculated on the possibility of getting their supply from the Nova Scotia bituminous coal centers. There is a strong feeling, however, in Canadian manufacturing centers, opposed to the quality of the maritime provinces coal, and it has been reported through official channels that it is doubtful whether such a change will be made.

In addition to the superior quality of bituminous coal from certain American districts over the Nova Scotia bituminous coal, freight charges from Nova Scotia are reported to be unusually high, and manufacturers in Quebec have found it more profitable to use American coal. The quality of bituminous coal from Nova Scotia, according to a report, would not relieve the domestic heating problem in Ontario.

Despite the warnings that have been sent by the transportation department of the Canadian Manufacturers' Association to all users of bituminous coal to secure their supplies as soon as possible, it would appear from the comparative figure on the importations of bituminous coal in Ontario that the users of this coal were well supplied.

The importations of bituminous coal between April 1 and August 31, 1916, according to customs returns, were in round figures 3,500,000 tons. In the same period in 1919, the importations amounted to 3,300,000 tons in 1917, 4,850,000 tons; and in 1918, 5,350,000 tons.

The large importations of 1918, with the sudden ending of the war and the closing up of many industrial plants, would lead to the conclusion that large quantities were on hand this year.—Coal Age.

Note:—We do not think that our Nova Scotian friends will altogether approve of the foregoing viewpoint of a New York trade journal. Of course anthracite happens to be an exclusive possession of United States collieries, but the reference to the "superior quality of bituminous coal from certain American dis-

tricts over the Nova Scotia bituminous coal" is worthy of notice, not so much because of its appearance in a New York paper, but because it reflects a certain erroneous, but ingrained belief in "Canadian manufacturing centres."

Actually, of course, the reverse is the truth, and Nova Scotian coal will have no difficulty in regaining the market it held before the war in Quebec on the score of quality. We do not grasp, either, the statement that the "quality of bituminous coal from Nova Scotia would not relieve the domestic heating problem of Ontario. Nova Scotia coal relieves the domestic heating problem of a very large area of Canada, and there is no known peculiarity in the climate of Ontario, or the constitution of its inhabitants, that should remove the heating qualities of Nova Scotia coal when it crosses the Ontario provincial boundary.—Ed.

### PEARSON OIL INTERESTS ENGAGE SIX MEMBERS OF THE GEOLOGICAL SURVEY.

The Geological Survey branch of the Department of Mines is soon to lose the services of six of its foremost experts, they having accepted appointments with the world famous British oil firm of S. Pearson and Son, Limited, with headquarters in London, but operating oil concessions all over the world.

The men to go are Messrs. L. D. Burling, A. O. Hayes, J. J. O'Neill, W. J. Wright, B. R. McKay and Bruce Rose, all of whom have seen long service in their department and are generally recognized as foremost experts in their line.

They were engaged by Mr. Robert Anderson, American manager of the Pearson and Son interests. Mr. Anderson arrived in the city on January 2 and met his men. After several consultations the propositions he was able to make proved so attractive that he closed with all of them and left Ottawa on Monday night, going to Montreal on his way to New York, and thence to Menlo Park, California, where he makes his headquarters.

#### Where They Will Go.

While the destination of all the men named has not yet been announced, it is known that Mr. Burling will go to Trinidad, in connection with the large oil and asphalt deposits there; Mr. Wright will go to North Africa, where the Pearson concern has extensive interests. At least one of the others will go to California and still another is likely to be located in Mexico.

While the many friends of the citizens named will regret to learn that their new positions will necessitate their leaving Ottawa, general congratulations upon their success will be in order when it is known that all the appointments are said to carry salaries at most generous proportions and the opportunity to do a most attractive line of work under particularly congenial circumstances.

It is also indicative of the quality of the experts engaged in the Geological Survey branch that when an organization of the size and resources of that represented by Mr. Anderson desires to secure men for particular appointments it should seek for them in the Government service.

—Ottawa Journal.

## AN ECONOMIC SURVEY OF THE IRON DEPOSITS OF ONTARIO URGED BY THE ASSOCIATED BOARDS OF TRADE ON ONTARIO.

Being the text of a resolution presented by Colonel L. W. Marsh, President of the Belleville Board of Trade, at the annual meeting of the Associated Boards of Trade and Chambers of Commerce held in the City of Toronto, November 20th and 21st, 1919.

There appears to be considerable information of a certain sort published by Government Engineers regarding the iron mines and formations of Ontario, but it is published partly by the Dominion authorities, and partly by the Provincial authorities. Moreover, it is scattered here and there through several volumes of annual reports where it is difficult to find, and is frequently buried in a mass of technical and geological information unintelligible to the ordinary lay prospector or miner, making the information of no practical use.

According to the Provincial Government 1918 Report, the Mines of Ontario shipped 198,882 tons of iron ore. Of this

91,609 tons were shipped to Ontario Smelters  
107,273 " " " " U. S. "

The chief producers were the Algoma Steel Corporation from their mines in the Michipicoten District, and the Moose Mountain Limited, at Sellwood, near Sudbury.

345 Tons were also shipped by the Poe Mining Co., Palmerston Township, Frontenac County, and 80 tons by the Canadian Union Iron Mines Corporation, Township of Drummond, Lanark County.

Ontario Blast Furnaces smelted in 1918

99,852 Tons of Ontario ore, and  
1,375,459 " " U. S. "

The Canadian Mining Journal says that iron ore deposits are scattered practically all over the northern and western section of Ontario. The principal deposits are as follows:

### In Northern Ontario.

There is a known deposit of titaniferous magnetite, containing vanadium, near Mine Centre, on the Canadian National R. R. 40 miles east from Fort Frances. This was studied and mapped three times by Dr. A. C. Lawson in 1887-8, 1913 and 1918. To develop this would require a R. R. siding 4 to 6 miles from Mine Centre. Dr. Lawson says he did not go all over the ground, but believes the ore body is from 10 to 15 miles long, and the railroad siding could easily parallel the veins, of which there are two or more.

There is another known deposit near Paska Station, on the Canadian National R. R., Thunder Bay Region. There are two distinct Iron Ranges here, examined by E. S. Moore 1907-8. Mr. Moore said the eastern end of the southern range was worthy of further prospecting.

A deposit of hematite ore has been discovered in Yarrow Township, West of the Montreal River, Matachewan Gold Area. This has not been mapped out or examined as to size, though one vein was found from 5 to 30 feet in width. There is plenty of water power handy for developing electricity in this neighborhood.

There are also good iron deposits near Dryden, the 1912 Report says that "there is reason to believe that further exploration will be rewarded by more large bodies of workable iron ores similar to the Helen,

Moose Mountain, Magpie, Atikokan. It is estimated that 100,000,000 tons of low grade ore await development near Helen Mine, Algoma.

### In Eastern Ontario.

There are several known deposits of iron ore in the counties of Peterboro, Hastings, Frontenac and Lanark. A few of these are being worked at present. Others were worked a number of years ago and abandoned owing either to high cost of labor and fuel, difficulties of transportation or ore, or ruinous competition of U. S. producers.

The Blairton Mine in Peterboro County, worked back in the 30's and around about 1873, was the greatest producer in Canada. It is now closed, and has been closed for some years. The Belmont mine close by is still being worked. The Blairton used to ship to Pittsburg.

The Mines Branch, Dept. of Mines, Ottawa, made surveys of these two mines 1912-1913.

Besides these two mines, there are known to be three distinct belts of hematite near Belmont Lake, Peterboro County, running from 12% to 15% iron.

There are also six bands of iron ore between Harlowe and Bishop's Corners near the Village of Queensboro, Hastings County.

Iron ore is also suspected in Huntingoon Township, Hastings County. There are good hematite deposits near Eldorado, the Wallbridge mine being one of them.

The Bessemer Iron Mine at Bessemer, Hastings County is now being worked in a small way, and has been a large producer in the past few years. There are also several known deposits of good ore within a few miles of Madoc, Hastings County, some of which were formerly worked.

The information given above was gleaned by much toil from some eight or ten Official Reports and other authentic sources, and is at the best but fragmentary, scattered and incomplete.

Though information is given in a general way that iron is to be found in a certain district, there seems to have been no attempt made to definitely plot out the size and area of any deposit, or to ascertain or give any clear idea as to the amount of ore, or its richness. There are few isolated exceptions to this statement, such as the Blairton and Belmont Mines in Peterboro County, where the Dominion Government, apparently at the request of the mine owners, plotted out the size of these two deposits, but left all the other rich deposits in the neighborhood untouched.

The presence of iron ore, and its near relative iron pyrites, can be detected by the magnetic needle. The Canadian Sulphur Ore Co., located and thoroughly mapped out one of their best deposits of iron pyrites with the magnetic needle, and opened the vein at the spot indicated by the needle to be the best ore though the surface soil or overburden at the spot was forty feet thick.

The known information regarding Ontario iron ores should be assembled in concise form, with non-technical maps, and properly described in terms intelligible to those who are not trained geologists.

In a general way there seem to be two main iron ore districts in Ontario. The deposit in southeastern Ontario, which seems to centre in or about Madoc, and the larger and more widely scattered areas in New Ontario from Sudbury to Dryden and north to Fort Matachewan.

These two iron ore areas should be dealt with separately by the Provincial and Dominion authorities. For instance, the Madoc area, as it might be called, should be thoroughly surveyed magnetically, the **size and boundaries of the various deposits definitely given**, and also information as to the probable tonnage of ore **and its percentage of pure iron**. This information should be embodied in a special bulletin or book, as free as possible from geological and technical phraseology. The northern iron area should be treated in the same way, making two distinct publications, the two covering thoroughly the iron resources of the Province. A new survey should also be undertaken, particularly of the older sections of South Eastern Ontario, where the work was done by prospectors and miners a good many years ago, but about which there seems to be little recent authentic information. The iron formation of Peterboro, Hastings, Frontenac and Lanark Counties does not appear to have been properly mapped out and described for a good many years.

The Madoc iron area, being smaller, more central, and easier of access, should be dealt with first, this area covering or embracing portions of four countries, Peterboro, Hastings, Frontenac and Lanark.

Steps should also be taken by either the Provincial or the Dominion authorities, or both in collaboration, to ascertain the best method of extracting the iron from these ores and utilizing the titanium, vanadium, and other rare materials associated with the iron.

The steel strike in the States has called our attention to our utter dependance on the States for most of our steel products. The Government should do what they can to so develop our iron resources and smelters that we will ultimately become independent of the United States for Plates, Sheets, and structural shapes.

Assistance is needed from the Government for solving the great technical difficulties in the smelting of some of our refractory ores, which difficulties have hindered development in the past. This is a problem too big for the private person or corporation, and requires the best knowledge and resources of the government experts.

The following resolution was adopted:—"Resolved "that the Provincial and Dominion Governments be "memorialized and urged to prepare and publish immediately a reliable and up-to-date general Report "upon the minerals and metals of Ontario, their distribution, quantity and quality, and especially with "regard to iron, the foundation of one of Canada's "basic industries."

"Iron and Coal Trades Review," a well-known technical journal published in London, England, contains in the latest issue received a number of advertising pages printed in colors by the three-color process, which are of striking excellence. The publishers refer to this innovation as a new departure in British technical journalism, although it is of course well-known in the United States, where the advertising pages are often more interesting than news columns. The advertisement of a well-known British safety lamp, which shows the revealing of the spectre of "gas" by the safety-lamp is a combination of clever drawing and effective advertising, effective even in black and white reproduction, but much more so in colors.

## DEVELOPMENTS IN THE SHININGTREE GOLD AREA DURING 1919.

The Shiningtree gold area is not easily reached from Porcupine or Cobalt and few of those who write about Northern Ontario gold mines have yet visited the Shiningtree properties. The district has suffered both from the extravagant claims of stock salesmen and from the equally erroneous counter statements of supposedly informed journalists. None of the mines in the Shiningtree district have yet reached the producing stage, but the work that has been done during 1919 has resulted very favorably. Most of the work during the year has been done on two properties—the Wasapika and Herrick, and the results obtained should be gratifying to the owners, for both seem now to be reasonably sure of becoming producers.

At the Wasapika development has been carried on steadily, though slowly. The big vein has been cut at the 100 ft. level, and found to be even wider than at the surface. The shaft is now being deepened. The footwall portion of the deposit where cut on the 100 ft. level carries about \$12. per ton for a width of 5 ft. This of itself would be considered very satisfactory, but there is in addition a wider body of lower grade ore. To satisfactorily develop this large orebody will take time and money. The company has been handicapped by lack of sufficient funds and has not been able to proceed with development rapidly. This weakness will be easier to overcome than would a lack of ore, but it is one of the many problems that the pioneer has to meet. The Wasapika has had a hard struggle and few friends, but it has the earmarks of a big gold mine.

At the Herrick a shaft was sunk by hand, early in 1919, to a depth of 50 feet on the vein. Very good values were encountered and sampling at 5 ft. intervals showed the ore for a width of 5 ft. to be high grade all the way down. The equipping of the property with machinery suitable for carrying on development work was not undertaken during the summer, but a contract for exploration by diamond drilling was let. By this means the deposit has been tested at depth. Three holes have been drilled and a fourth is now nearing completion. The satisfactory results of the summer's work have resulted in plans being made to equip the property this winter with the necessary mining plant. The erection of a mill is also under consideration. If these two leading properties receive the attention they merit during the coming year the Shiningtree district will doubtless emerge as a gold producer in spite of the voluminous criticism, some of it deserved, that it has received.—R.E.H.

## PERSONAL.

Freyh, Brassert & Company, Engineers, Chicago, announce the appointment of Mr. F. L. Collins as Power and Electrical Engineer.

Mr. Collins was formerly connected with the Illinois Steel Co., South Chicago, and Gary Works and Universal Portland Cement Co. at Buffington, as Electrical Engineer; later joining the Dominion Iron & Steel Co., Sydney, N. S., as Chief Electrical Engineer. Subsequently he was connected with the Ordnance Department of the U. S. Steel Corporation at Neville Island, and lately was Chief Electrical Engineer of the Pittsburg Crucible Steel Co.

# Our Northern Ontario Letter

## The Silver Mines.

Official statements to the Canadian Mining Journal tend to show that the mining companies operating in Cobalt are taking full advantage of the present high quotations for silver. Not only is \$1.33 silver in their favor, but the rate of exchange adds another 8 per cent for those companies which are Canadian concerns and receive payment in New York funds.

During the month of December the Nipissing mine established the highest month's record in its history by producing \$423,139. This compares with \$350,208 in November and \$375,247 in October, and makes a total of \$1,148,595 for the last quarter of 1919. It follows that this is at the rate of \$4,594,380 a year. With costs averaging about 40 cents an ounce, it is obvious that net profits amount to considerably more than two-thirds of the total value produced. This, based on the above figures would indicate a net profit of well over \$3,000,000 a year, which is equivalent to more than 50 per cent on the company's issued capital. Following is the official report of Hugh Park, manager, to the president and directors of the Nipissing Mining Company:—

"During the month of December the company mined ore of an estimated value of \$423,139 and shipped products from Nipissing and custom ores of an estimated net value of \$449,758.

"Drifting on vein 544 at the 515-ft. level produced good results. Drifting is proceeding east to west, one face showing two inches of 800 ounce ore, and the other face two to four inches of 1200 ounce ore. Vein 3006 continues to show good values. For the last fifty feet the vein has averaged 1000 ounces a ton over one and a half inches. All stoping operations at 73 shaft continue to be satisfactory. No new veins were encountered in exploration.

"Development work on vein 109 at a level 90 feet below the tunnel, is giving good results. Two raises show from one to two inches of ore assaying as high as 4000 ounces to the ton. Vein 99 was also encountered at the lower level. At the present time the vein is low grade but the rock assays sufficiently high to be sent to the low grade mill.

"A few veins of low assay were encountered in cross-cutting at 63 shaft.

"The low grade mill treated 6632 tons. The High grade plant treated 150 tons. The refinery shipped 326,079 fine ounces of bullion.

"The following is an estimate of production for the month of December:—

Washing plant.....	\$198,940
Low grade mill.....	224,199
Total.....	\$423,139

At the Kerr Lake, also, production is running high, a total of 106,000 ounces having been produced in December. Based on silver at \$1.33 an ounce and exchange at 8 per cent, the output had a value of close to \$150,000.

More than usual interest centers upon the renewed success of the Beaver Consolidated, not alone as a result of the success at the company's Cobalt mine, but also due to the favorable results in the development of the Kirkland Lake Gold Mines of which the Beaver owns close to 90 per cent of the stock. While the Beaver Company is realizing about \$2,000 daily net profit from the operations of its silver mine at Cobalt, the mill of the Kirkland Lake mine is operating at full capacity and has definitely taken its place among the important gold producers of that camp. In addition to this come reports that a large amount of new

ore is being developed, a considerable quantity of which is said to contain around \$30 to the ton.

A small shipment, amounting to about ten tons of picked ore, has been made from the Castle property of the Trethewey-Cobalt company. This consignment came chiefly from the new workings on claim R. C. 101. It is learned that effort is now to be concentrated on the latter claim, while work has been suspended on the original Castle property which adjoins the Miller Lake-O'Brien. In Cobalt, it is reported that the Coniagas is endeavouring to purchase the Cobalt property of the Trethewey company.

Concerning the proposed light railways in the North the scheme is coming in for fairly general favor with the exception of the Gowganda silver area where it is contended that the government would be inconsistent were future extension of the present Elk Lake branch to be forestalled by the installation of a light narrow gauge equipment. Leading silver mine operators in the district are utterly opposed to the Gowganda district being used as a field for such an experiment and are open in their criticism of the failure of the government to extend the standard gauge railroad. Were the Ontario government to ignore the views of the mine operators on this point it would create a peculiar situation inasmuch as the government confesses to a dearth of knowledge regarding the mining districts.

The McKinley-Darragh will keep its oil flotation equipment in operation all winter if possible to do so. From experience it is learned that the pumps operate successfully in weather registering 30 below zero and that the only danger of the plant being obliged to close would be due to a temporary interruption in operation, in which case the pumps would freeze. Provided the pumping equipment can be shifted to a point where the supply of sand tailings is adequate to keep the equipment in constant operation, it is believed no difficulty will be experienced in operating the flotation plant at full capacity in addition to normal operations in the mine.

The agitation among the workmen at the mines in connection with choosing a future policy still continues. While a majority of the members of the Cobalt Miners' Union have evinced a desire to break away from the International, yet such a step does not appear to have been definitely decided upon. It is learned that some 51 of the membership are in favor of joining the One Big Union. Should such a course be followed, it would probably mark the end of the union as an important factor in the labor problems of the North, because the steady men are utterly opposed to the principles of the O. B. U., knowing that it is condemned by all responsible labor organizations on the continent. Unless the course of the Union is marked by reasonable moderation, the workmen may be expected to split up into factions. For instance, the Finlanders and a small sprinkling of other foreigners are in favor of the O.B.U., while the returned soldiers and British born appear to favor a policy of moderation. It appears certain that the percentage of the workmen who will join the O. B. U. is decidedly small.

In regards to the indicated increase in the scope of operations in Cobalt as well as the outlying silver areas, it is interesting to note that inquiries relative to properties in the Elk Lakes and Gowganda districts as well as South Lorrain and Gillies Limit are coming in with increased frequency.

Another factor of more than usual interest is the decision of a local mining engineer to acquire and develop properties on which large deposits of Cobalt mineral occurs. Cobalt is now worth about \$2 a pound and is being used in the manufacture of cutlery as well as high speed tools. The South Lorrain district as well as a part of the Portage Bay area is expected to come in for attention.

During the week ended Jan. 8th, three Cobalt companies shipped a total of three cars containing approximately 215,855 pounds of ore.

Following is a summary:—

Shipper.	Cars.	Pounds.
Trethewey . . . . .	1	82,064
La Rose . . . . .	1	69,795
O'Brien . . . . .	1	64,000
Totals . . . . .	3	215,855

During the corresponding period, the Nipissing was the only bullion shipper, sending out one consignment on Jan. 8th made up of 75 bars containing 100,800 fine ounces.

### The Gold Mines.

While gold mining operations continue to record a steady increase, interest in the industry is growing keen. Despite the handicaps under which gold mining has been carried on in recent years, and in spite of the lack of government support, it is significant to find a greater number of gold producing mines in Northern Ontario at present than since the year 1917. That this situation will be further improved seems certain, owing to the large measure of success attending all aggressive gold mining operations in the province. The fact is that a large volume of capital is now found ready to participate in the development of the gold resources of this country and the next few months promise to see a greater number of producing gold mines than ever before in Ontario's history. Already the amount of gold being produced is the highest on record for Ontario.

It is stated that the Hollinger mine is now treating approximately 2,800 tons of ore daily. The significance of this may be realized by a glance at the 1918 annual report in which ore reserves are estimated to contain an average of \$9.15 a ton. It is evident that in treating 2,800 tons daily, and with ore averaging \$9 a ton, the daily output approximates \$25,200, and is at the rate of \$9,198,000 annually. While this record is a big one, yet it is interesting to remember that the present mill when at maximum capacity will treat about 3,500 tons daily. On \$9 ore the output at maximum capacity would amount to \$31,500 daily, or something like \$11,497,500 a year. Provided the Hollinger is able to procure sufficient men—and the prospects of this are brighter now than for some time—such a record may actually be achieved by the end of this winter. This seems to indicate that before the end of the current year the Hollinger may indeed take its place as the largest gold producing mine in the world.

The Porcupine Crown Company has dewatered the Moneta and is now proceeding with an examination. It is stated that the prospects of a deal between these two companies is considered more or less promising.

The Dome Mines is stated to be preparing a further increase in tonnage treated, and current earnings unofficially reported at the rate of upwards of \$100,000 a month. Earnings at this rate amounting to \$1,200,000 a year equal to 30 per cent net profit, and, if maintained, would indicate a return of around 10 p.c. on shares at \$30 each, whereas quotations on the open market are now around \$14.

With regard to the option which the Dome Mines holds on the Dome Extension, and which expires in March unless extended or exercised, it is mooted in mining circles that the Dome may request an extension of another year's time. Up until very recently the general impression appeared to be that the option would be exercised this year. Even yet, not a few mining men believe such will be the case. The current report that an extension of time might be requested is unofficial, but has caused widespread discussion among shareholders of the Dome as well as the Dome Extension Company.

According to official advice, the shaft at the Clifton-Porcupine has reached a depth of 200 feet. Down to that point the deposition of gold has been found to be quite uniform. It is stated that drifting and cross-cutting at that depth will be carried out at once for the purpose of developing the downward continuation of the ore bodies developed at the first level. A substantial quantity of commercial ore is now in sight.

A change in the management of the Porcupine-Keora is reported, and Mr. Waite, formerly of the engineering staff of the Hollinger has received the appointment. Arrangements have been made to sink the central shaft to a depth of 250 feet.

At Kirkland Lake, the favorable developments at the 600-ft. level of the Kirkland Lake Gold Mines is among the most interesting events of the week. Some of the ore being encountered is stated to run about \$30 to the ton. While this is considerably higher than the average, yet it indicates the likelihood of mill heads being increased.

In connection with the bonds held by Mr. Denison in the Teek-Hughes Company, it is reported that a large Cobalt mining company is negotiating with the object in view of purchasing them. As to this, nothing of an official nature has been given out.

Arrangements have been made to resume work on the Fidelity property, in the north-east part of Teek township in the Kirkland Lake area. Prior to the labor strike the shaft was driven to a depth of 145 feet at which point the vein had widened out to about six feet in width as compared with less than half that width at surface. The property is equipped with a steam plant. The present plans are to carry out drifting operations at the 145-ft. level, the work to be done by contact.

In the Boston Creek district, satisfactory progress continues. Until the shaft at the Miller Independence reaches the 500-ft. level and cross-cutting toward the ore bodies commences, nothing of particular interest is expected from that property. By the middle of February, developments will have reached an interesting point.

At the Kennedy-Boston, the shaft has reached a depth of 70 feet and high values are said to occur in the vein at that depth.

In the Fort Matachewan district, with operations confined chiefly to diamond drilling, and on account of the extreme reticence of the one important operation, that of the Matachewan Gold Mines, nothing of particular interest may be expected during the next few months.

At Larder Lake, interest centres around the Associated Goldfields. This Company has been extremely successful in raising capital, current reports intimating that the treasury now contains some \$800,000. As yet, however, no detailed report is available, although there is some evidence of the newspaper criticism of the situation causing the management to take some action in regard to the preparation of a report by a thoroughly qualified and reputable mining engineer.

In the Larder Lake district as well as Kirkland Lake, Boston Creek and Skead township, property powers are showing a great deal of interest in the recent proposal to build a light narrow gauge railway, some fifty miles in length proposed to pass through each of the camps mentioned, and interesting developments appear likely.

A revised statement of the dividend record of the silver and gold mines of Northern Ontario shows that the total amount paid up to the end of December 1919, amounted to \$95,757,368.04, and not \$101,087,368.04 as stated in an earlier statement.

The record is:—

Silver mines.....	\$4,882,341	\$81,003,616
Gold mines.....	2,461,542	15,753,752
Totals.....	\$7,343,883	\$95,757,368

**A DRAIN ON CANADIAN BRAINS**

By offers of better compensation and more brilliant prospects, the representatives of a United States petroleum company has succeeded in relieving the Dominion Department of Mines of half a dozen of its experts. It is not a surprising development. It is a notorious fact, and to the discredit of Canada, that experts and technical men in our public service are grossly underpaid. Even under the recent re-classification, which, despite all the abuse hurled against it, is an improvement on the past, technical men received far from the recognition they deserved. The result is bound to be bad for Canada. It is bound to mean that the old drain upon Canadian brains to help build up the United States will continue. Today, all over the United States Canadians are to be found in the highest positions, helping to build up the commercial, industrial, and scientific greatness of our neighbor. These men might have remained in Canada, might have been enlisted in the service of their own country, except for the fact that their own country refused either to recognize or was too small to pay for their brains. And as time goes on, and the importance of science increases in the growth and development of nations, the situation for Canada is bound to grow worse. It is a subject that might well engage the attention of the highest authorities in the land.

—Ottawa "Journal."

**MINING IN THE PORT ARTHUR DISTRICT DURING 1919.**

By J. J. O'CONNOR.

The year 1919 closed the first year of mining activity in this district in twenty years.

The abnormally high price of silver caused much attention to be paid to several of the old silver producers in this area, and to the opening of new silver properties. It is expected that the year 1920 will see many of the old properties, such as the Beaver, Porcupine, West Beaver, West End, Silver Creek, Silver Gance and Silver Fox, in the producing list.

Iron ore has been one of the chief factors in the mining activity of 1919. Drilling operations are being carried on on the Nepigon range with amazing results, large bodies of good merchantable ore are being disclosed by the drills, where nothing but lean jaspilites showed on the surface. This is but an indication of what may be expected on all the ranges of this district when drilling is commenced on them. We have vast deposits of iron ore, showing low grade on the surface, that, wherever drilled, have been proven to contain merchantable ore at depth.

A number of iron properties are now under working option to United States interests, and it is confidently expected that another year will see satisfactory results from the work in hand, and others to be undertaken.

A number of gold finds north of Schreiber, some of them carrying spectacular values on the surface, have been made during the year. No actual mining has been undertaken on any large scale. Trending, stripping and shaft sinking is being done on several of them, with highly satisfactory results. This district has been visited by several representatives of mining companies in Cobalt, Porcupine and Montreal, during the Autumn, and options have been taken on a number of the new claims, with operations to begin in the summer of 1920.

The most important transaction in gold mining was the purchase of the "Foley" at Mine Centre, by the Swedish-Canadian Mines, Limited, represented by Mr. J. A. Johnson. This property will be put under active operations Jan. 15th 1920. About 100 men will be employed.

The Wachman Mining Co., began active mining operations on their gold properties near Dryden, in October last, employing 60 miners. The Rognon Mining Co. are developing their properties at Contact Bay, Vermillian Lake.

The Mikado Mine, at Shoal Lake, has been sold to Chicago parties, and will be operated in the summer of 1920.

The Grace, and Norwalk gold properties have been sold to W. A. Burmeister, of Chicago, these mines are on the Algoma Central Railway, and will be actively operated during 1920.

Twelve claims have been staked at Ozone Siding, on which there are splendid showings of zinc blende. Near these claims, a ten foot vein of baryta has also been staked.

More geologists, mining engineers, and men prominent in the mining world have visited, and examined mining lands in the district surrounding Port Arthur, in 1919, than in the whole of the past twenty years, evidencing the interest that is being taken in our mineral areas.

The year 1920 is being looked forward to hopefully by all interested in the development of the dormant wealth of this mineral area.

## INSTITUTIONAL ACTIVITIES IN BRITISH COLUMBIA

(From Our Staff Correspondent at Vancouver)

**B. C. Chamber of Mines:** The British Columbia Chamber of Mines has arranged a series of lectures in the audience room of the Chamber of Mines in the Dominion Building, Vancouver. The lectures are free and the public is invited to attend.

The following is the series of lectures as arranged, and it will be noted that each subject is to be discussed by men well qualified to do this.

Jan. 6. Relationship of Geology to Mining, Dean R. W. Brock, University of B. C.

Jan. 8. Assaying. R. L. McKillop.

Jan. 12. Mine Development. Prof. J. M. Turnbull.

Jan. 15. Chemistry, Dr. D. McIntosh.

Jan. 20. Modern Ore Leaching, Prof. H. N. Thompson.

Jan. 27. Petroleum (Volcanic origin), Prof. G. A. Gillies.

Jan. 29. Oil Flotation Process, G. S. Eldridge.

Feb. 3. Petroleum, Dr. E. T. Hodge.

Feb. 5. Metallurgical Fuels and Refractories, Prof. H. N. Thompson.

Feb. 10. Petroleum, Dr. E. T. Hodge.

Feb. 12. Origin and Occurrence of Iron Ores, Dean R. W. Brock.

Feb. 17. Petroleum, Dr. E. T. Hodge.

Feb. 19. Iron and Steel Metallurgy, H. N. Thompson.

Feb. 24. Petroleum, Dr. E. T. Hodge.

The lectures on Petroleum are intended to form a series dealing with the origin and search for oil, and differing theories on the origin of oil will be presented, which it is hoped will add a little liveliness to the discussions.

It is evident, from the names of the lecturers, that the University of British Columbia intends to be a focus of both light and leading in Vancouver. It is undertaking that extension of its activities among the outside public which most quickly leads to the adoption of a university by the community among which it is placed, and creates that sense of proprietary attachment among the general public which a university must possess if it is to be successful in the best sense of the word.

### Short Courses in Mining and Allied Subjects at the University of British Columbia, Vancouver:

For a period of eight weeks, commencing the second Monday in January, the University of British Columbia offers short courses for the benefit of those who have had practical experience in mining and prospecting, or are connected with the business of mining in any way. The courses are not intended primarily for those who have had a technical training, but so far as they go are complete and adapted to fulfill their special purpose.

Classes are to be held in the day-time only, and require about 30 hours per week for those who attend all the courses.

Short mining courses were inaugurated in January, 1917, and lasted six weeks, with 27 students in attendance, which average was well maintained throughout the courses. Prospectors, miners, brokers, businessmen, newspapermen and others took the course. Resolutions were passed stating the appreciation of these persons of the courses, and requesting further en-

largement and extension of the work. As far as possible this request has been carried out.

All courses are free to returned soldiers. A registration fee of \$5.00 is charged, and as many courses as desired can be taken for this inclusive sum.

Following is a summary of the courses offered:

Mining. Prof. Turnbull.

Smelting. Prof. H. N. Thomson.

Geology and Ore Deposits. Dr. E. T. Hodge.

Ore Concentration. Prof. Turnbull.

Mineralogy & Rock Study. Dr. W. L. Uglow.

Fire Assaying. Prof. H. N. Thomson.

Chemistry. Dr. D. McIntosh.

Surveying. Prof. E. G. Matheson.

Blacksmithing. Actual Shopwork. Mr. H. Taylor.

Unqualified commendation should be accorded to the Faculty of the University for their enterprise and public spirit in arranging these university extension courses. There are many mining communities in Canada, older, more populous and as wealthy as British Columbia, that have not yet attained to these privileges.

**Canadian Mining Institute:** A recent reference in the "Journal" was made to the "Western Branch of the B. C. Division." This should have read: "The B. C. Division of the Western Branch of the C.M.I."

The North Coast Branch of the Institute has approved the proposed bill entitled the "Regulation of the Engineering Profession in Canada." So far, none of the other local branches have taken action in this connection.

### ALICE ARM REPORTS ARE EXAGGERATED.

The report in a morning paper of Vancouver that a vein of fabulous richness had been struck in the Dolly Varden mine is denied by the Taylor Engineering Co., Ltd., absolutely.

The Taylor Engineering Co., Ltd., which is operating the Dolly Varden at the present time or were before winter set in, state that they have had some very good returns, and several times have shipped some high grade ore to the smelter, which would total forty to fifty ton, but this would not run over an average of 1000 ounces to the ton. Although this is pretty nice returns at the same time these figures do not reach anywhere near the figures that were given in the newspaper report. In fact the prospector whose name was used now denies that he gave anything like the figures that were published. It will be well for the public in general to make some allowance for fancy stories that may be printed about the different districts throughout British Columbia from now on, as there is every indication of a big rush to the different fields the coming Spring, and some alluring stories will no doubt appear from time to time.

Note:—A report from Vancouver in the Montreal papers of January 13th is evidently the same report that is authoritatively denied by the management of the Dolly Varden Mine.

Canada's future largely turns upon her handling of the coal problem. Until she releases herself from coal subservience, she cannot rise to her full stature nor stride forward with free step. We cannot be economically or otherwise a sovereign people until we show that we can take care of ourselves, in summer or winter.—Montreal "Star."

**OUR BRITISH COLUMBIA LETTER**

**The Metal Mines**

Trail, B.C.—While the estimated value of the output of the Trail Smeltery of the Consolidated Mining & Smelting Company for 1919 is less than that of 1917 and 1918, the gross ore tonnage treated is not materially less than that of the previous year. Having in mind the great stimulation for which the war was responsible, and the high prices which prevailed during that period, the 1919 record, the third highest in the fourteen years' history of the Company's Plant, is extremely creditable.

The 1919 production is provisionally valued at \$7,942,101, zinc providing nearly one-third of the total value with lead and silver next in the order named. Details are shown in the appended table:

Output Trail Smeltery for 1919:

(Month of December partially estimated.)

Gold .....	\$ 938,449
Silver .....	1,598,489
Copper .....	951,360
Lead .....	1,890,597
Zinc .....	2,563,206

\$7,942,101

The estimated tonnage of ore and concentrates received at the Smelter for the year is 319,147, which is about the same as in 1918. On the basis of the actual figures up to December 21—omitting the last ten days of the year—the total tonnage of 312,589 is divided between raw ore and concentrates in the proportion of 302,589 tons of ore to 10,072 tons of concentrates. Up to that date 134 different properties were represented in these receipts. Properties of the Consolidated Company contributed over 230,000 tons of ore and concentrates.

Ore and concentrates of the Kootenay-Boundary District of British Columbia, not handled at the Trail Smelter, add quite substantially to the production of that section in the past year. The Granby Consolidated Mining & Smelting Company operated the Grand Forks Smelter for the first six months of the year, treating 152,821 tons of ore. All but a few tons from a couple of mines in the Republic Camp were from the Company's low grade property at Phoenix. The output of the Smelter was 1,888 tons of blister copper, which, at an average price of \$400 a ton, would work out at a valuation of \$755,200.

Nineteen Kootenay properties exported ore or concentrates for treatment in various American smelters. These exports were nearly all concentrates, although 3,143 tons of high grade ore were shipped, which at \$100 a ton would be valued at \$314,300. The concentrates amounted to 13,260 tons, which at \$250 a ton would work out at \$3,315,000. Thus the estimated total exports for the Kootenay-Boundary District would total \$649,300 in value.

Referring to ore and concentrates, the production of the district under discussion for 1919, inclusive of a few outside shippers, would be as follows:

	Mines	Ores	Concentrates
To Trail Smelter .....	134	302,589	10,072
To Granby Smelter .....	3	156,821	
To American Smelters ....	19	3,143	13,260
Totals .....	156	462,533	23,332

The Minister of Mines for the Dominion is to receive a special invitation to attend the annual meeting of the Associated Boards of Trade of Eastern British Columbia to be held next month at Trail, B.C. One of the most important questions for discussion is expected to be that of obtaining a preference in the British market for Canadian metals as well as for other Canadian raw materials and manufactures.

The Florence Silver Mining Company has resumed operation of its mine and mill, situated on Princess Creek. This property has been colsed down for between two and three weeks owing to plant trouble experienced during the severe cold of early December.

Slocan, B. C.—The Soho Silver-Lead Mine, which adjoins the Rambler-Cariboo Property in the McGuigan Basin, Slocan District, and which has been closed for the past eighteen months is being reopened under the supervision of J. C. Ryan, the manager of the Soho Mining Company. Although only from ten to twelve men will be employed during the winter it is the intention to increase the force materially in the spring and to that end it is proposed augmenting the camp accommodation. There are four veins on the property, on one of which there has been development of something like 3,000 feet, while on another a 100 foot shaft has been sunk from which there has been some drifting. Two carloads of ore were taken from the shaft in the working. It is said that there is about \$10,000 worth of ore on the dump awaiting shipment, basing the computation on present prices.

Another Slocan property recently heard from is the Ottawa, now under lease from the Consolidated Mining & Smelting Co., by A. L. McPhee and P. Maguire. They are said to have encountered a shoot of high grade ore in a raise from a lower drift, there being a vein of ore, eight inches in width, assaying approximately 1,000 ounces to the ton.

Still another Slocan property, known as the Anna Group, situated near Slocan City, is reported to have rewarded those engaged in development. Here again it is asserted that a rich vein has been struck, the ore of which assays very high in silver. The work of opening this up is proceeding.

Princeton, B.C.—Work on the railway from Allenby to the Copper Mountain Mine of the Canada Copper Company, is being prosecuted now with much vigor. A gang of about 500 men is employed and, if there is no further trouble, there is no doubt that the railway will be in shape for operation some time next summer. The working of the mine as well as the new mill at Allenby, and the placing of this large new British Columbia mining enterprise on a producing basis awaits only the completion of the railway and the power line from Bonnington Falls, near Nelson, B.C.

**Vancouver, B. C.**

Until sometime in the month of December last officials in charge of the Dominion Assay Office, Vancouver, B. C., were authorized to pay for gold offered for sale in New York Funds, providing the same were demanded. On the discontinuance of this concession by the Dominion Government representations went forward to Ottawa, the Canadian Capital, through the Vancouver Board of Trade, on be-

half of the gold producers of this Province. It was pointed out that with costs increased, the value of their product fixed, and the exchange quite substantially against Canada, the gold miners of British Columbia found themselves in a serious situation. They were tied, figuratively, hand and feet as the government embargo against the export of the metal still was effective. As a result the Canadian Government has decided to modify the condition to an extent by allowing what amounts to a bonus of 5 per cent over and above the actual value of the gold presented at the Assay Office. While this, under present conditions, will not entirely make up the loss incurred through the withdrawal of the previous arrangement of payment, on demand of New York Funds it will in a large measure meet the wishes of those most interested.

The original telegram of the Vancouver Board of Trade to Ottawa read as follows:

December 19th, 1919.

Sir Henry Drayton,  
Minister of Finance,  
Ottawa, Ontario.

We understand Vancouver mint has been instructed to discontinue payments for gold at value New York Funds. This will result in closing down the most important gold producing mines of British Columbia and thereby throw out of employment many men during this most critical period of our gold returns leave the country as blister copper without any arrangements being made for the return of the gold values. We would respectfully suggest that this order be withdrawn. Please wire immediately as situation is acute.

Ultimately the following reply was received:  
Vancouver Board of Trade:

"Referring to your message to Sir Henry Drayton the policy of paying New York Funds for gold deposits has been suspended in view of the present high rates. In lieu thereof the Minister has authorized an allowance to be made to depositors to the extent of 5 per cent. In other words the depositors will have a fixed rate of 5 per cent for the present if they desire to take advantage of it.

(Signed) T. C. BOVILLE,  
Deputy Minister of Finance.

Shareholders in the Belmont-Surf Inlet Mines recently received their third dividend in a twelve month period, the same amounting to 2½ cents per share, of the share capital of \$2,500,000 in dollar shares. This property, which is situated on Princess Royal Island, has been a steady dividend payer. The mine is worked by tunnels, shafts, stopes and winzes and ore is treated at a cost of about \$7.20 a ton, while the values realized in 1918 were a little over \$11 a ton. Owing to the increased price of silver this valuation will be considerably higher for 1919. Considerable development work also has been done during the past year and it is expected that, when official information is available, it will be shown that the ore reserves have been increased.

A syndicate of prominent Vancouver business-men has been organized, and incorporated as the Whale Channel Mines Co., to take over and develop six mineral claims situated on Princess Royal Island about three miles north of the Belmont-Surf Inlet Property. It is said that the ore bearing lead is about 12 feet in

width and that it has been traced for a distance of 3500 feet. A force of men is being sent north immediately to continue work on a tunnel which is to be driven for 1500 feet.

Statements painting the future of the mining industry in British Columbia in bright colors have been made recently by Hon. Wm. Sloan, Minister of Mines, and by others in touch with conditions. Among the concrete reasons given for this spirit of optimism are the following:

That the Granby Consolidated Mining and Smelting Company proposes the installation of a Mill to treat low grade ores, thus making a rich smelter product.

That the Granby Company also is likely to take over the Exstall Mine on the Skeena River, which it has had under development of some years.

That the Britannia Mining Co., Howe Sound, will be able to maintain its present rate of production.

That the Canada Copper Company will be ready some to commence active production at its Copper Mountain Mine.

That new mills are proposed for this year at the Sunlock Mine and the Old Sport Mine, Vancouver Island, in both of which the Consolidated Mining and Smelting Company of Canada is interested.

All these enterprises have a direct bearing on the copper production of the Province in which there was a distinct falling off in 1919. Basing their calculations on such very clear indications, and having in mind the smaller properties being developed and some producing in small quantities, it is argued that, providing the copper market hold good, 1920 should be a record year for British Columbia.

Mention also is made of the prospects of an iron and steel industry being launched. It is suggested this may be undertaken by the Canadian Collieries (D) Limited. Union Bay, Vancouver Island, where there is a fine harbour, suitable coking coal, and railway facilities is mentioned as a possible site. Here there are available, also, limestone and fire-clay, manganese ores and extensive iron-ore deposits, among the latter being those of Texada and Redonda Islands. In addition the Company has at Puntledge an hydro-electric plant which could be utilized in connection with the projected industry.

#### Victoria, B. C.

Intimation has been received by Hon. John Oliver, Premier of British Columbia, that the Dolly Varden Mines Company has taken the necessary steps to test the validity of legislation passed by the British Columbia Legislature relative to their holdings in this Province. No definite word has been given as to what course is to be pursued but it is likely to take the form of an appeal to the Minister of Justice, Ottawa, for the disallowance of the Provincial Statute complained of.

Possibly it will be recalled that at the last Session of the Provincial Legislature, that of 1918-19, a special Committee of the House was appointed to investigate a dispute between the Dolly Varden Mines Company and the Taylor Engineering Company, of Vancouver, B. C., the latter Company having been engaged in the construction of a railway from tidewater. Alice Arm, to the Dolly Varden Company's mineral properties. Much the greater part of the railway was complete, but a few miles of steel had yet to be laid and it was the fact that it was essential that the Provincial Charter granted for the building of the railway should be renewed that was primarily re-

sponsible for bringing the matter to the attention of the Legislature. This charter limited the period for the completion of construction and that period had lapsed. Having come before the House the differences between the mining company and the railway construction company became known and were ventilated. It was charged by the last named that the mining company was in debt for the greater part of the cost of the railroad and this allegation was proved, as is apparent from the subsequent legislation, to the satisfaction of the Special Committee of the House.

Then came the legislation which, evidently, it is proposed to have vetoed. It provided, briefly, that the Dolly Varden Mining Company should have a certain stated period in which to meet its indebtedness. Bluntly, it was "put up" to the company to meet what, it was considered, were its just obligations. If it failed, its properties were to be forfeited, and someone else was to have the opportunity to develop and operate them. The company did not respond. Accordingly, and in strict compliance with the terms of the Statutes, the mine, plant, and the almost completed railway fell into the hands of the Taylor Engineering Company. With further financial backing the principals of this company, and some other associates, acting as the Taylor Mining Company, took up the task of the development and the placing on a shipping basis of the Dolly Varden Mine.

These efforts, so far, have met with conspicuous success. The railway was finished to a point just below the mine by September 1st of last year. Within that period, also—work having started about the middle of June—a 2,000 foot, 2-bucket aerial-tramway, with upper and lower terminal-bunkers was ready for operation. Although little development work was done, a careful geological examination of the property is being made this winter on which will be based next year's programme. Between the 1st of September and December 15th the mine delivered to the Granby Company's Anyox Smelter approximately 7,000 tons of ore averaging 56 ounces of silver to the ton, as well as a small quantity of high-grade sacked ore averaging about 1,000 ounces.

W. E. Somerville, a prospector and mine operator of the Portland Canal District, and associates are reported to have bought the Homestake Group of five claims situated in the Alice Arm section. It is said that the lead has been traced for 3,000 feet by tunnels and open-cut and a good deal of diamond drilling has been done.

#### Grand Forks, B. C.

Since the closing down of the Phoenix Mines of the Granby Consolidated Mining & Smelting Co., with the result that the formerly bustling little town of Phoenix now is deserted, there have been reports from time to time that the company has plans which, in their development, will rehabilitate Phoenix to some extent as well as bringing a larger measure of prosperity to the contiguous section. The assertion now made is that the company proposes the installation of a concentration mill at or near Phoenix for the handling of the low grade ores of the mines. The volume of water necessary is said to be available. Such action, it is pointed out, might lead to the resumption of smelting at the Grand Forks Smelter. In this connection, however, it

is to be borne in mind that there is no assurance that the concentrates would not be shipped to the smelting plant at Anyox. The mines at Phoenix are said to contain a large quantity of low grade ore.

#### Prince Rupert, B. C.

For the benefit of the many smaller mines situated near the northern Coast and in the northern Interior of British Columbia a sampling plant may be established at Prince Rupert according to report from the latter City. It is said that the enterprise has sufficient financial backing to meet the required initial outlay and to enable advances to be made on small shipments of ore. Mining men consider that the enterprise can be made to pay its way and assert that it will materially assist in the development of the mineral areas of the North, there being not a few instances where operators are retarded in the development of their properties because they cannot ship in large enough quantities to make shipment to the existing smelters worth while.

#### Stewart, B. C.

The universal labour unrest appears to have spread to the Salmon River Mining District, B. C., from where it is reported that the men employed at the Premier Mine have gone on strike. The quality of the food is said to be the complaint.

#### Cowichan, B. C.

Having shipped 500 tons of Manganese Ore with satisfactory results the B. C. Manganese Company, whose property is situated on the E. and N. Ry. in the Cowichan District, Vancouver Island, is making arrangements for the installation of an aerial tramway. With better transportation facilities it is figured that it will be possible to increase the output of the Mine. The tram is expected to be in shape within two months. Meanwhile no shipments are being made because the road is in no condition for use.

In a letter to the owners Guy S. Rowe, second vice-president of the Bilrowe Alloys Co., Tacoma, Wn., expresses himself as pleased with the quality of the Vancouver Island Manganese Ore. He says that this ore analysed not lower than 48 per cent metallic manganese, with some cars going over 50 per cent metallic manganese, and that it contained no deleterious elements in sufficient quantity to interfere with the manufacture of standard 80 per cent Ferro-Manganese.

Mr. Rowe continues:

"We hope that you will be in a position soon to enter into a contract to supply us with approximately three cars of ore, or about 120 tons, a week.

"It is possible that we may start another furnace and need an additional 50 tons a week. In the event of our doing this we would be glad to contract with you for approximately 150 tons a week.

"Having visited your property we feel assured that you have thousands of tons of this excellent ore in sight, with large amounts yet uncovered, and we trust you will lose no time in installing your aerial tramway, as we are very anxious to use your manganese ore again in our operations."

#### Nelson, B. C.

James McGregor, for the past 22 years mining inspector for West Kootenay, Boundary and Yale Districts, who has made his headquarters in Nelson for

20 years, has been transferred to another of the Provincial Districts with headquarters at Vancouver, B. C. It is expected that he will assume the inspectorate in the Nicola District.

A British Columbia Prospectors' Protective Association has been organized with a membership of eighty-five and with headquarters at Nelson, B.C. The officers are: J. W. Mulholland, president; C. E. Crossley, vice-president; Fred A. Starkey, secretary; and Dr. F. E. Morrison, treasurer. The objects of the organization as outlined are: To deal with the matter of grants from the Government for roads and trails to mining properties; to continue to a successful issue the agitation for a government ore testing plant in the Kootenay District; to advocate the re-opening of dormant crown-granted mineral claims; to secure free sets of surface samples for purpose of study by prospectors; and to take the necessary action to have prospects examined by the district engineer, or by an engineer representing the association, the engineer's report to be filled with the secretary of the Association and the property to be listed. Not one prospector in a hundred, it was stated, had an engineer's report on his holding and such reports were essential, as investors were not in the habit of buying by word of mouth.

Having accepted an offer of the Henry L. Doherty Company, of New York, to undertake some important reconnaissance work in Southern Mexico, John D. Galloway, for six years prominently connected with the Provincial Department of Mines, during the last three of which he has performed the duties of Resident Engineer of Mineral Survey District No. 2 (Northeastern British Columbia) with headquarters at Hazelton, has placed his resignation in the hands of Hon. Wm. Sloan, Minister of Mines.

While Mr. Sloan very much regrets losing the valued services of Mr. Galloway, it is gratifying to him that a firm of high standing should seek one of the officials of his department to carry on important geological and explorative work in foreign fields it is proposed bringing under development. Mr. Galloway, it is pointed out, will have an opportunity to obtain a broader experience. His selection is taken as a flattering commentary on the reputation of the technical staff of the Department of Mines for efficiency, and Mr. Galloway is being extended the best wishes of his confreres together with the assurance of a warm welcome should he ever decide to return to British Columbia. Mr. Galloway is an honor graduate of McGill University in Mining Engineering. In 1911 he obtained the degree of B.Sc. and in the following year that of M.Sc.

### THE COLLIERIES.

While it is conceded that the success of Senator Robertson, Minister of Labor, and W. H. Armstrong, director of coal operations in District 18, U.M.W.A., (Eastern British Columbia and the Province of Alberta) in effecting an agreement with the coal miners, under the direction of the United Mine Workers of America, is a serious blow to the aspirations of leaders of the One Big Union Movement there is a firmly rooted belief that the last has not been heard.

Unquestionably the ground has been cut from under the feet of the O.B.U. in that the miners have agreed to the increase amounting to 14 per cent over wages

previously received and to the principle of the "check off"; or, in other words, that the dues of the miners are to be deducted by the operators themselves and remitted to the headquarters of the U.M.W. of A. and not passed over to the various local unions. S. Ballantyne, representative of the United Mine Workers, has charged that these funds for some time have been used for O.B.U. purposes.

Nominally the actual position facing the miners is this: They will have either to own allegiance to the U.M.W. of A. or cease work. There is little probability of a strike, however, as the O.B.U. is said to be practically without funds. Another point recognized is that a strike at the present time could not have public endorsement. In the Crow's Nest Pass District the situation has been complicated by the recent declaration of the local union in favor of the O.B.U. Still it is thought that nothing will be done for some time at any rate. From the standpoint of the miners the position appears to be summed up in an observation attributed to Henry Beard, the president of the dual organization in District No. 18, that "we shall wait and see."

In view of the increase of 14 per cent granted the miners the dealers have been authorized to increase the price of coal to the public. In the case of Drumheller coal the increase will be 40 cents a ton. The product of the Lethbridge field will advance 52 cents a ton while bituminous or steam coal will be increased 34 cents a ton.

A reconstruction of the Canadian Collieries (Dunsmuir) Ltd., which company has large holdings and operates on a considerable scale in the coal fields of Vancouver Island, has been announced from London England, where a large proportion of the company's stock is held.

In discussing the present situation, as well as the new proposals, the London Times in a recent issue says:—"It will be recollected that as part of the arrangement made in 1915 a Bondholders' Committee was appointed, and the control of the Company was placed in their hands through deposit of a majority of the shares in a voting trust in their favour. During the war the company's earnings have not sufficed to provide any interest on the bonds. During the first part of the war the company was actually working at a loss, owing to the falling off in the bunker trade on the Pacific Coast. In the latter part of the war the bunker trade revived and the company was able to make a better showing, but the scarcity of labour and its abnormally high cost both reduced the Company's output and continued to keep the margin of profit down to a low figure, while the depreciation of the plant and the upkeep of the mines absorbed considerable sums, leaving no surplus available for interest on the bonds. Although results have been better recently, the outlook for the company must remain uncertain for some time to come. While the Company has very large coal areas available for exploitation, the cost of obtaining the coal is very high, and the market for it is fluctuating both as to demand and price."

The same article then proceeds to give details of the contemplated re-organization, an interesting portion of which reads as follows:—"A new Debenture Stockholders' Committee is to be constituted which will have power to authorize the Company to issue prior lien securities ranking in front of the 'A' and 'B'

Debenture stocks to an amount not exceeding 1,500,000 dollars carrying interest at not exceeding 10 per cent, and will also have other wide powers and discretions, including power to consent to the whole or any part of the company's net earnings up to June 30, 1924, being applied or reserved to meet capital expenditure, and at any time to approve of development and exploration work being charged to revenue, etc."

With the completion of this plan of reconstruction it is believed in British Columbia that the Company will be in a better position to undertake the development of its holdings on the Island and the adoption of a progressive policy, which, it has been suggested, may include the launching on a small scale at least of an iron and steel industry.

Note:—With reference to the figures which appeared in the general review of British Columbia mineral production (see page 13, issue 7th January 1920) your correspondent would point out that the figures therein given are based on what was known regarding production up to the end of October. Since then information is to hand indicating that, contrary to earlier expectations, British Columbia's 1919 output of silver will be slightly in excess of that of 1918. This is accounted by the fact that the returns from the Sullivan Mine, operated by the Consolidated Mining and Smelting Company of Canada, for the latter part of the year were over what was looked for and also by reason of the accumulated production of small shippers of the Slocan District, to which insufficient attention was paid in the compilation of estimates. Gold and Lead production also will be somewhat above what was estimated although not equalling the mark established in 1918. As to Gold the explanation is almost entirely the speeding up of the output of the Rossland Mines, also operated by the Consolidated Mining and Smelting Company of Canada, during the months of November and December. The difference in regard to Lead is due to the increased activity at the Sullivan Mine and to the small shippers of the Slocan. Outside of these improvements the estimates stand and it may be predicted that the monetary value of British Columbia's mineral production for the past year will be approximately \$8,000,000 less than that of 1918 or about \$33,000,000. The decline is accounted for, almost to the full extent, by the falling off in production and the fluctuations in price of copper.

Mr. J. K. L. Ross, who recently resigned from the Board of the Dominion Steel Corporation, has been elected a director of the Consolidated Mining and Smelting Company.

Mr. Lorne Webster of Quebec has been appointed a member of the Senate. Mr. Webster, among many other activities and directorates, is a director of the Nova Scotia Steel & Coal Company, and was for many years the Quebec representative of that Company. He has taken a very active interest in the raising of war funds, and in charitable organizations. Mr. Webster's business acumen, and his wide knowledge of the coal and transportation problems of Canada, should enable him to take a leading part in the counsels and policies of the Senate.

Mr. D. H. McDougall was in Montreal recently for the first time since returning from England, and visited headquarters of the Canadian Mining Institute.

## PUBLICATIONS RECEIVED

Investigations in the Gas and Oil Fields of Alberta, Saskatchewan and Manitoba. By D. B. Dowling, S. E. Slipper and F. H. McLearn. Memoir 116. Geological Survey. Publication Serial No. 1722.

This Report is composed of three separate ones, namely, Part 1, "The Structure & Correlation of the formations underlying Alberta, Saskatchewan and Manitoba, by D. B. Dowling; Part 2, "Sketch of the Geology of Southern and Central Alberta, by S. E. Slipper, and Part 3, "The Cretaceous of Peace and Athabaska Valleys, by F. H. McLearn. An appendix gives a record of selected wells, arranged in East-West order, compiled by Dr. Dowling. The Reports are accompanied by relief and contour maps, and a series of colored sections of strata revealed by well records.

With reference to the foot-hill district, Dr. Dowling remarks:

"The oil boom of 1914 will long be remembered on account of the indiscriminate locating of oil leases without reference to the structure of the underlying rocks, and the consequent very large useless expenditure in drilling. The general absence of favorable structure areas in the disturbed belt of the foothills has directed attention to the plains, where the formations are only gently folded, and a little oil has been obtained in the Peace and Athabaska Valleys, and the presence of gas proved at various places. A more extended study of the general structure than has yet been made is necessary before the extent of the new fields can be predicted."

Summary Report, Geological Survey, Part A. This gives a general summary by the Directing Geologist of the work of the season of 1918, details of which have already been published in the parts "B" to "G" issued at intervals.

Mr. McInnes's introduction summarises in brief the chief points of interest in the investigations of the Survey, and is as follows:

"During the season of 1918 the work of the Geological Survey was devoted more than ever to the investigation of areas and deposits that promised to be of economic importance. The number of field parties was fewer than in the period before the war, but investigations were carried on in all parts of Canada. In Yukon, particular attention was given to lode deposits upon which the establishment, there, of a permanent mining industry must depend. In British Columbia, the field parties were placed in areas where geological work seemed to be most greatly needed to help in their commercial development; and particular attention was given to the investigation of the platinum situation and to the prospects of securing a greater supply of that mineral which was then so urgently needed for the purposes of the war. Further work was done in the coal areas of western Alberta; and in the Great Plains area and to the north of it further progress was made in working out the structure of the rocks and its bearing upon the occurrence of oil and gas.

The examination of areas in northern Manitoba in which important copper sulphide deposits and gold-bearing veins occur, was continued and the extent of the areas more closely defined.

The geology of several areas in northern Ontario was studied: the pyrite deposits were specially investigated; and further work was done on the central Ontario oil fields.

Important mineral areas were mapped geologically in Quebec and in the Maritime Provinces; and at Malagash, in Nova Scotia, a deposit of salt and associated minerals was examined. The deposit is of interest both because it is the first bed of salt to be discovered in eastern Canada and because of its promising nature from an economic standpoint."

**Gabbros of East Sooke and Rocky Point.** By H. C. Cooke. Museum Bulletin No. 30. Geological Survey. Publication No. Dept. of Mines 1762.

This is a petrological study of two plutonic masses of general gabbroid composition which occur on the southwestern coast of Vancouver Island, bordering the Strait of Juan de Fuca, and about 15 miles southwest of Victoria.

The author has formulated a theory of the processes through which the gabbros have passed, postulating an original homogeneous magma, which was differentiated into four differing rock types, these being later subjected to regional disturbances before complete solidification had taken place, followed by the effects of a new intrusion accompanied by faulting and jointing, through which hot solutions were circulated that caused further alterations in the rocks with which they came into contact. At a later date, further faulting took place, and into the fissures thus formed there ascended solutions which deposited the chalcopyritic ores that give economic value to this district of Vancouver Island.

**Report of the Commission of Conservation for 1919.** Tenth Annual Volume.

The latest annual report of the Commission of Conservation covers a striking variety of subjects, indicating that the Commission considers its scope is not limited to conservation of material resources alone, but includes such matters as town planning, venereal disease, prophylaxis and the general public health. This viewpoint cannot be quarrelled with, although it is a curious commentary on civilization that we spend much time and thought on preserving human life, and then are apparently unable to agree regarding a League of Nations, which, as Mr. Balfour says, if not perfect, has no substitute as a preventative of future wars.

Under the heading "Mines" we note the following paragraph

"In July, last, Mr. W. J. Dick, our Mining Engineer, resigned, to accept a more lucrative position in Winnipeg. Pending the appointment of a successor to Mr. Dick, your Assistant to Chairman has had to carry on this branch of work as best he could. In addition it is quite evident that we cannot get a competent mining engineer for the salary we were paying Mr. Dick."

We believe that Mr. Dick's new position is connected with the sale of coal, and it is evident that when the sale of coal commands a more attractive salary than the work connected with its conservation, the outlook is rather hopeless from the point of view of the public domain.

The Commission of Conservation is doing good work, if only in ventilating the records of waste of material resources in Canada, but in many respects its preaching is like to the voice of a pelican crying in the wilderness.

Another proof of the activity of the Commission is

a volume reporting the proceedings of a National Conference on Game and Wild Life Conservation.

Our readers will recollect a recent notice in the Journal of a bird sanctuary made possible by the Dorr Co. at Westport, Conn., and one of the most interesting parts of this recent volume is the description of a bird sanctuary created by Jack Miner of Kingsville, Ontario, who is doing his best to preserve the Canada goose, and to trace its migration by means of name plates.

We would suggest that Isle Perrot, which is situated within view of the "Journal's" office at Ste. Anne de Bellevue, at the junction of the Ottawa and the St. Lawrence, might well be made a bird sanctuary.

#### The Why of Westport.

This little book is a charmingly designed description of the Dorr Company's metallurgical laboratories at Westport Mill, Conn. The equipment of these laboratories consists of a library of scientific and technical literature, a fully equipped analytical laboratory, a large scale testing plant, with crushing and grinding apparatus, ball mill and Dorr classifier in closed circuit, concentrating tables and flotation equipment, a complete counter-current decantation unit consisting of Dorr agitators, Dorco pumps and thickeners, and two types of vacuum filters, hydro-separators and percolating tanks. Sleeping accommodation is provided for transient visitors, and, as has been previously mentioned in the "Journal," the surroundings of the Westport Mill are rural and designed to provide ideal working conditions for the staff.

We do not remember to have seen a more tastefully designed brochure, nor one of more consistent typographical excellence.

**MINERAL DEPOSITS OF SOUTH AMERICA:** By Benjamin L. Miller, Professor of Geology, Lehigh University, and Joseph Singewald, Assoc. Prof. of Economic Geology, John Hopkins University. First Edition. Cloth. 6¼ by 9¼ inches. 598 pages with Index and Bibliographies. McGraw Hill Book Co., New York and London.

This work fulfils the intention of its author: "to fill a genuine want in the literature of economic geology" and is the outcome of an extended trip made by the authors in 1915. The idea of publishing the observations made on this journey in book form is well justified by the volume now presented, for not only have the authors assembled in handy form a great deal of information regarding an immensely wealthy but little known half-continent, but they have added to each chapter that deals with the individual countries, a detailed bibliography that adds greatly to the value of the work.

The volume is too well digested and contains too large a mass of information to permit of covering the ground in a short review, but iron and steel men will be much interested in the description of the large deposits of iron-ore and manganese which occur in Brazil, chiefly in the State of Minas Geraes, and are concentrated around the peak of Itabira. The authors quote Harder's estimate that the Central Mines Geraes region, roughly 100 miles square, contains in the thirty known deposits 410,000,000 long tons of Bessemer ores with over 69 per cent iron and less than

# A MARSH HOIST

## IS MADE THE RIGHT SIZE FOR YOUR MINE

and in either Steam Power or Electric Power

This shows one of our Electric Mine Hoists. We make many other types. Send for our catalogue of Mine Hoists, Cars, Cages, Buckets, etc., and see what we offer you. It will repay you.

From the little 10 Horse Power size for prospectors or small mines to the massive 50 Horse Power size, one of our 7 sizes should be just right for your mine.

We are specialists in the building of Hoisting Machinery of all sorts. For nearly a quarter of a century we have been designing and building Hoists, and have developed a Hoist that we are really proud of—proud because of the record of good work they have done, and are doing in mines, quarries, and other classes of work from one end of Canada to the other.

0.02 phosphorous, and almost three billion long tons of non-Bessemer ores with over 50 per cent iron and 0.05 to 0.3 phosphorous. The authors state that without doubt Brazil contains "the most extensive undeveloped deposits of iron ore of any country in the world".

With reference to manganese, it is stated that during the first years of the European war the steel industry of North America was almost entirely dependent upon Brazilian manganese ores, and it is probable that even after the close of the war North America will continue to look to Brazil for a considerable part of its manganese ores. The authors say: "It is questionable whether any country in the world possesses greater deposits of manganese ore than does Brazil, so that we confidentially predict that the Brazilian manganese industry is bound to increase steadily in importance. No other country, certainly, with the exception of Russia and perhaps India, at the present time, seems to offer more promise in the way of exploration for workable manganese ore bodies."

The mention of Brazilian iron ores is of particular interest to Canadians, as at one time, if not now, one of the large steel companies in Canada held some extensive options on deposits near Itabira.

An interesting reference is made to the Minasragra Vanadium Mine near the Hauraucaca Smelter in Peru, now owned by the American Vanadium Company, which since its discovery is said to have furnished 80 per cent of the world's demand for vanadium.

The Moro Velho Mine of the St. John del Rey Mining Company, at Villa Nova de Lima in the State of Minas Geraes, Brazil, is described as the most interesting mine in South America, and in some respects the most remarkable in the world. The mine, which operates for gold, which has been operated by an English Company since 1834 without serious interruption.

The mine claims the world's record for depth, workings being on August 24th 1917 at a depth of 6,126 ft. below the surface. It is stated that it can probably be worked—if the ore retains its value—to horizon 26, which would give a vertical depth of 7,626 feet, and even to a much greater depth.

The authors remark that the persistence of the ore-body and the absence of any material change in the tenor of the ores with depth are of especial interest "as both are in disagreement with ideas commonly held by mining men."

It is interesting to note, in connection with the depth of the mine, that the surface has an elevation of 2,774 feet above sea-level.

South America appears to be extremely rich in metals, but the coal deposits are unimportant, except in Chili where there is an interesting extension of the coal seams under the ocean near Conception Bay, where mining has been carried on since 1840.

It may well be that Drs. Singewald's and Miller's work will see future editions as the knowledge of South American mineral deposits is added to.

---

IRON DEPOSITING BACTERIA AND THEIR GEOLOGIC RELATIONS; by Edmund Cecil Harder. Professional Paper No. 113, U. S. Geological Survey. 1919.

While this professional paper is extremely technical it is not without interest even to those who do not

possess the wide knowledge of chemistry and bacteriology that is necessary to its full understanding. In the preface, by F. L. Ransome, it is stated that since 1836, it has been known that certain bacteria have the power of withdrawing iron from solution, and causing its precipitation as ferric hydroxide. "The precipitation of iron sulphide by bacterial processes has also been known for some time. The geologic application of these discoveries, though predicted by some to be far-reaching, have been rather slowly made, and it is safe to say that many geologists have paid little attention to the possible extent of bacterial action in the deposition of iron ores."

Dr. Reinhardt Theissen recently, in a paper before the A. I. M. & M. E., referred to the part possibly played by the so-called "sulphur bacteria" in the formation of the sulphur that is present in coal (see *Iron & Steel*, November issue, page 283) and it is stated also by Mr. Ransome that the part played by bacteria in the deposition of limestones has been specially investigated and found to be important.

While the actual utility to the bacterial organism of the iron particles that it concentrates is not ascertained, it appears quite certain that large bodies of iron-ore have been formed entirely through the activity of bacterial deposition. Mr. Harder's conclusions are that in general it was found that iron-precipitating organisms were present wherever iron-bearing waters occur, both underground in wells and mines, and in surface waters. It was found that the ochreous scums which occur in such localities consisted mainly and in many places entirely of iron-precipitating organisms, of their remains. It was also found "that solutions of certain iron compounds when inoculated with almost any type of natural water or of soil, showed a precipitation of ferric hydroxide by certain types of lower bacteria, thus indicating the almost universal presence in nature of organisms capable of precipitating iron from solution."

We recollect, as a boy in the mine, seeing in a quiet air-course, a small lake of blood-red, almost cardinal coloured "ochre", which was made more conspicuous because it occurred in the midst of long needles of a saline efflorescence upon the white shale side of the air-course. The consistency and appearance of this cardinal lake corresponds exactly with the results of the work of the bacteria described by Mr. Harder.

Among the iron-ore deposits classified as being originally laid down mainly as ferric hydroxide are included the Wabana ores in Newfoundland, and our readers will recollect a paper which was delivered by Dr. A. O. Hayes of the Canadian Geological Survey, and summarised in "*Iron & Steel*" of August last (see page 176) wherein slight reference was made to the probably bacterial origin of these vast deposits.

---

The Mine & Smelter Supply Co. announces that Mr. W. A. Leddell has been appointed Manager of their Engineering Dept., with headquarters in Denver, Colo.

Mr. Leddell is a graduate of the Stevens Institute of Technology, and has had a thorough training in the design of machinery, the preparation of plans for metallurgical plants, erection of complete mills, smelters, concentrating plants, etc.

Problems relating to Macey Mills, Wilfley Tables and other MASSCO specialties and the preparation of flow sheets and specifications will come under the supervision of Mr. Leddell's department.

## Where Canadian Crocker-Wheeler apparatus is made

The modern design and excellent construction of Canadian Crocker-Wheeler apparatus is well known and has been still further improved in recent development work. The following apparatus is now all made by the Canadian Crocker-Wheeler Company at their St. Catharines plant.

## Oxy-Acetylene Welding and Cutting

### This One Repair Saved the Cost of a Welding Outfit

In thousands of Machine Shops, Mines, Railroad Shops and Factories, both in Canada and the United States, the adoption of the Prest-O-Lite Process of Oxy-Acetylene Welding has made possible many important improvements and economies in manufacturing and repair work.

Leading manufacturers are increasing their output and making stronger, neater products at less cost.

On repair work alone, one Prest-O-Lite welding operation frequently pays for the outfit by avoiding a replacement or preventing a tie-up.

## *Prest-O-Lite* PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

### B. C. COAL MAY EXTEND ITS MARKET

The announcement that the Canadian Manufacturers' Association is to investigate the possibility of developing sufficient coal in Canada to meet the requirements of Canadian industry has given rise to the suggestion that the time may not be far distant when the coal of Western Canada will find its way via the Panama Canal to the St. Lawrence River.

On a previous occasion when the subject was broached the statement was made in the East that British Columbia was too far away to be considered as a source of supply for manufacturing purposes in Ontario and Quebec. But with the changing conditions and the fact facing them that the United States may develop other markets for export besides Canada the whole question probably will be reconsidered and the possibility of this Province coming to the aid of eastern manufacturing concerns will be thoroughly investigated.

Arthur V. White, consulting engineer for the Commission of Conservation, in discussing this matter recently, said that the war had brought out the fact that nations which did not possess within their own borders coal and other fuel supplies from which to derive light heat and power have found themselves in desperate straits. Formerly Great Britain was a heavy exporter of coal especially to those European countries which either had no coal of their own or were only partly able to supply their requirements. But Britain is unable now to supply this demand. European countries which require coal have not only been exercising extreme efforts to produce fuel from all possible sources of their own but have been looking outside to ascertain what are the maximum deliveries that may be secured from those countries fortunate enough to have coal for export. The United States, it was said, is stepping to the forefront as an exporter and Great Britain, among other countries, is looking to the United States for assistance in this respect.

"It is manifest, therefore" Mr. White said "that Canada no longer occupies a favored position as being the easiest market for United States coal operators. It may be the easiest market insofar as transportation is concerned but there is the question of price. European countries have demonstrated the fact that they are practically ready to pay any price demanded because it is so evident to those in charge of affairs in these countries that they cannot go on, either economically or in many instances even maintain physical existence unless additional fuel is available.

# EDITORIAL

## Misplaced Parsimony

Further bearing on the opinions expressed under the above caption in the last "Journal" we reproduce a Canadian Press dispatch which has appeared in the newspapers, making excerpts from a Statement by the Civil Service Commission which takes exception to the widespread condemnation by Canadian newspapers and the technical press of the circumstances which have compelled a number of the members of the Geological Survey to resign their positions in order to take up more remunerative employment offered to them by wealthy oil corporations. We do not believe the explanation of the Commission requires much comment. It is self-revealing enough. The crux of the statement is in the following sentence, which we excerpt:

"This powerful and tremendously wealthy corporation (The British Petroleum Company) approaches 'an officer on the staff of the Geological Survey who 'has been receiving \$2,600, but who under the classification will at once increase to \$3,300, and offers 'him \$6,200 to start with. The Government cannot 'compete with such an offer, and the country would 'not sanction it."

What justification was there at any time, let alone the unusual times through which we are passing, for paying a competent geologist \$2,600 a year? What ground is there for considering \$3,300 to be an adequate annual salary for a competent professional man to-day?

The Commission asks that equally wide publicity should be given to the actual conditions under which the defections from the Geological Survey are taking place as has been given to the defections and their ne-

cessary consequence. It may be surmised that the daily and technical press will gladly give the requested publicity, for the facts disclosed by the Commission's statement of explanation and defence emphasize the point we have previously endeavoured to make clear, namely, that there is a fundamental and absolute misconception in the official mind, and in the mind of our provincial and federal legislatures, of the status of the scientific man, and the remuneration that he should receive.

The Commission states that two of the members of the Survey who are going away admit that the revised scale of salaries "is as liberal as the Government is justified in offering." Judging by the salaries for which Government geologists have worked in the past, we hardly think they can be admitted as competent judges of what is the extent of the remuneration the Government is justified in offering. The Ottawa Journal more-accurately sums up the relative issues at stake when it remarks:

"The loss within a few weeks of one-third of its staff is the worst blow ever received by the Geological Survey—the most powerful single instrument "in the past development of the natural resources of "Canada. Coming at the present crisis in the progress "of that nation this is nothing short of a calamity."

It is assumed—and it is nothing but an assumption—that the people of Canada will not sanction adequate remuneration of the Geological Survey and other departments of the Civil Service detailed to deal with scientific matters, but why should the people of Canada play second fiddle to a private corporation?

## The Permanency of High Prices of Commodities

Has the peak of commodity prices been reached? The reasons for such a belief, when examined, are found to consist largely of faith in things not seen, and they are insubstantial, conjectural, and above all the expression of a very natural hope.

Conversely, what are the reasons to expect a continuance of the decreased purchasing value of money, or possibly a further decrease in that value? These reasons, if looked into in detail, will be discovered to be substantial and matters of fact, and not admitting hopefulness for decreased prices.

Overshadowing all other questions affecting production is the loss in world population occasioned by war, famine and pestilence, three miseries that even to-day affect a large part of Europe and Asia. Added to these things is the political instability of Central Europe, and the whole Mohametan and Mongolian world. The outcome of this unrest none can foresee, but it is an unmistakable and certain deterrent to production. The world is not at peace.

There is a definite shortage in the basic raw materials of civilization. The wheat production in Can-

ada, Australia, the United States and Argentina, both that now being harvested and that which will be harvested and that which will be harvested next Summer, promises very poorly. There is no visible reason why either the supply or the price of wheat should favour the consumer in the near future.

The same outlook applied to the production and cost of coal. With the notable exception of the United States, and possibly Japan, there is every reason to look for lessened production of coal and increased cost of mining and transportation.

In the matter of transportation, it has recently been pointed out in the United States that when the railways are returned to their owners in that country an increase in rates will be required that will cost each family in the United States, no less than \$215. The likelihood of an increase in the rates of the Canadian National Railways has been announced by the Chairman of the Board, and, whether he had announced it or not, an increase in miners' wages and the increase in railwaymen's wages provide a self-evident and compelling reason to expect an increase in transportation rates. Some decrease in ocean-freights may take place as new vessels are completed, but this is a slow process, and, in any case, the cost of commodities in Canada is but slightly affected by ocean freights, except in the case of some luxuries and such articles as tea and sugar.

The general adoption of the shorter working day will inevitably decrease production, and no increased efficiency during the actual working hours can possibly make up for the shorter use of machinery during each twenty-four hours which accompanies the shorter working day of the machine attendants. By increased efficiency during working hours, by greater use of machinery, and by cutting out unnecessary or duplicate motions, possibly production may be helped, but the natural outcome of the shorter day is the adoption of multiple shifts, something to which labour is oppos-

ed, and a system moreover that is only possible where a complete sufficiency of workmen and housing accommodation exists. Neither of these requirements are found in North America to-day.

Increased wages mean very little in these days of considerable uncertainty as to what monetary value really consists of, but decreased working hours, smaller production, and actual shortage of basic raw materials, do mean a great deal, and, apart from all questions of currency inflation, functioning of themselves, they mean increased costs of commodities.

Summarizing the foregoing, the influences which tend to decrease production, and to cause scarcity of essential raw materials are, amongst others, chiefly the following—improvement of the world by actual material destruction during the war, and in the wars now in progress; loss of life by war, famine and pestilence, in the past four years and at the present time; shortage of the products of the field, the forest and the mine, cumulative over the war period, and still continuing; restriction of production by shorter working hours; lessening of efficiency by apparently high wages and easily gained wealth; diminishing stores of natural resources, particularly coal and timber; and above all, and entering into all, the lassitude and disillusionment that has followed upon a peace that is not peace, and the non-fulfilment of promises given under the urgency of national peril. promises that are impossible of fulfilment.

The resultant of all these forces, it seems to us, will be to further increase the apparent price of all commodities, and it may well be that we have entered upon a permanently higher level of prices, irrespective altogether of considerations of currency, and arising from a general desire to work less, to eat more, and to engage more frequently in life's little diversions.

As to reasons why commodity prices should decline there do not appear to be any.

## En Passant

AN interesting statement was recently made in London by Dr. H. Forbes Leslie, managing director of English Oilfields, Ltd., at the annual meeting. "In several of our borings," said he, "at a considerable depth from surface we have encountered a mineral formation quite unknown in England. It is impossible at present to estimate what commercial value, if any, this discovery may represent, but, so far, we have been able to determine the presence of several valuable metals and mineral substances. One thing appears certain, however, that below the Mesozoic formations in East Anglia there probably exist great thicknesses of metamorphic rocks, in character and mineral wealth resembling those outcropping on the west of these Islands in Wales and elsewhere, but, by

the appearance of the sediments which have been derived from them, they would appear to be far richer in minerals and metals than their Welsh counterparts, and to more nearly approximate to the South African metamorphic series." The analogy strikes us as rather strained, but the discovery of a hitherto unsuspected formation, with mineral-bearing possibilities, in so long-settled a country as East Anglia, would indicate how little can really be known of the vast and but meagrely prospected stretches of Canada, and is another proof of the folly of allowing Canada to lose the services of the men who are able to piece together with some coherence the fragmentary knowledge that is as yet possessed of the geological history and structure of this Dominion.

NO more romantic tale was ever told in mining annals than that entitled "Imprisoned Underground" reproduced in this issue from "Mining and Scientific Press," and best of all, the tale has a happy ending. The combination of the diamond drill, the geophone and the electric-light to rescue men entombed for fourteen days is literally a fairy tale of science.

OF much interest to Canada is the announcement that the experiments which have for some years been carried on at Duluth, Minn., by Heyden Stone & Co., for the commercialization of the lean magnetites of the Eastern Mesaba Range, have proved conclusively the commercial practicability of the enterprise. A new plant is expected to be completed towards the end of 1920 which will have a treating capacity of up to 4,000 tons daily. The product, which is understood to be a magnetically concentrated one, following sintering, will contain upwards of 60 per cent iron, low in phosphorous and with practically no moisture. Mr. Chase Osborn has described the great bodies of lean iron ore that exist on the North Shore of Lake Superior, and these will, if the Duluth enterprise proves successful, assume new and greater importance. It is also interesting to note, from our Port Arthur's correspondent's letters, that drilling in Northern Ontario has proved the presence of iron ores of considerable iron content at depth, where only lean ores were present in the surface exposures.

OUR readers will note a letter in this issue subscribed collectively by Sheffield manufacturers of molybdenum steels, which has reference to Dr. Arnold's new formula, reported to be a substitution of molybdenum for tungsten in high-speed steels, combined with vanadium as a stabiliser. The steel manufacturers who are licensees of "Como" steel believe that they have demonstrated the superior stabilizing value of cobalt mineral, a fact that should be of significant interest in Canada. We have both molybdenum, cobalt and tungsten, and, indeed, Canada appears to possess all the necessary factors to enable this country to take high rank as a producer of alloy steels.

THE confident forecasts which are so liberally distributed through our daily press, ostensibly originating in Holland, as to what Holland will do with regard to the Allied demand for the person of the ex-King of Prussia and the former German Emperor, evidence that the machine of German propaganda is working with undiminished efficiency. Some Canadian newspapers can even beat the Dutch at knowing the Dutchman's mind and intentions.

WHY should it be assumed that the Allies wish to put the ex-Kaiser on trial out of a spirit of revenge? What the British people want; what they

elected Lloyd George as Premier to do, is to find out who, or what, started the war. If this is uncovered, so that all the world can see it, then perchance, we can prevent a second, and an infinitely more horrible war.

#### OBITUARY.

John Casey, Manager of the Caledonia Colliery of the Dominion Coal Company at Glace Bay died of pneumonia on the 14th January, after a very brief illness.

Mr. Casey was 44 years of age, and had all his life been employed at the Caledonia Colliery, where by personal merit he had risen from trapper boy to manager, and had he lived was likely to have gained further preferment.

After the Caledonia Mine fire, which occurred in 1899, and following the death of the Underground Manager who, with a number of other men was killed in the mine at the time of the fire, Mr. Casey was appointed overman. He continued in this position until his father, who was Underground Manager, retired from that position, and his son took his place. In 1910, Mr. Casey was appointed manager, and remained in that position until his death.

John Casey was regarded by his fellows and those who worked under his direction as a man among men, and, as the Glace Bay "Gazette" remarks, they would have followed his lead anywhere.

Mr. Casey always took a lively interest in the "Safety First" Movement, and his management of the mine that came under his charge was competent, conscientious, and consistent. At the same time Mr. Casey was always on the look-out for new methods, and kept himself up-to-date by technical reading.

The Editor would beg permission to record his own grief at John Casey's sudden taking-off, and his appreciation of many kindnesses received from a man who in his time befriended many and was never sparing of his time or purse to serve others. The sympathy of Mr. Casey's many friends and admirers will be extended to his relatives.

#### VANCOUVER BRANCH OF THE CANADIAN MINING INSTITUTE.

Dr. E. T. Hodge was presented with a pair of gold cuff-links, engraved with his monogram, by the Vancouver Branch, in recognition of the competent manner in which he organized the First Annual General Meeting of the Institute in Toronto at the close of last November. Dr. P. W. Brock made the presentation on behalf of the Vancouver Branch, and that the recognition was well-deserved will be unanimously agreed in by every person who attended this meeting.

Dr. Brock reported on the recent conference held in Vancouver to consider the draft of the bill which Parliament is to be asked to enact regulating the engineering profession in Canada. The draft bill has been considered in British Columbia by a Committee comprising representatives of the civil engineers, architects, chemists assayers, and members of the Canadian Mining Institute, and amendments have been considered by this local body, known as the Joint Mainland Legislative Committee. The Institute members propose amendments to protect geologists and mining engineers specifically. A similar local committee is considering the draft bill in the interests of the Vancouver Island engineers.

# Primary Considerations In Hydraulic Stowing\*

By C. A. John Hendry F. R. S., A. M. I. M. E.,

The flushing of anthracite coal mines with slit and fine rock or slate has been carried on in the United States for many years with great success. In fact the idea originated in the United States, and the method has been adopted with certain modifications by various other countries. British engineers term the process "hydraulic stowing," and the following article notes conditions prevailing at various mines in India where stowing is practiced. Certain factors should be taken into consideration before a definite plant is decided upon in introducing hydraulic stowing in a mine and suggestions are here made as to the lines along which such preliminary investigations should be conducted.

Looking at the matter from a purely hydraulic standpoint, the delivery of stowing hydraulically through a pipe is subject to the following elementary rules: (1) The loss by friction is proportional to the length of the pipe; (2) it varies roughly as the square of the velocity; (3) it varies inversely with the diameter of the pipe; (4) it increases with the roughness of the pipe surface; (5) it is dependent of the pressure. The introduction of some lubricating element in the stowing material, such as nodules of clay, is possibly well worth consideration for it would reduce wear on the pipes carrying the stowing material.

The coefficient of friction naturally varies with the velocity of flow and the diameter of the pipe. With a comparatively short pipe it may be necessary to consider losses due to elbows or bends in the pipe line. Where (as is usually the case) the length of the pipe is greater than 1000 times the diameter, the velocity head and the loss of heat at the entrance need not be considered, for it is so small in comparison to the frictional loss as to be quite negligible.

## Loss of Efficiency in Pipe Lines.

Generally speaking, in long pipes we may ignore losses due to entrance, bends and variations in the pipe sections. The effect due to bends is of small importance compared with other frictional losses, and it is with these other frictional losses that we are chiefly concerned. If sand stowing, or packing, is to be carried out on definite lines, it will be necessary to find out the relation of head to length of pipe line, the ratio of sand to water and the velocity to the size of the pipe.

All these things will have a definite relation one to the other, and if the system is to be carried out on a larger scale than is desirable to collect information and to experiment so that a basis may be established for common use. It may be an exhaustive matter to derive suitable coefficients for all conditions, still there is no reason why the behavior of certain mixtures, such as one part of sand to three of water, should not have certain coefficients of friction worked out for them. Then the velocity (and therefore the rate of supply) can be determined; or the maximum length to a certain head can be derived and the cost of an installation and its capabilities can be worked out with some exactness prior to the commencement of the work.

Rough experiments have shown that the ratio of sand to water varies in direct proportion to the head and the length of the pipe, while the frictional coefficient is doubled when the sand is introduced to the maximum carrying capacity of the water. Such results should be checked with pipes of a greater head and length; then we will find that the effect of a bend at the entrance will be less evident and the flow steadier. Roughly speaking, where the proportion of the head to the length is 1 to 5, then the proportion of sand to water will be about 1 to 3; or where the proportion of the head to the length is 1 to 3, then the sand to the water will be about 1 to 15. However, the capacity of an installation will depend upon the size of the pipes and the velocity of flow in them; it would be an advantage of experiments as previously suggested could be carried out in instances where systems were in actual use so as to determine the proportionate results with some degree of accuracy.

## Planning a Stowing System.

To determine the size of a pipe for use under certain conditions it will be necessary first to decide upon the rate at which stowing (flushing) is to be done. Furthermore, the velocity of discharge will bear a definite relation to the diameter of the pipe and its length. Hence, the first problem will be to determine the most economical proportion of the head to the length of pipe underground. The problem is to determine whether it would be more economical to put down a series of boreholes direct to the various portions of the workings to be flushed, or whether it would be better to establish one or two main points of flushing supply pipes from the surface to the mines and use long lines of pipe underground.

This problem will be influenced by the following considerations: (1) The rate at which the flushing must be done; (2) nature of the strata to be bored; (3) quantity of water available; (4) grade of the underground pipes; and (5) the velocity of flow of the flushing mixture. It should be remembered that there is a limit or the minimum velocity at which the mixture will flow; at velocities below this minimum the sand held in suspension will gradually increase frictional losses until movement of solids practically ceases. On the other hand, high velocities of mixtures result in abnormal and costly wear of pipes.

The wear on the pipe due to friction would vary with the proportion of sand to water—the more water used the less friction. However, it should be considered that the more water used the greater will be the expense for pumping out the water after it had been used for flushing. It would be a nice balance of costs to determine which would be the most economical mixtures.

Having determined upon the output and velocity, it will be a simple matter to gage the head required, to work out the most convenient flushing or feeding point at the surface to calculate the dimensions of pipe required. Where the head is considerable it would possibly be an advantage either to put down two or more boreholes, or to supplement the head by the introduction of a pumping unit.

The disposal of the flush water and its clarification are important. In certain mines where the pitch of the

\*From a paper read before the Geological and Mining Society of India.

seam is steep enough, it may be cheaper to flush the sand to the workings through a flume or trough. This method can be used when the pitch is 15 deg.; or even at a less pitch if the proportion of sand to water is high. It may be necessary to bring the flushing water from a distance; this might be offset by the greater availability of river sand in a dry season. If the distance to move the mixture on the surface is considerable, and the grades favorable, then an open flume may be more economical than a pipe-line.

Regarding the character of the pipes to be employed we may consider: (1) Cast iron; (2) wrought iron; (3) wood; (4) terra cotta; and (5) porcelain lined. The shape in comparatively small installations would be circular, but avoid pipes may be considered in special cases. In general it will prove economical to employ thicker cast iron pipes for flushing lines than is usual in the case of pipes used for water only; in no case is it advisable to employ them under  $\frac{1}{2}$  in. in thickness as the tensile strength is low and uncertain.

If, for economic reasons, cast-iron pipes must be employed, it is advisable to have them as thick as practicable. For instance, assume the outer diameter of a pipe is 7 in. and the inner 6 in., then the cross-section area of pipe metal would be 10.21 sq.in. If we increase the outer diameter of the pipe to  $7\frac{1}{2}$  in., and keep the inside diameter 6 in., then the section area would be 15.904 sq.in.; there would be an increase of 5.694 sq.in. in section. Thus, for scarcely more than half as much more metal, the life of the thicker pipe will be double as long as in the first case; this is true provided we assume the pipe will give trouble and have to be discarded when its thickness get below, say,  $\frac{1}{4}$  inch.

#### Materials Used in Stowing Pipes.

Wrought-iron pipes are not particularly suitable for use on longitudinal lines, as their cross-section is comparatively small; they have, however, the advantage of considerable length, resulting in fewer joints, and their fibrous structure (if unriveted) offers less resistance than granular sections.

For underground pipe lines wood might be profitably employed in special cases; the pipes consist of a number of staves, their edges bevelled at an angle radiating to the centre of the pipe and bound around at intervals with steel ties arranged with a take-up block to insure efficient tightening. The staves would be 1 to 3 in. thick, depending upon the size of the pipe. The pipe would be bulky and not generally adaptable. Pressures up to 200 lb. per sq.in. are possible, though 150 lb. would be a satisfactory maximum. With higher pressures it is likely that water would be forced through the pores of the wood.

The porcelain-line pipe is possibly debarred by its high cost from adoption in cases where coal is mined and sold at a particularly low figure. It is possible that vitrified terra cotta may be suitable for underground use, as when vitrified it is coated with an impervious vitreous lining on which acids and alkalies make no impression. This is an important point. As in some cases a good proportion of the wear of pipes is due to the acidity of the water. It may be possible for interested concerns in India to devise means of materially increasing the vitreous lining to suit the peculiar conditions of use. The average pipe can be made to stand a reasonable pressure, say, 100 lb. per sq.in. The joint will, of course, be somewhat difficult and tedious to

make. In Pennsylvania half-section glazed-tile pipe has been used on the surface for carrying silt and water to great advantage; this transportation line constituted an open trough.

It all cases it will be advisable to arrange so that the pipe can be turned around, if desired, as the wear will be greater on its lower portion. Continental experiments have shown that steel pipes must be changed or turned over when 97,446 cu.yd. (74,500 cu.m.) of stowing material, made up of waste from the washeries, broken boiler cylinder, etc., had been flushed through them; while the same attention was necessary after 56,506 cu.yd. (43,200 cu.m.) of sand had passed through the pipes. With cast-iron pipes it was necessary to turn them over after the flushing through of 68,016 cu.yd. (52,000 cu.m.) of sand. The steel pipes in this case had a thickness of  $\frac{5}{16}$  in. (8 mm.) and an internal diameter of  $7\frac{1}{4}$  in. (185 mm.) The cast-iron pipes had a thickness of  $\frac{3}{8}$  in. (10 mm.) and an internal diameter of  $5\frac{7}{8}$  in. (150 mm.).

#### Considerations Influencing Materials Used.

In the Jharia, India, coal field the proximity to sand areas renders one apt to overlook other sources of packing nearer at hand. It might, for instance, be more economical to remove the overburden (surface) covering coal on the outcrop and utilize this if suitable; or even put it through crushers in the case of hard or lumpy material in order to reduce it to its requisite fineness, before using in the mine. There might be cases where local material which required crushing may prove more economical than obtaining something from a distance; at the Rand mines in Africa the whole of the tailings is often utilized for this purpose.

The following points require attention when considering the question of transporting sand from its source of supply to the mines: (1) Accessibility of the sand; (2) cost of transportation to the mines; (3) method of packing. In the case of India, whether the sand is required for the Dishergarh of Jharia field, the accessibility of supply is practically the same; but in the case of transport there are two entirely different problems to be dealt with—one in which mines are near enough to the river to draw their supply of sand, and the other where mines are at such a distance as to render the capital outlay prohibitive without co-operation between adjacent mines.

The packing may be deposited in a bin or reservoir adjacent to the mine or above the workings, and be washed down a pipe, the head being sufficient to drive the sand up to the required position. There will also be cases where it is possible to sink a borehole in the river bed and feed with sand direct; in this case the pipe should be fitted with valves at the surface and also (as an additional safeguard) at the foot, in order that they may be closed down during flood periods. Otherwise the loading from the river bed will, in a measure, depend upon the method of transportation adapted to the mine. In any case it is safe to assume a severe gradient will have to be negotiated from the river bed to the bank. The work on the bed will in a majority of cases have to be of a temporary nature suitable for rapid removal and therefore a separate unit to the main pipe line. For this light belt conveyors may be suggested, one of more horizontal ones on the bed and the other running up the bank (see Figs. 1 and 2).

BASE OF TOWER FOR FLUME AND SAND FEED IN RIVER BED

The maximum angle at which sand can be dealt with would be about 30 deg., although certain patent types and scraper conveyors will, of course, deal with much steeper gradients. The horizontal feed conveyors should preferably be entirely self-contained, driven by a motor and capable of being moved around in a semi-circle with the lower end of the inclined one as a pivot (Fig. 3). It would be necessary to fix it on rollers or skid plates to facilitate its circuitous movement, and it could be provided with a simple motor driving attachment for the purpose if necessary.

#### Methods of Transporting Stowing Material.

A steam shovel is likely to prove too heavy for the purpose of loading and a conveyor appears to be the most suitable. Should an aerial gear be employed for the transportation line another type of gear might be profitably substituted.

Assuming the case of mines adjacent to the river, with possibly plenty of water, the simplest form of transporting sand appears to be an endless haulage in conjunction with three-ply rubber and canvas conveyors. The plant would be practically automatic, and we might assume the following conditions: The sand would be loaded in a horizontal conveyor, and thence to an inclined one leading into a small loading hopper on the bank. From this it is fed into dump cars and these are moved by endless haulage over a bin; as the cars pass over the bin they are automatically dumped. From the bin the sand is washed into the mine (Figs. 4 and 5).

A constant supply of sand is by no means the least important matter when the tonnage becomes considerable. It might pay to have an inclined plane at the bank, have a supplementary haulage to the main one and run the dump cars on tracks on the bed of the river. A series of light tracks provided with the flat steel ties could be used. This plan omits the conveyors and bin at the bank (Figs. 6 and 7). Pumping the sand direct through a pipe line may be suggested; but it does not overcome any more successfully the problem of loading, while the effect of sand on anything with which it comes in contact is familiar.

#### Examples of Stowing Plants.

It may be mentioned that the dredging plant at the Port Talbot docks included a sand-pumping unit. This dealt with something like 150,000 cu.yd. of spoil material with a 22-in. pump and discharged it at a rate of 200 cu.yd. per hr., at a point 500 yards from the pump. Possibly further investigations of the suitability of such a unit is warranted under certain conditions.

Another method may be considered where the distance to the mine is comparatively short and the sand area is situated on the far side of the river from the mine; the sand for flushing, under these circumstances, would be (for a certain period of the year) carried across the river. The scheme might be outlined as follows (Figs. 10 to 14):

A tower might be set up at some point on the river bank most conveniently situated for sand excavation. A combined conveyor and elevator possibly could be arranged to run from the river sand deposit to the top of the tower, running horizontally in the river bed so as to facilitate loading. At certain times of the year it could be shortened to avoid flood water and to enable the vertical section still to operate should sand be avail-

able. The elevator would discharge sand into a flume at a sufficient height above the receiving point at the mine to allow the material flushed with water to gravitate to the mine. The water for flushing would be pumped up a pipe supported by the same tower. The proposition would necessitate the use of a number of frames or intermediate towers to carry the flume at a suitable grade. The flume towers should be suitably braced to withstand wind pressure and the load, the former possibly proving the most serious consideration. There may be cases where it would prove more advantageous to employ a pipe in the place of the open flume, so that the head necessary to transport the sand may be reduced; this plan would allow water to enter the pipe under pressure, thus preventing the settlement of sand in transit.

The scheme shown in Figs. 10 to 14 would only necessitate power to drive the elevator and necessary pumps. Further, in order to produce the necessary scouring effect the usual proportion of water to sand might be greatly increased. Having completed its work of transporting the sand to the mine, the water could be drained off and let back to the pumps by means of another flume.

#### Details of Hydraulic Features.

Thus the water could be used over again. The sand could be allowed to settle in a bin adjacent to the bore-hole into the mine and the usual proportion of water added to carry it underground.

In considering a suitable coefficient of friction for flume troughs of various dimensions with varying velocities to suit conditions, it should be observed that the scouring power of a flow of water in an open channel does not at all times bear a direct relation to the velocity and depth. In other words, as the hydraulic radius is increased, it does not follow that in order for the water to impart motion to the sand the velocity of the water will increase proportionally.

The depth of flow is an important factor, as the water first subjects the sand to a motion of dragging, and later the particles are lifted up into the stream, the motion then being converted into one of suspension. The water carries a larger quantity of sand in its lower portion than the upper, and generally it could be assumed that the amount is proportional to the depth. Regarding the wear due to friction of the sand on the pipe, it may be an advantage later to investigate carefully the relationship of this to the velocity. For it may be assumed that in pipes the greater amount of material carried will be along the center portion of the water; it remains to be determined to what economical limit the velocity of the water may be accelerated in order to increase the time of suspension of the particles and reduce the friction due to the dragging effect of sand particles.

Where, however, the sand is washed into a bin and precipitated, while the water is allowed to overflow and run back to the pumps at the river bank, then the portion of water to sand may be high so that the inclination of the flume or pipe line can be reduced. Further, at the feeding point the tower can be extended to a greater height so as to increase the head, and this would reduce the requisite height of the other towers in the case of a pipe line.

In the open flume it is doubtful whether a coefficient of friction for sand and iron will be less than one-fifth. Thus, for water to carry 1 lb. of sand a distance of 100 ft. requires  $100/5 = 20$  ft.-lb.; if the proportion

of sand to water is 1 to 10 lb. of water must fall 2 ft. in 100 to give this energy. However, while the water imparts motion to the sand there is a tendency for the former to run at a higher velocity over the latter, so that the inclination of the flume should be more than 2 ft. in 100. Possibly for feeding the sand, in the place of the flume it would be better to employ a pipe, and we may then roughly assume that the grade will be in proportion to the mixture; if one part of sand be used to 25 of water the grade would be also in this proportion, or 4 ft. in 100. The necessary head might be increased at the feed tower, so as to reduce the height necessary for the intermediate towers. The flume bearing the return water to the pumps could be carried across the river (when necessary) below the supply pipe and on the same supports.

#### Stowing Plant at the Mine.

The area of the receiving bin would in this case have to be of sufficient extent to admit of the requisite precipitation of the sand with sufficient rapidity to allow a large proportion of the water to overflow. For this reason the bin might be provided with a well in its floor and the surface graded to meet this, so that an adequate sand pump would be provided. The feeding pipe from the river should terminate at a comparatively deep point in the bin so as to keep the sand at as low level as possible to aid its precipitation; from the bottom of the veil the sand could be led straight to the mine or a supplementary feeding bin. The flume for taking back the surplus water should emerge from a point near the surface-level of the feed bin. A strainer might be put at the entrance of the flume to assist in keeping out the sand. It might be convenient to have this flume follow directly under the supply pipe though possibly set on the ground until it reaches the river when it can be carried across the stream to the pumps on the same support as the upper pipe. Owing to the low grade required for the return water, it is possible that this flume could meet the feed tower at a point considerably above the level of the river. Thus pumps could be situated at this higher elevation and reduce most of the expense of pumping water from the river below.

It is a course doubtful if this project would always prove economical or convenient. But it is possibly worth consideration, particularly where the location of the sand areas necessitates crossing a river which may need bridging for a good portion of the year. This is a case where the mine is comparatively adjacent to the sand area. In the Jharia field the river is generally at a distance from the mines, and the problem involves considerable capacity. This problem may be solved either by the co-operation of a number of collieries or the construction and operation of the main transportation line by a private company.

For transporting the sand, endless haulage appears the most suitable. With this system, if we have a four-mile transportation line and assume each car carries one ton at a speed of two miles per hour, then one car takes two hours to make the round trip. For the sake of illustration we may assume that we have to transport 5000 tons per day of 12 hours, equal to, say, 416 tons per hour. This means 832 full cars and 832 empty ones in transit, or a total of 1664 plus those being loaded at the river bed. Possibly not less than a total of 1800 cars will be employed. Five thousand tons daily means 11 200,000 lb., and at 100 lb. per cu. ft. this equals 112,000 cu. ft. A simple method of loading would be by running the cars on a series of

portable tracks at occasion required. The loading, however, would be a difficult problem as a loaded car would have to leave every eight seconds; and if we consider the sand is excavated to a depth of 2 ft. then every day an area equal to 56,000 sq. ft. will be cleared. Therefore, a simple loading device becomes absolutely necessary, the simplest methods being to employ a conveyor, which by reason of its length is particularly adapted to work of this kind.

In Amercia sand is often excavated and loaded by portable machines consisting of a frame with a number of buckets fixed to an endless chain running over both head and tail wheels. The buckets are about 18 x 18 in. in cross-section, and the apparatus delivers about one ton per minute. The machine is equipped with a chute and only requires about a 7-hp. motor to drive it, the weight with the motor being about 7000 lb. About eight of these machines would possibly help to solve the difficulty of labor trouble with regard to loading and prove more economical. The excavators at the river bed would then feed into a conveyor, and from experiments it is found that one man can load a conveyor with 6.75 cu. ft. of sand in 12 minutes with the material at a distance of 18 ft. from the conveyor. In practice the conveyor could possibly be moved in such a way that the men would be close to it all the time, and would at the most have to carry the sand about 3 ft. In the condition under review it was found that the 6.75 cu. ft. actually were deposited in the conveyor in 12 minutes, as noted. This represents 675 lb. in 12 minutes, or 1.6 tons per hour.

#### Practical Considerations Affecting Plant.

Assuming the conveyor could be moved practically in a circle, we get a superficial area of 783,828 sq. ft.; or excavating to a depth of 2 ft., we would have about 1,567,656 cu. ft. equalling about 70,000 tons, or 14 days' supply. This conveyor then would feed into another one leading up the bank, the latter being 600 ft. long. Since the loading point at the bank is being continually shifted from the bank terminal of the main transportation system, a supplementary haulage would have to be introduced running parallel and close to the bank; a portable bin would have to be provided into which the conveyor running up the bank would feed as the area was evacuated in the river bed, and the conveyors were shifted, the bin would be moved from time to time to suit conditions. Owing to conveyors being more expensive than a track, the former is not to be recommended for feeding direct to the main haulage. The loading bin would have a capacity of about 100 tons (or 2,240 cu. ft.) and if it was 40 ft. long, would accommodate eight trucks at a time; this would enable loading at the speed required to allow them to leave at their eight-second intervals.

In Jharia, the point for depositing the sand from the main transportation line would be about 80 ft. higher than the river bank, the grade being 1 in 230 or a pitch of 0 deg. 16 min. The load on the rope equals 832 tons; to handle this load a 1-in. rope may be used weighing, say, 5 lb. per yd. It will possibly be advisable to have a central power station which could either be situated at the river bank, thus saving the poles and wiring to the conveyor motors; or we may assume a power unit with sufficient power to operate, in conjunction with the main transportation line, and endless haulages in mines adjacent to it. The latter is the more expensive arrangement, but is used, as the grade to the mines is favorable to the load, as a rule.

# Imprisoned Underground

By GEORGE HUSTON.

(Copied from Mining and Scientific Press)

To be imprisoned for over two weeks in the cross-cut by a cave underground and to be rescued unhurt was the remarkable experience of two miners, Peter Grant and Emil Sayko. The accident occurred at 10.45 a.m., November 15, in the Gold Hunter Mine, situated on the outskirts of Mullan, Idaho, in the Coeur d'Alene region. Both men had families in the town.

The cave happened in what is known as the north-west stope, an extension of the Ryan stope. The old Ryan workings had caved in 1913, being filled thereby to the 33rd floor, leaving an opening between the top of the debris and the roof. The roof had not been penetrated, 60 ft. of solid rock intervening between it and the old level above. The extension stope had not been worked for several months, and the two men were cleaning up preparatory to taking a contract for a raise through. They had finished and were descending, when Sayko noticed a crack on one of the walls. Becoming alarmed, he climbed a few floors for his carbide and water. On descending again, he had a slight argument and prevailed on Grant to go back for his lunch bucket. The delays undoubtedly saved the men's lives, for on descending a few floors more, a cap snapped in front of them. They then made all haste to reach 48th footwall prospect cross-cut, barely entering it in advance of the cave, which was thundering behind them.

The Hunter lode is in a wide zone of fissuring, shearing, and sheeting, which crosses the strike of the thin-bedded Wallace formation. The dip of the fissuring is nearly vertical or slightly south. The practice was to timber close to the stopes, to hold the slabby walls apart, then fill for safety, afterward. In this case, the extension stope, consisting of 35 floors, had been filled from the 3rd to the 22nd, excepting three 6-ft. sets that were used for a man-way, timber-slide, and chutes. From the 28th floor up, it was only a raise. The 49-ft prospect cross-cut in which the men took refuge was on the 26th floor. From the third floor down to the tunnel-level the stope was supported on stulls, and as no stoping had been done below the tunnel-level, the stulled ground was not damaged by the cave.

What caused the cave was the slipping down of a huge wedge-shaped slab running parallel to the length of the stope, adjacent to the timber, and extending down to the eighth floor; the bottom lodged against the filling, while the top fell over and smashed the upper timbering of the stopes, the subsequent movement effectually sealing all the connecting openings.

Every means was tried to reach the men through old workings, but these were found to be blocked. An incline-raise from a safe floor was started toward the west end, where the extension stope was known to be narrowest, but it became apparent soon that all the chutes were closed and that no openings existed. Efforts were then concentrated on getting up through the muck-pile to the top by the quickest route. The rescue-crew knew the men were alive from faint rappings and the smell of wood-smoke resulting from their efforts to keep warm.

At this juncture the Bureau of Mines at Washington was asked for the use of the new device, the geo-

phone for locating noises incidental to operations of this nature. The Bureau responded at once, directing two experts at widely separated points to report at Mullan, and the apparatus and men arrived as fast as the railway could bring them. In the meantime the men had been reached by a drill-hole, but the mere fact of the ready acquiescence of the Bureau and the sending of some of their best talent gave a high degree of encouragement to the hard-pushed crew and management.

After working six days on the raise, reaching about the 24th floor, through the muck-pile, the whole mass started to move closing the mouth and other portions of the rescue raise, imprisoning two men, Jack Delmarh and James Collins of the rescue-crew.

It was hardly thought possible, in view of the movement of big slabs of rock and fine material, to find Delmarh and Collins alive, so a feverish search for the bodies began. After six hours of strenuous work the men were heard talking. They were removed unhurt, after 15 hours imprisonment.

But the settling left the search for Grant and Sayko where it had started, it being evident that raising through the muck was too dangerous and slow, and that the men would perish before being found.

A raise was started immediately in solid rock at the west end of the stope, utilizing the latter to break against and spiling against the muck. This method favored safety and speed, but the distance was nearly one hundred feet, and some coincident operation had to be carried on to sustain life in the men, who had now been imprisoned for six days.

There being a 1 1/4-in. diamond-drill outfit on the ground, the Diamond Drill Contracting Co. of Spokane was called by telephone to furnish a crew which arrived on the next train. A hastily improvised hoist lowered the outfit to the top of the 60 ft. of solid rock capping the Ryan stope, and on November 21 at 8 p.m. drilling was started the 60 ft. of drilling being completed in 15 hours.

The drill crew and management were ignorant of the exact position of the imprisoned men. To avoid end-projections of the stope and filling, the hole was drilled vertically into the Ryan stope, instead of on an incline to reach the cross-cut. When near the bottom the hole lost its water, the seepage attracting the attention of the imprisoned miners. They scrambled in the direction of the seepage with a lunch-bucket, catching the first drink that they had had for four days. After breaking through, the drillers lowered a half-inch galvanized pipe, which struck Grant on the head. The over-joyed man shook the pipe vigorously, conveying the information to those above that their efforts had not been in vain. A whistle had been attached to call the men, and after its removal communication was opened up.

One of the first things for which they asked was light, so a wire was passed down outside the pipe, with a two candle-power bulb, taking current from a storage battery. The pipe, after being warmed by flushing with hot water, served to convey soup, stimulant, milk, etc. The company's physician prescribed the diet, and the hungry men were made as comfortable

as possible. Meanwhile another hole was drilled and reamed out to two inches. Through this, elongated loaves of bread wrapped in paraffined paper were passed and suitable receptacles filled with finely chopped fruit, vegetables, and meats were forced.

On account of the danger from further caving, a two weeks stock of provisions, candles, and other things was lowered and conveyed to the cross-cut; also the 1/2-in. pipe was extended and the men were instructed to stay there until rescued. With plenty to eat and drink, and means of warmth, the question of sustenance was solved.

Meanwhile the work of raising went on with strenuous energy, day and night, until on November 29 at 3 p.m. the men were removed after being confined for 14 days and 4 hours in their underground prison.

It is pleasing to record that the resources of the entire district were placed at the disposal of the Gold Hunter management. With characteristic brotherly feeling, the workers engaged in the rescue gave of themselves freely and without stint. The rescued men after having their eyes bandaged were conveyed to the hospital at Wallace. They were in good condition, and thanks to their pluck and powers of endurance, will soon be out in good health. Their faithful wives who sustained the men's courage after communication was opened, are the happiest of women, never losing their faith in the ultimate rescue.

#### CIVIL SERVICE COMMISSIONERS' STATEMENT REGARDING GEOLOGICAL SURVEY RESIGNATIONS

In a statement from the Commission, on the recent withdrawals of experts from the civil service, it is said: "Many wild and exaggerated statements have been made in reference thereto and some newspaper comments have been none too complimentary to the Civil Service Commission." The Commission says many of the alleged facts are not borne out by careful enquiry. "Dissatisfaction with the classification does not appear to be at the root of the trouble, but rather a wide-spread activity in the commercial world in the direction of increased endeavor to exploit those natural resources which have been wasted so desperately during the past five years of world-wide war and devastation."

The Commission sets forth as typical cases those of a number of the most capable men on the staff of the geological survey who have accepted offers of outside employment. "The principal competitor for the services of these men," says the statement, "is the British Petroleum Company, an Imperial corporation with a capital of \$275,000,000, organized to develop the oil supply of the world, wherever it may be found. This powerful and tremendously wealthy corporation approaches an officer on the staff of the geological survey who has been receiving \$2,600, but who under the classification will at once increase to \$3,300, and offers him \$6,200 to start with. The Government cannot compete with such an offer and the country would not sanction it. Another on the same salary and with the same prospective increase is offered \$5,100 and he too accepts. Neither of these men has one word of criticism for the new schedule, on the contrary, they admit that it is fair and as liberal as the Government is justified in offering, but their services are worth more in the outside market and naturally they go."

The statement concludes by saying that the services of those men are not lost to the Empire, but their value in the wider fields will be enhanced. The Commission states "it is therefore to be hoped and may be expected that those newspapers which have given such wide publicity to the alleged deficiencies and "foolishness" of the Civil Service Commission will give their readers the benefit of an equally widely published statement of the actual conditions under which these defections are taking place."

#### RESIGNATIONS FROM U. S. GEOLOGICAL SURVEY.

##### Conditions similar to those at Ottawa.

That the personnel of the U.S. Geological Survey is facing serious deterioration is indicated by the following statement of the Director of the Survey in his annual report: "The fact that there have been 77 resignations from the scientific force of the U.S. Geological Survey during the last year—17 per cent of the force—suggests inadequacy of compensation, and the percentage of resignations in the clerical and non-scientific force was even larger. This statement, of course, does not include separations to enter military service. The largest inroad upon the Geological Survey personnel comes from the oil companies; the final result of the pioneer work of the Federal geologists in applying geologic methods to the search for oil and gas is that a large proportion of the leading oil geologists the world over are U.S. Geological Survey graduates. Indeed, the future decline in popularity of the Geological Survey as a recruiting station for oil-company employees will be due simply to the fact that the experienced oil geologists who remain in the Government service are from personal preference immune to outside offers. The relation between Government salaries and outside salaries of geologists has been definitely determined in a compilation of the records of 29 geologists who left Government service after receiving an average salary of \$2,271. The average initial salary of these men in private employ was \$5,121, and after about two years of average service this compensation averaged \$7,804, and eight of these geologists receive \$10,000 or more. The disparity is even greater if consideration is given to the large financial returns from investments made by the private geologists in connection with their professional work, a privilege properly denied by statute to the official geologist. That the value of these men as specialists and consulting geologists is far greater to the country at large than to private corporations is undeniable. Furthermore, it is important to note that most of these geologists had persisted to the limit of endurance with a magnificent spirit based on their love of scientific research and their desire to contribute to the sum of geologic knowledge. Most of them have been forced out of the service by sheer financial necessity. Unless adequate measures are taken to ameliorate the situation, the geologic staff is destined to suffer far greater deterioration of morale and depletion in its ablest, most responsible, most experienced, and most valuable members. The Geological Survey is passing into a stage when, with greater need than ever for systematic geologic work in the country, it is ceasing to be attractive to the young men of greatest ability, training, and promise. This situation deserves prompt and effective remedy, for it threatens most seriously to cripple this branch of the public service."

# Our Northern Ontario Letter

## The Silver Mines

In the silver mining areas of Northern Ontario the renewed Asiatic demand for silver has created another wave of enthusiasm. It is believed that any very sustained buying at this time will send quotations soaring once more. The most conservative producers are unable to discern any influence that would cause a recession of prices while the future appears to hold out reasonable promise of the demand over supply becoming even more pronounced.

Believing that the present condition will prevail for at least a few years and confident that no labor difficulties will develop during that time, the mine operators of Cobalt are not only becoming more aggressive in the local field but are evincing a desire to acquire prospective silver properties in the outlying districts, such as Gowganda and Elk Lake.

At the time of writing, negotiations between the Coniagas Mines and the Tretheway-Cobalt Company continue with fair prospects of the Tretheway being taken over by the Coniagas. It is learned officially that the deal, if consummated will include the mill as well as the mine of the Tretheway, at least with the exception of a few small milling parts. Inasmuch as the two properties adjoin, the Coniagas would be in a position to work the Tretheway in conjunction with its own property and thus eliminate the present overhead expense with dual management. The finances would strengthen the treasury of the Tretheway and place that company in excellent position to concentrate its full energies on the development of its large acreage in the Gowganda silver area. The transaction is one that would appear to hold out advantages to each company involved for which reason the successful conclusion of the deal is considered probable.

It is intimated that the La Rose Consolidated has had a very successful year and that agreeable surprises are in store for the shareholders. The company has been a consistent shipper of ore throughout the past year, and it is understood that a part of the ore mined was high grade. The company has commenced the current calendar year by continued aggressive operations and the year 1920 promises to be prosperous. Higher efficiency among the workmen, and high quotations for silver plus high rate of exchange on New York funds all serves to add to the company's prosperity.

The Crown Reserve is considering a plan to mine wide deposits of low-grade material, amounting almost to quarrying. In this way it is believed that some of the old abandoned workings of the mine may be turned to profitable account and a vast tonnage of very low grade material turned into a source of considerable revenue. In the meantime the company is proceeding with the development of the Canadian Kirkland property in the Kirkland Lake district and it is stated that excellent encouragement is being met with.

The Beaver Consolidated has been brought into favor to a greater degree than ever through the announcement that net profits at the company's Cobalt mine are running high and that operations may be

enlarged, and also, because of the success attending mining operations at the Company's Kirkland Lake mine. It is stated that a considerable quantity of the ore recently opened up at the Kirkland Lake mine contains around \$30 to the ton. Steady production is now established and bullion shipments are being made regularly.

In reference to the proposed light narrow-gauge railway from Elk Lake to Gowganda, the leading mining operators have stated that they are strongly in favor of the Ontario Government building a standard-gauge line. It is pointed out that the Elk Lake branch was never intended for a blind line and that it was only due to the war that the extension to Gowganda was held in abeyance. They declare that should the government be so inconsistent as to permit private enterprise to build the narrow-gauge road, it would perhaps forestall the possibility of getting a real railroad. The fact is emphasised that Premier Drury while on his December tour through the district of Temiskaming stated that he wanted to hear the views of those who were in a position to voice the opinion of any branch of industry. As to this, it is stated publicly: "In thus voicing the opinion of the leading mine operators of Gowganda in response to a general request which Hon. Mr. Drury extended to residents of the North while on his December tour through Temiskaming, the measure of attention which this recommendation receives will be accepted as the extent of the sincerity which actuated the request of the Premier."

In dealing with the railroad question, it is found that not a few of the claim holders in the Gowganda district entertain fears that opposition to the light narrow-gauge railroad is attended with some danger of discouraging one and failing to get the other. However, if the government is not prepared to proceed with the construction of the standard gauge road, it does not seem to be likely that they would under any consideration prevent the private narrow-gauge project. The fact is that the camp is greatly in need of rail transportation of some kind—even though it should ultimately be the narrow-gauge and entail the inconvenience and expense of rehandling freight at Elk Lake, the present terminal of the Temiskaming and Northern Ontario Railway.

Another discovery of silver is reported to have been made in the Kenabeek section of the Elk Lake district, on a claim situated in lot three of Cane township and adjacent to the north boundary of the township of Auld. It is stated that considerable cobalt occurs in the vein together with encouraging silver values. The rock formation like that at the Cane Silver Mines now idle, and at the Kenabeek Consolidated, is entirely diabase, lying between wide belts of quartzite.

One of the leading Cobalt mining companies is stated to have recently made an examination of the White Reserve mine in the Maple Mountain section of the Elk Lake district, on which property some exceedingly rich ore was recently encountered at surface.

Traffic to Gowganda is heavy, operators and claim-holders taking advantage of the present winter roads to transport supplies to the camp.

During the week ended Jan. 16th, the Mining Corporation of Canada shipped 221 bars containing approximately 221,573 ounces of silver. At the present quotation for silver, plus 8 p.c. exchange on New York funds in which the company receives payment the value of the bullion shipment may be estimated at around \$140 an ounce or approximately 310,200. This consignment ranks amongst the most valuable in recent months.

During the week ended Jan. 16th, three Cobalt companies shipped an aggregate of 3 cars containing approximately 241,349 pounds of ore. The following is a summary:

Shipper	Cars	Pounds
Temiskaming	1	103.990
Coniagas	1	76.272
Peterson Lake	1	61.087
Totals	3	241.349

### The Gold Mines

In spite of the fact that the chaos of Russia and Eastern Europe is something which the average Anglo-Saxon resires to avoid, Northern Ontario is to-day witnessing the spectacle of a large part of the foreign element joining in a fairly general trek back to the East. Throughout the war these men worked at high wages, until now, with money belts fairly bulging with money the equivalent to a fortune in the land of their birth, these men are setting out upon a great new venture in an old land. For the greater part, fired with the optimism which is a part of success and plenty, they fail to possess the foresight to avoid becoming directly involved in the general shamble of Russia and Eastern Europe. It does not seem to be too much to predict that a large part of these men, once they realize the extent of the stress and the misery of the near East will automatically become advertising agencies for the Dominion. This, when they begin to realize the extent of the freedom the success and the lack of want experienced in Canada during their more or less brief sojourn in this country.

In the meantime, strange to say, the number of men employed at the gold mines is increasing. It goes almost without saying, that under such circumstances the percentage of those races which stand for stability are increasing while those now manifestly "red" or Bolshevik tendencies are diminishing—swarming back into the great cesspool of misery which their kind has created. The impression in the North is that any who desire to return to the Near East should be permitted to do so with all possible speed; because, it is believed those desiring to do so must be friendly to the doctrine of those now in control, else they would have no desire to return, at least not under present conditions.

The return to pre-war conditions in the Porcupine and Kirkland Lake districts is being made more rapidly at present than at any time during the previous year. With a lower percentage of foreigners employed, the efficiency of the workers is stated to be increases. The new year having thus commenced, it may continue so throughout the year, and within the next few months efficiency may be reasonably close to normal, apart of course, from the effects of prevailing high wages and high cost of material. As to this, however, the shortage of efficient labor constituted the chief burden of the mines in recent years.

Considerable discussion is heard regarding the possibility of the Dome Company applying for an extension of time on the option which it holds on the Dome Extension property. The past year having been unsatisfactory for carrying out the desired development work, the Dome is in a fair position to make such a request.

Official figures showing the Hollinger consolidated ore as containing an average of \$9.15 a ton, with facilities for treating a maximum of 3,500 tons of ore daily when ready to run at full capacity, are interpreted as indicating a production of close to \$1,000,000 a month just as soon as it is found possible to procure the desired number of men. At the time of writing it is understood that production is at the rate of 2,800 tons daily or at the rate of close to \$9,000,000 annually.

In the Kirkland Lake district, interest is increasing in that part of the district lying east from the Tough-Oakes Gold Mines where there appears to be fair promise of the camp extending. Heretofore the Kirkland Lake camp has been confined chiefly to a strip of territory about two miles in length, running from west to east and terminating at the east boundary of Teck township. Now, however, it is considered probable that the auriferous zone may be found to extend far into the township of Lebel. As a consequence of this number of deals have been negotiated and a number of others are pending.

The Lake Shore mine is now completely de-watered and operations are proceeding at a normal rate. January production is expected to rank with the early summer months, prior to the labor strike. The year 1920 promises to be a prosperous one for the Lake Shore.

The Fidelity Company is calling for tenders for drifting at the 145 ft. level situated in the North-east part of the township of Teck. The property is situated west from the Lebel-Kirkland.

Dr. C. E. Wettlaufer together with associates in Buffalo, N.Y., has purchased a property near Mud Lake in the township of Lebel. The Boston-McCrea Mining Company has also purchased a claim near Gull Lake in Lebel township.

On the Bidgwood property, lying east of Mud Lake, it is stated that the result of work so far done has highly encouraging and indicates the presence of mineralization over substantial widths.

In the Boston Creek district interest is again increasing. The Miller Independence continues to be the centre of interest. The main or central shaft has now reached a depth of 462 feet and is expected to reach the 500 ft. level before the end of the month. In the meantime, the electrical equipment is being installed, and before the end of February, the transmission of power over the line of the Northern Ontario Light and Power Company will commence and put an end to power problems. Also, preparatory to the advent of electric energy, the management is bending its efforts toward preparing for the resumption of work in "D" shaft in which gold tellurides were opened up in spectacular quantities last year. This inclined shaft was driven to a depth of 200 feet. Electric power will make it possible to add three or four machines and thus hasten development work.

W. E. Simpson, who had some nine years experience in connection with mining and metallurgy of gold tellurides in West Australia has decided to make a careful study of the somewhat similar occurrences in the Boston Creek district, and at present has headquarters at the Miller Independence Mines.

The Boston-Kennedy shaft is now down some 70 feet. The vein which was comparatively narrow at surface is widening out, being close to four feet in gold.

The Boston McCrea has commenced cross-cutting at the first level and is calling for tenders to sink an additional 100 feet. Diamond drilling has been carried on steadily for the past several months and has shown the ore body to have straightened up considerably from its indicated surface dip to the south. The shoot is stated to have a decided rake to the East.

On the Catherine Gold Mine shaft sinking is proceeding, a depth of 30 ft. having been attained at the time of writing. Here, too, although not a great deal will be known until further work is done, the outlook is decidedly promising.

From the Larder Lake district comes reports that the Associated Goldfields Company may yield to the criticism of the press, and has prepared a report showing in more or less detail the result of work to date, and the blocked-out ore-bodies, together with a statement of average values and tonnage.

**WHERE COMMON SENSE FAILS.**

The Geological Survey which has proved to be such a potent factor in the development of Canada for nearly eighty years has just received a serious blow. Its officers carrying on their field-work under hard and hazardous conditions—in the last eight years no less than three have lost their lives in the field under trying circumstances,—have been content with the satisfaction of work well done although until recently hoping for some slight measure of improved recompense in the days to come. The hopes of years, however, have been dashed by the seeming inability of the Civil Service Commission to improve a foolish condition of affairs. In brief, the salary scale of 1908 is to be continued (as nearly as it will fit the new system) quite without any recognition of the normal curve of increased cost of living or even basic justice. As a direct result since October eight of the staff of the Geological Survey as a measure of self preservation have accepted appointments with private corporations; and still others are about to follow the same course. The point to be noted and emphasized is that because of their interest in their work these same men have in the past refused offers equal to those now offered, namely, double their present salaries, in the meantime hoping for a somewhat more liberal scale of salaries in the new classification.

Eight men leaving, out of a staff of twenty-five, is a loss of one-third,—and the end is not yet. The effect will be felt not in Ottawa but in the various parts of the country where they have been so busily engaged in assisting the mining industry. The men lost are drawn from the work of the various provinces as follows:—From British Columbia, 4; from Alberta, 1; from Ontario, 1; from the Maritime Provinces, 2.

How can these men be replaced? By no other means than by making the inducements such that additional

men will spend from seven to ten years training at universities at their own expense. There are no short cuts possible in obtaining this training. As a matter of history, up till about 1913 there remained enough enthusiasm and hope of adequate recompense to interest a number of assistants in preparing themselves for geologists. But with diminishing hope of improvement in Government salaries the positive offers of private firms were too tempting to be refused. For instance, in 1916 alone, all three student assistants finishing their work for their doctor's degree, at once went into private work for their doctor's degree, at once went into private work starting on salaries at least equal to those of their former chiefs and greater than they could hope to obtain on the Dominion Geological Survey after five years. At the present time it is doubtful whether there are more than three men training in anticipation of work on the Survey. But this is not all. Even after completion of the required university training it requires commonly two or three seasons' field experience before a geologist obtains enough intimacy with any field to render his work of special value. In the case of each of the men who are leaving, the country loses the advantage of from five to twelve years' experience. In point of time alone, then, it may be said that the work in the fields now being vacated, pending the development of assistants will be set back for twelve years. But, note again, such assistants are not forthcoming, owing entirely to the lack of prospective remuneration.

The loss within a few weeks of one-third of its staff is the worst blow ever received by the Geological Survey—the most powerful single instrument in the past development of the natural resources of Canada. Coming at the present crisis in the progress of the nation this is nothing short of a calamity.—*Ottawa Journal.*

**THE TANTALUS COLLIERY-YUKON.**

Mr. C. E. Miller arrived in Dawson the latter part of December from the Tantalus coal mine, where he has been acting as manager since last fall.

Mr. Miller reports the property in condition to begin operations in the Spring. It is planned to start about the first of April and continue throughout the season.

The Tantalus Butte properties lie two and a half miles south of the old Tantalus mine, and belong to the same company. They contain deposits of coal in the locality, possibly the largest in the Yukon.

The coal is of good quality and contains, according to Dr. Cairnes, less than 3 per cent ash

Capt. Miller is a pioneer coal miner of the Yukon. He discovered and opened up the Tantalus and Tantalus Butte mines, which he sold to St. Paul people some years ago.

**ENGINEERING INSTITUTE OF CANADA.**

**Programme of the Annual General Meeting, Montreal,  
January, 27-29th.**

The Montreal Meeting of the Engineering Institute of Canada, which will be in session when the "Journal" reaches the majority of its readers, promises to be one of the largest and most nationality important meetings yet held by the Institute.

The programme of the meeting reflects with much exactness those problems of most pressing urgency in Canada upon which the engineering profession is best qualified to consider and advise. Among the more significant subjects announced for discussion during the meeting may be singled out those of highway transportation, engineering education, and the problems of most efficiently utilising the water-powers and the forests of Canada. As evidence of the wide range of the engineer's province, as it is visioned by those who direct the policies of the Engineering Institute, will be noticed the inclusion of questions of public health, and the peace-time development of the newly discovered possibilities of aviation. The manner in which water-powers, the pulp and paper industry, the chemical industry, the public health, and the science of aviation, are linked up in the programme, indicates that neither romance or progress have yet departed from our midst.

**The Programme.**

The following programme, covering the three days of the convention, may be changed or added to to suit the exigencies of the occasion.

**Tuesday, January 27th.**

8.00 a.m.—Opening of registration at headquarters, 176 Mansfield street.

10.00 a.m.—Calling to order, annual meeting, appointment of scrutineers, reception of reports.

12.50 p.m.—Adjournment until 2.45.

1.15 p.m.—Luncheon at Windsor Hotel for members and ladies and invited guests.

1.50 p.m.—Formal welcome and greeting.

2.00 p.m.—Address, "Modern Highway Problems," by F. W. James, assistant chief engineer, Bureau of Roads, Washington, D. C.

2.45 p.m.—Resuming of business session, annual meeting.

4.10 p.m.—Reception of report of scrutineers.

4.20 p.m.—Address of retiring president.

5.00 p.m.—Inauguration of incoming president.

9.00 p.m.—Reception and dance, Rose Room, Windsor Hotel.

**Wednesday, January 28.**

10.00 a.m.—Calling to order, professional meeting, at headquarters. "The Gateway of the Profession.—"The Training of the Chemical Engineer," by R. F. Buttan, M.A., M.D., Sc.D., F.R.S., Professor of Chemistry and Director of the Chemical Laboratories, McGill University. "The Importance of Physics in Engineering Education," by A. H. Eve, D.Sc., C.B.E., F.R.S., Macdonald Professor of Physics, McGill University. Discussion by four authorities on technical education.

1.10 p.m.—Leave Windsor Hotel on special cars for Northern Electric Company's works.

1.30 p.m.—Luncheon, as guests of the president of the Northern Electric Company, Limited. At the con-

clusion of the luncheon the members will be escorted in parties over the works, and will be at liberty to depart any time before the closing hour.

7.45 p.m.—Annual banquet of the Institute. Ross Room, Windsor Hotel.

**Thursday, January 29th.**

10.00 a.m.—Continuation, professional meeting at headquarters. "Engineering Activities of the Province of Quebec."—"Quebec's Water Power Policy and the Work of the Quebec Streams Commission," by Olivier Lefebvre, B.A.Sc., C.E., M.E.I.O., chief engineer, Quebec Streams Commission. "The Operation of the Quebec Public Health Act," by Theo. J. Lafrenière, B.A.Sc., C.E., M.Sc., Chief Sanitary Engineer to the Superior Board of Health of the Province of Quebec. "Quebec Highways," by Alex. Fraser, B.A.Sc., C.E., A.M.E.I.C., assistant chief engineer Quebec Department of Roads.

2.30 p.m.—Resuming of session, professional meeting, "Pulp and Paper."—"The Pulp and Paper industry," by Ferd. van Bruyssel, C.E., D.P.S. "Aviation."—"The Policy of the Air Board of Canada," by Lieut. Col. O. M. Biggar, B.A., K.C., vice-chairman of the Air Boards of Canada. "Quebec Forests"—"The Forests of Quebec," by G. S. Piche, A.M.E.I.C., Chief of Forests Service, Quebec Lands and Forests Department.

8.30 p.m.—Smoker, Ladies's Ordinary, Windsor Hotel.

**NEW MINES INSPECTOR.**

**Mr. Thomas R. Jackson, of Nanaimo, Will Succeed  
Late Mr. Newton.**

To fill the position rendered vacant by the recent death of Mr. John Newton, inspector of mines for the Coast Inspection District, the Provincial cabinet recently authorized the appointment of Mr. Thomas R. Jackson, manager of No. 1 mine of the Western Canadian Fuel Company, Nanaimo.

The new inspector is popular in the coal mine industry at Nanaimo, and his long practical experience peculiarly fits him for the new office. In 1902 he commenced coal mining at Extension and he has progressed steadily through all the various grades to the position of mine manager, being possessed of all the requisite certificates of competency. He is president of the Vancouver Island Mine Safety Association in the work of which he has always taken a keen interest.

**COMMISSION ON COAL.****To Develop and Protect Industry in Alberta.**

Calgary, January, 16.—The immediate formation of a commission to develop and protect the coal mining industry of Alberta was announced by Hon. Charles Stewart, Premier of Alberta, in an address made to the members of the Calgary Board of Trade.

This commission, Premier Stewart intimated, will strive to form a real understanding between miners and operators, to avoid strikes, increase markets and to develop the industry in general. It will be representative of the Government, miners and operators, and will be given sufficient authority to make its rulings effective.

**BRITISH COLUMBIA LETTER.****Alice Arm, B. C.**

A new townsite at Alice Arm is being planned to replace the one now used which is objectionably placed on a minefield. The survey of the new site now is underway. It is situated on the side hill northwest of the present townsite and is owned by the Alice Arm Development Company. Sufficient water is said to be convenient and the installation of other public utilities will not be difficult. In view of the mining development now in progress and the accession to the population expected this year with the commencement of new work on many of the properties tributary to the town of Alice Arm it is thought that the new enterprise not only is warranted but is a necessity.

**Stewart, B. C.**

Grant Mahood, who is just out from Stewart, reports that he accompanied the first winter shipment of ore from the Premier Mine, of Salmon River. It consisted of 300 tons. Total shipments from the Premier during the next few months are expected, says Mr. Mahood, to amount to between three and four thousand tons. Hauling by tractor was tried out but had to be abandoned and horse transport substituted. Mr. Mahood refers to good showings on the '49 Mine, Salmon River, where ten or twelve men are working and to development on the Big Missouri, where extensive development is being done with satisfactory results. He states that considerable interest is being taken in work in progress on the Lakeview Mine, situated on the Bear River side of the Portland Canal. This property was taken over last Fall under bond by F. Welch and associates.

S. G. Benson, owner of the White Mouse Group of Mineral Claims, situated about two miles beyond the '49. Salmon River, reports that, while in Vancouver, B. C. recently, he placed the property in the hands of a Syndicate which will start active development as soon as it is possible to get in with supplies over the snow crust. Richard Elliott, K. C., is at the head of the syndicate. He has had considerable mining experience, having been heavily interested in Bear River properties at the time of the excitement of about nine years ago. Mr. Benson states that the White Mouse has promising surface showings.

The Sunset Group is another Salmon River property on which development will commence as soon as conditions permit. A Vancouver syndicate is furnishing the necessary finances.

It is hoped that the President Group will be another the new properties opened up in the Spring. Situated on the wagon road, and with ore which has given encouraging assay returns, officials of the President Silver Mines, Limited, and looking forward to doing considerable work this year. Stuart Moore, secretary treasurer of the Company, has left for New York on business related to this property and to holdings in the Alice Arm section.

The Salmon River Mother Lode Mining Company, Ltd., has been incorporated with an authorized capital of \$100,000 and with its head office at Vancouver, B. C.

**Grand Forks, B. C.**

A contract has been awarded for the driving of about 1,000 feet of tunnelling on the Little Bertha-Pathfinder Mining Claims, twelve miles north of Grand Forks. This property is an amalgamation of the Companies owning the Little Bertha and the Pathfinder properties, which adjoin. Years ago each property shipped considerable high grade ore, the values running largely in silver. Mining experts who have looked the properties over have been impressed by the showings. The last shipments of ore went to the Greenwood Smelter in 1919.

**Kamloops, B. C.**

The Stump Lake District, situated half way between the towns of Merritt and Kamloops, B. C., has been the scene of considerable mining activity during the past year. At the Mary Reynolds, where R. R. Hedley M. E. is operating, the year's development consists of a 74-foot drift from the shaft and a 140 foot tunnel, with a 30 foot raise and open cuts at the approach. A mountain wagon road two and one half miles in length has been built from the main highway at Rochford to the Mine, giving the company a short route for hauling. About 130 tons of ore have been shipped during the year, returns having been received on 97 tons. The average analysis of this shows the following value: Silver 51.2 ounces; gold, 0.143 ounces; lead, 1.4 per cent; zinc, 2.4 per cent; sulphur, 2.6 per cent; silica, 52.5 per cent; iron, 6.6 per cent; lime, 6.4 per cent.

Since the resumption of operations a few months ago on the property of the Donohoe Mines Company the Joshua Shaft has been unwatered and it is reported that the Joshua vein shows stronger at 420 feet depth than it did at the surface. Some mining has been done and some shipments made but the returns are not available. Major Moon, one of the shareholders has been made General Manager, and J. T. Knapp, M. E. is the superintendent. A working tunnel is to be driven to crosscut the several veins of the property and a new concentrating mill and other machinery is to be installed.

Some fifty or sixty claims have been staked in the Stump Lake District recently. Most of these have been taken up by Smith Curtis, of Kamloops, and associates who are understood to plan quite extensive exploratory and development work this year.

**Fort Steele, B. C.**

It is reported that the building of a concentrator in connection with the Victor Mine, Maus Creek, is about completed. This property has been under development for many years by R. Abernathy, of Spokane, Wn., and associates. The ore is rather complex, the metallic contents consisting of agentiferous galena and zinc-blende associated with iron pyrite in a quartz gangue. The quartz vein, which varies from a narrow width up to five feet, has considerable bodies of this characteristic ore at several points.

**Slocan, B. C.**

The Evening Star Mine, Dayton Creek, near Slocan City, is making favorable progress. The tunnel now being driven has followed the ledge for a considerable distance. Operations on the Silver Nugget, which together with the Evening Star, is owned by Hugh Sutherland, of Winnipeg, Man., are expected to start in the Spring.

### Trail, B. C.

Ore and concentrates received at the Trail Smelter, Consolidated Mining and Smelting Co., amounted to 6956 tons of ore and 861 tons of concentrates. This brings the receipts at the smelter for the year 1919 up to 308,457 tons of ore and 12,041 tons of concentrates, which is about the same as in 1918.

In the ore statement for the last ten days of the month of December one new shipper appears, the Lincoln at Blaylock, Slocan. The Sullivan Mine tonnage of over 2,000 tons, for the first time since early in September includes a percentage of lead ore.

### Victoria, B. C.

Led by Major-General R. G. Edwards Leckie, G.O. C., who served with distinction in France with the Canadian forces and who retired recently from the military post of Officer Commanding the Western Canadian Military District, the Great War Veterans of British Columbia intends making strong representations to the Provincial Government regarding the placing of returned soldiers in the field as prospectors. General Leckie endorses the plan first outlined through by the Canadian Mining Institute and laid before the Dominion Government where it was not favorably considered. Briefly the proposition is that the Government shall employ returned men, who are physically fit, to go into the hills in search of mineral. To qualify them for their duties the establishment of a "prospectors' school" is advocated, where those who wish to participate may obtain instruction in elementary mineralogy and geology. After passing through this school the men would be formed into small groups, about ten in each, with one more advanced member as leader. Each group would be outfitted, provided with food, given the necessary prospecting equipment and sent to work in a locality selected by the government. General Leckie does not think that the cost of the government of the maintenance of the school and the "grub-staking" of the men would be excessive and feels that it would be a first-class method both of giving the unemployed something to do and of opening up the mineral resources of the Province. The proposal has not yet been formally presented for the consideration of the Government.

The announcement from Ottawa that an order-in-council has been passed, at the instance of the Department of Indian Affairs, throwing open Indian reserves for the mining of gold and silver is of special interest to British Columbia. Heretofore these lands have been rigidly closed to miners and to mining operations unless a surrender first was secured from the Indians affected, a procedure which involved negotiations with the Indians and an application to the Ottawa authorities through the Provincial Department of mines. Owing to the necessarily long-drawn-out character of such negotiations and the uncertainty of their outcome they have not often been resorted to and, particularly in this Province where the aggregate area of Indian reserves is quite extensive, this has meant a serious handicap to the development of mineral resources.

Recognizing this, Hon. Wm. Sloan, Minister of Mines, introduced legislation at the last session of the Provincial Legislature, amending both the Mineral and the Placer Acts. In respect of the Mineral Act Section 14, which defines the Crown and other lands upon which the holder of a free miners licence may

not prospect or mine, was changed to the extent of eliminating the words "Indian reservations land" while alterations in conformity with the intent of the amendment, were made in the forms set out in the schedule to the Act for the guidance of those making records. An amendment along the same lines was made to the Placer Mining Act, Section 15, which makes reservations as to the right of entry on Crown and other lands, being amended by the striking out of the words "Indian and," so that the last three lines will read "and any land already lawfully occupied for placer mining purposes, and also naval and military reservations." These amending Acts, however, have not yet the force of law the Legislature very properly providing that they should come into effect by proclamation by the Lieut.-Governor-in-Council, owing to the fact that, as the Dominion Government has absolutely jurisdiction over Indian Lands, it was essential that it should take action before the Provincial proposals could be realized.

With the Provincial Legislature on record, and the legal machinery in shape as far as British Columbia was concerned, Mr. Sloan's next move was to induce the Federal authorities to move. Accordingly, while in Ottawa shortly after the session, he took the matter up and was successful in securing the promise which now has been implemented. The admission of prospectors to Indian Lands for mining purposes, therefore, is assured as soon as the Lieut.-Governor-in-Council declares the amendments referred to be law.

As Mr. Sloan has not received a copy of the Order-in-Council as finally passed by the Dominion Government he declines to make any comment on its terms. These terms, as outlined by telegraphic dispatches, are that the Federal Minister is empowered to issue leases for surface rights on Indian reserves upon such terms and conditions as may be considered proper in the interests of the Indians and covering such area only as may be required for purposes of mining, such terms to include provision for compensating any occupant of land for any damage that may be caused thereon.

Any person who has authority under the provincial laws to prospect for and mine gold and silver may enter an Indian reserve upon receiving the necessary permit from the Indian agent and with whom he must deposit a certified copy of his provincial licence. Upon locating and recording a claim upon an Indian reserve and obtaining a lease for mining thereon from the Provincial authorities, the lessee must then apply to the superintendent-general through the Indian agent for a lease of the surface rights, at the same time submitting a plan and description of the lands and offering to pay a yearly rental of such amount as the Indian agent shall designate. Any timber required for mining purposes must be purchased at a price agreed upon by the Indian agent and the lessee.

The minister may incorporate in any lease such terms and conditions as may in his discretion appear necessary to safeguard the interests of the Indians individually or collectively, and if considered advisable, leases may provide that if the lessee should be convicted of the violation of any provision of the Indian Act or be guilty of creating any agitation or discontent among any of the Indians, the minister may immediately terminate the lease and the lease thereafter be regarded as a trespasser on the reserve, reasonable time, however, being given to remove fixtures and equipment if all rentals are fully paid.

## NOVA SCOTIA NOTES.

The lessee of the Stirling Mine, Richmond Co., Cape Breton, reports that additional development has uncovered a continuation of the main ore body about two thousand feet from the main operation. \$40,000 has been expended in developing the prospect, and the ore body has been touched by the drill at a depth of 325 ft. The ore, by recent analysis, is stated to run, zinc, 32.7 per cent; lead, 10.44 per cent; copper, 5.9 per cent; with ten ozs. of silver to the ton. How representative this analysis is of the general tenor of the ore values is we are not informed. The property is distant from Framboise Cove, south of Louisburg, about four miles, and is 35 miles from the nearest railway at St. Peter's. A line running from St. Peter's to Louisburg, connecting there with the Sydney & Louisburg Railway, has been surveyed, and the construction of this road has been mooted on several occasions. Such a road would open up a district of Cape Breton that has many possibilities agriculturally, and is apparently well mineralized.

The Anglo Coal Company, at New Campbellton, Cape Breton, has been operating approximately one year. Since the mine was re-opened a great deal of prospecting and cleaning-up has been done, and at the present time about sixty men are employed, producing up to one hundred tons daily.

This property is in many respects an interesting one. The coal seams worked occur on the extreme edge of the Sydney coalfield, and the coal-seam can be seen standing almost vertically on the pre-Cambrian spur which ends in the abrupt cliff of Cape Dauphin. As presumably the carboniferous sediments were laid down in quiet waters along the sides and valleys of the pre-Carboniferous uplands, the present vertical position of the coal measures, at their contact with the older rocks, is due to subsequent earth movements as the coal measures flatten out not far from the contact and proceed seawards with normal dips.

The mine is entered by slopes from the outcrops, which occur at a considerable elevation on the mountain side, and is connected with the shipping wharf in Kelly's Cove by a narrow-gauge railway. The surroundings of this mine are unusually picturesque, even for this district of Cape Breton. An interesting feature is that near the mine the Carboniferous Limestone crops conformably under the Millstone Grit and formerly, when the mine was operated by Messrs Burchell, a high-grade dolomite was mined and shipped to Sydney for use in the open-hearth furnaces. Not far away, also is one of those seasonal lakes, not uncommon in this district, which has a bottom of what is apparently an infusorial earth that possesses quite excellent polishing properties. Also in this district, as is not unusual in limestone formations, caverns are to be found, one well-known example being locally known as the Faery Hole. No better spot for Campbellton, as the Coal Measures proper, the Millstone Grit and the Carboniferous Limestone crop on the Cape Dauphin spur within a superficial distance of less than a quarter mile, and a short walk will bring one on the mountain plateau of the spur—locally known as Blueberry Mountain—at an elevation of 1045 feet, affording an excellent prospect of the Bras d' Or Lakes and the Sydneys. Blueberry Mountain it may be mentioned in passing is a favorite haunt of the local Micmac Indians and is the reputed scene

of many of the exploits of the Indian tribal demigod Glooscap.

The coal production of the Anglo Mine must be shipped by water, as there is no railway on the Baddeck slide of the Bras d' Or Channel. The present General Manager is Mr. John S. Barton formerly General Manager of the Minudie Colliery at River Hebert, Cumberland Co., N.S., and the President is Mr. J. C. Douglas, M.P., of Glace Bay.

At one time the mine was operated by Mr. James T. Burchell, who sold the property to the Harmsworth's who contemplated supplying coal to the Newfoundland paper mills in Newfoundland, but have not operated the mine. The present operators it is understood, have a lease of the property from the Harmsworth interests.

The several Conciliation Boards appointed to consider the questions associated with wage classification Scotian collieries are proceeding with their duties.

Discussion of a revision of the wage classification has been continued between representatives of the Dominion Coal Company and its employees since early in December, and an agreement has now been arrived at, which only requires ratification by the locals to go into effect. Details of the new classification have not been published but are stated to include 300 differing rates. The new agreement is to continue for a year, and contains provision for revision at specified intervals should circumstances require.

Following upon the increase in wages given to its employees, the Dominion Coal Company has announced an increase in the price of coal to domestic consumers in the Sydney District from \$5.65 to \$6.20 per ton. The workmen's rate still continues unchanged from the rate of 1908, namely \$1.50 per ton, which today represents probably one-third of the cost of producing the coal. The increase announced is applicable to the colliery doctors and to the churches, who have customarily received preferential rates.

The Conciliation Board appointed to consider the wage question at the mines of the Nova Scotia Steel Company will shortly commence its work.

The high cost of coal production in Nova Scotia has its most serious reflex upon the production of steel and presents probably the most serious problem of the future to the steel industry, which, it should always be borne in mind, is the child of the coal industry.

It is announced that the Dominion Coal Company is shortly to proceed with the sinking of a new shaft to the Phalen Seam at Quarry Point, which is situated about 1¼ miles from the present Caledonia Colliery, on the cliffs overlooking the ocean to the southward of the mouth of Glace Bay Harbour. The Phalen Seam is expected to be about 600 ft. deep at this point, and the new shaft will be equipped to handle the coal from the submarine territory lying between the assigned barriers that bound the workings of No. 2 Colliery and No. 6 Colliery. The new shaft will form the main outlet for the submarine coal, the original Caledonia Colliery having been opened in 1866 to mine the land area, now entirely exhausted. It is amusing to go back to the evidence given before the Supreme Court in Sydney during the Steel-Coal trial in 1907, when it was gravely argued on behalf of the Steel Company that No. 6 Colliery was not operating upon the Phalen Seam. The workings of

Dominion No. 6 must by this time be closely abutting upon the workings of No. 4 Colliery, in submarine territory; but, as a matter of ascertained fact, the continuity of the Phalen Seam from the workings in the Glace Bay District to those at No. 6 Colliery was just as definitely established in 1907 as it is today, twelve years later.

### PORT ARTHUR NOTES.

By J. J. O'CONNOR.

A deputation from the City Council of Port Arthur, headed by Mayor Blacquier, had a very cordial reception from the Hon. Harry Mills, Minister of Mines, when they waited on him recently for the purpose of placing before his attention some of the needs of this part of Ontario.

While the Hon. Mr. Mills did not make any definite promises, he commented favourably on the various suggestions made by the deputation, and it is expected that they will have his closest attention, and be implemented at an early date.

The main points urged by the deputation were as follows:

1. That the government aid iron ore mining by adopting the policy of the Nova Scotia Department of Mines, in providing core drills for prospecting purposes, and defraying half the cost of drilling.
2. That the Ontario government examine exhaustively the merits of the proposed Federal subsidy in aid of iron ore mining, and, if it is deemed worthy of support, to co-operate with municipalities, and other public bodies already promoting this measure.
3. That the government demand more attention from the Geological Survey of Canada, to the neglected mineral bearing regions of Ontario, more particularly this part of the province.
4. That he be pleased to instruct the Ontario Bureau of Mines, to include the mineral areas tributary to the head of the Lakes, in the field work of its officers.
5. That his Department supply much needed areal maps, at cost, to prospectors.
6. That he cause to be added to the staff of the Ontario Bureau of Mines, a competent official, whose sole duties it shall be to attend to adequate publicity of Ontario's mineral wealth.
7. That the Mining Act of Ontario be amended, so as to permit of Crown Patents being issued, instead of Licenses of Occupation, as at present, for land covered by water, in mining claims, where there is no interference with navigation.
8. That he cause to be established here, a branch of the Provincial Assay Office, for the purpose of facilitating the securing of assays, cheapening the cost, avoiding delays, and increasing the number made.
9. That the alleged practice of staking mining claims for the sole purpose of securing the timber on the lands, be investigated.

### ONTARIO AND COAL.

#### An Informed Toronto Opinion.

Once an idea becomes firmly established, whether right or wrong, it receives general acceptance, and while conditions may change entirely, most people will still think that something different is impossible. Most of us hope to live to see the day when the whole of Ontario will be supplied with coal, whether raw or treated, from Canadian mines. This is by no means

the impossible dream it is supposed to be at present. Those who are perhaps best informed on this question have, at various times, outlined plans whereby this may reasonably become possible. Mr. F. W. Gray, editor of the Canadian Mining Journal, is perhaps as well qualified to speak regarding the possibilities of Eastern Canada coal fields as any one, following his long connection with the producing companies of Nova Scotia. He has recently pointed out what must be done to place this coal on a competing basis in Ontario, and the problem resolves itself into one of greater production, where costs are lowered, and ocean transportation to the Great Lakes. Those who remember the large fleet which, in former years, carried coal from Sydney to Montreal, should only consider this transportation factor trebled and it might be surprising how well our own coal would stand up against that otherwise imported. We are in a position where we may hope to reduce our costs on eastern coal by increasing production and by better water haulage facilities, but it is very questionable if American coal can ever be placed here again much cheaper than the present price. Besides these factors, there is every likelihood that carbonization plants will prove a factor and with those established along the St. Lawrence River, we have possibilities of the greatest importance.

From the other side, it would appear that a greater measure of co-operation on the part of the mine owners in Alberta along with a fair amount of success with briquetting schemes, must eventually allow western coal not only to extend its market into the United States, but at least to meet competition at the head of the Lakes. These pictures are not dreams, but they will not come true very quickly if we do not realize that here is one place that by stopping the gap, we could save perhaps \$100,000,000 on our trade balance in a year. With a hundred Canadian boats on the St. Lawrence, and a few more thousand miners in Nova Scotia, it might even surprise Buffalo where all the coal was coming from. Lest we should be forever begging, is it not worth trying for?

—Canadian Chemical Journal, Toronto.

### GENERAL MINERAL PRODUCTION IN NOVA SCOTIA DURING THE MINES YEAR 1919.

By the courtesy of the Deputy Commissioner of Mines, we have been furnished with some statistics relative to the mineral production of Nova Scotia in the fiscal year 1919.

Gold production will not exceed 950 ozs. Nova Scotia, in common with the other gold-producing areas of Canada, has suffered from the incompatibility between the fixed price of gold and the rising costs of production. This is the smallest gold production on record in Nova Scotia.

The most important new development of the year 1919 was the discovery of salt at Malagash. (See issue of 8th January, 1919, and May 14th, 1919, for full descriptions of this deposit by L. Heber Cole). Dr. Hayes, of the Geological Survey, has also examined this deposit during the year, and further development is proving that the deposit is extensive, and that a portion of it, at least, is high-grade material. It is reported that occurrences of soluble potassium salts have been found associated with the Malagash area, and we hope to give further particulars of this in a later issue of the "Journal."

# A MARSH HOIST

## IS MADE THE RIGHT SIZE FOR YOUR MINE

and in either Steam Power or Electric Power

This shows one of our Electric Mine Hoists. We make many other types. Send for our catalogue of Mine Hoists, Cars, Cages, Buckets, etc., and see what we offer you. It will repay you.

From the little 10 Horse Power size for prospectors or small mines to the massive 50 Horse Power size, one of our 7 sizes should be just right for your mine.

We are specialists in the building of Hoisting Machinery of all sorts. For nearly a quarter of a century we have been designing and building Hoists, and have developed a Hoist that we are really proud of—proud because of the record of good work they have done, and are doing in mines, quarries, and other classes of work from one end of Canada to the other.

# BOLINDER'S

## Heavy Crude Oil Engine

FOR MINING AND INDUSTRIAL PURPOSES

Built by a Firm who Stands Supreme in the Whole World as Oil Engine Experts.

The Bolinder operates on a cost of only  $\frac{1}{2}$  cent per Brake Horse power per hour—an enormous Saving as compared with a Steam plant. A 200 B.H.P. Bolinder (which is equal to a 250 I.H.P. Steam engine) costs only \$1:—per hour at full load.

The Bolinder eliminates firemen and fire hazard.

The Bolinder is the result of 30 years' experience.

**Reliable**  
**Durable**

A 320 B.H.P. Bolinder Engine directly connected with a Generator.

Representatives:—

Swedish Steel and Importing Co., Limited, Shaughnessy Building, MONTREAL

The production of coal during the fiscal year may be stated as 5,005,000 long tons, compared with 5,211,000 long tons during the fiscal year 1918. This aspect of Nova Scotia's mineral production was fully dealt with in the last issue.

There was no production of scheelite or molybdenum. About 150 tons of manganese ore was mined and shipped, and about 50 tons of barytes was produced.

No iron ore was reported as having been mined in the Province, but iron-ore was imported to the extent of 646,000 tons—chiefly of course from Wabana, Newfoundland and ferro-manganese was also imported to the extent of 1,100 tons.

During the fiscal year, 334,500 tons of pig iron, 374,900 tons of steel ingots, 353,400 tons of limestone for flux, and 518,700 tons of coke were produced, all in connection with the iron and steel works of the province.

Structural materials comprised 12,900,000 bricks, 12,000 tons of cement blocks and 605,900 feet of tile pipe, the figures being approximate in each case.

About 6,700 tons of ammonium sulphate were recovered at the coke-ovens of the Dominion Iron & Steel Company at Sydney.

Gypsum mining has been at a complete standstill, but with the revival of building mining should be resumed as Nova Scotia contains large deposits of high-grade "plaster."

An interesting development of the year, although only officially announced in 1920, is the intention of the Dominion Iron & Steel Company to provide a brick-plant for the manufacture of fire-bricks and other shapes of refractory brick, for use in the metallurgical processes and the coking plant of the company. It is now publicly announced that an expenditure of up to \$500,000 is contemplated in brick-making equipment and kilns. It is the intention to make silica bricks and the ordinary fire-brick, for the manufacture of both of which suitable materials have been found locally.

For some time the Steel Company have experimented with a small kiln with local clays and silicious materials. Quite good fire-clays, of moderately refractory character are found associated with the coal measures in Nova Scotia. For a good many years the Intercolonial Coal Company at Westville has made a fire-brick, much used locally, from a clay associated with one of the coal-seams being worked at Westville. The Nova Scotia Steel Company, also, about a year ago provided a small brick-making plant and has been obtaining a satisfactory fire-brick from Shubenacadie Clay (see "Iron & Steel of Canada," Oct., 1919, issue).

Large and really important deposits of silica rocks are found near Salt Mountain, Whycomagh, and it is probably not too much to anticipate that if a silica brick industry is commenced in Sydney, the sale of the manufactured products may not be restricted to the plant uses of the resident steel companies, although these are very extensive in themselves.

The establishment of fire-brick manufactories in Nova Scotia will do much to make the steel and metal trades in the province self-contained. The dependence of the steel industry on outside sources for refractories has been very severely felt during the war period, and will, of course, be still more felt, in view of the large increases in freight rates that may be shortly expected.

## ALCOHOL FROM COAL.

### Extraction on Commercial Scale.

Mr. Ernest Bury, of the Skinningrove Iron and Steel Works, read a paper before the Cleveland Institution of Engineers, in which he revealed that at the Skinningrove works he had succeeded in extracting ethylene, alcohol, and their derivatives on a commercial scale from coke oven gas.

The work is still to some extent in the experimental stage, but Mr. Bury has succeeded in producing a perfect motor spirit. Mr. Bury's process, if developed to its full extent, will render us largely, if not entirely, independent of outside sources of supply.

The practical working of Mr. Bury's process at the Skinningrove works, where 5,800 tons of coal are carbonized per week, has revealed an average yield of 1-6 gals. of alcohol per ton of coal carbonized. Having regard to the scarcity of liquid fuel, that in itself is important; it is national suicide to continue to burn any substance which might be converted into liquid fuel. He pointed out that the recovery of alcohol at the gas works of the country would yield 27,000,000 gals., or, taking alcohol and benzol together, the total quantity of liquid fuel available for extraction, through the carbonizing of coal would be 114,000,000 gals., as against the country's present total requirement of 16,000,000 gals. per annum.

The process of extraction by contact with sulphuric acid is not a new discovery, but Mr. Bury has been the first to establish it as a commercial proposition. His principal discovery is that the best results are achieved at a temperature of 60 to 80 degs. Cent., and in his process he has carried the utilization of heat from the coke oven plant to the utmost limit. Either, chloroform, iodoform, acetic acid, and acetone are among the derivatives he has obtained from this coke oven gas after the benzol has been extracted. Dr. J. E. Stead paid tribute to the brilliant young scientist, and also to the progressive policy of the company at whose works these experiments were carried out.

The Inter-Departmental Committee on Power Alcohol, in their report recently issued, stated: "We have received exhaustive technical evidence from representatives of the Ministry of Munitions concerning the investigations made by them during the war in respect of the extraction of ethylene from coal coke oven gases, and concerning quantitative results so obtained. Lord Moulton, in his capacity of Director-General of the Explosives Department of the Ministry, sat with us at one of our meetings when this subject was specially considered in relation to future output, the synthetic conversion of the ethylene into ethyl alcohol, and the estimated costs of the processes involved. The testimony of witnesses and records of work done indicate that there is thus available in Great Britain a large potential source of power alcohol, but further investigations are necessary in this connection, particularly as regards the conversion of the ethylene into alcohol, before definite figures as to quantities and price can be given."

The Shipton Electric Pig Iron and Steel Smelting Company, Limited, has been incorporated with an authorized capital of \$250,000 and head offices at Vancouver, B. C. No definite information is available as to the immediate plans of this new concern.

**CANADIAN COAL MEN.**

M. A. McINNIS.

Mr. McInnis has in a sense deserted his first love, inasmuch as he has transferred his very considerable energy from the work of producing coal in Cape Breton to the sale of coal in Montreal. "Mick" McInnis, as he is known to his friends—and they are many—commenced his coal mining experience as a boy at the Gowrie Mine at Morien, Cape Breton, a place that in those days ranked first in the coal-mining activities of the Glace Bay field, and will at some future date be again the scene of coal mining on a large scale, as a very extensive undersea coal tract is accessible from the vicinity of Morien. Later, he entered the service of the Warehouse Department as a junior, and rose successively to be mine manager and eventually Superintendent of No. 3 District of the Dominion Coal Company's mines. After having been in the service of the Dominion Company and its predecessors for over thirty years, and being still a young man, Mr. McInnis migrated to Montreal, and was for some months engaged in the service of the Fuel Controller in the work of facilitating the transportation and distribution of coal imported from the United States into Canada during the memorable coal shortage and severe weather conditions of the winter of 1917-1918, a period that should not be forgotten by Canadians, who were saved from something approaching disaster by the work of Mr. Magrath and his assistants, aided by the whole-hearted support of the United States Fuel Administration at a time when in the United States itself there was seen the phenomenon of "heatless Mondays" and other unprecedented occurrences.

Later, after an extraordinary instance of political bias, which raised objection to Mr. McInnis's employment because he has always been a Liberal in politics, Mr. McInnis entered into the business of selling coal on his own account, and has been as unqualifiedly successful in the coal sales business as he was in producing coal in Cape Breton, thanks to his complete knowledge of the business in all its ramifications and to his capacity for unremitting work. Recently, he has been placed in charge of the consolidated business of the Lackawanna Coal Co., and the P. McCrory Co., which are now merged as the Lackawanna McCrory Coal Co., with offices at 192 St. James St., Montreal. Mr. McInnis is still a young man, and is a good sample of the men of Highland descent, who so largely compose the staffs of the Cape Breton coal and steel companies, and who also, to a very large extent have supplied the impulse that has developed the coal mines of the Canadian West. To those unacquainted with the ethnological survivals of Cape Breton, and the principles of self-determination that have always marked the settlers in that Island, we would mention that our friend's name is not Maginnis, nor, to hint at another racial subtlety, is it MacInnes.—Ed.

## The Provision of Pit Timber

The relation between lumbering and mining has always been very close in Canada, and the subject is at this moment one of keen debate in Northern Ontario.

The branch of the mining industry preeminently interested in the timber supply is that of coal-mining as a suitable and moderately priced supply of timber for the support of roof and sides in coal-mines is a first consideration. This was well evidenced by the position of the coal-mines in Britain during the war, and the scarcity of suitable pit-timber is one reason why much attention is now being paid by French and Belgian and British colliery owners to the possible substitution of concrete as a roof support in coal-mines. For certain purposes, however, no really satisfactory substitute has yet been found for the timber pit-prop, although the greater use of structural materials in collieries is probable.

In Canada, the districts most interested in a supply of suitable pit-timber are the prairie coalfields and those of Nova Scotia, in particular the coal-mining districts of Cape Breton Island. As the coal-mining companies of Nova Scotia are now most heavily interested in timber lands, there is for the Nova Scotia coal-mining industry at any rate, matter for thought in an article on Canadian forests by Frank J. D. Barnjum, which is reproduced from "Pulp and Paper" in this issue of the "Journal."

Singularly, however, the timber lands owned by the coal and allied steel companies of Nova Scotia, do not contain quite the growth that is most suitable for pit timber, or more specifically, for pit props; as the timber on these lands is of comparatively large growth, and has been acquired by the companies referred to more as a reserve for general lumbering purposes than for the supplying of pit props. For example, the lands owned by the Dominion Steel Com-

pany in New Brunswick furnish board lumber, shingles and a large amount of barrel staves and package lumber for the shipping of nails and small-sized steel products. The very valuable lands in southeast Nova Scotia, controlled by the Dominion Steel Corporation, through its control of the Cumberland Railway and Coal Company, constitute one of the best general lumber reserves in Nova Scotia, from which such sizes as standard-gauge and pit-gauge sleepers are produced, together with heavy pit-timber and booms. The lumber properties acquired by the Nova Scotia Steel Company and recently largely increased by the purchase of the Rood, McGregor interests, are intended to provide lumber for car-building primarily.

Mr. Barnjum's article points out very conclusively the disappearing quantity of spruce timber in Eastern Canada, which he regards with trepidation because of its effect upon the life of the pulpwood industry. The growth that is suitable for pulpwood is precisely the growth that is required to furnish the ordinary pit-prop, and the coal-miner is, we believe, just as entitled to express concern at the prospect for pit-prop supply. The spruce of Northern Cape Breton is a small tree, of slower growth than in the districts mentioned by Mr. Barnjum, its habitat develops just those qualities of toughness and strength that are desirable in a pit-prop. The supply of pit-props in Nova Scotia has been steadily growing more restricted in Nova Scotia for some years past, and the cost has, of course, increased very rapidly, and is likely to increase with even greater rapidity in the future. The provision of a future supply of pit-timber is therefore a matter that interests coal miners in Nova Scotia very vitally, particularly in view of the likelihood of an enlargement of the number and extent of longwall extractions as the deeper and thinner coal seams are attacked.

## The Legal Status of Workmen's Compensation Boards

Many surprising things have in recent months come out of Manitoba, but nothing more upsetting than Mr. Justice Mather's recent judgement that the Workmen's Compensation Board of Manitoba is a court, and that its constitution is *ultra vires* of the powers of the provincial government of Manitoba.

Mr. Justice Mather's judgment seems to touch the

vital fact that lies at the bottom of our modern conception of workmen's compensation, which is that compensation for injuries sustained in and arising out of the course of employment is an inherent right of the workman, and therefore not subject to adjudication in a court of common law. This is why the recourse to common law proceedings is debarred by the

Workmen's Compensation Act of several of the provinces. It has been suggested that in Manitoba Mr. Justice Mather's judgment can be made to harmonise with the powers of the Provincial Legislature, and that the existing law can be made *intra vires* by an amendment giving an injured workman the power to elect whether he will submit his case to the Commissioners of the Workmen's Compensation Board, or will proceed under the common law; but while such an expedient might assist in the situation created by the recent judgment, it would strike at the root principle of the most approved and certainly most helpful system of disbursement of workmen's compensation yet devised.

If the Manitoba Act is *ultra vires* of provincial powers so are the acts of Ontario, Nova Scotia and British Columbia, and very large sums of money, touching the lives of thousands of dependents are involved.

The following opinion by a Winnipeg lawyer, taken from the Winnipeg "Free Press," seems not only to put the matter very clearly, but to indicate that the latest ruling on a novel point may not be sustained on appeal. The opinion referred to is as follows:—

"The effect of Chief Justice Mathers' ruling that the Workmen's Compensation Board is a court will simply be that the Dominion government will have power to appoint the members of the board, and that the province cannot appoint them as in the past.

"The same point arises in connection with the public utilities commission.

"A view contrary to that advanced by Chief Justice Mathers has been held by many authorities, and this is that Workmen's Compensation boards are essentially administrative bodies vest-

ed with incidental judicial attributes to enable them to pursue a simple and efficient course of administrative work, and that such boards are not courts because they are invested with some of the formal functions of judicial tribunals. The board is, according to this view, simply exercising such powers as the legislature itself might exercise, but which for convenience the legislature has delegated to the board."

There is another side to the general question of workmen's compensation, namely, that a unification of provincial laws, the adoption of a common scale of compensation, pensions and reserves, and a coordinated scheme of administration is likely to be one of the developments of the future. Already, the Workmen's Compensation Boards of the different provinces have formed an association for the study of these matters, and it will also be recollected that a unification of compensation acts and compensation rates was unanimously recommended by the Industrial Conference held in Ottawa last September. Mr. Justice Mathers' judgment is not likely to affect the enlargement of the general principle of workmen's compensation, and its delivery at this juncture will in the long run prove helpful, pointing out as it does some of the very wide powers that have been vested in Workmen's Compensation Boards, and indicating the possibility that the future may bring with it the necessity for federal supervision. As a practical instrument for the equitable disbursement of workmen's compensation, in the most economical manner and with the maximum avoidance of legal assistance and reference, the Workmen's Compensation Boards have proved their striking usefulness, and their retention—with some possible modification of their powers—may be assumed as very probable.

## Lower Percentage of Mine Fatalities in British Columbia

Our Victoria correspondent reports a gratifying decrease in the rate of mine fatalities in British Columbia during 1919. There is always a certain reluctance on the part of miners to note the absence of fatalities or their decrease, for reasons that are understandable, but not quite explainable to those who are outside the freemasonry of the miners' craft. The time when fatalities are decreased is precisely the moment when watchfulness should be increased, for in mining, as has been said of politics, eternal vigilance is the price of safety. With this reservation, the record of British Columbia mines during 1919, is one on which the industry and those who govern it are to be congratulated.

The Editor during a hurried visit to a few of the Vancouver Island collieries, was most favorably im-

pressed by the attention which is paid to first-aid and mine-rescue work and the inspectorial system of the Province, so far as it was possible to judge by hurried observation, seems to be both well staffed and well regulated. The coal-seams comprised within the Province of British Columbia are distinguished by a remarkable variety of geological occurrence; and the differing character of the mine gases, both as to quantity and composition is a circumstance that seems to have been well noted by the authorities. The little vest-pocket manual on the height of gas-caps, which was noted in the "Journal" of 24th December as being issued by the Department of Mines, is one indication of the interest which is taken by the Department of Mines in the education of the miners with regard to the peculiarities of the local mine gases.

# Some Startling Facts About Canada's Forests

Raw Material for Wood Using Industries in a Very Serious Condition

By FRANK J. D. BARNJUM, Annapolis Royal, N. S.

(From "Pulp and Paper.")

Mr. Barnjum is not a stranger to Montreal as it is the city of his birth, being a son of Francis E. Barnjum who came to Canada from London, England, in 1856, and a nephew of Major Fred S. Barnjum who was one of Montreal's best known citizens forty years ago.

Mr. Barnjum's business career began with the firm of Taylor Brothers, in the old Union Building on St. Francis Xavier St., as office boy. He later moved to Maine, where his first timberland purchase was made twenty-eight years ago and from there to Nova Scotia, where he has been largely interested for the past twenty years.

\* \* \*

The time has now fully arrived when an embargo or export duty should be placed on the large amount of fee land wood that is being shipped across the line from the principal pulpwood producing provinces of Quebec, Ontario and New Brunswick. (Pulpwood exports from Nova Scotia are practically negligible, amounting to only 770 cords in 1917, the last Government report available.)

These provinces now have enormous investments in pulp and paper mills which are increasing in number every year, and it seems incomprehensible that the owners and security holders of these splendid monuments to Canadian industry and brains should longer sit idly by and allow this steady stream of raw material to slip away from their very mill doors. The consumption of pulpwood in Canada has reached such enormous proportions that a halt should be called in such suicidal policy.

Surely Mr. Phillip T. Dodge, President of the International Paper Company, who is in a position to know better than any other authority, sounded a sufficient warning to Canada when he made the statement that the pulpwood supply of the Eastern States was practically exhausted and that they must look to Canada for their future supply.

There are two ways that the shipment of this wood can be prevented, one is by an embargo or export duty created by the Provincial governments, and the other is by a combination of the Canadian mills purchasing all this fee land wood year by year and making a division of the same on a basis of the shortest rail haul to the various mills.

The settler and farmer will also be benefited as with this wood all manufactured in Canada he will have a market nearer home, not only for his wood but a bigger and better market for his farm produce as well.

To offset the tremendous loss of standing timber caused by the spruce bud worm in Canada during the past two or three years, no paper mill should cut a living growing tree on its own limits just as long as it can buy a cord of this fee land wood that is daily crossing the line, simply cutting the burned and blown down timber and salvaging such worm killed timber as is economically possible.

I am not cutting a tree on my own lands while I can buy a cord of wood; notwithstanding the fact that I have the largest amount of standing timber of any pulp company in Canada, based on the capacity

production of my mills, and to which holdings I am adding as rapidly as possible.

The million or more cords of wood that is being annually shipped to the United States, returning only about 15 million dollars, if made into pulp and paper here would not only enrich this country to the extent of more than eighty million dollars per year, but would prolong the life of all of our pulp and paper mills a period of at least five or six years beyond their present expectancy.

This large additional income is doubly important in view of the unfavorable trade balance between the two countries, and would to a large extent help to correct the present deplorable condition of exchange.

Canada is in a very independent position as the United States simply must have our paper—she has no alternative. Newsprint cannot now be landed in New York from Scandinavia for less than \$170 per ton, 8½¢ per pound, and even then only in limited quantities. Our production has increased to such an extent that we are now producing a total of 800,000 tons of paper per year, which is very nearly half the consumption of the United States, and we shall very soon be producing much more than half, owing to the fact that many of the American mills will be forced out of business from lack of a wood supply. Strange as it may seem many of their mills do not own an acre of timberland. With the exception of the Oxford Paper Company, and the Great Northern Paper Company, the larger mills in the United States own timberlands which will provide a supply adequate only for a very few years. The greatest asset the paper companies have today who own timberlands, is their raw material supply. But the American mills should be stopped from drawing the life blood of our Canadian wood using industries. They can find no fault with such action as self preservation is the first law of nature and I am very sure if the case were reversed the American mill owners would have taken this action long before this. However friendly neighbors may be, it is hardly reasonable to expect the mill owner in one country to allow the raw material to be removed, almost from his mill yard, to supply the mills of another country with the possible closing down of his own industry.

Some may question the power of the provincial government to act, but the highest legal tribunal of the State of Maine ruled that it was constitutional for a state to regulate even the size of the trees a man may cut on his own private land. Anyone who bought land in this country bought it subject to the laws then existing, as well as to any regulations that might be imposed in the future.

## Annual Increment Leaves a Net Loss.

The wood resources of Canada have been so grossly exaggerated that very few are aware how meagre our supply of available wood really is. I have spent a large portion of the past few years in a personal investigation of the Canadian situation, the results of which are so alarming that I have refrained from publishing my findings.

The theory of an annual growth that has been indulged in so freely in the past has simply become a

popular delusion. There is, of course, a gross growth, and a net growth under some conditions, but to offset this the annual wastage by fire, wind, insects and fungi, taking the country as a whole, far over-runs the gross growth. Consequently we are simply consuming our capital year after year.

If anyone has any question as to the enormous amount of this wastage, let him explore the woods of Ontario, Quebec and New Brunswick, where one can travel day after day and see nearly everywhere the vast destruction caused by the spruce bud worm alone. There are millions of acres in these provinces where over fifty per cent of the standing pulpwood has been completely destroyed.

To emphasize further this question of growth, it is only necessary to refer to the recent reports on the growth in some sections of Quebec, which show only about 30 board feet per acre, meaning about one 6 inch tree per acre per year. It has never been disputed that there is no actual accretion in virgin timber as the mortality more than offsets all growth. Furthermore, even in cut-over land when one realizes that it is only necessary to have an average of one ordinary sized tree per acre per year blow down, how easy it is to see that the annual growth is wiped out by this one process of destruction. I have seen thousands of acres laid flat by wind, not only in cut-over lands but also in so-called virgin stands. So much for wind.

Now with regard to the losses from forest fires, the spruce bud worm, borers and fungi. The figures are so appalling that I dare not commit the result of my findings to print, but these losses are so enormous that no one who is sincere will attempt to deny that they far over-balance any annual growth that there is in Canada or the United States. Cut out this mythical annual growth theory and what are we doing? As I said before, we are simply using up our capital.

One often sees the statement in print that we are "using more than three times our annual growth," while in fact, as previously stated, there is no annual growth to use, for the reason that enemies of the forest, cited above, destroy much more than the growth.

The timberland owner has the satisfaction of knowing that even if he has lost one half of his standing timber, by the ravages of the spruce bud worm, still what he has left is worth double the previous price per cord, as the destruction is country wide, and the consequently diminished supply will necessarily create an immediate and substantial advance in land and stumpage prices.

If some of the paper mills of the United States had not gone so far afield for their wood last year by invading the more remote sections of Ontario and Quebec, where the freight alone amounted to \$16.00 or more per cord and accepted wood down to a diameter limit of one and one half to two inches, they would be short of wood to-day.

#### Logging by Aeroplane—Not Yet.

In some of the wild estimates of our supply of standing timber made in the past, they have simply taken the map of Canada, determined the number of square miles, and arbitrarily figured so many cords per acre. Now as logging by aeroplane has not been perfected as yet, there are only two ways you can get out wood, namely, by river or railroad. About all the more important rivers of Canada have been logged on and driven, from the very earliest days. Many of them have been practically stripped or cut out, while others are being operated pretty well back to their head-

waters, so far remote that it takes two years or more to drive logs to the mills.

In the case of the railroads the condition is pretty much the same with the exception of possibly the Transcontinental, but inasmuch as this road was built beyond the height of land, there is very little wood available north of this road, as the rivers all drain away from it towards Hudson Bay. This leaves only the territory that lies south of the railroad, but as sawmills are springing up along this line, like mushrooms over night, and as fire is taking a heavy toll in this section, the paper mills will derive only a small supply from this source. Every time a railroad is built in a wooded country, more wood is burned up than is hauled out.

When talk is made about obtaining pulpwood from the cold northern sections that have not been opened up, where it takes 150 years to grow a four inch tree, where the snow falls to a depth of 15 feet and the thermometer registers 50 below zero, it will be only when pulpwood has reached a price more than \$75.00 per cord. We hear Alaska suggested as a possible field for the making of paper, but all of the above handicaps apply to this section, except along the coast, as well as the fact that it is 4000 miles distant from the large paper consuming market.

All anyone needs to know is that in the United States more than 5,500,000 cords of wood are used annually for pulp alone, in order to realize that this appalling shrinkage in our capital stock of standing timber must necessarily all too soon wipe out the remaining supply.

#### Beyond Conception Is 5½ Million Cords

I want the reader to pause a moment when he reads this paragraph, five million five hundred thousand cords—not feet, but cords, used every year in the United States for pulp, and principally in the Eastern and Middle States. Few can realize just what this really represents, but to try and make this comprehensible, it means a solid pile of four foot wood, twelve feet high reaching clear across the continent, or a pile four feet high, nine thousand miles long, and yet we may travel for days on the railroads and hardly see a spruce tree. Personally I should not want to take the contract to furnish this amount for even one year, and where is it to come from after the next ten years?

Imagination can hardly grasp the real significance of the terrifying estimate of the annual consumption of all wood products in the United States, namely 244 million cords. Even this estimate of consumption is doubtless conservative, as it is impossible for the Government to obtain complete reports of all actual production.

#### Tremendous Losses by Fire.

In addition to this enormous amount that is being cut, fire is taking a terrible toll as well. Over a billion feet of timber was destroyed this present year in just one State—Montana. This means two million cords or nearly half the entire amount consumed for pulp in one year, destroyed by the fire fiend in one state. Last year the same thing happened in Minnesota, and this same thing has been going on since this country was first settled and to such an extent that 75 per cent of the original stand of timber has been destroyed by this same cause, and yet some authorities will still talk of an annual growth.

It is a curious fact that some of the coldest sections are the most prone to fire, such as Newfoundland, British Columbia, Northern Ontario, Northern Quebec, Minnesota, Alaska, etc. These fire zones are just as well defined as land and water.

#### Increase in Consumption Overlooked.

In many of the estimates that have been made as to the length of time our standing timber will last, the important question of the increase in consumption is quite overlooked, and as showing what an important factor this is, I will simply cite a 5 year period in the St. Maurice Valley, where the increase amounted to 200%, or at the rate of 40% per year.

Thus far I have largely discussed principally the pulp-wood consumption, and yet when you add to this the extraordinary demand we have in sight for lumber for new construction the world over, it simply adds to the danger that is facing this country from a premature exhaustion of a supply of raw material for our magnificent paper mills, which today are the second most important industry in Canada, and which with a proper and judicious guarding of our raw material, will shortly occupy first position.

The paper mills which have a wood supply will make large profits in the future, as there are so many American mills which have no supply of their own and will be forced out of business on that account, which will make a continued shortage of paper from this time on. Furthermore, no government can for any length of time, interfere with the natural law of supply and demand, or make a spruce tree grow in less than 50 to 75 years.

As showing what effect lumber and other products of wood may have on the price and scarcity of pulp-wood, I will simply note that in some sections, owing to the abnormally high price of laths, pulpwood is being sawn into laths netting from \$30.00 to \$35.00 per cord for the wood at point of shipment.

#### Prophecy Has Come True.

In an article which I wrote three years ago when the publishers were complaining of 2¼ cents paper, I then stated that the question of the future would be not one of price, but of obtaining paper at any price.

That prediction has already proved only too true in a much shorter time than I anticipated.

I have devoted the past 28 years to the study of the one subject of timberlands and wood supply, and during this period I have seen lands go from \$1 to \$15, \$20 and up as high as \$50 per acre for the same lands; and stumpage go for \$1.50 for a mark of logs that only took 4 to the thousand, to a price of \$20 per 1000 for a mark of 12 to the thousand; pulpwood from a low price of four dollars to a high of thirty-two dollars per cord, and spruce lumber from a low of twelve to a high of sixty dollars per thousand. Stumpage in New Brunswick even has been sold as high as \$15 per thousand during the present year.

In 1890 they were cutting trees that took not more than six or seven to make a thousand feet of lumber, while to-day they are cutting to such a small diameter limit that in many sections it takes 40 trees to make a thousand feet. I saw one pile of wood out on the Transcontinental containing 4000 cords, where the largest stick was 4½ inches and from that it ran to 1½ inches, with the average size running under 3 inches.

In one section of the Pacific Coast where the United States Government estimate a stand of eighty-six

billion feet, the highest authority in the timber cruising line, and one who knows more of that particular section than any other man, from actual cruises says the figure 8 wants to be dropped, as there is not over 6 billion at the very most. Another example I have in mind is a certain territory which was estimated to contain 25 million cords of pulpwood and where, after operating 7 or 8 years, and cutting out only about 250 thousand cords, all the available wood was cut, and at a severe loss, so that further operations of the property was abandoned.

I have in mind another limit that had been estimated to contain 16 cords to the acre, that was examined by a very competent cruiser, who found it ran nearer 16 acres to the cord, as he expressed it. I can cite several cases where the shrinkage in estimates are just as striking as those above enumerated.

In connection with this phase of the subject, I cannot help thinking of the reply an old lumberman made when at one of the Canadian Forestry meetings in Montreal. The question of shortage in supply was being discussed, and one of the members suggested that we did not know what there might be for timber in the unexplored regions. The old lumberman replied that "in any section that the Canadian lumbermen did not know what there was, there wasn't anything."

#### More Attention to Mills than Materials.

The great trouble with the paper mills in the past has been that the management have been devoting their whole thought and time to speeding up their paper machines, installing new and improved machinery, and improving their water powers, all of which is of course, very desirable; but while they have been doing this they have lost sight of the most vital question, viz. a supply of raw material to keep these mills running.

The newspaper publishers are not without blame for the present shortage in newsprint, for every time they have fought a legitimate advance in price, they have made it more difficult and expensive for the mills to do business, especially under Government control and regulation, and with regard to price it is not nearly as surprising that newsprint has advanced from 2 to 4 cents per pound and higher than it is that eggs have advanced from 25c to \$1.00 a dozen. A hen can be produced in a year, while these trees that are being made into paper have taken from 75 to 250 years to grow, and as they are becoming more and more remote from the mills, must necessarily become more costly to procure. Think even of the cost of toting supplies back into the woods, a distance of 70 miles, the cost of which in many instances, amounts from \$50 to \$60 per ton for haulage alone!

Newspapers must accept the inevitable, as all other legitimate lines of business have done, and simply pass the cost along by increasing the price of their papers and their advertising rates. The newspaper has become a public necessity—no one will do without it to-day, and papers will sell just the same, whether the price is, 2, 3, or 5 cents per copy. And when the paper mills are forced to use some annual crop as a substitute for trees in making paper (which time is not far distant) paper instead of costing 4 cents per pound will cost 24 cents or more. So far as the American publishers are concerned, it is of course immaterial to them whether newsprint comes from Canada or the United States, so long as they are assured of a paper supply while the trees last.

When the public begins to realize that this timber, which is being cut today as if it were an annual crop, has been growing from 75 to 250 years, and the only way it can be reproduced is by re-planting, planting with the present high cost of labor amounts to a matter of \$12 to \$15 per acre, to which must be added the cost of the land, which is from \$3 to \$10 per acre, something will be done. This brings the cost per acre of these plantations of tiny little seedlings from \$15 to \$25, with an annual charge for interest, taxes and fire protection for at least a matter of 50 to 75 years before another crop can be harvested.

In addition to this there is a possible loss from fire and the spruce bud worm, and other enemies; for it must be borne in mind that fire is always with us, and the bud worm returns in cycles of from 20 to 35 years, and further, that each recurrence, as the lands become harder cut, increases in violence.

#### Imminent Increase in Price of Timberland.

As soon as the above facts are absorbed, as they are beginning to be quite rapidly at the present time, timberlands will be selling on a much higher scale than they are to-day, and my prediction is that the biggest rise in timberland values that has ever been known, will take place within three years.

There is not a commodity in the world that is selling so much below its real value as an acre of timberland to-day. Think of a crop that has been 50 to 250 years growing, and that under most favorable conditions will take from 50 to 75 years to reproduce with all the attendant risks, and an actual cost of \$75.00 to \$125.00, selling today at \$10 to \$15 per acre for land and all, while an annual crop of cereal or potatoes brings from \$15 to \$100 or even more per acre, above cost of planting and harvesting, and without the land.

#### How to Remedy this Situation.

It is far better to look this question of a rapidly diminishing timber supply squarely in the face and try by practical methods to put off the day of reckoning as long as possible, and I advocate the following remedial measures:

An active campaign of education carried on by literature, and illustrated lectures, so as to reach all timberland owners and the public in general.

The creation of a strong public sentiment by various methods, so as to establish a greater appreciation of the value of forests to all, and a desire on the part of the public to help actively in preventing forest fires.

Improvement and enlargement of the present fire protective service.

Reforestation on a large scale by Governmental appropriation, regardless of cost.

Burning of slash under certain conditions and in certain cases.

Change the present wasteful methods of logging by a closer supervision of woods operations by intelligent practical foresters.

An embargo or export duty on raw material taken from fee lands; or the

Annual purchase of fee land wood by a combination of all the Canadian mills.

I will personally subscribe ten thousand dollars to the Canadian Forestry Association, if each of the other pulp and paper mills in Canada will subscribe a like amount, to be used in carrying out the work outlined above, under the direction of an Executive Committee

to be appointed by the subscribers to the Fund. This will give us a fund worthy of the name and will enable us to do some real work.

I am giving freely of my time and money towards an educational campaign along these lines, as I feel that it is the duty of every Canadian citizen to do everything in his or her power to safeguard, preserve and perpetuate our forest resources as they are the backbone of our country.

#### Reforestation Will Help

With regard to reforestation, I am glad to note that the bud worm has not invaded this part of Nova Scotia owing largely to the fact that it is practically all spruce, the amount of fir being almost negligible, and probably also to the fact that the spruce is of such a sound, vigorous and rapid growth. I presume that the quality and growth here is due to the fact that soil and climatic conditions are ideal for spruce growing, the amount of precipitation being very great. Records at Halifax covering a period of 35 years show an average annual rainfall of 57 inches.

I have a sample section of red spruce tree in my office that shows a growth of 20 inches in 20 years, an inch a year in diameter. That is of course abnormal, but it is a fact that spruce makes the most rapid growth here of any section on this Continent, which hints at possibilities in reforestation that are not applicable elsewhere. This phase is well worth the serious consideration and careful investigation of the Canadian Forestry Association.

In the old days when railroads were first built in Nova Scotia and timberlands were of little value and there was no such thing as fire protection, this Province shared the fate of the rest of Canada and vast areas were destroyed by fire, but this is a thing of the past, as Nova Scotia has to-day one of the very best forest fire protective systems, and her citizens are thoroughly alive to the fact that timber is one of the most important assets.

#### BEDFORD McNEILL'S GENERAL & MINING CODE.

The well-known Bedford McNeill's Mining & General Code was for some reason not one of the permitted cable codes during the War. The prohibition on the use of this code has now been removed, and it is possible to use it again in cabling any English-speaking country. Those who have had occasion to use McNeill's Mining & General Code can best appreciate its adaptation to the needs of mining men. The code words themselves are sensible, being combinations of ordinary English words, and not, as many codes are, puzzling aggregations of unpronounceable consonants. Bedford McNeill himself died during the war as a result of exposure on war duty, but his widow survives him, and needs the revenue derived from the sale of the code.

#### W. R. INGALLS SEVERS CONNECTION WITH "ENGINEERING AND MINING JOURNAL"

The latest issue of the Engineering and Mining Journal announces that Mr. W. R. Ingalls, who was for many years Editor of this periodical, and has for a short period acted as Consulting Editor, has now severed his connection with the "Journal" and will devote his whole time to professional work.

# Correlation of Pre-Cambrian Formations

By R. E. HORE.

As mining development and geological study go on new information is constantly being obtained concerning the geology of the Lake Superior regions. As the metal production of the Lake Superior states comes almost entirely from pre-Cambrian formations, those who explore Northern Ontario and Manitoba, also pre-Cambrian areas, benefit by the work done in the United States. An endeavor has been made by geologists of both countries to correlate information gathered by numerous workers and there has resulted a certain degree of uniformity in nomenclature. Contemplated changes in nomenclature in the United States are therefore of interest to some of the readers of this journal.

Classification of rock formation is properly based upon observed facts. As more and more new observations are recorded it becomes from time to time advisable to modify any classification. An attempt, however, has been made to leave undisturbed as long as reasonably possible the classification adopted by the U. S. Geological Survey for the pre-Cambrian formations of the Lake Superior States. Two geologists well known in Canada—Van Hise and Leith—are largely responsible for the classification used advantageously for several years past.

Other workers in the same region have made many observations which satisfy them that the classification adopted by Van Hise and Leith needs modification. There is a difference of opinion, however, as to the advisability of making radical changes in the accepted correlation. R. C. Allen, State Geologist of Michigan, proposes that revision should be made at once and presented his case before the Chicago meeting of the A. I. M. M. E. in September last. In the January 1920 bulletin of the Institute there are published some contrary opinions.

Whether changes are made by the U. S. Geological Survey or not the discussion will help to make it clear there are likely to be found difficulties in applying the classification used by U. S. Geological Survey. Studies in new areas and new studies in old areas show the necessity of keeping an open mind when undertaking to determine structural relations in our mineral areas. Existing classifications are useful if used, as Mr. Hotchkiss advises, merely as a starting point for detailed work. It is questionable, however, whether revision, as advocated by Mr. Allen, would not give a better starting point for new work, as well as give an opportunity for correcting inaccuracies in old descriptions.

In Ontario an attempt has been made to correlate some pre-Cambrian formations in widely separated areas, but it is recognized by the Bureau of Mines' geologists that it is wise to avoid general use of the names adopted for some of the formations in the areas first studied here and in Michigan. A few areas have been mapped in detail and local names are largely used. Thus at Cobalt there is a mapped area which serves as a basis for geological study for many miles of surrounding country. At Porcupine, Kirkland Lake and Sudbury there are other mapped areas which also serve as key areas. Correlation of the formations in any of these areas with those in the others and with those of Lake Superior is full of uncertainties and is fortunately of much less consequence

to the mining industry than is the determination of the structural relations in the individual areas.

It is of course important that from time to time an attempt should be made to correlate facts observed in all parts of the pre-Cambrian, but so long as there is much uncertainty in correlation, the use of local names is preferable.

One of the reasons why the writer would be pleased to see the U. S. Geological Survey adopt Mr. Allen's proposal to revise the classification of the pre-Cambrian in Michigan is that readers of governmental reports often fail to appreciate the conditions under which reports are written. The geologist gets together all the known facts and attempts to classify them so as to permit a better understanding of them. His conclusions are not final, but should serve as working hypotheses. To be used successfully they should be taken for what they are and revised promptly when new observations show the need. For experienced geologists like Hotchkiss and Allen the revision of the Van Hise-Leith classification is quite unnecessary, for they know its limitations, but for many who seek information about mineral-bearing rocks a more up-to-date working hypothesis should be provided.

## INTERESTING NOTES FROM PAPERS READ BEFORE GEOLOGICAL SOCIETY OF AMERICA— BOSTON, Dec. 29th.

By CYRIL W. KNIGHT.

That the Kennecott copper company in Alaska have 220,000 tons of copper ore blocked out in a glacier was one of the interesting pieces of information given out during the Boston meeting of the Geological Society of America which was held December 29th to 31st. This information was presented in a brilliant and notable paper on the geology of the ore deposits of Kennecott, Alaska, by Prof. M. Bateman, of Yale University. Prof. Bateman showed that the occurrence of the copper ore in the glacier is easily explained. The ore body proper occurs on limestone on a mountain. As erosion proceeded, blocks and fragments of the ore were carried down the side of the mountain into the valley and became incorporated in the glacier in great enough quantities to form a mixture of ice and ore sufficiently rich to mine at a profit. The Kennecott copper company is the only concern in the world which is carrying on such unique mining operations.

There were many other papers of interest presented at the meeting of the Society, one of the most noteworthy of which was an account by the President, I. C. White, of some results of deep drilling in the Appalachian oil and gas fields. It is probably not generally known that the deepest well in the world has been drilled in West Virginia. It reached a depth of 7,579 feet. Unfortunately at that great depth the rock caved, on account of the fact that no casing was used in the lower parts, and the hole had to be abandoned. The drillers had, however, arrived to within 600 feet of their objective—the Clinton Medina sand, in which oil and gas was expected to be tapped. The company which drilled the hole gave generous facilities to the United States government in connection with the accurate determination of temperatures at various depths in the hole. It was found that at a depth of 7,500 feet the

temperature was 168 degrees Fahrenheit. While this well ultimately proved a failure, because drilling operations had to be abandoned, nevertheless another well has been started to tap the same horizon, and this time the company is taking no chances, and will therefore ease the hole to the bottom.

In connection with the work of the staff of geologists attached to the American army in France, during the Great War, some curious information was obtained by Colonel Brooks, who was in charge of the geological staff. Among other things Colonel Brooks was able to prove that the German army used divining rods in their attempts to obtain water behind the lines for drinking or other purposes. Documentary evidence is in the possession of the United States government that this superstitious and mediaeval method of finding water was in use by the Germans and that lengthy reports were made regarding the results obtained.

#### OIL POSSIBILITIES IN THE JAMES BAY REGION.

Of interest in connection with the development of northern Ontario is the possibility of the occurrence of oil in that part of the province lying south of James Bay. Although shales and limestones of Palaeozoic age have long been known to underlie this area, the age, succession and structural features were little known. In order to ascertain the oil possibilities of these sediments Dr. M. Y. Williams of the Geological Survey made a study during the summer of 1919 of the exposures along Mattagami and Abitibi rivers. In summing up the results of his investigations Dr. Williams states:

Extensive basins of sedimentary rocks of Palaeozoic age or later are commonly found to contain oil accumulations, which may or may not be indicated by oil seepages or springs. The extensive Palaeozoic area to the south and west of James and Hudson bays, is known to contain formations of the same age as oil-bearing formations elsewhere, but to date no oil seepages are known to occur. Owing, however, to the long period of weathering along the rivers, which may have dissipated any oil formerly present, and to the heavy burden of clay, silt and muskeg moss which covers the interstream areas, the lack of observed oil seepages is not to be wondered at.

The Trenton formation outcrops on the Nelson and Churchill rivers, the Niagara on the Nelson, the Albany and the intervening rivers, and the Salina and the Onondaga ("Corniferous") on the lower Albany river and the Moose river with its tributaries. From analogy with other occurrences, these formations may be expected to contain oil. Economic accumulations, however, may only be looked for where there is an impervious cover to retain oil in the formation, and where the structure of the formations is favourable for oil accumulation.

In this region drained by the Moose river and its tributaries, the Onondaga limestone and the Salina shales are known to occur, but the Niagara and Trenton have not been observed, although they may be present beneath the outcropping formations. The Salina is not generally oil-bearing, but some of the lower dolomitic beds of this formation contain large quantities of oil in parts of southwestern Ontario, notably in Tilbury Township, Kent county. As the Salina consists of alternating shales and limestones, it is probable that suitable cover is present for any oil-bearing horizons which may be present. The Salina formation as a whole is generally well covered by younger formations.

The Onondaga limestone, which has been the most uniformly productive formation of southwestern Ontario, outcrops at the surface over wide areas, as already described, and for that reason an impervious cover is generally lacking. In the vicinity of the Long Rapids of the Abitibi river, and about 4 miles above the Long rapids of the Mattagami river, the Onondaga is covered in part by impervious shales. The areas known to be covered, however, are comparatively small and unless larger areas occur beneath the interstream regions in the vicinity, it is scarcely likely that extensive accumulations of oil are present in the Onondaga. The shale areas, however, probably indicate the deepest part of the basin (that is the greatest accumulation of sediments) and consequently a suitable location for testing the lower formation.

The structure in the Long Rapids region of the Abitibi river consists of a well-marked series of low folds, the major anti-clines being represented respectively by the limestone areas near the head and the foot of the Long rapids. The axes appear to extend north about 65 degrees east, and the dips of the limbs probably average 6 degrees, although one was noted measuring 13 degrees. Smaller, subsidiary folds are superimposed on the larger folds, the whole structure being clearly expressed in the exposures on the islands and in the banks of the river. The proximity of the Pre-Cambrian gneiss reported about 4 miles to the northeast on the Little Abitibi river suggests that the folding is due to the unevenness of the underlying crystalline rocks.

On the Mattagami river the formations lie nearly flat.

Among the islands in the Moose river below Grey Goose island, a series of folds occur with axes running nearly east and west and with dips as high as 25 degrees. The large island, next to the lowest of the group, lies in a syncline but has at its head a sharp local anti-cline with dips to the north of 15 degrees and to the south of 25 degrees. The gypsum deposits appear to indicate a broad, low anticline, and the Salina red and grey shale and limestone series of the third lowest island of the Grey Goose group, evidently form the northern limb of another anticline. The alignment of the gypsum outcrops of Moose river, Gypsum "mountain" and of the French River valley suggest the location of one of the best marked anticlines in the region.

As Pre-Cambrian crystalline rocks out-crop at various places throughout the region east of the Abitibi river, it is scarcely probable that the Palaeozoic basin is very deep anywhere in their vicinity. It is more likely that the basin is deeper to the west, the centre possibly being near the centre of the Onondaga outcrops in the inter-stream region between the Moose and Albany rivers. It is doubtful whether a depth of Palaeozoic strata greater than 600 or 700 feet is to be expected even there.

A full report on Dr. Williams' investigations will be published by the Geological Survey, Ottawa.—*Geological Survey Bulletin*.

Mr. A. D. Matheson, the Asst. Manager of No. 1 Colliery of the Dominion Coal Company, has been appointed Manager of Caledonia (No. 4) Colliery, succeeding the late Mr. John Casey, whose death was reported in the last issue of the "Journal". Matheson was Underground Manager at Caledonia for a number of years previous to his appointment as Asst. Manager at No. 1 Colliery.

# Report of Coal-Mining Industry Commission, Province of Alberta, 1919

To His Honour The Lieutenant Governor-in-Council:

The undersigned Commissioners appointed by Your Honour by Commission bearing date the fourth day of June in the year of Our Lord One Thousand Nine Hundred and Nineteen, in accordance with the powers contained therein beg leave to report that they have held sessions at Edmonton, Calgary, Drumhuller, Wayne, Edson, Lethbridge and Blairmore, and have examined seventy-four witnesses, being, in the estimation of your Commissioners, a fair representation of all persons interested in the Coal-mining Industry, including the general public.

Your Commissioners have made inquiry into and upon all matters pertaining to or concerning the Coal-mining Industry of the Province of Alberta, and have considered various resolutions, correspondence, and exhibits, which have been submitted bearing on the questions under investigation. All of these are herewith respectfully presented for your consideration, together with a copy of the evidence taken.

Your Commissioners herewith submit their Report, which has been made from the evidence submitted, and are of the opinion that the following matters have an important bearing on the Coal-mining Industry.

## 1.—*Extension of Markets.*

Many mines only operate one half of the year or less. If more continuous operation is obtained, the result will be a reduction in the price of coal to the consumer and steadier employment to the workman.

## 2.—*Working Agreements and Method of Handling Disputes.*

Provisions for making working agreements, the settling of disputes and such matters that employer and employee deal with, are not satisfactory.

## 3.—*Housing Conditions and Sanitation.*

At many mines the living and housing conditions, and matters pertaining to health and sanitation, are not in a satisfactory condition.

## 4.—*Educational Facilities.*

In some camps the educational facilities are inadequate.

## 5.—*Loss of Capital Investment.*

Much capital expenditure has been lost on account of failure to obtain reliable information about properties and marketing condition before operations are commenced; and also owing to lack of sufficient capital being provided to carry on operations to a successful issue.

## 6.—*Loss of Market.*

A considerable loss of market has been sustained owing to—

- (a) Cessations of work;
- (b) Shortage of railway cars;
- (c) Misrepresentation as to size and quality of coal.

## 7.—*Sub-leasing.*

Sub-leasing of coal leases issued by the Federal Government has the effect of unnecessarily increasing the cost of coal to the consumer.

## 8.—*Freight Rates.*

Existing freight rates militate against the marketing of Alberta coal in Manitoba and the United States.

## 9.—*Purchasing, Mine Equipment and Power.*

Mine equipment and power, under the present system, are too expensive.

## 10.—*Conservation of Coal.*

Large quantities of coal have been and are being lost through improper mining methods, as well as through cessations of work.

## 11.—*Hospitals.*

In many mining camps the hospital facilities are inadequate.

As the natural resources are not vested in the Crown in the right of the Province, but in the Crown in the right of the Dominion, or in private ownership, it is difficult for your Commissioners to determine what should be done with many of the questions which have been brought before them. Your Commissioners are of the opinion that, for the best interests of the mining industry in this Province, steps be taken at as early a date as possible to have the natural resources vested in the Crown in the right of the Province.

Your Commissioners further submit for your consideration the following recommendations, and unanimously recommend that the same be provided for, as far as possible, by legislation at the coming session of the Legislature:

### *Recommendations.*

1. (a) That employees be required to use every effort to see that all coal is mined properly, and free from impurities, so that the best product will be obtained from the working face.

(b) That employers be required to see that all coal is properly prepared and graded before shipment.

(c) That railway cars are properly cleaned before being loaded.

(d) That better facilities for more prompt dispatch of cars from the mines to the point of consumption be obtained.

(e) That all invoices for coal sold, either by owners or dealers, shall have inserted on them the size and kind of screen over or through which such coal passes, and the name of the mine from which the coal is supplied.

(f) That in order to get correct weights, better provision be made for the taring of railway cars.

(g) That steps be taken to establish testing stations in different Provinces, particularly in Manitoba, so that the buying public may be given information as to the uses and values of different coals.

(h) That a complete system of advertising Alberta coal be undertaken.

(i) That attention be given to the question of storage of coal by both consumer and dealer.

2. That a permanent Commission be appointed and given power by legislation to make working agreements and provide for the settlement of disputes.

3. That living and housing conditions and matters pertaining to health and sanitation be dealt with by the said Commission.

4. That the said Commission co-operate with the Department of Education with a view to seeing that satisfactory educational facilities are provided for all children of school age.

5. That before mining operations are commenced, the question of the advisability of opening a mine in any particular field, as well as the question as to the amount of capital required to open in that field, be referred to and approved by the said Commission, and that the administration of the regulation passed by Order-in-

Council P.C. 2303, by the Federal Government, a copy of which is herewith attached, be vested in the said Commission.

6. That all matters pertaining to loss of market be placed under the jurisdiction of the said Commission.

7. That sub-leasing of coal lands, leased by the Federal Government, be prohibited.

8. That the services of an expert be obtained to investigate the question of freight rates, including the question of a preferential rate on slack coal, and a reduced rate on coal during the summer months previous to the movement of grain, and that the report of such investigation be submitted to the said Commission, with a view to bringing the facts before the Railway Commission for adjustment.

9. Your Commissioners are of the opinion that considerable saving would be attained if owners would establish some central purchasing agency, thereby standardising equipment; also that a considerable saving would be attained if the power used were obtained from central power plants located in the various fields. The carrying out of these suggestions, in the opinion of your Commissioners, would decrease the cost price of coal, and would not only be a saving to the consumer, but, in addition, would tend to increase the market.

10. As this Province has within its borders the largest known coal resources in the world, the conservation of this heritage should be zealously guarded. Your Commissioners therefore recommended that you obtain authority from the Federal Government for the same Commission to be given full powers for the safe-guarding of this national asset.

11. That districts be formed, and proper hospital facilities be provided, in the various mining fields.

12. That legislation be enacted at the coming session, making provision for the appointment of a Commission which would be representative of—

- (a) Owners;
- (b) Workmen;
- (c) Consuming Public;
- (d) Provincial Government.

That such Commission, in addition to the matters above mentioned, have such authority as may be given to it from time to time by Regulation.

That such Commission also be made responsible for the proper equipment and running of mines to ensure safety.

Evidence has been submitted with respect to Old-Age Pensions and Compulsory Health Insurance, but your Commissioners have not obtained sufficient evidence to reach a final conclusion, and recommend that the matter be further investigated.

Dated at Edmonton this twenty-third day of December, A.D., 1919.

John T. Stirling, Chairman.  
Walter Smitten.  
John Loughran.  
W. F. McNeill,  
Harvey Shaw.

Extract from Order-in-Council P.C. 2303, dated the twenty-first day of September, A.D., 1918, being the Regulation referred to in section 5 of the Recommendations:

"The lessee shall, before opening any mine on the lands described in the lease and before extracting any coal therefrom, submit to the Minister plans and specifications showing in detail the manner in which it is

proposed to open up, develop and operate such mine, and if the location contains more than one seam of coal detailed information shall be furnished as to the particular seam which it is proposed to develop. No work shall be commenced for the recovery of coal, and no coal shall be extracted until such plans and specifications have been approved by the proper officer of the Department. The procedure to be adopted in opening up and operating a mine on the lands leased, as well as the particular seam of coal which shall first be operated shall at all times be in accordance with the provisions of regulations duly approved by the Minister, and failure to comply with the requirements shall render the lease subject to cancellation in the discretion of the Minister."

#### MARKED DECREASE IN BRITISH COLUMBIA MINE FATALITIES DURING 1919.

Only twelve fatal accidents occurred in the coal mines of British Columbia during 1919. This is a new record of a very satisfactory character. Never before in the history of coal mining in this Province has it been equalled. In point of number of deaths it has been paralleled once in the last twenty years. This occurred in the year 1905, but it is to be remembered in considering the statistics of that year that there then were little more than half as many men employed in and around the mines as now is the case.

This announcement regarding the operation of the coal industry of the Province was made yesterday by Hon. Wm. Sloan, Minister of Mines. That he was gratified is scarcely an adequate expression of his sentiment. He trusted that with the evident growing interest manifested by miners in the acquirement of knowledge of mine gases and their greater appreciation of the importance of the "Safety First" principle, a further reduction in the fatality rate might be looked for. Mr. Sloan complimented Mr. George Wilkinson, Chief Inspector of Mines, on the evidence of the efficiency of Mines' Inspection Staff of the Provincial Bureau of Mines.

Of the twelve accidents referred to four were the result of falls of rock; four resulted from falls of coal; and an equal number occurred in the handling of mine cars in haulage. The fatalities were divided among the Collieries as follows:

Canadian Collieries (D) Ltd., Cumberland..	5
(All of whom were Orientals.)	
" " Extension..	2
Canadian Western Fuel Co., Nanaimo, B. C. . .	4
Crow's Nest Pass Coal Co., Coal Creek..	1
	—
	12
	—

An estimate of the fatalities per thousand of employees would put the percentage at approximately 2.2 as compared to the average of the past ten years of 5.098. This year's average, therefore, compares very favourably with that of Great Britain and other European countries, which is worthy of special note, when it is borne in mind that in the coal fields of the United Kingdom and of the Continent there are so many more miners actively engaged that it takes more than one serious accident to materially affect the general average at the end of a given period.

Only one fatality occurred in the mines of the Crow's Nest Pass District during 1919. This again is a record. If the mines of Eastern British Columbia Field be considered apart from the rest of the Province, it is the lowest mark since the first year of their development, over twenty years ago.

Mr. Wilkinson notes, in his report, that the majority of these twelve fatal accidents could have been avoided had ordinary care been exercised.

Still another record has been established by the metalliferous mines of the Province in 1919. There were but six fatal accidents throughout British Columbia in connection with the metal mining industries. This is the lowest in the history of metalliferous mining in British Columbia.

It is estimated that fatalities per capita of employees will work out at approximately 1.2 per cent. in comparison with an average over the last ten years of 3,899.

These accidents are tabulated as follows:

Falling down shafts, chutes, raises etc. ....	5
By breaking compressed air pipe .....	1
	—
	6
	—

The majority of these accidents, too, were avoidable had ordinary care been exercised.

**ASBESTOS.**

The mining and manufacturing of asbestos is well illustrated on a recently published volume entitled "Asbestos, from mine to finished product." In this book sixty plates are used to reproduce scenes about asbestos mines in Canada and manufacturing plants in the United States. Some excellent photographs of different types of raw asbestos are also shown. The Asbestos and Mineral Corporation of New York are the publishers.

Several plants are used to depict scenes in the Quebec asbestos mining areas. These give a very good idea of the way the material is mined and treated there and of the necessary plant.

A series of plates is used to show specimens of asbestos from all parts of the world. In each case the properties of the material are mentioned. Regarding the Canadian asbestos the publishers say "this material is a true chrysotile asbestos of great tensile strength and silkiness, and must be distinguished from asbestos found in other parts of the world." The photographs show that some asbestos of comparatively little value closely resembles in appearance the Canadian asbestos. Low tensile strength and harshness of fibre detract from the usefulness of asbestos from many places.

A series of plates used to illustrate the manufacture of asbestos gives some idea of the processes of making asbestos lumber, paper, etc. Particularly interesting are the views showing the spinning of asbestos for textile purposes. These photographs from a modern asbestos textile manufacturing plant indicate clearly some of the qualities essential in asbestos and show why Canadian asbestos is so highly valued.

Anyone interested in asbestos will find useful information in this book, which by the way is very well printed on good paper and attractively bound in cloth. The Asbestos and Mineral Corporation has published a limited edition for complimentary distribution.

**THE RAINY LAKE GOLD AREA, ONTARIO.**

By J. J. O'CONNOR.

For over twenty years the lower Seine River gold-bearing area, has been practically an abandoned field. It is coming back to its own very fast. The current year is certain to see extensive developments carried on, that, in the opinion of the best informed, will place it in the permanently producing class.

The pioneer spirit of adventure that first brought this field into notice, was displayed by citizens of Duluth and other Americans, in their operations on the United States side of Rainy Lake, at Rainy Lake City, Bell City and other bustling camps of the early '90s.

Many old timers will recall the trip made from Tower to Rainy Lake, in the winter of 1896-97, by sleigh and dog team, by the late Capt. W. H. Mack, of Cleveland, Ohio, an account of which, he published in the "Marine Review" of that period, under the heading "A Golden Cruise," in which he described the venture most graphically, and the quest that prompted it.

The operations on the American side of the Lake, naturally directed attention to the Canadian side, and by 1895 mining activity was well underway, on such well known properties as the "Foley" "Golden Star" "Ferguson" "Olive", and others, Mining was carried on at the "Foley" and "Golden Star" on quite an extensive scale, under the greatest difficulties, for some years.

Several mills were erected, from two of these, the "Foley" and "Golden Star", over \$200,000 in bullion was shipped.

Transportation costs were the great handicap in the early days. All supplies had to be brought in via Kenora, on the Canadian Pacific Railway, over 200 miles away, over the Lake of the Woods, Rainy River, and Rainy Lake, necessitating transfers at Fort Frances.

The mining system then in vogue, was not well suited for the development of the maximum of possibilities. Modern methods of gold recovery, greatly increase the possibilities in this field, while transportation facilities are revolutionized, and are now ideal.

The gold-bearing area is situated one mile south of Mine Centre station, on the Canadian National Railway, and connected with it by a good waggon road. It is one mile wide, and four miles long, extending in a north-east, and south-westerly direction, bounded on the southern extremity, by waters navigable for steamers from Fort Frances, 40 miles to the westward, on the Canadian National Railway.

The country rock of the gold-bearing area, is an altered granite. The quartz veins, of workable value, occur altogether in the granite rock, with the exception of the "Golden Star" which is along a small dyke extending from the main mass of the granite.

The only development carried on during the past five years, has been done by private parties, mainly in high-grading on the "Isabella" and "Ferguson" properties.

Most of this has been done during the past eighteen months. Very gratifying results have been obtained from this work, with only the crudest kind of appliances.

The showings made by this work are remarkable. They have uncovered several veins, 18' to 2' in width, showing visible gold in many places.

The veins vary in width from a few inches up to 8 and 9 feet. Over 60 of these have been located with-

in the gold-bearing area. Visible gold has been observed in 18 of them, fine gold in numerous others, and 23 of them are considered undoubtedly rich in irregular shoots, by men competent to voice an opinion, after careful examination.

Highly favourable report have been made on different properties in this field, by such well known mining engineers and geologists, as the following: Frederick Gleason Corning, Horace G. Cole, J. H. Chewett, R. A. Kerr, E. P. Rathbone, and Horace V. Winchell.

The Swedish-Canadian Mines, Limited, have taken over the "Foley" and will operate it to capacity during the current year.

It is confidently believed by the best informed mining men, and mining engineers, who have spent more than one season in making critical examinations of the whole area, that there is no more promising ground in Ontario, than the Rainy Lake field. With prudent mining, and economical management, the field has a bright future.

**ENGLISH ENGINEERS VISIT CAPE BRETON COLLIERIES AND STEEL PLANTS.**

General Sir Newton Moore and Mr. F. W. Harbord, the well-known English metallurgist, visited the collieries of the Dominion Coal Company, the shipping piers at Sydney and Louisburg, and the Steel Plant at Sydney during the week ending the 24th. Later they visited the collieries and Sydney Mines Steel Plant of the Nova Scotia Steel and Coal Company, and returned to Halifax, calling at the Trenton Works of the Nova Scotia Company en route. At Halifax, General Moore and Mr. Harbord will meet Col. Grant Morden and Mr. Benjamin Talbot, who is also prominent in the technical progress of steel manufacture in Britain. These gentlemen are members of the Advisory Board of the Dominion Steel Corporation, the other members being Sir William Beardmore, Viscount Furness, and Mr. Henry Steel, with Col. Lorne Hamilton as Secretary of the Committee.

**ANNUAL MEETING OF THE CANADIAN MINING INSTITUTE.**

The Secretary of the Canadian Mining Institute has issued a final notice of the 22nd Annual General Meeting of the Institute, which will be held in the King Edward Hotel, Toronto, on Monday, Tuesday and Wednesday, March 8th, 9th and 10th next. Members are strongly advised to make their hotel reservations early, and Mr. Cyril W. Knight, of the Provincial Bureau of Mines, Toronto, who is Secretary of the Local Committee, will be glad to make such reservations, if he is notified in time.

**DRESSES AND ADDRESSES.**

Bradley Stoughton, secretary of the A. I. M. E., has an apt way of classifying addresses. At a recent meeting of the San Francisco section of the institute he said that public addresses are of two kinds: One is like a mother hubbard dress—it touches only a few places but covers everything. The other is like a modern gown—it touches everywhere but covers nothing.—E. & M. Journal.

**PERMITTED EXPLOSIVES  
British Order.**

In the Explosives in Coal Mines Order of the 14th November, 1919, the explosives which have passed the Rotherham Test are listed as follows:—

**PART I.**

Explosives.	Permissible maximum charge in ozs.	Pendulum swing in inches.*

**PART II.**

Bobbinite.

Permitted only for the purpose of bringing down coal in certain mines, and only until 31st December, 1920.

\* This is the swing given to the ballistic pendulum at the Home Office Testing Station by firing at it a shot of 4 ounces of the explosive. It may be compared with the swing of 3.27 inches given by a shot of 4 ounces of gelignite containing 60 per cent of nitro-glycerine.

**PROPOSED MONUMENT TO MINE EXPLOSION VICTIMS AT STELLARTON, N. S.**

A proposal is mooted to raise the sum of \$10,000 to erect a monument in joint memory of the victims of the explosion at the Allan Shaft Mine which occurred in January 1918, and those who died in the disasters of 1873 and 1880 at the Drummond and Ford Pits respectively.

## Northern Ontario Letter

### THE SILVER MINES.

The year-end annual reviews of the leading metal authorities in London and New York tend to strengthen the belief of the silver mine operators that the quotations for silver during 1920 may be expected to continue high. The point is emphasized that Great Britain and the United States, now being in possession of the greater portion of the world's gold, must be expected to cling to it as long as possible and thus fortify their standing, as creditor nations. This leaves but the one precious metal—silver, to meet the demands of the Eastern countries. With production declining, and with low stores, not only does a continuation of the present high quotation appear probable, but a possible increase is indicated.

Comparatively speaking, wages are high in Cobalt. Machine runners are being paid \$5.50 a day, made up of \$4 regular wage and a high price of silver bonus of \$1.50 a day. As a result of the high cost of labor, the non-producing mines having no product to balance accounts, are laboring under a real handicap. The producing mines, of course, in receiving increased price for their silver are still left with added profit after the bonus is deducted. The condition is one that has appeared to retard to a certain extent the scope of operations among the small prospective silver mines.

The Beaver Consolidated has made another rich strike at a depth of 510 feet, and altogether with the several other discoveries reported within the past three or four months, offers reasonable promise of the year 1920 being a profitable one for the company. Some exceptionally rich ore is being bagged.

As indicated in reference to negotiations between the Coniagas and the Trethewey Companies during the past two weeks, as reported in these columns, the Coniagas has succeeded in purchasing the Cobalt mine of the Trethewey Company. The price is stated to be \$100,000. On Jan. 31st a special meeting of the shareholders of the Trethewey Company will be called for the purpose of considering and, if approved, ratifying the agreement already entered into by the directors. From this date forward, the Trethewey will concentrate its efforts in exploring and developing its property in the Gowganda district.

At the Chambers-Ferland, as a result of work being carried on in the No. 4 workings, a substantial tonnage of low grade ore is being developed. In addition to this work, a cross-cut is being driven south through the territory lying between the Nipissing and the La Rose. Up to the present only one shift has been engaged on this work, but it is proposed to add to forces and make more rapid headway. As yet no new veins have been encountered, with the exception of a number of small stringers. In regard to the reported negotiations for the tailings pile on the Chambers-Ferland, the holders of the option with whom is associated H. Cecil, have let a contract to M. P. McDonald for the sampling of the tailings pile. The option price is stated to be \$55,000. The deal will probably hinge upon results obtained in the present sampling operations.

The McKinley-Darragh has been compelled to close down its pumping equipment for the winter, and thus discontinue the treating of the sand tailings pile in the bed of Cobalt Lake. The flotation plant, however, is to be utilized in treating tailings from current operations. These tailings, in part only, have formerly been treated in a small flotation unit in the mill, but will now be diverted to the big flotation plant. The small flotation unit will be closed.

Diamond drilling at the 310-ft. level of the Adanae has so far failed to produce any satisfactory results. The hole is being driven entirely in the diabase formation and the chances of encountering commercial deposits of ore is considered meagre.

The Crown Reserve Mining Company is making good headway in the exploration and development of the Canadian-Kirkland property in the Kirkland Lake district. It is learned that a high degree of efficiency for the size of the operation has been established in the cost of work. In spite of the strike which commenced June 12th and continued until fall, the property, since early in May has been equipped with a mining plant, and work carried to the first level.

In the Supreme Court of Canada, Mr. Justice Middleton has reversed a decision formerly rendered in connection with the litigation involving the Bailey-Cobalt mine. The present judgment is sweeping, and leaves the company free to accept the offer recently made by A. J. Young to merge the Bailey with the Northern Customs Company. This will probably now be carried out; unless, of course, the opposing faction succeed in appealing the case. As to this, there appears to be a good deal of uncertainty.

Mr. Justice Middleton's judgment, after upholding the power of the Court below to sanction the offer made by A. J. Young to acquire the assets of the Bailey Cobalt Mines, Limited, proceeds as follows:—

"It remains to consider whether the offer should be accepted. In substance it provides for the turning over of all the assets to a new Company; this company will pay the creditors in full, the largest creditor limiting his claim to a fixed amount; shares in the company will then be given to the shareholders of this company. The creditors welcome the offer as it procures them payment in full when they expected a loss. The shareholders—save a few represented by Mr. Laidlaw—are anxious to accept, for in this they see their only chance to obtain anything. The minority—putting the matter bluntly—seek to prolong litigation in the hope that, some one may be forced to buy them off or may be induced to do so for the sake of peace. This is not presented nakedly but made of thin cloak of optimism and many charges of fraud and misfeasance against their having the largest claim as creditors. For here truth could not appear naked and remain unashamed.

The other creditors and shareholders prefer the speedier and more certain solution proposed to the prospect of long drawn out and highly problematical litigation. The attacked creditors make some concession in inducing their claim perhaps not as much as in the opinion of some they ought to do, but they will go no further. Mr. Laidlaw's clients propose no alternative save a cash settlement with them. They can procure no better offer, and ask the Court to compel the great majority of those concerned to throw away the substance in an attempt to grasp that which seems very like a shadow—though called a hope and an expectation.

I adopt the words found in the judgment already referred to, and think that when a very large majority of the shareholders desire that the offer should be accepted, it is the duty of the Court to give effect to their wishes.

Then should terms be imposed? There is nothing in our Statute analogous to the provisions which guided Mr. Justice Kay—on the contrary there is the provision in the Ontario Act, under which the Company was incorporated, by which the Company has power to "sell or dispose of the undertaking

of the company of any part thereof for such consideration as the company may think fit, and in particular for shares, debentures, or securities of any other company having objects altogether or in part similar to those of the company," if authorized by the vote of 2/3 of the stock of the company.

This ought to be the guide, if there is to be any guidance by analogy, rather than a provision in an English Act not found in our own.

But I would go further and would determine that the shares were always subject to this control by the majority and that the liquidation did not destroy this charter provision but made it subject to the approval of this Court and the superior rights of the creditors.

The appeal should be allowed, and the matter should be referred back to the Master to carry out the sale. The liquidator should have his costs out of the assets. No other order should be made as to costs.

During the week ended Jan. 23rd, four Cobalt companies shipped an aggregate of five cars containing approximately 353,135 pounds of ore. The Larose was the heaviest shipper, with two cars:

A summaries follows:

Shipper.	Cars.	Pounds.
LaRose . . . . .	2	144,186
Northern Customs . . . . .	1	87,910
Temiskaming . . . . .	1	81,095
Crown . . . . .	1	39,944
Totals . . . . .	5	353,135

During the corresponding period no bullion shipments were reported.

### THE GOLD MINES.

The gold mining industry and the problems met with at the leading mines have ceased to be regarded as temporary. The management of the various mines throughout the North have long since considered the industry to be permanent. However, economic conditions have been unfavorable, and adverse influences have occurred with such frequency as to necessitate temporary shifts to offset the abnormal and changing conditions. Public men, in connection with road-building, assistance in attracting workmen to the mines, and in dealing with duties on mining machinery, and so on, have shown little or no interest, and have for the industry no advantages. This attitude has not helped to create the very desirable impression of permanency.

However, although public men and the government are offering a minimum of assistance, the mining companies themselves are building their future upon permanent foundations; and this determination to deal in a permanent way with the industry bids fair to shame the government into at least some measure of departure from its present lethargy.

The Dome Mines is reported to be making good headway in the exploration of the Dome Extension. While work has long since been carried onto the Dome Extension at the 600-ft. level, the first intimation that mining operations had been carried across the line at the 1150-ft. level came this week. Net production at the Dome as a result of milling operations is stated to be running high and by March 31st, the close of the company's fiscal year, a large cash surplus will likely be shown. The officials of the Porcupine Crown and the Crown Reserve Mining Company have concluded a visit to the Moneta property. As to the possibility of the Porcupine Crown acquiring control of the Moneta, opinion is divided. This week an unoffi-

cial rumor is in circulation to the effect that the deal is not likely to go through but that the Moneta interest themselves are considering the installation of a mining plant to be followed by exploration work at their own initiative.

The question of the option which the McIntyre-Porcupine holds on the Plenaureum property is a live topic at present. As to whether or not the deal will go through or another extension of time be granted has not been stated officially.

In the Kirkland Lake district, one of the most interesting developments is found in the result of work at the Ontario-Kirkland mine. At a depth of 500-ft. a considerable amount of work has been done and several thousand tons of commercial ore is stated to be in sight. Altogether about 1000 feet of underground work has been done. According to official advice to the Journal, a good deal of the ore will average close to \$20 to the ton. The development is interesting and important in that it opens up added possibilities in the area lying immediately south from the present producing zone.

During 1919, according to the annual statement just issued by the Lake Shore, the profit and loss account shows a deficit of \$47,000. Net profits for the year amounted to \$38,273.49 and the balance brought forward for 1918 of \$44,978.08. The labor strike which lasted throughout the whole of the summer was a serious handicap, in spite of which the mine produced close to \$300,000. Mill heads averaged close to \$25 a ton. During the year two dividends were paid amounting to \$100,000 in addition to which was \$25,000 put aside as "provision for contingencies."

In the Township of Lebel activity is increasing. It is stated by interested parties that about eight new companies will be formed within the next few weeks for the purpose of exploring mining properties in that township. The territory which is attracting interest is a strip about two miles in width and running from West to East through the township.

J. A. Hough, mining recorder for the Larder Lake and Swastika districts for the past thirteen years has tendered his resignation, to take effect March 1st. Mr. Hough, it is understood, feels that the salary attached to the office is inadequate, and the political situation too uncertain to allow him to remain in the service any longer. He will accordingly devote his attention to mining.

In regard to the question of the construction of light railways in the North, the Canadian Light Railway Construction Company through Mr. J. W. Solloway requested publication of the following:—

In view of misleading statements appearing in the public press in reference to the use of light railways for outlying districts of the North Country, we beg to submit the following for your information.

The situation in the North Country is as follows: For the past ten years, railway extensions, good roads, et., have been promised for these districts or the subject in some form has been under consideration by various Governments but very little has been done.

The idea of building light railways is to give undeveloped districts immediate transportation facilities. The construction of light railways is only temporary. Their operation

will assist development of water power and of the mining industry. When the business increases to warrant same the light railways can be turned into electric or standard roads. The light rails and equipment can be transferred to new fields to be used again as a method of assisting development.

The idea is to use light railways to assist the development of new and undeveloped districts. They are cheaper to build and maintain than macadamised roads, and at the same time do the business on short hauls up to their capacity of a standard railway and the operation of same is a commercial and business proposition. The plans of the Canadian Light Railway Construction Company are only to build branch lines (not trunk lines).

Light narrow gauge railways embody three economic principles.

Low cost of Construction, Maintenance and Operation. In addition they can be quickly laid down and run over almost any kind of country. They proved to be the most economical and successful method of transportation adopted by the allies during the war. Commercially they have been used in France, Belgium, Germany and Russia for the past twenty years as feeders to the main railways, and it is proposed to use them in the same capacity in this country.

The Canadian Light Railway Construction Company are not advocating light railways in preference to Government owned standard or electric roads.

### G. W. V. ASSOCIATION AT COBALT ASKS FOR EXTENSION OF SPECIAL LICENSING PRIVILEGES TO RETURNED WAR VOLUNTEERS.

Following is a Copy of Resolution passed by Cobalt Branch G. W. V. A. at a regular Meeting, held on Jan. 19th, 1920.

**Whereas** a great number of Prospectors and Miners in Northern Ontario voluntarily enlisted in His Majesty's Canadian Expeditionary Force and went Overseas and fought in the Great War:

**And Whereas** upon their return and demobilization they are obliged under the Law at present existing, to outlay large sums in order to perfect their Titles to Mining Claims held by them prior to their enlistment, in order that the same may be secured by Patent and the Titles to the same as indefeasible;

**And Whereas** upon their demobilization they find that they have not sufficient funds to make the outlay necessary in the premises in order that their interests acquired before enlistment be protected;

**And Whereas** prior to their enlistment they duly paid their Miner's Licence Fees, and for the recording of their Mining Claims, and had they not enlisted would have been in a position to have complied with all the provisions of the Mining Act of Ontario;

**Therefore be it resolved** that the Temiskaming Branch of the G. W. V. A. hereby endorse the following position of the Prospectors and Miners namely:—

That the Government relieved such Prospectors and Miners so having enlisted from the performance of any Assessment work upon Mining Claims which we staked out and recorded, and upon which thirty days' assessment work had been performed prior to the enlistment of the recorded holder or owner thereof, and that the provisions of the Mining Act of Ontario with respect to the performance of working conditions and surveys and Patents be waived, and that the said Prospectors and Miners so having enlisted be granted a Patent freed from the necessity of performing the balance of such assessment work or from the necessity of paying the fee to the Crown in other cases necessary before Patent issues, and that in the event of any of their Mining Claims being situated in unsurveyed territory that the Crown pay the cost of the survey of the same in order that Patent shall issue to such recorded holder or owner.

**And be it further resolved** that in the event of such Prospector or Miner being a partner or holder of an interest in a Mining Claim with a civilian, or one who has not served Overseas in the Great War, in default of such civilian, or one who has not so served, performing his due share of the as-

essment work required under the provisions of the Mining Act of Ontario, and filing proof of the same in accordance with the provisions of the said Act, then within thirty days after such default the Prospector or Miner so having served may file a notice with the Mining Recorder in the Mining Division in which such claim is located to the effect that he desires to complete the assessment work required by his defaulting partner or partners, and upon such notice so having been filed the Mining Recorder of Mining Commissioner may grant to such Prospector or Miner so having served sufficient time according to the exigencies of the case to permit him to complete the assessment work of his defaulting partner or partners, and the whole Mining Claim shall thereupon vest in the Prospector or Miner so having served.

**And be it further resolved** in the case of a Returned Soldier wishing to, or being capable, of, completing the work on his already existing Claims, he may forgo the above grant, and shall be entitled to stake three more claims on his new licence, which he was deprived of doing owing to his having so served, and be given a free Patent **without cost**, said Claims to be staked within one year of the date of the new Amendment of the Mining Act of Ontario being passed, the said right to apply to any Prospector or Miner who may not have been the possessor of a Claim or Claims at the outbreak of the War;

**And be it further resolved** that it is the feeling of this Branch of the G. W. V. A. that equivalent consideration be extended to the Prospecting and Mining Industry as has been shown to the agricultural community."

#### A Reasonable Feature.

Regarding the above, the request for consideration as regards working conditions appears to be favourably regarded in the mining districts. That is to say: The prospector who lost a lot of time in the service of the country seems to be entitled to protection for work which he would otherwise have been able to complete.

#### The Objectional Feature.

As regards the second last paragraph in the above resolution, the Bureau of Mines must be prepared to reject it. Were such to become law, it would mean that several hundred thousand men in Canada would be privileged to stake out three mining claims and secure a free patent. It would probably mean that unscrupulous interests could hire thousands of these men who are not interested in mining, have them stake claims and secure patent in return for a more or less small amount of money. It might mean that a million claims, or approximately four million acres of land would become tied up, without the necessity of work or payment.—J. A. McRae.

Dr. Jas. S. Stewart, who has been in charge of the Edmonton office of the Geological Survey, has tendered his resignation. Dr. Stewart has been specializing in the gas and oil possibilities of the great plains of Alberta and the northwest and while not on special field work was engaged in Bureau of Information work. After 10 years' experience with the Geological Survey and with the highest attainable university degree. Dr. Stewart is leaving a salary of \$2,100.

John R. Cox, of the Topographic Division of the Geological Survey, has also resigned to join the S. Pearson and Sons Petroleum Company. Several student assistants in the Topographical Division have also signed contracts.

While little has so far appeared in print it may be said that the work of the division interlocks with that of the geologists, and a loss in one affects both.

—Ottawa Journal.

**TORONTO NOTES.**

(From Our Staff Correspondent.)

**Dr. W. G. Miller Emphasises Canada's Possession of Strategic Minerals.**

Addressing the Royal Canadian Institute in Toronto on Jan. 10th, Dr. W. G. Miller, Provincial Geologist, outlined some of the outstanding mineral products, including the virtual control of gold by the British Empire, with about two-thirds of the world's output. In iron and steel, he said, the Empire does not show up so well only about eleven per cent of the world's iron and ten per cent of its copper, being produced in the Empire. In silver and lead, however, the Empire produces about seventeen per cent of the world's output, but in certain Canadian minerals the Empire controls the world supply. These are nickel, cobalt and asbestos. About one-seventh of the whole world's supply of coal is found within the borders of the British Empire, but in petroleum the Empire is a small producer, with prospects, however, of great expansion. Search, under Imperial auspices, is being made for petroleum in various parts of the world, including even Papua in the South Pacific.

It was pointed out by Mr. Miller as a curious fact that before the war, while Great Britain possessed virtual control of certain minerals there were no facilities for refining them, and the bulk of the ores were exported. This state of affairs, which he described as most unsatisfactory, applied to such minerals as tungsten, but during and since the war, conditions have altered and the Empire has now sufficient refining facilities to supply all its needs.

"As regards Canadian mineral industry," he said, "it may be said to have had a rapid and satisfactory development during the last two decades and holds out great promise for the future. For example, during the past two or three years, discoveries of important mineral deposits in northern Manitoba, a province that has heretofore been considered only from an agricultural standpoint, showed the great possibilities there are in our vast unprospected regions. Other Suburbys, Cobalts and Poreupines await the prospector and miner in these regions surrounding Hurson Bay, and extending to the Arctic regions. Great regions of promise for the miner lie tributary to the Pacific and on the eastern seaboard vast mineral resources are yet to be utilized.

Announcement was made this week by Mr. Sweeney, of Northern Securities Limited, Toronto, which controls the Nipissing Extension Mines, Limited, that he had purchased the Thompson-Gowganda property in the Gowanda district, a property in which Premier Borden, Sir Edmund Osler, Hon. Dr. Pyne, E. A. Kemp, Lieut.-Col. Hendrie and others formerly held large interests. Mr. Sweeney states that the deal has been completed and that a new company of Canadian and American capitalists is now being formed to operate the holding.

Gilbert Sheridan, ("Shorty"), one of the popular old-timers of the Poreupine, was married at Trinity Church, Galt, recently, to Miss Evelyn Turner, daughter of Mr. and Mrs. Turner, formerly of the Dome, but latterly residing at Galt, Ont. Mr. Sheridan was for years on the Dome staff and more recently has been in charge of the Hollinger stores. Mr. and Mrs. Sheridan will reside at Timmins.

Among the Canadians mentioned this week by the British War Office for distinguished services in the war is Lieut.-Col. "Joe" Boyle, the former widely-known Klondike miner. Col. Boyle, who was head of the Canadian Klondike Mining Company at Dawson City, will be remembered as having organized, equipped and despatched to the front his own machine gun detachment at his own expense in the early stages of the war. He served chiefly in Roumania where he became a national hero through being able to save several Roumanian deputies from Boleshevists. He also rendered valuable assistance to the royal family. The Colonel's old home is in Woodstock Ont., he being a son of the late Charles Boyle who was prominent in Canadian racing circles.

Toronto mining men were interested in the announcement from Winnipeg this week that Provincial Engineer L. B. Copeland had left for the Copper Lake Gold district, where he will have charge of the construction of a winter road from Herb Lake to Copper Lake, in the gold district. The length of the road will be about fifteen miles. It was also stated that Engineer V. H. Campbell would leave shortly for the Rice Lake Gold district for the purpose of making a survey for a road in that district from Lake Winnipeg to the Rice Lake district.

A meeting of the Toronto branch of the Canadian Mining Institute was held on Saturday when preliminary arrangements were made for the annual meeting of the Canadian Mining Institute to be held in Toronto probably on March 8, 9 and 10. Indications are that this will be one of the most successful and interesting meetings the Institute has ever held. It was also decided to invite students resident in Toronto who are members of the Mining Institute to attend the periodical meetings of the Toronto branch without extra fee.

Alexander P. MacAuley, a well-known Toronto mining engineer has been awarded \$100,000 damages by the United States Supreme Court in his suit for malicious prosecution and false arrest, against Theodore P. Starr, New York jeweller. MacAuley was arrested in St. Louis in 1917 and held on suspicion of being a notorious confidence man. Starr was held responsible for the mistake and the prosecution and action was taken against him by the victim.

According to the report of Major Birkett, Resident Mine Manager for Nipissing Extension Mines, made to Northern Securities, Limited, in Toronto, No. 2 shaft has been continued to a depth of 100 feet and a station 10 feet by 10 feet has been cut at the 90-foot level. Forty-three feet of cross-cutting to connect with the new vein has been done and a drift to explore the known vein in the No. 2 shaft and has been started for the purpose of picking up a chute of ore. It is believed that the present work has carried the engineer to the edge of a chute where a 30-ounce assay was obtained. The veins in No. 2 shaft and the drift of the 20-foot level are said to show silver values and the Manager says that there is no geological reason, as shown by the performance of the veins in Cobalt, why the veins should not develop into producers.

Northern Securities, Limited, Toronto has issued a statement in regard to the Bailey Cobalt Mines, stating that the Company has been in litigation for five years, but that during that time the mine has been kept free from water and in the charge of a caretaker. An offer has been made by certain large interests to form a new company and amalgamate the Bailey Mine with the Northern Customs Mill.

**Proposed Air Service for the North Country.**

Toronto mining men were interested in the announcement from Cobalt that Messrs. Bishop and Barker, the noted Canadian airmen, through Captain Staler, had asked the Temiskaming Board of Trade of New Liskeard, to use its influence for the establishment of an airplane service in the North country. The board's annual meeting endorsed the project, contending that such a service would be of great assistance in the mining and lumbering industries. The necessity for Hydro power and a trunk road and extension of the Nipissing Central Railway were outlined as the urgent needs of the district. In connection with the proposed air line it is said that a proposition has been made looking to the installation of five machines for an outlay of \$50,000 at a point of points somewhere along Lake Temiskaming which would enable mining men who have to make more or less frequent trips under conditions of hardship into such districts as Matachewan, to cover the distance in an hour or so.

The aeroplane would not only carry a couple of men into the back mining areas, but would carry packs and baggage as well and thus obviate the hardships attendant upon the use of the tump-line and the rough going generally.

James Nelson, a pioneer operator in Baden township in the Fort Matachewan district, is in Toronto. He recently encountered some very high grade gold ore on his property and he has three men at work following up his find and he is in the city arranging to take in a good steam prospecting plant and possibly a diamond drilling outfit before the snow goes, in order that development work may be carried on aggressively during the coming summer. Mr. Nelson is arranging for the organization of a company for the purpose of taking over the property and carrying on active mining operations.

The Hughes McElroy Gold Mines, Limited, in which several Toronto mining men are interested, has just been granted a provincial charter. The company will take over the nine Hughes claims in McElroy Township on which considerable development work has already been done and on which a limited amount is now in progress in the way of sinking test pits on two of the veins of the property. This property adjoins the Mondoux property on the north the Mondoux having recently been transferred to other Peerless Gold Mines, Limited, which is controlled by Alexander McKinnon and Sherley Ogilvy of Montreal. It will be recalled that there was a big discovery of gold on the Mondoux last fall. Eight drill compressors have been installed, together with three boilers and hoist and several camp buildings are under construction, while a good road is being built through from Larder Lake.

**A REPLY TO THE CIVIL SERVICE COMMISSION.**

Editor, Citizen:—A statement from the Civil Service Commission in regard to the Geological Survey appeared in your paper yesterday with the request that it be given wide publicity. In substance it asserts that "the British Petroleum Company, a powerful corporation, etc., approached a member of the Geological Survey staff who had been receiving \$2,600, but who under the classification will at once increase to \$3,300, and offered him \$6,200 to start with. Another on the same salary was offered \$5,100. Both these men admit that the new schedule is fair and as liberal as the government is justified in offering for their services."

The above statement is so wicrdly inaccurate that one wonders whether the commission has taken to kidding the public. It is true that one of the men who is leaving is receiving \$2,600 in the Civil Service. The rest of the statement is absolutely contrary to the fact. The fortunate individual with a salary of \$2,600 "who under the classification would be at once increased to \$3,300" received an official notification from his deputy on December 29th that he had been classified by the Civil Service Commission as an associate geologist, for which position there is a beginning salary of \$2,580. Of the six other men who accepted outside positions, one at salary of \$2,700, was reclassified at a beginning salary of \$3,300, three at salaries from \$2,300 to \$2,500 were classified as associate geologists, two at salaries of \$2,100 and \$2,300 as assistant geologists, beginning salary \$1,680. None of these men would, it is true, have received lower salaries than they had been given previously, but only one was assured of a substantial increase. Six men accepted outside positions soon after. The commission asserts that the government cannot compete with such salaries and that the nation would not sanction it. We believe that the nation would have endorsed the modest recommendations of the deputy minister of mines that each of these men be raised to the class above that in which his old salary fell.

The Civil Service Commission is faced with a difficult task in their attempt to apply a scheme of reclassification to such a large and intricate organization as the Civil Service, and in this effort they deserve support. They have made the mistake of underestimating the value of the services of trained geologists. Theoretically, the reclassification as applied to them was fair; as put in practice by the commission it was not. An assured and immediate increase of twenty five per cent in their salaries would have retained the services of nearly all of the seven desrters. A rigid application of the schedule issued on Dec. 29th will, no doubt, work the other way.—L. REINECKE. Ottawa, Jan. 20th, 1920.

# Industrial Use and Limitations of Respirators, Gas Masks, and Oxygen Breathing Apparatus

By A. C. FIELDNER.

(By permission of the United States Bureau of Mines.)

During the last year the Bureau of Mines has received many inquiries regarding the use of army gas masks in the industries for protection against poisonous and irritating gases. These inquiries show a general belief on the part of the public that this type of mask will protect the wearer, under all conditions, against any gas whatsoever and even in absolutely irrespirable air to the exclusion of the more cumbersome mine rescue breathing apparatus or the air helmet with hose connection to pure air. This erroneous belief will no doubt be further confirmed by millions of discharged soldiers who have been trained in the use of the gas mask and have been taught that it gives them absolute protection against all gases used or likely to be used in warfare. These men will not realize that out in the open air of the battlefield, the percentage of gas in the air can never be nearly as large as may occur in the confined spaces of a factory operation. A mask may afford complete protection under outdoor conditions and break down at once when used indoors where a gas container has burst and filled a closed room with gas. It must also be remembered that the absorbents in the army respirator, which filter out the poisonous gas, are especially designed for the gases used in warfare, and as a matter of fact do not protect against the more common industrial gases, as, for example, illuminating, natural, producer and blast furnace gas.

In view of these limitations of the army gas masks, which, if not realized, will lead to serious accidents and fatalities, the Bureau of Mines is issuing this brief statement of the industrial use and limitations of dust respirators, gas masks, and oxygen breathing apparatus.

## Dust Respirators.

More or less protection from dust and liquid mists is obtained by the use of a simple dust respirator, which removes these particles of dust or mist by means of a filter of moist sponge, cotton or wool pad, porous paper or even a very fine mesh metallic gauze. The respirator may enclose the mouth and nose only, or it may be combined with a face mask containing eye-pieces if the eyes must also be protected. The simple "pig snout" respirator containing a moist sponge has been on the market for years. It is highly uncomfortable to wear, is rather insufficient for removing fine dust, and most workmen prefer to tie a large handkerchief over their nose and mouth. Some improvement has been made in recent years, but on the whole a really efficient and comfortable dust respirator that workmen will wear continuously is yet to be devised. There is an urgent need for such a device for safeguarding the health of workmen in the mining and metallurgical industries and in other dusty trades.

All of the present type of "pig-snout" respirators have an utterly inadequate filtering area. The inspired air is of necessity forced through this restricted area at a high velocity which prohibits the use of an effective filter because of the high breathing resistance it would have.

It has been shown that the injurious quartz particles which become imbedded in the lungs of "hard-rock"

miners are no larger than one to ten thousandths of a millimeter. Dusts of this degree of fineness require an extremely fine-meshed filter, very much finer, indeed, than cotton or silk gauze or moist sponges as are commonly used.

A really effective dust filtering mask can be made by using rather dense felt or paper filter of large area, say 100 to 200 square inches, and attaching this with a hose connection and cheek valve to the facepiece of an army gas mask of the Tissot type. By using this large area the velocity of the inspired air through the filter is low—consequently the breathing resistance is quite low and the filtering efficiency becomes very good.

## Army Gas Mask.

The army gas mask consists of a facepiece of rubber and cloth fabric, containing eye-pieces and connected by means of a flexible rubber tube to a canister containing charcoal and soda-lime for filtering out the poisonous gas from the inspired air. The canister is supported in a knapsack slung from the neck.

The army gas mask is by no means the unusual protective appliance that is popularly believed. It does *not* afford universal protection against all gases, nor can it ever be of use in low-oxygen atmospheres. It furnishes no oxygen to the wearer and can only remove comparatively small percentages of poisonous gas from inhaled air, usually less than 1 or 2 per cent. Higher percentages may penetrate the canister and "gas" the wearer. The standard army gas mask will furnish protection against percentages not exceeding one or two per cent of the following gases in air: Sulphur dioxide, hydrogen sulphide, chlorine, carbon bisulphide, nitrogen peroxide, aniline vapor, benzyl bromide, benzyl chloride, chloroacetone, chlorpicrin, hydrogen chloride, phosgene, sulphur chlorides, xylol bromide, stannic chloride, titanium tetrachloride, silicon tetrachloride, hydrogen cyanide, benzol, gasoline vapor, and carbon tetrachloride.

It will be seen from the above that the mask has a wide field of usefulness in the chemical industries, around smelters, roasters, and acid plants where sulphur fumes are given off, and in the industries using chlorine and bleaching powder, and in rubber factories for sulphur chloride, carbon bisulphide and other volatile organic solvents. The army canister also contains cotton filter pads which remove irritating and poisonous dusts, which increase its usefulness around smelters where sulphur and arsenic fumes must be removed.

The army mask furnishes no protection whatever against carbon monoxide, which is the poisonous constituent of mine gases after fires and explosions in coal mines and of blast-furnace, producer and illuminating gases. For these purposes oxygen breathing apparatus or air helmets must be used.

It is expected that a carbon monoxide mask will become available in the near future which may be used for protecting against low concentrations of this gas.

Ammonia is another gas that will penetrate the standard army canister. However, a special chemical may be placed in the army canister which will adapt it for use around refrigerating plants.

### Use of Army Mask by Firemen.

Whether or not firemen should adopt the general use of the army gas mask has been a much discussed question. Tests made by the Chemical Warfare Service and by the Bureau of Mines proved conclusively that the mask, when fitted with a canister containing filter pads, would protect the eyes and throat from the irritating and choking constituents of smoke. Men wearing the masks have remained in small rooms filled with dense smoke from small fires of wood, wet straw, pitch, rubber, and sulphur, for periods of thirty minutes without any discomfort whatever. These tests have been repeated by fire departments all over the country; as a result most of them have pronounced the mask safe, and have accepted it as a final solution of the vexing problem of smoke protection.

However, despite these tests, it must be kept in mind that the gas mask has pronounced limitations. It provides no oxygen if the wearer should step into a burned-out atmosphere, nor, will it protect against carbon monoxide, which may be present in fatal proportions in a closed room where a fire has been smoldering for some time.

The usual smoke test made by burning rags, wet straw, pitch, rubber, and sulphur for thirty minutes or an hour in a room, will not as a rule generate enough carbon monoxide to cause any effect. Consequently the results of all these tests were favorable to the mask.

Recently a long-time test was made in the Bureau's 1,000 cubic foot gas chamber at the Pittsburgh experiment station, in which a smoldering fire of 6 pounds of moist rags and excelsior was kept going without allowing it to burst into flames for a period of 4½ hours. At the end of one hour the chamber atmosphere contained 0.37 per cent carbon monoxide; in two hours, 0.62 per cent; in three hours, 0.95 per cent; and in 4½ hours, 1.13 per cent.

Some of this final air was drawn through a gas mask canister, then through a large bottle in which was placed a canary bird. The bird collapsed in half a minute. This experiment demonstrates that the gas mask will not protect a fireman under all conditions, and that it must be used with some caution.

The final solution of the problem of a mask for firemen will be the construction of a special canister having about three times the volume of the present army canister and containing in addition to the present filling of charcoal, soda-lime, and filter pads, special absorbents for ammonia and carbon monoxide. With such a canister a fireman could safely enter any atmosphere in which a safety lamp would burn.

Probably the strongest argument for the use of the present Army type of gas mask by firemen is that it will be a great help to them in the majority of cases, and that at any rate a fireman has to take chances in line with his duty.

### Oxygen Breathing Apparatus and Air Helmets.

The self-contained oxygen breathing apparatus or air helmet can never be displaced by a gas mask for use in atmospheres deficient in oxygen. Such atmospheres are encountered in mine rescue work, in gas mains, blast furnace stoves, producer-gas or water-gas apparatus, etc. Aside from the lack of oxygen, carbon monoxide is also present, for which the gas mask is useless.

Air helmets or oxygen breathing apparatus should also be used instead of the gas mask for entering tanks, towers, and other closed spaces containing large quantities of irrespirable or poisonous gases, as, for example,

a gasoline tank containing some residual liquid. The concentration of vapors produced by volatile liquids in closed containers sometimes is too high to be removed entirely by gas-mask absorbents. The only safe protector in such places is a self-contained appliance or air helmet in which the wearer does not breathe any of the irrespirable atmosphere.

### Importance of Expert Advice on Protective Appliances.

On account of the many factors entering into the use of protective respiratory appliances, the importance of competent advice on the selection and use of such appliances can not be over-estimated. In connection with the Bureau of Mines' work of safeguarding the health of miners and workmen in the metallurgical industries, a general investigation of respirators, gas masks, and breathing appliances is being undertaken at the Pittsburgh experiment station of the Bureau. This research will be conducted by experienced chemists and engineers who had charge of gas-mask research in the Bureau's war-gas investigations and subsequently in the Research Division of the Chemical Warfare Service, U.S.A. In the 1,000 cubic foot gas-chamber which has been built at this station, breathing appliances can be tested on men in any gas desired.

The industrial respirator investigation will include:

- (1) Advice on the suitability of the standard Army gas mask for use in various industrial gases.
- (2) Approval of industrial gas masks and respirators when properly submitted to the Bureau by the manufacturer in accordance with a schedule to be announced later.
- (3) Instruction of workmen at plants in the use of masks and respirators in a manner similar to that now being given by the Bureau in the use of oxygen breathing apparatus.

The A. B. C. of Iron & Steel: The Penton Publishing Company, Cleveland, Ohio edited by A. O. Backert. Third Edition. Cloth. 8 by 11 inches by one inch. 374 pages with Directory and Index. Price \$5.00.

This book epitomizes the technique and business extent of the iron and steel industry of the United States, and contains a series of chapters, each written by an authority in his particular specialty, on various branches of the industry, commencing with the mining of the iron-ore, dealing fully with transportation and fuel supply, with the basic processes of iron and steel manufacture, and with all the branches of fabricated steel. Chapters are included on malleable iron, steel castings and electric steel.

The book also contains statistics of the American iron and steel industry, and a complete directory of iron and steel works of the United States and of Canada, classified by firms and also by products. A complete index is attached.

The book is printed on fine stock and the illustrations are numerous and good. The article on Transportation of Ore on the Great Lakes contains a number of historical photographs showing how the transportation facilities of the Great Lakes have developed from small schooners of 15 to 20 tons burden to the great 10,000 ton freighters that are now used.

This book should be of considerable utility to all who have occasion to do business with the steel industry, and to advertisers of steel plant equipment.

## The Microscopical Investigation of Coal

An address on the above subject, illustrated with lantern slides, was delivered by Mr. James Lomax at the December meeting of the Past and Present Mining Students' Association, at the Wigan and District Mining and Technical College. He said that a microscopical examination could give the chemist useful information regarding the various coal constituents. It was owing to the great difficulty in making a slice of coal sufficiently thin for microscopical use that coal had not had the attention of microscopical investigators which it would have received if the preparations had been quite as easy to prepare as in the case of other rocks. If a preparation from a sample of coal was to be made it would be useless to heat it in the same manner as an ordinary rock specimen. It was essential that the preparations should be so large cut usually from parting to parting, that when all were cut and finished they could be arranged in their order, showing a more or less thin transparent slice from floor to roof. When the preparations were held in front of a suitable light all the various laminae would be seen in colours according to their composition and density, the colours ranging from a light yellow to a deep ruby red. Generally the more yellow and red yellow, the higher the coal's volatility and the less the carbon contents. The preparations if viewed only in the manner indicated, were of some value. Moreover, on closer examination every lamina could be resolved into its original form, although it might be highly flattened and compressed. With the aid of palaeobotany it could be determined to what kind or genera of plants any given part of a seam owes its origin, what changes have occurred in the plant succession during the deposition of the vegetable debris now forming our coal substance. He had come to the conclusion, after an exhaustive study of a large number of seams, that almost all had had their origin in vegetable matter grown and deposited on the spot where it now rested. To his mind there were very few seams that owed their origin to drifted vegetable matter, and these showed a structure totally different from the seams they were considering.

It must be apparent to all who have studied the question that coals are not of equal value, this being impossible since it is to the plant remains that we owe our coals. Study of a recent peat bed of any considerable thickness will show that the growth and deposition of plant remains in the bed are not homogeneous, but that for a length of time the lower portion was composed mainly of the remains of equisetinae, oak, and other ferns, willow, &c., on the top of which came a deposit composed mainly of the remains of birch, hazel, and other shrub-like plants, this again being succeeded by a deposit of sphagnum, then again by cotton grass, willow, and other shrubs, a thick bed of the remains of pines, covered by a mixture of sphagnum seirpus and grass-like plants. Such a deposit is similar to that of the deposition of the vegetable remains during the carboniferous times, allowing for the difference in character and species of the plant remains. Such being the conditions we can expect a difference between one part of a seam and another, and also between seams in different horizons, and this being so there is bound to be a difference on carbonisation, and constituents of each distinctive class of vegetation will still have their effect on the

coal substance when carbonised. This is the reason why one class of coal may be quite as good as another of like heat value for a specific purpose, but would be useless for another, such as coking for metallurgical purposes. All bituminous coals do not coke, or if so, do not possess the properties of metallurgical coke. Hence it may be said that the various coals are individually adapted to one or more specific purposes from which they cannot be diverted without disadvantage.

In order to illustrate how the microscope can be made useful take the question of generating power, the prime requisite being heat. In this case one class of coal which possesses a certain value per unit may seem just as suitable as another of a like heating value. The lantern slides give an idea of the different varieties of coal. One is taken from a bright and brittle humic coal which gives off a large volume of gas and liquid volatile matter, comparatively rich in benzene and its homologues. It is not my intention to go very deeply into the microscopical structure of the fuels, and I am only pointing out the distinguishing features. Such coal as the specimen under consideration is nearly always found next to the floor of a seam, and is chiefly composed of finely divided fragmentary plant debris. The plants from which the remains originated would be of a low order, and more or less small and dwarfed. Such coal on carbonisation contumaces and swells, forming at a low temperature a pasty mass, and if carbonised in a vertical retort the gases made in the lower part of the retort are with difficulty passed through to the upper part. Such coals very often form an almost solid mass in the middle portion of the retort causing it to hang, obstructing the passage of any further fuel. In using such coal great attention to this point is required, very often continual picking and stirring with long poker being necessary. The coke is soft and spongy the spongy cavities being formed by the imprisoned gas made whilst the material has been in a semi-plastic condition. In addition to gas such fuel is not good for steam raising purposes, for, as in the retorts, it swells and contumaces, stopping the air passages through the fire bars, which necessitates the use of the poker, causing to be made a large volume of black smoke in which the largest part of its heating properties is carried through the flues into the comparatively cold chimney stack, and onward into the atmosphere. Another picture shows coal similar in calorific value, volatile contents and ash, but which is microscopically different in composition. It is not as soft, and it is bright banded and laminated, the bright bands being sometimes formed of jetonised wood tissues more or less irregular in many of which the tissues are well preserved. These show them to be the remains of fairly large stems or branches chiefly of a Cordaitan species. The fine laminations are resinous bodies, and fine leaf laminae with here and there a few microscopores and megaspores. Such coal is seldom near the floor of a seam, but is generally found one-third the distance between the floor and the roof, and it may, as found in many seams, continue to the roof forming two-thirds of the thickness of a seam, or, as more generally is the case, give way to a spore coal. Such fuel gives a large volume of gas and a higher yield of volatile liquid products, especially

# A MARSH HOIST

## IS MADE THE RIGHT SIZE FOR YOUR MINE

and in either Steam Power or Electric Power

This shows one of our Electric Mine Hoists. We make many other types. Send for our catalogue of Mine Hoists, Cars, Cages, Buckets, etc., and see what we offer you. It will repay you.

From the little 10 Horse Power size for prospectors or small mines to the massive 50 Horse Power size, one of our 7 sizes should be just right for your mine.

We are specialists in the building of Hoisting Machinery of all sorts. For nearly a quarter of a century we have been designing and building Hoists, and have developed a Hoist that we are really proud of—proud because of the record of good work they have done, and are doing in mines, quarries, and other classes of work from one end of Canada to the other.

of the benzine series. The tar oils are lighter and are more easily distilled, and the residual pitch is less than that obtained from the other or very soft coal; although if the same soft coal could be distilled without becoming pasty it would probably give quite as good results.

The next case of coal is much different both microscopically and macroscopically, being more compact and tough, and it does not break up in dice or cube-like pieces. It is laminated with alternating dull and bright looking bands, and it splits with a more or less slaty cleavage parallel to or along the bedding planes. Microscopically the laminae or alternating bands are found to be composed of layers of leaf-like humus, constituting the bright part, the dull looking part being composed of the flattened remains of fructiferous organs of a lycopodaceous nature in the form of megaspores and microspores. There may be, as is often found in some seams laminae of a resinous nature which are clearly the remains of resin droppings or exudations from resin ducts of some species of plants of that age. Such coals are the best both for steam and for gas-making purposes. They do not swell or become pasty, and consequently when used in a furnace or retort they do not obstruct the passage of air or gas through the thickness of coal on the fire bars or in the retort. The volume of gas made from this class of coal is fairly large, there being a high calorific value and illuminating power. The liquid volatile contents is also high, but contains a percentage of naphthalene. The residual tars are higher in proportion than in the soft coals, there being consequently more pitch. Such coals make excellent coke both for ordinary and also for metallurgical purposes.

Another class is the hard, tough, bony, grey-black looking coals, these being classed as hards. Macroscopically they are known to be composed of finely laminated bands, very regular, and extending over large areas, being found as a rule in thick seams (in the middle of the seam) and having both below and above one or both of the coals already mentioned. Generally from the floor upwards the soft coal gives place to the harder or less soft and this in turn to the Hards under consideration which may be classed: (1) The soft bright coal near the floor, humic coal with little or no structure, (2) the next bright and a little harder and more laminated, semi-humic coal, in which the microscope shows remains of leaves and resinous bodies, (3) more hard coal with bright and dull looking laminae, semi spore coal, (4) spore coal.

The latter when seen in thin sections is found to be composed of microspores and megaspores, while it is variable in thickness, sometimes passing quickly into semi-spore or into humic coal, or it may be placed with lenticles of cannel, or canneloils coal. In some seams it forms the root coal, which is overlain in its turn by a more or less thick sandstone. It will be seen that we have in one seam four distinct classes of coal, the constituents being distinct and different from one another, and each producing different results on carbonisation. Anyone with a little practice can with accuracy distinguish and pick out all the four varieties. It is not meant to be understood that all seams are composed on similar lines, but in general most of the thick seams say over 5ft. or 6ft. in thickness are built up in the manner indicated, while others are composed of humic or semi-humic constituents, and may never have more than humic consti-

tuents, some may extend to the semi-spore condition, and some may be composed almost entirely of spores, this condition very often prevailing when the workable portion is preceded below by a thin band or stratum of bassy or inferior coal which represents the portion that is humic and semi-humic in other seams. From "Science and Art of Mining."

#### A SOUTH AFRICAN VIEW ON THE USE OF HAMMER DRILLS IN SHIPPING.

In the course of the discussion by the South African Institution of Engineers of a paper on "Hammer Drills for Rock Boring," by Mr. H. S. Potter, Mr. J. H. Veasey gave a large amount of information with respect to modern methods of stoping and suggested that it might prove economical to adopt a smaller diameter of hole and replace hand drills by light pneumatic hammer drills. In this connection he pointed out that during the year 1918 over 20,000,000 tons of ore were mined from stopes on the fields of the Rand, and which about 8,000,000 tons were produced by hand and about 12,000,000 tons by machine. Assuming eight tons per machine shift, 312 shifts per year, two native operators per machine, and four holes to a shift's work, it would require 4,800 machines and 9,600 native operators drilling 6,000,000 holes to break this 12,000,000 tons. If it were possible to do the same work with machines requiring only one native per shift, the saving to the industry on these 6,000,000 holes would be about 9d. per hole less cost for native labour, a total of £225,000 during the year, with 4,800 fewer natives. Assuming that these 4,800 natives would be available for other work, about 1,200 of them could be employed on light one-man stoping machines, which at eight tons per machine-shift would yield 9,600 tons per day increased output, or 3,000,000 tons per annum, while the remaining natives, viz., about three-fourths of the total, would be required for steel carrying, shovelling, and tramming the increased output. Again, in regard to the 8,000,000 tons obtained from hand stoping, it is difficult to say how many natives were actually employed on this work. But if it is assumed that one native breaks about 300 tons per annum, it would appear that about 27,000 natives were so employed. Neglecting the odd 7,000 as being engaged on work which might be entirely unsuited for light machines, and assuming that the remaining 20,000 could be used in connection with light machine stoping—allowing, as before, three-fourths of the total number for steel carrying, shovelling, tramming and incidental work—5,000 of these natives would be available for light one-man stoping drills, which at eight tons per machine-shift, and 312 shifts per year, would break 12,000,000 tons, an increase of 50 per cent, over hand work. It must not be inferred that any reduction in cost per ton mined has been foreshadowed in this last comparison. Hand stoping is one of the most economical methods of mining on these fields, and it is not suggested that a light machine and rig, requiring only one native per machine shift, will be cheaper so long as the old average is adhered to for a shift's drilling. Also it must be remembered that many concerns would not be justified in making the capital expenditure required for the necessary equipment of machines, rigs, hoses, steel and pipe-lines. At the same time it is believed that if these light one-man drills are allowed to do all they can in the hands of trained operators, light machine stoping will eventually be cheaper than hand stoping.

## Misplaced Parsimony

It has been intimated that certain of the members of the Geological Survey who have been compelled to resign their positions because of the insufficiency of the salaries permitted to them under the revised classification of the Civil Service list, may be given extended leave of absence, and that Canada may not entirely lose their future services. In case this intimation may create an impression that the incident is closed, some additional facts should be presented, for the information of the public, because we believe that the present anomalous position of the government geologist is primarily due to a widespread ignorance of his functions on the part of the public. The citation of particulars in one or two typical cases may bring enlightenment, and, while it has been considered best not to mention names, the particulars given will be sufficient to ensure identification by those interested.

One of the members of the Survey who has resigned, is the author of the most complete and scientific monograph on the Wabana iron-ore deposit. His work in this connection is accounted worthy of note in every bibliography on iron-ores that has since been published. His original speculations on the part played in iron-ore deposition by low forms of animal life have received recognition in later works. The application of these speculations to the origin of sedimentary iron-ores may quite conceivably lead to the discovery of important new deposits, and may also be of great assistance in determining the extent over which known deposits may be expected to be found by deductions from the probable extent and shape of the area of original deposition.

Another important work of this geologist is on the revision of the City of St. John, N.B., sheet, a district of much interest to geologists, and one which it is surmised may throw light on the area of deposition of the carboniferous sediments that may extend from Rhode Island to Grand Lake, Newfoundland; and the subsequent earth movements, followed by erosion and the deposition of newer sediments that have delimited the coalfields of the maritime provinces as we know them to-day. Such studies are, of course, the preliminary to the location of the hidden coalfields of the maritime provinces.

A further recent duty of this geologist has been the revision of a portion of the sheets of the Sydney coalfield.

To digress, for the purposes of further elucidation, it may be mentioned that in the case of the comparatively small coalfield of the Nanaimo district, the Geological Survey has provided no less than four most excellent maps, dealing respectively with the topography, the stratigraphical geology, the superficial geology, and the economic geology of the field. Of particular interest and usefulness to the miner is the sheet on economic geology, which shows the crops of the seams, the course of the folds and their continuance under the sea, and the delimitation of the economic working of the coal-seams by depth of cover and by the influences of the anticlines and synclines.

For comparison may be mentioned the sheets of the Sydney Coalfield which are compiled from surveys made in 1874-6, corrected to 1898. Not only are these sheets woefully out of date, as regards the revisions and new data revealed by actual mining and borings, but no attempt has ever been made to show the seaward course of the anticlines and synclines, or to show the economic delimitation of the undersea coal-seams, as affected by depths of cover, undersea outcroppings, and the seaward course of the folds.

If one-quarter the work had been spent on the Sydney coalfield that has been spent (and very properly spent) on the relatively smaller and less valuable deposit at Nanaimo, many of the purely technical questions that have been the subject of animated debate in recent months would never have arisen; and the problems of the undersea coalfield would have been half solved by being more accurately displayed and understood.

Three years or so ago, the gentleman we have in mind was detailed to supply some of the crying deficiencies of the Sydney sheets, and now, with his work half done, the only man who has any close acquaintance with the geology of this district is compelled to resign. Why? He is thirty-seven years of age, married, with ten years service in the Survey; the highest scholastic qualifications, an enviable scientific record and unique acquaintance with some of the neglected problems of the geology of the maritime provinces, and a salary of \$2,400 per year: C'est pour rien.

This instance is typical, and we propose to give others equally glaring, only we have some respect to the patience of our readers.

The maximum salary of the senior members of the Geological Survey is \$4,200. There are men in the survey with nearly forty years experience, and international reputations, who have reached this giddy pinnacle of affluence, and have had the pleasure of seeing many men get rich through their labours. There are men, and have been men, in the Geological Survey of Canada whose labours and deductions have added millions upon millions to our national wealth, and it has been their lot to sit by like cloistered monks vowed to penal poverty, seeking presumably,—otherwise their salaries are not explainable—to free themselves from breaches of the tenth Commandment.

#### THE SELECTION OF MINE INSPECTORS.

According to reports from Cobalt, the local Miners' Union is undertaking the task of finding suitable men to fill vacancies on the staff of mining inspectors of Ontario. They propose to recommend to the Minister of Mines that men selected by the Union should be appointed inspectors. They apparently are of the opinion that the Minister might be prevailed upon to patronize the Union instead of appointing men properly qualified to fill the positions.

The duties of an Ontario mine inspector as defined by the Mines Act are such that careful selection of inspectors is essential. If instead of selection according to qualifications we are to have the political party or class favoritism mode of selection, the recommendations of the Miners' Union will be in order.

The regulations governing the operation of Mines in Ontario impose duties and responsibilities on the inspector that could not be properly delegated to many miners or mine managers. They assume on the part of the inspector not only general engineering training, but special knowledge and interest in the safe and efficient operation of mines and an ability to guard the safety and health of the workmen without imposing unnecessary burdens on the mine managers. The inspector is frequently called upon to make important decisions concerning the application of sections of the Mines Act, for instance in the case of rules for protection of miners it is provided that "the following rules shall be observed and carried out at every mine except in so far as the Inspector of Mines may deem the same not reasonably applicable."

The inspector is empowered under the act to make such examination and industry as "he may deem necessary" to ascertain whether the provisions of the Act are complied with. He may order the immediate cessation of work in and the departure of all persons from any mine or portion thereof "which he considers unsafe," or to allow persons to continue to work therein on such precautions being taken as "he deems necessary." He may exercise such other powers as may be necessary for ensuring the health and safety of

miners and all other persons employed in or about mines, smelters, metallurgical and mining works. In conducting inquiry with respect to any accident he has power "to compel the attendance of witnesses and the production of books, documents and things and to take evidence upon oath."

The many provisions of the Mining Act devised with the intention of guarding the safety of workmen necessitate on the part of the inspector a very good knowledge of the machinery used in mining and of mining methods. It has been found advisable to invest the inspector with a good deal of authority and therefore in addition to his qualifications as a safety engineer he must, to successfully fill the position, be quite free of labor or company influences R.E.H.

#### EN PASSANT.

THE Montreal Meeting of the Engineering Institute of Canada, held from the 27th to 29th January, was a most successful gathering. More perhaps than any other technical body in Canada the Engineering Institute reflects the common interests and aims of the Canadian people in their two great racial sections of French and English-speaking peoples. The genius of the French people for the exact sciences, and their eminence in mechanical arts, in mathematics and general engineering is prominent in Canadians of French descent, and the leading position taken by the Province of Quebec in the development of water-powers, highways, and the ganglion of transportation that is known as the City of Montreal, are not mere outgrowths of geographical position, but are also evidences of the native talent of the citizens of Quebec Province. The speech of Major-General Mitchell at the Annual Dinner in proposing the toast of the Province of Quebec, in which he described the part taken by the 22nd Regiment at Courcellette; and the graceful diction of the ex-Speaker Marcell in response, was an incident of much significance, and indeed of much hopefulness.

MUCH prominence has been given by newspapers to the indisposition of certain members of the United Mine Workers of America in Nova Scotia to ratify the agreement made between the U. M. W. Executive and the Dominion Coal Company. The wisdom of this extended publicity is to be doubted, especially when it is known that on the occasion of every new agreement on wages made between the labour leaders for the time being, and the coal companies, such disagreements have taken place. These disagreements usually take the form of a local adjustment, and the procedure is a well-known and recognized one. It is a great pity that efforts at labour conciliation should be hindered by giving wide publicity to matters of purely local detail, as thereby the general public is unnecessarily disturbed and fictitious importance is given to subjects that are of only local

and passing significance. An instance of this undue alarming of the public was the prominence given to a small strike at Minto, N. B., where all the three parties concerned, namely the miners, the Company and the Conciliation Board bungled an easily adjustable situation, largely through over-estimating the importance of the incident.

A SIGNIFICANT event is the overture made to the "salaried" or "new poor," as the middle-class people of Britain are now known, by the British Labour Party. How much of the present social unrest is traceable to the anomalous position of the lower professional and official classes in corporate and government employment is uncertain, but much of it probably originates with men whose position is very helpless and very irritating. Corporations who will attend to the demands of labour, insistingly and threateningly made, often forget the clerk and sub-foremen, on whose loyalty and personal comfort so much of the machinery of corporate organization depends. These men are the great buttress of modern society against the dissolving forces of these days, and, if through forgetfulness, or more unworthy motives, employers neglect to take care of these men, the forces of unstabilization will increase even more quickly than they have so far done.

SOME interesting information concerning the present cost of producing gold on the Mother Lode in California is contained in the recently published review of mining in that state. The State Mineralogist, Mr. F. N. Hamilton, quotes cost figures for several properties and states that any company working Mother Lode ores for less than \$4.75 is doing it at the expense of the future of the property or because they have ore blocked out ready to mine for a long time to come and do not have to carry on current exploration and development. At the Morgan mine, where an ore shoot 30 ft. thick and 150 to 165 ft. long is being very profitably worked, the operating cost is \$5.14 per ton and the development cost 65 cents per ton. The itemized cost statement for the Morgan mine for July 1919 and the preceding six months gives a good idea of the present cost of mining a large ore-body in California.

#### **STRONG OPPOSITION TO ENGINEERS' BILL IN BRITISH COLUMBIA.**

The British Columbia Prospectors' Association adopted ten resolutions at a recent meeting held at Nelson, B. C. The resolutions were a part of a petition to be placed before the Minister of Mines and Provincial legislature at the coming session. Among the resolutions was one asking for the "rejection of that section in the Engineers' Incorporation Bill that would compel foreign mining companies to employ local mining engineers."

Not only are members of the Prospectors' Association strongly opposed to this section of the Bill but many prospectors who are not members are outspoken in their opinions of this section of the Bill.

The other resolutions were as follows:—

Request for district ore-testing plants and free assays for prospectors, powder at cost to prospectors, a winter school of mine for the interior, accessible district engineers reports, a division of the Eastern District, the application of trail and cabin buildings as assessment work toward grants, the allotting to returned men of the half shares of delinquent partners, the prosecution of parties who misuse prospectors' cabins.

A resolution asking for a special transportation rate on small ore shipments will be presented to the railway companies and the Railway Commission and one asking for a special rate for such lots will be presented to the Consolidated Mining and Smelting Company of Canada.

#### **THE BRITISH COLUMBIA CHAMBER OF MINES; NEW OFFICERS FOR 1920.**

The officers elected for 1920 at the recent annual meeting of the British Columbia Chamber of Mines, are as follows:

Honorary President, Col. the Hon. E. G. Prior

Honorary vice-president, Hon. Wm. Sloan.

President, Dr. E. T. Hodge.

First vice-president, W. H. Hargraves.

Treasurer, Wm. Godfrey.

Executive: C. E. Cartwright, S. J. Crocker, F. J. Crossland, G. S. Eldridge, Major Fleck, B. G. Hawkins, Dalby Morkill, H. P. McCraney, G. W. Pettapiece, Noble W. Pirrie, W. W. Thomas, A. M. Whiteside, F. E. Woodside, P. W. Turnbull, N. Thompson.

Mr. A. M. Whiteside, the retiring president, predicted a big boom in British Columbia mining this coming Spring and stated that New York people were aware of this. He complimented the retiring executive on its excellent work during the past year, and spoke of the good accomplished by the convention held in Vancouver last Spring. From his own knowledge he could say that many of the activities in the Portland Canal district were definitely traceable to that Convention.

Mr. Whiteside could see no reason why Vancouver should not have as palatial buildings as those in Spokane, built of British Columbia materials.

Dr. E. T. Hodge, the newly elected President, on taking the chair for the first time expressed his appreciation of the honor conferred on him, and stated that the Chamber of Mines had a work of immense importance before it. He said that it was their duty to advertise to the world the minerals which B. C. actually had. They must also maintain the cordial relations which already existed with the governing bodies of the Province. He pointed out that apathy shown towards the work of the Chamber was not from the outside world, but rather from the citizens of Vancouver, who needed to be aroused to a sense of their own welfare.

"Mining will make Vancouver into a Metropolis" he said "and the Chamber of Mines should be situated in a building worthy of the work being done, in a main street of the city, where exhibits could be shown to visitors and those interested."

# Mechanical Loading Devices for Underground Work

A Successful "Mucking" Shovel in Michigan.

The present, and prospective, shortage of men who are willing to undertake hard manual labour underground, has led mine managers to turn their attention to the perfecting of mechanical devices for underground use in substitution for manual labourers. A further compelling reason for studying the possibilities of these devices is the shortened working day, which requires intensive production if anything like full interest is to be earned on the plants that have been designed to handle greater quantities than it is possible to produce in a shortened working day.

The limiting conditions attendant upon the design and operation of mechanical devices for use underground are much more irksome than in the case of overground operation, because, in addition to the limitations of size imposed by the restricted area of mine passages, and a further restriction of weight required in order to achieve portability underground, there are considerations of ventilation and the presence of mine gases that limit the motive powers that may be used.

The conditions attending iron-ore mining and, in some favoured instances, copper and precious-metal mining, are less limiting than those associated with coal mining, and therefore the evolution of mechanical loading machines has proceeded most rapidly in metal mining.

The accompanying photographs show a mucking machine that was recently put into operation in a Michigan copper mine, and is giving satisfactory service. It loads from 15 to 30 tons of ore an hour, depending on the depth of the bank. It is operated by compressed air, and has a reach of eight feet on either side of the centre line of the track. The photographs show the machine in three working positions.

viz., empty, loading and loaded. We should be pleased to put any of our readers into touch with the designer of the device. It was designed and built at the mine where it is in use, and is shown in the photographs as it appeared when ready to leave the shop.

Loading shovels have been successfully operated for some time past in the mines of the Nova Scotia Steel Company and of the Dominion Steel Company at Wabana, Newfoundland. In these instances the great height of the seam, the width of the passages, and the tremendous blasts that are made provide an unusually favourable condition, as underground conditions go, for the use of a mechanical loader.

The Dominion Coal Company has also tried a shovel of a smaller type in its coal-mines at Glace Bay, and will in course of time evolve a satisfactory device, but the conditions of operations are very onerous, and probably a greater deterrent than anything else is the attitude of the workmen towards the introduction of these labour-saving machines. The further extended use of these devices will, however, be compelled by the growing and probably permanent shortage of unskilled labour in this district, and by the necessity to cut the costs of coal production by the adoption of every possible means.

It is also understood that the Hollinger Mines are experimenting with a mechanical loader, having been impelled to this by a similar shortage of suitable labour. At the Sullivan Mine, in British Columbia, similar experiments are being conducted.

About eighteen months ago, and before the signing of the Armistice, the "Journal" pointed out the likelihood of a growing shortage of unskilled labour, and the possibility that an exodus of south-European

*Empty Position of Shovel.*

*Loading Position of Shovel.*

labourers following a conclusion of peace might be accompanied by an influx of British-born immigrants of a type unsuited and disinclined to replace the men who it was anticipated might return to Europe. This forecast has been fulfilled, altho' the continued unsettlement of southern Europe has delayed to some extent the efflux of labourers. It was counselled at the time referred to that investigation of the possibilities of mechanical devices in substitution for manual

labour would be repaid. The necessity to look into this question is now much more urgent. In the case of many large-scale mining operations on this side the Atlantic it has for some time been, and will continue indefinitely to be, not a question of getting unskilled labourers at a price, but of getting them at all; and those executives that proceed with the greatest rapidity to provide mechanical devices are most likely to show a good balance sheet.

*Shovel Loaded.*

# The Zinc and Lead Deposits of Gaspesia

A Paper Read Before the Montreal Section of the  
Society of Chemical Industry.

By J. C. BEIDELMAN.

Extending out in the Gulf of St. Lawrence with the Baie des Chaleurs as a southern boundary, is the Gaspé Peninsula—the oldest settled portion of the Dominion of Canada but yet so sparsely populated to-day that at places civilization reaches only several miles inland from the coastal line.

This Peninsula is 160 miles long and 75 miles wide and with the exception of the few miles above mentioned along the coastal line, it is a mountainous wilderness—void of all roads or inhabitants, and development has been at a standstill since Sir William Logan made his exploratory trip across the Peninsula in 1844.

Running in a northeasterly and southwesterly direction, and a considerable distance north of the Centre of the Peninsula, are the Shickshock or Notre Dame Mountains, the northeastern extension of the Appalachian chain. These mountains are very rugged and their peaks rise from 2,500 to 4,200 feet above sea level, consisting of rocks from Pre-cambrian to Devonian, which have been folded and faulted to a marked degree and in turn pierced by eruptive rocks, thus in an ideal manner producing conditions that are extremely favorable to the deposition of ore.

On the southern slope of the Shickshocks at the headwaters of Berry Mountain Brook, a tributary of the Grand Cascapedia river, and in a region showing great faulting, is an area of land with numerous fissure veins carrying sulphides of both zinc and lead.

The zinc and lead field is situated 46 miles in a northerly direction from the village of Cascapedia, Que., and is confined, as far as known, to the projected Township of Lemieux, County of Gaspé, P. Q. Following the east bank of the Grand Cascapedia river from the village of Cascapedia to the junction of the River and Berry Mountain Brook, a winter road has been built which is sadly in need of repair and whose grades, commercially, are impossible until depressed, which is easily accomplished. From this point a road is now being constructed connecting the zinc and lead fields with the winter road. This portion of the road is being made with low grades and suitable for tractors.

A railroad has been surveyed from Matane to Gaspé through the centre of the Peninsula, and the surveyed lines run within six miles of the present zinc and lead development. A portion of this railroad has been built, but the remainder has been held up owing to the financial situation.

For a number of years numerous stories had been circulated about discoveries of gold, copper, zinc and lead ores in the interior of the Gaspé Peninsula, and specimens of copper, zinc and lead had been exhibited as coming from said discoveries. These discoveries when investigated proved to be worthless until the year 1909 when several prospectors discovered lead and zinc float in large quantities on the side of a hill some fifty miles in a northerly direction from Cascapedia. The float principally galena, as the sphalerite had been leached, was found to exist to the top of the hill and a slight but unsuccessful effort was made to locate the source of the float. These efforts were soon discontinued and no further effort was made

until the following year (1910) when James McKinlay staked the hill and proceeded to search for veins. These efforts were only partially successful as far as the prospectors were concerned, as they paid particular attention to the soft rock (slates) and were adverse to disturbing the hard rocks which were the veins proper, but their efforts although misdirected, unknowingly outlines several rich values of ore.

Prospecting was carried along in the same loose manner for several years but no further discoveries were made, although trenches were cut in the slates and carried to within a few feet of the now so called main veins, but in no case did they cut these veins. One trench actually was carried up the hill at an angle of about 30 degrees and pierced the cropping of a vein at the crest of the hill two feet, and was then discontinued. This trench was 150 feet long in solid slate and the vein was visible to the naked eye at all times. Another trench cut the slates for a distance of twenty feet and jumped a space eight feet wide, and was then carried out for twelve feet further. The writer asked one of the prospectors why he left this "hump" of eight feet between the trenches, and he answered it was to keep the water from one trench draining into the other trench. This space of eight feet that the prospectors had never disturbed was a solid vein of ore. Where the prospectors' forge stood fifteen bags of solid galena were bagged from one shot "at grass roots."

This roughly outlines how ignorantly the work of prospecting was carried on in this area for five long years. In the fall of 1915 an effort was finally made to open up the area in a systematic manner, and development has been carried on until the present writing with great success.

## Ore Occurrence.

The country rock of the zinc and lead area is Devonian and consists principally of slates, sandstones, porphyries, syenite and basalt. The rock in which the zinc and lead sulphides occur is generally a slate considerably tilted and greatly fractured with areas of porphyry close at hand—relatively. On the northern and eastern portion of the field proper, quartz-porphry is present in very large flows. In fact, some of the hills at this point are all porphyry in the shape of lacoliths and dykes large and small, which have disturbed the country to a marked degree.

A detailed statement of the geology of the zinc and lead field is given in Prof. Adhemar Mailhot's report on the "Geology of a portion of the projected Township of Lemieux, County of Gaspé, P. Q." published in the Quebec Mines Report for 1917. In this report Prof. Mailhot (Ecole Polytechnique) deals with the geology in an able manner and in great detail, he having spent two summers in this field making a special study of same.

The fissuring in most cases is across the strike of the slates, filled with a quartz matrix, a small amount of dolomite being present. These quartz fissure veins crop strongly, and the system can be traced for a distance of over three miles by float, outcrops and openings, and wherever encountered impress one with

their strength. In all cases, these veins are well defined and show zinc and lead ore in about the same quantity and quality, and at every point where a vein has been opened to any extent, the metal contents have increased with depth.

The principal, and practically the only real development in the field, is the Federal mine. This property has made great progress in its development and has proven at least sixteen different veins within an area a little over fifty acres with widths of from four to sixty feet and traceable on their strike in some cases for over three thousand feet. These veins generally strike a little east of north cutting across the strike of the slates.

The present camp of the Federal mine is situated on the crest of a hill 450 feet above Berry Mountain Brook. This hill is fractured to a remarkable extent, showing a regular network of veins, each carrying practically the same zinc and lead contents.

At a number of places in the drifts and crosscuts of the Federal mine the slates are crushed to a marked extent by cross-fissuring and then cemented with a dolomite quartz carrying a good percentage of blende and galena. This breccia follows the strike of the veins and at places is over 100 feet wide. The blends and galena contents are lower than the metal contents of the veins proper but add greatly to the mineable area of the property, and will be very valuable assets

whenever development is pushed on a very large scale, thus allowing of ore being mined whose metallic contents are considerably lower in zinc and lead than the main veins as now exposed.

One peculiarity of the breccia is that the mineral bearing solutions did not in any way attack the shattered and splintered fragments of the slates, and in all cases, the edges of these slates no matter how small are sharply defined.

Eleven hundred feet a few degrees west of south of the main shaft a vein is cropping sixty feet wide with an apparent horse of slate in the centre of same. This vein is known as the "McKinlay vein" and is cropping on the flank of the hill with crags 50 feet high, decomposed and leached but still showing the usual zinc and lead contents. This vein is also visible on the road below the main croppings, thus giving a vertical height of 110 feet of exposed ore which is all below the bottom of the main shaft.

One half a mile south of McKinlay vein, while grading a road, the vein system was cut 560 feet below the floor of the main Federal shaft, thus proving that the slates have been enriched quite uniformly where fractured and to depth.

North and northeast of the Federal shaft prospecting has uncovered several additional veins—the extension of the main vein system—with ore contents practically the same. One half a mile northeast of the Federal shaft another shaft has been sunk to a depth of 64 feet, piercing a vein averaging nine feet in width thus showing a further extension to the length of the vein system. At this point the same general conditions were found to exist concerning the quantity and quality of ore uncovered. This vein has been proven to extend to be northeast of the shaft over 1120 feet, and to the southwest 1200 feet, thus adding nearly one half mile of vein averaging over five feet in width (as proved by trenching) and showing ore of good quality but badly leached for the entire distance.

Float is visible on the strike of this vein for nearly 1500 feet further, but owing to weather conditions, trenching has ceased for the winter months.

South of the Federal shaft about three miles, road grading uncovered a vein carrying zinc and lead with the same general north and south strike. This is of great interest, owing to the fact that this is the first indication that the veins were cutting the basic rocks.

North of the Federal shaft about 500 feet, a vein has cut syenite-porphry and is traceable for 400 feet, but is "narrowed up" while passing through the syenite-porphry.

Several veins at this main camp of the Federal are traceable for two and three thousand feet, while others, owing to the overburden are only traceable for from 300 to 700 feet.

One mile west of the Federal shaft and on a hill of the same general character as the hill on which the main camp is situated, a large quantity of float carrying the usual zinc and lead contents is found. The slope of this hill is towards Brandy Brook with a higher ridge between it and the main vein system at the Federal camp thus accounting for another occurrence of ore which has not been opened up at present.

In all the veins so far opened amethystine quartz is a part of the vein matrix. It seems to run with the strike of the vein in the form of veinlets and vugs and is generally barren of ore itself, but may be in very close proximity to very rich ore. The purple coloring is caused by a small amount of manganese.

#### Character of Ore.

The sphalerite and galena encountered in all of the openings and workings in the zinc and lead fields is of the highest grade, being equal to the ores of the Joplin Missouri field which are considered to be the highest grades of zinc and lead ores mined, and is of a honey yellow color generally. The sphalerite shows a zinc content of from 62 to 65 per cent with an average of less than one half ( $\frac{1}{2}$ ) per cent iron. This is not only the average of the surface ores but in the underground workings on the main Federal vein the same average is carried out.

The ores, both zinc and lead, are in no way complex, and their treatment is simply one of concentration as at the present time they are free of silver, barium, arsenic, antimony or any other complexity whatsoever, other than that of separating the lead and zinc concentrates from their silicious gangues, which is easily accomplished owing to the considerable difference in specific gravity between the two sulphides—specific gravity of galena being 7.4 to 7.6 and of zinc blende 3.9 to 4.1.

The lead and zinc sulphides are mechanically combined at places throughout the veins, but not chemically, and at places large masses of lead and zinc sulphides exist that simply need hand sorting. A small amount of carbonates both smithsonite and cerussite is found on the surface but only traces are found on the 100-foot level of the main vein. Considerable fine grinding will have to be provided for, as a portion of the ore is disseminated through the gangue in a finely divided state. The value of the ores does not lie in the saving of all these fine particles, but this operation with the aid of the soil flotation process will add materially to the amount recovered.

The usual bug-bear in zinc concentration—iron—will not be a disturbing factor as there is too little of it to be of any harm. This remark refers to all development in the district up to the present writing, but what the future will bring forth, I cannot state, but believe the iron contents will continue to be very low.

The zinc found in the breccia outside the main vein is, sometimes of a brown color similar to the Joplin

"color" but upon analyzing same it was found to contain the same zinc contents as the honey-yellow blende.

As one of the veins approaches the porphyry area to the north, a varying amount of chalcopyrite is present in same, and this is the only ore so far discovered in the entire field that has any other valuable metal present in quantity, besides zinc and lead. The copper at spots is as high as four and five per cent and would lead one to believe that as depth is obtained on the veins of this section and porphyry is encountered, that copper values will be present to a more or less degree. This condition is found solely in the northern portion of the field and only when the veins are accompanied with or near porphyry.

In Bulletin 154 issued by the Bureau of Mines at Washington, D.C., Mr. Clarence A. Wright in co-operation with H. A. Bushler, State Geologist of Missouri, outlines the generally accepted practice of milling the "Joplin" ores as follows:—

"Concentration of the ore is commonly effected 'by crushing to ½ inch and roughing and cleaning 'the crushed material over two or more large Cooley 'jigs of the Harts-type, and running the finer sands 'over the usual types of sand and slime tables."

This practice, in addition to regrinding the "chats" and tabling the product, is followed by treating the slimes by flotation. This general scheme of concentration is particularly adapted to the Gaspé ores owing to their great similarity to the Joplin ores and to the further fact that the grains of blende and galena in the Gaspé ore separate from their gangue much more readily than the Joplin ores. This is due entirely to the gangue of the Gaspé ores being much more friable than the Joplin vein matter.

Owing to the character of the deposits in the Gaspé field, mills with greater degree of efficiency in concentration are made possible and can be built with the idea of permanency instead of being built for only a few years, which is the practice in the Joplin field—an average of three years being the life of the ordinary Joplin zinc and lead mine.

#### Development.

Numerous pits and trenches are in evidence over the field showing a great amount of surface ore but the main development consists in the Federal and Bois shafts and the undergrounds works from the first named shaft. A shaft has been sunk on Federal hill 142 feet (160 feet on the vein) from which drifts were run north and south (the strike of the vein being a few degrees east of north) and crosscuts driven east and west, making a total underground footage of 1816.6 feet.

The north and south drifts are driven on the strike of a very strong vein cutting the slates at right angle to the strike and dipping 78 degrees to the west. The vein is faulted but in no place does it show any material narrowing. Several veins intersect the main trunk system and wherever sampled carry the same general zinc and lead contents. The main vein on the 100 foot level is robbed to a considerable extent of its values by leaching and I confidently look for higher values on the 200-foot level. The ore at the bottom of the main shaft shows less leaching than at the 100-foot level and the blende has a lighter color.

This development "blocked out" above the 100-foot level in two veins a large amount of ore of an average value of \$10.00 per ton and accounted for a very large amount of probable and possible ore. The main vein was drifted on in ore for 870 feet before turning to the east to break through to "air," and showed an

average width of twelve feet of ore. From end to end of this 870 feet the ore body was continuous with here and there some very rich bodies extending over considerable areas. The average metal contents of the 870 feet together with the shaft, as proven by channel cuts, was 8 per cent metallic zinc and 4 per cent metallic lead—exclusive of the rich spots in the vein, or 13.33 per cent of 60 per cent zinc concentrates and 5 per cent of 80 per cent lead concentrates, as Joplin figures its ores. This compares very favorably with the contents of the Joplin-Oklahoma field as the above percentage of concentrates in the "mine run" of the latter field would be considered very high.

Mr. Walter Harvey Weed, mining geologist of New York and for over 20 years with the United States Geological Survey, examined the district in detail. I have taken the liberty of quoting from his report on the main property as follows:—

"The ore occurs in well defined fissure veins whose outcrops on the cleared tract are distinct and traceable across the claims. . . . while no definite statement as to the genetic relation of ore and rock is perhaps warranted, an experience makes me feel positive that the observed geological relations are extremely favorable."

"The conditions just noted together with others which need not be described here, show movement indicating deep fracturing and persistence of ore values downward."

"I see no valid reason why these deposits should not be as rich 1000 feet down as at the surface."

"There is practically no pyrite or marcasite in the ore. It does occur, however, but in scanty amounts."

"The ore seen in the underground workings is typical of that seen in the other veins nearby. From the statement already made, I have shown that the property has a considerable body of commercial ore already opened up but this is only a very small percentage of what may be expected from deeper and more extensive mine development; moreover, the property has possibilities of a large tonnage from other veins and from other claims as yet unprospected."

"The quality of the ore at every point is excellent and it has no troublesome components."

"Concentration of the ore will in my opinion be easy because of its simple mineral composition and favorable mechanical analysis."

"This development is merely indicative of what future work may show. The probable greatest value of the mine is its undeveloped portion."

"The geological evidence indicates that the ore will extend a great distance downward. A depth of 1500 feet or 15 years supply for a 200-ton mill from this one ore shoot is quite possible"

Dr. A. P. Coleman, Professor of Geology, of the University of Toronto, visited the zinc and lead field during the past summer and was very much impressed with the ore occurrences and the general geology of that section of the Peninsula, and in a paper written for publication makes the following statements:—

"Now folded and faulted sediments acted on by masses of eruptive rocks which have cooled slowly and at great depths furnish the natural conditions for the formation of ore deposits. In northern Ontario or British Columbia such conditions would be considered very promising; but in Gaspé until recently nothing of value has been reported."

"On the mountain top several veins cut the slate and porphyry and have been opened up by stripping as well as work underground."

"The most promising sulphide in the ore is zinc blende of a honey yellow color, almost free from iron, unlike the dark brown or black blende found in other parts of Canada. Galena comes next in amount. The gangue minerals are quartz, often amethystine, and dolomite; and along with the vein matter there is sometimes a breccia of slate fragments cemented by spar containing some ore, evidence of important faulting in connection with the veins."

"The conclusion is reached that the mine has a large body of ore of unusually high quality"

"The mine itself has been examined and reported upon by

"the well-known American mining geologist and engineer, Walter Harvey Weed, a very competent authority."

"As a vein has been cut in roadmaking in the valley, 560 feet below the outcrop at the camp, the ore may be expected to go to considerable depths, perhaps, as suggested by Weed, even to 1500 feet, making the mine one of the great zinc deposits of America."

"As the tunnel is only 92 feet below the surface this is only a very small percentage of what may be expected from deeper and more extensive mine development."

"The ore assays about 8 per cent of zinc and 4 per cent of lead, and the association of minerals permits an easy separation of the two metals. It is compared by Weed to that of the Joplin district of Missouri, and in general character it is surprisingly like the ores of that famous zinc mining region, in spite of the fact that the geological features of the two districts are as different as possible. At Joplin the zinc ores occur in flat sheetlike deposits at no great depth in carboniferous limestone, which is very little disturbed and nowhere pierced by eruptive rocks; while the Federal ores are in well defined veins reaching a known depth of hundreds of feet in slate, squeezed and faulted and penetrated by eruptives from which the metal bearing solutions are supposed to have come."

"The Shickshocks give promise of becoming a valuable asset to the Province of Quebec instead of a barrier to enterprise; and it may well be that the mines of the heart of Gaspe may before long surpass in value the forests or the fisheries of its coastal regions"

Adhemar Mailhot, Professor of Geology at the École Polytechnique of Montreal, in his report to the Quebec Provincial Government for the year 1917 concerning the zinc and lead field states:—

"The galena in the veins of the projected township of Lemieux occurs in the shape of grains of all dimensions from small flakes very thinly disseminated among the zinc-blende and the gangue to cubes measuring two inches. Sometimes it forms with the blende solid masses weighing over one thousand pounds. The gangue of the metalliferous veins, formed of quartz and dolomite makes the ore very easy to concentrate by the ordinary mechanical processes."

"The blende of the deposits in Lemieux County is very pure and almost free from iron; its color varies between waxy yellow and reddish brown."

"As the deposits are fillings of great fractures of the earth's crust, it would seem that they must go down to the base of the slaty sedimentary rocks."

"There are outcroppings of ore not distant from each other between which are differences of level of several hundred feet and it is almost certain that the highest deposits go down in depth to the level of the lowest ones."

"Some veins have been followed for distance of about 3000 feet and it is probable that they extend still further under the cover of superficial deposits"

"Then the natural inference is that these veins must go down to a considerable depth, for it is generally admitted that the length of a fissure is proportionate to a certain extent to its depth."

The only chemical by-product that will be commercially produced from the above character of ores is sulphuric acid, which is quite an item to the smelters at the present time treating the Joplin-Oklahoma zinc ores, but the character of the zinc concentrates renders it possible to produce cheaply from said ores the highest grade of spelter—free from all deleterious ingredients, thus commanding a ready sale and giving the British Empire reserves of the highest grades of spelter comparing favorably with the "Horse Head" and "Bertha" brands of spelter manufactured by the New Jersey Zinc Company and the "Mascot" brand of the American Zinc and Lead Company.

From what I have seen of other zinc fields, I am strongly of the opinion that the present area will prove on development to be one of the few zinc and lead fields of the world producing a high grade zinc blende, minus the usual complex ores, and if the depths are sustained, as I thoroughly believe they will be, then this field has a future before it of tremendous possibilities

## THE SILVER ISLET MINE IN LAKE SUPERIOR.

By J. J. O'CONNOR.

The Nepigon Mining and Lands Company, owners of the famous Silver Islet Mine, have granted an option to United States interests on all of their holdings comprised in the Wood Location, at Silver Islet, including the land covered by water, this location covers about ten thousand acres.

It is the intention of the parties taking the option to unwater the mine to a certain depth, to enable them to extract the ore in the roof of the mine, and to carry on systematic explorations on the mainland, where several promising veins are known, and on which considerable testing work had been done under the old operations. Vein values, that under the old regime had no attraction, are now well within commercial possibilities. The abnormally high price of silver, and the improved methods of recovery, more than counterbalance the increased costs of production, and offer a very promising future.

The roof of the Islet has been thoroughly tested by drilling, and is known to contain well over three hundred thousand ounces of smelting ore. Many schemes were planned for taking out this ore, but none were ever undertaken, or at least, put into operation. At one time a cargo of bricks were brought up from Southhampton, with the intention of constructing an artificial roof, but this scheme was abandoned, and the bricks were afterwards used in the construction of the Roman Catholic church in Port Arthur, in 1881.

Silver was discovered on the Islet by a man named Brown, in the employ of Thomas Macfarlane, M.E. in 1868, while placing pickets for a land surveyor.

The first silver mining was done in 1869, when 5/1-4 tons of ore were taken out, valued at \$6 976. Eight men were employed in mining during the winter of 1869-70. The Islet is exposed to the full force of the storms of Lake Superior, the weather in the spring of '70 was such that the boarding house and all other structures were washed away, and for a time the miners were in rather a hopeless condition. When matters got straightened away in the spring, they took out ore to the value of \$25,000 in one week.

These operations were carried on under the superintendance of Thomas Macfarlane. He visited the Montreal owners of the property, and requested them to advance \$40,000 to enable him to fortify the works against the storms of Lake Superior. They refused this request believing it to be impossible to carry on successful mining operations, and placed the property on the market for sale.

A sale was made for \$125,000, and the first payment of \$50,000 was paid in gold on September 1st, 1870. Mining was proceeded with, and \$108 000 worth of silver was mined and shipped before the close of navigation that year.

From this time on mining was carried on, on a very extensive scale. A 40 stamp mill was erected on the main land, in 1874, and the ore conveyed to it by scows, and tram. A village of quite extensive proportions grew up at the Islet several hundred miners with their families making up the population.

Mining was continued with varying degrees of success, until March 1884, when they were compelled to close down for want of fuel. The steamer "Hulbert"

carrying their winter's supply of coal to operate the mine, was storm-bound at Marquette, Mich. and did not reach the Islet until the opening of navigation. Finding operations at the mine closed down the coal cargo was discharged at the C. P. R. Horn elevator dock, Port Arthur.

During the time the mine was in operation there was mine dand marketed \$3,250,000 worth of silver.

The closing down of this property, saw the end, for the time, of one of the most picturesque and daring silver mining ventures ever undertaken.

It is confidently believed by well informed mining men, that this famous old property has a profitable future yet in store.

## Manitoba Notes

### Gabrielle Mines Ltd.

The "Journal" is informed by the Secretary of the Gabrielle Mines Ltd., that Major Pelletier has been placed in charge of construction work, and left Winnipeg on the 12th January, via Riverton, with all supplies and equipment necessary for the re-building of the permanent camp site. New buildings are to be erected, and some of the old ones made habitable. Water and ice supplies are being arranged for next Summer's work. The purchase and installation of permanent machinery will be decided upon when Mr. J. B. Tyrell, the Consulting Engineer of the Company, returns from England. Those in charge of operations are proceeding to develop the mine so as to avoid unnecessary expenditure, and propose to study the character of the deposit from every angle before committing the Company to large outlays. The management of the Company express the belief that the showing of the former operations, and the later development of the property, warrant the confidence of those who have invested in the enterprise. From the investor's standpoint, the engagement of a competent and reputable mining engineer as a permanent consultant is the best guarantee that the property will be made to yield any values that are contained in it.

### Pan Extension.

Completion of the camp buildings, and progress with the foundations of the boilers, and permanent power-plant of this Company are reported by John Beckman, the Managing Director.

### A New Flotation.

The Bingo Mines, Ltd., is the latest mining flotation in Northern Manitoba. Capitalization is \$2,000,000. Development shares of par value of one dollar are being offered at fifty cents. The advertising literature of the new venture is not marked by any restraint, and it is several times mentioned that the Bingo property contains "the richest vein in the richest camp since Cripple Creek". The mine is situated near the Rex Mine, in the Herb Lake District of Northern Manitoba, distant about 82 miles from Le Pas.

### Reported Discovery of Improved Method of Electrical Transmission.

The Winnipeg "Free Press" announces that Captain J. W. Dorsey, Asst. Professor of Electrical Engineering at the University of Manitoba has completed experiments which enable him to publish the

the discovery of a new principle in electrical transmission which will reduce present costs of transmission by at least one-half.

"The principle," said Capt. Dorsey, "involves the use of an electric arc, several types of which I have invented as long as eight years ago. I have since been working on the application of this arc and a solution of one of the long-standing problems of electrical engineering. The principle gives rise to the invention of a number of new types of power machines. It may be applied from the time the power leaves the turbine generators to its use in electric motors in distribution centres."

Capt. Dorsey's experiments were interrupted when he went overseas with the 9th Americans in 1917. He was wounded at Chateau Thierry. Since his return from the war, he has applied himself to the carrying out of his experiments.

### Gold Pan.

A general meeting of shareholders to receive the report of the President, J. H. Ashdown, will be held February 10th. At present a force of eleven men is employed on the exploration work.

## TORONTO SECTION. A. I. ELECTRICAL ENGINEERS

(Lecture By Prof. A. E. Kennelly)

A lecture of unusual interest to electrical engineers took place at the regular meeting of the Toronto Section, the American Institute of Electrical Engineers, held at the Engineers club, Friday January 30. Professor A. E. Kennelly D. Sc. of Howard University delivered a lecture on artificial power and transmission lines.

During the past thirty years of the electrical industry a marvellous advance had been made in electrical theory and transmission-line formulae had been very thoroughly worked out by Heavyside and others. Much of this mathematical theory was of little use to the practising engineer owing to its complexity, and recourse has been had to more simple formulae, derived for practical uses.

Hyperbolic functions were of great use in the practical applications of electrical theory, and the speaker developed the mathematics of these functions at some length.

Of much use also to the engineer were the artificial lines built for laboratory investigation. By proper construction these could be made to duplicate actual full-scale conditions, and served to investigate the phenomena of transmission telegraph and telephone lines up to 500 miles in length or over.

Professor Kennelly while in the city is also speaking at the meeting of the Royal Canadian Institute on February 7th, on the subject of "Research in Engineering."

### Personal

Mr. J. B. Tyrell is expected to sail for Canada by the "Adriatic" ex Southampton for New York, January 28th.

## Our Northern Ontario Letter

The first month of 1920 closed a favorable record for the producing mines at Cobalt. From the results achieved, and the preparations under way it is already possible that a greater number of mines will contribute to the 1920 output than was the case in 1919. It is interesting to find all the 1919 shippers continuing to produce, with the one exception, the Adanac. New shippers will probably include the Bailey-Cobalt, Lumsden, Nipissing Extension and Hargraves Consolidated. Among these the Bailey has the greatest indicated possibilities, but the other three mentioned properties are conceded to have a good deal of merit.

The Mining Corporation of Canada is continuing its aggressive policy of endeavoring to acquire new prospective mines in the newer fields. It is planned to carry out an exploration program on claims acquired last fall in the township of Butt, district of Nipissing. This work will be for the purpose of exploring for radium-bearing ore, encouraging quantities of which were discovered in that township late last summer. The company, in addition to keeping in touch with the newer fields in Northern Ontario is also active in the Port Arthur district as well as in British Columbia.

The sampling of the tailings pile on the Chambers-Ferland property has been completed, and it is understood the holders of the option are considering the erection of a 300-ton flotation plant. As to this, no official statement has been issued. It is generally believed, however, that the deal will go through.

At a meeting of the shareholders of the Tretheway-Cobalt Company held Jan. 30th the agreement entered into recently by the directors authorizing the sale of the Cobalt mine of the Tretheway Company to the Coniagas Mines, Ltd., was endorsed. This leaves the Tretheway in a position to concentrate its energies on its Castle property.

The Coniagas Company have acquired the mine and mill of the Tretheway will proceed to extend its workings over onto the Tretheway territory where a raise will be driven for the purpose of connecting up with the main workings on the Tretheway. The Coniagas would appear to be in a position to benefit considerably in that the overhead expense will not be increased while the volume of the ore available will be materially increased.

Favorable developments at the Beaver Consolidated continue. The new ore shoot encountered recently at the 530-ft. level is gradually being found to extend to quite large proportions, and ore of a medium grade is found to occur over a width sometimes amounting to ten feet. The location of the deposit leads to the belief that it will also be found to extend upwards and may be tapped on some of the upper levels. Coincident with this, the company is developing a large amount of high grade ore on its Kirkland Lake mine where at the 500-ft. level some five feet in width of vein matter is found to be rich in gold tellurides.

The support of mining companies in Cobalt is being solicited by the Thompson Power Company, with

head office and plant at Deseronto, Ont., and where it is proposed to manufacture a comparatively new explosive known as Thompsonite. The explosive has been tested at such mines as the Temiskaming, Beaver and Bourke's, and favourable testimony is submitted by the respective managers of the mines above mentioned.

In the Gowganda silver area the number of outfits engaged in exploration work on various promising mining properties is steadily increasing and the camp is experiencing a boom of at least fair proportions. It is learned that the South Bay Power Company will again proceed with the development of Hanging Stone Falls. This enterprise was commenced two or three years ago, but was suspended owing to the concern apparently becoming financially embarrassed. As to this it is now stated that the requisite finances have been arranged for and that about one hundred tons of material is already in course of transportation to the scene of development. It is understood that the plans are to have the first unit in operation and electricity in Gowganda before the end of the coming summer.

Satisfactory progress is unofficially reported in the negotiations for the Miller Lake-Everett property. It is intimated that the Kilpatrick property may also be included in the deal and that strong financial interests are associated in a scheme to acquire a large acreage in the immediate vicinity of the proven area and with the object in view of carrying out a comprehensive scheme of exploration and development.

It is stated that a number of mining deals are in various stages of consummation, and that they range from more or less small transactions to deals of quite large proportions. In connection with the purchase of the Miller Lake-Everett the name of Sir Henry Pellatt of Toronto is mentioned, while in connection with the Kilpatrick property the name of C. L. Campbell of Montreal is mentioned.

Activity in the vicinity of Leroy Lake continues with promising results. It is learned that a deal is about closed for the purchase of the Dodds property.

Concerning the construction of a railway to Gowganda from Elk Lake, the Journal correspondent has been officially advised that the Canadian Light Railway Construction Company has received encouraging offers from oil operators in the Peace River district, Alberta, as well as the mining district of The Pas, Man. This company which desired to construct a light narrow gauge railway to Gowganda states that it is up to the people of Northern Ontario to decide whether or not they want quick relief in the way of a light narrow-gauge railway or prefer to wait some time for standard-gauge railways. In the meantime, Premier Drury has up to the time of writing failed to reply to queries as to his view of the possibility of having the standard-gauge railway extended from Elk Lake to Gowganda this year.

In the once active South Lorrain silver area, not a wheel is turning, but there appears to be some prospect of a limited amount of work being resumed in the early spring.

The Boards of Trade in Northern Ontario, at least those active in the district of Temiskaming, have again taken up the question of urging the Ontario Government to throw open Gillies Limit for prospecting. It is pointed out that a considerable part of the Limit contains geological conditions which are favorable, and that an aggressive prospecting campaign might reasonably enlarge the proven silver-producing areas of Cobalt.

During the week ended January 30th, four Cobalt companies shipped an aggregate of approximately 359,270 pounds of ore. The Coniagas was the heaviest shipper as shown in the following summary:

Shipper	Cars	Pounds
Coniagas . . . . .	2	175,630
O'Brien . . . . .	1	64,030
Hudson Bay . . . . .	1	61,610
Dominion Reduction . . . . .	1	58,000
Totals . . . . .	5	359,270

#### Bullion Statement

During the week none of the mines shipped bullion, the only consignment of refined silver being sent out by the Dominion Reduction Company as a result of treating customs ore.

#### The Gold Mines.

The gold mines of Northern Ontario appear likely to be confronted with a request from the workmen for another increase in pay in the early Spring. It is intimated that the men have the issuing of such a request now under consideration. The attitude of the companies is not known for the reason that the workmen have not yet directly intimated their intentions. It is learned, however, that the workers will base their request on the present wage scale at Cobalt which amounts to about \$1 a day higher than in the gold camps. At the same time, according to information obtainable, it is understood they are calculating this comparison on a basis of silver at or above \$1.30 an ounce.

It is unofficially estimated that the 1919 output from the mines of Porcupine was well over \$9,000,000 which record would bear out previous estimates made in these columns that the 1919 production for the province amounted to around \$10,500,000. Further it is now assured that provided sufficient men can be procured and allowing for a reasonable temper in the workers, the 1920 production will greatly exceed any previous year on record in the province.

At the time of writing, the Hollinger Company is expected to declare a dividend of one per cent. payable February 15th, amounting to \$246,000. It is also believed that the annual statement will be issued within the next thirty days.

Local criticism is being directed at the continued reticent policy of the directorate of the Dome Mines. The crop of unofficial rumors pertaining to tonnage treated, gold produced, and costs of operation have not served to appease the hunger of the shareholders for definite information. It was expected that the interim dividend cheque of January 15th would be accompanied with at least a brief statement as to the present financial condition of the company. Failure to do this has aroused some uneasiness. The company will end its fiscal year March 31st. Also its option on the Dome Extension property will either have to be exercised, extended or rejected in March.

Unofficial reports concerning the McIntyre would appear to offer reason for speculation as to the manner in which the McIntyre-Porcupine will dispose of the option which it holds on the Plenaurem property. Here, also, opinion is divided, and all shareholders await the verdict.

The Hudson-Porcupine Gold Mines Company has been incorporated for the purpose of exploring and developing the property formerly known as the Whelpdale. The property is situated on the north side of Timmins.

Concerning the Porcupine Crown and its negotiations in connection with the Moneta, nothing of a definite nature can be learned, and apart from the fact that an examination of the Moneta was made by officials of the Porcupine Crown, no official statement has been issued.

In the Kirkland Lake district there is much to arouse the enthusiasm of those involved. This is not only true of the producing mines but also applies to various properties in the development stage as well as to mining claims in general.

The Lake Shore mine having been dewatered to its deepest level, the 400-ft. it is now finding it possible to produce at full capacity and the figures soon to be issued for the month of January promise to show a very substantial increase over the December record.

Work at the 500-ft. level of the Kirkland Lake Gold Mines is serving to develop a large tonnage of rich ore. Gold tellurides have been found to occur in rather spectacular quantities over a width of about five feet. The work of developing this ore body at the 400-ft. level, as well as at the 600 and 700-ft. levels is to be carried out at once.

At the Miller Independence property at Boston Creek, the central shaft has reached a depth of 500 feet and arrangements are being made to carry out extensive lateral operations. The annual meeting of the company will be held in Dayton, Ohio, this week.

At the Peerless property, formerly the Mondeau, the installation of a mining plant has been completed and will probably be set in operation by the beginning of next week. The capacity of the plant will make it possible to carry operations to a depth of at least 500 feet.

Shaft sinking at the Kennedy-Boston has been carried to a depth of 76 feet at the time of writing and will be soon completed to the 100-ft. level. It is understood further arrangements will be made to carry out lateral work at the first level.

Among the new mining companies recently incorporated is the Wood-Kirkland Gold Mines, Limited, with a capitalization of \$2,000,000 made up of 2,000,000 shares of the par value of \$1 each.

The Wood-Kirkland owns close to three hundred acres of mining lands situated in the township of Lebel, in the Kirkland Lake district. The property is located South of Mud Lake and is just one claim removed from the Bidgwood. The exploration and development of the property is to commence within the next month or so, toward which end Jack Murphy, a former mine captain at the Tough-Oakes Gold Mines has been engaged to superintend the work.

The directorate of the new company is made up of strong financial men, as shown below:—

Geo. W. Morris, Buffalo; N. R. Kirkpatrick, Dayton, Ohio; J. E. Day, Toronto; Fred C. Bonnet, Hamburg; A. L. Pfau, Haute, Ind.; E. L. Wettlaufer, and Henry J. Wood of Buffalo.

Reports from the Boston Creek district are to the effect that the exploration work being done on the Rice Mine, or commonly known as the Charette property, has been exceedingly satisfactory. It is reported unofficially that some very rich ore has been encountered in a diamond drill hole, commercial ore extending over more than twenty feet in width.

Lack of official confirmation has caused the report to be received with all due caution, but fairly general interest has been aroused among those holding claims in the township of Boston in the vicinity of the reported find.

### HARMONY AT COBALT.

#### Employees' Sick Benefit Fund Proposed.

Among the first benefits to be derived from the scheme of "Employee Representation" at the mines of Cobalt is presented herewith. It has to do with the insurance of men during illness. The present practice at the mines of Cobalt is for the men to form into committees representative of the workmen at individual mines. These committees deal with questions arising in connection with the mine at which they are employed. No unions are recognized, but all employees whether members of unions or not are given full representation the scheme thus providing representation for one hundred per cent of the men employed.

Following is the full text of the rules governing the proposed "Employees Sick Benefit Fund" as applying to the employees of the Dominion Reduction Company. It is understood that the company has approved of this scheme and has offered a loan in order to place it on a satisfactory working basis. The rules follow:—

(1) That this Fund be called "The Dominion Reduction Employees' Sick Benefit Fund."

(2) That employees agree to pay into the fund one-half of one per cent. of his monthly wage based on a thirty day month at the daily rate, i.e. A man earning say \$3.50 per day receives \$105.00 for thirty day's work. His contribution to the fund will be 53 cents monthly no matter whether or not he works the full thirty days.

(3) The Dominion Reduction Company pays a like sum, 53 cents, making a total of \$1.06 per man to the fund.

(4) That employees who are sick for more than three days be entitled to receive from the fund an amount equal to 55 per cent. of his daily wage for each day's sickness up to 60 days. After 60 day's illness he shall be entitled to receive one-half of 55 per cent. of his daily wage for another period of 60 days' after which he shall cease to have any further claim on the fund. In cases of dire distress, however, if funds sufficient are on hand and the committee recommends it, a vote shall be taken on the question of additional relief among all the employees when a majority vote shall decide, also as to what additional relief (if any) shall be given.

(5) A medical certificate must accompany all claims for sick benefits, and men falling sick must see a doctor within 24 hours of his calling on the fund

and must obtain a certificate from such doctor certifying that he is unable to work. The claim will commence from the date of such certificate. He must also obtain a certificate calling him off the fund. No claim will be paid without the approval of a majority of the committee.

(6) That in cases where a man is placed in quarantine because of contagious diseases in his home or place of abode the benefits be the same as for sick pay provided he supplies a medical certificate to that effect.

(7) That no employe shall be entitled to receive sick pay where he has not been in the company's employe for at least 30 days immediately prior to his illness except in cases where he has been paying into a similar fund of another company which has previously made such arrangements as to permit each other's men the privilege of immediate full benefit.

(8) That the amount of payment to be made at death be governed by the amount on hand at that time, but at no time shall it exceed \$250. This amount will be paid if there \$500 in the fund. If not one-half of the amount of the fund will be paid.

(9) That all funds be deposited in the bank in the name of the fund and all cheques to be signed jointly by the manager and the Chairmaan of the committee.

(10) That in cases of accidents where employes are already protected these rules do not apply. There shall be no claim on the fund.

(11) That a balance sheet be issued at the end of each financial year and posted in a prominent place for perusal.

(12) That these rules, rates of pay etc., be subject to change at any time and that special assessments may be levied to meet the claims of sick members should conditions warrant it. In the event of the ceasing of operations, the fund on hand to be divided between the company and the men fifty-fifty."

### TORONTO NOTES.

President F. L. Culver of the Beaver Consolidated Mines, Limited, has returned from the North, bringing further important news of finds on the Kirkland Lake and Beaver properties. At the Kirkland Lake mine the volume of rich ore in which exploration has recently been taking place has been found to be considerably larger than was previously known. This was ascertained through further drifting on the fourth and fifth levels. This work will be continued on the sixth level next week. The ore body is about five feet wide and as rich as anything previously encountered at the mine, showing free gold and tellurides all through the quartz at this point. These workings are the deepest at the Kirkland Lake camp and the further discovery of good ore at this depth is considered important.

Encouraging results have been found at the Beaver, the parent mine of the Kirkland Lake, in virgin ground at the 530-foot level, where some springers were followed, which have developed into a body of mill ore from 6 to 10 feet wide. Where the explorers have driven in on this the wall rock has been found impregnated with leaf silver. Also on the 400-foot level it has been found that the same conditions exist.

## British Columbia Letter

### METAL MINES.

#### Nelson, B. C.

Word from Salmo B. C. indicates that the Concentrator, which has been under construction at the Emerald Mine, Iron Mountain, near Sheep Creek, during the past four months, of San Francisco Cal., and erected under his supervision. It has a capacity of 30 tons a day on a double shift basis and stands at the mine site. The new plant is described as being more or less experimental as it is the intention of the Iron Mountain Ltd., if the ore developments warrant it, to erect a large plant on Sheep Creek, possibly of the hydro-electric type. This, however, is a matter for the future and meanwhile the new concentrator is expected to give entire satisfaction. The history of the Emerald Mine started in 1906. It was the first in the silver-lead belt of the Sheep Creek Camp and has shipped between 40,000 and 50,000 tons of ore to the Trail smelter.

One of the private bills to be brought before the Legislature of British Columbia for consideration at its forthcoming session provides for the granting to engineers, practicing in this Province, the right to organize and to insist on men of the same profession taking a Provincial Examination before being admitted to practice in British Columbia. This, in broad general terms, is the object of the measure to be placed before the legislatures for their approval or otherwise. It is argued that it is no more sweeping in its terms than the legislation affecting medical and dental doctors seeking to practice in this Province. Whatever arguments there may be pro and con there is no doubt that the bill will meet with strong opposition in-so-far as it affects mining engineers. The newly organized Prospectors' Association, with headquarters at Nelson B. C., already has taken a strong stand against a closed corporation of engineers. The most objectionable phase of the proposal to the prospectors is that American mining operations bringing capital into this province will be required to employ local engineers, if they wish to do more than look at properties. For a province so interested as British Columbia in attracting foreign capital for the purpose of development, this proposed restriction on the movement and employment of American experts, when their employers are American corporations, is regarded by the prospectors with disfavor. The "Daily Sun", of Vancouver B. C., considers the objection taken by the prospectors as sound. It observes that, while it has been apparent for many years that the profession of mining engineering required better definition and some recognized local status in the interests of both the public and the engineers themselves, "care should be taken that the bill should not have the effect of discouraging outside capital from coming to the province to develop our mining resources. To close our doors to American or other engineers would certainly have that effect." The paper goes on to say that "capital knows no international boundary in brains"; that "hitherto Canadian and American engineers have freely crossed the boundary line in pursuit of their calling"; and that "these men have influenced much of the development of British Columbia mines". However it is thought that "if the engineers of British

Columbia will set a high standard of qualification as a condition of membership, so that affiliation with their organization becomes a hall mark of efficiency, they will do a great deal towards establishing themselves in the confidence of both the public and the employing corporations."

#### Trail B. C.

During the first week of January, 1920, there were fifteen shippers to the Trail Smelter of the Consolidated Mining & Smelting Co. of Canada. The receipts amounted to 5,604 tons, of which 451 tons were concentrates and the balance ore. The Rossland Mines of the Company, the Centre Star, Le Roi, White Bear and Black Bear, lose their identify in the list now issued under the grouping "Rossland Properties, Rossland." Two properties have made contributions which were not in last year's list, the Kaaba, Washington, which sent concentrates and the Ptarmigan, of Athlamer.

#### Hazelton B. C.

The Sunset Claims, Nine Mile Mountain, in the Hazelton Section of the Omineca District, Northern British Columbia, are to be developed, it is reported, under the supervision of a representative of the American Mining and Smelting Co. A party has already gone into the properties with supplies etc. and work will be started as soon as conditions permit. Referring to this and other Nine Mile Mountain prospects in his 1918 report J. D. Galloway, resident engineer, says: "There are a number of veins on these claims, varying from a few inches up to several feet in width and mineralized with galena, zinc-blende, grey-copper, stibnite, and jamesonite. The galena is, as a rule, high in silver content, while the stibnite and zinc-blende also carry some silver. The grey-copper occurs sparingly, but carries a high silver content."

#### Cowichan B. C.

The Ladysmith Smelting Corporation is reported to have acquired fourteen copper claims on Mount Sicker, Vancouver Island, from the Mount Sicker and B. C. Development Co. This is in line with recent activity in this long-deserted mineralized zone, development work having started some months ago at the Lenora Mine and being still under way. The object is to re-locate the Tye vein. If this is successful, and the result is likely to be known in the course of the next two months, and ore of commercial quality and quantity is found on the claims which have just changed hands there is no doubt that the Ladysmith Smelter, which recently has been operated but intermittently, and at present is inactive, will be again heated and maintained as a productive industry assured.

#### Vancouver B. C.

Arguing that the extension of the Pacific Great Eastern Railway from Prince George to Swan Lake at the eastern boundary of British Columbia will mean the opening up of a vast territory, rich in coal, oil, as well as other natural resources, members of the Vancouver Board of Trade at a recent conference impressed on Premier John Oliver and other representatives of the Provincial Government the desirability of forwarding this work with as little loss of time as possible. This railway now is under construction from Williams Lake to Prince George a distance of 100 miles. The distance from the latter town to Swan Lake is 300 miles. The first mentioned section will

be completed by January 1921 and Premier Oliver assured the delegation that the road would be carried to the boundary without delay, although he pointed out that it was a heavy financial burden for the Province to undertake the estimated cost being about \$60,000 a mile. It was the Premier's hope that the Dominion Government to take the railway of the hands off the Province but, failing that, construction would be continued, it being appreciated that the country's natural wealth in minerals and agriculture warranted the expenditure.

At the annual meeting of the Vancouver Chamber of Mines officers were elected for the year 1920 as follows: Honorary President, Hon. William Sloan; vice-presidents, J. M. Lay and W. H. Hargrave; treasurer, William Godfrey; executive committee, C. E. Cartwright, S. J. Crocker, F. J. Grossland, G. S. Dawson, Major Fleck, B. G. S. Hawkins, Dalby Morkill jr., H. P. McCrancy, N. Thompson, Prof. J. M. Turnbull, G. S. Pettapiece, Noble W. Pirrie, Dr. E. T. Hodge was selected as president vice A. M. Whiteside, who retired after serving for several consecutive years.

#### Salmo B. C.

John Waldbeser, President of the Iron Mountain Ltd., states that the new Mill has not yet been started and that water conditions may make a test run impracticable until next June. However this trial will take place as soon as weather conditions permit.

#### Slocan B. C.

High grade silver-lead ore is being raw-hided from the Republic Mine, Lemon Creek, to Slocan City, advantage being taken of a recent heavy snowfall for this purpose. Twenty-three tons of ore were shipped from this property in the early part of last year to the Trail Smelter from which good returns were obtained. The Republic is being operated by a syndicate whose headquarters are at Calgary, Alberta.

The Ottawa is another property from which ore is being taken for shipment over the snow to railroad. It, too, is situated in the vicinity of Slocan City.

The Meteor and the Neale Claims, both located on Springer Creek in the same section, are among other properties which are active this winter.

#### Campbell River, V.I., B.C.

An immense outcropping of low grade ore, carrying copper, gold, silver and lead, is reported to have been located on Buttles Lake, Strathcona Park, or, to speak more generally, almost in the exact geographical centre of Vancouver Island. Representatives of the Temiskaming Mines Co., Toronto Ont., have visited these claims, if which there are a number, the ore body being said to have been traced for miles. That the Temiskaming Company has taken a bond on this property from the Vancouver holders and that it is proposed to initiate extensive exploratory work without loss of time are other statements made by those interested. The suggestion is that diamond drilling will be undertaken and that, if the surface indications are borne out by the disclosures of further development, Vancouver Island will have one of the biggest mines of the Province.

Until about a year ago Strathcona Park was under reserve by the Provincial Government for park purposes. No mining was permitted within its limits. The present Provincial Administration, however, removed this restriction and since there has been much prospecting within the park area.

#### Victoria B. C.

The Steel Smelter Co., of Seattle Wn., has conclusively demonstrated that it is practical to produce pig iron economically from the magnetite iron ores of British Columbia, by means of the electro-thermic process. This is the positive statement of F. A. Pauline, a member of the Provincial Legislature who has interested himself specially in the development of the iron ore resources of the Province and who recently made a special trip to Seattle to inspect the plant of the company named. Mr. Pauline found one furnace, capable of producing five tons a day, in operation. He learned that a unit of four furnaces is being installed and that the management is looking forward to reaching the maximum output of this plant very soon. The ore is being brought from a property situated on the coast of British Columbia at a cost of from \$3 to \$4 a ton. The product is described by Mr. Pauline as being the finest grade of pig, fully equal to the product of Sweden. There seems to be no question as to market, local demands being sufficient to absorb all that the Company can provide.

R. A. Grimes, manager of the Slocan Silver Mines Ltd., stated to Hon. Wm. Sloan, Minister of Mines, that development work on the Company's property, situated on the north fork of Carpenter Creek, near Sandon B. C., had given extremely satisfactory results. A considerable amount of good milling ore, carrying substantial silver values, had been blocked out and a small lead of very rich ore had been struck. The prospects were such that plans were under consideration for the installation of a concentrating mill and other equipment.

It was to express his gratification with reference to the working of the Mineral Survey & Development Act that was chiefly responsible for Mr. Grimes' visit to the Minister of Mines. He declared that there was no doubt whatever that the Mining Engineers appointed under that Act were doing much for the mining industry of the Province. In his own case prior to the taking over of the Carpenter Creek Property a copy of a report written in 1917 by A. G. Langley, Resident Engineer, was procured. This was favorable and its terms were confirmed by a personal interview with Mr. Langley, who rendered all assistance possible, particularly in regard to advice and suggestions as to necessary development. Thereupon Mr. Grimes and his associates proceeded to acquire the prospect which then was controlled by the McAllister Mining & Milling Co.

#### COLLIERIES.

Once more the title of the Granby Consolidated Mining and Smelting Company to the Vancouver Island coal area which they are developing is being contested in the courts of British Columbia. The action has been brought by the Esquimalt and Nanaimo Ry. Co., against Charles Wilson and Angus C. McKenzie, who are executors under the will of the late Joseph Ganner, and the Mining and Smelting company.

To the Ganner estate belong much of the coal lands to which the Granby Company acquired title from the Province of British Columbia under the terms of the Vancouver Islands Settlers' Rights Act, 1904, Amendment Act, 1917. Since the acquisition of this property the Company has installed collieries at a point colloqually known as Cassidy's equipped with modern plant, and has built up a community which, in respect of the accommodation provided for officials and workmen, is considered to be a model, at an expenditure aggregating approximately \$2,000,000. In the short space of little more than a year it has put the mines of Cassidy's on a producing basis of about 700 tons a day. Depending on the coal from this colliery it has installed at its smelting centre, Anyox, B. C., where it is engaged in the mining and the smelting of copper ore, by-product coking ovens at a cost of in the neighborhood of \$2,500,000. For these reasons the law suit referred to is of first importance to the Company and of much interest to the entire Western Canadian mining industry.

The Esquimalt and Nanaimo Ry. Co. ask the courts to declare that the Crown Grant issue by the Provincial Government to the defendants is null and void in so far as it purports to grant coal, coal-oil, stone, clay, marble, slate, mineral and substances in and under the said lands and that part of the surface of such lands to which, or upon which, the plaintiff is entitled to exercise acts of ownership, purchase or rights to easement. An injunction also is sought restraining the defendants "their servants, agents or workmen or assigns from entering and working or mining for coal and other materials and substances and from registering or applying to register any title to the surface of the lands." The plaintiff also seeks a declaration that the plaintiff always has been the owner of the lands and damages against the defendants.

With reference to this case it is well to note that the Settlers' Rights Act of 1917, which was passed by the Provincial Government and under the terms of which the Crown Grants now assailed were issued, was disallowed by the Dominion Government in May 1918. The Grants in question were given after the passage of the Act and before the Federal Government disallowed it. The point, therefore, arises as to whether the Settlers' Rights Act of 1917 was legally operative during the period that lapsed between the affixing of the signature of the Lieut. Governor and the receipt of the formal declaration of its disallowance at Ottawa.

The One Big Union does not appear to be dead among the coal miners of Eastern British Columbia and the Province of Alberta. Recently the O. B. W. forces of Alberta met at Calgary and forwarded a resolution to the Minister of Labour, Ottawa, stating they were willing to accept the 14 per cent increase in wages awarded them, pending further negotiations on which they are insistent, and absolutely opposing the order of the Fuel Commissioner that the United Mine Workers of America shall be the workers' organization to receive recognition. On January 14th the miners at Coal Creek, Crow's Nest Pass Coal Company, refused to enter the mines because the President of the Fernie Local of the One Big Union was ordered off the miners' train for refusing to pay his fare. They were idle for a day and no further information is

available as to further developments. As to the situation in the Province of Alberta a letter written by one of the O. B. U. officials on January 8th is interesting. He states that at the Western Gem, Monarch, and Brule Mines the operators have withdrawn the check-off, (the check-off was the system proposed whereby the management would withhold from the men's pay their union dues forwarding the same direct to U. M. W. of A. headquarters). He also asserts that everywhere the O. B. U. is making headway against the forces of the U. M. W. of A. How much of the latter may be accepted cannot be said but there can be no doubt that the miners are divided in their union affiliations, that counter propagandists are energetically at work, and that, meanwhile, the mines are on a productive basis with the assurance that there will be plenty of coal available for the imperative needs of the winter.

#### OFFICIAL ESTIMATE OF 1919 COAL PRODUCTION.

The official estimate of the coal production for British Columbia during 1919 places it at 2,504,423 long tons, of which 147,205 tons was made into coke, leaving the net production at 2,357,218 tons. These figures show a decrease as compared with 1918 of 74,301 tons gross and an increase of 54,973 tons net. The quantity of coke made was about 98,598 tons, which is a decrease of about 90,369 tons as compared with the previous year. The decline in coke production is explained by the very small output of the ovens of the Crow's Nest Pass Coal Co. It was affected in the first place by the long drawn out strike of the coal miners in the early part of the year and later by the closing down of the smelters of the boundary district.

The Provincial production of coal is summarized as follows:

	Tons of 2240 lb.
From Vancouver Islands Collieries.....	1,690,724
From Nicola and Similkameen Collieries..	152,731
From Crow's Nest Pass Collieries.....	659,408
From Twelkwa Collieries.....	1,560
<hr/>	
Total quantity coal mined.....	2,504,523
Less made into coke.....	147,205
<hr/>	
Net quantity of coal produced.....	2,357,218

In addition to the above net production of coal there was made into coke the production shown as follows:

From Vancouver Island Collieries.....	43,517
From Nicola and Similkameen Collieries.....	nil.
From Crownsnest District Collieries.....	55,081
<hr/>	
	98,598

It is observed that the coal mines of the Province have had a fairly good year but that there were some interruptions. Among the latter mentioned are the strike at Fernie, which closed the mines during June, July and August, work being resumed at the beginning of September, and the fact that the Vancouver Island mines, during the months of May, June and July, worked on slack time, losing a production of probably 160,000 tons.

# A MARSH HOIST IS MADE THE RIGHT SIZE FOR YOUR MINE

and in either Steam Power or Electric Power

This shows one of our Electric Mine Hoists. We make many other types. Send for our catalogue of Mine Hoists, Cars, Cages, Buckets, etc., and see what we offer you. It will repay you.

From the little 10 Horse Power size for prospectors or small mines to the massive 50 Horse Power size, one of our 7 sizes should be just right for your mine.

We are specialists in the building of Hoisting Machinery of all sorts. For nearly a quarter of a century we have been designing and building Hoists, and have developed a Hoist that we are really proud of—proud because of the record of good work they have done, and are doing in mines, quarries, and other classes of work from one end of Canada to the other.

### THE LIMESTONE AND PHOSPHATE RESOURCES OF NEW ZEALAND.\*

This admirable Bulletin was undertaken by the New Zealand Geological Survey at the request of the Department of Agriculture, which for the sake of the agricultural industry required a comprehensive report on the limestone deposits of the Dominion. Part I of the Bulletin, now to hand, summarises all the known information regarding the limestone deposits of New Zealand. It contains 316 pages of letterpress, with fourteen plates, six text-figures and two maps. Part II, which is to follow will not be so long, and will contain a general account of the plant and machinery used in the calcination and pulverization of limestone, followed by a description of the phosphate deposits of the country.

The scope of the monograph is ambitious, as will be seen from the following headings selected from the first chapter, which deals with general information regarding limestone and its uses, viz., the functions of lime in agriculture, the non-agricultural uses of lime, and the military importance of limestone and lime. The chemistry, geology, and economic utilization and treatment of limestone deposits are dealt with in great detail. Specific information as to limestone is given with regard to every known occurrence in New Zealand, and a notable feature of the monograph is the fine photographic plates of limestone occurrences, which not only are a fine collection of illustrations of the characteristic and often fantastic physical features of a limestone formation, but reveal incidentally that New Zealand is a country of much natural beauty. It is evident that the geologists who selected these photographs had not only an eye to topography, but a nice appreciation of the artistic values in a New Zealand landscape. The affection of New Zealanders for their country is not difficult to understand.

The monograph explains the property of lime to liberate plant foods from soil compounds, and the advantages to be gained from the use of ground carbonate of lime as compared with quicklime and slaked lime. The liberation of nitrogen by carbonate of lime proceeds more slowly, nor does the carbonate destroy the humus as quicklime does.

There are a number of concerns in Canada who are prepared to supply ground carbonate of lime for soil dressing. One firm that has done a good deal to edu-

\* Note:—The Limestone and Phosphate Resources of New Zealand. (Considered principally in relation to Agriculture). Part I. By P. G. Morgan. Issued by the New Zealand Department of Mines. Bulletin No. 22 (New Series).

cate the public as to the usefulness of ground limestone uses the limestone near Windsor, Nova Scotia, and it would appear that in many parts of Canada, where acidity of the soil is a great drawback, the use of ground limestone to correct the sourness might find a large field. Heavy clay lands are much improved in texture for agricultural purposes by the addition of quicklime.

### OBITUARY.

#### E. Fred Wood.

E. Fred Wood, formerly Vice-President of the International Nickel Company, died suddenly at New York City on January 5th, in the sixty-second year of his age. Mr. Wood was born in Milwaukee on August 28, 1858. He was educated in the public schools of his native city and later entered the University of Michigan where he was a brilliant student and graduated with distinction.

After leaving college Mr. Wood devoted himself assiduously to the study of metallurgy and in connection with his studies made extensive trips through the various mining camps of the West and lived for a year at Leadville and in other mining towns where he pursued his studies and obtained his practical experience. He later entered the employ of the Carnegie Steel Company and rapidly rose to the position of Assistant General Superintendent of the Homestead Plant, which position he filled for a number of years, and during the period of the big strike at the plant, when Mr. Frick was shot, Mr. Wood was in entire charge of the plant. He was looked upon by Mr. Carnegie and his associates as one of the valuable men of the organization and was one of the so-called "Carnegie Veteran Associates."

Because of the great reputation he had achieved he was invited to join the International Nickel Company, upon its organization, becoming First Vice-President of the Company and a member of the Board of Directors of its Executive Committee, and he was an important factor in developing the mining, smelting and refining business of the Company, so that from a small and unimportant undertaking it developed into the largest business of its kind in the world.

When the United States entered the World War, Mr. Wood resigned his official connection with the International Nickel Company to devote himself to public work, and became a member of the Committee on Production of the War Industries Board, of which Committee Mr. Samuel Vauelin, President of the Baltimore Locomotive Works, was chairman. Mr. Wood served continuously on this Board during the entire period of the war, without compensation.

## LOWER YOUR HAULAGE COSTS— INCREASE YOUR PRODUCTION

There is no argument against the practical value of a

### MANCHA STORAGE BATTERY LOCOMOTIVE

to mine haulage—except when there is not a sufficient daily tonnage. Made in capacities 1½ ton to 6 ton, all gauges, for any mine specification.

We would like to submit a complete proposition. Let us have a synopsis of your problems.

# GOOD YEAR MADE IN CANADA EXTRA POWER BELTING

## Pulling the Peak Load

Nearly every industry has some belt-drives with variable loads.

Nearly every industry has had belt trouble when the peak came on these drives.

One of the best things Goodyear Extra Power Belting does is to take care of peak loads without trouble.

How it has solved one peak load problem is told in a letter to us from the Chisholm Milling Company (reprinted here).

The very qualities which give Goodyear Extra Power its great advantage where loads vary, make it a better belt for all-round use.

The *pulley-gripping friction surface* pulls over the stiff places and prevents power waste through slippage.

The *great strength of the fabric plies* which are welded into one by much fine rubber, gives very long life.

Practically *all the stretch is taken out* of Goodyear Extra Power before you buy it—saving costly shut-downs to tighten belts.

The fine rubber, *which seals the seam*, prevents ply separation.

Over 1000 Canadian industrials have found Extra Power Belting an economical proposition—in price, in length of service, in efficiency of service. Some of them have solved problems exactly similar to yours. Let a Goodyear-trained belting man tell you about it. No obligation. Just phone, wire or write the nearest branch.

The Goodyear Tire & Rubber Co.      Nov. 15th, 1919  
of Canada, Ltd., Toronto, Ont.

Gentlemen:—  
About five years ago we bought our first Goodyear Extra Power Belting. To-day half our belts are Goodyear Extra Power, and as fast as old belts wear out we are replacing them with Extra Power. The performance of the first belt has brought about this change.  
We were having trouble with our corn degerminator. Every now and then the machine would stick. Although we were using the highest priced belts we could buy, they continually burnt through when the sudden load of a sticking degerminator came. One expensive belt went in two days. The next one lasted but little longer. Then we tried a Goodyear Extra Power Belt. IT gave us 18 months' service. When the degerminator stuck, Extra Power just seemed to buckle down to the job and pulled right through the peak load. It wasn't long before we decided to use Extra Power Belts on all our equipment.  
Now we have installed them on grinding mills, corn mill shaft drives, etc.  
We figure that we save a great deal in price, save power, and get surer service.  
Yours very truly,  
The Chisholm Milling Co., Limited

## The Price of Silver

The decision of the Indian Government to fix rupee exchange at ten to the sovereign in place of the "gold exchange" rate of fifteen to the sovereign established in 1898 is interpreted by Mr. Moreton Frewen to mean that silver cannot fall below \$1.29 per oz. because of the preponderating influence of the Indian price of silver upon the world price of the metal.

This action of the Indian Government adds another reason to the many that are causing the present unprecedented persistence of high quotations for silver, and it will prove to be one of the most important factors from the viewpoint of Canadian silver producers because it promises a virtual stabilization of silver at a value of approximately \$1.30 Canadian money. The additional revenue which Cobalt shippers of silver are obtaining from payment in New York funds is, it is to be hoped for our general national good, a passing phase, but there is every reason to expect that a substantial premium on New York funds—which means of course a serious discount on Canadian funds—will persist throughout 1920 at least, and this will ensure good revenues to producing gold and silver mines for some time to come.

From the national standpoint there is today in favour of gold and silver production not only the promise of satisfactory financial reward, but there is the compulsion of necessity. During the war period, it was a moot question whether precious metal mining should be prosecuted with full vigor or not, and in the

critical days of the war, our leaders may be forgiven if they had not the time to devote to thinking out the infinite complexities of currencies, and saw more clearly the necessity for men and guns. Today, however, the demand for bullion is insistent. Unfortunately, the effect of the war was to reduce the capacity for mines for output, and this is true of gold and silver mines, as it is also true of iron-ore and coal mines.

If the new production of precious metals will help our national credit, and the credit of Britain, as the most competent economists tell us it will, then every possible encouragement should be given by provincial and federal governments to assist production. Labour shortage is one long existing reason for restricted gold output in the Northern Ontario camps. If the Federal Government were to detail a competent person to study the labour situation it might be possible to find some means of supplying the existing deficiency of workmen.

It seems to us that Canada is singularly fortunate in having within her borders at this time natural resources of gold and silver, and it would also seem the obvious part of wisdom to augment production by every possible expedient. The quickest and most tangible results can be obtained by operating the larger and most dependable mines to the limit of their capacity, which means, in short, supplying them with enough workmen.

## The Politics of the Technical Man

The Secretary of the Association of Technical Engineers in Great Britain in stating that the technical men are unlikely to make common political cause with the so-called "labour" party, expresses probably a fairly general attitude of technical men. Under this head are included a wide variety of workers, and the term is wide enough to cover all persons who by study and application of brain and hand have equipped themselves with a special knowledge of one branch of human endeavour. Most of these men have at some time felt themselves in revulsion against that form of "labour" propaganda which arrogates all the so-called dignity of labour to the man who works with his muscles. If the British labour leaders have

felt it necessary to suggest an alliance with the technical men it reveals a tardy, if not a grudging recognition of the usefulness of the part played by the white-collared and black-coated person to whom in the past there has so often been allotted the thankless triple role of long hours of hard work, meagre remuneration, and denial of the "dignity" of labour.

If those who govern and direct the stabilizing influences of modern civilization, which are variously known as governments, capital and industry, have retained the backing of the technical men, it is solely because of the inherent common sense and the decent loyalty of these men, for they are the men who, in person and vicariously suffered the brunt of the hurt

occasioned by the war, and they are today shouldering the burden of reconstruction.

The technical men are unlikely to organize, except in associations for the study of their respective arts, and they are likely to remain inarticulate in political life, for they are primarily thinking men, and will wish to choose their political affiliations by the free use of their brains and consciences.

There is however the danger that technical men, in both their lower and higher grades, will be impelled to organize for self-protection unless fitting recognition of their difficulties and aspirations are made. Indications of this tendency are not lacking in Canada, and while one young association is making "service" the keynote of its policies, it is useless to hide the fact that the genesis of this association, and others in other countries, lay in the necessity for technical men either to organize for self-protection, or suffer piecemeal disintegration of all their hopes and ambitions in life.

The trained technical man, with his analytic mind, and his desire to connect cause and effect in all that concerns mankind, is one of the first to detect the fallacies of such forms of group government as have recently become fashionable, and he is the last man in the world to support political organizations which have frankly announced economic aims for any one industrial group. He represents the commonsense of mankind, the saving sanity of decent men, and his vote, in the long run, will decide national policies. There are moreover, in the ranks of "labour" itself many men of this type, numbering amongst themselves the fathers or the putable fathers of men of the technical grade of workers.

"They do not preach that their only duties are spreading dissension and going on strike.  
They do not teach that its square and decent to scamp their work as they damn well like.  
They aim to uphold a mind of fairness, not class suspicion and social strife.  
They too must think of making a living—but they sometimes think of making a life."

But—if the living is denied to men, then the herd instinct will surely show itself.

---

#### INDEX TO VOLUME 40.

Bound in with this issue will be found the Index to the issues of the "Journal" during 1919, being Volume No. 40.

---

The United States Senate has amended the Zine Ores Bill to provide for an increase in the rate of cobalt from ten cents to twenty-five cents per pound,

#### THE FINANCING OF MINING ENTERPRISES.

By R. E. HORE.

Mr. Thomas Mulvey K. C., Under Secretary of State for Canada in a recent discussion on "blue sky" legislation made some statements that should prove interesting to those who wish to see the public take part in mining ventures. Mr. Mulvey has found that in many cases blue sky legislation has failed to prevent the licensing of certain companies which operated to defraud the public. He considers that the British law, the underlying principle of which is publicity is preferable.

There was last year prepared for the Ontario Legislature a bill of the "blue sky" class. Drafts of this bill were given some publicity and there was much criticism of it because it appeared that legitimate business was to be made more difficult. There was general approval of the endeavor of the framers of the bill to provide protection for the investor against fraud, but disapproval of the effect the bill would have on honest enterprise. Mr. Mulvey's opinion that blue sky legislation is not even successful in preventing fraud is worth noting in this connection. The bill was withdrawn at the last session not because it was not expected to ensure protection for the investor, but because its provision would have done more harm to industries than the framers intended. In aiming to make business safe, legislation was proposed that would make some desirable business impossible. Mr. Mulvey is evidently of the opinion that it would not even provide the safety that its proposers claimed for it.

For the successful development of a mine much work and money is necessary. The first essential is an ore deposit. There are many known undeveloped ore deposits and there are doubtless very many unknown. To find the unknown ones and to develop the known ones much money must be expended. When preliminary development gives satisfactory results, and profitable operation appears to be possible, very large sums of money are required for the necessary mining equipment and further development work.

If our material deposits are to be developed, we must first find where they are. This is the work of the prospector, and on his efforts the expansion of the mining industry very largely depends. The prospector has an arduous task and usually very little money. He knows that good ore deposits are not common and that he may search months and years without making an important discovery. Whether he will succeed or fail depends partly on his enterprise and largely on fortune. He lives in hope, facing hardships without certainty of reward. If, finally, he does find an ore deposit that looks promising, he cannot himself mine the ore and put the metal into merchantable form, for that requires money far beyond his means.

The ordinary prospector has little money and yet must be prepared to spend his time at work for which no one pays him wages. In most cases therefore he must be financed by some other person. Often he accepts a "grubstake", undertaking to share his interest in any discoveries made during a certain period with the person supplying his living and transportation expenses. Commonly the money, a comparatively small amount, comes from a personal friend of the prospector who has himself a modest but more certain income.

When a prospector makes what seems to him to be an important discovery, he and his partner find many difficulties confronting them. To obtain any reward from the success of the search they must find money to develop the deposit or sell it to some other person. In either case they must first give the discovery some publicity and induce others to examine it. Then follow negotiations and the claim or an interest in it is disposed of. The prospector's reward depends of course not only on the merits of the property but on his ability as a salesman. In a few cases the discoveries are so valuable that the prospector's fortune is made; but the ordinary ore deposits are, when first discovered, of such doubtful value that very large sums are not often obtainable for them. In most cases the sum realized for discoveries is a modest one which permits the prospector to take a holiday and then to return to his work in the wilds, without the need this time of financial assistance. If fortune smiles on him he makes another find before he has spent his "stake".

The purchaser of the prospector's claim may be one who shares the hardships of pioneer life and who intends himself to develop work on the property or to personally supervise the work. Some supply merely the necessary money and delegate the work to others. In either case the success of the venture is very uncertain. Frequently the development work proves unsatisfactory and the time and money spent on the property yield no return. In some cases however results are considered satisfactory and then heavier expenditures are undertaken.

It is often at this stage in the history of a mining property that an appeal is made to the public to invest money to provide mining equipment and do development work. In view of the fact that a large amount of money is needed to bring the ordinary property to the producing stage, public stock offerings are not only necessary but desirable otherwise we would be dependent on a few wealthy men or companies for the expansion of the industry and the average man would be unable to take part in the venture. The uncertainty attaching to mining ventures is of itself a good reason why the risks should be shared by many.

In the interests of the mining industry, which must have more money from the public for its development, the transaction between mining companies and the public or between mining brokers and the public must be above reproach. The promoters of a mining company are unable to state with any degree of accuracy what the capitalization should be. The fixing of some figure is however, required, and some large round number like \$1,000,000 is commonly chosen. The capitalization therefore bears no necessarily fixed relation to the value of the property. It would prevent some misunderstanding of the par value of shares was not fixed, but the common practice is to require this. The proper capitalization on an earning power basis obviously cannot be determined for a company whose mining property is in the prospect stage.

In some cases the treasury stock is sold in large blocks to brokers who in turn sell to the public. Some companies sell their own to the public in small lots directly or through agents working on a com-

mission basis. Much might be said in favor of either method. The latter method involves much greater head office expenditures and a selling staff, but allows the company to sell stock at a higher price than might be obtainable for large blocks. The operator might have had little experience in selling shares, however, and then he naturally turns to brokers, who make it a business.

The development of mineral resources in Canada, as in other countries, requires large sums of money. Those who supply the money must have confidence that their money will be wisely spent, for there are risks enough in the venture in any case. To gain the confidence of the public every endeavor should be made to inform the shareholders of the progress of the work. Publicity is desirable and should be insisted upon by shareholders.

### THE ENGINEER AND THE PUBLIC.

In an address to the Engineers' Club of Philadelphia, on January 20th, George Otis Smith, Director of the U. S. Geological Survey dealt with engineering as prosperity insurance. He pointed out that the engineer is an insurance agent of the first magnitude even if he does not talk like one. "Conservation, whether of material or of energy, is engineering, and the policy which a few years ago began to attract public attention is really as old as engineering. The truth is that we needed thrift on a national scale before we began to realize it, and conservation or national thrift therefore became a popular issue. The task is growing larger and more critical, however, as the years pass, and it places a large civic duty upon the engineer. In his role of insurance agent the engineer has not only to plan but to execute, yet in putting his plans into effect he must depend upon popular support. The public must be educated in its use of resources, and the engineer must therefore also function as a teacher." "No type of citizen, is better fitted to tackle the civic problems of today than the engineer. The large questions before the people are economic questions, and engineering is mainly applied to life in an economic way."

In urging American engineers to take a prominent part in public affairs, Mr. Smith appeals to their interest in the general welfare of their country. He believes that it is in the power of engineers to be of greater service to the community by assuming more of leadership in public opinion so that raw materials and energy will be used to greater advantage. It is not enough to know what should be done. The general welfare is not promoted by secretiveness and exclusiveness. The engineer has duties in addition to those which he owes to his employers.

There has been during the past few years much discussion among Canadian engineers along the lines of Mr. Smith's address. The engineer's potential power for public service is well recognized. Possibly he might learn something from other insurance agents. Mr. Smith says he does not talk like one

R.E.H.

The annual meeting of the Mining Society of Nova Scotia is expected to be held in Glace Bay on May 4th and 5th.

# Nickel Ore Mining In Sudbury District

## ONTARIO, CANADA

By W. L. WOTHERSPOON.

The Geological Survey reported finding Nickel in the Sudbury District as early as 1853, up to which this section of the country was little seen by the white man, with the exception of the officers of the Hudson Bay Company and the Geological Survey, whose travels were confined more to the immediate vicinity of the lakes and rivers, and little was known of the minerals of the district.

The country, although broken by rocky ridges, was well wooded but extensive forest fires raged throughout the district in the thirties and forties, destroying heavy timbers and leaving vast tracks of dead pine standing like grim sentinels, with little or no undergrowth.

Following these fires, second growth timber sprang up, but similar fires raged from time to time resulting in the rocks being exposed to the action of the weather, which soon attacked the ore where exposed and converted it into gossan.

The presence of mineral was first shown during the construction of the Canadian Pacific Railway in a cutting on the main line about four miles from Sudbury, (now Murray Mine), and later in a cutting on the Soo branch of the C. P. R. about twenty-five miles south-west from Sudbury, now Worthington Mine.

In the summer of 1885, New York interests had a shaft sunk in one of these ore exposures, and a small quantity of copper-ore was obtained, but in quantities not considered for a paying mine and the property was abandoned.

The prospecting in the district dates from 1884, among the pioneers being Thomas Frood, R. McConnell, Henry Ranger and James Stobie. Mr. Frood discovered some promising looking properties in the spring of 1885, and with other associates began development work on a field in the Township of Snider, known as the McAllister Mine. The prospected were reported encouraging for a paying copper mine, and in 1886 this property was visited by Lady MacDonald, in company with a party of Montreal capitalists, among whom were W. C. Van Horne, Sir George Stevens, and Sir Chas. Tupper. In honour of the visit the name of the mine was changed to the Lady MacDonald Mine, afterwards McArthur No. 5. Prospecting was also done at other points, the most notable being by Thomas Frood and associates at McKim, and by R. McConnell in the Township of Snider.

Until the end of 1885 only prospecting had been done, and copper was the only metal of commercial value known to exist in the district. During 1885 Mr. S. J. Ritchie of Akron, Ohio, visited the district and took over several properties, and during the winter of 1885-86 the Canadian Copper Company was formed to operate these properties, among them being the McAllister, now Lady MacDonald Mine, the McConnell Mine later known as the Copper Cliff Mine and part of the Frood or No. 3 Mine.

The Evans Mine was then discovered and was purchased by the Canadian Copper Company in September 1886. The Stobie Mine was also discovered, the

Canadian Copper Company acquiring same in July 1886, when a railway was built from Sudbury to the Mine, a distance of four miles.

The Canadian Copper Company began prospecting and developing several properties about this time, work being begun on the McConnell or Copper Cliff mine. An open cut was made which exposed ore which consisted of pyrrhotite and chalcopyrite, but the pyrrhotite was considered valueless the presence of nickel not being suspected.

Several hundred tons of picked copper ore were shipped during 1886 to New York, upon the treatment of which the presence of nickel in the ore was discovered.

Prospecting was continued at the McAllister and at the McConnell mines, and a vertical shaft was sunk on the Evans Mine.

R. McConnell then discovered mineral in Denison Township, and sunk several test pits and stripped the surface, exposing ore; this property later being known as the Victoria mines, now owned by the Mond Nickel Company.

In October 1886 the southern half of lot 7, Con. 6, McKim, (part of Frood or No. 3 Mine), was purchased by the Canadian Copper Company from Thomas Frood, P. C. Campbell and Robert Tough for the highest price reported to have been paid up to this time for any mining property in the district.

The year 1887 did not show any marked increase in mining activity, beyond a few further discoveries, the principal difficulty being that a practical method for the treating of nickel ores had not yet been discovered.

The Canadian Copper Company secured the services of Dr. E. D. Peters, who went to Copper Cliff in July 1888, and planned and erected the first smelting plant in the district, which consisted of a roast yard, one 100-ton Hereshoff smelting furnace with blowing engine pumps, etc., which furnace was blown in on December 22nd, 1888; a nickel and copper matte being produced containing from 15 to 20% nickel and 20 to 25 per cent copper. A second furnace was added early in the summer of 1889.

Spurs were completed from the Canadian Pacific Railway to the Copper Cliff and Evans Mines in September 1888, and ore was brought from Copper Cliff, Evans and Stobie mines to the roast yards, near the smelting plant at Copper Cliff. The ore from the three mines differed somewhat in character, that of Copper Cliff carrying a relatively high percentage of copper, but all the ores consisting of intimate mixtures of pyrrhotite, chalcopyrite and pentlandite.

The ore from the Stobie mine is fairly free from rock and carries a much smaller percentage of chalcopyrite than Copper Cliff ore. It was found that the Stobie ore, although lower in nickel and copper, carried more iron, and aided the smelting operations, the excess of iron assisting the fluxing quality of the other ores.

In 1889 other mining and smelting companies entered the field. The Dominion Mineral Company

*Cupola Building in the Port Colborne Refinery of the International Nickel Co.*

opened and developed the Blezard and Worthington mines and built a smelter in 1890 a short distance from the Stobie mine. The Blezard mine was closed down in 1893, the Worthington mine in 1894 and the smelter in 1895. The property was purchased in 1913 by the Mond Nickel Company who are again operating the Worthington mine.

In 1889 the Murray mine was secured by the H. H. Vivian Company, of Swansea, Wales, and a mining and smelting plant was erected in 1890. This property was worked about five years and then closed down. The property was sold in 1912 to the Dominion Nickel Copper Company, now the British-American Nickel Company, who have built a large mining and smelting plant.

In 1891 the Drury Nickle Company acquired the Chicago mine in Drury Township and built a smelter there. It was closed down in 1892, but was worked again for a time in 1896-7 by the Trail Mining Company.

The Nickel Copper Company of Ontario, (promoted by the Late John Paterson), built a small plant near Worthington and a refinery in Hamilton in 1900. The Hoepfner and Frosch refining processes were tried in turn, presumably without success, as the plant was closed down in 1901 and some time later the holdings were sold to the Dominion Nickel Copper Company, (now the British-American Nickel Company).

In 1900 the Great Lakes Copper Company built a plant at Mount Nickel near Blezard mine, to try out the refining process of Aubon Graf of Vienna. This failed and the Company closed down in 1901.

The Lake Superior Corporation, operating the Gertrude and Elsie mines, built a smelter at Gertrude in 1902 which closed down in 1903. This property was also sold in 1912 to the Dominion Nickel Copper Company. Other nickel mines operated without any smelting plant being erected, were as follows:—Algoma Nickel Company, Township Lorne, 1891, Sheppard Mine, Township Blezard, 1891, Gersdorfite Mine, Township Denison, 1891, Trillabelle Mine, Township Trill, 1894, Sultana Mine, Townships Trill and Drury, 1900.

This review covers the situation generally up to the year 1900.

The Mond Nickel Company was incorporated in 1900, and The International Nickel Company in 1902, the latter embracing as subsidiaries The Canadian Copper Company, The Vermillion Mining Company, The Anglo-American Iron Company, etc., and the Oxford Copper Company with its refinery at Bayonne, N. J.

Since 1900 the history of the nickel production is confined to the story of these two companies, by far the largest part of the production, however, going to the credit of the latter company.

The British-American Nickel Company has a mining and smelting plant at Nickelton near Sudbury, (on the old H. H. Vivian property), and a refinery at Deschenes near Ottawa, both nearly completed.

The International Nickel Company of Canada, Limited, was incorporated in 1916. This Company, with head office in Toronto, has a \$5,000,000.00 refining plant at Port Colborne, Ontario, completed about two years ago, and is amalgamated with the former

Canadian Copper Company, which has large mining and smelting plants in Copper Cliff, Ontario, and vicinity, and is now known as the Mining and Smelting Division of The International Nickel Company of Canada, Limited.

A large capital investment has been distributed over the many branches necessary for the success of the industry, including mining, smelting, refining, exploitation and sales, each department of which has a history of its own which would make a long story.

A general description follows of the work done by The International Nickel Company, Limited, in connection with the development of the largest nickel mine in the world, namely, Creighton mine, located about eight miles from Sudbury, in Northern Ontario, from which the major portion of the ore is obtained for its current operations.

The ore is located on the Company's holdings on the South Range of the Sudbury nickel belt. The ore consists of pyrrhotite, with chalcopyrite and pentlandite, together with some gangue material which is generally basic.

The ore deposit is a massive body and for some years mining was done by the open pit or quarrying methods, but during the last ten years has taken place at depths which have now reached about 1,200 feet, and the earlier methods of mining have been replaced by a system of main levels from which the ore is mined in underground chambers, or stopes, and hoisted to the surface through a large incline shaft.

The capital investment in Creighton Mine, (aside from the ore deposit), including machinery, equipment and housing for employees, amounts to many

millions of dollars. The expenditure covers such items as many miles of diamond drilling to a maximum depth of 2,000 feet for exploration work necessary to prove the existence and amount of ore in the mine, and, in addition, to give information to the Company's mining engineers for the design and layout of the main shafts and system of mining to be adopted.

A general idea of the efficient methods of mining of mining and the large expenditure involved will be appreciated from the following:

The main shaft is an incline of 55 degrees, has five compartments, two being used for hoisting ore in skips, two for transportation of men and material in specially designed cages, while the fifth compartment is used for pipes, such as compressed air and water mains, electric cables for power and lighting, and a ladderway for emergency use by employees. The shaft has at present a total depth of 1400 feet the section dimensions being about 45 feet by 8 feet.

The hoisting of ore is now from a station having a vertical depth of about 1000 feet, the capacity being about 5000 tons per day, working 16 hours. The shaft connects with several main stations in the mine from which levels consisting of drifts and crosscuts are made through the ore body in order to carry out the development of the mine and give haulage facilities between the stopes and main shafts.

Three main levels have tracks of 45 lb. steel rails, the ore being hauled in trains of automatic side-dumping type steel cars of four tons capacity hauled by electric locomotives. These cars dump the ore into a large underground storage chamber of 100-tons capacity which in turn connects with a crusher

*Nickel Finishing Building, Port Colborne Refinery, International Nickel Co.*

station for the purpose of reducing the ore from the large pieces as mined to about six inches in size before being loaded in the 7½ ton skips from measuring pockets for hoisting to the surface.

On account of the massive nature of the ore which is extremely tough and heavy, extra heavy crushers have been designed with 42 inches by 30 inches jaw opening, and each operated by two 100/H.P. electric motors. These crushers were made in sections, to permit taking down the shaft, the total weight of each machine being about 25 tons.

The underground workings have electric light and fresh water supply for drinking purposes, and in addition special attention has been given to ventilation. There are at times as many as 200 rock drills in use, all operated by compressed air, generated in a compressed air power station at the surface, the air piping system being distributed to all the working places in the mine by the use of approximately ten miles of steel pipe of varying sizes from two inches to sixteen inches in diameter.

The underground equipment also includes pumps, operated both electrically and by compressed air, for the handling of mine water, and there are many other important items, but the reader will be particularly interested in the surface equipment and machinery which has been designed, erected, and placed in operation successfully during the last five years.

There are many important mining districts in America and in Canada, but there will not be found anywhere a more complete equipment than at Creighton mine. All machinery is operated by electric power, generated in the Company's own hydro-electric station at High Falls, 26 miles away, being transmitted

at 34,000 volts. This power is used at the mine for hoisting engines, air compressors, locomotives, pumps, lighting workshops and sundry service, and even to the heating of the buildings during the winter months when temperatures as low as 20 degrees below zero occur.

The main hoisting engine has a 1500 H/P motor and is capable of hoisting nine tons of ore at a speed of 2500 feet per minute, and on account of the motor load being as high as 3000H/P for a few seconds at the start of each hoisting trip, the engineers have installed the most modern systems of electric drive known as the "Ilgner" system, in order to take care of this extremely large variation in the use of power. The "Ilgner" system utilizes for the equalizing of the power a large fly wheel weighing fifty tons and is connected to a converter set driving the hoist motor. In operation this wheel absorbs and gives out power in such a way that the motor driving the hoist has a steady load.

There are special high tensile steel cables used for hoisting the ore, men and material from the mine. At present it is not necessary to operate the hoist at more than 1500 feet per minute, but in years to come when the mine has reached greater depths the speed will be greater in order that the increasing quantities of ore can be hoisted in a minimum time.

There are other hoisting engines used solely for handling men and material. The men who work underground are transported in special man-cages so that thirty men can be handled per trip. There are in addition four large electrically driven air compressors, three of which have motors of 1000 H/P each.

Diagrammatic View of Mining System of the Creighton Mine of the International Nickel Co.

The shaft house or rock house is an immense steel structure 145 feet high, containing about 1600 tons of constructional steel. This huge structure, believed to be one of the three largest shaft houses in the world, is enclosed with hollow tile on account of the climatic conditions in this district. It is in this structure that the ore delivered from the skips, after being hoisted by the massive engine, gravitates through rock crushers and screens on three floors and is classified to various sizes on rubber sorting belts from which the waste rock is removed by the pickers. An electric elevator is installed for handling men and material, and ore storage facilities are for 4000 tons, steel bins being arranged so that ore and waste rock is discharged directly into 50-ton hopper bottom railroad cars.

The mine equipment includes blacksmith shops where a large number of steel sharpening machines are in use, together with steel hammers, forges, steel plate rolling machines, etc., etc., so that all repairs to mine cars, skips, cages, etc., are made at the mine. Machine shops containing lathes, shaping, drilling

and milling machines, drill presses, etc., and an up-to-date carpenter shop are provided, and owing to an immense amount of stores and supplies being necessary, special facilities for storing have been made, the arrangement for the storage and handling of explosives having received particular attention.

The comfort of employees is provided for in a well laid-out town, with modern houses owned by the Company and rented on a favourable basis. Water supply and sanitation is under direct supervision of a resident medical officer, who is also responsible for the health and physical examination of employees.

Connected to the main shaft by a covered passageway is a large change house for 1700 men, containing individual steel lockers, shower baths and other conveniences, with hot and cold water service, so that every employee has the opportunity of leaving work refreshed from the day's labor.

A modern club house, well equipped for recreation and amusement, together with facilities for sport, and a school house with qualified teachers have also been provided by the Company.

Map of the Sudbury Nickel Area showing location of mining properties referred to in foregoing article.

# How to Recover Added Millions from the Mines of Cobalt

(By J. A. McRAE, COBALT.)

As further evidence in support of the fairly general belief among the mining operators of Cobalt that a merging or consolidation of various of the mines is to become fairly general is last week's announcement in *The Canadian Mining Journal* that the Trethewey mine has been sold to the Coniagas Mines, Limited. All signs point to the likelihood of the Coniagas being one of the companies which may become active in this respect.

As regards the financial status of the company it is an excellent position to carry out a policy of absorption of other properties. This is also true as regards mining and milling equipment. The annual statement from year to year which shows the cost of producing silver at the Coniagas to compare favorably with the best records in the Camp is conclusive proof of the efficiency of the management, and serves to show that the system of ore handling and treatment must necessarily be of the highest order.

View No. 1 being a general view of the Coniagas, forms only a limited idea of the size of the mining and milling plants. In the foreground is the main shaft-house and mill, but the mining plant as well as the oil flotation plant is concealed in the background owing to the situation of the buildings making it difficult to secure a photograph of the whole.

to the shareholders of the companies involved. It is a practice that should be beneficial to the purchaser and the vendor alike, in that it offers an opportunity for the company owning a mine which may be pretty well worked out in itself and therefore a source of much worry and but little revenue, to sell its property at a substantial cash price, and at the same time it offers an opportunity for the purchasing company to add to its acreage and volume of low grade ore, which, combined with its own brings the whole to a point sufficiently large to maintain a high degree of efficiency and the attendant higher margin of profit. In a word, worked singly and with a multiplicity of managerial staffs the mines of any camp in the days when mill heads become low will be compelled to close at a much earlier period in their life than is the case where they become merged into one large operation and under the expense of but one management.

In view No. 2 is shown the mill situated on the Trethewey mine, and which now also becomes a part of the Coniagas.

As to what companies will play a leading part in the process of absorbing other properties would be difficult to estimate at this time. The Nipissing, with some 840 acres situated in the heart of the Cobalt Camp appears destined to be a fixture even without

No. 1.—General View of Coniagas Mine.

No. 2.—Trethewey Mill.

In the purchase of the Trethewey mine, the Coniagas acquires an additional 43 acres of mining lands situated adjacent to its own property which comprises some 40 acres, and thus increases the whole to 83 acres.

On the Coniagas, work has been carried to deeper levels than on the Trethewey, but it is now proposed to extend the Coniagas workings onto the Trethewey and drive a raise into the main workings of the latter property. Once this work is completed it will be possible to considerably increase the volume of ore available for treatment in the plant of the Coniagas, and with the elimination of dual management and with very little extra overhead expenses, the added margin of profit should be considerable. That this tendency toward the absorption of the smaller properties by the larger and well equipped mines will result in a greatly reduced cost of operation seems certain, and promises to add to that extent to the benefits accruing

becoming involved in any consolidations. The Mining Corporation of Canada already owning the Townsite, City of Cobalt, Cobalt Lake, and having recently purchased control of the Buffalo as well as a lease on the Foster appears determined to stick with the camp to the end. The Northern Customs Concentrator in the purchase of a part of the Chambers-Ferland, as well as consolidating with the Bailey-Cobalt and the acquiring of a lease on the Silver Cliff appears also to have big ambitions in this direction.

It is in the case of the activities of the Coniagas and the Mining Corporation of Canada, however, that the careful observer is found turning with a great deal of interest and in regard to which, sooner or later, one of the biggest consolidations in Cobalt may reasonably occur. In this I refer to that entire ridge extending from the McKinley-Darragh mine on the South, to the Hudson Bay Mine on the North. This ridge includes the McKinley-Darragh, the properties of the Mining

Corporation inclusive of the Buffalo, the Coniagas as well as the Trethewey and the Hudson Bay. It also includes that part of the Nipissing lying to the West of the railway as well as the Chambers-Ferland, Right of Way, and the original property of the La Rose.

In dealing with this chain of properties, all of which have produced a large volume of high grade ore in which are maintaining their output by treating medium grade ore, I have in mind the belief that they will some day all be a part of one enormous consolidation. As to this, I have discussed the matter with some of the best informed mine managers in the Camp and they have readily concurred that the idea of a large mill, possibly with a capacity of two thousand tons daily located somewhere along this great ridge and operated at a minimum of expense under one management would add many millions of ounces to the final production record of the Cobalt camp and would result in added millions of profit to the operators.

The fact is that in various parts of this enormously rich strip of territory, there are sections that could actually be quarried out and treated provided equipment sufficiently large to treat such a volume of ore

were available. To treat this enormous tonnage of low grade ore in small parcels in small mills could not be carried out on a commercial basis, but to include the whole in one giant operation would make it possible to reduce the cost per ton treated to a point where the margin of profit would be very satisfactory. A merger of this description would include every producing mine situated along the west side of the railway. In years to come it might not be unreasonable to suppose that even the Nipissing might also figure in the scheme which is already presenting itself as desirable to mines where the resources of high grade ore are gradually becoming exhausted.

Below is a somewhat long-range view showing a part of the North end of this ridge. The high shaft house is that of the Coniagas while at the opposite end of the picture are the buildings of the Trethewey. North of the Trethewey lies the Hudson Bay, while South of the Coniagas lie the long chain of properties, which belong to the Mining Corporation of Canada. On the East lies a part of the Nipissing and farther over the Chambers-Ferland, Right of Way and La Rose.

No. 3.—“The Ridge,” showing the Coniagas and Trethewey Mines.

## Our Northern Ontario Letter

### THE SILVER MINES.

During the past week the silver producing mines of Cobalt have received as high as \$1.60 an ounce for their silver. The reason for this rapid jump in price is not due to an upward movement in New York quotations but is brought about by the rate of exchange between Canada and the United States.

With silver quoted in New York at \$1.34½ an ounce, and with United States funds at a premium of 18 p.c. at the time of writing, the Canadian producer is actually receiving \$1.59 an ounce for silver. Old Canadian silver coins, minted on a basis of silver at \$1.29 are rapidly disappearing from circula-

tion. These coins, figured in 1000 parts are made up of 925 parts silver and 75 parts alloy.

It will be recalled that the Canadian Government at the beginning of this year decided to reduce the silver content of new coins to 800 parts silver and 200 parts alloy. With the rate of exchange operating unfavorably in addition to possible further increases in New York quotations for silver the question may arise as to whether or not the proportion of alloy in the new coins will constitute an adequate safeguard against these sufficiently unscrupulous to resort to the melting pot in the work of mutilating the Canadian piece for its silver content, which in turn may be marketed in New York at the high price plus the premium on U.S. money.

The Crown Reserve Mining Company during 1919 produced \$223,034 a gain of \$25,000 as compared with 1918. The net profits for the year amounted to \$77,330 as compared with \$6,756 during the preceding year. Optimistic reference in the report is made to other properties in which the company is interested. These include the Poreupine Crown mine at Poreupine which the Crown Reserve controls, as well as the Canadian-Kirkland property at Kirkland Lake on which the Crown Reserve holds a working option and on which work is now being prosecuted.

The Mining Corporation of Canada proposes to carry out a limited amount of exploration work on claims acquired last fall in the township of Butt, district of Nipissing. The work will probably consist chiefly of surface prospecting in an effort to explore the possibilities of commercial deposits of radium-bearing ore. It will be recalled that considerable attention was attracted to that district late last summer on the strength of a report that radium-bearing ore had been found, which was later confirmed by Cyril Knight, geologist for the Ontario Bureau of Mines.

The Kerr Lake continues to produce upwards of 100,000 ounces of silver monthly, thus indicating an output at the rate of about 1,250,000 ounces a year. The January output amounted to 108,000 ozs. With costs for 1919 having averaged under 41 cents an ounce, and since having perhaps risen to around 45 cents an ounce (owing to the high price of silver entitling the workmen to a bonus), it is evident that at present the company is realizing over \$1 an ounce on its silver output. Should this continue throughout the year the net profit would amount to about \$2 a share on each of the company's 600,000 issued shares.

The Directors of the Comiagas Mines have under consideration an option on the Gamble-Thompson group of properties in the Gowanda silver area. Provided the deal goes through, arrangements will be made to commence exploration work this month. The claims in question are situated in the Miller Lake area.

On February 2nd the Trethewey-Cobalt Company received \$100,000, this being payment in full from the Comiagas Mines Company for the Cobalt mine of the Trethewey Company. Further reference as to this is made on another page of this issue of the "Journal".

It is learned that the management of the Temiskaming mine plans to submit the annual report about the last week in February. From the available information it would appear reasonable to expect that an increase in ore reserves will be shown. Also, that net earnings for 1919 were adequate to take care of the 4 p.c. dividend paid last month, without drawing from the surplus of \$900,000 with which the year 1919 was commenced.

The deal for the Dodds property, situated at the Leroy section of the Gowanda district has been closed. Exploration work will be commenced by the new holders within the next month or so.

Your correspondent has received the following

statement from Premier E. C. Drury, in reply to a request for an expression of opinion in regard to the possibilities in regard to the Gowanda district being provided with railway accommodation this year:

"The matter to which you refer is under consideration, but at the present time, I am unable to express an opinion on the question. It is a matter of such importance that I should not express an opinion until I have fully gone into the facts of the case and had an opportunity to view it from all angles."

The above statement appears to be an admission that the government is as yet undecided in regard to authorizing the Canadian Light Railway Construction Company to proceed this spring with the building of a light narrow-gauge line, in that if the government had decided to let private interests proceed it would scarcely be itself considering the extension of the Elk Lake branch of the T. & N. O. as urged by mine operators. The situation has given rise to the fear that the Ontario Government by lack of decision may discourage the private enterprise, and itself finally fail to take definite steps to provide the desired accommodation. In the meantime it is learned that an application will be made to the Legislative Assembly of the Province of Ontario at the next session thereof for an act to incorporate the Northern Light Railways Company with the following powers:—

"to construct and operate light narrow gauge railways with steam, electricity or other motive power, from a point at or near the Elk Lake Branch of the Temiskaming and Northern Ontario Railway adjoining the Town plot of Smythe, in the District of Temiskaming; thence in a south westerly direction through the Township of Roadhouse and Lawson, thence in a south westerly direction through the Township of Nicol, to a point in, at or near the Town plot of Gowanda, and with Branch lines proposed as follows:—

- (1) Commencing at a point on the Elk Lake Gowanda line in the township of Nicol. Thence in a northerly direction connecting with the established gold mines in the township of Powell known as the Fort Matachewan Gold Mining Area.

- (2) Commencing at a point on the Elk Lake-Gowanda line in the township of Nicol, running in a westerly direction through the townships of Nicol, Milner and Tynell, in the District of Temiskaming, and McMurchy in the District of Sudbury, and connecting with the mines in the township of Churchill known as West Shining Tree Gold Mining area. And a loop line commencing at a point on the T. & N. O. Railway at or near Swastika station in the township of Teck, running in a north easterly direction through the township of Teck and the Kirkland Lake Gold Mining area, thence in an easterly direction through the townships of Lebel and Gauthier, thence in a southeasterly direction to Larder Laks in the township of Hearst; thence in a southerly direction through the township of Hearst near Lake St. Anthony in the township of Skead; thence in a westerly direction through the township of Skead and in a north westerly direction through the townships of Catherine and Boston at a point or at near Boston Creek Station on the T. & N. O. Ry. and other railways that may be built; with bonding powers and with such other powers as are usually given to Railway Companies."

In connection with the development of the Gowanda district it is interesting to note that nine out of ten of the concerns operating in that field are doing so on behalf of previously financed mining companies or with private capital and that stock promotions are playing but a very small part in the financial requirements of the camp. The situation is regarded as highly favorable and one that lends strength to the camp. One reason for this is that funds of the above description are usually handled

with greater care than where they are a part of a campaign of stock selling. Also, that money of this kind is only spent upon property of outstanding merit, whereas that in less stable concerns may be spent any place where a spectacular showing may be made as a temporary advertising medium.

As an instance of one unfavorable influence of the decline in British sterling exchange those companies with head offices in the Old Country, endeavoring to spend money in the development of mining properties in this country.

On the Dickson Creek property, located about half way between Haileybury and New Liskeard, the main shaft has reached a depth of 200 feet. This will be continued to a depth of 300 feet. The head office of the company is in England.

#### Ore and Bullion Shipments.

During the week ended Feb. 6th, two Cobalt companies shipped an aggregate of three cars containing approximately 233,612 pounds of ore.

A summary follows:—

Shipper	Cars	Pds.
McKinley-Darragh . . . . .	2	170,412
La Rose . . . . .	1	63,200
Totals . . . . .	3	233,612

On Saturday the Nipissing sent out 75 bars containing 100,365.97 fine ounces of silver bullion. At the present high price of silver, plus the high premium on United States money for which the silver is sold, it is probable that the shipment had a value of around \$155,000.

#### THE GOLD MINES.

The gold mines in this country find themselves in the favorable position of receiving the equivalent of a very substantial premium on their gold. In the past week when United States money rose to a premium of 18 per cent. the mining companies of Porcupine found themselves free to dispose of their gold in New York and instead of the standard value of \$20.67 an ounce they received 18 per cent. additional, this premium amounting to approximately \$3.70 an ounce.

While the premium is merely the result of unfavorable trade balances and therefore subject to more or less rapid fluctuation, and while there is no doubt the exchange rate will lessen within a reasonably short time and finally be brought back to normal, yet for the next few months it may prove to be an important factor operating in favor of the producers of gold.

The monetary problems of the greatest nations of the world appear to have reached a state bordering upon demoralization. That as in other things the British Empire as well as France will in due course recover their financial status is certain. At the same time, the period of readjustment promises to be slow and the premium on United States money may reasonably rule high for considerable time to come. For this reason, mine operators of Northern Ontario look forward to the receipt of a substantial premium for their product for at least some months.

Mining men who had given the matter careful thought appear to be convinced that the crest of high prices had been reached. "I believe that the twelve months immediately before us will be marked by a collapse in the price of material and a big decline in

wages", said a conservative mining man to the writer. "Should this reach proportions of money-panic", he said, "it will be a pity, for many will suffer; but, as for the gold mines, it is a thoroughly recognized fact that a money-panic and a gold producing mine is one of the finest combinations known."

The Hollinger Consolidated is treating around 2700 tons of ore daily. It is now understood that the present equipment is adequate to treat 3000 tons when at full capacity instead of 3500 tons daily as indicated in previous unofficial estimates. With mill heads averaging around \$9 a ton, and treating 300 tons daily, the rate per annum would be 1,095,000 tons treated and \$9,855,000 produced or approximately 492,750 ounces of gold. Receiving payment in American funds which are at a premium of 18 per cent. and therefore equal to a bonus of \$3.70 an ounce, the added revenue on one year's output would approximate \$1,822,175. Of course, this 18 per cent. basis of calculation is not permanent, but the importance of the exchange situation is in this way emphasized. The fact is that even if exchange drops to half that of the present the income of the Hollinger will still be enhanced by several hundred thousand dollars for the year 1920. As regards costs of operation it is understood that during 1919 they were reduced to \$4.31 as compared with \$4.93 in 1918.

At the Dome where production is running between \$2,000,000 and \$3,000,000 annually, and at the McIntyre-Porcupine where an output of not far under \$2,000,000 is being recorded, it can readily be seen that these mines will also derive large benefits from the exchange situation.

It is learned on good authority that the McIntyre will not drop its option on the Plenaureum property, but, rather, will seek another extension of time. Water troubles as well as a shortage of labor were unfavorable factors during the past year, and the general impression appears to be that the Plenaureum control will grant the requested extension of time.

The mill of the Dome Lake is once more in operation, the first clean-up since resuming work having been made during the past week. A force of between 40 and 50 men are now employed and the mill is treated between 60 and 70 tons of ore daily.

Sinking operations have commenced at the Porcupine-Keora. For the time being, this work is being done with hand steel and progress is consequently not rapid. However, by the time the steam mining-plant is installed, the work will have been carried to a point where the sinking of the shaft to the 300-ft. level may be rapidly carried out.

At the Clifton-Porcupine mine the main shaft has been completed to a depth of 225 feet and average values are stated to have been uniform to that depth. At the 200 ft. level a warking station was cut and drifting both north and south is under way at that depth on vein No. 7. Crosscutting east to cut the downward continuation of veins 5 and 6 as well as the Boulder vein is under way. It is estimated that these veins will all be cut with about 120 feet of undergroundwork. Owing to vein No. 7 having contained uniform values to a depth of 225 feet it is reasonable to expect that the other veins which con-

tain good ore at surface may also be found to show up well at depth. It is officially announced that the mining plants is to be used at practically full capacity, and that if the work of the next three or four months continues to be favorable, the question of installing a mill during the coming summer will be gone into.

In the Kirkland Lake district the scope of operations continue to broaden. Whereas a year or so ago the active section was confined to a two-mile strip of territory running from the Elliot-Kirkland to the Tough-Oakes and only a claim or so in width, this has now broadened out to a mile or so in width and gives promise of extending several miles in length.

In connection with the development of the Ontario-Kirkland property (formerly the Hurd group, it is learned officially that for a distance of 100 feet along the vein recently encountered at a depth of 300 feet the ore body has averaged \$20 a ton for the full width of the drift, and with the vein still strong in the West face of the drift. It is also stated that the two other veins have been encountered recently, being known as veins A. and B. Vein A. is only twenty feet north from the rich vein above mentioned and is stated to be highly mineralized and containing visible gold. At the time of writing the average gold content has not been determined by assaying. Drifts have been commenced on veins A. and B.

At the Lake Shore, Kirkland Lake and the Teck-Hughes production continues at normal rate, and development work it being attended with favorable results.

In the Boston Creek district, the usual activity continues. The shaft on the Kennedy-Boston has reached a depth of 85 feet and is completely timbered. It will now be carried to the 100-ft. level where a station will be cut and a contract for drifting will be let.

The Catherine Gold Mines is planning the purchase of a mining plant consisting of a boiler, compressor, hoist and corresponding equipment. This will enable the management to make more rapid progress in developing the very promising veins which occur on the property. Sinking will be resumed as soon as a plant can be secured and installed and it is expected that this equipment will be taken to the property before the snow is off. A small sawmill is now in operation on the Catherine property, and sufficient lumber for shaft timbers, building material, etc., will be sawed before spring.

On March 1st, J. A. Hough will retire from the service of the Department of Mines after having served for thirteen years as mining recorder in the Larder Lake and Swastika division. A successor for Mr. Hough has not yet been named.

The War Veterans in the district of Temiskaming are urging the Minister of Mines to give preference to the appointment of a returned soldier to fill the vacancy on the staff of mining inspectors caused by the death last fall of A. H. Brown. It is pointed out that not a few returned men can thoroughly qualify, having had previous practical experience as well as having a knowledge of engineering, and that the appointment would be made on merit. The request is regarded with general favor throughout the North.

## WAGE ADJUSTMENTS AT THE NOVA SCOTIA COLLIERIES.

The adjustment of wages at the collieries in Nova Scotia has made fair progress since the New Year. A number of Conciliation Boards have been appointed to deal with the questions as they stand at issue between the separate companies and their workmen, and, owing to the fact that the mineworkers are now all members of the United Mine Workers of America, it has been necessary for the individual Boards to arrange their meetings seriatim so as to permit of the U. M. W. Executive Board being in attendance.

The Dominion Coal Company and its workmen have agreed upon a complete revision of the wage schedule, particulars of which are given in this issue, in so far as they relate to day-paid rates. There have been some not unusual difficulties in getting the individual locals to ratify the agreement made by the Executive on their behalf, but these difficulties have existed chiefly in the imagination of the newspapers who have assiduously striven to create the impression that serious trouble was brewing among the employees of the Dominion Coal Company. As a matter of actual fact, the leaders of the U. M. W. have driven the most advantageous bargain for the workmen that was ever driven, nor should it be forgotten that the increased wages earned by the mineworkers does not affect the price of workmen's coal, which stays at \$1.50 per ton; or the house rentals, which are probably the lowest in North America today. If the Secretary of the United Mine Workers in America never has any harder task than to defend the text of the latest agreement with the Dominion Coal Company he will not complain.

The Conciliation Board appointed to deal with the wages of the Nova Scotia Steel & Coal Company's workmen is in session, and its duties have been enlarged to include the collieries in the Inverness field.

In the Pictou Field, the demands of the mineworkers has called forth from the Manager of the Acadia Coal Company a remarkable statement of the position of that Company, a position, which it may be remarked has general application to the coal mines of Nova Scotia, and an even wider field. The statement is as follows:

"During the past few days we have discussed with the representatives of our employees the question of advancing certain daily rates and have tentatively intimated that we would be willing, in case an agreement is arrived at, to make certain concessions as a compromise.

"The Acadia Coal Company expected to be able to make these concessions without any increase in the price of coal to the public. We would try to do this by a policy of economy and would expect to have assistance and good will of all our employees who would enjoy the benefits of these concessions.

"We have been asked to discuss the question of an advance in certain contract rates. We can only reply that any advance in these rates, be it ever so small, would make it necessary for us to increase in proportion the price of coal to the public. An agreement between ourselves and our employees to increase the present contract rates is in effect an agreement that would compel the public to pay more for coal otherwise we cannot exist.

"We believe such an agreement to be an unsound method of settling these disputes, and we desire to set out briefly for the information of our employees, the board of conciliation and the general public, the reasons why we believe no such increase should be made.

"First.—The average daily earnings for contractors is now \$5.83 while in 1914 it was \$2.99, an increase of 95 per cent. In addition to this, our employees are provided with houses at low rents and with coal at \$1.20 per long ton, privileges which are equal to not less than 55 cents per day. Both in wages paid and in the percentage of the increase our employees compare favorably indeed with coal miners anywhere in Canada or in the United States, and this, in spite of the undoubted fact that the Pictou coal seams have been among the most difficult to work at any profit. We think also that they compare favorably indeed with the men in any other industry.

"Second.—The price of coal is not increasing. It is decreasing. We are actually selling coal today for 95 cents less than in 1918. And the price of coal today is hardly 80 per cent. greater than in 1914 although wages have increased 100 per cent. We do not know that we can get an increase in the price of coal from many of our customers. We may be driven out of certain markets. Local industries may be unable to operate and we and our employees (if we agree to demand an increase in the selling price) may find ourselves eventually met by a lack of orders, broken time and other difficulties.

"Third.—No industry can prosper which does not have a decent regard for the community to which it sells its product. To meet together and agree to charge more to the public for coal, without regard to the merits of the question is economically unsound. For these reasons we will not take the responsibility of agreeing to any increase, nor will we make any agreement behind closed doors which will make it necessary for us to forthwith increase the price of coal to the public."

There has been very general belief that coal owners can increase wages and absorb the increased cost of production without increasing the cost of coal to the public. In the United States this misconception almost led to a mandate from the U. S. Government to increase wages without increasing selling prices. Under these circumstances, Mr. Notebaert's complete expose of his Company's dilemma is important. There is no leading branch of industry in Canada today that is so unremunerative as coal-mining to the operators. This statement is made advisedly. The profits of the coal and steel companies in the past few years have been made out of steel manufacture, and not out of coal-mining. The unremunerative character of coal-mining is a condition that affects all collieries in Canada, east and west, and there is only one way by which mineworkers can be given increased wages, namely, by passing that increase along to the consumer.

The public is indebted to Mr. Notebaert for his frank statement.

Col. Walter Karri-Davis, well-known to the mining fraternity of the Pacific Coast, has been visiting British Columbia, familiarizing himself with present conditions. He expressed much interest in the recent developments in the Portland Canal section of the north.

Joseph Errington, the mining engineer who is interested in the exploration and development work now underway at Aspen Grove, near Kamloops, B. C., denies that the Temiskaming Company, of Toronto, Ont., with which he is associated, has acquired any interest in the large low grade property staked on Buttle's Lake, central Vancouver Island.

Mr. C. J. Coll, formerly General Manager of the Acadia Coal Company, and later General Manager of the Cape Breton Coal Iron & Railway Co., at Broughton, Cape Breton, has been appointed General Manager of the Minto Coal Co., at Minto, N.B.

## CORRESPONDENCE FROM BRITISH COLUMBIA.

### Victoria, B. C.

A meeting of Coal Mine Operators was held at Calgary over the week-end, January 24th to 26th, to discuss the wage question and also the matter of the "check-off," which already has been described as being a method set out in an order issued by W. H. Armstrong, Director of Coal Operations, by which the men's union fees were to be deducted from their pay cheques and the aggregate amount forwarded to the U. M. W. or A. headquarters. This was designed as a means of circumventing the One Big Union and was by way of being a *sine qua non* to the receipt by the men of a 14 per cent increase in their wages. Word from the coal fields, however, indicates that many of the men refused to accept this condition. It is said that as many as 5,000 took this stand. Rather than face a walk-out in mid-winter a proportion of the Operators ignored the Armstrong order and the men are being paid at the advanced rate, without the deduction of union fees. At the Coal Operators' meeting referred to no way was discovered out of the dilemma and no action, apparently was taken.

An interesting action to those connected with the coal mining industry in British Columbia was mentioned in the courts a few days ago. It is known as Hodgson vs. French, Elliott, Hamilton and Dunsmuir. On the occasion in question an application was made for the dismissal of the case but it was not allowed. Edward E. Hodgson, it appears, is asking for a portion of the \$1,000,000 commission paid to Messrs French, Elliott, Hamilton and Dunsmuir, as a result of the sale years ago of a large block of Vancouver Island coal lands. In 1912 an action was started by Hodgson in which he claimed one-third of the commission. Subsequently he brought another action in which no amount was specified. Counsel for the defendant sought to have the latter phase of the litigation set aside as he could not see the idea of starting a second action before the first was settled.

Counsel for the Pacific Coast Coal Mines, Limited has left for Ottawa to appear before the Supreme Court of Canada in re Wellington Collieries and Canadian Collieries (D), Ltd. vs. the Pacific Coast Coal Mines, Ltd. This is a suit brought by the Wellington and Canadian Collieries for the recovery of \$85,000 damages for alleged trespass by the Pacific Coast Coal Co. on their Vancouver Island coal properties. In the Supreme Court of British Columbia the plaintiffs were successful but in the Court of Appeal (Provincial) the decision was reversed. The Wellington and Canadian Collieries now have taken the suit to the highest court of Canada where, of course, it is being combatted by the defendant Company.

Coal lands near East Princeton are being developed by the Harvard Coal Company a re-organization of the United Empire Company. James Gray, an experienced miner, is the superintendent. He has only some fifteen men employed at present but is said to be meeting with good success. Small coal shipments are expected in the course of a short time.

Alexander Ewart, a pitt boss in the Middlesboro Coal Mines, was murdered on the evening of the 19th of January. Ewart returned to assist in straightening out some trouble the rope-riders were having with the cables. He had just reached his objective when a

masked man stepped in from the darkness and discharged two revolver shots at him from point blank range. Ewart was killed instantly. The murderer, picking up a lamp, which subsequently was discovered in the mine, made his escape. While an arrest of a suspicious character has been reported there is no certain evidence that the man responsible is in the toils. Ewart was a well-known and highly respected citizen. He was a member of the Masonic Lodge and had served for several terms on the aldermanic board of the City of Merritt. He had been engaged in the coal mining business in the Province for some years.

Samuel Matthews Robins, for many years a prominent figure in connection with the coal mining industry of British Columbia, died on the 4th of November last in Devonshire, England, where he took up his residence after the Vancouver Island Coal Company's holdings on Vancouver Island passed in to the hands of the Western Fuel Company. This happened in the year 1901. It was in 1884 that he took charge of the old Company's business in this Province, making his home at Nanaimo, B. C. He is well remembered by all the old timers of that City and the miners who worked under him have nothing but praise for their old boss. Pursuing an energetic programme of development the properties were made highly productive. The workers, too, were contented. The late Mr. Robins always gave them a hearing and, while his word was law, it was not passed before both sides of every story were weighed. He was fair and just in his balancing of the scales as between employer and employed with the result that there was little of the bickering that has been so common in latter years and the then little mining town flourished.

#### Stewart, B. C.

Native silver is reported to have been discovered on the crosscut being driven on the E. Pluribus Claim, William Noble, superintendent of the development work in progress, being credited with bringing samples of the same from the property to the town of Stewart. The Big Missouri Group, to which this claim belongs, has been considered to be an immense low grade proposition but, if information from the North can be accepted, recent work has disclosed ore carrying high silver values.

According to statements made in Seattle, Wn., Governor Riggs, of Alaska, has left for the Eastern United States with a view to interesting the American authorities in the question of obtaining more adequate transportation facilities for the town of Hyder, which is situated on the seaboard of Alaska and is one of the gateways to the Salmon River mineral zone. He is quoted as expressing confidence in the future of the district to which the Premier Mine has been chiefly responsible for the attraction of general attention and interest. The Alaska Territorial Government, co-operating with the Forestry Service and the Alaska Road Commission, is to have a road completed up Salmon River, across American territory to the British Columbia border by next summer. It is proper to interpolate here that the British Columbia Government has expended a considerable sum in the construction of a road from Stewart to Hyder and in the building of a road from the American boundary to the mines. More expenditure, it is likely, will be authorized this year for the further improvement of the avenues of transportation on the Canadian side.

To return to Governor Riggs, he is credited with saying that this American road will permit silver ore being brought to Hyder for transportation to the smelters. He also is quoted as being dissatisfied because the American Steamship Lines do not touch at Hyder while the vessels of the Grand Trunk Pacific Steamship Co. do so at regular intervals.

Grant Mahood, of Stewart, is reported to have taken a very rich specimen of silver ore from the Divide Group, situated in the Salmon River section, about a mile and a half from the Spider Prospect.

#### Kamloops, B. C.

Application for the extension of the charter of the Kettle Valley Ry. to permit of the construction of a branch line into the Aspen Grove Mining Properties, which now are under development, is being made at Ottawa. The same railway company is applying for authority to build a branch to tap the Coalmont Coal Mines. The latter has been operated on a small scale recently, its output being transported by motor truck to railhead. With railway connection no doubt the production will be increased.

#### Princeton, B. C.

H. R. Van Wagenen, General Manager of the Canada Copper Corporation, who has been spending the winter at Denver Colo., with his family, is expected to return to Princeton early in February to take personal charge of the Company's preparations for the opening of the mine and mill at Copper Mountain and Allenby respectively.

#### Nelson, B. C.

The Prospectors' Association of British Columbia is growing in strength rapidly. Branches are springing up in different parts of the Province, organizations have been launched at Prince Rupert, at Cranbrook, as well as at Nelson and others being promised for other centres. The intention is that these various locals shall affiliate and a central executive selected whose headquarters shall be at Nelson. At a recent meeting of the Nelson Association resolutions were adopted as follows:

To petition the Railway Companies and the Railway Commission for special transportation rates on small shipments of prospectors' ore.

To ask Consolidated Mining and Smelting Company for a special smelting rate on such small shipments.

To advocate the establishment of ore testing and sampling plants and free assays.

To advocate the furnishing to prospectors of powder at cost.

To advocate the establishment of a winter school of mines at Nelson under the British Columbia University.

To oppose the section of Engineers' Incorporation Bill which would compel foreign mining corporations to retain local mining engineers.

To advocate the application on assessment work under the Mineral Act of expenditures by prospectors or miners on trail or cabin building.

To advocate that reports of district engineers be made accessible to owners of properties dealt with by said reports.

To advocate a division of the Eastern Mineral Survey District or the appointment of an assistant engineer under A. G. Langley, the present Resident Engineer.

To advocate that where partners of overseas soldiers allowed their half interests in mining properties to lapse, while the government retained the soldiers' interests intact, the delinquent half interest be made over to the returned soldiers.

Officers named in the application of the Association for incorporation are: President, J. W. Mulholland; Vice-President, Cecil E. Crossley; Secretary, Fred. A. Starkey; Treasurer, Dr. F. E. Morrison; Directors, James Miller and M. C. Monaghan.

Development of the Mountain Chief Mine at Renata continues with satisfactory results. After taking 423 tons of ore from the upper workings J. W. Evans, the manager, has started to sink from the bottom of the shaft. There has been a considerable addition to the mine plant during the last few months, notably a two-drill compressor and a power hoist.

#### Kimberley, B. C.

A shoot of silver-lead ore, samples from which have assayed between \$101 and \$103 for the total metallic content, has been encountered by Robert B. Durrant while tunnelling on a gold-bearing quartz ledge on Perry Creek. This galena ore body in a quartz ledge is not the chief feature of the property and Mr. Durrant proposes driving to 100 or 120 feet depth to ascertain whether the ore body persists and, if so, to gain stoping ground.

#### Slocan, B. C.

The Silver Bell is reported to be showing up very satisfactorily on further development. A new find is announced as a result of a raise from the lower tunnel. It consists of 12 inches of mixed ore, through which more or less clean ore is scattered. The indications become better as the work progresses. The Silver Bell has about 1,000 feet of work in its two tunnels and raise, the latter opening into ore about midway between the tunnels. The property has been operated continuously since August 1918 last year shipping 135 tons of ore. New cabins have been constructed with accommodation for twenty men and a crew of fourteen now is engaged in taking out ore, four cars having been shipped since sleighing began. R. F. Green, M.P. and S. H. Green, of Kaslo, are the owners.

#### Trail, B. C.

Some additions as well as remodelling is underway at the Trail Smelter of the Consolidated Mining and Smelting Company. A supplementary drafting office is being provided for the use of a staff of about twelve draftsmen who will be engaged in connection with the new concentrating plant which, it is expected, will be erected at Rossland. As far as can be learned the site of this Mill has not been definitely decided as yet, there still being a possibility that it will be placed at Trail, owing to the difficulty as to the obtaining of a satisfactory water supply at Rossland.

Sixteen properties shipped ore or concentrates to the Trail Smelter during the week ending January 14th, the total being 6,510 tons. Included in these were three of the Clarence Cunningham properties, the Queen Bess, at Three Forks, and the Wonderful and Richmond-Eureka, at Sandon. For the first two weeks of the year a grand total of 12,214 tons have been shipped to the smelter, which is considered an excellent start.

#### Golden, B. C.

The Castledale Mine at Castledale, a copper property on which development work has been done to the extent of about 50 feet of tunnel and 60 feet of drift, is reported by C. H. Rowley, the superintendent, to be showing up well. He says that ore carrying between 15 and 20 per cent copper has been struck but the extent of this body will not be known until development is carried further.

#### Vancouver, B. C.

C. Camsell, in charge of the British Columbia Branch of the Geological Survey of Canada, is quoted as being of the opinion that the airplane should prove of much assistance in the exploration of the vast areas of northern Canada of which little is known. As a means for the transport of travellers and supplies to points almost inaccessible under ordinary conditions he considers the aeroplane of first importance. He states that, as far as the geological survey can learn, there are one million square miles, practically one-third of Canada, which has never been traversed by a white man. The greater part of this territory lies between the Rocky Mountains and the Hudson's Bay to the north of the provinces of Saskatchewan and Alberta. British Columbia, with the exception of a strip in the northeast section, has been examined and authenticated by geologists. Mr. Camsell spoke of the hydroplane as being the most suitable form of an airplane for the work in mind because, as the northern part of Canada is broken up by many lakes and rivers, there would be little difficulty in finding good mooring. In support of the suggestion it was pointed out that under present conditions geologists spent much of their time in travelling to the point marked for exploration. On one of his recent trips he left Edmonton in May and the party was absent for five months, six weeks of which period was devoted to the work in hand. Their destination then was Athabaska Lake, which is only a comparative short flight from Edmonton. With the development of the airplane during the war, and its present reasonable cost, Mr. Camsell thought it might be well that the proposal be given consideration. Mr. Camsell also referred to the loss of a number of the members of the staff of the Canadian Geological Survey, who have taken positions with a private Company, stating that their loss probably would mean the curtailment of this season's work.

#### Victoria, B. C.

It is definitely announced that the Consolidated Mining and Smelting Company of Canada has taken over the Jordan River properties, Vancouver Islands, known as the Sunloch Group. These have been under development for some time, about 1,000 feet of cross-cutting and drifting and 300 feet of diamond drilling having been done. Besides this there has been constructed some 6,000 feet of automobile road. A four drill compressor plant has been installed and new building erected. A track also has been laid from the mine to the waterfront. The Consolidated Company is expected to pursue development energetically and it is possible, although no official announcement has been made, that, with confirmation of the belief that the Sunloch is to become a large producer, a concentrator will be installed. It has been known for some time that the Consolidated Company was interested in this property but not until now has a definite statement been authorized.

**TORONTO NOTES.****Preparing for the annual convention of Canadian Mining Institute**

(From Our Toronto Correspondent.)

Arrangements for the annual meeting of the Canadian Mining Institute to be held in Toronto on March 8, 9 and 10, were well advanced at the meeting of the Toronto branch last Saturday. Assistant Secretary Rose was present, and during the meeting a provisional program for the convention was drawn up and read. It will, of course, be subject to changes, but as it stands now the program provides for a full and very interesting three days. The first day will be devoted to an address of welcome, the President's address and the presentation of mineral statistics by John McLeish, T. W. Gibson, T. C. Denis and W. Fleet Robertson. Papers are expected from O. C. McKenzie, B. Geikie Cobb, W. H. Collins, F. E. Lucas and others.

At the Tuesday and Wednesday sessions time will be given to a consideration of the coal and oil resources of Canada when among the speakers will be J. T. Stirling, W. J. Dick, F. W. Gray, editor of the Canadian Mining Journal, W. B. Lanigan, freight traffic manager of the C.P.R., O. E. S. Whiteside, A. McLean, Edgar Stansfield, M. Y. Williams, T. C. Bosworth, Dr. R. C. Wallace, J. G. Ross, Professor Baker. Papers are expected to be read before the Iron & Steel Section of the Institute dealing with the manufacture of alloy steels in Canada, the new plate mill of the Dominion Iron & Steel Co., in Sydney, and the general question of fuel economy in steel plants. It has been arranged that J.

A. Campbell, M.P., will speak at the evening dinner on the closing day.

The local committees have charge of the arrangements for entertainment, these to include luncheons, dinners and possibly a dance. It was decided at the meeting to send representatives to the Joint Committee of Technical Organizations. This Committee has been about three years in existence and was originally appointed to give the engineers an opportunity to help the Government in war work. It has been reorganized on a peace basis now. James McEvoy was appointed representative of the Toronto branch of the Canadian Mining Institute on the Committee.

Vickery & Co., a mining brokerage firm doing business at 56 King Street West, Toronto, has made an assignment and a meeting of creditors revealed what appeared to be assets in the neighborhood of \$1200 against \$40,000 liabilities. The firm carried on a business mainly on margin, the stocks dealt in being chiefly of Northern Ontario properties.

Sir John Carson, in his address to the shareholders of the Porepine Crown Mines, Limited, in submitting the annual report, pointed out that development had proceeded on the Canadian Kirkland, one of the company's options, despite the fact that they had been hampered by labor troubles, and good progress had been made. According to the annual report, surplus had been reduced \$54,166, bring the account to \$224,610 and comparing with an addition in 1918 of about \$13,000. Mine operating account, development, etc., during the year, totalled \$46,736.

# A MARSH HOIST

## IS MADE THE RIGHT SIZE FOR YOUR MINE

and in either Steam Power or Electric Power

This shows one of our Electric Mine Hoists. We make many other types. Send for our catalogue of Mine Hoists, Cars, Cages, Buckets, etc., and see what we offer you. It will repay you.

From the little 10 Horse Power size for prospectors or small mines to the massive 50 Horse Power size, one of our 7 sizes should be just right for your mine.

We are specialists in the building of Hoisting Machinery of all sorts. For nearly a quarter of a century we have been designing and building Hoists, and have developed a Hoist that we are really proud of—proud because of the record of good work they have done, and are doing in mines, quarries, and other classes of work from one end of Canada to the other.

## MARSH ENGINEERING WORKS, Limited

ESTABLISHED 1846

BELLEVILLE, ONTARIO, CANADA

Sales Agents:—MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

Schedule of Wage Rates and Classification agreed upon between the Dominion Coal Company and those of its employees who are members of the United Mine Workers of America.

1st Jan. 1920.

AT THE COLLIERIES

Surface.	Per Day
Headman (attending man cage or coal hoisting cage where men are lowered and dumping cage-man)	3.75
Tally boys (boys taking tallies out of empty boxes)	2.40
Tipple men, unhookers and grabmen, at head of slopes.	3.50
Bank and screen-men (including men reading off tallies at weigh scale)	3.50
Car shunters and trimmers (including box car trimmers)	3.35
Pit tub oilers	3.30
Pick men	3.30
Hoisting enginemen (including shafts and main trip haulages)	4.60
Man enginemen, shafts	4.60
Man enginemen, slopes	4.30
Main endless haulage	3.95
Fan enginemen (steam engine) Nos. 2 and 9	4.00
Fan enginemen, other large engines	3.80
Fan enginemen, small engines and motor fans	3.55
Screen and bank mechanic, (No. 2)	4.00
Others	3.80
Box car enginemen	3.75
Brook and reservoir pumpman	3.80
Compressor men (with oilers)	3.85
Compressor men (doing own oiling)	4.50
Compressor men, oilers	2.85
Head stokers	4.00
Stokers	3.80
Ash wheelers and coal to fires	3.40
Convey men	3.70
Machinists, 1st grade	4.00
Machinists, 2nd grade	4.00
Machinists, apprentices (boys)	2.80
Electricians	4.05
Smiths, 1st grade	4.30
Smiths, 2nd grade	4.00
Smiths' helpers	3.40
Carpenters, 1st class	4.05
Tubmen and 2nd class carpenters	3.80
Masons	5.60
Masons' helpers	3.25
Teamsters (double team)	3.50

Teamsters (single team)	3.40
Stablemen, (per month)	110.00
Washhouse and boiler tenders	3.50
Washhouse tender only	3.25
Lamp room men (monthly) No. 2	120.00
Lamp room men (others)	100.00
Lamp room men (daily)	3.80
Lamp room boys	2.80
Laborers	3.25

Underground

Examiners and shot firers (by night)	4.50
Examiners and shot firers (by day)	4.25
Boss drivers	4.00

## Nationalization of Mines

The King's Speech at the opening of the Houses of Parliament in London recently forecasted legislation for the acquirement by the State of the coal royalties in Britain, designed to settle the questions affecting the coal industry on "an enduring basis." Mr. Wm. Brace, representing the Miners' Federation, moved an amendment to the reply to the speech from the Throne regretting "the absence of any proposal to nationalize the coal mines of the country along the lines recommended by the majority of the members of the Royal Commission on the Coal Industry." Mr. Lloyd George, in the discussion which followed Mr. Brace's motion definitely aligned himself and his associates against nationalization of coal mines as understood by Br. Brace, and with the genius to epitomize a situation which marks this distinguished tribune of the people, said it was impossible to have nationalization without bureaucracy. Herein we believe Mr. Lloyd George has summed up the main objections to nationalization, and to a freedom loving nation that has so long submitted to the whims of "Dora" the mere mention of bureaucracy is nauseating.

The miners' leaders have not as yet given any satisfactory reason for their advocacy of nationalization of the coal industry, and the only thing that stands out with any clearness from their arguments is their determination not to work for private profit. As to this the miners' leaders are very frank, and their point of view is understandable, being, in fact, nothing more than the ancient human failing of envy. There is no academic reason favouring the nationalization of the coal mines that is not equally applicable to every other industry in which private profit constitutes the spur and original incentive, and in what branch of human endeavour is not personal betterment the compelling power?

The British people is not in the mood to allow itself to be mulcted for the preferential treatment of one class of men, whose strength consists in their employment in the production of an essential article, but not in any intrinsic personal merit or deserving claim to be more favored than other men. During the railway strike in Britain last summer, the country discovered that in a good many respects railway transportation was unsuited to British conditions, and that a combination of short distances, good highways and motor-lorries provided a system of transportation that was found upon trial to have superseded railway transport of such com-

modities as fish, milk and vegetables. As a result of this strike, the railwaymen found the importance of their occupation was diminished, and the country breathed more easily when it found itself emancipated from the demands of men who took an undue advantage of the necessary and specialized character of their employment.

It is probable that if the miners strike in order to compel Parliament to enact a nationalization law for coal mines that similar disillusionment awaits them and their leaders, by reason of the essential unfairness of their policy, which, baldly expressed, is that because the miners are strongly organized and produce a commodity that is the life-blood of Britain's internal industry and her export and shipping trades, then the miners must be given preferential treatment. No matter how disguised the proposals of the miners' leaders may be by their presentation, they will be found when stripped of their verbiage to be based upon envy and greed.

### EN PASSANT.

There is scarcely a week that the newspapers do not contain the announcement of the destruction by fire of some factory, some historic building, church or school, and altogether too often it is stated "the loss is only partly covered by insurance." This matter has been previously mentioned in the "Journal," but since that date, construction costs have gone further upwards. A revision of insurance schedules by the average mining company will reveal a serious divergence between the amount of insurance cover and the actual cost of replacement today. The next thing that we shall hear about will not only be still higher building costs, but increased insurance premiums, and there is no time better than the present to put insurance schedules in order.

The past few months have been marked by an unusual number of earth tremors, one series, of unusual duration, being felt with alarming severity near Nanaimo, Vancouver Island. So far as can be gathered, however, no effect of this tremor was experienced underground in the coal mines of that district. According to Mr. Napier Denison, of the meteorological observatory at Victoria, V.I., the shock was the worst tremor recorded in that vicinity.

Previous records of earthquakes have tended to show

that the seismic wave is a surface one, not reaching far down into the earth's crust, and instances where deep underground workings in mines have been affected are rare, if not non-existent. It might prove of interest to the readers of the "Journal," if residents of the coal-mining districts which felt this western earthquake would communicate their experiences to our columns.

#### THE MINING SOCIETY OF NOVA SCOTIA.

The Annual General Meeting of the Mining Society of Nova Scotia is planned for May 4th and 5th, and will be held in Glace Bay.

The new officers for 1920 have been nominated as follows:—

President—A. J. Tonge, General Superintendent of Dominion Dominion Coal Company.

First Vice-President—Geo. D. Macdougall, Chief Engineer of the Nova Scotia Steel & Coal Co.

2nd Vice-President—Charles M. Odell, Resident Engineer, Dominion Coal Company.

The retiring president is Colonel Thomas Cantley, Chairman of the Board of the Scotia Company.

Arrangements are being made for excursions to the collieries and to the neighbouring steel works.

This is the first time that the Mining Society's Meeting has been held in the colliery town of Glace Bay. The Dominion Coal Company will place its Officials' Club Rooms and the Committee Room at the disposal of the Society for the meetings.

Later announcement will be made of the programme and papers.

#### MINING SOCIETY OF NOVA SCOTIA DEPLORES INADEQUATE SALARIES PAID TO GEOLOGISTS.

At a recent meeting of Council of the Mining Society of Nova Scotia the following resolution was adopted and forwarded to Ottawa:—

"It has come to the notice of the Council of the Mining Society of Nova Scotia that owing to the inadequate salaries paid by the Survey and Mines Branch of the Geological Department, some of the staff have been forced to resign. In the interest of the mining industry we wish to protest against the scale of salaries now being paid to such highly trained technical men whose services to the country are of such value. We would urge that steps be taken immediately to make the salaries paid sufficient to attract and retain for the service a class of men of the standard formerly associated with the work of the Department."

#### MINING AND MINERAL PROSPECTS IN NORTHERN ALBERTA

The Government of Manitoba has issued a well-prepared and beautifully illustrated pamphlet, written by Dr. R. C. Wallace, the Commissioner for Northern Manitoba, in which the intending settler, prospector or investor can find up-to-date and accurate information on all that relates to mines and minerals in this interesting and promising country. The work deals with the geological features, the history of mining development, the metallic and non-metallic deposits and the economic situation. A complete bibliography is appended and a synopsis of the regulations governing mineral rights. This is publicity of the right kind, emanating from accurate sources, and is in every way commendable.

#### OBITUARY.

##### Capt. David Kyle, M.C.

We regret to publish the announcement of the sudden death from pneumonia, following influenza, of Captain David Kyle, M.C., Vice-President and a Director of the Algoma Steel Corporation, at the early age of thirty-six years.

Mr. Kyle was born in Scotland, and came to the Sault in 1910 as engineer in charge of the construction of the Merchant Mill, and was later in charge of the erection of the gas engines. When that work was completed, he joined the staff of the Steel Plant, and was placed in charge of maintenance.

In 1912 he was made General Superintendent of operations, and in the Autumn of 1914 left the service of the company to go overseas, where he won the Military Cross. In 1917, by special arrangement with the military authorities in London, Captain Kyle was allowed to return to Canada, and again take his place in the executive offices of the Steel Company. Two years later, when Mr. Franz came back to the Sault from Cleveland, Captain Kyle was elected a director and made vice-president of the company.

Captain Kyle had no relatives in Canada. The regard in which Captain Kyle was held by his business associates and the officials of the Algoma Steel Corporation, is a sufficient testimony to his engineering ability. He was an ardent sportsman, and took a lively interest in the local football and cricket matches.

##### R. H. Brown.

With the passing of Mr. R. H. Brown, of Halifax, is severed a link with past history of the coal and associated steel industries of Nova Scotia.

Mr. Brown was the son of Richard Brown, who came from England to be the Manager of the General Mining Association in 1826 and continued in that position until 1864, when he retired and was succeeded by his son, who administered the association's affairs until its properties were acquired by the Nova Scotia Steel Company in 1900. Mr. Brown continued to act as manager for the new company until 1901, when he retired from active management. A continuous administration by father and son for seventy-five years is worthy of record.

No two single men have left a more enduring mark on the coal industry of Nova Scotia than Richard Brown and his son. Both were men of great industry and of little personal display.

Mr. R. H. Brown was President of the Mortgage Corporation of Nova Scotia, and was at the office when he was seized by a fatal illness at the age of eighty-two years. Notwithstanding his age, Mr. Brown was an active man and usually walked to his appointments. He was a modest, kindly man, and generous in his support of good causes.

In recognition of his long-standing in the mining profession, and of his length of membership, Mr. Brown was a few years ago made an Honorary Member of the Mining Society of Nova Scotia. Under his direction some of the earliest submarine coal-mining in Nova Scotia was undertaken, and several historical papers by Mr. Brown are included in the Transactions of the Mining Society. With his death comes a break in the long tradition that links coal-mining in Nova Scotia to such notable names of past years as the older and younger Haliburton, Lyell, Dawson, Logan, and last, but not least in the regard of students of the early days of Nova Scotian geology and mining, Richard Brown, the elder.

## Molybdenite Deposits of Lacorne Township, Abitibi, P.Q.

By ADHEMAR MAILHOT, Professor of Geology at  
l'Ecole Polytechnique, Montreal.

In accordance with the instruction from Mr. Theo. C. Denis, Superintendent of Mines of Quebec, the writer spent a few days during August last on the Eureka property in Lacorne Township, County Temiskaming, making a geological examination of the molybdenite deposits.

The area is located at the south-west corner of Lacorne Township. The nearest railway station is Amos on the National Transcontinental Railway, 433 miles west of the city of Quebec and 141 miles east of Cochrane, Ontario. From Amos the route to the district follows the Harricana River, on which unobstructed navigation is possible for gasoline launches and small river steamers from the railway crossing to the landing on the Askigwaj River, about two miles from the Eureka mine. The distance from Amos to the landing is about 30 miles, and within this distance the river locally expands into three lakes which are known respectively from north to south as lake Figury (or Peter Brown), lake La Motte (or Jack Pine), and lake Malartic (or Seal's Home). The stretch of river between lake Malartic and lake De-Montigny is locally called the Askigwaj River. The landing to the mine is situated about two miles beyond lake Malartic on the Askigwaj River. A concession road two miles long, partly built, leads from the landing to the mine.

The country along the water route is of low relief and heavily covered with stratified clay deposited in the bottom of a very extensive lake that, geologically speaking, recently occupied the region of the "Clay Belt" during the recession of the glacial ice-sheet. The valley of the Harricana River is well suited for farm lands and the Quebec Government, for the last five years, has been encouraging colonization in that district. The region under consideration is situated just north of the height of lands and drains into James Bay through the string of lakes and the Harricana River.

### General Geology.

The General geology of the region as outlined by Dr. J. A. Bancroft, in his report to the Bureau of Mines of Quebec in 1912, indicates that the oldest rocks within this region belong to the Keewatin. They comprise a complex of igneous rocks both extrusive and intrusive, together with bands of highly altered sedimentary rocks. These ancient sedimentary rocks are represented on the property of the Eureka mine by the bands of micaceous schistous rocks which have been cut by granite masses and pegmatite veins. These Keewatin rocks occupy a vast area along the Harricana River from beyond the town of Amos to the north to the Thompson River which flows into Long Lake to the south.

The Keewatin rocks were invaded later by huge masses of acid rocks through all this part of the country. These intrusions belong to the Laurentian. The rocks are mainly granites and rock types which have been evolved from the differentiation of a granitoid magma. The hills of the northern and central parts of the La Motte Township, and the prominent hills of the central and southern portions of Lacorne Township are composed of granite. The prevalent type is a quartzose biotite granite frequently displaying pegmatite characteristics, as is the case for the pegmatite dykes in which molybdenite is found on the Eureka property, associated with sericite and a little pyrite. At the mine the main batholithic granite mass has penetrated the Keewatin in the form of apophyses and tongues. The pegmatite dykes are clearly subsequent to the granite intrusion, and represent the last stage of the igneous activity in this region. The pegmatite matter was accompanied by sulphurous vapours which have impregnated the nests of sericite in the dykes, and the vapours seem to have also penetrated into the pegmatite itself while it was still in a viscous state.

*Veins Nos. 1 and 1A, Eureka Molybdenite Property.*

### Economic Geology.

The development and prospecting work has been done to date on the two claims forming the southern part of lots 1 and 2, range 1, Lacorne Township, forming an area of 70 acres. Moreover, the work has been limited to the parts of these lots where the superficial layer of loose material was sufficiently thin to reach the rock with the least cost.

In the cleared part a series of pegmatite veins were uncovered along the contact between a biotite granite and a mica schist; some of these pegmatite veins cut the mica schist, but there exist always tongues of granite at the spots where the mineralization is more abundant. The presence of granite has an influence upon the richness of the mineralization.

The veins have a general direction N. 70 to 80° E. and dip 40 to 70° to the south. They constitute a series of close parallel veins disposed in echelons over a cross distance of about 600 feet. Their width varies from a few inches to several feet.

Test pits have been put down on most of the veins and on vein No. 4A a shaft 7 x 8 feet has been sunk in its wider portion to a depth of 45 feet with the inclination of the dip. The shaft was full of water at the date of my visit. In this vein the mineralization took place in the sericite which forms lenticular masses along fissures in the pegmatite. These fissures are irregularly distributed in the pegmatite from the centre to the walls. The quartz and the feldspar of this pegmatite vein are also well impregnated with molybdenite, and then this mineral forms crystals and pockets having larger size than those disseminated through the sericite where the molybdenite is fine grained.

The description of the mineralization of vein No. 4A can be applied to all the veins of the property. Prospecting trenches made upon different veins show the same order of mineralization.

Besides these big veins there exists a distinct series of small stringers of variable direction. The veins Nos. 8, 9, 11, and 15 on the plan belong to that group. Their widths vary from 1 inch to 15 inches and molybdenite is frequently accompanied by fluorite and

molybdenite. Whenever these stringers cut the black mica schist, they contain no sericite, but only quartz and Feldspar; on the other hand when they cut the granite the molybdenite is disseminated through the sericite which is very abundant.

### Development and Prospecting Work.

The development work on the property consists of trenches and a shaft sunk to a depth of 45 feet. Seventeen veins had been discovered at the date of my visit on the stripped surface, and it is reported that prospecting has uncovered a certain number of promising veins on the north-east corner of Malartic Township just south of the main workings.

We give hereafter the description of the work done on these veins individually.

**Vein No. 1.**—This vein has a length of 110 feet with an average width of 4 feet. At the western end the vein is 6 feet wide and it narrows down towards the east to 2½ feet. This vein has been partially trenched. The vein material is formed of quartz, feldspar and sericite, through which molybdenite is disseminated, and a little tourmaline.

**Vein No. 2.**—The length is 130 feet, the width averages 3 feet. Two rock excavations have been made, respectively 5 and 6 feet deep. The minerals are the same as those of vein No. 1.

**Veins Nos. 4 and 4A.**—These two veins have a parallel direction and can be followed over a distance of 350 feet. At the western end these veins are separated by a band of schist having a width of two feet, and this band widens to about 15 feet towards the east. Their width varies. Vein No. 4 is 2½ to 4 feet. Vein No. 4A has a constant width of about 5 feet. Towards the western end a shaft has been sunk to 45 feet on vein No. 4A. In the shaft the vein is 3 to 5 feet wide. At the bottom it is said to have 2½ feet. (The shaft was full of water at the date of my visit). The sericite is abundant in the quartz and the molybdenite is fairly well disseminated through the sericite. Quartz and feldspar are also mineralised with molybdenite. Tourmaline is not abundant.

*Piles of Picked Ore from Vein No. 1.*

**Vein No. 5A.**—Lenticular vein. The hanging wall is granite and the foot wall is schist. A trench 60 ft. long has been made to uncover the vein, and a rock excavation 5 feet deep. The quartz is different from the other veins, being of a bluish black color and vitreous. The sericite is abundant carrying disseminated molybdenite.

**Vein No. 5A.**—This vein is cutting alternate bands of schist and granite. Length 80 feet, width 10 to 18 inches. The vein matter is pegmatite containing abundant sericite carrying much disseminated molybdenite. A trench 100 feet long was made to uncover the vein.

**Vein No. 6.**—Cutting alternate bands of schist and granite. The width varies from 8 inches to 5½ feet. The vein has a lenticular form, with its maximum width at the middle. The length uncovered by trenching is 200 feet. The vein carries much sericite with molybdenite and very little tourmaline. Two rock excavations have been made each 5 feet deep.

**Vein No. 7.**—Cutting alternate bands of granite and grey schist carrying pyrite. Length uncovered by trenching 300 feet. Four rock excavations have been made having each an average depth of 5 feet. This vein contains large pockets of tourmaline towards its western end. At this end the vein bifurcates in two other veins having each one foot in width, separated by a band of schist two feet wide. The average width of the main vein is about two feet.

There exist two small outcroppings north of vein No. 7, one has a width of 3 feet and the other 10 inches. These two outcroppings can be followed for a distance of about 50 feet each.

**Vein No. 8.**—Cutting alternate bands of schist and granite. Length 300 feet. Average width 18 inches. One rock excavation 5 feet deep. The vein is a pegmatite carrying tourmaline, sericite, molybdenite and a little pyrite. The grey schist contains also a little pyrite.

**Vein No. 9.**—Cutting alternate bands of schist and granite. Length 200 feet. Average width 2½ feet with a minimum of one foot. One rock excavation 5 feet deep. The vein is a pegmatite carrying tourmaline, sericite and molybdenite. The sericite is present in the form of nests facing the schist bands only.

**Vein No. 10.**—This vein is formed of a series or parallel stringers cutting the granite. The vein is uncovered for a distance of 60 feet. The vein matter is the pegmatite containing a little tourmaline, sericite and molybdenite.

**Vein No. 11.**—This vein cuts the grey schists following the bedding planes. It consists of two parallel stringers. Average width 10 inches. The minerals are: quartz, feldspar, fluorite, molybdenite, molybdenite with a few particles of tourmaline.

**Vein No. 14.**—Cutting the granite. Length uncovered 25 feet, width varying from 1 to 5½ feet. Minerals present are: quartz, feldspar, molybdenite and a little sericite.

**Vein No. 16.**—Cutting the schists towards the east and a dyke of quartz porphyry towards the west. Length 75 feet. Width varying from 6 to 15 inches. The minerals present are: quartz, feldspar, tourmaline and molybdenite. This last mineral is more abundant where the vein cuts the porphyry dyke. A rock excavation 12 feet long, 4 feet wide and 4 feet deep has been made. There is no sericite in the vein, as is the case in the other veins cutting the schists.

**Vein No. 17.**—Cutting the green and grey schists. Length uncovered by trenching is 75 feet. Its width varies from one inch to the east to 8 inches to the west. The vein pinches out towards the east. The minerals present are: quartz, feldspar, a little tourmaline and molybdenite.

*Vein No. 2, Eureka Molybdenite Property.*

Plan showing position of veins and mine buildings, Eureka Molybdenite Property, Lacorne Township, Que.

**AWARDS BY THE INSTITUTION OF MINING AND METALLURGY**

We are informed by the Secretary of the Institution of Mining and Metallurgy that the following awards have been made by the Council of the Institution of Mining and Metallurgy:

1. Gold Medal of the Institution (premier award) to Mr. H. Livingstone Sulman, M. Inst. M. M., in recognition of his contributions to Metallurgical Science with special reference to his work in the development of Flotation and its application to the recovery of minerals.

2. "The Consolidated Gold Fields of South Africa

Ltd., Gold Medal to Mr. William Henry Goodechild, M. Inst., M. M., for his papers on "The Economic Geology of the Insizwa Range" and "The Genesis of Igneous Ore Deposits"

3. "The Consolidated Gold Fields of South Africa Ltd.," Premium of Forty Guineas to Dr. Edward Thomas Mellor, H. Inst. M.M., for his paper on "The Conglomerates of the Witwatersrand"

The Gold Medal awarded to Mr. Sulman is the highest recognition in the power of the Institution to confer. The original and monumental nature of Mr. Sulman's treatise on flotation has been widely recognised.

## The Rice Lake Gold District, Manitoba

By REGINALD E. HORE

The Rice Lake Gold district, Manitoba, lies east of Lake Winnipeg, near the edge of the great area of Pre-Cambrian rocks which makes up such a large part of Northern Ontario and Northern Manitoba. It is only 120 miles from Winnipeg, but in country quite different from that of the prairie cities. It is not mountainous country by any means, but is rocky and wooded and poorly drained. It is attractive country to the trapper, but not to the agriculturalist. It is not yet developed by the miner. It is not traversed by railroads. It has no good waggon roads and few roads of any kind. In summer, it offers attractions to the venturesome, for its rivers and lakes make travel by canoes both possible and pleasant. In winter, dog teams are the chief motive power, but there are two winter roads on which horses may be used in travelling from the railways to the mines.

For mining purposes the winter brings advantages in the improved transportation facilities. There is now being taken into the district machinery and supplies for mines that will be practically cut off from the outside world during the summer. The canoe routes make good travelling for passengers and light freight; but are of very little use for heavy freighting, as the cost is in most cases prohibitive. In winter the cost of transporting material from the railway to the centre of present mining activity is about \$35 per ton. The route most used is from Riverton across Lake Winnipeg to Manigotagan and thence by a road to Rice Lake and thence to Gold Lake. There is a much shorter winter road from Mile 69 on the Canadian National Railway, Victoria Beach branch, but there has been much trouble with the muskeg portions of this road this winter. An early very heavy snowfall last October protected the muskeg from frost and made the road impossible for some time.

While the Rice Lake district is as close to Winnipeg as Muskoka lakes are to Toronto, the former trip takes about two days instead of three or four hours. Leaving Winnipeg in the afternoon, Riverton is reached at night. From Riverton to Manigotagan is only about 40 miles, but it generally takes about a day to cross the ice. There is a stopping place at Hecla, a village on one of the islands. It is a cold trip in mid-winter, but can be made with a fair degree of comfort by using a canvas covered sleigh or "caloose" heated by a small stove. The fishermen on the lake, most of them Icelanders use snow plows to keep a road open when the snow gets deep. These plows have been utilized in taking freight across for the mines.

At Manigotagan there is another stopping place and stables. It is advisable to spend the night here unless fresh horses are available. There are, however, two cabins at twelve mile intervals along the road to the mining district which afford possible, though not very comfortable, shelter.

From Manigotagan, or Bad Throat, settlement the road runs eastward. It follows the north bank of the Manigotagan river for a short distance and then crosses to the valley of the Wanipigon, or Hole, river. It follows this river for several miles, passing south of Wanipigon lake and thence to Horseshoe lake. From here it runs south to Rice Lake and then southeasterly to Gold lake and then on to Long lake.

Most of the present activity is in the vicinity of Gold lake where the Gold Pan mine is situated. This property has attracted much attention because of the richness of its ore. The deposit was partially developed a few years ago and very high grade ore encountered in places. Development was chiefly confined to the immediate vicinity of the shaft, which is located where a diabase dyke crosses the vein.

The Gold Pan vein is nearly vertical and strikes northwesterly. It is said to be traceable on the surface for over 3000 ft. crossing the Gold Pan and Gold Seal claims and extending in Gold Pan Extension on the northwest. Near the Gold Pan shaft the vein is in feldspar porphyry and grey felsite.

Arrangements have been made to resume work at the Gold Pan. The mine has been dewatered and development should soon be in progress again. Some well-known Winnipeg business men are now identified with the enterprise. Mr. Gordon McTavish, secretary of the company, is taking an active part in the work. Mr. J. B. Tyrrell has been engaged as consulting engineer. Mr. Frank Phillips is mine superintendent.

Near the Gold Pan are the Moose, Brooklyn and Gold Pan Extension. Some development was done on the Moose a few years ago under the management of F. M. Connell, Jack Redington being in charge at the mine. Development at the Brooklyn was begun early in 1919. A. L. Anderson being in charge and Dan MacDonald mine foreman. Work at the Pan Extension is to be begun shortly. Other properties in the immediate vicinity will doubtless receive attention this year. The rocks in this area are well exposed. Between the rock outcrops, however, there are muskegs that effectually hide portions of the veins.

The pioneer property of the district is the Gabrielle, which is situated on Rice Lake. This property was partially developed a few years ago, but has been recently idle. Recently arrangements have been made for the resumption of development work at the Gabrielle. Mr. J. B. Tyrrell has reported favorably on it and has been retained to advise on the development work.

East of Wanipigon lake and north of the river of that name is the Bellevue mine. This property has been partially developed and is equipped with a 20-stamp mill. It is at present idle, but it is understood that development work here is being planned.

Further south in the vicinity of Long lake, gold has been discovered on several properties. Further east also, numerous finds have been made. There is undoubtedly a large promising field here for the prospector.

The Rice Lake district warrants more attention than it is at present getting from the Dominion and Provincial Governments. In spite of its nearness to the business centre of Manitoba, it is without reasonable transportation facilities. Its development depends of course primarily on the nature of the gold deposits, and will come in the course of time if they prove so good that a profit can be made in spite of the high cost. But under present conditions the exploration must continue to be slow. A little encouragement on the part of the Governments might make the difference between an idle wilderness and a thriving industry east of Lake Winnipeg in the immediate future.

### RARE METALS IN SUDBURY NICKEL ORES.

The recently issued report of the Ontario Bureau of Mines again calls attention to the fact that the ores mined in Sudbury district for their nickel and copper content contain important quantities of rare and precious metals: platinum, palladium, rhodium, gold and silver. The actual amount of these metals in the ore mined is not reported. It is known that some is recovered in the refineries, but much of the platinum and palladium is not. According to the Royal Ontario Nickel Commission the average precious and rare metal contents of the Copper Cliff smelter mattes for the 3 years ending 1915 was 0.1 oz. platinum, 0.15 oz. palladium, 0.05 oz. gold and 1.75 silver per ton. At this rate the mattes produced by the company in the year 1916 would contain 5,640 oz. platinum, 8,460 oz. palladium 2,820 oz. gold and 98,709 oz. silver. The recovery reported for that year was 3,495 oz. gold, 110,285 oz. silver, 1,016 oz. platinum, 1,335 oz. palladium and 257 oz. rhodium. There would naturally be some difference in recovery from the estimated contents of the matte; but the figures indicate that a large part of the rare metals was lost, supposedly passing into the nickel.

Concerning the recovery made by the other large nickel producer, whose refinery is in Wales, there is an almost entire lack of information. It is understood that the mattes produced at the Coniston Smelter are richer in precious and rare metals than those from Copper Cliff. It is also understood that a more complete recovery is made in the Wales refinery than in that at Hoboken, but the British operators do not report the recovery made. Assays of samples of the Mond Company's matte made on behalf of the Ontario Nickel Commission indicate that it is considerably richer in the platinum group metals than is that produced by the International Nickel Co.

It may be taken for granted that the operating companies recover as much of these rare metals from their mattes as their processes of refining permits. The Mond company's process is well adapted for recovery of the rare metals, but the Orford process is evidently not. In the latter process much of the platinum and palladium goes into the nickel and Monel metal and is doubtless left there because it does not pay to take it out. The announcement therefore that there appears to be a possibility of adapting electrolytic methods to the refining of nickel at certain stages of the Orford process is an important one. If all the rare metals can be economically saved the production of platinum and palladium from Sudbury ores will be much larger in the future. We do not know exactly what it is at present, but we do know that there is a possibility of greatly increasing it.

The electrolytic process referred to in the Bureau of Mines report is one devised by Geo A. Guess, professor of metallurgy at the University of Toronto. Prof. Guess has found that if an anode of crude nickel which may contain copper and iron, is electrolyzed in a bath of nickel sulphate in which is suspended finely divided calcium carbonate, there is deposited on the cathode, which is suspended in a sack diaphragm, metallic nickel practically free from copper and iron. The copper is precipitated as a double basic sulphate of copper and nickel, which is quite insoluble. The removal of most of the copper of the matte is an obvious preliminary step to the Guess electrolytic pro-

cess. This could be done as at present by fusion with salt cake and coke.

If such a process as Prof. Guess has devised were in use, the recovery of rare metals from Sudbury ores would be a comparatively simple matter and Canada would take its proper place as an important producer of palladium and platinum, metals which command prices several times that of gold.

As pointed out by the Ontario Nickel Commission the importance of the precious and rare metals in the ores mined in the Sudbury district is even yet practically unrecognized. The Commissioners say: "Anything which can be done to encourage the better recovery of these metals, or enforce the use of refining processes which recover them, would be justifiable, and particularly so now that platinum and palladium are increasingly required and stand at as high a price." It is to be hoped therefore that the Guess process will be given a fair trial. Some progress has already been made in testing it at Copper Cliff. The International Nickel Company has only recently completed a \$5,000,000 refinery at Port Colborne and will perhaps be content with its process until it has very convincing evidence of possible improvements. The company has however shown readiness to scrap plant at Copper Cliff when better methods were found and if convinced that the Guess process can be used advantageously there will doubtless be changes made at Port Colborne.—R.E.H.

### NOVA SCOTIA NOTES.

The production of the Dominion Coal Company's Glace Bay Collieries during January was as under:

Dominion No. 1	30,021
Dominion No. 2	50,459
Dominion No. 4	26,216
Dominion No. 5	8,615
Dominion No. 6	21,462
Dominion No. 9	25,831
Dominion No. 10	10,513
Dominion No. 11	15,110
Dominion No. 12	16,790
Dominion No. 14	15,189
Dominion No. 15	12,335
Dominion No. 16	12,847
Dominion No. 17	928
Dominion No. 21	13,620
Dominion No. 22	14,135
Dominion No. 24	1,374
Total	275,445

An interesting feature of the individual outputs is the inclusion of two new producers, namely, No. 17 Colliery, and No. 24. No. 24 is an opening on the Emery Seam, and its production, added to that of Nos. 10 and 11, the other Emery Seam mines gives a total of almost 27,000 tons of coal from that seam, or approximately ten per cent of the general production.

Production in January, 1919, was 276,036 tons, and in January, 1919, 273,929 tons. The mines worked steadily throughout the month, and the output obtained represents about the present capacity of the collieries. The unusually low temperatures, and the lack of rain which marked most of December and all January in the district, caused a shortage of water which interfered to some extent with production.

It is reported that a resumption of operations at the Broughton Colliery of the Cape Breton Coal, Iron and

Railway Company is contemplated. This mine has not produced since early in the war period. This property has had a most unfortunate history. The capital invested was almost entirely English, and the representative of the bondholders is Wm. Hanson & Sons of Montreal. A shipping-pier near Mira Bay was projected to load the coal from this colliery into vessels, and heavy expenditure was incurred on the construction of a railway from the mine to the pier site, which involved some heavy cutting and filling, but the project was never completed.

The Anglo-Newfoundland Co. at New Campbellton has completed the dredging at the pier in Kelly's Cove, and has now a sufficient depth for loading vessels. The production during 1919 was about 12,000 tons, and it expected to market 50,000 tons in 1920. Work has hitherto been carried on in the Four Foot Seam, but another seam, which was worked by the former operators, is now in process of being re-opened, and a new bankhead and other necessary equipment is being provided in readiness for shipping when the season opens. This point of supply will attract considerable schooner business, as it is accessible through the Gut of Canso via St. Peter's Canal and the Bras d'Or Lakes, giving a sheltered route for Prince Edward Island schooners, and the likelihood of quick despatch. All coal from this mine must be forwarded by water.

### TORONTO NOTES

(From our Toronto correspondent)

Considerable interest was displayed in Toronto at the announcement from Prescott that coal had been discovered in the new quarry being opened at Old Windmill Point, east of Prescott. Samples taken forty feet below the surface have been forwarded for analysis. Those on the claim they have struck a rich vein of anthracite.

Professor A. P. Coleman, of the University of Toronto stated that he did not think that there was any anthracite, but anthraxolite may have been found. "Anthraxolite is a valuable mineral and burns like anthracite," he said, "but it has never been found in sufficient quantities to be worth working. Generally the seams are an inch or so thick, and are practically valueless for commercial purposes. The largest deposits have been found in the Sudbury district, but even there they have never been put to any commercial uses."

According to reports from Huntsville there are prospects of a big mining boom there this spring. It is stated that Israel Ward, a local mineralogist, in association with two prominent mine experts from Cobalt, closed an option on a piece of mining property three miles east of Huntsville. They are arranging to continue development. Radium, in quantities which promise to make the property one of huge value, is said to have been discovered and platinum, gold and silver are said to be there in paying quantities. Reports from Huntsville say that the options obtained are valued into the millions.

At the annual meeting of the directors of the Dome Lake Mining and Milling Company, held in Toronto this week the retiring directors were re-elected with-

out change. Drifting is being continued on the 600-foot level, with a view to picking up the ore bodies indicated by the diamond drilling. This indicates the presence of two layers, one 60 feet in length and assaying \$19.00 a ton, and the other 84 feet in width, assaying \$11.20. The mill treated 4,433 tons of ore, containing \$30,322. The net recovery was \$23,832, an extraction of 78.85 per cent. The mill was only in operation three months owing to the fire. The broken ore reserves are shown at 2,422 tons, which at \$89.70 a ton are valued at \$23,424.

Representatives of all classes of the mining industry have for the past few days been conferring with the view to organization and this week the proposition took concrete form in the formation of the Ontario Mining Association, the objects of which will be to endeavor to stabilize and look after the interests of the industry generally. The organization is a development of the Northern Ontario Mine Owners Association. The present organization has been organized on a broad basis and takes in many big concerns. Those at the organization meeting included men who are prominent in the iron, steel, nickel, silver gold and copper industries and after some discussion it was decided to form a company without share capital and to maintain an office in Toronto in charge of a salaried secretary.

The officers chosen were as follows: President A. D. Miles, of the International Nickel Co.; First Vice-President, F. L. Culver, President and General Manager of the Beaver and Kirkland Lake gold mines; Second-Vice-President, G. C. Bateman, General Manager of the La Rose Mine; Secretary, B. Neilly, M.E. A board of Directors was chosen in which are representatives of the industry from all parts of the Province.

### Prince Rupert, B. C.

The installation of a Smelter for the treatment of silver-lead-gold ores at Port Edward, near Prince Rupert, provided a site can be secured from the townsite and the Provincial Government is said to be assured by George B. McMillan and Colonel Cox, who represent the Company interested. Mr. McMillan has told the Prince Rupert Board of Trade that, after an investigation of six or seven months, they were satisfied that, when the Smelter is ready there will be a sufficient tonnage of ore available to keep it in continuous operation. They probably will be prepared to commence taking ore, it was said, within the year. There is more than enough water at Port Edward both for the electrolytic zinc process and the smelter and, as the Company expects to have several of its own boats engaged in the transport of ore, it was essential to obtain a suitable waterfront site.

A delegation from Prince Rupert recently waited on members of the Provincial Government advocating the adoption of a policy having as its object the establishment of a metal refinery in British Columbia. Chief among the arguments in support of the petition is that of the necessity of doing everything possible to redress just the trade balance. With copper going out of the country for refinement to be re-purchased in the finished manufactured article by Canada one serious obstacle to the removal of the present intolerable condition was apparent.

# Our Northern Ontario Letter

## THE SILVER MINES

Receiving from \$1.35 to \$1.37 an ounce for spot silver in New York, plus a premium of some 15 per cent on New York funds, the Nipissing and the Mining Corporation of Canada were last week able to ship some 401,000 ounces of silver bullion which may be estimated at a value of upwards of \$622,000. The week's shipments rank among the most valuable ever sent out from Cobalt.

Recent bullion shipments have all been to the Far East, purchased in New York on China's account. The demand that has arisen in the Far East is said to be exceedingly keen. Taking this into consideration, and in view of the shortage of output all over the world, the metal authorities continue to believe that no material recession in quotations may be looked for.

The achievements of such leading mines as the Nipissing, Kerr Lake and Mining Corporation during the opening month of the year, and as shown in official figures, is pointed to locally as a fair indication of the general prosperity in all parts of the camp. The near-demoralization of finances as indicated in the abnormal exchange rates is a factor that is going far to swell the treasuries of the precious metal mining companies. "It is like finding the equivalent to 15 per cent of our gross production," one operator stated to your correspondent. The importance of this may thus be realized. The added revenue entails no additional expense.

At the Chambers-Ferland, operations are being conducted successfully at the lower levels, and conditions which were formerly believed to not extend to that depth have now been found to do so with the result that a substantial tonnage of low grade ore is being developed. In the south cross-cut between the Nipissing and the LaRose nothing of material importance has been discovered. The work, however, is being continued.

Max Morgenstern, a minority shareholder in the Buffalo Mines has made application to restrain the Mining Corporation from proceeding with its plans in connection with the Buffalo mine, following the recent purchase of control. Details as to the action have not been announced officially. It will be recalled that the Mining Corporation bought out Mr. Charles Denison, former holder of about 75 per cent interest in the Buffalo.

During the month of January the Nipissing Mine produced silver at the rate of \$10,626.16 every twenty-four hours. The large output was more or less of a surprise for the reason that the first week or so of the new year is usually taken advantage of as a time to clean-up following the close of the past year.

In his regular monthly report to the president and directors, Hugo Park, manager, states:

"During the month of January the company mined ore of an estimated value of \$329,401 and shipped bullion from Nipissing and custom ores of an estimated net value of \$134,199.

"Underground development and production was satisfactory for the month, notwithstanding that it was a short period, due to the annual clean-up at the mills and general repair work around the various shafts.

"Development work on vein 544, at 73 shaft, was in the main encouraging. The vein is erratic, both in width and assay. At times it has been as high as seven inches in width and assaying from a few hundred to several thousand ounces. Other work at 73 shaft continued to be favorable.

"Development work on vein 109 from a winze level 90 feet below the tunnel gave good results during the month. Two

raises are developing a satisfactory ore shoot. One of the raises shows two inch vein assaying 4,000 ounces at the present time. Drifting on vein 99 at the lower level was also satisfactory during the month. The face of this drift is now showing one inch of ore assaying several thousand ounces to the ton.

"The low grade mill treated 5,839 tons. The high grade plant treated 98 tons. The refinery shipped 100,902 fine ounces of bullion.

"The following is an estimate of production for the month of January:—

Washing plant . . . . .	\$143,370
Low grade mill . . . . .	186,031
Total . . . . .	\$329,401"

The Miners' Union of this district has under contemplation a scheme to take a referendum of all its members for the purpose of determining whether or not the organization will break away from the International, and as to the choosing of a future course. Opinion seems to lean strongly in favor of forming a district union, according to advice to your correspondent from representative labor leaders. The present movement has only to do with organization, there being no dispute involved as regards wages and conditions in Cobalt.

The Cobalt Branch of the G.W.V.A. have passed a resolution urging the Minister of Mines to select a returned man to fill the vacancy on the staff of Ontario Mining Inspectors caused by the death last fall of Mr. A. H. Brown. It is urged that the appointment be based on merit.

In the Gowganda district the usual activity continues. The deal for the Dodds property at Leroy Lake has finally been closed and it is proposed to commence exploration work within the next few weeks.

Arrangements have been made to begin work on the Kilpatrick property, in the Miller Lake district, Gowganda. The deal involving the Miller Lake Everett with the Kilpatrick is still pending. Harry Holland, one of the original members of the Borden Battery, will take charge of work on the Kilpatrick.

The shaft on the Kells property in the township of Corkhill has reached a depth of about 60 feet. Drifting operations are being carried on at this depth, pending the completion of the installation of a compressor. It is stated that silver values continue to the present high.

The Famous Orr case, having to do with a fight instituted by minority shareholders of the Orr Gold Mines against the Kirkland-Porphry Company has drawn to a close, as is shown in the following summary of and extracts from a judgment of Mr. Justice Sutherland:—

"It is said that Wettlaufer and Wills held all the bonds and Company that according to the terms of the agreement of September 15th, 1918, that Wettlaufer would be getting more for his stock in the Orr Company than would the minority shareholders and if the agreement were carried out would be in a more secure and preferential condition.

"It is said that Wettlaufer and Wills held all the bonds of the Kirkland Company except those remaining in the company's hands unissued. It is evident that the sale under the terms of the agreement by the Orr Company to the Kirkland Company would be a sale where a Company with valuable property would be transferring to a company with no property of proved value and taking pay in stock of the latter company share but subject to first charge against all the assets and property of the latter company, including the property proposed to be conveyed to it by the Orr Company.

The agreement between Wettlaufer and Kirkland is unfair and oppressive to the minority shareholders of the Orr Company and one which the Kirkland Company holding a

majority of the stock therein could not properly make. The proposed sale by the Orr Company is a fraud on its minority shareholders and those in control of the Company were acting oppressively and in such a way that the minority shareholders will not get as much for their shares as the majority.

The sale is in reality a sale by the vendor to himself, the sale having been previously agreed upon. Those in control of the Company were dummy directors and had no alternative than to act as their masters dictated. The majority shareholders cannot dispose of the assets of the Company for their own use and benefit.

The minutes stating that sufficient work had been done to show that \$2,000,000 of ore was in sight and then further stating that the company was not in a position to develop the property do not seem very reasonable nor does the statement that consideration on the basis of share for share, had been carefully considered. I am of the opinion that the price was wholly inadequate.

The agreement of September 5th, 1918, says the old directors of the Orr Company were to resign and the new directors were to be nominees of Kirkland Company and were to enter into an equitable agreement with the Kirkland Co. to sell them the assets of the Orr Company. The agreement was certainly far from equitable.

If the directors of the Orr Company wished to be fair and reasonable when valuable ore was found they would have called together a meeting of shareholders to discuss the matter. This was not done, moreover the notice calling the meeting of shareholders to ratify the by-law and option disclosed as little as possible of the transaction.

The plaintiff in each action will therefore have judgment perpetually restraining the defendant companies from carrying out the proposed sale with costs."

The annual report on the Temiskaming Company's property, just issued shows that production during 1919 amounted to 243,037 ounces of silver, as compared with 420,078 ounces in the previous year. Labor troubles at Cobalt were an unfavorable feature of the mine's operations.

Earnings were \$295,252, compared with \$425,014. The surplus on mining account was \$70,448 compared with \$135,394 in 1918. The surplus account had a balance of \$922,738 at the end of 1918, which with last year's surplus made \$993,186. Depreciation amounting to \$29,170 was provided for, and a dividend of \$10,000 was paid, leaving \$864,016 in surplus account at the end of 1919. A pocket of high grade ore was found in the middle of April on the Gans property, and other rich patches in the same area gave encouragement and stimulated further exploration in the older workings of the property. Development work for the year amounted to 2283 feet. Ore production for the year had net value of \$283,623, and shipments had a value of \$225,596. Costs averaged \$15.61 per ton milled.

#### Increasing Mine's Life

General Manager Gordon F. Dickson in his report, says: "The results of the year's work may be viewed with satisfaction. The discovery of rich ore in the southern extension of the vein system in the Gans area is an important feature, and one that opens up possibilities of increasing the length of life of the mine. Although the ore so far proved in the vicinity has been limited in quantity, there is scope for further exploration, and from the development scheme at present in view of favorable results may be reasonably anticipated. The tonnage of milling ore produced during the last few months from the older workings of the property has been the means of maintaining operation on a profit earning basis. The active development program at present in progress gives encouragement for the belief that further additions of profitable ore may be rediscovered.

#### Aided by Discoveries

President J. P. Bickell, in his report, says: "The high average price of silver has enabled the profitable working of low grade deposits, thereby permitting the execution of an extensive development and exploration scheme, which otherwise would have been impossible without drawing upon the company's cash reserves. In process of this development work, occasional patches of high-grade ore were encountered

To avoid possible misconceptions, no official statements were issued at the time, pending sufficient development to warrant a reliable estimate of their importance. Subsequent results proved to be the wiser course, as these occurrences were all of minor importance.

#### No Assurance of Dividends

"The present outlook does not permit of any assurance

being given with regard to future dividends, and the disbursement of 4 per cent. paid January 31 this year should not be considered as the forerunner of regular dividend payments. The future policy in this respect depends entirely on developments and the maintenance of the company's sound financial position."

Assets of the company are now given as \$3,653,256, compared with \$3,893,463 a year ago.

#### MINING PERSONALS.

Harry Darling, manager of the Porcupine Crown mine, has returned to the North after an absence of more than two years. Mr. Darling was in Cobalt on a brief visit prior to proceeding to Timmins where he will perhaps remain for the next month.

Frank C. Loring has returned from a business trip to England, according to advice just received from New York.

W. E. Simpson, general manager of the Miller Independence Mines attended the annual meeting of the company held last week in Dayton.

H. C. McCloskey, manager of the McKinley-Darragh Mines, spent several days in Toronto on business.

Frank Groch has returned from a business trip of some weeks, spent in part in the western states, as well as a visit to Cleveland.

Neil Morrison of the Kells property, at Elk Lake, has returned to the property after a business trip to Haileybury and Cobalt.

J. B. Tyrrell, Mining Engineer, Confederation Life Building, Toronto has returned from a business trip Western Canada.

Mr. H. C. CROW.

**PAINKILLER LAKE DISTRICT; NORTHERN  
ONTARIO CARTWRIGHT GOLDFIELDS  
LIMITED**

The "Journal" is informed by Mr. H. C. Crow, President of the Cartwright Goldfields property that arrangements for the financing of the enterprise have been arranged, and that by Spring an outfit of machinery will be installed, and development proceeding. Before the fire in 1916 destroyed the buildings and plant, this company had expended \$75,000 on the property.

Operations were recently resumed on a portion of the claims north of the Lake, upon a vein which varies from 2 ft. up to 7ft. in width. Sinking a shaft on the main vein has commenced and it is hoped to reach a depth of 10 ft. by Spring. Surface assays gave up to \$43.00 in gold. The shaft is down 20 ft. and the vein is six feet in width at this depth.

Up to recently the difficulty of obtaining labour was great, but conditions in this regard are improved, and advantage is being taken of the winter roads for hauling in machinery during the Winter.

Recently, the Cartwright Goldfields sold part of their holdings to La Santa Lucia Gold Mines, Ltd. This company is making preparations to open a shaft. With this addition to the mines already in operation on the Painkiller Lake, much optimism is felt as to the prospects of this district next Spring.

**INDIAN RUPEE EXCHANGE—TEN RUPEES TO  
THE SOVEREIGN**

Moreton Frewen, whose writings on Indian exchange are familiar to those interested in the silver question, made the following comment to a representative of Dow, Jones and Co., publishers of the Wall Street Journal, on the change which has been made in the gold value of the Indian rupee:

"The news is of the very highest interest, and did Wall Street appreciate it, it would overshadow in its permanent importance all the other exchange happenings in this crisis in exchange. The information is only quite clear as to one point. The Indian Government has decided to fix its rupee exchange at ten to the sovereign in place of its 'gold exchange' rate established in 1898 of fifteen.

"This is really wonderful news. It promises permanent exchange with India at ten rupees for five gold dollars. It also fixes Chinese exchange at, say 3 taels for five gold dollars, and the Mexican dollar at par. There can be no reason that if the Government of India refuses to sell exchange at a lower rate than ten rupees for a sovereign, silver can never fall lower than, say, \$1.30 per ounce at the mines.

"The Government of India is not only the greatest silver buyer in the world, but also by far the greatest seller. Every Wednesday the India Office sells at the Bank of England to the highest bidders six million rupees of 'council bills,' two million ounces of silver. Now, according to the London cable, the Government of India is apparently to 'put in the peg' below which they will not sell and that price is the equivalent to \$1.29 per ounce. Silver can never fall below \$1.29."

Robert Bonar, for the past five years superintendent of the Pacific Coast Coal Co. at South Wellington, has left for Michel, B. C. where he will make his home.

**CORRESPONDENCE FROM BRITISH COLUMBIA  
THE METAL MINES.**

Stewart, B.C.

That there will be something approaching a rush into the Salmon River District, northern British Columbia, as soon as the season breaks, appears to be the conviction of those closest in touch with the situation. The strike on the Premier Mine and the development of other properties in the vicinity, together with the frequent reports of the staking of claims of promise, have had the effect, without a doubt, of attracting widespread attention to that part of the northern country. In British Columbia mining circles it is the confident belief that the towns of Stewart and Hyder, the portals through which prospectors, miners, and others who would enter to the new mineral camp must pass, are about to experience a boom. Real estate already is said to be selling at high figures in both towns and it is known that many enterprising Canadian businessmen are waiting only for more propitious weather to establish themselves at Stewart. Doubtless not a few Seattle, Wn., people have the same plan in contemplation with respect to Hyder. In short, the feeling in this province is that the camp is to be permanent and that it is likely to become one of the most important in a mining sense on the Pacific Coast. While the Premier Mine is the scene of operations, one shipment of between 300 and 400 tons already having been shipped over the snow to the Tacoma Smelter and another having been ready a couple of weeks ago; and while development continues on the Big Missouri and a number of other properties, there are many owners of claims and prospectors wintering in Stewart, Hyder, Vancouver, Victoria and Seattle prepared to "hit the trail" either for their properties to take up work where it was left off or to strike into the hills in search of prospects. Quite possibly, too, there are some "tenderfeet" who, fascinated by the reports of the richness of the ore of the Premier Mine, are arranging to cast in their lots with their tougher and more experienced fellows. On this point Mr. Dale Pitt, Assistant Manager of the Premier Mine, seems to show some concern when he says that there is a misleading impression that the country back of Stewart is another Klondyke. He adds that it should be understood that it is a hard rock camp, and that money is needed to develop it. For the benefit of those who may not understand, Mr. Pitt's statement will bear supplementing. In and around Stewart the snow usually remains until the month of April and in the hills in some places it persists until the month of June. Although everything possible is being done to prepare for the accommodation of the hundreds of visitors looked for those proposing the trip will be well advised to take with them tents and blankets. Previous mining excitements have taught that such utilities often turn out to be essential and, in any event, are a necessary safeguard against emergency. With these few words of, possibly gratuitous advice, it may be stated that marked activity is being evidenced, not only by the miners, but by the Provincial Government and, according to report, by the officials of the Alaskan Territory, in preparing for the opening up of the Salmon River zone. The British Columbia Government, although no official statement is yet available, is expected to continue the road built last summer from the international boundary to the Premier Mine in order that transportation facilities may be furnished other properties rapidly being brought to the shipping stage and to such prospects as

may develop favorably. The road between Stewart and Hyder, short, but involving extremely heavy and expensive construction, also is complete. The Premier Mine Company, it is understood, carried the road from Hyder through American territory to the Canadian boundary, from which point it was taken up by the Provincial authorities. Governor Riggs, of Alaska, it has been reported, will recommend that further work with a view to the improvement of transportation facilities be carried out on the Alaskan side during the coming summer. At the present moment he is in Washington, in company with C. F. Caldwell, a British Columbia mine operator of prominence (at least, their departure was announced through the daily press), engaged in the discussion of this matter with administrative officials. Mr. Caldwell is an ardent advocate of the necessity for the building of a railroad from tidewater into the Salmon River District, and it is likely that governmental support of this project will be urged. Further confirmation of the importance with which the northern mining camp is considered is found in the announcement that a special mail contract has been entered into for the benefit of the people of Stewart whereby mails are to be conveyed to them from Anyox once a week during the winter and twice a week during the summer, transportation to be provided by a substantial power-boat.

#### Atlin, B.C.

While British Columbia has been comparatively free of trouble with respect to boundaries in its placer mining camps disputes sometimes arise. One of these has been before the courts for some months. The disputants are Isaac Matthews and L. Schultz, the former being the owner of the Poker placer gold claim on Spruce Creek in the Atlin district and the latter the owner of an adjoining claim known as the Peterboro. Mr. Schultz, in the course of operation, permitted his men to encroach beyond what Mr. Matthews considered the line. In the action that followed, Mr. Matthews was upheld, whereupon he followed up his success with an action for damages to the extent of \$100,000. This latter litigation is about to come to trial and developments are being very closely followed by the placer miners of the Atlin camp.

#### Barkerville, B.C.

J. M. Yorston, who represents the Cariboo District in the Provincial Legislature, reports that development work is proceeding on the Prosperine Mountain properties. While no statement is made by Robt. A. Bryce, who is in charge of the work, there has been no abatement of activity at the camp and the general understanding is that results so far are satisfactory. Residents of the district confidently anticipate that the property is to prove one of the biggest quartz mines in the province. Mr. Yorston also states that some excitement was occasioned recently by the discovery of quartz gold in the creek about three miles from Barkerville. Much is expected both by miners and settlers from the Pacific Great Eastern Ry., now being constructed through the Cariboo into the Peace River country. There is no doubt that prosperity will follow the completion of this new railroad because it will open up a country rich in mineral and agricultural possibilities.

The plans which the Cariboo Gold-Platinum Extracting Co. Ltd. are said to have in view with respect to the Cariboo are attracting much interest. This Company's property, situated about 20 miles east of Ques-

nel, consists of five leases on the river and a ranch of some size, the latter having been acquired recently. Plant now is being transported over the Cariboo Road which, when it is assembled, will consist of a dragline excavator with a Shearer & Mayer one-yard bucket, a specially designed concentrator with a capacity of from 25 up to 150 tons of black sand a day, and the machinery required for the development of steam power. G. J. Marsh, president and general manager of the company, states that he has been successful, after twenty-five years of experiment, in the extraction, at a reasonable cost, of gold and platinum from the black sand. In describing his method he asserts that the sand first is crushed to a 200-mesh screen and afterwards treated by an electro-chemical process. Tests, Mr. Marsh declares, have proved its commercial feasibility. The importance of this to British Columbia is emphasized by indication of the many creeks, rivers and beaches where deposits of black sand are to be found; and also the fact that in dredging and other placer operations black sand is the source of nothing but trouble, its high specific gravity making it impossible to recover its gold and platinum content at a profit. Mr. Marsh appears to be confident that his company's success is assured. Before operations started about \$250,000 will have been invested and the capital, it is said, has been raised in Minneapolis. To induce individual miners to produce black sand concentrates for treatment at the extraction plant Mr. Marsh has a portable concentrator which he proposes distributing, by sale or lease, and by means of which he has visions of the bars of the Fraser and other rivers being exploited.

#### Grand Forks, B.C.

Active operations are proceeding at the Waterloo Mine under the management of G. A. Rendall. A shipment to the Trail Smelter, Consolidated Mining & Smelting Co. of Canada, consisting of 361 sacks of high grade silver-lead ore is reported to have been made. Last summer a shipment of 10 tons brought good returns. W. J. Banting's Lightning Peak Property is being developed as shipment of six tons being packed out to Edgewood to be forwarded to Trail. This, of course, is high grade ore.

#### Kaslo, B. C.

The Utica Mine, on Paddy's Peak is attracting much attention in this district. A portion of the mine workings was leased to A. J. Poyntz, formerly superintendent of the property, and shortly afterwards he made a strike of such richness that it is estimated the returns approximated \$100,000. His lease is to expire in the course of two months and it is expected that C. F. Caldwell, one of those chief interested will take steps to interest capital in the further development of the property. The ore taken out by Mr. Poyntz contained high silver values.

#### Nelson, B. C.

The striking by the Nugget Gold Mines Ltd. of an ore body at a depth of nearly 1200 feet, which it would appear, confirms the sanguine expectations of company officials, is described by James Anderson, a well-known operator of Kaslo, B.C. as the most important mining development in the Slocan for many years. "This" he says "is the greatest depth obtained in any workings in the Camp and the success of the Nuggett people will encourage others on Sheep

Creek and throughout the Slocan to sink or drift for greater depth on their ore deposits. This should result in cheaper mining and greater production." At a recent meeting of the directors of the Company a statement was read from R. H. Stewart, engineer in charge of development, to the effect that he proposed turning on the vein and would start drifting immediately. Milling, it was thought, would commence about May 1st.

### Three Forks, B.C.

That a new strike has been made on the Queen Bess at Three Forks, B.C. is reported, it being said that three feet of high grade ore has been exposed between the seventh and eighth levels. This is the mine which gave Clarence Cunningham, one of the largest individual operators in the Province, his start. For the most part its ore has been shipped direct to the smelters.

### Vancouver, B. C.

Recent resignations of members of the Geological Survey of Canada will have a serious effect on geological research work in British Columbia. A short time ago announcement was made of the leaving of a number of the members of the board. This caused some alarm among those interested in the Board's activities in the Canadian West but the feeling has been considerably accentuated by the report that J. S. Stewart and Leopold Reinecke also have retired. Four of those who are withdrawing from government service were particularly well qualified, through practical personal experience, to continue the work in this Province and Charles Camsell, chief of the geological survey in Vancouver, points out that these men cannot be replaced. It is observed that, unless the Dominion Government recognizes the value of the geological survey to the Canadian mining industry by offering such inducement as will assure the retention of the best brains among geologists, this branch of the Canadian Department of Mines must become disorganized.

### Victoria, B.C.

Since the meeting of the British Columbia Legislature the development of the iron ore resources of the country by the establishment of an iron and steel industry has been the subject of much comment. F. A. Pauline, one of the members, addressed the House on this question at length, referring to the fact that in Seattle, Wn., a firm is engaged in the production of the highest grade pig iron from the magnetite ores of the Province by the electro-thermic method and advising that something be done to place the industry on a footing on the Canadian side. A. P. Gillies, a promoter who claims to represent eastern capital, has endeavored to interest the cities of Vancouver and Victoria and through them the Provincial Government in the launching of the industry on a considerable scale. He wants the government to guarantee interest on a bond issue of \$5,000,000. The matter has not as yet been formally brought before the Provincial Executive. Meanwhile the Department of Mines is proceeding with plans for the further investigation of the limonite and hematite deposits of the Bridgewater River section, Lillooet Mining Division, on which Wm. M. Brewer, government mining engineer, reported favorably last summer.

Continued on page 149

## THE COLLIERIES

Commenting on the coal mining development on Vancouver Island, B. C. during the past year Wm. M. Brewer, government mining engineer, observes that two mines have been added to the active shippers. These are the No. 5 Mine, at South Wellington, the property of the Canadian Collieries (D) Ltd., from which coal has been mined on a commercial scale since early in 1919 and the Wakesiah Mine on the Wakesiah Farm, property of the Canadian Western Fuel Co., Ltd., which began producing commercially about October, 1919.

"Amongst new development" Mr. Brewer continues "or prospecting work there is the diamond drilling being done by the Canadian Collieries (D) Ltd. on the Tsa-abl River, which empties into Baynes Sound about 5 miles southerly from Union Bay in the Comox Section of the Nanaimo Mining Division, also the reopening of the old slope by the Canadian Western Fuel Co., Ltd., on the Wellington seam, southerly from the Harewood Mine. The slope had been driven about 400 feet and abandoned by the former management. During the past summer the old workings were unwatered and examined with the result that the General Manager, George A. Brown, ordered that the workings be reopened and extended and the mine placed on a producing basis. This may be worked as Harewood No. 2 Mine, with a new railway connection, or the underground workings may be extended to connect with the haulage system on the Harewood Mine and the coal transported through that mine to the transportation system now in use.

Mr. Brewer also refers to the transfer of the Grant Mine, Nanoose Bay, to the Nanoose Wellington Coal Co., Ltd. Since the change of management considerable new construction and development work has been undertaken. This is itemized as follows: Two return tubular boilers, 125 H. P. each, one, 150 KW Electric Generator, one electrically driven Centrifugal Pump for Coal washery and fire protection, capacity 450 gal. per minute, two storage tanks for fire protection and coal washery, capacity 25,000 gallons, one coal washing plant, jig washer, screening plant, picking table, loading boom and bunkers for three grades of coal, the whole to be electrically operated, new office building and other new housing.

The underground development has been pushed on steadily, consisting of a main East level, and a counter level, driven approximately 1900 feet in the last year, with stalls driven to the rise and slope to the dip, and with entries turned off East and West. The mine is worked on the pillar and stall system.

## NEW MINING COMPANIES.

The Stemwinder Mining Company, Limited, has been granted letters of incorporation for the purpose of prospecting, exploring and developing mining property and to carry on the business of a mining, milling, reduction and development company. Among the incorporators are H. A. Harrison, W. J. Beattie, T. J. Carley, G. D. Kirkpatrick and J. F. Van Lane, all of Toronto.

A number of Ottawa men have formed a company which has been incorporated under the name of the American Mining and Milling Company, Limited, for the purpose of carrying on a general mining business. Among the incorporators are D. A. MacArthur, N. G. Larmouth, J. T. Richards, all of Ottawa.

**LT.-COL. NISSEN SPEAKS.****Inventor of "Nissen Hut" Gives Interesting Address.**

The Engineering Society met at a special meeting on Friday, January 30th, to hear Lt.-Col. N. P. Nissen speak on his invention, "the Nissen Hut." The auditorium in Gordon Hall was filled almost to capacity, and with quite original humor Col. Nissen held his audience with fixed attention and caused many a hearty laugh.

Prof. McPhail in his own inimitable manner introduced the speaker and informed his hearers that Col. Nissen studied at Queen's in 1894, and while here installed the machinery in the Mining Mill. Col. Nissen improved and perfected the Nissen Stamp, an invention of his father's, and besides being the inventor of the Nissen Hut was also an artist of note.

Rising to address the Society Col. Nissen said he was the most maligned man in the British army. Having heard such dreadful things about the Nissen Hut he apologized for ever having invented it. He once heard a Tommy describe it as, "One of them huts you sit down in but couldn't lean back." He then went on to explain that it was while serving in an R.E. Field Company at Ypres he realized the need of a standard hut for troops. In designing such a hut he was confronted with many problems: it would have to be perfectly dry, manufacture, transportation and erection to involve a minimum of labor, materials easy to procure and inexpensive and each part would have to be interchangeable. While working out the problem of its shape he recalled the Kingston skating rink, and he said that was the real father of the Nissen Hut.

These huts were used by all the Allies. Over 100,000 were manufactured and shipped to every theatre of war. Later Col. Nissen designed a circular portable hut with improvements in ventilation. The latter was eight feet in diameter, held twenty men and weighed only thirteen hundred weight. The signing of the armistice, however, came before these could be sent to France.

Col. Nissen exhibited a statuette he had designed and modelled for the institution of Mining and Metallurgy to commemorate one hundred and fifty members of the Institution who, serving in the Tunnelling Companies had been killed in action. The statuette is indeed realistic. It is the production of a tunnelling officer in thigh boots, ankle deep in Flanders' mud, in the act of plunging the handle of an exploder to "blow the Hun." —From the Journal of Queens University.

*Power House and Shaft, Brooklyn Mine.*

**DEEP MINING IN MICHIGAN COPPER DISTRICT.****Direct Hoisting Contemplated from Depth of 10,000 Feet.**

By R. E. HORE.

Plans are now being made for mining at greater depths at the Calumet and Hecla and Quincy copper mines in Northern Michigan. These are already very deep mines.

The Calumet lode is one of the best known ore deposits in America. It is the copper-bearing portion of one of the conglomerate beds interstratified with the volcanic rocks of Keweenaw Point. The conglomerate is a relatively thin bed which has been traced more or less continuously for several miles. The ore bearing portion is almost entirely confined to that part, about two miles long, which outcrops on the property of the Calumet and Hecla Mining Company. The copper occurs as native metal. The rock is made up largely of pebbles of felsite and quartz porphyry cemented together with small particles of rock, calcite copper and some hematite, quartz, epidote and chlorite. The thickness of the lode as determined by mining operations is from 10 to 20 ft. The lode strikes No. 33° E. and dips to the northwest at about 38°. There are several incline shafts in the lode. Mining operations have been continuously carried on for many years, and the problems encountered with increasing depth have been satisfactorily solved. The methods devised have permitted the complete extraction of the ore and when a stope is finished there are no pillars of ore left standing. The support necessary during the mining operation and for a short time after is obtained by the use of heavy timber. The system adopted makes long support by stulls unnecessary, the hanging being allowed to cave or shot down to provide its own support. A substantial pillar is left at the shaft to be recovered only when the ore on either side is all extracted. Stopping is started at the boundary of a shaft block and retreats towards the shaft. A solid row of heavy stulls at the level alone gives the necessary protection during the period of working the stope below. The miners are always working under a stope that has only recently been mined and in which the timbers are still strong. The method has been in satisfactory use down to the depth of 8,100 ft., the deepest of the slope shafts in the Calumet lode. It is now proposed to make the 8,100 ft. a main haulage level and to sink sub-shafts from that level to a depth of 10,000 ft.

At the Quincy mine the Perratic amygdaloid lodes are worked. The lodes here dip more steeply than at Calumet, the Quincy near the surface being about 54°, but becoming flatter with depth. At a distance of over a mile down on the slope the dip is about 40° and in the northern part of the mine 38°. The lodes strike N. 30° E. and dip to the northwest. They have been developed on the Quincy for a length of about three miles and a depth of over one mile. Machinery is now being installed to permit direct hoisting from a depth of 10,000 ft.

At the Quincy mine there is less timber used than on the Calumet lode. Broken waste rock is used to fill the stopes as soon as possible after the ore is extracted. There have been many severe underground disturbances due to crushing in the Quincy mine, but the present policy of leaving large shaft pillars and filling the stopes quickly with waste appears to be giving satisfaction. In the earlier days insufficient support was

provided and the mine is still subject to "air blasts," owing to failure of support in old workings. The management is confident, however, that mining can be safely carried on at much greater depth if the stopes are promptly filled after the ore is extracted. The installation of the new hoisting engine is evidence of faith in the present methods.

Aside from the problems arising from the great pressure at the depth where mining is to be carried on, there are big problems in hoisting. The two companies are attacking this problem in different ways. Their success in overcoming such problems as depth has increased may well lead one to have confidence that the engineers of the Quincy and Calumet and Hecla companies will in both cases give good exhibitions of the possibilities of mining copper at still greater depths.

### ONTARIO'S GOLD PRODUCERS

There has just been published by the Ontario Bureau of mines a report on mining in the Province during 1918. This contains the statistical review by L. W. Gibson, Deputy Minister of Mines, and the usual reports of the inspectors of mines. There is also presented the first report of the Joint Peat Committee and the report of the Advisory Gas Board. The publication is Part I of Vol XXVIII. Part II, entitled "Abitibi—Night Hawk Lake Gold Area," the authors being C. W. Knight, A. G. Burrows, P. E. Hopkins and A. L. Burrows, was published some time ago.

A preliminary report on production in 1918 was published in March 1919 and much of the other information in this final report was given out by the Bureau several months ago. There is much new matter, however, bearing on progress in 1918 and in many cases information gathered during 1919 by the staff of the Mines Bureau has been incorporated.

An analysis of the gold production of Ontario shows that there was milled during 1918 875,593 tons of ore which yielded 411,878 oz. gold valued at \$8,502,480 and 73,753 oz. silver valued at \$71,366, a total of \$8,573,846. Of this \$7,833,965 is credited to Porcupine and \$636,667 to Kirkland Lake area. The 816,037 tons of ore from Porcupine mines yielded an average of \$950 per ton and the 53,523 tons from Kirkland Lake mines yielded \$11.81 per ton. The tonnage milled and the gold produced for every producer in Ontario is given.

Ten mines contributed to the Porcupine output in 1918,—Hollinger, McIntyre, Porcupine Crown, Dome Lake, Schumacher, Porcupine V.N.T., Dome Davidson, West Dome and Newray. Several of these are not producing at present owing to the high cost of operating.

The chief producer outside the two main areas was the Croesus. From this property 692 tons averaging \$93.61 per ton was taken in 1918. The mine has been closed down for some time. The Patricia now idle obtained \$10,113 from 1,502 tons of ore.

In Western Ontario the chief gold producers in 1918 were the St. Anthony, which is now idle.

While several of the properties which produced some gold in 1918 are at present idle, it is expected that the 1920 output will be much larger than that of 1918. The chief producers Hollinger and McIntyre are making great headway and the Dome is again in operation after a long period of non production. Progress of the Kirkland Lake mines was halted by

labor troubles in 1919, but it is expected that the favorable development of this area will soon be reflected in increased production.

Assistance to the gold mining industry is coming from an unexpected source—the high rate of exchange. During the war the cost of gold mining increased rapidly and has remained high. The operators have been in an unenviable position as regards sale of their product, the price being fixed. It has been frequently argued that the price of gold is too low, but the arguments did not help the producers in their battle with increased costs. In the present exchange situation the gold producers have an advantage as welcome as it was unexpected. The selling price of gold in Canada remains nominally as before, but with a premium in accordance with exchange that makes it possible to secure the same price as could be obtained in the United States.

### THE JOINT COMMITTEE OF TECHNICAL ORGANIZATIONS

The Joint Committee of Technical Organizations was formed in Toronto during the war to bring together engineers for war work. The several technical organizations having Toronto branches each sent representatives. The Committee did useful work during the war and it is now planned to put the organization on a peace basis. It has served the purpose for which it was brought into existence, but there seems to be good reason for the perpetuation of such organization as it bring together men from several branches of the engineering profession.

The first representative of the Toronto branch of the Canadian Mining Institute on the Joint Committee was Mr. W. E. Legsworth. He did not long continue to attend the meetings of the Committee, however, for his keen interest in the work started by the organization led to his being selected for the important position of Director of Vocational Training where he found so much work to do in all parts of the Dominion that he had to give up entirely his engineering practise. Mr. Legsworth succeeded in interesting Prof. H. E. T. Hamilton in the work and the latter appointed Director for Ontario, built up an organization that did splendid work. The early meetings of the Joint Committee therefore were in no small measure responsible for bringing from the ranks of Toronto many engineers, two men who did work of great public value; work that has been creditable to the engineering profession and of great assistance to thousands of return soldiers.

The work of the Joint Committee has been naturally varied for there were many different things to occupy its attention. The Dominion Government evidently approved of the work, for during the war it granted money to help defray the expenses. This grant is no longer available and the new work and new methods of financing it make reorganization necessary.

The Toronto branch of the Canadian Mining Institute at a meeting on Jan. 31, decided in favor of proposals to reorganize the Committee and to appoint representatives. There was some discussion as to whether there was further need for the Joint Committee, and there was opinion expressed that such a Committee might take too much authority on itself and undertake to act as representative of all the local technical societies.

**B. C. NOTES—CONTINUED**

Continued from page 146

**Hazelton, B. C.**

The Golden Crown Group of mineral claims situated near Usk on the Grand Trunk Pacific Railway is being systematically developed by the Kleanza Co., Ltd. Three veins carrying gold—silver—copper, values have been traced and prospected by a series of open cuts and stripping for a distance of three miles from Gold or Kleanza Creek over the summit to the Copper River slope. In the summer diamond drilling is to be started. Water power has been secured on Gold Creek and a dam is under construction which will assure the development of three thousand horse-power.

**Atlin, B. C.**

The Engineer Mine, Atlin, B. C. has been thoroughly inspected by a number of American engineers with a view, it is said, to its purchase. This is one of the best-known lode gold mines of the Province. As far as it has been developed the richness of the quartz in places has been shown to be remarkable. Capt. Alexander, who lost his life when the S. S. Sophia foundered, was offered over \$1,000,000 for the property. On his death it fell to Allan Smith, who was financially interested with Capt. Alexander. Subsequently Mr. Smith died. Since then the mine has been idle but it is said that the title has been straightened and residence of the Atlin District are looking forward to the resumption of operations on a considerable scale.

**Stewart, B. C.**

A 100 ton concentrator and flotation mill is to be in-

stalled at the Premier Mine, reports from the north being to the effect that machinery is being taken in now in order that it may be transported over the snow by sleigh. The plan is to set up the plant during the summer so that it will be ready for operation early in the fall.

**Hyder, Alaska.**

Until a few weeks ago Hyder probably was the most "wide open" town on the American continent. Its daily life recalled Bert Harte's narratives of early California days. John Ronan's appointment as United States Marshall has effected a complete change. Gambling and "Blind Pigs" have been closed down and the prosperous little mining town is now quiet and respectable.

**Alice Arm, B. C.**

The La Rose Mine, Alice Arm, has made a shipment to the Trail Smelter on which a gratifying return has been secured. This property is situated near the Dolly Varden. A tunnel has been drifted 250 feet disclosing a good body of ore. Plans are being made for extensive development next summer.

**Prince George, B. C.**

The Taltapin Mining Company is making satisfactory progress in the development of the Silver Fox Group on Anderson Creek, 22 miles from Burns Lake on the Grand Trunk Pacific Railway. A tunnel is in 30 feet exposing 4 feet 6 inches of ore which is said to run \$800 to the ton by fair sampling, the values being in silver, lead, copper, gold and zinc.

# A MARSH HOIST

## IS MADE THE RIGHT SIZE FOR YOUR MINE

and in either Steam Power or Electric Power

This shows one of our Electric Mine Hoists. We make many other types. Send for our catalogue of Mine Hoists, Cars, Cages, Buckets, etc., and see what we offer you. It will repay you.

From the little 10 Horse Power size for prospectors or small mines to the massive 50 Horse Power size, one of our 7 sizes should be just right for your mine.

We are specialists in the building of Hoisting Machinery of all sorts. For nearly a quarter of a century we have been designing and building Hoists, and have developed a Hoist that we are really proud of—proud because of the record of good work they have done, and are doing in mines, quarries, and other classes of work from one end of Canada to the other.

ENGINEERS MANUFACTURERS & CONTRACTORS

Works  
WELLAND, ONTARIO

General Sales Offices  
285 BEAVER HILL, MONTREAL

#### Phillips Arm, B. C.

A well defined quartz vein, said to be eight feet in width, has been located on the Amethyst Group of Claims. The ore returns gold-silver-and copper values. The Bluebell property, on the opposite side of the Arm to the Amethyst, is reported to be bonded to the Ladysmith Smelter interests.

#### Salmo, B. C.

The Nugget Gold Mines, Limited., whose tunnelling operations at Sheep Creek for the purpose of striking at depth the vein of the Motherlode Mine have attracted considerable attention, announce that the object of the work has been attained. It is said that the tunnel has cross-cut a vein of good-looking quartz. The vein is twelve feet between walls. There are three feet of rich looking ore, the balance being crushed quartzite." Assays are reported to have given returns of about \$17 a ton.

#### Nelson, B. C.

J. R. Hunter, President of the Nelson Board of Trade, in his annual report refers to the mining situation of the District in part as follows:

"The Eureka and Granite Poorman Mines have been bonded to Walla Walla capitalists, who are at present driving a long cross-cut on the Eureka with the object of striking the ore bodies at greater depth. When this is done and a slipping is commenced the ore will be treated at the Granite Mill, which has been equipped with a flotation process, which, according to tests, will mean a great saving in ore values. It is also the intention of the owners to carry out extensive developments on the Granite Poorman as well, so that we can look forward to great activities.

"The Molly Gibson has been under development and considerable shipping has been done. The Ivy Fern (Cultus Creek) which has been bonded by the Consolidated Mining and Smelting Company, is being developed by the driving of a cross-cut tunnel to strike the main ore bodies at depth. A great deal of surface work also is being done. This is going to be one of the great tonnage properties of the Interior.

"We might also mention the Nugget, Motherlode and the Emerald, the latter having just completed a new mill for the treating of its ores. Its showings are most satisfactory and it no doubt will be one of the big producing properties."

The Rambler-Cariboo Mines, Ltd., has completed its title to the Jennie and Last Chance Claim by making the large payment of \$25,000 on the purchase price of \$60,000. The new ground gives the Rambler 1650 feet on the strike of the vein which already has yielded between \$2,500,000 and \$3,000,000.

#### Trail, B. C.

In only three weeks of shipping receipts of ore and concentrates at the Consolidated Mining and Smelting Company's smelter at Trail new stand at 19,872 tons, of which 1,138 was concentrates and the balance ore. The receipts for the week ending January 21st were 7,758 tons, of which 244 were concentrates. The week's shipping list consists of 19 properties or groups of properties and during the three weeks 32 properties or groups of properties have shipped. An average of 6,624 tons of smelter feed per week for the three weeks is considered an excellent start on the year's work.

## The Availability of Labour in Canada

We call our readers' attention to the note on the labour situation in Canada which appears in this issue. It is specially contributed by one who is in the closest touch with the questions surrounding the availability of workmen for the mineral and associated metallurgical industries of Canada. It will be found to confirm the forecast which appeared in the "Journal" in October 1918\* of an impending shortage of unskilled labour, and indicates that before very long the Government will have to consider not only the relaxation of the present stringent immigration regulations, intended to act as a deterrent to the incoming of this class of workmen, but will require to resume the former policy of attracting emigration to Canada. Our correspondent points out that the diminished value of European currency in Canada, and the greatly increased expense of railway and steamship transportation are in themselves factors that will tend to restrict emigration from Continental Europe in a very marked measure.

The shortage of unskilled labour is already acting as a brake on production in the East. In the West conditions are easier, but the coal mines and steel works of Nova Scotia, the lumbering, metallurgical and mining industries of Quebec and Ontario, are all suffering from a shortage of men who are willing to work with their hands, and an over-supply of men who are not so willing. It is certain that the type of emigrant now coming into Canada will not undertake the kind of employment that the Italian, Hungarian, Galician, Pole, Russian, Bukovinian and Finnish labourers did before the war.

One partial solution of the difficulty is the substitution of mechanical devices for hand labour, and much progress has already been made in this direction. At one large mine, situated in a locality where labour was formerly plentiful, not less than ninety-five per cent of the ore handled underground is loaded by mechanical shovels. A recent article in this Journal, and a much more detailed article in a recent issue of the "Engineering and Mining Journal" show that mechanical loading devices are now available in much variety and suited to many differing underground conditions. Shovels can be obtained for use in open-face work and in high seams, or they can be obtained for use in the confined conditions of heading and development work. In practice they are found to increase production and materially decrease costs of production, and although the capital expenditure required is not light, the choice of the operator will shortly lie between introducing mechanical methods of handling the product of the mine, or cessation of production. The mining company handling large quantities of ore, stone or coal, that does not include among its appropriations some expenditure on the adaptation of mechanical handling devices for underground use is neglecting an obvious precaution, in the light of the forecast made by our contributor.

## Mining "Investments"

One of the features of newspaperdom today is the extent of unrestrained advertising of gold and silver mine promotions. "Age cannot wither, nor custom stale their infinite variety" and the apparent freshness of their appeal is contemporary confirmation of the everlasting renewal of the confiding ones. We recently heard of a gentleman—a prosperous plumber—who testified to his contempt for the uninteresting character of Victory Bonds as an investment. "Give me," he said, "something sporting, something on which I shall either make a lot or nothing." Just how much

of the lure of mine promotion advertising lies in this frame of mind, and just how much is pure flat-catching would be difficult to estimate, but judging by the full-page advertisements that are run in our most reputable newspapers, the audience of the mine promoter must be large and avid.

In the Montreal Star there appears an advertisement of the Little Gem Mining Company, and truth to say, the literature of this promotion is a gem. "If," says the tempter, "if you think our proposition is too good to be true, why not then be a sport if you think it is

a gamble, and buy 1,000 shares or even 100 shares? You will find it is one of the squarest games you ever played, and the pot you win will be the largest you ever dreamed of. "ALL DEPENDING ON THE AMOUNT YOU ANTIE UP." Our surmise would be that the author of this diamond of appeal knows more of poker than his spelling of the word "ante" would indicate.

This Journal knows nothing of the little Gem Mining Company, except that it is stated to be in Alaska, but we believe there is no real necessity for Canadian investors to gamble on a pot in Alaska, seeing that so many are sitting in at the feast of Canadian mine promotion at this date. The most glittering ornament among the coruseation of promises in the advertisement is the statement "Dividends sure unless an earthquake destroys the mine, or the boat with the machinery is sunk en route."

The mining engineer on whose report the glowing nature of the prospectus is based is R. David Reese, M.E., to whose character testimony is borne by Mr. G. Goldstein of Goldstein's Emporium, Juneau, Alaska. If there is anything in a name Mr. Goldstein should be well qualified to pass upon a gold mine.

Now we know nothing of Alaska, Mr. Reese, or the Little Gem property, but, if Canadian investors feel in serious need of a little poker game there are quite a number of domestic ventures that are daily recommended through our newspapers, sandwiched in between advertisements of Victory Bonds and provincial long-term notes, and cunningly alluded to in the letterpress of the financial page, beflowered with a verbiage that is redolent of diabasic flows, batholiths, circulating solutions and differentiated magmas that sound like something but mean really nothing.

---

#### EN PASSANT.

We recently noticed in a Toronto newspaper some artless references to a gentleman named John Jones who it is said is noted from Cobalt to Alaska as a prospector. He is making a trip into the "North Country"—a delightfully vague terminology, — to locate a "huge tract of coal-bearing country, of which word was brought back by a traveller a quarter of a century ago." In this legendary region it is ingenuously remarked: "There is some coal, lignite. How much. Jones is going to find out. Lignite is a soft coal, but Jones is strongly of the opinion that the coal will get harder the deeper it is mined. The geological formation is very similar to that of the Pennsylvania mines, where the surface of the coal is lignite, gradually improving and getting harder as it is mined."

We had not heard of this remarkable natural phenomenon of Pennsylvania. Perhaps if they dig a little lower there may be diamonds. It is an interesting hypothesis. Mr. Jones's remarks, as inter-

preted by the reporter sound rather like the prospectus of a gold mine, of which Mr. Jones should not be ignorant, because it is further stated that "Jones knows the history of the North from A to Z, not only its commercial aspect as set forth by company prospectuses, but the very human history of the mining and timber lands, where law is often an unaccepted theory and men become plutocrats by the simple expedients of stealing their neighbor's timber or flooding them out of their mines." Oh, Mr. Jones!

But Mr. Jones had still more wonders to unfold to his trusting auditor. He informed the reporter that Northern Canada is a neglected El Dorado, and that he could talk on the subject for a day and a half and touch but the fringe. We can believe it. Nevertheless it is recorded that "Mr. Jones outlined it in a few words, and then—took the reporter into the yard and showed him his dogs." Mr. Jones should write mine promotion literature. He is wasted driving a dog team. Or perhaps, it is the reporter that has mistaken his vocation?

---

#### NOVA SCOTIA NOTES.

##### Malagash Salt.

The "Journal" is informed that very satisfactory progress is being made with the development of the salt deposit at Malagash, owned and operated by Messrs. Chambers of New Glasgow. About ten tons daily are being produced, and users of the salt are pleased with its quality. The property is of course capable of much larger development, but up to the present, the expenses of equipment and development have been met out of the proceeds of production and no large capital expenditure has been made. In view of the promising nature of the deposit, and its great economic importance to the fisheries which are so large a source of revenue to Nova Scotia, it may be anticipated that before long the property will be developed on a much larger scale.

---

##### Coal Production.

Coal production is proceeding at a brisker pace, particularly at the mainland collieries. In the Picton Field the coal required to fill the sales programme of the Nova Scotia Steel and Coal Company is not only taking all the production of the Acadia Coal Company, but arrangements have been made by which the production of some of the smaller operators in this field is being taken by the Scotia Company.

The coal mines of the Scotia Company at Sydney Mines are working to full capacity, the production being at the rate of from 50,000 to 55,000 tons monthly, or approaching pre-war figures.

The mines of the Dominion Coal Company are working steadily, but the rate of production remains very much below previous figures. This company is more affected by the shortage of suitable labour than any other operator in Nova Scotia nor under present immigration regulations and the cost of railway and steamship transportation does there seem any immediate likelihood of additional suitable labor being secured.

# Notes on the Labor Situation in Canada

(Specially Contributed.)

Previous to the war Canada got its common labor supply largely through immigration from Continental Europe.

During the period of the construction of the Grand Trunk Pacific and Canadian Northern railroads thousands of Italian, Austrian, Hungarian and Russian laborers came into the country.

When the war broke out in 1914 practically all the Italian and Russian laborers of military age either went back to Europe to join the army or joined the Canadian forces.

The subjects of the Central Powers were of course not allowed to leave Canada and during the winter of 1914-15 when industrial conditions were very bad and these men could not get work some thousands of them were gathered up by the Dominion Government Authorities and placed in internment camps in various parts of Canada.

During 1915 and 1916 when conditions had improved and when industrial plants and mines were working to capacity some hundreds of these laborers were released on parole from the internment camps for work in different parts of the country to make up to some extent for the shortage of common labor then existing. These men were all paid the regular wages that pertained to the industry in which they went to work.

At the conclusion of the war and as soon as traveling facilities could be obtained thousands of these laborers left Canada to return to their homes and at the present time other thousands are waiting to go as soon as passports and transportation are available, so that it looks at present as if there would be a serious shortage of common labor in the country when construction work starts up in about three months time—as it is very doubtful if the countries to which these laborers belong will sanction their leaving home for some time at least. It might be here mentioned that all or nearly all these men made big wages and took away with them hundreds of thousands of dollars in the aggregate.

Even if the men wanted to return to Canada and their governments were willing to give them permission to come the cost of travelling has advanced to such an extent that it is practically prohibitive. For instance a ticket from Europe to Canada that in pre-war days could be purchased for \$30.00 now costs \$75.00 and the recent enactment of the Dominion Department of Immigration whereby laborers and mechanics coming into Canada must be in possession of \$250.00 adds to the difficulty particularly as the value of Continental money is now less than half of what it was in pre-war days.

One thing regarding new immigrants coming to Canada is practically certain and that is that men who have spent five years in the armies of Europe no matter how anxious they might be to get away from there cannot gather up sufficient money to travel under the above conditions.

The situation therefore that confronts the employer of common labor today is something as follows:—Some thousands of laborers have gone to their homes in

Europe, other thousands are anxiously waiting to go and when railroad construction and other public works start up in April and May there is no available common labor.

There is no immigration into the country at present but some relaxation of the Government Regulations will no doubt be made.

It is well known that railroad construction and as a matter of fact all construction work pays higher wages to laborers than do the industrial plants—the reason for this being that construction is only temporary work whereas industrial plant work is looked upon as permanent nevertheless the question of permanency does not enter largely into the calculations of a man looking for a job. He goes where the wages are highest and consequently the construction job gets the pick of the men while the industrial operator takes what is left.

A perusal of the Trade Journals shows that the United States steel plants and coal mines at present are working to the limit of their labor supply and they are unable to take any more business, as their unfilled tonnage orders are growing larger each month, and it is reasonable to assume that this state of affairs will also apply to Canadian plants. It is hard to see how production can be increased if there is a shortage of labor to produce.

## SHORT COURSE FOR THE PAS PROSPECTORS. Will Begin With Meeting of Manitoba Branch of Canadian Mining Institute.

Arrangements have been made for a short course for prospectors and others interested in mining development in The Pas field, during the fortnight following the Dog Derby, on March 17. The course will begin with an open meeting of the Manitoba branch of the Canadian Mining Institute, on Friday evening, March 19th, in the Community Building. It is intended that the course take the form of short talks, followed by discussions on the following:

- The characteristics of copper ore.
- Field relationships of copper deposits in Northern Manitoba.
- Copper smelting and refining.
- The copper market.
- Zinc-copper ores and their treatment.
- Gold and associated minerals in Northern Manitoba.
- The field relationships of gold deposits in this district.
- The treatment of gold ores.
- What assistance should the gold mining industry obtain?
- Some unprospected fields in Northern Manitoba.
- Blowpipe and other methods of ready determination of ores and other minerals.
- The marketing of prospects.

A representative collection of specimens from all known properties in Northern Manitoba has been assembled for reference, and a general collection of ores will be provided for practical study. Lantern slides will be used for purposes of illustration. It is hoped that all who intend to be in town for the Derby will, if interested, co-operate in this course.

# Engineers and the Mining Industry

By R. E. HORE.

Man has become dependent on the products of mines for his existence. There may be places where people can live comfortably, like Adam in the Garden of Eden, without utilizing or knowing anything about metaliferous minerals or of coal or oil; but without the products of the mines most of us would be far from contented, even if we had many other things that Adam had to live without. It may therefore be said to be the function of the people engaged in mining, to supply us with certain materials necessary for our existence. Those who do no mining must provide the miner with other necessities, if they wish to get a share of the products of mines. It is up to those who operate mines to see that the exchange is on a fair basis. They must give close attention to the selling of their product as well as to the work of mining and treating the ores, so that those who supply the necessary money and those who do the necessary manual labor will all be well paid.

Those who undertake mining ventures are doing something for the public good; but they are not doing it for philanthropic purposes. Their purpose in producing metals or fuel is to obtain a surplus of something that can be exchanged for some other things they want. Money being the medium for the exchange, the primary purpose of mining ventures is to make money.

Those who devote their lives to the application of science to mining are commonly called mining engineers. It is a function of the mining engineer to use materials, energy and money to the best advantage in the working of ore deposits. This function of the mining engineer is comparable with that of the civil mechanical or electrical engineer and brings him into close touch with men of those professions. Some of these men are connected with industries in much the same way as the mining engineer and have constantly to keep in mind whether proposed work will be profitable or not. Many engineers however, are engaged in work, such as that of public highways, railroads, power development etc., in capacities which place on them no responsibility as to whether it will pay profits or not. There are some mining engineers working in a similar capacity for large companies, but the mining engineers in more responsible positions have constantly to keep in mind that the purpose of their work is to make a profit for those who finance the venture. He has also the task of finding more ore as the work proceeds.

While in the operation of a mine the mining engineer has to assume duties not incumbent on many of his professional relatives, he has still more diversified duties in the early stages of development of a property. When work is begun, there is little known concerning the amount and value of ore in any deposit, yet the engineer must decide on the possibility of mining it at a profit. He has also to decide whether the possible profits warrant payment of large sums to the owners for the property. If he wishes to operate the mine himself he has then to demonstrate some financial ability in finding the necessary money. Comparatively few mining engineers have the necessary money to bring a prospect to the producing stage; but many have undertaken the task of raising money as well as spending it. The mining engineer is thus

called upon in some cases to do many things that are not commonly called engineering.

The impossibility of determining beforehand the extent and value of an ore deposit makes the development of mineral property a hazardous enterprise. The engineer who advises development work cannot demonstrate the value of the property until the job is finished and the ore is all mined out and sold and the plant is scrapped. He can however, examine the property carefully and obtain more useful information on which to base an opinion than can the average person. His report on a prospect is an opinion based on the facts obtainable and its value lies in the fact that the trained, experienced observer sees more and is more likely to interpret facts correctly than is the inexperienced. Any engineer's report on a prospect is however, best regarded as but an expression of opinion. Those who provide money therefore for the development of prospects must properly consider that they are venturing into the unknown, and that they may lose all the money spent in development work. The justification that the engineer has in recommending such speculation lies in the possible large profits that may accrue. If the many mineral discoveries made each year a very small number prove to be of any consequence and few of these prove worthy of development. Engineers knowing the facts are not inclined to be overly optimistic about any prospect.

Favorable reports are not numerous. Mining engineers are sometimes charged with being unduly pessimistic, but in most cases it is the ore deposits rather than the examining engineer, that is the cause of disappointment. A lot of time and money is spent in the search for ore deposits. It is a function of the mining engineer to see that the prospective expenditures are warranted and to advise his clients of his opinion. His experience and training can reasonably be expected to assist him in forming an opinion, that is more valuable than that of most men. In all cases however, it should be understood that the engineer in recommending development of a prospect is advising speculation rather than investment. He can give no definite assurance of success; but he can indicate to those who are willing to take big risks, possibilities of making large profits. Having a special knowledge of ore deposits and the methods and costs of working them, the mining engineer can properly advise speculative enterprise. All producing mines were in the prospect stage at one time in their history and they would still be prospects if no great risk had been assumed by those who developed them.

Many engineers must devote their attention chiefly to the economical working of ore deposits that are already partially developed; but others must undertake the more hazardous task of developing prospects and in some cases the financing of the enterprise. Since financing must be undertaken at a time when the value of a mining property is unknown the mining engineer who undertakes to find the money for development work is faced with a problem in finance quite as important as his technical problems. He must also have executive ability for the carrying out of the work which his technical training and experience and his knowledge of the property suggest.

The mining engineer has also work of quite another character. Mines are commonly the pioneer industry in otherwise undeveloped places. The men in charge of operations become naturally leaders in the mining community and they naturally take greater interest in the welfare of their employees than is to be expected in the case of industries in large cities.

While the services of the mining engineer are needed in the development of properties and in the determination of methods of mining and of the necessary machinery, tools supplies and labor when mining is begun, they are also needed at all times during the life of the mines. The engineer who constructs a concrete highway or builds a bridge can turn it over for public use and feel satisfied that he has finished the job. The equipment and development of a mine is a very different matter. Every day's work in the mine brings new engineering problems and it thus becomes desirable that the operation of a mine should be in charge of an engineer until the ore is all extracted. The most suitable equipment and methods cannot commonly be definitely determined very far in advance of development. Changes to meet new conditions are constantly necessary. The appointment of mining engineers to the positions of mine managers is a natural consequence of this necessity for the continuous service of engineers.

#### PROF. GWILLIM REPORTS ON BRITISH COLUMBIA OIL PROSPECTS.

The report of Professor Gwillim on the oil possibilities of the Peace River District of British Columbia was brought down in the Legislature at Victoria by Hon. T. D. Patullo, Minister of Lands, who stated that Prof. Gwillim was appointed in May last to make a geological reconnaissance of areas in the Peace River country where strata formations were believed to correspond with those being investigated in Alberta, where extensive exploratory work was being carried on.

A comparison is made between the oil-bearing formations in Southern Alberta and similar formations found in the Peace River district, the latter of which are declared to be on a larger scale. It is pointed out that the strata are traced from the up-thrust and crumpling of the Rocky Mountains down to the rolling foot-hills until they flatten out and decline at low angles beneath the great trough or syncline which crosses the Peace River. It is the opinion of Prof. Gwillim, therefore, that the portion most worthy of closer investigation is the strip of country lying between the gentle dip towards the great syncline and the area of disturbed geology adjacent to the mountains.

The following formations, says the report, were met with in descending order.

1. Smoky River shales.
2. Dunvegan sandstones.
3. St. John shale.

4. Bullhead sandstone, with trassic shales and sandstones below. The Bullhead sandstones are considered to be the shoreward equivalent of the Peace River sandstones and Loon River shales. It is near the base of the latter that oil is found on the lower Peace River at about 1,100 feet below the river level.

Prof. Gwillim's report says that the Bullhead sand-

stone is a geological equivalent to the oil or tar-bearing strata of the lower Peace River, Athabaska River and of the Black Diamond area in Southern Alberta. "These Bullhead sandstones are structurally favorable, that is, there are rolls, saddles or anticlines, covered by St. John shale," the report continues, "which is impervious enough to hold down any oil beneath them. There is no proof that oil exists in or beneath the Bullhead sandstones, but the possibilities are sufficient to justify extensive reconnaissance work in adjacent areas by a large oil corporation."

Commenting upon the report of Prof. Gwillim, Mr. Pattullo says: "From the work carried on by Prof. Gwillim last year it seems highly desirable that much more extensive work of a general character should be carried on during the coming year, with some detail work in certain localities. The report is of a valuable character, and the good work must be continued this year."

#### MR. F. B. MACAULAY'S APPOSITE PARABLE.

##### The House of John Bull & Sons.

"An American professor has been kind enough to suggest that Canada is insolvent because she does not pay gold. We may compare our position with that of two men, each of whom owns a number of highly profitable farms, and has other industries. One however, is more southerly than the other, and can grow crops which the other cannot. The northern man buys the southern products. He offers in payment wheat or flour, but is told, 'I do not need that; I have all I require of my own.' He is offered beef and pork, with the same answer. He is offered lumber and paper, and is told, 'Yes, I will take some of that, but not enough to cover the amount you owe me.' The southern man says, 'Pay me gold,' which of course the northern man cannot get anywhere. Finally the southern man says, 'I will take a mortgage on some of your farms for the amount, but I will only take it at fifteen per cent. discount.' Is the northerner insolvent? Rubbish. He is highly prosperous and able to pay everything, if only his southern uncle would take the kind of goods which he produces. Insolvent? Not at all, he is merely showing bad business judgment in buying from the wrong person. He begins to look around, and finally remembers that he actually belongs to a big firm, John Bull and Sons, and that another member of that firm, who happens to be his father, has factories that can supply much of what he needs, and another member a brother, has southern farms which could be developed to supply all the tropical goods he requires. What does he do? He begins to deal with the members of his own firm, and to develop their resources, and soon his problems come to an end.

"That is the lesson from our exchange situation with the United States."

The coal problem of the United States, and of Canada also, is to a great extent one of haphazard production, uncoordinated with transportation facilities; and varying seasonal requirements for coal accompanied by seasonal limitations of transportation and production. The coal problem is probably seventy-five per cent a transportation question.

# The Ore Deposits of Goudreau and Magpie-Hawk Areas, Michipicoten District, Ont.

The Summary Report of the Geological Survey, Part. E., 1918, contains a detailed report by W. H. Collins on the pyrite and iron ores of the Michipicoten District in which pyrite mining was greatly stimulated by increased domestic demand for sulphuric acid caused by war requirements and the cessation of shipments of Spanish pyrite. In 1918 the Survey entered this field with the intention of aiding prospecting and development.

An attempt was made to assign some definite stratigraphic horizon in the Keewatin to the formation which carries the iron ore and pyrite. A tentative effort was made to recognize some of the members of the Keewatin group, arrange them in order of age, and even to represent them thus on the maps. The Report states:

The attempt met with only a small degree of success. It was soon found in Goudreau area, explored first, that most of the iron-formation rests upon light coloured porphyries which, being volcanic flows, are, therefore, older. Also, that the flows above the iron-formation are largely, if not altogether, dark-coloured greenstones. On this basis the Keewatin in Goudreau area was separated into three parts; an older group of light-coloured acid volcanics, an intermediate one of iron-formation, and a younger one of dark-coloured, basic volcanics. Later on, however, it developed that this classification is only approximate; that there are a few acid volcanics apparently younger than the iron-formation and quite a few basic volcanics older than it. Nevertheless, the subdivision was successfully used in searching for and locating belts of iron-formation not heretofore known, so it has some practical value.

An attempt to make a like threefold subdivision in Magpie-Hawk area failed. It is quite remarkable how many of the volcanics found in Goudreau area are also present in this area; but the distinction between acid and basic volcanics is not so pronounced. There are many of intermediate character, which could not be placed unhesitatingly in one division or the other, even on a lithological basis. It was also discovered, in the case of the Bartlett range, that the iron-formation does not lie between acid and basic flows but apparently within one acid tuffaceous formation.

The main structural relationships of the rocks are shown in Fig. 1.

### Pyrite and Iron Ores.

Pyrite, siderite and hematite are constituent part of the Keewatin iron-formation in Michipicoten District, and the pyrite deposits may be classed as range deposits for the most part. There are a few smaller bodies of high-grade pyrite presumably derived from the range deposits by solution, transportation and redeposition. There are still other small bodies in the

Pleistocene drift, where the drift has been replaced by pyrite sand and granular silica, deposited from the mineralized waters that drain off the iron ranges. Thus there are three distinct types of pyrite deposits in this district.

An example of a replacement deposit in the drift is shown in Fig. 2, which refers to the Rand Consolidated Company's pit at Goudreau. This deposit

Figure 2. Diagram showing geological relationships of the body of pyrite sand in the Rand Consolidated Company's pit, Goudreau. This body is younger than the Pleistocene drift.

is modern in age, and the concentration is so perfect that the sand shows 95 per cent pyrite by analysis. The Report discusses at length the probable process by which this pyrite sand was laid down, and remarks that the similarity between the recent replacement deposits and the Keewatin iron ranges is sufficiently remarkable "to suggest that the banded silica and pyrite of the latter may have been concentrated by processes of solution and redeposition analogous to those which manifestly gave rise to the younger deposits."

The iron formation is composed essentially of banded silica, pyrite and siderite or sideritic limestone arranged in stratiform form. The banded silica is so perfectly stratified that the whole iron formation must be assumed to have been deposited horizontally in the first place and over considerable areas. Later earth movements have complicated the structure to an inexplicable extent.

An effort has been made in Figures 3 and 4 to indicate the general stratigraphic character of the iron-formation by placing side by side cross sections of different parts of the ranges in both areas, those in Figure 3 representing surface exposures, whereas those in Figure 4 are from diamond-drill borings. The sections were selected so as to be as repre-

Figure 1. Diagram representing the main structural relationships of the rocks in Michipicoten district.

sentative as possible of the principal ranges examined. They do not, however, illustrate such extreme types as the body of siderite at Leg lake, Magpie-Hawk area, or the Dreany range, near mile 182 on the railway, which consists solely of banded silica.

The iron ranges vary in thickness from about 2 feet to 500 feet, and in apparent length from a few yards to more than 7 miles. They are associated exclusively with volcanic formations. No clastic sediments occur near them, with the exception of the conglomerate and sideritic greywacke on Parks lake, and these appear to be only a volcanic tuff modified by water action. As a rule the underlying volcanics are acid, and more or less tuffaceous. The overlying volcanics are prevailingly greenstones, especially in Goudreau area, where they are also ellipsoidal but the range east of Parks lake lies in part between acid flows and tuffs. There is nothing then in the environment of the iron-formation that suggests it to be sedimentary.

The successive materials passed through in drilling in this district are discontinuous, lenticular bodies more or less complexly imbricated, and drill holes must be placed fairly closely together before the sections can be interpreted accurately. But when any range is considered as a whole (see Fig. 3) the general sequence, namely, banded silica, pyrite (or hematite), siderite, is obvious and without exception, whether all three or only two members are present.

Among the properties described are those of the Nichols Chemical Co. lying immediately north-east of Goudreau Station on the Algoma Central, where in 1918 ore was being taken at the rate of 150,000 tons for the season, and 300 men were employed.

The Rand Consolidated Co. holds properties which are a continuation of the Nichol Company's main range known as the Morrison No. 4 Group. Another property owned by this Company is the Morrison No. 2 on which are two parallel iron ranges, on the southern range of which much diamond drilling has been done along a distance of 3,800 ft. These holes show a pyrite deposit ranging in thickness from 12 to 50 ft. at a depth of from 60 to 200 ft., which, assuming the ore body to be continuous between the holes, would indicate a probable ore content of 1,250,000 tons. The drill-core analyses are not available but it is intimated that a large part of the ore may not contain more than between 25 to 35 per cent of sulphur.

Considerable space is devoted to a description of the Josephine Mine, which is too long to quote here.

Figure 3. Cross-sections of iron formations showing the stratigraphic arrangement of banded silica, pyrite, and siderite, or sideritic limestone, and the topographic expression of each. I. Near middle of mining location J. L. 10, Goudreau area. II. Along east boundary of mining location A. C. 39, Goudreau area. III. Near east end of Cuthbertson lake, Magpie-Hawk area. IV. Near middle of the Bartlett group, Magpie-Hawk area.

Figure 4. Diamond drill sections of iron formations showing in more detail than Figure 3 the stratigraphic arrangement of banded silica, pyrite, and siderite, or sideritic limestone. The drill logs have been corrected so as to show true thickness in each case. I. Hole No. 15, C deposit, Nichols Company's property, Goudreau area. II. Hole No. 8, Morrison's No. 2 property, Goudreau area. III. Hole No. 16, Morrison No. 3 property. IV. Hole No. 8, Morrison No. 1 property. V. Hole No. 1, Bartlett property, Magpie-Hawk area between 950 feet and 30 feet. VI. Hole No. 111, Helen mine, Magpie-Hawk area between 450 feet and 850 feet.

Thirteen drill holes are said to have been put down, which indicate the presence of an oval area of iron ore, which, if reckoned on a basis of all ore carrying over 30 per cent metallic iron, would give an estimated content of 2,250,000 tons of hematite, or 1,300,000 tons at a 50 per cent metallic iron basis. At least 850,000 tons is believed to be recoverable.

### Gold.

Gold was reported from near Webb lake, Goudreau area, early in 1918. Considerable prospecting ensued during the summer of that year, trending in the direction of Missinabi station, on the Canadian Pacific railway. Fresh discoveries were reported during July and August from the east side of township 26, range 27. Only those within the Goudreau map-area, however, were visited by the writer.

The most important among these lie in the McCarthy-Webb group of claims situated just north of Webb lake. Small veins of the same appearance were seen near S.S.M. 1778 and also on the portage between Bearpaw and Pine lakes. At all three places the prospective ore-bodies are quartz veins intersecting on ash-grey feldspar porphyry, the second Keewatin formation described in this report.

**McCarthy-Webb Property.** Messrs. D. J. McCarthy and W. H. Webb, Sault Ste. Marie, Ontario, hold and are doing the assessment work on a group of seven claims situated around Webb lake, township 27, range 27. The gold-bearing veins lie north and northwest of the lake, in a small rocky area circumscribed by heavily drift-covered country. This area is underlain by a fairly massive feldspar porphyry, traversed in a direction of about north 60 degrees east by occasional shear zones a yard or less in width. The porphyry is intersected by two sets of veins, one parallel to the shear zones, one at right angles to them. A dyke of late Pre-Cambrian olivine diabase cuts across veins and porphyry alike.

Veins of the first set are vertical, from ½-inch to 18 inches wide, and rather crooked, as if they had been disturbed a little since they were formed. Individual veins do not appear to continue greatly in length, but veins and veinlets are commonly grouped lengthwise along-shear zones. They consist of white quartz carrying some pyrite and occasional small particles of visible gold. The schistified porphyry for 2 or 3 inches on each side carries pyrite and, when crushed and panned, yields finely divided gold.

Veins of the second set cut across the others at right angles and are plainly younger than the first set. They dip vertically but, unlike the first series, are clean-walled and occur singly. They are from 6 to 24 inches wide and apparently longer than the other veins. They contain the same association of white quartz, pyrite, and some visible gold, but in addition a surprisingly large amount of tourmaline in the form of shiny black, needle-shaped crystals. The cross-veins have not as wide margins of mineralized wall rock as the older group.

Though none of the veins seen in July, 1918, is large, there is an extraordinary number of them. Over a dozen were seen, and gold was observed in almost as many places. A majority are too narrow to be mined singly and too far apart for two or more to be exploited from a single opening. One of the vein-filled shear zones, however, is 4 feet wide and reported to carry gold across that width. There is also a mineralized width of 3 to 4 feet at one place close to the trail between Webb and Lovell lakes, where a cross-vein 18 inches wide intersects one of the Shear zones. Satisfactory assay samples were not obtained, but encouraging returns are said to have been obtained from cross-section samples collected by the owners.

General Sir Newton Moore, after visiting the steel and coal plants in Nova Scotia recently, expressed his opinion as follows: "What is essential is that production be increased to the maximum output of the plants and mines, thus reducing costs." This opinion may seem trite, but it is none the less true, and it has a much wider application than to the conditions of Nova Scotia.

### DON'T WORRY ABOUT ENGLAND.

Mr. J. B. Tyrrell, the well-known Toronto mining engineer, who has just returned to Toronto, from a business trip to England, is decidedly optimistic over the outlook in mining and commercial circles generally in England. English mining companies are largely interested in gold mines and Mr. Tyrrell says that the old established mining industries not only went on receiving small dividends during the war but the added price for gold as well. The South African mines do not have to sell in the English market now and when gold is selling as it does now for 129 shillings an ounce, the enormous profits being earned can be understood. The owners and shareholders of these mines, who had to economize closely during the war, find that the exchange may be against England in matters of trade, but in the matter of gold mining it is very much in her favor.

"So the gold miners are all feeling reasonably comfortable", said Mr. Tyrrell, "The shareholders in oil companies have also been doing well since the war. These companies had men out locating good new districts, but it was impossible at that time either to purchase or to conduct big drilling campaigns. Now the war is over and money can again be sent out of England for investment elsewhere. The result of the knowledge obtained during the past few years is being used and a considerable amount of money is being invested in oil territories in various parts of the world. In fact, during the war, while the nation was fighting desperately, a few of the older men were gathering information which they are now beginning to use for the advancement of British interests and British commerce. The time has now come when they are using that information. So while there may appear to be rather unrestrained speculation in London at the present time, most of it is founded on reliable information which has been collected during the past five or six years.

"The mining people are not worrying seriously over the exchange situation. True, it happens to some extent in the obtaining of funds in this country from England for steady investments where only a moderate interest could be expected, but it will not prevent of bringing out funds to Canada for mining development where there is a probability of substantial returns. If you can show a fair speculation and the chance of good returns they are ready to go in.

"Whatever the laboring classes in England may be doing, the financial men and mining people in London are hard at work. Work is the basis of success and as long as people are willing to work from morning to night there is no such thing as failure. The leaders in the commercial world of England have never worked so hard as they are working now and those in other walks are following their lead. While some may be crying blue ruin, it does not amount to much and there is no real reason for it. Unfortunately some of the worst abuse of England is Journal in the country's own newspapers. If one believed some of the London papers, he would be convinced that the British Government and executive were the biggest rogues in the country. Possibly the Irish people read these attacks and take them at their face value, but the people as a whole in England know how to discount these attacks."

### THE GOLD PAN MINES, MANITOBA.

Several hundred shareholders in the Gold Pan Mines, Limited, met in response to a call by the directors. A report had been received from R. W. Brigstocke, who recently sampled the property near Gold Lake, and the directors desired to sound the shareholders as to the proper action to take.

It will be remembered that J. B. Tyrrell, inspected the claim last October, but as at that date the shaft had not been unwatered, he could only form an opinion by surface examination and from hearsay. He was, however, impressed with the desirability of continuing exploratory work underground, and had expected to be able to return later in the winter and sample the Gold Pan, but was called at short notice to London. The property having been put into shape for an examination by Mr. Phillips, superintendent, the directors felt forced to find another engineer as they did not care to spend money in what might prove a vain quest. Their choice fell upon Mr. Brigstocke, who had worked in close connection with Mr. Tyrrell, and has for the past fifteen years confined himself closely to the pre-Cambrian formations. He is well known in Sudbury, Cobalt and Porcupine, having been manager of the Drummond silver mine, and the Long Lake gold mine, as well as acted as consulting engineer in numerous cases.

Mr. Brigstocke spent a couple of days taking samples, and came to an adverse conclusion regarding the property. Thus there were two reports which the directors desired to lay before the shareholders.

Almost unanimously, those present were of the opinion that exploration should be continued for several months, and at the end of such period a fresh examination be made, either by Mr. Tyrrell or some other engineer recognized as competent, and that the future should be regulated by the results disclosed by this third examination.

The meeting was called to order by Frank O. Fowler, who presided, and the minutes of the previous meeting together with the conflicting reports were read by the secretary, Gordon C. McTavish. A copy of Mr. Brigstocke's report will be mailed to each shareholder as soon as it comes off the press.

### GOVERNMENT ENGINEER RECOMMENDS BUILDING OF LAND AND WATER ROAD TO RICE LAKE, MANITOBA.

Recommendations by V. H. Campbell, engineer of the provincial reclamation department, for the construction of a summer road to the Rice Lake goldfields, were received by Hon. George A. Grierison, minister of public works, today. Mr. Campbell recommended that communications with the goldfields be opened by means of water transportation and the construction of a summer road 14 miles long, to cost approximately \$15,000. He also recommended as the best method of opening the goldfields, the construction of a light railway from Great Falls, on the Winnipeg railway, into the interior, a project which would entail an expenditure of approximately \$350,000. It was announced today that the latter recommendation would not be considered by the government at present.

The plan which will receive government approval is the water and land route, it is stated. Launches will be employed to traverse the Winnipigon river to Bellevue landing, a distance of 4 miles. From there a summer road will be constructed for a distance of 14 miles to Caribou lake, in the heart of the mining country. This road would traverse a country part of which is thickly covered with spruce and poplar and the remainder with granite boulders. From Caribou Lake, the major portion of the mines are within easy canoe distance.

It was also announced that the construction of the road would be contingent upon an undertaking on the part of the mine owners to furnish the launches necessary to carry material over the water route. On the road recommended by Mr. Campbell there is only one portage, in contrast to the present one, which has fifteen.

### TEXT OF TELEGRAM SENT TO OTTAWA BY THE MINING SOCIETY OF NOVA SCOTIA.

"It has come to the notice of the Council of the Mining Society of N. S., that owing to the inadequate salaries paid by the Survey and Mines Branch of the Geological Department, some of the staff have been forced to resign. In the interest of the Mining Industry we wish to protest against the scale of salaries now being paid to such highly trained technical men whose services to the country are of such value. We would urge that steps be taken immediately to make the salaries paid sufficient to attract and retain for the services a class of men of the standard, formerly associated with the work of the Department."

### Text of Resolution adopted by the Mining Society of Nova Scotia re Salaries of Geological Survey.

RESOLVED—That the Council recommend that at the forthcoming Annual Meeting of the Society the Secretary be requested to communicate with the Canadian Mining Institute, the Canadian Society of Engineers and any other Canadian Society interested in the development of the mining resources of the Dominion, to the end that united action be taken by all representative of the mining industry of Canada to bring to the attention of the Minister of Mines, Ottawa, the present unsatisfactory status of the Geological and Mining Departments of the Government, and in connection with the foregoing, to urge that in view of the great importance at the present time of the utmost development of the mines of Canada which the Geological and Mining Branches of the Canadian Government could assist materially, the mining fraternity view with the greatest alarm the depletion of the staff of the Geological Branch by the recent resignation of several of its most experienced and valuable members, due principally to the low scale of remuneration prevailing in the department, urges on the Minister of Mines the complete reorganization of the Department including the uniting of the Geological and Mining Branches under one executive head, and providing for a salary scale and such regulations as to service under the Mines Department as will attract and hold the services of the geologists and mining engineers of experience and repute, and further encourage graduates of our engineering universities to enter the service of the Department with a view to its being their life work.

# Our Northern Ontario Letter

## THE SILVER MINES.

As time goes on and the New York quotations for commercial bar silver show no signs of receding, and, as the rate of exchange between Canada and the United States continues to rule high, the first-named condition is gradually being accepted as more or less permanent. The high rate of exchange, while not expected to long continue as at present is nevertheless believed to be a condition to reckon with for at least several months, although it may have a gradual decline.

Provided these fairly generally accepted conclusions prove to be correct, the net profit to be derived from the operation of the silver mines of Cobalt during 1920 may be expected to surpass any previous record. To-day the leading mines are realizing more than \$1 an ounce net profit on the silver they produce. Even at the smaller mines, believed some time ago to be "on their last legs," so to speak, the margin per ounce of net profit now going to their treasury is almost equal to the gross value of their entire output had quotations remained as in the opening year of the late war.

Max Morgenstern, of New York, minority share holder in the Buffalo Mines has failed to secure an injunction restraining the company from passing a by-law authorizing the sale of the company's assets to the Mining Corporation of Canada for \$462,000. The application was dismissed in the absence of any proof of fraudulent intent being established. As a consequence of this, it would appear, the Mining Corporation will now be free to carry out its proposed scheme of development on the recently acquired Buffalo Mine.

Development work on the University property of the La Rose Consolidated has recently resulted in opening up encouraging quantities of high grade ore. As a result of this as well as the expectation that the annual report for 1919 will be quite favorable, the La Rose is attracting more than usual attention.

Reports published in some of the Toronto papers that the Trethewey had made another shipment of high grade ore from its Castle property at Gowanda, are not correct. These reports had it that \$60,000 worth of ore had just been sent out. The truth is that the Trethewey is making good headway in the development of the Castle, and is meeting with exceptionally favorable results. Early in January a shipment of about ten tons of high grade ore sent to Cobalt for treatment. As regards the present, there is no indication of a shipment for another month or so at least. It is learned that about five tons or so is now in bags at the mine as a part of that being assembled for the second shipment.

A plan is under way to bring about a merger of the Adanae mine with the Victory Silver Mines. The latter was formerly known as the Hvlands property and was only recently taken over under the new name. It is situated between the Ophir and the Gifford Extension, and lies within 660 feet of the Adanae. The plan is to merge the two properties, with a capitalization of \$2,500,000 shares divided into 2,500,000

shares of the par value of \$1 each. Of this, 1,000,000 shares are to go to shareholders of the Adanae and 1,000,000 shares to the Victory Silver Mines, thus leaving 500,000 shares in the treasury with which to finance operations. It is believed that the acquisition of the Victory Silver Mines' property would greatly strengthen the outlook for the Adanae, as it comprises a piece of territory where geological conditions are very favorable which has not been explored. Provided such a consolidation were to be carried out, the shareholders of the Adanae would receive one share of the new issue for three shares of the old, and would have the advantage of the money to be derived from the sale of half a million treasury shares for development work, as compared with a depleted treasury as at present.

The mining interests of the province of Ontario have formed themselves into a new organization known as the Ontario Mining Association. Their aim will be to assist the mining industry. Contrary to intimation in press despatched, the organization will not play politics but will bend its effort toward closer cooperation between all concerned. The officers appointed at the first meeting are provisional. Permanent officials will receive endorsement at a subsequent meeting. This may be held in Toronto during the second week in March at which time a large number of mining men will be there for the purpose of attending the 22nd annual meeting of the Canadian Mining Institute, to be held in the King Edward Hotel, on the 8th, 9th, and 10th of March.

The Dodds property, having been purchased by Toronto and Montreal interests, is now figuring in a merger with the Silver Bullion property. Both properties are in the Leroy section of the Gowanda district. The merger is to have a capitalization of \$1,500,000 made up of 1,500,000 shares of the par value of \$1 each. It is stated that no stock will be offered for sale, the proposition being more or less a close corporation, the finances for development work being raised privately.

## JANUARY ORE STATEMENT

Following is a statement of ore shipments over the T. & N. O. Ry., for the month ending January 31st, in tons of 2,000 lbs.

	Silver Ore.	Tons.
Cobalt Proper.		
1. Crown Reserve . . . . .		19.97
3. Dominion Reduction . . . . .		29.00
2. Coniagas . . . . .		125.95
4. Hudson Bay . . . . .		30.81
5. LaRose . . . . .		106.99
6. McKinley-Darragh . . . . .		107.98
7. Northern Customs . . . . .		43.96
8. O'Brien . . . . .		64.01
9. Peterson Lake . . . . .		30.54
10. Temiskaming . . . . .		92.54
11. Trethewey . . . . .		71.03
		722.78

The above shipments were made to the following Companies:

CANADA

Coniagas Reduction Co., Thorold.....	68.14
Deloro Smelting & Refining Co., Marmora..	263.93

UNITED STATES

American Smelting & Refining Co., Pueblo..	252.19
American Smelting & Refining Co., Perth Amboy . . . . .	30.54
Pennsylvania Smelter, Carnegie. . . . .	107.98

722.78

Price of Silver.

Jan. 12th. Highest . . . . .	137.000
Jan. 16th. Lowest . . . . .	128.500
Average . . . . .	132.827

THE GOLD MINES.

The premium on United States money continues to be an important factor in swelling the amount of revenue at the gold mines. In discussing the matter with the correspondent of the Canadian Mining Journal, A. F. Brigham, general manager of the Hollinger Consolidated, stated that while such a premium was quite welcome under the circumstances, yet a condition resembling normal was much to be preferred.

The labor supply at the gold mines continues to improve gradually, and the efficiency of the men has improved. With 1,100 men and 58 machines employed, the Hollinger is now treating an average of about 2,300 tons daily, or an average of well over two tons per man on the pay-roll. This compares with a low record of less than one and a half tons about the time the armistice was signed with the Central powers. Current costs are \$4.77 per ton, and mill heads average around \$8.75 a ton. The average value of the ore in reserve is estimated at \$9.09 per ton, and it may thus be seen that the policy of the management is exceedingly conservative and that the physical condition of the mine is being strengthened rather than impaired. From 170 to 180 stamps are being operated, the balance of the total of 200 not yet having been brought into play. As regards future plans, it is officially learned that instead of sending a large volume of ore through one main haulage level as was the former practice, it has been decided to establish a complete electric haulage unit at intervals of every 150 feet in depth, beginning at 500 feet. This will avoid too great a centralization and attendant congestion. While endeavoring to pay as high wages as possible so as to attract adequate men to the mine, the general manager is also keeping in mind that while paying dividends which represent only reasonable interest on the capital invested, he must also provide earnings which will represent a reasonable return of capital involved.

The directors of the Dome Mine will pay a visit to the property about the end of February. The president, Mr. Bache, will not visit the mine until after the close of the company's fiscal year, March 31st. As regards achievements at the Dome, nothing of an official nature has been given out for some months. Reports that mill heads have been ranging from \$7 to \$8 per ton have been interpreted in the North as an indication that the physical condition of the mine may be impaired. As to this, the interpretation may be entirely wrong, but in the absence of official information such a belief is gaining ground. In the meantime, with a force of between 300 and 400 men on the

pay-roll and the steady shipment of gold bullion from South Porcupine lends to the operation an outward appearance of prosperity. In connection with the option which the company holds on the Dome Extension, it is intimated in usually well informed circles that a request may be made for an extension of six months time.

The Clifton-Porcupine has everything in readiness to turn on electricity on March 1st at which time the number of machines employed will be doubled from two to four. At present development work is being carried on at the 200-ft level. It is proposed to cross-cut east and west over a total length of about 800 feet for the purpose of opening up eleven known veins. Accordingly as these veins are opened up, the policy will be to drift along those which appear to be the most important. Up to the present a substantial tonnage of ore has been opened up on the Boulder vein. A two-ton shipment was made recently to the Temiskaming Ore Testing Laboratory at Cobalt for the purpose of testing its value.

The McIntyre Porcupine main shaft is nearing the 1,600 ft. level and is soon to become the deepest shaft in this country. Ore deposition is being found to continue without any signs of diminution. The mill at present is treating upwards of 550 tons daily and the output is not far under \$6,000 every twenty-four hours. A force of approximately 360 men and about 30 machines are employed.

Reports are current that the controlling interests of the Porcupine Lake Gold Mining Company are considering a plan to resume work in the spring. The property is situated at the North end of Porcupine Lake and has been idle for some five years. When operated in 1914 a shaft was put down about 285 feet. Ore deposition was found to be more or less patchy, but would appear to offer inducement to proceed further with exploration work.

It is learned that the Tashorn Mining Company may decide to arrange for the re-opening of their property situated at Tashota in the Kowkash mining district. Whether or not the plan includes a re-organization, sale, or private capital advancement had not been learned. It will be recalled that this was about the only property to be explored to any very great extent following the rush of prospectors to the Kowkash field some years ago. The result of work at that time on the Tashorn was generally understood to have been favorable. A shaft was driven to a depth of something like 200 feet, and considerable drifting was done.

The Lake Shore Mine at Kirkland is operating on a normal basis, and mill heads are again running high. From achievements during the opening month of the new year, it is evident that the 1920 yield will greatly exceed that of 1919. A full force of men has served to bring the mill up to full capacity.

At the Wright-Hargreaves all is in readiness to proceed with the installation of the big new mill. All the heavy parts have been transported to the mine, and with the arrival of spring the work of placing the concrete foundations will be commenced, following

which the installation of the equipment will take place. It is believed that barring unforeseen obstacles the Wright-Hargreaves will be treating close to two hundred tons of ore daily before the end of the summer. The mine is situated adjacent to the Lake Shore, has the eastward continuation of the Lake Shore vein system, and is under efficient management. It owns nearly three-quarters of a mile in length of the auriferous zone which has made the Kirkland Lake camp an important gold producer.

At such properties as the Ontario-Kirkland, the Canadian-Kirkland, Green-Kirkland, Bidgood and Fidelity, advice received is such as to arouse general optimism over the likelihood of the extensive growth of the camp.

The new mining plant on the Mondean property of the Peerless Mining Company has been placed in operation, and underground operations have been resumed at full blast. A force of about 40 men are employed. It is stated that the Timmins' interests of the Hollinger are interested in the exploration and development of the Mondeau.

The station at the 500-ft. level of the Miller Independence mine has been completed and the work of driving a cross-cut north to the downward continuation of the rich ore body is to commence at once. It will be recalled that the gold tellurides found some time ago caused somewhat of a sensation. The sinking of a central shaft so as to cut the ore body at a depth of 500 feet followed, and as this program nears completion it is becoming the centre of considerable interest. W. E. Simpson, the newly appointed general manager has taken up residence at the mine.

#### MORETON FREWEN POINTS OUT NECESSITY TO INCREASE SILVER PRODUCTION TO PROTECT OUR GOLD RESERVES

N. Y.—Moreton Frewen, British economist and authority on silver says: "The Wall Street Journal of Feb. 9, contains a digest of our Board of Trade figures from the Manchester Guardian which presents the most interesting exchange position in modern economics. The writer has spent much time in the far East, and the press of this Continent has never perhaps taken seriously my conviction that the great and new industrialism of Asia, showing itself in the cotton mills of Bombay, the jute mills of Calcutta, the great iron industries of Hankau—a hundred more, were created and their baneful competition fostered by low exchange and equally that the low exchange value of silver was destroying your exports to Asia of cotton and wheat and lumber and steel rails.

"Before giving figures of the cotton trade arising from the recent great jump in silver, let me refer to the then quite unprecedented fall in silver in 1907—the greatest fall in any 18-month period, particularly marked during the last nine months of 1907. Elihu Root, then secretary of state, at request of Senator Lodge sent a circular to all your consuls in Asia asking information. The circular was sent out some months too soon to secure maximum results in ease of remote provinces in China. But the replies were most educational and were all the same way. I must confine myself to a single small table from Consul Greene at Dalny, in Manchuria:

#### Dalny Value of Imports.

	Cotton Goods	Flour Exchange
March quarter, 1907	\$709,969	\$301,123 .57
December quarter, 1907	204,904	73,969 .47

"Still only half awakened and relying chiefly on what Prof. Francis A. Walker had written me in 18-94, that the world-wide financial crisis had resulted from the great break in silver exchange in 1893, you may recall perhaps that in early months of 1907 I anticipated a great financial crisis at hand, publishing this forecast in many newspapers and reviews here and in England.

"Now let us look at the figures from the Manchester Guardian. The sterling rise in silver last year was from 48½ pence in January to 76¼ in December. In January England's export of piece goods to China was six million yards, in October it had risen to 45 million yards and in November was over 40 millions. I expect when we get the returns for December and January the figures will be more sensational still.

"Thus much China; but in case of India every effort was made by her government to tie the rupee down to 16 pence. You recall the flagitious attempt by Lord Reading to purchase in advance all the silver product of this continent at 86 cents an ounce—an attempt happily frustrated by Emmett Boyle and the other western governors. So that the Indian figures, unlike the China figures present a tampered silver exchange, not a free exchange—they represent a final and despairing effort by the government of India to tie silver down and for that very reason a comparison of Bombay and Calcutta cotton imports with the Chinese 'free silver' exchange is all the more interesting. Whereas, then England's piece goods exports rose within the twelvemonth 600%, these exports to Bombay and Calcutta barely doubled (50,000,000 yards to 100,000,000).

"I need hardly point out that the present premium on your dollar and present discount on our pound sterling, if these should continue, will build up your cotton exports to China and India at expense of England. There is today an exchange premium behind your cotton export to, say Shanghai, represented by the full fall in sterling exchange. Massachusetts for three Shanghai taels gets five gold dollars, Manchester for the same three taels gets not a sovereign, but only eleven-sixteenths of a sovereign. Although it is far from clear at this moment what the government of India is aiming at, one point is certain, they have fixed their rupee exchange at such a price that silver can never again fall below 129 cents an ounce. As this becomes generally recognized, new silver mines should be opened and the silver urgently needed to protect our western gold reserves against the Asiatic drain should be forthcoming. But the expansion will require time. Which is to win in this terrible race the man in the silver mine or the man in the pulp mill?

"Let me appeal confidently to public opinion here to express itself as the accumulating evidence presents this mighty exchange problem more fully. It is a problem on which all other exchange problems turn. From the Babylonian era, as Prof. Max Muller pointed out, at what time the ratio was 1 to 14, until 1873, because of 'free coinage' at leading mints the ratio of value of the two metals in the world's market varied never more widely than between 1 to 14 and 1 to 16. Calonne's French Mint law the law, the law of 1903, is simplicity itself and is invincible in its

simplicity. Let me leave it on your pages for a new generation to admire.

"To every person bringing to the mint 1 kilo of gold, nine-tenths fine the same shall be given back to him transformed into 155 disks of 20 francs, of which the total shall be reckoned at 3100 francs. And to all persons bringing 1 kilo of silver nine-tenths fine, the same kilo shall be returned to him coined into 40 five-franc pieces of which the total shall be equal to 200 francs. The debtor may tender these gold and silver disks at his option and can obtain for them a full receipt for his debt."—Boston News Bureau.

Detroit, Mich. Feb. 20|20.

The Editor,  
Canadian Mining Journal.

Dear Sir:—

The effort of the mining engineers of British Columbia to receive government recognition if not entirely successful will have accomplished much in that it has once more started their Eastern brethren thinking and talking on the subject. Thought and words following a good sample should beget action. In the vernacular of the day "They started something". I do not intend to comment on the British Columbia action as the Journal has covered their case both pro and con very ably. However I would like to point out that recently the engineers of Ontario had an opportunity to insert an opening wedge which seems to have been entirely overlooked.

Last year as we all know the Ontario Government framed a remarkably good blue-sky law—remarkably good inasmuch as it afforded great protection to the investing public and made provision for its own enforcement. The reason the law was drafted was because public sentiment demanded it—get that—public sentiment demanded it. But certain "so-called" brokers saw where their combs were going to be cut and hurried long dispatches over the wires to the Toronto papers telling of the great indignation and dissatisfaction among mining men throughout the north. Being in the North at the time both in Cobalt and Porcupine I had an opportunity to discuss the provisions of the law with several men who were claim owners and therefore most deeply interested. The majority of these men seemed inclined to favor it and certainly weren't tearing the rugs with rage as we were lead to believe by newspaper reports. But certain elements saw the handwriting on the wall and proceeded with all their might to do battle for their very existence. With the help of all whom they could coax or coerce they attacked the bill in its one vulnerable point—namely that political influence would largely determine the findings of the government officials appointed to enforce the law.

Here is where the engineers lost their opportunity. The government wanted to pass the bill but the first rule of politics is "If you can't make a friend don't make an enemy." Now if the engineers had offered to form themselves into a body patterned for example like the Ontario Land Surveyor's Association and take over the duties that were to be assigned to the different district inspectors, the government would have been forced to accept the offer to save its face with the public and the broker's argument re political influence would have been met. Those who read the draft of the bill will agree that any qualified member of an association with an iron-bound set of

rules and definitions could meet the terms of the bill with fairness to all concerned.

Maybe it's not too late yet for although the Ontario Govt. has changed public sentiment throughout the country demands something in the line of a blue-sky law. How are engineers organized and equipped to get what they are after—government recognition through the medium of this law? Last time one element of the mining community put up a real fight and got what they wanted. Why can't the engineers be next

Trusting that the Journal can scare up a little action or discussion on the subject from its readers who are better qualified to speak than myself, I am

Sincerely,  
Dion S. Halford.

### C. M. I. TORONTO MEETING.

Provisional programme, Monday, March 8th.

#### Morning Session.

Addresses of Welcome; Presidential address by D. H. McDougall; Mineral Statistics for 1919 by John McLeish, T. W. Gibson, T. C. Denis and W. Fleet Robertson (or by proxy); General business: Status of the engineer, etc.

#### Afternoon Session.

"Ferro-Alloys in Canada," by G. C. Mackenzie; "Electric Smelting of Tin Ore," by B. G. Cobb; Two papers on the Plate Mill of the Dominion Iron and Steel co., and one on "Economies in Steel Plant Management," being arranged for by Mr. F. W. Gray, Secretary, Iron and Steel Section; "Iron Ranges of Michipicoten District, Ontario," by W. H. Collins.

#### Evening Session.

"The Mining and Smelting Operations of the International Nickel Company of Canada," written by The Company Staff. (Lantern slides); "Operations at Alfred Peat Bog" (illustrated by moving pictures), by A. A. Cole; "Some Aspects of the Mining Situation in the Middle West," by R. C. Wallace.

### Tuesday, March 9th.

#### Morning Session.

Formation of Proposed Coal Section of the Institute; "Coal Mining in the Province of Alberta," by J. T. Stirling; "Fuel Problems of Western Canada," by W. J. Dick; "Coal Supply of Canada," by F. W. Gray; "Lignite in Saskatchewan," by A. McLean; "Briquetting Industry," by E. Stansfield.

#### Afternoon Session.

"Future Prospects for Oil and Gas Production in Ontario," by M. Y. Williams; "Natural Gas in Ontario," by E. S. Estlin; "Oil Possibilities in Western Canada," by D. B. Dowling; "Oil Problems in Canada," by T. O. Bosworth; (Subject to Dr. Bosworth's being in Canada).

#### Evening Session:

Smoker and Concert in Pompeian Room; (Chairman, Mr. G. G. S. Lindsey and Colonel J. J. Penhale).

### Wednesday, March 10th.

#### Morning Session:

Discussion on Institute's Prospecting Scheme, following an address by J. A. Campbell, M.P., on "Attitude of Canadian Governments toward Mining Development"; "Britannia Mines, British Columbia," by S. J. Schofield; "Progress Notes on the Investigation of the Quebec Asbestos Deposits," by R. Harvie and E. Poitevin; "Asbestos Mining," by J. G. Ross.

**Afternoon Session:**

Discussion on nickel coinage; "Lost Placers of Ontario," by A. P. Coleman; "Recent Developments in Mining in Northern Ontario," by J. G. McMillan; "Geology of Silver Islet and Vicinity," by T. L. Tanton; "The Nipissing Mine," by H. Park; "Minerals of Eastern Ontario," by J. W. Evans.

**Evening.**

ANNUAL DINNER at 7.30 p.m. in the Pompeian Room.

**British Columbia Letter****METAL MINES**

Victoria, B.C. Further evidence that the prospectors are proceeding with their organization in this Province is obtained in reports from Rossland and Hope of the launching of local associations. At Rossland officers have been elected and the machinery prepared for action. The prospectors of Hope, however, are somewhat in advance of this, having passed a resolution for submission to Hon. Wm. Sloan, Minister of Mines, putting themselves on record as viewing with alarm "any proposed legislation which may have a tendency to discourage capital or to lessen the prospectors' chances of reward by placing iron or other ores on the reserve list, ultimately causing him to either abandon his vocation or leave the Province for some other more favorable field." This, no doubt, has reference to a statement made in the "Kings's Speech" on the opening of the Legislative Assembly that legislation might be expected to be placed before the House reserving some of the iron ore deposits of British Columbia in order to facilitate the promotion of the iron and steel industry.

Mining men anticipate that some important amendments to the Placer Mining Act of British Columbia will be considered by the Provincial Legislature during the session now in progress. That changes are in contemplation cannot be doubted inasmuch as the Minister of Mines has made no secret of his dissatisfaction regarding present conditions and of his desire to enunciate a policy calculated to open up placer areas privately held without development. As in all cases of proposed changes to long established law and customs the problem is to work out a method that will have the result sought without imposing anything open to fair criticism on the ground of inequity or injustice.

The position obtaining in this Province with respect to placer mining is that there are over 1100 placer mining leases of which only something over 170 are fully paid up in regard to their rentals. The arrears as can be readily understood when it is stated that the annual fee for a creek claim is \$75 and that for a bench claim \$50, and that \$1000 assessment work is required to be recorded on each lease amount to a very considerable sum in the aggregate. Some have estimated that it totals \$600,000. It is true that the Placer Mining Act contains a provision that the Minister of Mines may cancel any placer lease in arrears of rentals but it is also a fact that the Act permits extension of a period of grace to placer lease holders on their advancing good cause for the benefit of such concession. It is only necessary to refer to the extremely onerous conditions the placer miner has been facing during the past few years to indicate the explanation of what has led to the present unsatisfactory situation.

Mr. Sloan is anxious that placer mining in British Columbia shall be placed on a new footing, with no hardship, if possible, to those who have been engaged in it in the past. While the contemplated amendments have not yet been placed before the Legislature there can be no doubt that, when drafted and submitted, they will be the crystallization of much investigation and matured judgment. It is thought likely that the fees will be reduced, especially in respect of the amount of assessment work required, the same being placed more on a par with the terms of the Mineral Act, only \$100 assessment work per annum being asked for on a lode claim. Probably some equitable arrangement will be made for the payment of arrears on leases held by individuals or companies which have been under development or upon which it can be satisfactorily shown that development is planned. But such ground as is held, manifestly, for purposes of speculation no doubt will be thrown open, the leases being cancelled.

That such legislation will be endorsed cannot be questioned as the importance of stimulating the gold production of the country is generally recognized.

With the acquirement by the Consolidated Mining & Smelting Company of a bond on the Big Interior Group of Mineral Claims, situated about ten miles from the head of Great Central Lake, Vancouver Island energetic development of the property is expected. In his preliminary report for the year 1919 Wm. M. Brewer observes that "it has been handicapped by lack of transportation, also because, although there is good reason to consider that the ore body is so extensive as to promise a tonnage possibly equal to the Hidden Creek Mine of the Granby Company at Anyox or the Britannia Mine, yet the expense of proving its value will necessarily be so great as to tax the resources of any except a corporation as wealthy as the Consolidated. Reference too, is made to the Great Central Lake is likely to overcome the transportation problem should the property prove up to expectations on exploration and development.

The Lucky Four Group, situated on the Cheam Range of Mountains in the New Westminster Mining Division, is another property in which capital has become interested, it being authentically reported that a half interest has been secured by the Guggenheims. Wm. M. Brewer's 1918 report on this property stated that copper ore, almost exclusively chalcopyrite, occurred in a wide zone or stockwork of metamorphosed argillites in which occur many narrow quartz veins. The line of strike of this formation is N 65° W. and dip nearly vertical, with high angle towards the north, so far as can be determined from the present condition of the prospecting work that has been done. The stockwork is bounded on the northerly and southerly side by granodiorite which on the southerly side has a pronounced gneissic structure near the occurrence of ore. Apparently the metamorphosed argillites to a great extent form a capping covering bodies of solid ore." He adds that "from such an examination of the surface as is possible under present conditions the statement is warranted that the property bears all the indications of developing into one of the big copper mines of the Province," but promising to produce ore of a considerably higher grade than that of either the Britannia or Hidden Creek Mines.

Recent reports as to developments on the Indian Chief Group of Mineral Claims, Sidney Inlet, being carried on by the Tidewater Copper Company are extremely satisfactory. This property now is under the general management of H. W. Price who came to British Columbia from the management of an important South American producer. The underground workings have been extended about 600 feet, the Mill at the beach has been remodelled, its capacity being increased to treat about 200 tons of ore a day and water power developed to run the Mill, Compressor, and Electric Light Fans. A new ore body has been discovered on the northerly side of the mineralized zone, which has been crosscut for about 80 feet up to November 4th last. The face then still was in ore assaying 2.62 in copper and from a point 30 feet from the portal to the face on the date indicated the ore averaged 3.96 per cent in copper.

While on the subject of oil exploration in the Peace River it may be noted that the D'Arcy Exploration Company, said to be subsidiary to the Anglo-Persian Oil Company, again is seeking, through a local representative, to obtain certain concessions with regard to that part of the northeastern section of the Province in question. The Company's claims are reported to be endorsed by the Vancouver Board of Trade. The Company asked for the exclusive right of exploration over a block of land sixty miles square. Five years is wanted to carry its work to the point where only one-tenth of the area will be held. In return it undertakes, besides initiating a thorough exploration and, in the event of success, the establishment of an industry on a scale commensurate with the importance of the discovery to hand the Provincial Government the equivalent of one-eighth of the product at the casing head. Hon. John Oliver, Premier, and Hon. T. D. Pattullo, the minister directly interested, backed by the remainder of the government, are understood to be strongly opposed to the granting of any such concession.

An Order-in-Council has been gazetted at Ottawa doubling the rental on oil and natural gas locations in the western provinces and giving the Minister of the Interior greater control over oil and gas development. The rental in future will be 50 cents an acre for the first year and \$1 for each subsequent year, such increase to apply on all applications submitted after March 1, 1920. Section 40 of the Petroleum and Natural Gas Regulations is rescinded and the following clause substituted: "A Company acquiring by assignment or otherwise a lease under the provisions of these regulations shall be a company registered or licensed in Canada and having its principal place of business within His Majesty's dominions."

Slocan, B.C. Activity continues in the silver belt of the Slocan, B.C. In addition to properties already mentioned development is in progress on the Anna, Meteor, Republic, Tamarack, and Twelfth of July Group. The Meteor was bought by W. A. Buchanan from George H. Aylard and associates. A long crosscut is being driven.

Alice Arm, B.C. Cold weather of exceptional severity has been experienced this winter at Alice Arm. The townspeople were forced to cut through the ice to permit a boat from the outside to reach them. Passengers, freight and mail, however, were taken off

and the trying situation of the residents was much relieved. The launch which has been making regular trips to Anyox, B.C., according to last reports, is frozen to the dock.

### THE COLLIERIES

The Settlers Rights Act of 1919, passed by the Legislative Assembly early in that year and which did not receive the signature of the Lieut.-Governor pending advice from the Ottawa authorities, has been disallowed by the Dominion Government. The position taken by the Federal authorities is that the legislation is in conflict with the terms of the Order-in-Council under which the Settlers Rights Act of 1917 was vetoed. It is considered likely that the Provincial Government will ask the Legislature to re-enact the measure, its stand being that nothing is proposed under its authority that is not well within Provincial administrative rights.

To those interested in the coal mining industry in British Columbia the issue of this controversy is of importance. The Act of 1917, which was not disallowed before a number of Provincial Licenses had been issued, is responsible for the opening of the Cassidy Collieries of the Granby Consolidated Mining Smelting & Power Co., Ltd. These licenses, under which the Granby Co. is operating on Vancouver Island, now are the subject of litigation. The Settlers Rights Act of 1919 extended the period in which pioneer settlers within the Esquimalt & Nanaimo Ry. Belt, or the descendants or legal heirs of old-time settlers, could obtain title to the coal rights within the area of their realty holdings.

The Government of British Columbia has passed an Order-in-Council reserving for the people all the unalienated coal lands within the Province. This means that hereafter staking under the Coal and Petroleum Act is forbidden. Hon. T. D. Pattullo, Minister of Lands, explains that it is the definite policy of the Government to put an end to alienation in respect of coal lands as already there are coal bearing areas, to which Crown Grants have been issued, which are being held out of production merely for speculation. He adds that it is proposed that use is to be the basis of all British Columbia alienation policies. This is taken to mean, in the case of coal for instance, that no part of the public domain may be taken up by individuals or corporations unless satisfactory guarantees are forthcoming that it is their intention to take immediate steps to make it productive.

The Jingle Pot Mine, B.C. Coal Mines Ltd., which property is situated near Nanaimo, B.C., has closed down after having been in operation since 1907. Although the area of coal bearing land controlled by the Company was small—only 71 acres—approximately 800,000 tons of coal were taken from the Mine during the twelve years, or an average of about 11,266 tons per acre. The highest daily production was attained in the year 1912 when the day's output averaged 525 tons. The somewhat odd name "Jingle Pot" is said to have been derived by a unique method introduced when the mine opened up for underground signalling. An ordinary iron pot was hung up inverted, a piece of railroad steel being suspended and used as a bell clapper. From the jingling sound which this device made spring the mine's name.

## BOOK REVIEW.

**A HANDBOOK FOR NEW CANADIANS**

In the lumber camps, in the vicinity of steel works, and at coal and metalliferous mines in Canada, there has for a number of years been proceeding an unostentatious but worthy work, now called the Frontier College, but formerly and perhaps better known as the Reading Camp Association, under Mr. Alfred Fitzpatrick, which has for its object the Canadianizing of the newly arrived immigrant, so that he may become a help to this country and not a disturbing and unsettling force. The writer, during his connection with the coal and steel companies of Nova Scotia, had occasion to come into personal contact with the endeavours of Mr. Fitzpatrick and his associate, and desires to bear testimony to the impression then gained that this work was pursued with such excellent and pure motives, and such good results; under such conditions of personal sacrifice and absence of gain, as to be a source of refreshment and almost of wonder to observers. The instructors of the Reading Camp Association merely asked for employers of labour the permission to erect a tent or frame building in which to hold the classes, and, after working themselves as day labourers and thereby supporting themselves, these instructors would spend their evenings teaching to foreigners the rudiments of English and the principles of our Canadian citizenship and popular government.

Mr. Fitzpatrick has now published a volume designed as a primer for newly arrived Canadians. This primer is drawn up from full personal experience of the outlook of the average immigrant from Continental Europe. As Mr. Fitzpatrick says in his preface: "The immigrant finds himself in the midst of new conditions. He lacks the language and everything combines to make him the prey of unfavourable circumstances. Even the better informed of his own race, already in Canada, are sometimes ready to take advantage of him. Particularly does this apply to the masses of unskilled labourers."

Mr. Fitzpatrick's reference to the exploitation of newly arrived foreigners by his own countrymen in Canada is not strained. They are oftentimes the very worst foes of the newly arrived immigrant, who are rack-rented and overcharged for supplies in a shameless manner. Usually the gentlemen who thus take advantage of their knowledge of the immigrant's language combine the illicit sale of bad liquor with their other commercial enterprises, as all residents of mining camps will bear witness.

The "Handbook for New Canadians" contains practical information about Canada, about employment and modes of payment, banks, remittances of money, schools, the police, the seasons, birds, animals, and many other things that are all new to the immigrant. Information is given about our geography, our form of government, and Canadian history. A specially valuable chapter is that on naturalization, which the book urges should be regarded as a prize to be striven for, and as a badge of honour to the new Canadian. A vocabulary of common words in parallel columns of Italian, French, Swedish, Ruthenian and Yiddish is given compared with the corresponding English word idiom. The book is a real text-book of Canadianism, and employers will be helping along

a good work, and materially assisting themselves by giving it circulation among their foreign employees, and by also giving to the Frontier College the small assistance that it asks.

Ed.

**MINING INSTITUTE MEETING WILL BE BEST EVER.**

At the meeting of the Toronto branch of the Canadian Mining Institute on Saturday Feb. 21 further progress on preparations for the Annual Meeting March 8—10 was reported. Dr. W. G. Miller, who presided at the meeting in the absence of Mr. C. E. Smith, stated that he had seen most of the papers that are to be presented and that he believed them to be of high order and that they would make the technical sessions very interesting. Mr. C. W. Knight, secretary of the meeting committee announced that arrangements have been made to have special cars, pullman and diner for the trip to the International Nickel Refinery at Port Colborne on Thursday. It is expected that many will wish to take this trip and those doing so should advise the excursion committee, of which Dr. T. L. Walker is chairman, early. The Smoker and Concert on Tuesday evening is to be one of the rousing old time parties, with Col. J. J. Penhale and Mr. G. G. L. Lindsey in charge. Those wishing to attend should advise Assistant Secretary Rose on the first day of the meeting so that arrangements can be made to seat everyone. Those who wish to attend the Dinner on Wednesday evening should notify Mr. Rose not later than Tuesday.

Two of Ontario's biggest mines will receive attention at the meeting. On Monday evening the mining and melting operations of the International Nickel Company of Canada will be described by, E. A. Collins presenting a paper written by members of the staff. On Wednesday afternoon, H. Park, superintendent of the Nipissing, will describe Ontario's most successful silver mine.

Recent developments in Manitoba and some of the problems to be solved will be indicated by Dr. R. C. Wallace, Mining Commissioner of Northern Manitoba, in a paper to be presented Monday evening.

The afternoon session on Monday will be specially interesting to those in the iron and steel industry. On Tuesday morning coal will be the chief topic and in the afternoon oil and gas. The Wednesday sessions will be devoted chiefly to metals and asbestos.

The Ladies' Committee has arranged a program for entertaining visiting ladies. Tea will be served at Mrs. J. B. Tyrrell's on Monday and at the Art Museum on Tuesday afternoon. On Tuesday evening there will be bridge at Mrs. R. F. Segsworth's. Mrs. D. A. Dunlop, Mrs. James McEvoy, Mrs. J. P. MacGregor, Mrs. W. A. Parks, Mrs. R. F. Segsworth and Mrs. J. B. Tyrrell form the committee.

The splendid program arranged for the meeting and the excursion on Thursday should bring a record attendance.

The announcement was made in Toronto this week that the Department of Mines had authorized the closing of the Recorder's Office for the Larder Lake Mining Division, which has been located at Matheson. The present branch office at Swastika is made the head office for the Division, and George Ginn, formerly Assistant Recorder at Swastika is appointed Recorder. One of the requests made of the Cabinet when Premier Durny and his colleagues visited Northern Ontario in December last was that the Swastika Division be extended. This has now been brought about by the closing of the Matheson office.

**PREPARING FOR THE CANADIAN MINING INSTITUTE MEETING.**

**Additional features announced for Meeting.**

In addition to the various features of the annual meeting of the Canadian Mining Institute to be held in the King Edward Hotel, Toronto, on March 8, 9 and 10, as previously announced, the local committee has arranged for a trip to the International Nickel Company's plant at Port Colborne. Special pullman and dining cars will be attached to the train. The Good-year Tire Company's factory will also be visited while the members are in Toronto. H. Parks will give a lantern talk on the Nipissing Mine. Tuesday evening there will be a vaudeville show at the King Edward Hotel for the entertainment of the members and a number of good speakers have been secured for the annual dinner on Wednesday evening. All indications point to the most successful annual convention the Institute has yet held and the prospects are that the attendance will be a record one. One of the items for the first day will be an address by J. A. Campbell M. P. on the attitude of the Government towards mining development.

**ASSOCIATED GOLDFIELDS.**

At the head office of Associated Goldfields, the company which is developing a large orebody at Larder Lake, Ontario, news has just been given out of important developments. Mr. A. J. Moore, the consulting engineer, has reported the finding of a large body of \$12 ore. The company has previously been counting on a large tonnage of comparatively low grade material. Plans are now being made for the development of the richer ore.

### STATUS OF THE ENGINEER

At the meeting of the Toronto branch of the Canadian Mining Institute on Saturday Feb. 21, the chief topic of discussion was the proposed engineering bill. A committee of the Engineering Institute of Canada has been industriously working on the problem of improving the status of the profession, and during the past year there have been many conferences at which there were representatives of the Toronto branch of the Canadian Mining Institute. It is proposed to bring up the subject at the annual meeting of the Institute and Mr. James McEvoy has been asked to introduce the discussion on Monday morning, March 8th. At the meeting of the Toronto branch last Saturday, attention was directed to some objectionable features of the proposed bill. The objections were stated in a communication from the Sudbury branch Mr. J. P. McGregor, secretary of the Toronto branch read the communication and his reply.

It will probably be admitted by most engineers that some legislation to protect the men of their profession and the public is desirable. A few engineers have interested themselves seriously in this matter and after much deliberation are making proposals as to what should be done. It is now up to all Canadian engineers to consider whether these proposals would, if carried out, be in the public interest. The comparatively few engineers who have been active in this matter should be advised whether their views are fairly representative or not. It is not sufficient to thank them for their work without offering helpful suggestions. The proposals are up for discussion and should be criticized now, not after they have been put into effect.

It is well known that many unqualified men have posed as engineers in order to obtain some remuneration that would otherwise have been denied them. Such practice might conceivably be prevented by legislation. In applying for such legislation, however, it is quite possible that mistakes will be made. A simple bill framed to protect the public would meet with general approval, but such framing appears to be not easy. Most proposals made have objectionable features that are partly the result of an endeavor to be too specific. Proposals made by one group of engineers and considered very favorably by many are quite objectionable to another group. Apparently however, many of the objections have been met satisfactorily and the committee's work may soon result in proposals that will meet with general approval. It is now fairly well understood that the proposed legislation should not provide for any special privileges for engineers. It should provide for registration of engineers so that the public will know whom they are employing, but it should not prevent anyone else from doing the work if the employers are satisfied.

The Engineering Institute of Canada is not as a body applying for legislation for engineers. A bill drawn by a committee of that Institute has been given some publicity, but it is understood that application for legislation will be left solely with the engineers in each province. The Council of the Canadian Mining Institute has requested the various branches to consider the proposed legislation and to submit their reports to Council.

Some time ago it was agreed by the Engineering Institute of Canada that there would be no application for legislation by that body until the bill as affecting mining had been approved by the Canadian

Mining Institute. This agreement is of no consequence under the present circumstances however, as the intention is to leave the application to engineers in the several provinces. There being no provincial organization in the Mining Institute it will not be an easy matter to get the opinion of the mining engineers in any province, and it is quite possible that an inadequately considered bill may be submitted to the legislature.—R.E.H.

### IMPERIAL INSTITUTE TO ISSUE MONOGRAPHS ON MINERAL RESOURCES OF THE EMPIRE.

The Mineral Resources Committee of the Imperial Institute, of which Viscount Harcourt has succeeded the late Viscount Rhondda as chairman, has arranged for the issue of a series of Monographs on the Mineral Resources of the Empire, of which one on zinc ores has already appeared. Others on manganese ores and tin ores are now being published by Mr. J. Murray. The Monograph on manganese ores has been prepared under the direction of the Committee by A. H. Curtis, B.A., F.G.S., and that on tin ores by G. Davies, M.Sc. (Lond), F.G.S., of the staff of the Imperial Institute. In each case the book is arranged in three chapters.

The first gives a brief survey of the occurrences of the ores and of the characters and uses of the metals. The second chapter deals fully with the sources of the supply within the Empire, and the third describes shortly the deposits in foreign countries. The Monographs conclude with a bibliography of the principal publications of the subjects dealt with. The Monographs are published at 3s. 6d. net. Owing to its extensive employment in the manufacture of iron and steel, manganese was in great demand during the war.

#### World Supplies.

Unfortunately there was a serious shortage of manganese ores, as supplies from the Caucasus, the chief producer, was shut off, and shipping facilities restricted the amount available from India, which ranked second to Russia as a producer of manganese ores. At the present time the output from India is increasing, and Brazil has enormously enlarged its production, but in view of the disturbed conditions still prevailing in Russia, there is likely to be a continued shortage of the ore there for some time to come, particularly of the higher grades now required by metallurgists and in chemical industries. Several additional sources are indicated as possible contributors to the world's supply in the future.

The Empire is favorably situated as regards supplies of tin ore, and at the present time between 50 and 60 per cent of the world's output is obtained from British countries. Moreover, it holds a controlling influence in the industry of tin smelting and refining.

#### Federated States' Output.

The Federated Malay States is the most important tin producing area in the world, and most of its output, together with ore from Siam, the Dutch East Indies, South Africa and other countries, is smelted in the Straits Settlements. Bolivia and the Dutch East Indies are the chief foreign producers of tin ore. Owing to the war the German tin smelting industry has practically ceased, and another result of the war has been the establishment of a tin smelting industry in the United States, which country consumes 40 per cent, or more, of the world's output of tin.

# A MARSH HOIST IS MADE THE RIGHT SIZE FOR YOUR MINE

and in either Steam Power or Electric Power

This shows one of our Electric Mine Hoists. We make many other types. Send for our catalogue of Mine Hoists, Cars, Cages, Buckets, etc., and see what we offer you. It will repay you.

From the little 10 Horse Power size for prospectors or small mines to the massive 50 Horse Power size, one of our 7 sizes should be just right for your mine.

We are specialists in the building of Hoisting Machinery of all sorts. For nearly a quarter of a century we have been designing and building Hoists, and have developed a Hoist that we are really proud of—proud because of the record of good work they have done, and are doing in mines, quarries, and other classes of work from one end of Canada to the other.

:-: EDITORIAL :-:

The Mineral and Metallurgical Industries of Canada  
and Customs Tariff

The guiding principle in the policies of the farmers' organisations in Canada is the immediate financial betterment of the farmer through decrease in taxation and the lessening of the price of agricultural implements and accessories by the abolition of protective tariffs. Mr. T. A. Crerar has publicly stated: "I would absolutely root out the principle of protection in our customs tariff."

In a straightly drawn issue between the merits of free trade versus protection there is no discharge in the war of argument, and unfortunately persons who have strong convictions on either side appear to draw these convictions from a natural preference, or perhaps it should be called a prejudice, which takes no account of economic facts. These prejudices partake of the nature of religious leanings, or they may be likened to the incompatibility of temperament between the prohibitionist and the non-prohibitionist. It is as useless, and as profitless to indulge in academic argument concerning free trade as compared with protection as to argue about many other matters that are merely a reflex of two eternally opposed types of human nature.

Unfortunately those whose business is connected with the production of minerals and their utilisation in Canada must reckon with economic facts, chief among which is that the two most important branches of Canadian mining and metallurgy, namely, the production of coal, iron, nickel and various ferro-alloy materials, and their utilisation in the arts on the Canadian side of the border, are based upon protective tariffs. This is a fact that is thoroly appreciated by the farmers in the East, which accounts for their disapproval of the root and branch condemnation of all forms of protection favoured by the western farmers. The day is coming when this conflict of agricultural opinion will be cured by the industrial development of the West itself. When the enormous coalfields of Alberta are developed on a scale somewhat commensurate with their extent, then we may expect to see the industrial activities of the West exceed the industrial activities of the East in the proportion that the fuel supply of the West exceeds that of the East. The possession of coal spells commerce, industry, political power and purchasing power. Coal

is the most important commodity in modern civilisation. Its value exceeds that of agricultural products, because without coal large agricultural production is impossible, seeing that neither the provision of modern implements or transportation are possible in the absence of coal. The cure for the single and very selfish vision of the western farmer is the admixture of manufacturing industries with grain raising, and this will come in time.

Meanwhile, however, there is a grave danger that in order to reduce the cost of farm implements the farmers' parties may be willing—if they obtain the power—to chance the destruction of the established industries of Canada, on which the purchasing power and wealth of our population depend. If the farmer thinks that he can escape the effects of the financial depression which would cover Canada from coast to coast were protective tariffs completely abolished, he is much mistaken. The price of wheat would fall, and even at reduced prices would be beyond the purchasing power of Canadian industrial workers. The facts are so inescapable that, should the farmers' parties control Canadian politics, it may be expected, when faced with the actual responsibility, they would do as many other parties with similar aims have done in Canada, and decide they dare not risk the commercial disintegration of Canada to achieve a temporary saving in a few selected agricultural accessories, and to test a pet political theory.

There should be no ambiguity among the mining men of Canada as to the protected nature of their industry. The fact should be freely and frankly admitted, and the necessary steps should be taken to safeguard the industry when tariff changes are proposed. We believe also that the industry should look at the largest aspect of the question, and should not urge the exemption of tariff duties upon some specialised and selected equipment needed in mining operations, without fully realising that the basic mineral and metallurgical industries are all protected by tariffs, and that requests for small and relatively unimportant exemptions on mining equipment, may effectively weaken and vitiate a principle that works to the benefit of the larger interests of mining men as a whole.

### BLASTING COAL ON THE NIGHT SHIFT.

The Dominion Coal Company, under the direction of the General Superintendent, Mr. A. J. Tonge, has decided to extend the practice of night blasting to all its collieries. For a number of months past all the shots in the Caledonia Colliery have been fired at night, and the system has lately been given general adoption in Nos. 2 and 9 Collieries, where two seams of coal are worked to a common hoisting shaft. The holes are bored during the day, and at night they are charged and bored by shotfirers. These men are specially certified as to fitness, and have the status of an official. The "Special Rules" governing the practice of shot-firing require strict examination as to the presence of mine gas and dust.

An examination of the records of the mine explosions in Nova Scotia will show that most of them were connected with blasting. Approximately four hundred lives have been lost in Nova Scotia coal mines by explosions attributed to blown-out or "flaming" shots, and each of the larger explosions is believed to have been so caused. The object of Mr. Tonge's decision to confine shot-firing to the night shift is, of course, to minimize the loss of life which may follow blasting on the day-shift because of the larger number of men at work underground. The plan should also be attended with more efficient and skilful blasting, arising from the added knowledge that comes from specialization. The chief merit of the new plan is, however, that it removes from the mine, during the crowded day-shift, what has by painful experience been indubitably proved to be the proximate cause of all the great colliery explosions in Nova Scotia, and an infinitely large number in collieries in other fields.

The seductive literature of the "Little Gem" still continues to appear in the "Montreal Star", but as the Company ceases to give away money, (which we gather is the equivalent of the withdrawal of the stock offer) on March 6th, possibly readers will be shortly deprived of this source of amusement. The latest advertisement quotes a telegram received from the mine in Alaska, which reads: "Vein widening 'Quartz two feet wider and looks very good and pans strong'". For the benefit of investors it is explained that "The words 'pans strong' mean that the ore pans 'lots of gold, and 'Quartz two feet wider' means considerable more ore". The explanation of the meaning of the telegram would appear on its face to be elementary, not to say gratuitous, and discriminatingly adapted to the intelligence of the prospective investor.

### WHAT IS A CONCENTRATOR?

The varied usage of the term concentrator has been well brought out by the recent dispute over the interpretation of the Assessment Act in Tisdale township. Whether or not certain property of the Schumacher, Dome Lake, McIntyre, Dome, Porcupine Crown and Davidson mining companies should be assessed or not must be determined by the applicability of the term concentrator, for under the Act such are not assessable.

In the treatment of ores after they are brought to the surface at a mine, various processes are used to separate and recover the valuable constituents. The elimination of any material of less value than the average gives a product containing a correspondingly greater proportion of desirable constituents. This gives an increased concentration and the process may be spoken of as concentration and the agent as a concentrator. The agent might be a person handpicking the ore, either picking out and discarding waste or picking out and saving the pieces of supposedly higher grade. Such a person might properly be called a concentrator. Again the agent may be a machine or a series of machines doing work of a similar kind—mechanically separating better from poorer material. Such machines might well be called concentrators. If the man who acts as picker used a hammer to break the ore he is sorting, he and his hammer are concentrator and crusher and since the degree of concentration which he is then obtaining, necessitates the breaking of the rock, the hammer becomes a necessary agent—a part of the concentrating machinery though not itself doing any concentrating. Among the earliest records of mining in America are the stone hammers which are found in hundreds in Michigan native copper districts. The native copper was obviously concentrated from the mixed masses of copper and rock by men who wielded hammers. The men equipped with stone hammers were not simply rock breakers they were concentrators. So also if machines are used to separate better from poorer material and other machines are used to crush the ore preparatory to sorting it, these other necessary auxiliary machines become a part of the plant that is called concentrating plant. The crushers are not primarily designed to do any concentrating, though commonly they do a certain amount, owing to the fact that some of the ore crushes more readily or into finer particles than the remainder. A crusher is not of itself a concentrator, but it can be, and in concentrating plants is commonly made to serve in some way as a concentrator by utilizing its classifying action.

A very different type of concentration is that effected in smelting operations. Here instead of fine crushing and subsequent mechanical sorting, melting at high temperature is used to concentrate the valuable constituent. In the ordinary furnace operation the object is to separate the molten mass into two parts in one of which will be concentrated most of the valuable constituent, while in the other will be the greater part of the undesirable constituents. Advantage is here taken of the behaviour of metals when in the liquid state and the furnace may quite properly be regarded as a concentrating device.

Still another method of concentration is that of utilizing the solubility of minerals in water in which has been dissolved some chemically active substance like sodium cyanide. In a dilute cyanide solution gold

and silver are soluble while many minerals and rocks are not. It is thus possible to effect a concentration of valuable constituents by separating a liquid part containing the metals from the solid part which contains relatively little of them. In the furnace, concentration is effected by the formation and separation of two hot liquid solutions, while in the cyanide plant, concentration is effected by the formation and separation of a cold liquid solution from a mass of solid particles. The cyanide plant, like the furnace, is therefore a concentrator. It is however not common practice among mill men to speak of either as concentrators, that term being used by them more specifically for plant used to effect concentration without solution.

What is meant by the term concentrator is therefore not easily determinable. When the average chemist or physicist speaks of concentration he seldom has in mind a machine for treating ores. If he happens to be interested in gold mining he probably considers cyanide plants and Wilfley tables and amalgamating plates all as concentrating machines. If he happens to be an iron furnace chemist he probably considers that concentration is very well effected in a furnace. The practice among gold and silver metallurgists however is to disregard the ordinary use of the term in order to have some useful name for the processes of effecting concentration in which resort to solutions is not used. The limited meaning of the term concentration has been generally accepted by each class of metallurgists. These same persons are however not very strongly inclined to reject the name concentrator for a plant in which solution processes are used. The term "mill" is frequently used as an alternative, but such use is open to objections also. Hence the latter is frequently used for all the buildings and plant at a mine in which the treatment of ore is carried on. The stamps, ball machines, tables, cyanide plant, melting furnace are frequently considered as parts of the concentrator. The term concentrator is used in gold mining districts practically equivalent to "metallurgical works". On the other hand the metallurgical works at Copper Cliff or Hamilton are not commonly called concentrators, and the terms are not equivalent.

Most of us would probably call the metallurgical works at Porcupine and Cobalt concentrators or mills indifferently not being satisfied that either was a good name. Where concentrators are named as not assessable the term concentrator will be more popular. In other places the shorter and more general term "mill" will doubtless continue to win favor until some more adequate nomenclature is adopted.

In the evidence, Mr. H. E. T. Haultain expressed the opinion that the term concentrator is understood to apply irrespective of whether the process is a mechanical one or if it is chemical. Mr. Gauthier claimed that if a chemical process is used it is not concentration. Mr. A. A. Cole would distinguish between concentrating, cyanding and amalgamating mills and is evidently of the opinion that the term concentrator is not applicable to the mills at Porcupine.

For the purpose of interpreting the Assessment Act the important determination to make is the common usage of the term concentrator in Ontario. Many will be found to agree with Prof. Haultain that the term is loosely applied to various kinds of mills in various localities. What names should be used for these mills is another matter.

The dispute should lead to the better nomenclature of metallurgical works. There is already a useful distinction made between two classes of works—mills and smelters. Mr. Cole's suggestions as to the classification of mills merit attention.

#### GRAPHITE IN SOUTH AUSTRALIA.

There is ground for believing that there is a bright future for the graphite industry of South Australia. The Director of Mines and Government Geologist, in his annual report, states:—"As in the previous year, a great deal of work was done in the testing of samples of graphite ore from Eyre Peninsula. The result was very encouraging, and taken in conjunction with the departmental reports on the mine, there is very good reason to believe that a valuable deposit of graphite exists in that locality, awaiting only the erection of a suitable mill to treat it. For the better treatment of samples of graphite ore, an experimental winnowing machine was constructed. The design was made in the department, and the construction carried out in workshops of the Public Works Department.

"Briefly this little machine consists of a narrow box, 2.5 ft. long, 2 ft. high, and about 8 ins. average width. A current of air is drawn through the apparatus by means of a small fan placed at one end of the box, and the ore is fed in through a slot in the top at the opposite end. The width of the box increases regularly from the feed to the end where the fan is. Arrangements are made whereby the formation of eddies is reduced to a minimum. The effect of the winnowing operation can be watched through the sides of the machine, which are of glass, and the final products are caught in a drawer, divided into a number of compartments, which fits into the bottom of the apparatus.

"Although no doubt capable of much improvement, still the machine is highly effective, and has eliminated to a large extent the uncertainty connected with the operation of winnowing by hand, which had to be practised formerly. The machine undoubtedly forms a basis upon which an apparatus working on a commercial scale could be designed."

Toronto officials of the International Nickel Company of Canada this week refused to verify the Canadian Press Despatch which stated that the company had bought the huge sulphite copper mines at Flin Flon outright for one million dollars. The despatch, which was sent out from The Pas, Manitoba, further says: "It is known that the nickel crowd have been negotiating for it since early in January and ten days ago it was reported that the deal was tied up satisfactory to both parties. A sum of nearly ten millions of dollars will have to be expended upon its development before taking out a pound of ore. This includes the construction of a railway from the Pas, the erection of a smelter and the harnessing of water power in the Churchill River, besides the usual mine equipment.

The death took place in Toronto this week of T. D. Ledyard, 74 Shuter Street, who for fifty eight years was a barrister in this city and a mining expert of some prominence. Deceased, who was eighty years of age, was educated in Toronto and the Old Country and was one of Toronto's oldest residents. He had retained his mental vigor and was at his office daily until his recent illness.

# The Cassidy Colliery of the Granby Consolidated Mining & Smelting Company, Vancouver Island

A Colliery Lay-out which includes unusually complete provision for the comfort of the work people.

The Cassidy Colliery of the Granby Company is situated about eight miles from Nanaimo, on Vancouver Island. The site selected was beautiful in its original state, and care has been taken in laying out the residential district not to destroy its natural attractiveness. The residential site comprises eighty acres of an alluvial flat, or what is locally known as "bench land" overlooking the Nanaimo River to the North, Haslam Creek to the South, and is sheltered by a well forested ridge, 300 feet in height, to the East and West, which is being preserved as a park. In the distance can be seen the purple silhouettes of Mount Buttle, Tye Mountain and other mountains. To one coming from the East, the tall trees luxuriant ferns and brilliantly tinted undergrowth are very pleasing. Close to the colliery site is a gorge of the Nanaimo River cutting through the Protection sandstones, of unusual beauty.

The seam worked at Cassidy's is the Upper Douglas Seam, which outcrops about ten feet thick, in the bed of the Nanaimo River at this point. From this seam the first coal on Vancouver Island was mined by the Hudson Bay Company in 1852. The area was thoroly tested by diamond drilling, and the first coal was hoisted from the Main Slope in June 1918.

The seam dips at about eight degrees, and the coal varies in thickness from 5 to 20 feet, averaging about 10 feet. As is common in this district, the seam is disturbed by rolls, which at Cassidy's are more pronounced in the shales of the pavement, the roof shales being fairly regular. The coal, as seen at the screens, is very slickensided, and does not possess the regular laminated appearance, or the cleat of bituminous coals as they are usually found.

## Small Panels and Large Pillars assure Maximum Extraction.

The mine is opened on the dip of the seam, the Main Slope having been driven to a depth of approximately half a mile. It is being driven 7 ft. x 14 ft. in the clear to allow for double track and is timbered with 12" x 14" framed sets spaced 4 ft. centres. A separate railway is provided as a travelling road and employees are not allowed to use the main haulage way in passing to and fro from their working places. The mine is worked on the pillar and stall system. The mine is divided into relatively small panels, as a precaution against mine fires, and large pillars are left along all main haulage roads and permanent airways, the idea being to extract a maximum amount of coal at the least cost rather than to take out cheap coal for a few

years to the final detriment of the mine, as has been done in so many of the mines on Vancouver Island and elsewhere.

## Storage Battery Locomotives Used Underground.

Mining is planned so as to deliver the coal from the face to the main haulage system by gravity as far as possible. Storage battery locomotives are used on the levels underground. No horses or mules are used.

The drainage system has been carefully planned so that surface water entering the mine from the gravel will drain by gravity, and water from workings below the Drainage Level will run to a central pump.

The mine is ventilated by a Sirocco fan, capacity 150,000 cu. ft. per minute. The mine is provided with a double intake and return airway throughout the workings which are planned so that the air can be

CASSIDY COLLIERY—GENERAL VIEW.

taken to the face where required with a minimum loss.

The mine cars are of wooden construction having a capacity of 1¾ tons of coal. The track gauge is 36 inches. Hadfield manganese steel, self-oiling wheels 18" diameter and 3" tread are used. The mine cars are built in the company shops at the mine and have no end doors.

The Fan House is a concrete fireproof structure and also houses the telephone exchange and motor generator set for charging storage battery locomotives. The fan is driven by 150 H. P. Westinghouse electric motor.

The main hoist is a Vulean 18" x 36" double-drum second-motion hoist.

### Tipple and Washery.

The tipple is equipped with Fairbanks scale, rotary drum, Marcus screen and loading booms. The railroad cars are handled with Fairmount car-retarders. The track scale is a Fairbanks Standard all steel and concrete, capacity 100 tons. The rock cars are handled with a special Wilson rotary dump.

The washery is equipped with two, 2-compartment jigs, having a capacity of 40 tons per hour each. The tipple and washery were designed by Roberts & Schaefer of Chicago. The washery is equipped with sludge recovery and uses the same water over and over again.

The washed slack is used in the new by-product plant at Anox in making coke for the copper smelter and the lump, nut and some pea coal sold. The bone coal is burned under the colliery boilers.

Special attention has been paid in the screening plant to protection of the coal against breakage. The "Marcus" screen appears to be a general feature of British Columbia and western collieries generally. A handy arrangement for raising and lowering the extension of the picking-belt that feeds the coal into the railway cars, is a small electric motor, which is used instead of the air-hoist that is generally seen in the collieries in the East.

### Power and Water Supply.

The equipment for generating the motive powers used, and the arrangements of the water-works system, are all designed with a view to checking consumption by accurate measurement, and especial care has been taken to avoid radiation and condensation losses, and to effect every possible economy in fuel use. The colliery consumption at Cassidy's will no doubt show the economies which must follow such careful planning. The mechanical layout of this colliery is not by any means the least notable achievement of a really remarkable plant.

### Power House.

The boiler plant at present consists of two Badenhausen water-tube boilers, 260 H.P. each, fired by Type "E" mechanical stokers. The ashes are removed by washing and fluming to the dump. The feedwater is heated with Webster feedwater and forced draft is used. The brick stack is 8 feet in diameter and 125 feet high. The boilers and steam pipes are all insulated with asbestos and magnesia to prevent loss of heat. Venturi meters are used to check quantity of water pump station and at the boilers.

The compressor is a Rand cross-compound condensing, capacity 2000 cu. ft. of air per minute. The air is used for running the underground drills, pump and hoists.

Electric power is supplied by an Allis-Chalmers 450 K. W. generator (2300 v. 3-phase 60 cycles, 360

CASSIDY COLLIERY—BANKHEAD AND WASHERY.

rpm) and also an auxiliary unit 250 K. W. (2300 v. 3-phase, 60 cycles, 450 rpm) both direct connected to vertical high speed engines (Goldie & McCullough). The remainder of the electric equipment is of Westinghouse make. The power-house is equipped with the Bowser oil-handling system. A Worthington fire pump, capacity 1,000 gals. per minute, size 18" x 10 x 12", is ever in readiness for an emergency.

### Exhaust-Steam Heating System.

The entire plant is equipped with an exhaust-steam heating system, the condensation being returned to the boilers.

### Water Works System.

The pump station is equipped with two Morris Centrifugal pumps each having a capacity of 300 gallons per minute. These pumps elevate the water to the two 50,000 gal. storage tanks situated on top of the hill overlooking the town, from whence it flows by gravity through the water mains. The pumps are driven by 50 H.P. Westinghouse electric motors. A Venturi meter records the quantity of water leaving the station at all times. The Nanaimo River furnishes a plentiful supply of pure fresh water for domestic and power purposes.

### Carpenter, Machine and Blacksmith Shops.

The shops are all thoroughly equipped, well lighted, and will be connected with the mine tracks. The carpenter shop is fitted with rip-saw, band-saw, planer, boring and mortising machine.

The machine shop is equipped with a large lathe, small lathe, planer and shaper, pipe-threading machine, drill press, emery wheel, etc. The shafting is all well guarded. The Master Mechanic's office adjoins the Machine Shop.

The Blacksmith Shop is fitted with two forges, steam hammer and swing crane. Adjoining the blacksmith shop is a special tool house where miners' picks are

kept after sharpening. All scrap iron is sorted out and stored in pockets provided for the purpose. Racks are provided for storing stock of iron and steel.

#### Mine Buildings.

Between the change house and the manway portal are the powder house (in which the stock of explosives is limited to one day's supply, the larger magazine being on the opposite side of the hill from the town) the timekeeper's office, lamp-house and Mine Rescue Station. The lamp house is equipped with 300 Edison storage-battery electric lamps. The Mine Rescue Station is equipped with Gibbs apparatus, lungmotor, smoke chamber, etc., and a large lecture room for holding First Aid or Mining Classes.

The above mentioned buildings are all heated with exhaust steam from the power house.

#### Arrangements for Comfort of Workmen.

Cassidy's is unique, in Canada at least, in the care that has been taken to provide for the well-being, the health and comfort of the employees. The climate of Vancouver Island is one that permits a great deal of open air life, and indulgence in the pleasures of gardening to an extent difficult to appreciate in the East. Full advantage has been taken of the pleasant aspect of the site and the favourable climate to create a mining village that is without a parallel, in Canada at least. The streets have been boulevarded, and planted with one variety of trees to each street, which give their name to the street alongside which they are planted. For example, one street is an avenue of pink and white flowering hawthorn. Each house is surrounded by a lawn and flower beds, and the climate permits the use of hanging flower-baskets on the verandahs, a privilege that is not confined to the dwellings but is made full use of on the large verandahs of the Mess House and Rooming House.

The water system has already been referred to, and in addition to this, a modern sewage disposal system is provided. The colliery and town are provided with a telephone system.

Some idea of the style of the dwellings provided for the workpeople can be obtained from the accompanying photographs, but these do not show the houses to best advantage, as they were taken prior to occupation and completion of the lawns and gardens.

#### Accommodation for Single Employees—Rooming House.

The Rooming house for the accommodation of single employees is a "gunite" structure built in the form of a double "L". It contains about 80 rooms, all of which open to the outside verandah or balcony. The rooms are steam-heated, electrically lit, and each room is provided with running hot and cold water. The

floor is a patent material "Raccolith" and the rooms can be washed out with a hose when necessary. On the verandahs and balconies are window boxes of flowers. The company supplies the furniture and bedding as a precaution to ensure cleanliness and comfort of employees.

Each man has a room to himself which compares favorably with good-class hotel accommodation. Especial care has been devoted to the lavatory provision.

#### Mess House.

The Mess House or Dining Room is a "gunite" structure and is equipped with every modern convenience. The men enter the building through a lobby equipped with wash basins and running hot and cold water, so that they may enjoy a refreshing wash,

CASSIDY COLLIERY. FROM LEFT TO RIGHT—TIMEKEEPER'S OFFICE, LAMPROOM AND RESCUE STATION.

hang up their hats and then proceed through a pretty vine covered pergola to the Dining Hall. At the entrance to the Dining Room a drinking fountain is provided where a stream of clear cold water is constantly available. The Dining Hall is bright and comfortable cool in summer and steam heated in winter. Each table accommodates six men. No enamel dishes are used.

The kitchen is equipped with every labor-saving and modern device, which include an electric dish washing machine, vegetable-paring machine, tables heated by steam coils to keep dishes hot and a refrigeration plant. Living accommodation is provided up stairs for the help. The completeness of the kitchen must be seen to be appreciated.

The Dining Hall is one of particularly pleasing proportions, and its decoration is in the best of taste.

In order that there may be no waste the scraps from the Mess House are fed to pigs. A vegetable garden will furnish all vegetables for the Mess House.

**The Change House.**

The Change House is in charge of an ex-British soldier who is an experienced First-Aid man. Here the miners can turn in their working clothes, if they are wet, and have them placed in the drying-room by the attendant so that they will be perfectly dry and comfortable when the men are ready to go to work in the morning.

The change house is equipped with steel lockers which are heated with steam coils from underneath, shower baths and large lavatories including every convenience.

The plumbing is not of the rough and ready type usually seen in colliery wash-houses, but is all shining nickel and brass and porcelain. The writer has seen colliery change-houses in many countries, including the elaborate arrangements at the Westphalian coal-mines, but has never seen

anything so workmanlike, durable, clean and attractive as the arrangements at the Cassidy wash-house. It reminded one of the wash-room and lavatory appointments of a good city club.

**Hospital and First Aid.**

A modern temporary hospital and first aid station has been established in one of the larger houses until the permanent hospital can be constructed. This hospital is in charge of a skilled Matron and trained nurse.

Cassidy Colliery and its residential features are an attempt by Mr. F. M. Sylvester, the Vice-President and Managing Director of the Granby Consolidated Mining & Smelting Company, to translate into actual being his conception of the duty of a large corporation towards those who serve it. The contrast between the residential conditions provided for mine workers at Cassidy's and those usually provided is so great as to come as an actual shock to those who have been accustomed to the traditional accompaniments of life in a coal-mining community of long-standing.

It is to be hoped that the actual operation of the colliery, under the ideal conditions of residence provided for the workpeople and staff, and with the aid of the extremely well-designed surface and underground equipment will reward the management of the Granby Company for its courage

CASSIDY COLLIERY—THE MESS HOUSE.

in blazing so wide a trail towards improved conditions of mining and mining life, a trail, unfortunately, that less wealthy companies will find it hard to follow.

The Cassidy Colliery was developed chiefly to provide a supply of coking coal for the coking plant which supplies the copper smelting at Anyox, B. C., a purpose for which it is understood the coal has been found entirely suitable. This coking plant, the first full-scale by-product plant on the Pacific Coast, has

CASSIDY COLLIERY—THE GENERAL OFFICE.

been already described in the "Journal". (See C. M. J., 26th Nov. p. 881). The output of coal from Cassidy's has now reached 700 tons daily.

The coal area tributary to the Cassidy Colliery the subject of an unfortunate dispute as to ownership. The provincial grant under which the Granby Company holds the property was given under the Vancouver Island Settlers' Rights Act of 1904, the validity of which is attacked by the Esquimalt & Nanaimo Railway Co. The Settlers' Rights Act, as amended in 1917, was disallowed by the Federal Government in 1918, but it is not considered in British Columbia that the action of Ottawa ends this matter. In any case it is hardly likely that the outcome of the pending litigation will be allowed to interfere with the further development

of the Cassidy Colliery, which has made so auspicious and commendable a commencement.

#### Outdoor Sports.

The Colliery is provided with one of the finest athletic parks in the country. There is a baseball diamond, football ground, tennis courts, bowling green and quarter-mile track. The athletic field is so large that a baseball and football game can both be played at the same time without clashing, and the entire field is as level as a billiard table. The hillside, back of the athletic field, forms a natural grand-stand and the company has reserved this as well as the timber on the other side of the town as a natural park.

The school is to be erected close to the athletic field, and playground equipment installed so that the school children will be enabled to enjoy all the advantages of the facilities for clean healthy sport.

#### Amusements.

A striking feature of the company's plans in laying down ideal condition under which the men shall work is the programme of entertainment and physical and metal relaxation provided. A temporary recreation hall has been provided with gymnasium, dancehall, library reading room, billiard and pool room. Provision is made for wrestling, boxing and every other means of amusement and recreation which it is possible to give the men.

The town is within a short distance of bathing beaches, in a first-class game country where pheasants, grouse, deed, wild duck and other game are plentiful, and within a few hundred feet of the best fishing waters on Vancouver Island.

#### Note:

The "Journal" wishes to acknowledge in the preparation of the foregoing description the use of the information contained in a paper read by Mr. R. R. Wilson, the Resident Manager of the Cassidy Colliery, before the Vancouver Meeting of the Canadian Mining Institute in November last. The rules of the Institute forbidding prior use of papers before they appear in the publications of the Institute prevent the presentation of Mr. Wilson's paper in full. We are also indebted to Mr. Wilson for the photographs included in the description.

CASSIDY COLLIERY—TYPES OF RESIDENCES.

**TEXT OF JUDGMENT IN ASSESSMENT APPEAL  
BY SIX GOLD-MINING COMPANIES OF  
PORCUPINE, ONT.**

**The Assessment of Concentrators.**

Between:—The Schumacher Gold Mines, Limited, Appellants; and Charles B. Morgan and Charles V. Gallagher, Respondents; and

Between:—The Dome Lake Mining and Milling Company, Ltd., Appellants; and Charles B. Morgan and Charles V. Gallagher, Respondents; and

Between:—The McIntyre-Porcupine Mines Ltd., Appellants; and Charles B. Morgan and Charles V. Gallagher, Respondents; and

Between:—The Dome Mines Company, Limited, Appellants; and Charles B. Morgan and Charles V. Gallagher, Respondents; and

Between:—The Porcupine Crown Mines, Limited, Appellants; and Charles B. Morgan and Charles V. Gallagher, Respondents; and

Between:—The Davidson Gold Mines, Limited, Appellants; and Charles B. Morgan and Charles V. Gallagher, Respondents.

**Opinion of the Board.**

These are appeals from the judgment of the learned District Judge of the District of Temiskaming allowing an appeal from the decision of the Court of Revision of the Township of Tisdale in respect of certain several assessments of the above. Applicants for the year 1919. The appeals were by consent of all parties heard together as the facts in the several cases were either identical or so closely similar that the same question was raised in each for determination by the Board.

It appears that the Assessor for the Township of Tisdale assessed each of the Appellants in respect of "Mill Buildings," Plant and Machinery," for specified amounts. The Assessments in respect of all six Appellants appear to be irregular as not sufficiently identifying the lands assessed, in that number of the Concession, Lot etc. is not given as required by Section 22 of "The Assessment Act," nor is the valuation in each case suggested under columns appropriated to "actual value of land," and "value of buildings," as prescribed by that section. The Board directed that subject to its determination of these appeals these irregularities should be cured and the assessment in those details made to conform to the requirements of "The Assessment Act."

Upon an appeal to the Court of Revision the assessments of the several Appellants were struck off, and upon an appeal to the District Judge the several assessments were restored. The question of the propriety of the Judges' determination turns upon the interpretation of subsection (4) of Section 40, of "The Assessment Act." This subsection reads as follows:

"(4) The buildings, plant and machinery in, on or under mineral land, and used mainly for obtaining minerals from the ground, or storing the same, and concentrators and sampling plant, and, subject to subsection 8, the minerals in, on or under such land, shall not be assessable."

No question arises upon these appeals as to the assessability of the buildings, plant and machinery in, on or under mineral land, and used mainly for obtaining minerals from the ground or storing them, nor as to the assessability of the sampling point or the minerals in, on or under such land; all these are admittedly entitled to exemption from assessment. The crux is the meaning and application of the term "concentrators" and whether the mills of the several Appellants properly fall within that designation, and in-

identally also what is the status in respect of taxation of certain subsidiary structures such as pump houses, power houses, carpenter, machine and blacksmith shops, assay and refinery buildings etc.

The question raised here is a question of fact, as in the case of Township of Turnberry and North Huron Telephone Company, 4 O. W. N. 598, which is to be determined as all questions of fact should be, upon evidence. By the testimony of witnesses, and by a view of the McIntyre Mill, the nature of the operations, carried on in the various mills was made to appear as well as the instrumentalities by which those operations are affected. In the result it was clear that by whatever route it is reached the sole objective of these complex operations is the segregation of the valuable constituents from the mass.

Coming now to the instrumentalities by which this objective is reached it appeared that they are divisible into two classes, mechanical and chemical. Among the mechanical agencies are the crushers, stamps and other devices used to crush, pulverize, classify and separate the ore. The Chemical agencies employed are the amalgam process and the cyanide process reinforced by zinc precipitation; admittedly the latter is a purely chemical process, but as to the amalgam tables some witnesses asserted that their action was wholly physical, and others that it was partly chemical. In view of the conclusion reached by the Board on the main question this difference of opinion of the technical witnesses is unimportant.

It may be well to note here that of the six Appellants, the Dome Mines Company, the McIntyre Porcupine Mines, and the Dome Lake Mining and Milling Company use both the amalgam and cyanide processes, while the Schumacher Gold Mines and the Porcupine Crown Mines use only the cyanide and not the amalgam process, and the Davidson Gold Mines use the amalgam and not the cyanide process. All the mills take advantage of a property inherent in gold—its high specific gravity—a physical fact and of course neither a mechanical nor chemical process.

Upon these facts the case of the Respondents cannot be better put than in the words of Mr. Gauthier in cross examination of Mr. Dowsett, p. 21 notes of evidence:

Q. If there is a chemical process used it is not concentration, it is a process of metallurgy; it is the treatment of the ore metallurgically. In other words concentration of ore is purely and simply a mechanical operation; therefore a concentrator is a building in which only a mechanical operation is carried on.

Again in argument Mr. Gauthier said as reported, pp. 337, and 338 notes of evidence:

"We have evidence that the whole process of taking the mineral from the ground and finally refining the same is in the mining world, divided into three distinct branches; the actual mining and storing of ore, then there comes the ore dressing operation, or the preparation of that ore for shipping away from the mine or for treatment on the mining property. Ore dressing is the preparation by mechanical means of these ores for shipping away from the mines or for further treatment; then there is the division of metallurgy, which takes in the actual extraction of the metal from the concentrates or from the ore. Concentration and concentrating mills are used for the purpose of the mechanical dressing of ore for the purpose of treating it, or shipping it as concentrates. The cyanide mill or amalgamation mill is for the purpose of treating the ore itself as is done here. That is the distinction between the mills of the Cobalt Camp that are known as concentrators, and the mills that we have here for the purpose of treating their ores. The amount of con-

centration that is accomplished in a concentrating mill is 60 or 75 to one. The concentration that is accomplished, if you want to use the term in that way, in one of our Porcupine Mills is from rough ore down to bullion, or from 1000 to one, showing that the output from these mills is different from the output from a concentrator."

Applied to the mills in the so called Porcupine Camp Mr. Gauthier's argument comes to this, if a mill confines itself to purely mechanical processes in ore dressing, its output—a coarse product at best with the values still heavily involved in ton of dress—is concentrate and the mill is a concentrator and as such exempt; on the other hand such a mill ceases to be exempt from assessment if the mill owner supplements his mechanical appliances with an amalgamating or cyaniding plant or both, which may enable him to turn out bullion of a fineness varying from 950 to 995 parts gold and silver in 1000 parts to from 50 to 5 parts base. In this conclusion Mr. Gauthier is supported by the evidence of several mining engineers. For instance, Mr. Arthur Cole, Mining Engineer, for the Temiskaming and Northern Ontario Railway Commission is reported as saying at p. 302 notes of evidence:

"In looking over these different definitions (of concentrator) the best one that seemed to cover the case in point to my understanding best was, that concentrator is a machine that concentrates mineral by mechanical means without changing its chemical character."

Again at p. 302 notes of evidence; "It (Concentration) is to a certain extent the art of enriching ores by mechanical means."

Q. You would differentiate that term (concentrating mill or concentrator) from a cyanide mill or an amalgamating mill?

A. Yes, when the concentration is the essential part of it; when the cyanide part become the essential part of the mill then I would call it a cyanide mill.

Q. And an amalgamating mill?

A. In the same way, as soon as amalgamating becomes the essential part of the mill, I would call it an amalgamating mill.

Asked at p. 303 notes of evidence how he would describe the mills in the Porcupine Camp, his answer was: "I would call them all mills, I would call none of them concentrators."

While holding so strong an opinion Mr. Cole when asked (p. 309 notes of evidence) could give no reason why mills producing bullion should be taxed and the concentrating mills be exempt.

While aware that enactments conferring a special privilege such as this should be construed strictly the Board is of the opinion that to give effect to the intention of the Legislature in this case a broader meaning must be given the term "concentrators," one adaptable to the developments from time to time of a progressive art. For didactic purposes or purposes of exposition it may be convenient to portion out into separate compartments the complex successive processes observed by the Board at the McIntyre Mill, but in practice there is no such arbitrary subdivision. On the contrary the various processes are dovetailed into one another, at one stage mechanical process following chemical, but all contributing in some measure to the consummation sought; the segregation of the valuable and the expulsion of the worthless constituents.

As Professor Haultain when called as a witness for the Respondents says at p. 38 notes of evidence, speaking of the three divisions of ore dressing—mechanical—physical and chemical—referred to by Henry Louis in his work on Ore Dressing;

Q. Are these used in combination or how?

A. Always in combination.

Q. Various mines that have made and developed these processes have done so to what end?

A. To reduce the cost and increase the efficiency of the plant, and also to increase the capacity of the plant. These are the three ends.

Q. One would produce a finer product, something nearer the pure article?

A. Get rid of waste, I should have said.

Q. The more of that you do, the more of a concentrator you have?

A. Yes.

Again p. 93, notes of evidence:

Q. Paragraph 28, page 27 (Independence Correspondence School) states "The object of concentrating works is clearly to get the values in an ore into smaller bulk in order to diminish the trouble and expense of further treatment, and not for the immediate actual extraction of the metals in the ore?"

A. That is a pretty good general statement.

Q. Is that a proper statement, if so, how can you make it coincide with your statement that the cyanide process carried on in the McIntyre mine or mill is concentration?

A. I think I had the McIntyre mill in mind when you were reading it; I think that applies to the McIntyre entirely.

Q. Don't they get it in the form of bullion?

A. Bullion is only one stage purer than the other. It is not the final product any more than coarse concentration. It is a matter of degree only.

Q. Bullion is an article of commerce.

A. So are concentrates. I have sold hundred of tons of concentrates.

Again on page 94, notes of evidence.

Q. Do you mean to say that the object of the McIntyre Mill is not for the immediate extraction of the metals in the ore?

A. I take that as an ordinary, common sense every day expression. That fits the McIntyre, both first part and second part. You can extract the value of the ore in the form of concentrates—dirty concentrates—clean concentrates—dirty bullion—clean bullion; there is only a difference in degree between any of them. You are extracting values in every case. They are not extracting pure gold or pure silver here; even if they were it would not make it any less a concentrating plant.

Q. Is the object of the work to produce concentrates?

A. It is to produce just what they say in the first part of that definition.

Q. Concentrates?

A. To reduce the bulk, and that is what the McIntyre does beautifully.

It seems to the Board that the solution of the controversy is to be found in certain statements made by Professor Haultain in the course of his testimony; for example—at page 35 notes of evidence:

Q. Dealing with the concentration of ores, is the term "concentration of ores" a scientific term, or what would you say it is?

A. It is not a scientific term, it is a colloquial term, it is a term describing a practice, an art rather than a science. I should think it is a term attached to a very varied practice and very varied art.

Again at p. 40:

Q. What do you say as to the cyanide process as to whether or not it is a method of concentration?

A. It is an ideal method of concentration.

Q. The amalgamation process that is in use at the McIntyre and at the Dome and some other mines, are you familiar with that?

A. Yes.

Q. Do you say that is a method of concentration?

A. Decidedly.

Again at p. 41:

Q. Is the term "concentrator" a term of fixed definite scientific meaning any more than concentration?

A. No, it is like so many of our other engineering terms. It is used loosely and has a variety of applications.

Q. What do you say is a concentrator as applied to a plant?

A. A concentrator as applied to a plant, that is more or less of a colloquialism.

A significant confirmation of Professor Haultain's testimony is this regard is to be found in the Report for the year, 1910 of Mr. Cole, Mining Engineer of the Temiskaming and Northern Ontario Railway

Commission. At page 19 the flow sheet of the Buffalo Plant using the cyanide process is labelled a "concentrator" and so at page 27 he designates "concentrator" the Nova Scotia Plant turning out bullion by the amalgam process. It is true Mr. Cole stated or the stand that his characterization of these plants was erroneous, and that he had corrected it in later reports, but the fact of the so called error seems to establish that the term "Concentrator" had not then at all events taken on a definite scientific meaning which excluded from that category a mill using chemical processes. In the Report of the Bureau of Mines for Ontario for the year 1910 in the division headed, "Mines of Ontario" contributed by Mr. E. T. Corkhill, Inspector of Mines, the Buffalo Plant and the Nova Scotia Plant are each designated a concentrator.

From this Board concludes as a fact that the term "concentrator" is a term loosely applied by technical men to various kinds of mills in various localities, and is not a rigid term of act having a strictly defined signification, and that a mill of the kind in question on these appeals is not disentitled to be termed a "concentrator" by reason of its combining chemical processes—the amalgamating or cyaniding or both—with mechanical apparatus is separating values from mineral bearing ore. It follows in the opinion of the Board the mills of the Appellants are not assessable. Mr. Cole concedes (p.324 notes of evidence) that the assay office and equipment and the refinery building and equipment go with the mill and should be exempt if the mill is exempt, and with this conclusion the Board agrees.

Two other classes of buildings with their equipment so far as the latter consists of fixtures, remain to be dealt with.

The first is the class of buildings with their fixed equipment, which are by their accessories physically connected with the several mines or mills such as pump house, power house, transformer house, boiler house. These are necessary to the proper functioning of mine and mill, driving lighting, heating, and watering them. "Machine includes the "engine that works it" (Stroud's Jud. Dict., Title "Machine.")

These, so vitally essential to the efficient working of a modern mine or mill, share the character of the latter and are entitled to the same exemption from assessment to the extent to which they serve mine or mill. To the extent that they are used for purposes other than to serve mine or mill the buildings are assessable, but the fixed equipment in its entirety, as fixed machinery used for manufacturing purposes, is exempt under Sections 5, subsection (17) of "The Assessment Act." It may be that the fixed equipment in the pump house cannot be regarded as fixed machinery used for manufacturing purposes, and that it is therefore, assessable but only to the extent that it is used for purposes other than to serve mine or mill. This proportion of the whole value of the pumping plant is however negligible. The telephone equipment of the several Appellants, while no doubt fixed machinery can scarcely be regarded as used for manufacturing purposes. It is however, physically annexed to mill and mine and is indispensable to the efficient working of both under modern conditions. Besides it exists and is used solely in and about the mines and mills of the several Appellants, the installation of certain instruments in the dwelling houses of officials and employees is quite consistent with such sole user. In the view of the Board this equip-

ment is exempt, none of these companies being companies "carrying on business," under Section 14 of "The Assessment Act," and assessable as such.

The second class of buildings are those which do not form an integral part of mine or mill by reason of physical annexation as do those in the first class, and these are in the opinion of the Board assessable. This class includes such buildings as stables, blacksmith, machine and carpenter shops, store houses for other than ore, bunk houses, oil houses, dry and change houses, ice houses and offices. It is to be noted that while subsection (4) of Section 40 opens with an enumeration in general terms of things—buildings, plant and machinery—used for two specified purposes, it closes with an enumeration of specific things—"concentrators" and "Sampling plants." The class of buildings under consideration cannot fall under any of the things in the general enumeration in view of the limited purposes set out. If the Legislature had intended to exempt this class of building it would have enumerated them specifically along with "concentrators and sampling plant," but this it has not done. The fixed equipment in blacksmith, carpenter and machine shops may perhaps, though near the line, be regarded as fixed machinery used for manufacturing purposes, and as such exempt in toto, while the fixed equipment, if any, in the other buildings of this class is assessable as partaking of the nature of land as land is defined in "The Assessment Act." In the foregoing when the term "mine" is used, the reference is to the "buildings," plant and machinery in, on or under mineral land and used solely for obtaining minerals from the ground."

Where an apportionment of valuations requires to be made in accordance with the findings of the Board, the parties indicated that such apportionment could be made by agreement. Before adopting the valuations appearing in the statements furnished the municipality by the several companies the provisions of subsection (2) and (3) of Section 40 of "The Assessment Act," should be considered. The Board understands that the valuations appearing in these statements are the cost values of the several structures as carried on the books of the companies. It may be well that in many cases the cost at which a structure is carried on the books of the Company is quite different from the "amount by which the value of the land is increased" by the erection of the structure.

The appeals will be allowed and the several assessment rolls amended in accordance with the foregoing. There will be no costs to either party. There will be a fee of \$10.00 in Law Stamps on each order payable by the Appellant, the Appellant in each case being recouped \$5.00 by the Respondent.

(Signed) D. M. McINTYRE,  
Chairman.

The Sudbury "Star" reports the death of Mr. Geo. Behenna, of Creighton mine, one of the pioneer miners of the nickel district. Mr. Behenna was captain of Stobie and Murray Mines when they were flourishing and Creighton just beginning. Stobie has been abandoned, and Murray is just opening up after 20 years inactivity. Mr. Behenna was born at Redruth, Cornwall, coming to the United States at the age of 24. After holding the position of captain of a copper mine at Champion, Michigan, for several years he came to the Stobie Mine.

## Our Northern Ontario Letter

### THE SILVER MINES.

At the time of writing, the New York quotations for commercial bar silver have receded to a fraction above \$1.29 an ounce. This is approximately the point around which quotations may be expected to hover just as long as the white metal remains in a position where it is virtually standard, that is to say on a parity with gold on a basis of 16 to 1.

Detailed figures issued this week by the United States Bureau of Mines shows a further decline in the silver production of that country in 1919. This is pointed to as evidence that the less intensified development of the base metal mines of the U. S. from which a large amount of silver is mined annually as a by-product, is bound to bring the silver mines themselves into greater favor.

As an illustration of the favorable affect this situation is having in Northern Ontario where a large number of mines are operated exclusively for the silver they contain, is this week's announcement that the Keeley mine in South Lorraine will be re-opened, and that immediately following an aggressive development program an effort will be made to place the mine on a steady producing basis. In former years this mine was worked intermittently, but without commercial success. In the first place, it was never equipped with milling facilities. The cost of shipping the ore by truck and steamer to the railway was expensive and made it possible to deal only with the high grade ore. Now, however, with the price of silver having jumped to such high levels, and the operation company having decided to install a 20-stamp mill on the property, the indications appear to be that before the end of the current year the mine will be producing silver at a substantial rate. Work will commence on March 9th and will consist of de-watering the underground workings and the commencement of a comprehensive development scheme. In the meantime, the plans for the new mill have been completed, and the purchase of the equipment has already commenced. By the time the mill is on the ground the amount of development work accomplished is expected to have placed sufficient ore in sight to keep it running at full capacity.

The directors of the McKinley-Durragh Mines have declared a regular quarterly dividend of 3 p. c. payable April 1st to shareholders of record March 6th. The disbursement will amount to \$67,428, and is the second to be paid so far this year. The total paid to date by this company amounts to 259 per cent., or some \$5,754,163.

The Buffalo Mines has gone into voluntary liquidation, a winding up order having been issued for March 14th. The mine and its assets all pass to the Mining Corporation of Canada.

Development work on the Temiskaming Mine continues to add more ore to that already in sight. As yet, however, there is a tendency to regard the current developments as being somewhat similar to those of 1919 at which time the number of comparatively small shoots of ore were encountered from time to time.

It is stated that the proposal to merge the Adenac with the Victory Silver Mines, as outlined in last

week's Canadian Mining Journal is meeting with considerable favor among the shareholders of both companies. Provided the consolidation goes through on the present basis of 1,000,000 of the new issue to the Adenac, 1,000,000 shares to the Victory shareholders and 500,000 shares to the treasury, it is believed possible that work may be commenced on the Victory part of the merger in the early spring.

Up to the present, Henry Cecil, holder of an option on tailings pile on the Chambers-Ferland mine has failed to consummate a deal. The option was for \$55,000 and it had been planned to erect an oil flotation plant for treating the tailings.

From the outlying districts there is every evidence that the coming summer will bring increasing activity. The Gowganda district promises to be the leading prospective field, while interest in the Elk Lake and in the old South Lorraine district is steadily growing.

The Silver Bullion Mines, at Leroy Lake in the Gowganda district, having completed the purchase of the Dodds property, now announces that a \$30,000 mining plant has been purchased from a Nova Scotia mining concern and is already in course of transportation to Elk Lake. Also, the contract for hauling the equipment from the railway to the property has been let, and it is expected that the mining plant will be in operation before the break-up.

In the South Lorraine district, the announcement that the Associated Gold Mines of Western Australia, operators of the Keeley Mine, will erect a new mill, has caused more than ordinary interest, and the indications appear to be that it may be the commencement of a general revival of activity in that promising silver district. On a number of properties in the neighborhood of the Keeley there are encouraging silver bearing veins, the development of which is now given added incentive due to the high quotations for silver and, also, on account of the more abundant supply of labor.

The Cobalt branch of the G. W. V. A. continues to press its request for three free mining claims to all returned soldiers who were "bona fide" prospectors prior to enlistment. While it has as yet been impossible to secure definite figures, it would appear as though 10,000 would be a conservative estimate of holders of Miners Licenses who enlisted for service from Ontario. Provided this estimate is correct, the request presented to the government is for the surrender of approximately 30,000 mining claims, of 40 acres each, or a total of about 1,200,000 acres. This area would be equal to 52 townships of the size of Teck in which is situated the mines of the Kirkland Lake district or of Tisdale in which is located all the proven mines of the Poreupine field. It is believed that the government will not accede to the request, but, instead, will endeavor to find some other way in which to satisfy the request of the veterans without placing the entire mining industry of the province in jeopardy by adding to the already enormous area tied up and idle.

According to official advice from Thos. W. Gibson, Deputy Minister of Mines, to the New Ontario Pros-

pectors' Association, it has been suggested that the following townships shall be transferred from the Temiskaming Mining division and added to the Larder Lake Mining Division:—Catherine, Pacaud, Marquis, Otto, Eby, burt, Black, Tolstoi, McEvay, Nordica, Terry, Lee, Sheba, Dunmore and Bombas. As regards this, the general feeling appears to be that such a transfer would be reasonable with the exception of the transfer of the townships of Catherine and Pacaud. These two townships, or that part staked for mining property, are largely held by prospectors and mining men resident in Cobalt, Haileybury and New Liskeard. For that reason it is believed that they should remain a part of the Temiskaming Mining Division the recording office for which is located at Haileybury. Concerning the request from the New Ontario Prospectors' Association, it is pointed out, the Department should keep in mind that such a request represents a total membership of less than one score.

During the week ended Feb. 28th, four Cobalt companies shipped a total of four cars containing 309,593 pounds of ore.

Following is a summary:—

Shipper	Cars	Pounds
McKinley-Darragh . . . . .	1	106,850
La Rose . . . . .	1	78,057
O'Brien . . . . .	1	64,040
Hudson Bay . . . . .	1	60,646
Totals . . . . .	4	309,593

During the corresponding period, no bullion was shipped.

**THE GOLD MINES.**

For the first time for the past two years, some of the gold mining districts of Northern Ontario report a surplus of men. In some instances, according to official advice of your correspondent, men are applying for work faster than jobs can be found. While this does not show that the labor supply is favorable in all parts of the country, yet, when such a condition is found in some of the smaller camps, the belief is expressed that it will be a matter of but a very short time when the same will be true of the larger camps. In fact, all of the mining centers of Northern Ontario, the Porcupine field appears to be the only one where a shortage of men is being felt.

On former occasions, the remark has frequently been made: Give the gold mines of Northern Ontario adequate men and they will establish records which will totally eclipse all former achievements. From present indications, the next few months may see this actually being realized. Even now, the rate of the gold output will amount to more than \$12,000,000 for the current year.

A statement issued near the close of February states that the annual report of the Hollinger Mine will be in the mails almost immediately, but that the annual meeting will not be held for some few weeks. As regards progress at the mine, the number of men is now stated to be upwards of 1,100, and with about three score machines in operation. Concerning the experiments in connection with mechanical muckers, it is yet too soon to pass judgment, but the impression appears to be that they will not be able to take the place of manual labor. However, in view of the improved labor supply, it will perhaps not greatly matter whether or not the mechanical muckers can be brought into general use.

The directors of the Dome Mines Company and the Dome Extension Company have sent a report to the shareholders outlining the progress made during the past year in developing the Dome Extension property on which the Dome Mines Company holds an option. The latter company has asked for a six month's extension of time, as forecasted in last weeks issue of the "Journal". Accordingly, the shareholders of the Dome Extension have decided to hold a meeting on March 10th for the purpose of considering and, if approved, ratifying such an extension. The statement shows that the cross-cue at the 10th level of the Dome has already passed onto the Dome Extension and is now about 150 feet, and advancing at the rate of 5 feet a day. It also states that exploration and development work will continue at the 6th level. At this point a lense of ore measuring about 14,000 square feet was developed and which contains average gold values of \$4.62 a ton. Some 4,878 tons of ore were sent to the mill and averaged \$4.39 a ton. It is estimated that up to the present not far under 1000 feet of underground work has been done on the Dome Extension.

Concerning the Clifton-Porcupine, the acting secretary Ernest H. Bridger, has sent out the following statement to the shareholders, under date of February 19th:—

Since our last report was mailed, bearing date of December 1st, 1919, development of your property has proceeded without interruption.

During that interval the main shaft has been continued to a depth of 225 feet. A station has been cut at 200 feet and all timbering, etc., has been completed in preparation for lateral work at that level. This work has included the cutting of an ore pocket and pumping station below the level, and the installation of a skip in the shaft for the more economical handling of ore and waste.

Crosscutting both east and west is now in progress to open up the veins, the development of which gave such satisfactory results on the first level. All of these veins should be encountered within the next thirty days.

The sinking of the shaft on Number 7 has proven that there is no change in conditions in the depth so far reached. Only a small amount of drifting has as yet been carried out on this vein, but this work has proven that values are fully equal to those opened up in this same vein on the surface and on the first level. It accordingly seems reasonable to expect good results from the opening up of November 6. the Boulder and other veins on this new level.

The scale of our operations is being enlarged and from now on it is expected that even more rapid progress can be made. The results of the work so far carried out have been entirely favorable. The attentions of the management will continue to be directed toward demonstrating the possibilities of the property with the least possible expenditure of time and money.

According to an official statement just issued by R. C. Coffey, general manager of the Lake Shore mine, the production for January was the highest so far in the company's history, amounting to \$45,428.31. The average gold recovery per ton of ore treated was \$25.-80. Having thus regained its normal standing, the Lake Shore is expected to produce around \$600,000 during the current calendar year.

Within the week the Miller Independence will switch on electric power. This is looked upon as of utmost economic importance owing to the increasing difficulty of securing coal. Also, within the week the mine will be connected up with outside points by telephone. The main shaft having been completed to the 510-ft. level, and a large working station having been cut, a contract for several hundred feet of lateral work is to be let. The "D" or inclined shaft has been de-watered to a depth of 100 feet and the work of de-

veloping ore will be carried on at the same time the deeper developments are being conducted.

Sinking operations are now under way at the Mondeau property of the Peerless company and the shaft, beginning with the former depth of 130 feet, is going down at the rate of from 4 to 5 feet daily.

## British Columbia Letter

### METAL MINES

Stewart, B. C.—A shipment of 250 tons of ore from the Premier Mine, Salmon River District, Portland Canal, B. C., recently was brought over the winter trail to Stewart where it was loaded on the G. T. P. Steamer, Prince John, en route to the smelter at Tacoma, Wn.

R. K. Neill, one of the owners of the property, is reported as saying that a cyanide plant is likely to be installed after development has advanced to the point that a steady supply of ore is assured.

Statements from those in a position to know indicate that the management of the Premier is experiencing some difficulty through the activity of agitators among the workmen. Confidence is expressed, however, that this will not seriously interfere with the plans in mind for development and operation.

Preparations are in hand for the commencement of work on the Spider Group, which consists of three claims lying north of Long Lake in the Salmon River section. This property is under bond to the Algonquin Syndicate of Belgium, represented by W. A. Meloche, a mining engineer who was through the district last summer.

Fifty tons of supplies have arrived for the Spider Camp. It is planned to take them over the trail immediately by means of packhorses equipped with snowshoes. Some machinery required for initial development is expected to arrive shortly.

Sandon, B. C.—The annual report of the Silver-smith Mines, Ltd., operators of the Old Slocan Star Mine, gives an account of 1919 activities. Ore mined amounted to 14,558 tons, of which all but 325 tons went through the Mill at the Mine. Concentrates were marketed on both sides of the line, the smelter at Trail receiving 19 cars of silver concentrates, 17 going south, and all but 3 of 24 cars of zinc concentrates shipped went to the United States. It is estimated the report asserts, that the ore in sight totals 90,000 tons.

Nelson, B. C.—At the recently held Annual Convention of the Associated Boards of Trade of Eastern British Columbia several resolutions affecting the mining interests of the Province were passed. One protested against the "Engineers Profession Act," a measure being presented to the Legislative Assembly which, it is alleged against it, would exclude all foreign engineers except those who are duly qualified members of the Association or have a temporary license from its Council. This, the Convention declared, is undesirable, if on no other ground, on that its effect would be to bar engineers and others coming into the Province as the representatives of outside capital seeking investment. Another resolution dealt with the taxing of "so-called" profits from Mines, the opinion being expressed that an allowance should be made for the depletion of mines in assessing the Income Tax. The concluding two paragraphs read as follows:

"Whereas the United States Government and the Canadian Government both have granted such allowance and an eminent expert engaged by the British Columbia Government has reported favourably to such allowances;

"Both precedent and justice are in favour of granting an allowance for mine depletion and the Taxation Act should be amended accordingly."

Alice Arm, B. C.—The railway from Alice Arm to the Dolly Varden Mine is to be extended from its present interior terminal to the Wolf Group of Mineral Claims, a distance of about two and one half miles. That this work is to be undertaken this year, and that as little time as possible will be lost, is officially announced by the management of the Taylor Engineering Co. This additional mileage involves some heavy canyon work and the Kitsault River will have to be bridged. The benefit to the district, and particularly its mining industry, will be substantial. Not only will it mean the development to a shipping point of the Wolf property, which together with the Dolly Varden passed from possession of the Dolly Varden Mining Co. to the Taylor Engineering Co., but it will give transportation facilities to several other promising prospects.

A. J. T. Taylor, managing director of the operating Company, confirms the report that workmen already have been dispatched to open up a camp at the Wolf, that a water power compressor is to be installed there, that some new plant is to be added to the equipment at the Dolly Varden, that a quantity of new equipment is to be provided for the railway, and that work will be commenced as soon as practicable on new ore bunkers at tidewater at Alice Arm.

The North Star Mine is one of those which, with the completion of the railway extension, will become a shipper. Already there is a considerable quantity of ore ready to be taken out. Others affected are the Toric, Tiger and Muskateer, now under development. With these, as well as the Wolf, waiting for the steel it would appear that before long now the Dolly Varden will have a number of rival shippers in the district.

The Last Chance, belonging to A. McPhail, is reported to be under bond to Messrs. Price and Keith, of New York. It now is being explored by diamond drill. The David Copperfield claims situated near the Dolly Varden, are said to have been bonded to Messrs. Watt and Watt, of Toronto, Ont., for the sum of \$200,000, with a cash payment of \$2,000. R. F. McGinnis, Wm. McLean and A. E. Wright are the original locators. The La Rose Group, situated about two miles from the Dolly Varden Ry. and about eight miles from Alice Arm, is to be developed extensively this year according to a recent announcement. A 450 foot crosscut tunnel and considerable diamond drilling are planned. For the past three years the property has been worked on a small scale, several shipments of high grade ore having been made.

D. J. Hancock, an operator of the Alice Arm District, has returned from Eastern Canada and the United States and asserts that he has been successful in exacting a promise from Major General Sir John Carson, president of the Crown Reserve and the Porcupine Crown, well-known properties of the Crown Reserve and the Porcupine areas to visit British Columbia accompanied by two engineers for the purpose of looking over the Alice Arm section with a view to investment.

Trail, B. C.—Ore receipts in gross tons at the Trail Smelter, Consolidated Mining and Smelting Co., of Canada, from the 31st January to the 7th of February, inclusive, were 8,057 tons, making a total for the year of 34,278 tons.

The management of the Consolidated Mining and Smelting Co. has announced an advance of 50 cents a day in the wages of their employees in all their camps to take effect on and from the 16th of February.

Authoritative announcement was made recently of some additions to plant and improvements in contemplation by the Consolidated Mining and Smelting Co., of Canada. One, of which brief mention already has been made, in the enlargement of the Copper Refinery Plant at the Trail Smelter. The purpose of this is to increase the output to 50 tons of refined copper a day the present capacity being 29 tons. This is rendered necessary by reason of a contract with the Canada Copper Company for the handling of about 130 tons of concentrates a day, with an estimated copper content of 25 per cent; the anticipated greater production of the Rossland mines; and the general mining development of the country. The cost of this is placed at \$250,000. A Rod Mill, for which plans are complete, represents an entirely new line of industrial activity for the Company. Heretofore copper has been exported to the United States, rods produced and the material re-shipped to Canada for conversion into copper wire. Prior to 1916 all the copper production of Canada with the exception of a small amount of copper sulphate, was exported in the form of ore, concentrate, matte, or blister. A slight change but an important step forward, took place three years ago when some refined copper, from the plant of the Consolidated Co., Trail, was produced. And now the decision of the same company to put in a plant for the manufacture of copper rods at an expenditure of approximately \$200,000 is a further advance in the independence of Canada, at least as far as the commercial perfection of this particular metal is concerned. A minor improvement, comparatively speaking, is the construction and equipment of a large machine shop, the functions of which will include some foundry work which formerly went elsewhere for attention, and which will be more efficient and modern in every respect. Draughtsmen are engaged preparing plans for the concentrator designed to treat the ores of Rossland and a definite statement as to its site, Rossland or Trail, is looked for soon. The installation complete is expected to cost \$1,000,000.

Windermere, B. C.—The Ptarmigan, Sitting Bull and the Bald Eagle, the former situated on Horse Thief Creek and the latter on Slade Creek, are properties on which development gives promise of good results. W. S. Watson is operating the Ptarmigan under lease and bond. While the owners of the Sitting Bull have been devoting most of their attention to the Trojan Mine, the ore of which contains copper values, and for the development of which a compressor run by gasoline power has been installed, they plan to extend the wagon road to the first mentioned property this year. Operation on a considerable scale are expected then to be initiated. The Sitting Bull ore is a steel galena of a fairly good grade. On the Bald Eagle a crosscut is being driven to tap the vein. The Paradise, is a well-known mine of this district, and work is continuing shipments being made regularly.

Vancouver, B. C.—That the discoveries made in the Mayo District, close to Stewart River and about 200 miles southeast of Dawson Y. T., are as rich as reports have given them credit for is stated by J. E. Binet, a miner who went to the Yukon in 1895 and who arrived at Vancouver recently. He compares the ore with that of some of the richest pockets which twenty years ago made famous the Payne and Slocan Star and other well-known mines of the Slocan District of the Kootenays B. C. Assays, he states, give returns running from \$150 to 1500 a ton in silver. Surface indication and development as far as it has gone appear to assure large reserves. The finds have been made above the timber line. Last summer, Mr. Binet says, the Yukon Gold Company bought the most promising claims, paying about \$45,000, and one of the Company's representatives spent the season in camp. They are working all winter. At present the ore is being sent out by sleds to the bank of the Stewart River, 40 miles away, and from there will be shipped by steamer to White Horse and probably to the Anyox smelter in the spring. The Silver King, which was staked in the Mayor District two years ago, is reported to have yielded its owner, Thomas Aitken, who has shipped 3500 tons of picked ore, a modest fortune. The Guggenheims are expected to install a concentrating plant. It is estimated that there are about 165 miners in the district and work is in progress on claims situated on Kino Hill, Haldane, Patterson and Cameron Mountains.

Claiming that he has a legal claim to a one-fifth interest in the Engineer Mine, of the Atlin District, W. Pollard Grant, a barrister of Vancouver, B. C. has brought action against J. A. Fraser, gold commissioner and mining recorder. The latter is made defendant in his capacity as administrator of the estate of the late Capt. James Alexander and also of the estate of the late Allan I. Smith, of Philadelphia, the latter being named in Capt. Alexander's will as his sole legatee. Interest in this suit is keen because Mr. Grant is well-known on the Coast and because the Alexander Mine, admittedly a very rich property has been strong corporation and is likely to be sold for a considerable figure.

W. Porteous Sloan, of the Drum Lummon Mine, Skeena District, has returned from the North. He asserts that a new body of promising ore has been uncovered on the Drum Lummon and that it is expected that the Mill will be operating by next month.

Victoria, B. C.—The possibility of large deposits of alunite, situated near Kyuquot, West Coast of Vancouver Island, containing potash in commercial quantities is to be thoroughly investigated by Wm. M. Brewer and P. B. Freeland, Government Mining Engineers. They have been instructed to inspect the property as soon as possible, to obtain large samples and to undertake to see that the latter are so assayed as to leave no doubt as to the content of the mineral. If the claims of the owners of the deposits are substantiated there is no doubt that the establishment of an important industry will result. There is some difference of opinion, however, on this point and it is to set at rest all questions of this character that the government engineers have been sent to investigate.

(Continued on Page 186.)

### RESIGNATIONS FROM THE GEOLOGICAL SURVEY.

Copies of Letters and Resolutions of Protest from the Council and Branches of the Canadian Mining Institute.

February 21, 1920.

Sir George Foster,  
Acting Prime Minister of Canada,  
Ottawa, Ont.

Sir:—

I have been instructed by the Council of the Canadian Mining Institute to forward to you the enclosed copy of a letter sent to the Minister of Mines, with reference to the harm which the mining industry of Canada is suffering by the resignation of technical officers from the Geological Survey and the Mines Branch.

I am, Sir,  
Yours faithfully,  
(Sgd.) R. R. Rose  
Assistant Secretary.  
February 21, 1920.

The Honourable Arthur Meighen,  
Minister of Mines,  
Ottawa, Ontario.

Sir:—

The Council of the Canadian Mining Institute has noted with regret and alarm the large number of resignations from the staff of the Geological Survey. It is understood that the cause of these resignations includes the following:

- a. Inadequacy of the salaries in actual amount, these being insufficient to meet the ordinary living expenses in Canadian cities.
- b. Entire inadequacy of the salaries in comparison to those paid by private employees.
- c. Unfair classification of the members of the Survey in view of the experience of the men who have resigned, their length of service and technical attainments, which has caused grave dissatisfaction and actually brought about the resignations.

While the council fully appreciate the reasons that have compelled the resignations, and sympathise with the geologists affected by the above-mentioned causes, it is chiefly concerned at the harm which the loss of these geologists will occasion to the progress of the mining industry in Canada. A number of letters and telegrams of protest have been received from the provincial branches of the Institute, copies of which are appended hereto. These protests represent accurately the feeling of the mining industry throughout Canada, and the Council desires to respectfully emphasise the extreme un wisdom of allowing the most capable and experienced men among the younger geologists of Canada to leave the country because of such an entirely indefensible scale of salaries as is provided by the classification.

The members of the Survey who have resigned are all men who have unique experience in certain phases of Canadian geology, and have become especially fitted by long service in the Survey to advise on the problems of our economic geology. On certain phases of the mineral industry in Canada, including oil occurrences, coal, copper and precious metal deposits, the men who have resigned can give the most competent and expert advice obtainable. Such advice may mean millions of dollars to Canada, and this fact is well recog-

nized by private corporations. The Council does not suggest that the scale of government salaries can compete with those offered by private companies, but it does most emphatically believe that the existing absurd and indefensible disproportion should be lessened, and that the members of the Geological Survey should be remunerated in keeping with their training, their professional attainments, their social status and their value to the mining industry, and through this to the country as a whole.

The Council would for these reasons respectfully suggest that the salaries of the members of the Geological Survey and Mines Branch should be reviewed, and that the obvious injustices of the existing classification should be removed.

I am, Sir,  
Yours faithfully,  
(Sgd.) R. R. Rose,  
Assistant Secretary.

### The Northern Alberta Branch, Canadian Mining Institute.

Edmonton, Alta.  
Feb. 7, 1920.

Dear Sir:—

At the meeting of the above Branch the executive were instructed to draft up and forward to you a resolution with reference to the resignation of Dr. J. S. Stewart from the Geological Survey of Canada, protesting against the possibility of the local office being closed.

A meeting of the executive was held on Friday the 6th inst. when the following resolution was drawn up and I was instructed to send same to you with the request that you forward it to the proper authorities.

"That the Northern Alberta Branch look with anxiety upon the recent resignation of Dr. J. S. Stewart of the Geological Survey, whose work in the Alberta Branch has been most valuable and thoroughly appreciated.

This source of information has been taken advantage of and proved of great benefit to the Mining Industry, Boards of Trade and other individuals throughout the Province.

We hope and sincerely trust that adequate steps will be taken immediately to carry on the work of Dr. Stewart."

Kindly give this matter your very best attention in the interests of the Mining Industry.

Yours truly,  
(Signed) JAS. A. RICHARDS  
Secretary.

R. R. Rose, Esq.,  
503-4 Drummond Bldg.,  
Montreal, Que.

### Night Letter.

SYDNEY, N. S.  
Feb. 10 '20.

R. R. Rose,  
Asst. Secy., Canadian Mining Institute,  
Drummond Bldg.,  
Montreal.

It has come to the notice of the Council of the Mining Society of Nova Scotia that, owing to inadequate salaries paid by the Survey and Mines Branch of the Geological Department, some of the staff have been forced to resign. In the interest of the mining in-

dustry we wish to protest against the scale of salaries now being paid to such highly trained technical men, whose services to the country are of such value. We would urge that steps be taken immediately to make the salaries paid sufficient to attract and retain for the service a class of men of the standard formerly associated with the work of the Department.

E. C. HANRAHAN,  
SECRETARY.

CANADIAN MINING INSTITUTE,  
Hastings District Branch.

Deloro, 9th Feb. 1920.

Council of the C. M. I.,  
Montreal, Que.

Gentlemen:—

Hastings District Branch views with alarm the wholesale resignation of the Geological Staff, and consider it necessary that energetic action be taken by the Institute to bring the matter forcibly to the attention of the Government.

Yours truly,

(Signed) R. A. ELLIOTT,  
SECRETARY, HASTINGS  
DISTRICT BRANCH.

The Northern Alberta Branch Canadian Mining  
Institute,

EDMONTON, ALTA.

Feb. 7, 1920.

Dear Sir:—

I am in receipt of your telegram of the 5th inst. which reads as follows:—

“Reference resignations of Geologists from Geological Survey, please forward protest by the Branch against the Government allowing resignations to continue.”

This matter was brought up at a special meeting of the Executive of the Northern Alberta Branch when the following resolution was unanimously carried.

“That the Executive of the Northern Alberta Branch regret to hear that it has been necessary for a considerable percentage of the regular staff of the

**WANTED.**

Assay laboratory outfit:—muffle and crucible furnaces, gasoline preferred; crusher, pulveriser, balances, etc. Must be in good condition.

Address: P. O. Box 117, Crosby, Minn., U. S. A.

Geological Survey to resign particularly as it will greatly hamper the progress of the Geological Survey throughout the Dominion, especially as it is required for the industrial progress of the country. The Executive therefore trust that immediate steps will be taken to restore to its former strength this valuable Branch of the Government service.”

Yours truly,

(Signed) JAS. A. RICHARDS,  
SECRETARY.

R. R. Rose, Esp.,  
503-504 Drummond Bldg.,  
Montreal, Que.

**MATERIAL FOR SALE**

- RAILS—7,800 lin. ft. of 56 lb. rail with fastenings. 4,400 lbs. plates.
- STEEL TRESTLE—59,450 lbs. structural steel.
- WOOD TRESTLES—About 205,000 F. B. M. of heavy lumber.
- CABLES—About 12,000 feet of one-inch and one and a quarter inch steel wire cable.
- CARS—Four.
- BUILDINGS—Park Ave. Station. Centre Station and Engine House. Upper Station and Engine House
- COVERED PAVILION—Including structural steel frame (about 18,000 lbs.)

**Equipment at Upper Engine House**

- ENGINE—one 14 in. x 24 in. simple twin reversing link motion horizontal engine connected by gears to a double drum hoist.
- HOIST—Double drum twin hoist. Drums 100 in. diam. x 60 in. face. Lagging on drums 9 in. oak blocks bolted to drums. Driving pin on 32 in. diam. x 8 in. face. Driving gear, 12 in. diam. x 8 in. face. Drum shaft, 7 in. diam. in bearings. Bearings, 3-7 in. Cast-iron babbitted. Brake bands on both drums.
- BOILER—Horizontal return tubular. 60 in. x 14 ft.—72-3 in. tubes. Grate surface 36 in. deep x 60 in. wide. Stack 30 in. diam. x 35 in. high approx. Boiler designed for 125 lbs. working pressure. Boiler fed by injector.
- STEAM PIPING—6 in. wrought iron pipe from boiler to engine.
- EXHAUST—5 in. spiral revitted from engine up through the roof of engine house.

**Equipment at Lower Engine House**

- ENGINE—One 8 in. x 16 in. simple twin reversing link motion horizontal engine connected by gears to a single drum hoist.
- HOIST—Single drum endless cable type, with the necessary gears shieves and idler shieves and cable tightening device for taking up slack by means of idlers. Brake hand in drum.
- “NEW” BOILER—Horizontal return tubular. 60 in. x 14 ft.—72-3 in. tubes. Grate surface 36 in. deep x 60 in. wide. Stack 24 in. diam. 50 ft. long approx. Boiler designed for 125 lbs. working pressure. Boiler fed by injector.
- “OLD” BOILER—Horizontal return tubular. 52 in. x 12 ft.—60-3 in. tube. Grate surface 30 in. deep x 50 in. wide. No stack. Boiler designed for 125 lbs. working pressure
- STEAM PIPING—4 in. wrought iron pipe from boiler to engine.
- EXHAUST—3 in. wrought iron pipe from engine up through roof of engine house.

Night Letter.

COBALT, ONT.

R. R. Rose,  
Asst. Secy., Canadian Mining Institute,  
Montreal, Que.

The Cobalt Branch of the Canadian Mining Institute protests most emphatically against the Government allowing resignations of trained geologists from the Dominion Geological Survey on account of inadequate remuneration and suggests the immediate consideration of the reclassification of such men so as to allow them salaries more in keeping with their training and ability and showing less disparity with the salaries being offered by private concerns.

ARTHUR A. COLE.  
SECRETARY.

MINING CORPORATION DIVIDEND.

The Mining Corporation of Canada, Limited, have declared a quarterly dividend of twelve and a half per share for the three months ending March 31st, payable March 15th to all shareholders of record March 1st.

MINING BROKER DEAD.

The death took place this week in Toronto of H. Acton Fleming of the Standard Exchange firm of Fleming & Martin. Death resulted from pneumonia following an attack of scarlet fever. He was among the best-known members of the exchange. Mr. Fleming is survived by a wife and two children.

A SAN FRANCISCO OPINION ON GEOLOGICAL SURVEY SALARIES

Canadian geologists are like American geologists in expecting their government to give them a living wage. We referred recently to the loss suffered by the personnel of the U. S. Geological Survey on account of resignations caused by the inadequacy of the salary paid to members of the staff. The same blight has fallen upon the Canadian Geological Survey. Out of a field staff of 25, no less than 13 have resigned since last October. As an example of the lack of appreciation for scientific service shown by the Government, and back of it, of course, the Parliament of the Dominion, we may instance a graduate of McGill university who was receiving \$2100 per annum after having been on the Survey for ten years. He was offered, and accepted, \$5600 per annum from Pearson & Son. All the younger men are leaving the Survey, and we do not blame them. One may love the rocks, but one cannot live on them.—Editor, Mining and Scientific Press.

BRITISH COLUMBIA LETTER

(Continued from Page 183.)

A bill has been placed before the Legislative Assembly of British Columbia providing for the amendment of the Mineral Act in such fashion that power will be given the Lieut-Governor-in-Council (the Government) to reserve from location and mining for iron any lands containing iron ores which are not at the time of reservation included in any mineral properties held under the existing or other statutes and to dispose of such reserved lands on such terms as to royalty per ton of ore removed as may be deemed advisable. This authority is to extend over a period of three years. Under the Act the term "Iron Ore" means any mineral deposit containing in itself or in the concentrates made therefrom not less than 40 per cent of metallic iron capable of being melted on a commercial basis.

Indian reservations of British Columbia are to be thrown open for the location and mining of gold and silver as and from the 1st of April of this year. This announcement is contained in a Provincial Gazette issued recently and with it is published the regulations, drawn by the Dominion Government under which mining on such lands will be governed.

Samuel W. Cohen, General Manager of the Blue-stone Mining & Smelting Company, Mason, Nevada, has returned to Montreal, after an examination of the Company's property.

# A MARSH HOIST

## IS MADE THE RIGHT SIZE FOR YOUR MINE

and in either Steam Power or Electric Power

This shows one of our Electric Mine Hoists. We make many other types. Send for our catalogue of Mine Hoists, Cars, Cages, Buckets, etc., and see what we offer you. It will repay you.

From the little 10 Horse Power size for prospectors or small mines to the massive 50 Horse Power size, one of our 7 sizes should be just right for your mine.

We are specialists in the building of Hoisting Machinery of all sorts. For nearly a quarter of a century we have been designing and building Hoists, and have developed a Hoist that we are really proud of—proud because of the record of good work they have done, and are doing in mines, quarries, and other classes of work from one end of Canada to the other.

## The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$75,436,103; Lode Gold, \$97,121,786; Silver, \$46,839,631; Lead, \$42,294,251; Copper, \$145,741,069; Other Metals (Zinc, Iron, etc.), \$13,278,058; Coal and Coke, \$187,147,652; Building Stone, Brick, Cement, etc., \$28,843,272; Miscellaneous Minerals, \$651,759; making its mineral production to the end of 1918 show an

### Aggregate Value of \$637,353,581

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462; for the year 1917, \$37,010,392; for the year 1918, \$41,782,474.

### Production During last ten years, \$313,976,022

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with Mining Reports and Maps, may be obtained gratis by addressing

THE HON. THE MINISTER OF MINES  
VICTORIA, British Columbia

# The Minerals of Nova Scotia

## THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

**Coal** Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

**Iron** The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

**Gold** Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

**Gypsum** Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and other Literature may be had free on application to

HON. E. H. ARMSTRONG, - HALIFAX, N.S.

*Commissioner of Public Works and Mines*

## PROVINCE OF QUEBEC MINES BRANCH

Department of Colonization, Mines and Fisheries

*The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.*

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

**MINERS' CERTIFICATES.** First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

**WORKING CONDITIONS.** During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

**SIX MONTHS AFTER STAKING.** At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

**MINING LICENSE.** The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

**MINING CONCESSION.** Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

**PROVINCIAL LABORATORY.** Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE J. E. PERRAULT,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

# EDITORIAL

## The Safeguarding of Investors in Mines

Mr. R. E. Hore, in this issue, argues for recognition and protection of the "speculator" in mining enterprises, and refers to an article contributed to the "Engineering and Mining Journal" by Mr. J. B. Tyrrell, which, if we may be pardoned for stating the fact, this journal would have been pleased to have had for its own circle of readers. Both writers urge the necessity to protect the small investor against fraud by safeguarding public stock issues through provisions requiring disclosure of pertinent facts. This much will be very generally conceded, and Ontario by requiring the filing of certain statutory information regarding mining flotations, has provided one effective safeguard. We cannot quite agree with Mr. Hore in his plea for the "speculator", for the term is practically synonymous with that of "gambler". The French word "entrepreneur" more exactly defines the person who imparts the initial impulse to mining flotations, and this function is a proper and useful one. It is not one, however, that should be attempted by the "small investor", and we do not believe that any useful purpose has ever been served by mining flotations offering stocks, or "certificates of a taken chance" at so many cents a share. Legislation to protect such persons is probably necessary, but it is nevertheless an attempt to protect a fool against his folly. A recent stock offering in a Montreal newspaper frankly admitted that its proposition was a gamble, inasmuch as the advertisement stated that the winnings would be larger in proportion to the amount "you ante up".

It may be regarded as unfair to the "small investor" to suggest that the only proper way to develop mining prospects into producing and profitable mines is through wealthy development companies advised by competent engineers but such is undoubtedly the teaching of experience. Such organizations offer solid inducements to the prospector, and provide the bridge between him and capital that is so necessary.

Mr. Tyrrell, with good reason, deplors the fact that in Ontario, "anyone, no matter how incompetent, untrained, or reckless, is allowed to manage or mismanage a mine, to handle or disburse large sums of money

"intrusted to him by confiding people for purposes of development and equipment, and, by bad management to risk the ruin of what might have been, under proper management, an excellent property." There is some danger of confusing some issues here. The government is, or should be, charged with the duty of seeing that only competent persons are allowed to superintend mining operations insofar as these are concerned with prevention of accident and safety of life and real property. The principle of requiring certificates of competency from mine managers is a well-recognized one. It should also be within the powers of government to require that no persons should practise as a mining engineer, professing certain qualifications, unless his profession of such essential qualifications can be certified, either by examination, or by endorsement from some organization of engineers, in the same manner that other professions are regulated. But, as those who pay the piper call the tune, it will never be possible to regulate in any statutory manner, the expenditure of money on mine development. The best manner in which to safeguard the expenditure of monies invested in a mining company is for shareholders to insist upon the employment of competent engineers, and to give a wide berth to mining ventures that do not employ competent mining engineers and give publicity to the reports of these men.

It cannot, moreover, be denied that technical attainments and business acumen do not always go together, another fact in favor of the handling of mining prospects through large development companies, in which there will usually be found the necessary admixture of the spirit of the scientific engineer and the financial "entrepreneur".

One statement of Mr. Tyrrell's will be generally acceded to, no matter what personal opinions may be held as to the fitness of the new government in Ontario to oversee the mining development of the Province, namely, that no better men could be found to advise the Ministers than the present Deputy Minister of Mines and the Provincial Geologist, and their respective staffs.

## Gold and Credit

Credit being based largely on gold, the present situation has an unusual interest for gold producers. During the war it was realized in Canada that the maintenance of a high rate of production of gold was desirable, but the pressing need of men for the battlefields and for munitions manufacture made increased production impossible. The restoration of peace would have brought about a rapid expansion of the gold mining industry if the selling price had increased as has the cost of mining. The future expansion depends largely on the faith of the public in the soundness of the credit structure. If there comes a demand for maintenance of the normal ratio between gold and credit, conditions favorable to the gold producer will exist.

Some indication of the trend of events is to be found in the opinion expressed recently by James S. Alexander, President of the National Bank of Commerce in New York. He says:

"The strain under which the credit resources of the country are now laboring is evidenced by the high money rates in all classes of loans. An analysis of the fundamental factors in the situation clearly reveals that the chief cause of the strain is that the volume of credit has expanded until the gold basis is becoming inadequate in view of conditions affecting the liquidity of credit. One index of the basic situation is found in the seriously altered ratio between the total stock of gold coin and bullion in the United States and the total volume of other money and bank deposits subjected to check. Both of these latter items are efficient instruments of business because of the unshaken and unexpressed faith of the public that underlying them is enough gold for the redemption of all obligations incurred in either of them which might be required in the course of business. As long as this faith is unshaken there is a relatively small call for the gold, so that a comparatively small ratio of the metal normally suffices. Thus, in the last analysis, the soundness of the business situation requires that the ratio of the gold base to the credit structure be such that all practical needs will be easily met, maintaining unwavering public faith. I in no sense mean to imply that the gold ratio is now down to a point that should unsettle public confidence or that any fixed ratio is advisable, but nevertheless it is approaching a point that is lower than experience shows best serves the credit requirements of the nation."

When one considers that Mr. Alexander is speaking of conditions in the United States, where there was a great importation of gold during the greater part of the war in part payment of goods purchased by the Allies, it is not surprising that that country does not pay a high price for the paper money of other coun-

tries. Americans may still have faith that there is sufficient gold behind their own paper, but they have expressed in no uncertain way their preference for gold when trading with other countries. In the United States the gold ratio was well maintained until the year 1918. During 1919 it fell off rapidly, and is still falling off. Is it mere coincidence that exchange rates have risen so sharply during recent months?

It is generally believed that the British Columbia Legislature will re-enact the twice disallowed Vancouver Island Settlers' Rights Act. The Victoria "Daily Colonist" writes: "Were it not for the fact that the principle involved in the measure, which continues to cause Ottawa so much official displeasure, has stood the test of the highest court in the Empire, the Legislature might have some reason to proceed more cautiously." This reference is to the decision of the Privy Council, which decided that the Act in question was one within the powers of the provincial legislature.

### WELL KNOWN CARIBOO PROSPECTOR THINKS P. G. E. ROUTE SHOULD BE CHANGED

Joe Wendell, who has mined, prospected and hunted the hills of the Cariboo for thirty years is now in Vancouver.

He says that the route of the P. G. E. should be changed from the Fraser River to the Willow or the Bowron River. The railway would then pass through the fine agricultural and big timber areas of the Horsefly. It would take in the big River where there is a wonderful supply of water power capable of electrifying the Railway and many industries and also Barkerville where mining is rapidly developing. Down the Bowron River there are great areas of pulp spruce and coal measures. Following the present route there will be 150 miles south of Prince George which will produce practically no traffic.

Mr. Wendell's suggested route would require considerable more grading than the present one but would prove cheaper in the long run because it would eliminate the many branch lines which will eventually be necessary if the present is followed. The government has been asked to investigate thoroughly before continuing construction.

There is some talk of the G. T. P. building a line of railway to the coal deposits of the Bowron River. This coal is similar in character to Vancouver Island coal and would be very valuable for smelting purposes.

Mr. Wendell says the country is large and full of untouched mineral areas of many kinds and he would not be surprised if a placer camp equal to any of the old time diggings should some day be found.

A private company under the name of Sudbury Alloys Securities Company, Limited, has been formed with head office at Toronto, the provisional directors being William Bain, John Henry and James S. Lovell.

# Digest of the Preliminary Report of the Mineral Production of Canada 1919 Compiled from the Statistics of the Department of Mines

## A Year of Transition.

By the courtesy of Mr. John McLeish, Chief of the Division of Mineral Resources and Statistics, and with the permission of the Deputy Minister of Mines, the "Journal" is enabled to publish the following digest of the Preliminary Report on Mineral Production for 1919. The Report states that:

Estimates of the total probable value of the mineral production of Canada during 1919 made on the first of January last were short about 3.6 per cent of the preliminary figures now available. Sufficient allowance had not been made for the increased production and increased value of cement, clay, quarry and other similar structural material products. The coal mining industry too, during the last three months of the year responded quickly and extensively, particularly in the Province of Alberta to the heavy demand for fuel.

In reviewing the industry as a whole it is customary to express the total mineral production and to make comparisons of production of different years or districts in terms of dollars or total values. The wide range of prices through which many metals and mineral products have passed during the past five years and the continuation of high prices for many products have of course resulted in greatly increasing the total value of the mineral production, even when the actual quantities of metals or minerals obtained might be decreasing. It is evident that less importance should be given to comparisons in values and that more stress should be laid upon quantity comparisons. This may be readily done with individual products, but appears less feasible when dealing with totals of a great variety of products.

The total estimated value (1) of the metal and mineral production in 1919 was \$173,075,913 which is less than the total value reached during each of the three preceding years. Compared with the production in 1918 valued at \$211,301,897 a decrease of \$38,225,984 or 18 per cent is shown.

Just as the declaration of war in 1914 was followed by a short period of industrial dislocation before the activity necessitated by the war's requirements became fully launched so following the cessation of hostilities there has been an interregnum, or transition period, during which the war's demands are being replaced by the legitimate requirements of peace industries and the demands of reconstruction.

The difficulties of making these readjustments have been aggravated by social upheavals and strikes.

The net falling off in mineral production in 1919 has been a means between a large decrease in the production of metals, coal and many "war minerals"

such as chromite, graphite, magnesite, pyrites, etc., on the one hand and large increases in the production of structural materials such as cement, clay products, lime and building stone and also of asbestos, gypsum and salt.

The metallic production in 1918 was valued at \$14,549,152, which fell in 1919 to \$72,401,829 a decrease of \$42,147,323 or 36.8 per cent. Gold is the only metal of which there was an increased production. The falling off in the quantities of other metals varied from 9.5 per cent in zinc to nearly 52 per cent in nickel.

The total value of the non-metallic production including clay and quarry products in 1919 was \$100,674,084 as compared with \$96,752,745 in 1918 showing an increase of \$3,921,339 or 4.1 per cent. The cement clay and stone products alone were valued at \$25,754,692, as against \$19,130,799 in 1918 an increase of \$6,623,893, or over 34 per cent. The total value of non-metallic products other than structural materials was \$74,919,392 as against \$77,621,946 a decrease of \$2,702,554 or 3.4 per cent.

In the decline and recovery of the production of structural materials, in the increased value of non-metallics (which are chiefly composed of fuels), and in the astonishing rise of the production and values of metallics during the war period, and the much smaller figures of 1919, may be traced the chronology and effect of the War.

**Copper.**—The 1918 production of copper was highest recorded in Canada. That of 1919 is the lowest since 1911. Compared with 1918, copper production shows a decline of 36.7 per cent in quantity and 52 per cent in value. Manitoba produced three million pounds of copper, compared with two million pounds in 1918, all from the Mandy Mine.

**Gold.**—The total production of gold in 1919 amounted to 767,167 ozs. against 699,681 ozs in 1918. Nova Scotian production was only 940 ozs against 1,176 ozs in 1918. This is the smallest production obtained in any one year in this province, the records of which have been published for 58 years. The largest production was 112,226 ozs. in 1899. Production in Manitoba, derived from the gold and copper ores of Le Pas District, was only 611 ozs. as compared with 1,926 ozs. in 1918.

**Lead.**—Production in 1919 was 43,895,888 pounds compared with 51,398,002 pounds in 1918, a decrease of 14.6 per cent.

A comparison of the value of the production in Canadian mines and quarries, in the three main divisions used in the statistics of the Mines Department, during the period 1913 to 1919 inclusive, is as follows:

	Structural Materials and Clay Products	Non-Metallics	Metallics	Total
1913 . . . . .	30,809,752	48,463,709	66,361,351	145,634,812
1914 . . . . .	26,009,227	43,476,229	59,386,619	128,863,075
1915 . . . . .	17,920,759	43,373,571	75,814,841	137,109,171
1916 . . . . .	17,467,186	53,414,983	106,319,365	\$177,201,534
1917 . . . . .	19,837,311	63,354,363	106,455,147	189,646,821
1918 . . . . .	19,130,799	77,621,946	114,549,152	211,301,897
1919 . . . . .	25,754,692	74,919,392	72,401,829	173,075,913

**Nickel.**—The production and also the value of this metal show heavy declines, 1919 production being 44,452,953 lbs. against 92,507,293 lbs. in 1918. The quantity of nickel ore refined in Canada showed a gratifying increase, amounting to 5,063 tons as against 1,204 tons in 1918.

The British-American Nickel Company practically completed in 1919 the construction of a new smelter at Murray Mine and of a refinery at Deschenes, Que. The smelter started operations in January 1919, and the refinery will, it is anticipated soon be in full operation. It is expected to have a capacity of 7,000 tons of nickel and 3,500 tons of copper per year. There has also been erected a refinery for precious metals; and refined platinum, palladium, iridium, gold and silver will be produced. The International Nickel Company's plant at Port Colborne has reported for 1919 a production of platinum, palladium, gold and silver.

**Platinum.**—About 25 ozs. of platinum and 62 ozs. of palladium, in an impure state, together with some gold and silver are reported as having been recovered by the International Nickel Company during 1919 from Surbury nickel ores. A substantial recovery of platinum group metals is expected in the new refinery of the British-America Nickel Co. which will employ the electrolytic method.

**Silver.**—Production in 1919 was 15,675,134 ozs. against 21,383,979 ozs. in 1918, a decrease of 26.7 per cent.

The contribution of Ontario to silver production was 76.1 per cent of the total, compared with the maximum figure of 93.8 per cent in 1911, when the Cobalt mines were producing at their highest rate. Manitoba produced in 1919, silver totalling 20,760 ozs against 13,316 ozs. in 1918. British Columbia showed a decrease of 9.4 per cent in quantity, but an increase in value of 4.1 per cent. Yukon production fell from 71,915 ozs. to 24,671 ozs.

**Zinc.**—Zinc showed little change, production for 1919 being 15,869 tons against 17,541 tons in 1918. Both imports and exports of zinc showed a decline.

**Iron Ore.**—Next to the coal production, the output of iron ore is the most disappointing feature of the mineral record of Canada in 1919. Shipments from Canadian Mines were the lowest recorded in 19 years, amounting only to 195,970 tons.

The quantity of iron-ore charged to blast furnaces in 1919 was 1,752,585 tons, of which 78,391 tons were of domestic origin, or 4.4 per cent. Of the imported ore 519,722 tons came from Wabana, Newfoundland, and the remainder, 1,154,473 tons from the United States.

**Asbestos.**—The asbestos industry continues to thrive amazingly. Under the conditions of 1919 a production of 153,069 tons of crude and milled fibre compared with 143,456 tons in 1918, is a noteworthy performance. Values of asbestos and asbestic increased so that the monetary return from 1919 production was \$10,723,033 against \$8,870,707 in 1918.

**Coal and Coke.**—The production of coal in Canada during the historical period 1913-1919 inclusive has been as follows:

	Short Tons
1913 . . . . .	15,012,178
1914 . . . . .	13,637,529
1915 . . . . .	13,267,023
1916 . . . . .	14,483,395
1917 . . . . .	14,046,759
1918 . . . . .	14,977,926
1919 . . . . .	13,586,300

This is indeed a lamentable record. No country can hope to progress, either commercially or culturally, which allows its coal production to slide downhill in this fashion.

The obverse of the picture is seen in the following comparison:

	Canadian Coal Consumption	Coal Mined in Canada	Annual Deficit
1913 . . . . .	31,582,545	15,012,178	16,570,367
1914 . . . . .	26,852,323	13,637,529	13,214,794
1915 . . . . .	23,906,692	13,267,023	10,639,669
1916 . . . . .	29,865,856	14,483,395	15,382,461
1917 . . . . .	33,123,735	14,046,769	19,076,976
1918 . . . . .	34,771,832	14,977,925	19,793,917
1919 . . . . .	28,768,099	13,586,300	15,181,799

The only province in Canada to show an increase in 1919 was Saskatchewan, where 382,684 tons was raised an improvement of ten per cent on 1918 figures.

The production of Nova Scotia had been exceeded in twelve out of the thirteen previous years, and that of British Columbia had been exceeded seven times in the past ten years. The case of Alberta was peculiar, as production in that province has been interrupted by strikes. The output for 1919 was 4,990,726 tons, or 1,079,086 tons less than 1918, but nevertheless the largest production of any year, except 1918 only. The production in Alberta in the month of December 1919 reached 742,482 tons, from which it may be deduced that the mines of Alberta could produce 10,000,000 tons annually without great effort. The production of Nova Scotia is at least 3,000,000 tons annually below what it might be, so that if one adds to these deficiencies the decline in British Columbia, and New Brunswick it is within the mark to say that the coal output of Canada is 10,000,000 tons annually below what it should be.

The progress of the by-product coke-oven industry in 1919 makes interesting reading. During that year there were completed 60 Koppers Ovens at Sydney, 25 Willputte ovens at Sault Ste. Marie, and 30 Lomax ovens at Anyox, B. C. The imports of coke fell from 1,165,590 tons in 1919 to 383,374 tons in 1919. This not displeasing reversal is not altogether due to the larger coking capacity of Canada, some of it being of course due to the slackness in steel production during the first half of 1919, but the additions to Canada's plants have a good deal to do with it, and from now on, it is hoped that importations of coke will lessen in quantity. It will be still more gratifying when Canadian coke is made from Canadian coal. An illuminating statement in Mr. McLeish's Report is that the quantity of coke-oven gas recovered in 1919 was 9,340 million c. ft., or the equivalent of one-third of the total production of natural gas in Canada.

**Structural Materials.**—While the full result of the resumption of building activity, which must follow its practical cessation during the war period was not felt in 1919, a decided recovery is recorded in the production of cement, clay products, lime, sand-lime brick, and building stones. For the first time, the value of cement exports has greatly exceeded the imports. The increase in values in building materials almost overshadows the increase in quantities, but this is still a material one.

**Salt.**—Salt production in Canada continues to increase with fair regularity, 1919 production being the equivalent of 148,302 tons compared with 131,727 tons in 1918. During 1919 there was an experimental production of salt from brines flowing from springs near Senlac, Sask. A small quantity of salt was ob-

tained by solar evaporation and disposed of locally. Development continued on the salt deposit at Malagash, 175 tons being shipped during 1919. The discovery of potash minerals associated with this deposit is attracting much interest. The Brunner-Mond (Canada) Co. completed and placed in operation at Amherstburg, Ont., a chemical plant for the manufacture of soda-ash from brine.

**Petroleum.**—Production of crude oil in 1919 was 240,970 barrels of 35 Imp. galls. compared with 304,741 barrels in 1918. Over 90 per cent of the crude petroleum still comes from the old oil-fields of southern Ontario. The recorded production in the West is all from the Turner Valley Field, about 35 miles from Calgary. Approximate production in 1919 was 16,891 barrels. New Brunswick production was 4,275 barrels.

The tremendous extent of the oilrefining industry in Canada is shown by the fact that in 1918 ten oil refineries in Canada used 262,641,155 gallons of crude oil of which only 12,258,190 gallons came from Canadian wells. The total imports into Canada during 1919 of petroleum oils, crude and refined, was 451,211,270 gallons or some thirty million gallons more than in 1918. The desire to find additional oil-wells in Canada is therefore very understandable.

**War Minerals.**—Pyrites, molybdenum, graphite, chromite and magnesite all show large declines. The records of 1919 can hardly be considered as representative of the ability of Canadian Mines to produce these minerals profitably in peace time, but the outlook for all of these minerals, particularly for those which are used in alloying steel, is not by any means dark.

As a measure of the importance and stability of Canadian mining, the year 1920 will be more accurate than the figures of 1919. The most reassuring feature that we can hope to see recorded is an increase in the production of coal in Canada, and conversely, if such an increase is not recorded, there will be adequate ground for grave anxiety.

### MINING VENTURES AND THE PUBLIC.

With the resumption of more normal trade and industrial conditions will probably come the re-appearance of the professional promoter of more or less avowable enterprises, issuing beautifully engraved stock certificates and brilliant prospectuses.

Although such activities are not limited to mining, it must be owned that the lure of returns of one thousand to one on the money invested in mining ventures, as usually inferred by the promoting literature, often attracts and entraps men otherwise same and of keen business acumen. These last three years have been very prosperous and a great deal of savings have been accumulated, both in rural and urban communities as demonstrated by the success of the various war-loans issued by the Government. This may prove an incentive to shady and questionable promoters to launch new efforts to make victims, especially in rural communities, and among urban people of small means.

Many warnings have been issued through the annual reports of the Quebec Bureau of Mines, guarding the public against the insidious literature and glowing statements of agents, offering mining shares and beautifully engraved certificates in ventures which have never had a chance of success.

Therefore before putting their hard-earned savings into mining or other ventures, of which they personal-

ly know little or nothing, the investing public should enquire from reliable and disinterested sources as to the value and chances of success of such enterprises. The statements and promises of agents, whose sole interest is to sell shares, should not be taken without thoroughly investigating them.

The investing public should discriminate between "mines" and "prospects." Some producing mines, or mines well developed, constitute as safe an investment as any other commercial and industrial enterprise, but these rarely yield more than a fair return. On the other hand, "prospecting" and "developing," be it for ores, for natural gas, for oil, are naturally hazardous ventures. When successful, the returns from such investments are large, but failures are infinitely more numerous than successes. Such investments are not for the small savings, for it should always be remembered that the risk is proportionate to the returns. If the investor expects large returns he has to take risks of losses. And before buying shares in companies searching for, or developing, deposits of gold, lead, zinc or other minerals, or carrying on boring operations for gas and oil, the public should investigate the statements made by the peddlers of stock certificates, enquire from reliable sources as to the possibilities of the enterprises, so as to be able to discriminate between (1) "safe mining investments," (2) "legitimate and reasonable mining speculation," and (3) "mining frauds." In the first the returns are not high but are reasonably sure; in the second, the money contributed by the buyers of shares is really expended in intelligent search and development on the mineral deposits, which may or may not answer the hopes which were founded on them; and the third class comprises the ventures of shady adventures who spend the money obtained from the sale of shares on full page advertisements, in printing, alluring and tempting prospectuses for the purpose of obtaining more money, of which the smallest possible fraction is expended in actual work—usually on hopeless mining claims.

The Bureau of Mines is entirely at the disposal of the public for technical information regarding the mines and mineral resources of the Province of Quebec. An enquiry on such subjects, addressed to the Department of Colonization, Mines and Fisheries, Quebec, will always bring to the writer information from which he usually can judge of the merits of mining ventures in the Province and this will enable him to go into it with a better knowledge of the facts.

### Babine, B. C.

The Taltapin Mine, Anderson Creek in the Babine country, is being developed with very satisfactory results, rich ore having been opened up, some of which is being sacked for shipment. The government is assisting in the construction of a road to open up the property.

John D. Galloway, who some months ago resigned his position as Resident Mining Engineer for Mineral Survey District No. 2, British Columbia, to accept a position with a well-known New York concern, has found the climate of Mexico, where his new duties have taken him, too much for his health. Therefore he has asked for and received appointment to his old place in north-eastern British Columbia with headquarters at Hazelton.

# Protection For Speculators

R. E. HORE.

In a recent issue of the Engineering and Mining Journal, Mr. J. B. Tyrrell makes some interesting comments on "New Mining Control in Ontario." He outlines the system of Government in Ontario and tells of the recent success of the Farmers' party at the recent general election. He call attention to the fact that the Department of Mines has now at its head a Minister who was elected to the Legislature by supporters of the Labor party and selected by a Premier who was chosen as leader by the Farmers' party. The little knowledge that the present government has of the mining industry might seriously react on the industry of the Province; but some consolation is found in the fact that the staff of the Department of Mines remains as it was. The Minister of Mines will have able advisers and Mr. Tyrrell expresses the hope that he will take their advice. He then makes some suggestion as to policies which will insure the growth of the mining industry and provide security for those who engage in it. The government should encourage people to invest in sane and honest mining enterprises, and money so invested should be as safe from confiscatory legislation as money invested in any other business. Mr. Tyrrell also claims that the government should protect the small investor from professional swindlers and incapable management.

The term "investor" seems to be rather unfortunately used by Mr. Tyrrell in referring to attempts to make mines.

The protection of the public against loss in mining enterprises is an obvious impossibility. The very nature of the enterprise makes return of capital doubtful and the making of profits very doubtful. Our present mining industry has resulted from the early work done by men who took big risks in the hope of making big profits. The expansion of the industry still depends not so much on the "investor" as on the "speculator." The making of a mine in Ontario is a speculative enterprise and anyone who looks on it otherwise should not be invited to take part in the development of mineral deposits.

We have in Canada a comparatively few important profitable producing mines which have considerable ore reserves and good prospects of finding more ore. These enterprises have already passed the hazardous stage. They have in most cases reached independence of outside capital. The companies operating them have no stock for sale. Investors who realize that mining ore means liquidation of assets can properly be advised to buy shares on the market from other shareholders and put them in their strong boxes, but it makes no difference to operations at the Hollinger, Nipissing or Creighton mine whether the comparatively small block of stock changes hands or not. The so called "investor" is in such cases not helping to provide funds for development. That was done by the "speculators". The investor must be given governmental assurance that the shares he thus purchases will not depreciate in value owing to unfavorable legislation; but the credit for development of the properties remains with the speculator.

Those who wish to see the mining industry expand therefore must recognize that investing in mining enterprises is of comparatively little importance as

compared with speculation in mining enterprises. Protection for the speculator will properly include any measure of protection that is provided for the investor; but it should also include other important features. Failure is often due to legitimate causes, but the speculator finds that many failures are due to deceit or mismanagement. It is in the interests of the mining industry that the risks of the speculator should be confined as far as is humanly possible to the risks of mining. Legislation concerning mining corporations should therefore command attention and suggestions should be made by the mining fraternity with a view to protecting speculators. The problem of providing protection against incapable management should also be discussed.

With regard to speculation in mining enterprises, it should be clearly pointed out that the protection that is needed is for those who provide funds for the company's treasury. If, after the company has disposed of its stock at a certain price, the stock is resold several times at varying prices these sales cannot be regarded as of equal importance to the mining industry with the first sale. The stock exchanges serve a useful purpose in making share certificates negotiable; but the transactions on the exchanges do not provide money for the development of mines. In some cases the exchanges are made to serve as a medium between the original purchasers who have large blocks of stock and the purchasers of small blocks, but such transactions are obviously in the interests of the purchasers of the shares and not in the interests of the mining company whose shares are being dealt in. Those who trade in shares on the stock exchanges, sell or buy mining securities in just the same way as they sell or buy other securities and for the same purposes. It is quite unlikely that any trader is under the delusion that his money goes into the treasury of a mining company when he purchases stock on the exchanges.

The transactions between the original purchaser of mining stock and the public should become of interest to the government when the first purchaser acts in the capacity of a broker who sells the stock to the public. When a mining corporation deals with the public through agents it retains control of the sale and is in a position to see that the prospective buyer of shares gets reliable information concerning the company's affairs and property. When the purchaser of a large block of shares undertakes to dispose of the stock in a similar way, however, the company has no longer control.

Ontario's new Government has in the problem of protecting the speculator and investor a task worthy of close attention. A sale of shares bill that will give protection without hampering honest enterprise is much to be desired; but admittedly difficult to draft. There are many who believe that more to be desired than new legislation is enforcement of the provisions of the present statutes.

Mr. Tyrrell's suggestions inreference to mine management bring up the question of licenses and certificates for those in charge of operations. So long as this remains debatable ground with those interested in the industry, we can hardly call upon the Farmers'

government to take action in the matter. There is considerable difference of opinion as to whether any but the employer should decide on the qualifications of the man he wishes to employ as manager or superintendent of a mine. Under the present Act there are rules and regulations governing the operation of mines which the operators must comply with. The position of manager is not however restricted to any specially trained or favored group of persons. Ability to do the work satisfactorily to his employers is the present basis of employment. There are some who would like to place restrictions around the employer by the granting of governmental authority to a corporation of engineers who would decide on the qualifications of other engineers and of others in charge of mining operations. It can hardly be said, however, that there is a great demand for such action, though a few engineers are industriously working to that end. "Equal opportunity for all" is a pretty good slogan just now and the Farmers' party will not be loudly praised if it grants special privileges to a certain class of workers. Application of science is a necessity in good mine management; but it does not follow that specialists in applied science are the only capable operators.

The new government of Ontario will do well to give some attention to protection of speculators and investors. In the sale of shares under the present Act there is much that is objectionable. In the management of mines there is also room for improvement. What should be done is, however, not easily determinable.

#### LETTER TO THE EDITOR

Editor, Canadian Mining Journal:

Sir: For some time past, the writer of your Northern Ontario letter, has referred to the Gowganda Railway problem, stating that the war was entirely responsible for this work being held in abeyance, and quotes Premier Drury's failure to give a definite statement.

Regarding the first claim, anyone who has followed and noted as we have, the statements and proceedings by the late Conservative Government during the last nine years admit that there is no evidence to justify the assumption that the Government ever intended to build this railway, but there is evidence to show that they did not. It is quite true that the Legislation passed an appropriation of \$275,000 for the purpose of beginning construction of this railway. That the Cabinet had other intentions is evident by the beginning last summer of the building of a macadam road which at last year's rate of progress, would take fourteen years to complete, and seems to be intended principally as a source of income for their political friends, who, when the Government were swept out of power, recognised their loss and became the leading figures in a secession movement, by which they hoped to retrieve their lost position. At this very same time it required the united efforts and organized protests of the people interested in Kirkland Lake to prevent the construction of a railway in that camp.

In view of the aforementioned facts is it any wonder that Premier E. C. Drury fails to make a definite decision.

During the administration of the late Government the Cabinet had a following in the Legislature sufficiently large to carry any measure proposed by the

Government. The present government however, does not occupy that position and a direct promise by the Premier at this time, to extend the Elk Lake branch of the T. and N. O. Railway, might be used by the combined opposition as a united action to defeat the Government, when the matter of appropriation of money for this particular work is asked for.

Some time ago I read in the "Toronto Star" a statement attributed to Premier Drury, that the bulk of legislation proposed for consideration at the next session of Parliament would be introduced as private bills, in order to allow of a free discussion.

Such being the case, why should not the member for this district introduce a Bill asking for the necessary appropriation for the immediate construction of this extension of the Elk Lake branch of the T. and N. O. Railway. By doing so he would be only redeeming his pre-war, pre-nomination promises and we would also have the opportunity, when the Bill came up for discussion to separate our friends from our foes. Who is not for us is against us, was considered to be a correct definition during the war. If correct then it must also be so now.

As regards the Canadian Light Railway Company, it is quite clear that they can not definitely decide until they have secured a Charter by act of Parliament and without race-track tactics are resorted to, this Bill could be disposed of before the application for this Charter came up for final action.

The abnormal exchange rates, the high price of silver and the world-wide demand for both gold and silver, coupled with the imperative need of the monetary metals, by both Canada and the British Empire, brings the opening up by a railway of the country west of Elk Lake and through to the C. N. R. a work; that might be termed of national importance, from the fact that it is known to contain producing mines and prospects sufficiently promising to give reasonable assurance that other mines will be developed, along the entire length of such a railway. Cobalt has produced millions of dollars to the shareholders, to the manufacturers and farmers of Old Ontario as well as large revenue to the Province. Cobalt, however, is apparently on the decline and Gowganda is the only presently known district as yet undeveloped that possesses native silver—Cobalt veins, occurring in the same geological formations, at at Cobalt, extending over an area several times as large as the productive area at Cobalt.

Given direct railway connection and with the aid derived from the experiments conducted at the mines at Cobalt in the matter of treating low-grade ores, Gowganda may in a few years attain a yearly production even higher than Cobalt in its palmiest days.

The first serious attempt by the people of this district to secure a railway connection was made in 1911. The stand taken by the Government is described on page 171 of your journal for March 15th, 1911, and is as follows:—"The Minister of Mines candidly told the delegation that the policy of the Government was to protect its timber resources on the Temagami Forest Reserve, rather than to encourage further encroachment by prospectors, miners or railroads."

This is a policy that has in a few years converted large areas of green forest into black stumps and charred dead timber in which even the moose cannot find shelter during the winter months.

As the present Government in Ontario came into power entirely as a result of the mistaken policy of the Conservative Government, it is fair to assume that the Drury Government are not likely to persist in a policy that has proven so damaging to the interest of the Province and its forests.  
Gowganda.

February 27th, 1920. L. O. HEDLUND.

**NOVA SCOTIA NOTES.**

**Dominion Coal Outputs.**

The production of the Dominion Coal Company's Glace Bay Collieries during January and February compares with last year as follows:

	1920	1919
January (tons) . . . . .	275,129	276,036
February (tons) . . . . .	248,338	262,876
	523,467	538,912

The inability of this Company to increase its production, notwithstanding the brisk demand for coal, is due to the continued shortage of coal producers, and the Company announces vacancies for 400 "shooters and loaders". Permission has been granted by the Department of Immigration for the admission of miners from abroad, but so far it has been found possible to secure only a limited number.

The amount of coal stored in bank at the end of February is stated to be about 60,000 tons, which is an unusually small stock for this time of year. The demand during the past two months has been in excess of the production of the collieries, and it has been necessary to fill coal from bank to meet current orders. Coal has been exported during the winter months from the Company's piers to Holland, Italy, Norway and Portland, Maine, in addition to usual winter shipments to Newfoundland and the Nova Scotia ports.

It is anticipated that the requirement of the Steel Works during 1920 will take at least one million tons of coal, and that if the hopes of the officials for increased production in the remaining months of 1920 are realized, about one and a half million tons of coal will be available for export to points outside Nova Scotia.

The change that has taken place in the distribution of the Dominion Coal Company's output of coal during the war period may be gauged from the following approximate figures.

In 1913 the coal was distributed about as follows:

	Tons	
Used in the manufacture of cake and for steel-making . . . . .	1,550,000	or 21%
Sold to workmen, and used at Collieries and railways . . . . .	726,000	or 10%
Sold commercially . . . . .	4,987,000	or 69%

In 1918, the distribution was, approximately:

Used in the manufacture of coke and for steel-making . . . . .	1,750,000	or 34%
Sold to workmen, and used at collieries and colliery railways . . . . .	570,000	or 11%
Sold commercially . . . . .	2,855,000	or 55%

The difference of 2,132,000 tons of coal sold through ordinary commercial channels, as between 1918 and the last pre-war year is almost entirely represented by the amount of coal sent to St. Lawrence ports during 1913.

A partial recovery of the Montreal market was made last year, and no doubt in 1920 more strenuous efforts

will be made to enlarge shipments to St. Lawrence ports. Allowing for the per capita increase in coal consumption, which is always growing in Canada, and the very large additions to manufacturing establishments that have in recent years been made in the Montreal district and along the whole valley of the St. Lawrence, there ought to be a potential market for Nova Scotian coal of at least three million tons annually in the market of which Montreal is the business metropolis.

Indications of a fire were detected in the Drummond Colliery of the Intercolonial Coal Mining Co. at Westville at the end of February. The district has been walled off, and a temporary loss of about 200 tons of daily output will be occasioned. Other sections of the mine are working as usual.

The session of the Nova Scotia Legislature which opened on March 4th is expected to deal with a number of important matters connected with the coal mining industry, and some action is anticipated in pursuance of the powers granted to the Government at the last session to re-adjust the submarine coal leases so as to ensure their more certain and speedy operation. The Speech from the Throne dealt with the anticipated recovery of the coal production, a matter of very considerable importance to the Province of Nova Scotia, which in recent years has found its royalty revenues much decreased through the lessened coal outputs.

The opening ceremonies of the 1920 Session were saddened by the absence of the venerable President of the Legislative Council, the Hon. Monson H. Goudge, who died just previous to the opening of the Houses of Assembly at almost 91 years of age. Mr. Goudge has been a member of the Legislature since 1873, with a short break between 1887 and 1884, and since 1903 has been President of the Upper House. Mr. Goudge's birth was exactly contemporaneous with the real beginnings of the coal trade in Nova Scotia, the General Mining Association having been formed in 1825 to take over the Duke of York's Lease. Men whose lifetimes span the whole of the Victorian era, and who have lived to see the new heaven and the new earth of these days and the ebb of the greatest conflict of history, are necessarily rare, but to his venerable and distinguished age, Mr. Goudge added many lovable qualities. To see the late President of the Council with his venerable aspect, seated in the Chair that has in its time been occupied by royal and distinguished visitors to Nova Scotia, and flanked by ancient oil paintings and mural tablets of as great, if not greater antiquity than can be seen elsewhere in America, was an impressive sight to which use had accustomed the Haligonians, but which always appealed to visitors from those provinces of Canada and the States of the Union that have shorter traditions than Nova Scotia.

**Rossland, B. C.**

A strike has been called at the Rossland Mines of the Consolidated Mining & Smelting Co., because the Company last Saturday (February 28th) laid off approximately 125 men, it being the intention to cease shipment of ore for a time. The company, it is explained, plans concentrating on development work. How the action of the men will affect the situation in the camp cannot be said at the time of writing.

# Mineral Products of Canada as a Factor in Export Trade

The products of the mine exported from Canada in 1918 totalled \$75,668,875 out of the total of exports valued at \$1,586,169,792, which, considered in the light of these figures alone, would seem to indicate that the mineral production of Canada was not an important factor in exports. No correct estimation of the part played by the mineral industry is, however, possible on these figures alone, because under the general head of manufacturers is included exports totalling in value \$660,840,430 which are very largely the assembled and finished product of the mine, and more particularly of the motive power furnished by coal. For example, the production of steel in Canada during 1918 totalled 1,893,000 tons, all of which was the combined product of the mine, in the form of iron ores, fluxes and coal. This steel, in various forms, was used in Canada, together with the greater proportion of the production of Canadian coal, in making manufactures possible, and in transporting the manufactured goods to their export destination.

It is, therefore, not too much to say that without the product of the mine, in particular coal and iron, no exports of manufactures could be made by Canada.

## World's Greatest Nickel Miner.

Canada has a great advantage economically and strategically, in possessing almost the exclusive world supply of nickel, which was exported in 1918 to the value of \$9,029,535. Canada is exceptionally well equipped to produce alloy materials, as our country possesses not only a preponderating quantity of nickel ores, but is also well provided with such materials as chromium, cobalt, manganese, titanium, and molybdenum, and has also the advantage of large and cheap supplies of electric current, generated from water-powers, a combination that favours the manufacture of ferro-alloys. The possession of these materials by Canada is important, not only as they may help to foster the growth of specialized metallurgy in Canada, but because they will ensure preferential treatment for Canada in export markets, if our advantage is safeguarded and wisely used.

Asbestos is also a mineral with which Canada is well supplied. As a producer of asbestos Canada now holds first place in the world, and there are very great possibilities in the possible industries connected with the fabrication and uses of asbestos in the arts. This wonderful mineral is now so much used in electrical appliances, and in manufacturing processes employing heat, that in its possession of large supplies Canada holds a strategic advantage similar, but not quite so great, as in the case of nickel.

## Exports of Gold and Silver.

The production of gold and silver is a matter that enters into export business in a good many ways. Canada is becoming increasingly important as a producer of gold.

The actual production of gold has declined in recent years, because of the fixed selling price of gold, combined with a rising cost of all labor and materials, but the potential yield of gold from Canadian sources is steadily increasing by reason of a constant succession of new discoveries of gold-bearing areas, not the least important in which is Northern Manitoba.

The position of silver is not quite so certain, but at the present time the increased value of the white metal has had the effect of increasing the known silver re-

sources of Canada by making it profitable to work ore bodies that were too lean to be profitable when silver was selling at about one-third of its present value. There is every likelihood that the increased value of silver will be maintained for a number of years to come—at least until the value of the gold standard is restored to whatever may turn out to be the after-war scale of monetary values.

Our silver and gold production will prove of great assistance in maintaining Canada's exchange credit in foreign markets, and in this connection it would advantage Canadian business men as a whole if they would support the plea of the gold-miners that the Government should assist in some financial manner as increasing the production of gold, either by bonusing the gold mines, or by relieving them of all possible burdens of taxation. The increase of gold production is one way in which Canada's credit can be most effectively buttressed, and incidentally it would assist in the restoration of British exchange.

## Importation of Coal.

The weakest spot in Canada's import and export trade balances, and in her internal prosperity and financial soundness, is the declining production of coal from Canadian Mines and the rapid and unparalleled increase in the tonnage of coal imported into Canada from the United States. Canada could produce quite easily, and could with greater ease consume within her own borders at least ten million tons more of soft coal from our own domestic collieries. The unnecessary, and indeed, inexcusable purchase of coal in the United States that could be mined in Canada has the effect of creating an adverse trade balance (so far as coal alone is concerned) of not less than \$100,000,000 annually. If this lopsided and humiliating arrangement were corrected we should not see Canadian funds at a ten per cent, discount in New York, for not only would our exchange credit benefit, but the increased employment and general impetus that would be given to our internal trade would be of even greater benefit than a correction of exchange values.

Summarizing the foregoing, it would appear that, except in some notable cases like nickel and asbestos, the mineral exports of Canada will not bulk largely in the general total of values, but, in proportion as the products of the mine are produced and utilized within Canada, so will our exports of manufactured goods increase in bulk and value; and, further, our possibilities in the export of the products of agriculture, of the forest and the fisheries, will increase just in proportion to the tonnage of coal that is mined, and the tonnage of steel that is manufactured to provide new avenues of transportation, by land and by sea.

It is not certain, moreover, whether it is desirable that Canada should unthinkingly and greatly increase the quantity of its mineral exports—merely as such. It is, however, most desirable, that Canada should so utilize her mineral resources as to provide the maximum of employment and the maximum of revenue within her own borders; and that, with regard to such "key" minerals as nickel, asbestos and coal, that we should use whatever strategic advantages they give us to make the best possible bargain for our exporters, and to secure that preferential treatment in foreign markets we are entitled to ask if we give of our best.—By the Editor in the "Grain Growers' Guide."

## Our Northern Ontario Letter

### THE SILVER MINES.

With the approach of spring it is evident that the coming summer promises to see realized the expected favorable influence upon the silver mining industry of Northern Ontario as a result of the continued heavy demand and high quotations for commercial bar silver.

One result of the present situation has been the complete depletion of any stock of bullion that may have been held in store at the mines. The high quotations for the metal, taken together with an additional 15 p. c. on New York exchange has caused the bullion vaults to give up every available ounce. A like condition is said to exist in other countries, with the result that the demand of the nations must be met entirely by production of new silver. That this cannot be done for some years appears to be certain. With no new silver producing area looming up, and with the mining industry of Mexico still more or less uncertain, the belief is expressed by metal experts as well as the operators of silver mines that the demand is **likely to continue greater than the supply** for many years.

The influence of the strong position of silver has been decidedly favorable on the mines of Cobalt. Not only has it encouraged the operators to intensify their efforts, but it has also added thousands of tons of ore to known reserves by lending to it the added value necessary to make it of commercial grade instead of waste rock. As a consequence the annual yield is greatly increased as well as the lives of the mines materially lengthened.

Another favorable influence, and one which seemed slow to materialize, but it nevertheless now a fact, is a general rejuvenation of interest in the outlying silver districts. These include, not only the outlying properties in the Gowganda district, but also affects the Elk Lake, South Lorraine and Casey Township silver areas.

In the Gowganda district, while production continues unremittingly at the Miller Lake-O'Brien, and another shipment is being assembled at the Castle property of the Thetheway Company, a number of other properties are getting under way. Among the properties to recently commence work is that known as the Big Four.

The Silver Bullion Company, with property at Leroy Lake has purchased a partly used \$30,000 mining plant from a Nova Scotia Mining Company. The equipment is now in course of transportation to the property.

February production from the Kerr Lake mine approximated 100,000 ounces, and with silver quoted at around \$1.31 an ounce plus 15 p. c. on New York exchange the value of the output is estimated at about \$150,000. Basing estimates on achievements during 1919 the net profit on the month's operation amounted to at least \$100,000. It is unofficially reported that the ore bodies on the Kerr Lake are being found to extend well beyond their previously known limits.

The proposed consolidation of the Adenac and the Victory properties is not making very satisfactory progress. It is learned that some doubt now exists as to the likelihood of the merger being carried out. In the meantime, the Adenac having practically exhausted its chances of developing anything other than

more or less small patches of ore, is closed down and partly dismantled.

At the McKinley-Durragh current net earnings continue to cover current dividend disbursements at the rate of 3 p. c. quarterly. On April 1st the company will pay its regular 3 p. c. dividend, amounting to \$67,430. It is understood a financial statement will accompany the dividend checks and that a surplus of approximately \$500,000 will be shown. Total disbursements to date amount to 259 p. c. or \$5,754,163.

The Coniagas Mines has sold twenty-stamps together with some other equipment to the operators of the Keeley mine in South Lorain. The stamps and equipment are a part of that contained in the mill on the Tretheway property recently purchased by the Coniagas from the Tretheway Company. During the course of carrying on extensive development work on the Keeley mine, the mill will be transported to the property and installed. Work will be commenced today on the Keeley and for the time being will consist of dewatering the underground workings. By late summer the mine is expected to be turning out silver concentrates.

According to official advice, a syndicate composed of shareholders in the Casey Mountain Mining Company has subscribed \$30,000 to be spent within the next six months in further development work on the company's property situated in Casey Township. The proposed extension of the Nipissing Central Railway from New Liskeard to North Temiskaming is expected to encourage further work in that district. Such a line would pass along the southern boundary of the township of Casey. This, together with the encouragement offered by the big production record of the Casey-Cobalt mine as well as the present program of the Casey Mountain Syndicate is expected to attract considerable attention.

Hon. Harry Mills, Minister of Mines for Ontario, has submitted a favorable reply to the Cobalt branch of the G. W. V. A. in regard to their recent resolution in which they recommend the selection of a returned soldier to fill the vacancy on the staff of Ontario Mining Inspectors caused by the death last fall of A. H. Brown. The Minister states that the appointment will be based on merit, and that he is desirous of assisting the returned men to become re-established in civilian occupations. This being the case, it is thought that no difficulty will be experienced in appointing a returned man, for the reason that there are a large number who have had previous practical mining experience as well as a knowledge of engineering.

With Cobalt, the metal, valued around \$2 a pound, not a few mining men are investigating the possibilities of operating some of the outlying properties on which large veins occur. In the boom-days of Cobalt some of these properties were worked with the object in view of getting silver values. Very little attention was paid to the cobalt content of the veins other than in so much as it might indicate silver possibilities. It is now thought with the increased use of cobalt metal and the consequent higher quotations, some of these veins could be turned to profitable account.

The Coniagas Mines is still negotiating for the purchase of the Gamble-Thompson group of claims in the

Gowganda district. The deal has been under way for several weeks, and the prospects appear to be that it will shortly be closed. The group of claims are situated in the Miller Lake section of the camp and are regarded as being excellent prospects.

The annual meeting of the Right of Way Mines will be held on March 15th.

During the week ended March 5th two Cobalt companies shipped 148,274 pounds of ore. Following is a summary:—

Shipper	Cars	Pounds
Northern Customs . . . . .	1 . . . . .	86,274
Dominion Reduction . . . . .	1 . . . . .	62,000
Total . . . . .	2 . . . . .	148,274

During the corresponding period no shipments of bullion were made.

**THE GOLD MINES.**

A feature of the week with the gold mining industry of Northern Ontario is the ninth annual report of the Hollinger Consolidated Gold Mines. The report shows a total income of \$7,063,099.21, and is couched in the usual conservative terms. Working expenses absorbed \$3,222,617.11. Municipal, Provincial and Dominion of Canada taxes for 1918 and reserve for Dominion of Canada for 1919 taxes \$286,372.65, and depreciation and donations \$1,232,819.40, in all \$4,741,809.14, which leaves a net profit of \$2,321,280.07, out of which was paid \$1,722,000 in dividends, and added \$599,290.07 to surplus account.

It is interesting to note that during the year some \$600,000 was written off for depreciation. This compares with \$375,000 in 1918, \$100,000 in 1917 and \$150,000 in 1916. It will be observed that the 1919 figure is almost equal to the total for the three preceding years. Costs of operation average \$4.52 per ton, plus the amount spent on plant construction, bringing the total up to about \$4.77.

Ore reserves at the Hollinger are estimated to contain \$39,928,430 made up of 4,392,680 tons of ore containing an average of \$9.09 per ton. Of this immense reserve, some 1,921,640 tons containing \$17,350,100 is above the 425-foot level. Some 1,950,020 tons containing \$18,033,410 is between the 425-foot and the 800-foot level, while the small remainder is estimated in the ore bodies opened up below the 800-foot level and where but a limited amount of work has been done, and also includes a small estimate in veins as yet undeveloped below the 100-ft. level. Of these latter veins, and which in due time may become an enormous source of production, there are no less than 39, ranging in width from 3½ feet to 25 feet in width and containing values ranging from \$4 to \$20.10 per ton.

The work of completing the equipment in connection with the remaining 20 of the total of 200 stamps in the mill is nearing completion, and provided the desired number of men can be secured, the management hopes to get up to full capacity of 3,200 daily this year.

Following are interesting extracts from the annual statement:—

Average tons per day . . . . .	1,950
P. C. of possible running time . . . . .	70.5
Tons per 24 hrs. running time . . . . .	2,766
Stamp duty per 24 hours . . . . .	14.95
Mining Costs per ton . . . . .	\$2.88

Mill costs per ton . . . . .	\$1.21
General operating charges . . . . .	.42

Another interesting feature is that the Hollinger Company during 1919 invested \$115,195.20 in oil and gas leases in Dickenson and Morris Counties, near Harrison, Kansas.

A meeting of the shareholders of the Dome Extension Company is being held March 10th for the purpose of considering, and, if approved, ratifying an agreement previously entered into by the directors authorizing the extension of an option on the property to the Dome Mines Company for six months. It is generally believed the extension will be ratified.

Before the end of the current month, according to progress already made, the Porcupine Crown Mine will once more be producing gold bullion. The requisite material and supplies are being rushed to the mine, and the desired force of men has been engaged. It is now thought that production may be continued without interruption. Prior to closing down in July 1918, the Porcupine Crown was a heavy producer and was disbursing dividends at the rate of 3 p. c. quarterly. Ore reserves are now estimated at around \$500,000 and the present surplus amounts to approximately \$200,000. The mill is in a first class state of repair.

Some of the leading interests involved in the Porcupine V.T.N. have commenced a movement calculated to bring about a more satisfactory degree of co-operation between the British and American interests involved in the Company, and between whom there has been a more or less pronounced degree of lack of cohesion. It is believed that favorable results may follow. While the financial position of the Porcupine V.T.N. is not very strong, yet the mine is equipped with a mill adequate to treat about 100 tons of ore daily, and by use of which the mine can be quickly made self-supporting. In addition to this is some 750,000 shares of unissued stock on which additional finances could be raised if necessary to do so. Provided the plan materializes it is proposed to continue operations from the present depth of 600 feet to the 1000-ft. level.

In the Kirkland Lake district, there is greater activity than ever before in the history of that district. The mines in the proven zone are not only increasing the scope of operations, but in all direction on outlying properties there is a steady increase reported in the amount of work being done, and the favorable results achieved. This is true, both of the Southern part of the camp where the Ontario-Kirkland appears to be developing into a probable mine, and where the result of work on the Canadian-Kirkland property is reported to be favorable, and in an Easterly direction in Label township where new incorporations comprise more than two thousand acres of promising mining territory, and where, as in the case of the Bidgood property, commercial ore has been found at outcrop. On the Bidgood, in the numerous veins opened up and which range from a few feet to 25 feet in width, while some of the veins have not yet been found to contain commercial ore yet according to official figures as much as 5½ feet in width of one of the most important veins has been found to contain average values of \$13.50 per ton at surface. It is also true, that West from Kirkland Lake in the direction of the McIvor property, as well as the Baldwin, and the township of Grenfell, considerable activity is in evidence, and the coming summer promises interesting developments in

that direction. The success so far achieved in the proven section, and with the visible prospective merit of the territory lying both East and West, the mining men and prospectors interested in the Kirkland Lake district appears to have every reason to be decidedly optimistic.

At Boston Creek, what is true of the Kirkland Lake district is true of this district, although as yet on a lesser degree. Taking the Miller Independence as the center of activity and in all direction operations of more or less important proportions are being carried on. At the Miller Independence itself, a contract for some 300 feet of cross-cutting at the 500-ft. level is soon to be let, while in the inclined shaft the work of developing ore is to be carried on.

On the Mondeau property, of the Peerless Mining Company a rich vein measuring over four feet in width was encountered at a depth of about 150 feet and which is said to be working satisfactorily and shaft sinking is preceeding at the rate of about five feet per day.

On the Boston Kennedy property, after completing the shaft to a depth of 100 feet it has been decided to spend another \$10,000 in continuing the shaft to a depth of 150 feet at which point it is proposed to carry out lateral work. A small sawmill has been purchased and shipped to the property where it will be installed for the purpose of cutting lumber and timber required in connection with further buildings and mining.

In Skead township a good deal of activity is reported. The Wisconsin-Skead and the Crawford-Skead are both being worked. The Minneapolis and St. Paul property is also to resume work soon, as also will the Allied Gold Mines on claims held in that district.

The outlook for the gold mining industry in this country is exceedingly bright, that is when measured by the results so far achieved and the extent of activity promised within the next few months. As to the economic conditions, the future alone will contain the verdict.

### B. C. CORRESPONDENCE

Victoria, B. C.—That the many resignations received recently from members of the Geological Survey of Canada constitutes a serious situation in so far as the Province of British Columbia is concerned because some of those who have been engaged in geological work in the Province for years have left the service without completing their important work, is recognized by the Provincial Government. The matter is to be brought before the Legislative Assembly, now in session, by Hon. Wm. Sloan, Minister of Mines, who has given notice of his intention to move the following resolution:

Whereas under the Terms of Union of this Province with the Dominion of Canada it is incumbent on the Dominion Government to maintain in British Columbia the Geological Survey:

And whereas from the pioneer work of Dawson to the present day the services of the Geological Survey have been of inestimable value to the mineral industry of this Province;

And whereas recent advices show that, out of a total number of twenty-one geologists available for field-work throughout the Dominion, eight already have tendered their resignations, and others are like-

ly to do so, thus leaving very few fieldmen for the whole Dominion:

And whereas during the six years prior to 1914 the Geological Survey maintained an average of nearly twelve geological and topographical field-parties in British Columbia alone, it becomes evident that it will be impossible for the survey to provide for work in British Columbia trained geologists from the remaining staff to continue the geological work so necessary to the mineral development of this Province.

Be it Resolved, That this Legislative Assembly of the Province of British Columbia expresses its appreciation of the great value of the work of the Geological Survey of Canada as assisting the mineral development of this province, and views with apprehension the depletion of the survey staff, especially at this time, when, with the world entering upon a period of reconstruction, it is most important to our mining industry that all possible knowledge of British Columbia geology shall be made available.

And be it further Resolved, That this Legislative Assembly of the Province of British Columbia does strongly urge the Dominion Government:—

- (1.) To take some immediate action to prevent further depletion of this most valuable branch of the Civil Service:
- (2.) To offer adequate inducements to engineering and scientific students of Canadian universities to undertake training with a view to employment on the Geological Survey of Canada, in order to provide trained men for the future:
- (3.) To complete and publish the results of the geology of such districts as have been topographically mapped:
- (4.) To adopt a policy assuring the maintenance on an adequate basis of the work of the Geological Survey of Canada in British Columbia, to the end that the letter and spirit of the terms of the "British North America Act" may be implemented and the development of British Columbia expedited.

And be it further Resolved That an humble Address be presented to His Honour the Lieutenant-Governor, praying that a copy of the preambles and Resolutions hereinbefore set out be transmitted to the Honourable Secretary of State (or other proper person) at Ottawa.

The developments which have given rise to the foregoing must have an unfortunate effect on this season's geological work in British Columbia. C. Camsell, in charge of the western branch of the Canadian Geological Survey, has left for Ottawa for the purpose, it is understood, of discussing the 1920 programme in Western Canada. Lack of competent men probably, in fact indubitably will necessitate a reduction of the number of field parties to the minimum.

J. W. Mulholland, President of the Prospectors' Protective Association of British Columbia, came from the Northwest Mining Convention at Spokane, Wn. to Victoria, B.C., in order to bring to the attention of the Minister of Mines a number of resolutions endorsed by the organization with which he is officially connected. The prospectors, he states, are banding themselves together throughout the Province. They are going to bring all the pressure of which they are capable to bear on the authorities to obtain the concessions set out in the resolutions which already have been reviewed in detail. Chief among

the desires of the prospectors are powder at cost, winter schools, district engineers' reports made public the subjecting of those caught despoiling miners' cabins and property to a severe penalty, and the shelving of the B. C. Engineers Bill. This latter is being vigorously fought by the prospectors as "class legislation," likely to interfere with the investment of foreign capital (with that of the United States in mind) in local mining proprietors. The Canadian Mining Institute also has taken a stand against the measure. Mortimer Lamb, the secretary, appearing before the Private Bills Committee of the Legislature and asking that it be laid over for a year, as the Institute did not consider the bill, as at present drafted, in the interests of the mining industry. This proposed legislation has not yet reached the House.

G. Lewis Casey, President of the Smelters Steel Co. Seattle, Wn., has undertaken to make a proposition to the British Columbia Government, through the Minister of Mines, for the establishment of an iron industry in the Province. This Company has acquired extensive iron ore deposits, together with a ten acre tract of land, at Dean Channel, a northerly arm of Burke Channel on which the town of Bella Coola is situated. Conditions for the extraction of ore, which assays 52½ per cent metallic iron with very small percentages of impurities, are ideal, it being possible to bunker the mineral at tidewater by gravity.

With the aid of the "Iron Bounties Act," assuring \$3 a ton on pig iron produced, and with the possibility of further assistance under the "Iron Ore Supply Act," Mr. Casey thinks the prospects of arranging for the installation of a plant in British Columbia are good. Two of the Company's chief problems in connection with operations in Seattle would be satisfactorily overcome, after the necessarily heavy initial outlay, by construction at Dean Channel. One was that of power. In Seattle this cost was high and only the high prices received counter-acted it. On Dean Channel there was water power ready for harness and there was timber for the production of charcoal. In Seattle coke, from the local gas works, had to be substituted for the latter and, as would be readily understood, the high ash content of this material very substantially increased the cost of production.

A quantity of British Columbia ore already has been shipped to the Company's plant at Seattle where by means of the electro-thermic method, it has been converted, in one operation into the highest grade of grey iron castings. The characteristic fine texture and close grain of the product for which there is a good market, there being unfilled orders on hand at \$65 a ton, is sufficient comment on the quality of the ore and the efficacy of the electrical form of treatment adopted.

Starting in a conservative way the Company has carried forward the problem of the treatment of the Magnetite Ores of the Coast to a point that appears to assure economic success. With one single-phased arc furnace they have produced 30 tons of the quality of grey iron described. Work now is proceeding on the completion of a four furnace unit, each furnace of a 440 K. V. A. capacity, which will be capable of a daily output of 15 tons. All the electrical equipment has been installed. The furnaces all are being provided with automatic regulators and recording pyrometers, so that the Plant, when finished, will be modern in every respect and designed along lines which ex-

periments have indicated as necessary in the satisfactory handling of the ores of British Columbia.

Under the Mineral Survey and Development Act of British Columbia the Minister of Mines has power to check up mining concerns placing stock on the market in respect to prospectus statements or other representations as to the value and prospects of their properties. At present, however, such companies are not required to file a prospectus with any official, the result being that there is no sure way for watching the activities of such enterprises. This condition has resulted in an amendment, now before the Legislative Assembly, requiring all joint stock companies, other than a private company operating under the Companies Act, which acquire mining properties or engage in mining to notify the resident engineer of the district in which the property is held, filing full particulars of the property and the work done and also as soon as issued a copy of every prospectus or statement in lieu of prospectus.

Dual control of the minerals within considerable areas of British Columbia has been a vexatious problem from an administrative standpoint for years. The Provincial Government is anxious that all the mineral zones affected should come under its sole jurisdiction. Prospectors and mining men have expressed their dissatisfaction most emphatically with respect to the mineral properties in the E. and N. Land Belt, a Vancouver Island section approximating 2,110,054 acres. At present the Province owns the precious metals and the E. and N. Ry. Co. the base metals. While the mine operator must conform, generally speaking, with the Provincial laws in taking up claims within this section the Company is in a position to impose any condition in connection with the extraction of minerals, other than gold and silver, that may seem good to it. Royalties have been exacted in some cases. Throughout the past year the Minister of Mines has been in negotiation with the railway officials in an endeavor to reach an agreement whereby the minerals of the belt aforesaid may be brought entirely under the control of the Department of Mines and the progress made in this direction will be discussed in the Legislative Assembly during the present Session. A somewhat similar condition, although not altogether parallel, is found within the limits of what is known as the Dominion Railway Belt, an area along the line of the C. P. R. on the provincial mainland about 17,050,000 acres in extent, and also in the Peace River Block of about 3,500,000 acres. An arrangement now subsists under which the prospector or miner may obtain title to both precious and base metals, and the surface rights necessary to operate, within the Dominion Belt, the prelude to this involving compliance with both Dominion and Provincial regulations. Although there is more red tape attached to this procedure than would be if the control were solely vested in the Province the conditions are not particularly onerous. However, Hon. T. D. Pattullo, Minister of Lands, is asking the Provincial Legislature to pass a resolution asking the Dominion Government to turn over its rights in these two latter areas to the Province. His argument is that the dual control of these lands makes satisfactory administration extremely difficult and that the development of the Province as a result, is being retarded.

**Vancouver, B. C.**

There is to be an international mining convention at Seattle, Wn., next month and an effort is being made to have Canadian currency accepted at par in that City for the convenience of delegates from north of the line. The Canadian Mining Institute, the Mining Bureau of the Board of Trade and the Vancouver Chamber of Mines are co-operating with a view to assembling a thoroughly representative delegation from British Columbia.

**Nelson, B. C.**

An international mining convention is to be held at Nelson, B. C. during the week of June 7th and 12th. The Kirby Group of five claims at Rondel is said to be showing up well with development, a 50 foot cross-cut having exposed a stringer of six inches of galena carrying ruby silver, widening to eighteen inches of spathic zinc and galena. This property is interesting old timers because it appears to contradict all theories respecting one of the oldest silver-lead camps of the Kootenays. The Blue Bell, which dates back to 1865 and the old Hudson's Bay Co. workings have produced old grade ores. The Yankee Girl Mine, near Ymir, has been inspected by A. W. Newmerry, of New York, who has returned to report to his principals. This property was a steady producer of gold-silver ore for many years, and has about \$400,000 worth of ore to its credit. The Highland Mine at Ainsworth has been closed down, owing to shortage of water necessary for its compressor. Some months ago the Mill had its last run and during the winter has been overhauled. This work still is in progress. The property was acquired some years ago by the Consolidated Mining and Smelting Co. of Canada. The Slocan Silver Mines Ltd. are proceeding with the development of their property near Nelson. A 50-ton Mill is to be installed as well as a Hydro-Electric Plant. A San Francisco firm is understood to have received the contract for much of the proposed installation. The recent strike reported on the property of the Nugget Gold Mines Ltd., Sheep Creek, which is said to be improving with development, has been followed by the announcement of the uncovering of a promising vein on the Tango Group, situated nearby in the same section. Seven feet of high grade ore is said to have been located at a depth of 210 feet below the surface outcropping.

**Greenwood, B. C.**

As a result of the operation of the British Columbia Taxation Act, 1916, many mining properties held without development and presumably for speculative purposes have reverted to the Crown. Some forty of these have been leased by officials of the government in the course of the last few months and as most of the applicants are mining men of Greenwood, it is expected that active development will be started. Confidence is felt that some will prove to be mines and that Greenwood is destined to again take a place among the leading mining centres of the Province. Among the active mines and prospects of the Greenwood district are the Providence, which has produced \$400,000 worth of mineral and from which about \$50,000 was taken last year; the Last Chance, Skylark, and Silver Cloud, the Bell, the Castor Fraction, the Bounty, the Rambler, Wellington and the Wallace Mountain Group.

**Trail, B. C.**

Ore receipts in gross tons at the Trail Smelter of the Consolidated Mining & Smelting Co. of Canada for the week from February 8 to 14, inclusive, were 7,872. For the week ending February 21st the receipts were 5,692 tons. This brings the total for the year to 47,842 tons, of which 2,139 tons were concentrates and 45,703 ore.

**Barkerville, B. C.**

The Lightning Creek Gold Gravels & Drainage Co. has a crew of forty men employed in sinking a shaft to develop the deep gravels of this creek which drilling has shown to be rich. Hitherto similar efforts have been unsuccessful owing to the tremendous water pressure. With a large capacity pumping plant, and all other modern equipment, this company is looking forward to achieving where others have failed. John S. Horgan, a well qualified engineer, is in charge of the work.—A. D. Whittier, having taken up 25 miles of dredging ground starting at the mouth of the Quesnel River, is reported to plan the installation of a dredge this season.—Keystone drill prospecting by the Lightning Creek Hydraulic Mining Co. and preparations for a busy year by the Stouts' Gulch Hydraulic, owned by the Cariboo Gold Field Ltd., are among other activities in the district.

**Victoria, B. C.**

That the Settlers' Rights Act, 1919, which has been disallowed by the Dominion Government, will be re-enacted at the present session of the Provincial Legislature has been announced by Premier Oliver. The settlers within the E. & N. Ry. Belt, Vancouver Island, will be given a further extension of time, in which to make application for title to the coal rights in connection with their lands. This assurance was given a delegation, representative of a large body of the claimants, which waited on members of the Government and the Legislature at the Capital City. It is to be expected that, in conformity with the policy of the Dominion Government, such legislation, if again placed on the statute books of British Columbia, will be disallowed again. However the Provincial Government express a determination to maintain the right of the settlers to a fair deal, and it seems likely that the question of jurisdiction between the two Administrations will come to a definite issue before long.

Discussing the coal development prospects in the northern part of the Province of Alberta George Macdonald, general manager of the Pacific Great Eastern Ry., said: "Imagine, if you can, a mountain of coal extending nearly two miles, with only a depth of three feet of earth to strip. It isn't a mine—it's a quarry. Coal can be loaded on cars as cheaply as gravel can be loaded in a ballast pit. No expenditure will be required for tunnels or shafts, no timbering, no skilled labor; and there are upwards of thirty million tons of the very best bituminous in sight."

Mr. Macdonald was referring to the Blackstone Coal Mine, near Jasper Park, about fifty miles southwest of Edison and some 700 miles from Vancouver. It is about 800 miles from Prince Rupert and 400 miles from Fort George.

"With the extraordinary and increasing demand for cars for lumber on the Pacific Coast the government railways can afford to give a rate of one-half a cent a ton per mile and make money. At present, coal at Prince George and Quesnel (both interior British

Columbia centres) stands about \$20 a ton. This coal should be laid down at Prince George for \$5 a ton, and when the Pacific Great Eastern Ry. is completed to that point it can be laid down at Quesnel at \$6 a ton. One cannot conceive of what this means to mining development in the north. Northern British Columbia and Northern Alberta are the future hope of Canada and cheap Alberta coal will be the medium bringing about such a condition.

"There has been nothing," he continued, "happen in western Canada since the Klondyke rush that is fraught with so much importance as this wonderful coal deposit.

"Now that the government has taken over the Grand Trunk Pacific Ry. it is confidently expected that low rates will be placed on coal from the mine to all western points. The president and chief owner of the property is Stuart Cameron, of the Pacific Construction Co. There already is a small town at Blackstone and a large number of men employed building dwellings, stores, offices, etc. Even at its present limited capacity the mine is capable of shipping 1,000 tons of coal a day, and this can be increased with ease to 5,000 tons."

A fatal accident occurred recently in No. 1 East Mine, Coal Creek, Crow's Nest Pass Collieries, when Frank Rigosta, a young Italian coal miner, was caught beneath a fall of top coal and instantly killed.

The Kettle Valley Ry. Co. has definitely announced its intention to construct a spur to Granite Creek, thus furnishing the Coalmouth Collieries with transportation facilities which were badly needed. At present the output of this mine is hauled by motor truck to the railway. With cars practically at the tippie it will be possible to develop the property with a view to the increasing of the output.

#### Trout Lake, B. C.

The Netty L., near Ferguson; the True Fissure, on Great Northern Mountain; and the Gold Bug, at Eight Miles, above Ferguson, are properties under development in this section. A promising vein has been struck on the Netty L. and tunnelling on the True Fissure has disclosed a body of concentrating ore carrying values in gold and silver. A rich strike was made some months ago on the Gold Bug and continuous development with satisfactory results has been in progress since that time.

#### Pendicton, B. C.

At a recent meeting of the directors of the Pendicton Development Co. it was decided to proceed with the development of the Company's property, the Torpedo Group, situated close to Okanagan Lake. A car load of ore was shipped last summer with satisfactory results and it is proposed installing a concentrator.

#### Lardeau, B. C.

The Mobbs and the Beaver Mineral Claims are among those of the district which are under development. The former is reported to have been bonded to a Vancouver syndicate for \$35,000 and the new operators propose letting a contract for 250 feet of tunnel work. It is planned that the tunnel shall reach a depth of 30 feet below the shaft, which is down 80 feet and at the bottom of which is a foot of silver-lead ore, averaging 250 ounces of silver and some gold. On the Beaver, the tunnel, which has been driven 150 feet, is reported to be in eight feet of mixed ore, containing two feet of clean ore.

#### Vancouver, B. C.

C. F. Caldwell, a British Columbia operator of prominence, is pursuing with determination the project of

a railway from Hyder into the Salmon River section of the Portland Canal District, northern British Columbia. Returning recently from a visit to Seattle he stated that he would accompany Governor Riggs, of Alaska, to Washington to forward the enterprise. The money, he said, was in sight and the proposed road would be an inestimable boon to the camp. Discussing the proposal of the Vancouver Board of Trade that a government ore dressing plant should be established on the Coast Mr. Caldwell disapproved of anything in the nature of a government operated smelter for the mines of British Columbia. What was wanted was some means of proving and remedying "the extortions that the octopus of the smelting interests." He advocated either a royal commission with wide powers of investigations or the appointment of an investigator, nominated by the mine owners but backed with powers by the government, who would be able to investigate results obtained at other smelters all over the country and compare their results and their charges with the figures we obtain in this Province.

J. T. Hillis, one of the best known of British Columbia's mining men, died recently. He came to the Province in 1900 from the State of Montana. With his partner he was one of the first interested in what now is the Britannia Mine property, Howe Sound. They did the preliminary development work, persevering in the face of much difficulty, until the possibilities were proved and capital was interested. Subsequently he became identified with a group of claims at Hidden Creek which later were to develop into the Hidden Creek Mines operated on a large scale by the Granby Consolidated Mining and Smelting Company.

### THE SILVER ISLET MINE, LAKE SUPERIOR.

By J. J. O'CONNOR.

The prospective opening up of the famous Silver Islet silver mine, by Messrs. Jamison and Peacock, and their associates of Duluth, Minn. who have secured an option on the Wood Location which includes Silver Islet, naturally suggests the question; will Silver Islet come back? Will more of the rich bonanzas be encountered, that were met with in the former operations, and will it again take the place in the mining world that it formerly held, as one of the great mining enterprises of its period?

Jamison and Peacock are well known and successful explorers. Among other properties, they discovered the Croft Iron Mine, on the Cuyuna range, a high grade Bessemer producer.

The first steps to be taken will be to unwater the mine. This will likely be carried down, to at least the third level.

The main shaft was sunk to a depth of 1265 feet, with several thousands of feet of drifting. Good milling ore only, was found to any extent in the drifting. The two great bonanzas encountered at moderate depth, in the old operations encourages the belief that further rich bodies of ore will be met with in that zone, rather at greater depth.

It is not expected that any great difficulty will be encountered in keeping the mine free, while the rich silver known to be in the roof of the mine, is being extracted. The free use of concrete, should make this a comparatively simple matter. The foundations of the old cofferdams are still intact, a short way below the surface of Lake Superior, and may easily be brought back to their old form, and give ample protection to the contemplated operations.

When Nature got through with the Islet, it was about 90 x 90 feet, and the highest point on it was 9 feet above the Lake. It lies 3700 feet from the mainland, six miles east of Thunder Cape, Lake Superior and is therefore exposed to all the fury of its waters in time of storm.

Incredible as it may seem, Silver Islet, though only a small speck of rock, 90 x 90 feet, on the world's greatest body of fresh water, is richer in romance and has furnished more interesting mining history than many mining districts of the same size in miles.

The first deposit was discovered at the surface. It was pear shaped, very rich and produced a large amount of silver. The second deposit was met with on the third level. It was in the form of an inverted cone with a base of about fifty feet on the third level, and the apex down at the fifth level. This latter deposit was remarkable in its structure, a winze in the middle of it, for a depth of 60 feet was sunk literally through native silver, the metal sticking out in masses from the four sides of the winze.

In the breast of the drift it stood out in great arborescent masses, in the shape of hooks and spikes, in gnarled, drawn out and twisted bunches, with bands of animikite, and huntelite. This deposit was at the junction of the two veins on the Islet. The hanging wall is described as smooth, and as polished as a mirror.

The company that formerly operated Silver Islet was headed by Major A. H. Sibley, of New York, with Captain W. B. Frue, of Detroit, Mich. as superintendent. Captain Frue was the inventor of the Frue Vanner, well known to the mining fraternity. The invention was made at Silver Islet, the working models were set up in a building on the main land and the vanner was first used in the Silver Islet Stamp Mill, in 1874.

One of the principal shareholders at this time, was Captain Eber B. Ward, a well known vessel-owner of Detroit, Mich. History, tradition, or both, have it that his profits from Silver Islet went far to enable his daughter Clara Ward to purchase the title of Princess Chimay.

From where the vein outcrops on the Islet, 3700 feet from the main land, it is traceable a total distance of 9000 feet, or 6300 feet on the main land.

The gangue of the Silver Islet vein consists of calcite quartz and dolomite, the latter varying in colour from cream to pink, according to the amount of carbonate of manganese (rhodochrosite) it contained. The metallic minerals are native silver, (argentite) galena, blende, copper and iron pyrites, with marcasite, according to W. M. Courtice, Consulting Engineer for the Company. Thomas Macfarlane, also mentions tetrahedrite, domekrite, niccolite and cobalt bloom. According to Prof. Ingall, the two latter are probably oxidation products of a peculiar mineral called Macfarlane, and containing arsenic, cobalt, nickel and silver. Two new forms of silver were discovered in the ore, by Dr. Wurtz, and named huntelite, and animikite. The two latter are almost solid silver. Graphite also occurs in considerable quantity and seems to be connected in some way, with the occurrence of the silver. It has been observed, according to Richard Tretheway, Superintendent, that they never had silver without graphite, although they sometimes had graphite without silver.

The present Board of Commerce is but history repeating itself. Under the old management at Silver Islet, all kinds of goods and supplies were sold in

their well appointed store. They were very conscientious with their employees, a form of temperance was enacted and carried out, under which an employee could only obtain two or three drinks per day, these on credit, if he wished. Boarding houses were not permitted to charge more than a certain price, and in a general way, the best interests of the employees were carefully guarded.

### MINISTER OF MINES OF BRITISH COLUMBIA PRESENTS RESOLUTION TO LEGISLATURE URGING ADEQUATE MAINTENANCE OF WORK OF GEOLOGICAL SURVEY.

Hon Wm. Sloan, Minister of Mines for British Columbia recently laid before the Legislature the following Resolution:

"Whereas, under the terms of union of this province with the Dominion of Canada, it is incumbent on the Dominion Government to maintain in British Columbia the geological survey;

"And whereas from the pioneer work of Dawson to the present day the services of the geological survey have been of inestimable value to the mineral industry of this province;

"And whereas recent advices show that, out of a total number of twenty-one geologists available for field work throughout the Dominion, eight already have tendered their resignations, and others are likely to do so, thus leaving very few fieldmen for the whole Dominion;

"And whereas during the six years prior to 1914 the geological survey maintained an average of nearly twelve geological and topographical field parties in British Columbia alone, it becomes evident that it will be impossible for the survey to provide for work in British Columbia trained geologists from the remaining staff to continue the geological work so necessary to the mineral development of this province.

"Be it resolved, that this Legislative Assembly of the Province of British Columbia expresses its appreciation of the great value of the work of the geological survey of Canada as assisting the mineral development of this province, and views with apprehension the depletion of the survey staff, especially at this time, when, with the world entering upon a period of reconstruction, it is most important to our mining industry that all possible knowledge of British Columbia geology shall be made available.

"And be it further resolved, that this Legislative Assembly of the Province of British Columbia does strongly urge the Dominion Government:

"(1) To take some immediate action to prevent further depletion of this most valuable branch of the civil service.

"(2) To offer adequate inducements to engineering and scientific students of Canadian universities to undertake training with a view to employment on the geological survey of Canada, in order to provide trained men for the future;

"(3) To complete and publish the results of the geology of such districts as have been topographically mapped.

"(4) To adopt a policy assuring the maintenance on an adequate basis of the work of the geological survey of Canada in British Columbia, to the end that the letter and spirit of the terms of the 'British North America Act' may be implemented and the development of British Columbia expedited.

"And be it further resolved, than an humble address be presented to His Honor the Lieutenant-Governor, praying that a copy of the preambles and resolutions hereinbefore set out be transmitted to the honorable secretary of state (or other person' at Ottawa."

Ottawa, Ontario.

Dr. James S. Stewart, who has been in charge of the Edmonton Office of the Geological Survey Branch, Dominion Mines Department, has tendered his resignation, after ten years service. Dr. Stewart has been specializing in geological investigation of the gas and oil of the great plains of the Province of Alberta and the Canadian Northwest.

Percent earned on . . . . .			
common . . . . .	2.55%	6.02%	7.25%

As 1919 was marked by a number of serious recurrent labor troubles, resulting in long periods of idleness the showing is regarded as highly satisfactory.

**Internation Coal Mining Co., Westville, N. S.**

Profits for 1919 totalled \$152,449, being very slightly in excess of those of 1918 and about \$30,000 less than the profits of 1917. After deducting depreciation—for which increased allowance was made—provision for income tax and preferred dividends, there remained for application to common stock dividend \$58,464 against \$77,280 in 1918. The sum of \$10,644 was carried forward to profit and loss, bringing the total surplus to \$254,831.

**Canadian Salt Co.**

Gross and net profits compared with 1918 as follows:

	1919	1918
Gross operating Profits . . . . .	\$226,881	\$223,342
Net Profits . . . . .	136,286	136,565

After paying bond interest, and making provision for depreciation, sinking fund and interest on overdraft, the sum of \$72,286 was added to surplus making a total to credit of this item \$595,858. During the year great difficulty was experienced in obtaining fuel, and interruptions occurred in operation due to failure of the hydro-electric supply.

**Hollinger Consolidated Gold Mines, Ltd.**

Comparisons with 1918 are as follows:

	1919	1918
Tons of ore milled . . . . .	711,822	578,755
Average value per ton . . . . .	\$9.73	\$10.24
Net value of gold recovered . . . . .	\$ 6,722,000	\$ 5,752,000
Ore Reserves (tons) . . . . .	4,392,000	4,439,000
Computed Value . . . . .	\$39,928,000	\$41,080,000
Average number of men employed	1,207	1,061
	1919	1918
	\$	\$
Total income . . . . .	7,063,000	5,908,000
Working expenses . . . . .	3,222,000	2,857,000
Depreciation taxes and donations	1,232,000	462,000
Net profit . . . . .	2,321,000	2,588,000
Dividends paid . . . . .	1,722,000	1,230,000
Addition to surplus . . . . .	599,000	1,358,000
Balance carried forward . . . . .	2,670,000	2,071,000
Total assets . . . . .	27,644,000	26,821,000
Current assets . . . . .	3,602,000	2,296,000
Bullion shipped . . . . .	6,979,000	5,720,000

**Ore Reserves.**

General Manager A. F. Brigham, dealing with the matter of ore reserves, says that ore of a value in ex-

cess of \$10 to the ton has been depleted about \$1,500,000, while ore of \$80 to \$10 tenor has increased by more than \$2,000,000. Ore below \$8 a ton shows a decrease of \$1,850,000. He remarks: "It will be seen that our development efforts have been principally directed towards the maintenance of reserves approximating the value of the tonnage milled during the year. We find it very difficult to determine a definite program while labor conditions are so unsettled, and mining supplies and machinery rising from levels already abnormally high. The lower grade veins could be profitably developed and exploited if a tolerably sure combination of stable conditions obtains, but it is useless to exhaust our resources upon such, unless we can be assured of a fair return from them."

Mr. Brigham, dealing with the company's efforts to sell foodstuffs, clothing and other necessaries to employes at net cost, makes the interesting announcement that the reduction at present is 15 per cent. below the price obtained on August 1, 1919.

Other statements made by the general manager are: "The net value, \$9.40 per ton milled, was determined by the selection of such ore as would yield a close approximation to the average value of the ore reserves. Should labor become more plentiful and mining supplies fall to a rational level, this figure can be further reduced. The wisdom of this latter course is obvious.

"The mine is ready to supply the mill to maximum capacity, namely, 3,200 tons per day, when a sufficient number of miners can be secured to break the ore. Remodeling the last four tanks in the continuous decantation plant and some minor details connected with the remaining twenty stamps are rapidly nearing completion.

"Mining machinery and supplies continue to advance, and any advantage which we secured in the small reduction in the price of cyanite and explosives has been more than absorbed by the advance in timber alone. Only the most drastic economy will prevent an increase under this head during the coming year.

Mr. Timmins says pre-war labor efficiency has not been attained, and that there is still a serious shortage of labor. Relations with employes continue satisfactory. He goes on to make this significant comment:

"The demand for gold, to provide an adequate backing for the highly inflated issues of paper money now outstanding, already great, becomes daily more insistent. We are ready to supply this demand, and to add to the gold reserves of Canada to the fullest extent of our ability and the capacity of the mine, but before we do so the disadvantages from which the gold mining industry has suffered since the commencement of the war must be improved or entirely removed. There must also be a more abundant supply of efficient labor and an appreciable reduction in the cost of all materials and supplies used by us, otherwise it will not be possible to greatly increase our output along sound economic lines, which is the only policy we would feel justified in attempting to carry out."

Northland Gold Mines, Limited, has been granted Ontario incorporation with a capital stock of two million dollars and head office at Haileybury. The company is empowered to carry on a general mining business and the provisional directors are W. A. Gordon, P. C. Montgomery, E. M. Ferguson, Pearl Hunton, and A. M. McLean.

### MINING NOTES FROM TORONTO.

Frank C. Loring M. E. on the mining situation in England—Death of an aged mining expert—An interesting mining case in the courts.

(From Our Toronto Correspondent).

That England is ripe for a big educational campaign and propaganda in the interests of Canada's mineral resources, is the opinion of Frank C. Loring, Mining Engineer, Sun Life Building, Toronto, who has just returned from a business trip to the Old Land. "Canada received a rather bad reputation through the failure of one or two of its mines," said Mr. Loring to the "Canadian Mining Journal", "and unfortunately they appear to know rather more about these than they do about the many good mines. What is needed in London is a first class mining exhibit, with maps and data showing the wonderful mineral resources of this country and particularly Ontario. Particularly is this needed now when the country is showing a great speculative spirit in industrials and is also greatly interested in gold and silver mining. This is evidenced by the fact that the five million pound exploration company recently formed in London had its stock over-subscribed almost before it was thoroughly organized. General Sims, Canada's representative in Great Britain, is doing good work, and it is not his fault that the Canadian trade office in London does not compare sufficiently with the trade offices of the other British colonies. In my opinion the same attention that is being paid to the agricultural resources of Canada in the London office should be devoted to educating the British public to our wonderful mineral resources with a view to enlisting British capital for Canadian mining enterprises. There is no doubt that there is a large amount of money in England ready for investment in Canada and with effective propaganda work much of this can be diverted to Canada. Already several companies are being formed to exploit Canada, and real exploration and development will take the place of the cursory work done in the past. Now that the South African production is falling off and gold and silver is in such great demand there is a great opportunity for Canada to place her wonderful resources before the investing public of Great Britain."

Mr. Loring returns to England shortly on business connected with various mining enterprises. Since his return he visited the Dome, Hollinger and other mining properties in the north country. He is the consulting engineer for the Hughes McElroy mine.

### BOOK REVIEW

The Kent Coalfield, its Evolution and Development, by A. E. Ritchie. Published by the "Iron and Coal Trades Review" London, England. 5 by 7½ Cloth, 302 pp. map and index.

This little volume is collected from a series of articles which appeared in the "Iron and Coal Trades Review."

Except to Englishmen, Mr. Ritchie's recital of the long story of the evolution of the Kent Coalfield from a shadowy scientific hypothesis to a producing coalfield is not absorbingly interesting, but the proved existence of numerous seams of workable coal of good

quality in the south-east of England will exert a far-reaching influence on the future of England, and in importance is only approached, but not exceeded, by the proved extension of the Midlands coalfield south and east of what were supposed to be its extreme limits of workability and persistence.

To non-English readers the chief interest in the Kent Coalfield resides in the testimony it bears to the value of geological speculation and deduction. The first suggestion of a buried coalfield in the south-east of England came from Sir Henry de la Beche, head of the Geological Survey in 1846, and in the same year similar conjectures as to an extension of the French coalfield of the Nord into the Pas de Calais district were confirmed by the accidental discovery of coal in an artesian well.

In 1855 Godwin-Austen read before the Geological Society a paper that made history on "The Possible Extension of the Coal Measures beneath the South-Eastern part of England." Godwin-Austen's reasoning was chiefly based on his belief that the axis of the Ardennes was continued into England and represented by the Mendip Hills. Unfortunately, Godwin Austen's theories were opposed by other geologists, particularly by Sir Roderick Murchison, then head of the Geological Survey. The borings which were later put down are stated by Mr. Ritchie to have been useful chiefly in proving where coal was not, and he remarks that if Godwin-Austen's recommendation of 1858 had been acted on the evolution of the coalfield to a producing stage would have been advanced by fifty years.

Mr. Ritchie's volume is one long record of a process of trial and error, chiefly error, and periodically he compares the lack of progress and clashing of opinions which delayed the finding of coal in Kent, with the business-like manner in which the French engineers opened up the deep mines of the Pas de Calais field, making incidentally many persons very rich. It would be profitless to review this record, but it should be proper to point out that if in so old a country as England, a country in which the science of geology was born, it is possible to discover hidden coalfields in these latter days the possibilities of study of our own coal measures are very great. Even in England, the full implications of the finding of coal in Kent have not been realised, and in years to come the prolongation of the coal measures of Kent, under the Thames Valley in the direction of the Somerset coalfield may prove to be more than a mere hypothesis.

The seams in the Kent Coalfield have not been correlated, but a study of the aggregate thickness of coal seams over three feet in thickness already, proved in numerous boreholes, and actually yielding coal from six collieries, will reveal the tremendous importance of the field. The analyses are surprisingly good. For example, in the Ripple boring of the Kent Coal Concession, Ltd., ten feet of coal is proved having the following analysis; Volatile, 10.71%, Fixed Carbon, 84.24, Sulphur 0.63%, Ash 4.40%.

The volume is prefaced by a quotation from George Stephenson, which was never more opposite than today. "The strength of Great Britain lies in her iron and coal beds; the Lord Chancellor now sits upon a bag of wool, but wool has long since ceased to be emblematical of the staple commodity of England. He ought to sit upon a bag of COALS."

# A MARSH HOIST IS MADE THE RIGHT SIZE FOR YOUR MINE

and in either Steam Power or Electric Power

This shows one of our Electric Mine Hoists. We make many other types. Send for our catalogue of Mine Hoists, Cars, Cages, Buckets, etc., and see what we offer you. It will repay you.

From the little 10 Horse Power size for prospectors or small mines to the massive 50 Horse Power size, one of our 7 sizes should be just right for your mine.

We are specialists in the building of Hoisting Machinery of all sorts. For nearly a quarter of a century we have been designing and building Hoists, and have developed a Hoist that we are really proud of—proud because of the record of good work they have done, and are doing in mines, quarries, and other classes of work from one end of Canada to the other.

## MARSH ENGINEERING WORKS, Limited

ESTABLISHED 1846

BELLEVILLE, ONTARIO, CANADA

Sales Agents:—MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

# BOLINDER'S

## Heavy Crude Oil Engine

FOR MINING AND INDUSTRIAL PURPOSES

Built by a Firm who Stands Supreme in the Whole World as Oil Engine Experts.

The Bolinder operates on a cost of only  $\frac{1}{2}$  cent per Brake Horse power per hour—an enormous Saving as compared with a Steam plant. A 200 B.H.P. Bolinder (which is equal to a 250 I.H.P. Steam engine) costs only \$1:—per hour at full load.

The Bolinder eliminates firemen and fire hazard.

The Bolinder is the result of 30 years' experience.

Simple

Reliable

Durable

A 320 B.H.P. Bolinder Engine directly connected with a Generator.

Representatives:—

Swedish Steel and Importing Co., Limited, Shaughnessy Building,  
MONTREAL

**Worthington  
BOILERS**

Supplied in capacities from 50—600 H.P., especially suitable for shipping, knocked down, to localities difficult of access. Very little brickwork required. Highly efficient.

**MacGOVERN & COMPANY, Inc.**

AGENTS

285 BEAVER HALL HILL, MONTREAL

Offices: New York, Pittsburg, St. Louis  
Plants: Brooklyn, N.Y., Lincoln, N.J., and Linden, N.J.  
Buyers and Sellers of New and Used Machinery  
A CONTINENT-WIDE SERVICE

**MINING CLAIM FOR SALE**

Containing Copper, Nickel and other Minerals in the district of Parry Sound, known lately as the Radium District. This property will stand inspection.

W. E. DALTON,  
454 Burlington, Ontario.

The only reliable protection against the action of acid and chemical fumes. For batteries, battery rooms, chemical works, etc. — Used by Admiralty and War Office.

Made by: GRIFFITHS BROS. & CO., London, England.  
Spielman Agencies, Reg'd., 45 St. Alexander St., Montreal.

**WANTED.**

Assay laboratory outfit:—muffle and crucible furnaces, gasoline preferred; crusher, pulveriser, balances, etc. Must be in good condition.

Address: P. O. Box 117, Crosby, Minn., U. S. A.

**MATERIAL FOR SALE**

RAILS—7,800 lin. ft. of 56 lb. rail with fastenings. 4,400 lbs. plates.  
STEEL TRESTLE—59,450 lbs. structural steel.  
WOOD TRESTLES—About 205,000 F. B. M. of heavy lumber.  
CABLES—About 12,000 feet of one-inch and one and a quarter inch steel wire cable.  
CARS—Four.  
BUILDINGS—Park Ave. Station. Centre Station and Engine House.  
Upper Station and Engine House  
COVERED PAVILION—Including structural steel frame (about 18,000 lbs.)

**Equipment at Upper Engine House**

ENGINE—one 14 in. x 24 in. simple twin reversing link motion horizontal engine connected by gears to a double drum hoist.  
HOIST—Double drum twin hoist. Drums 100 in. diam. x 60 in. face. Lagging on drums 9 in. oak blocks bolted to drums. Driving pinion 32 in. diam. x 8 in. face. Driving gear, 12 in. diam. x 8 in. face. Drum shaft, 7 in. diam. in bearings. Bearings, 3-7 in. Cast-iron babbitted. Brake bands on both drums.  
BOILER—Horizontal return tubular. 60 in. x 14 ft.—72-3 in. tubes. Grate surface 36 in. deep x 60 in. wide. Stack 30 in. diam. x 35 in. high approx. Boiler designed for 125 lbs. working pressure. Boiler fed by injector.  
STEAM PIPING—6 in. wrought iron pipe from boiler to engine.  
EXHAUST—5 in. spiral revitted from engine up through the roof of engine house.

**Equipment at Lower Engine House**

ENGINE—One 8 in. x 16 in. simple twin reversing link motion horizontal engine connected by gears to a single drum hoist.  
HOIST—Single drum endless cable type, with the necessary gears shieves and idler shieves and cable tightening device for taking up slack by means of idlers. Brake band in drum.  
"NEW" BOILER—Horizontal return tubular. 60 in. x 14 ft.—72-3 in. tubes. Grate surface 36 in. deep x 60 in. wide. Stack 24 in. diam. 50 ft. long approx. Boiler designed for 125 lbs. working pressure. Boiler fed by injector.  
"OLD" BOILER—Horizontal return tubular. 52 in. x 12 ft.—60-3 in. tube. Grate surface 30 in. deep x 50 in. wide. No stack. Boiler designed for 125 lbs. working pressure.  
STEAM PIPING—4 in. wrought iron pipe from boiler to engine.  
EXHAUST—3 in. wrought iron pipe from engine up through roof of engine house.

# EDITORIAL

## THE SAFEGUARDING OF INVESTORS IN MINES

Mr. Alexander Gray in his comments in this issue, which we welcome, views the protection of the investor and the simultaneous encouragement of the prospector from a point of wide experience in mining matters, and he touches a vital point in suggesting that reputable newspapers should censor the mining flotation literature which now forms so large a part of the advertising columns of Canadian dailies. Some of the newspaper propaganda is so subtle that it would deceive the very elect. Recently we pointed out the apparent character of the investment afforded by the stock offering of the Little Gem Mining Company of Anchorage, Alaska, which had appeared in the Montreal "Star," and the very frank manner in which those who offered this stock admitted its speculative character. The writer was amused, when attending the Annual Meeting in Toronto, to note that the advertisement of this Company was appearing in the Toronto "Globe," but, either from an astute psychological insight into the Torontonionian mind, or perhaps to conform to the code of morals professed by the "Globe" the suggestions to "ante up" and take a chance on winning a "big pot" were deleted. Instead, a statement was made as to the amount of stock that had been sold in Montreal. Now that is not bad, because no matter how Toronto may regard Montreal's moral character, it has a most wholesome respect for the business acumen of its civic rival.

As one example of the other little gems that stud our newspapers, we have had brought to our attention a despatch from the "correspondent in the mining field" of the Montreal "Standard" written from Dane, Ont., which refers to the Argonaut Mine. This gentleman, having summoned up sufficient courage to explore the vasty deeps of a gold mine found himself on the 200 ft. level, where, he writes, "one had great difficulty in getting about to see anything owing to the number of men at work. We are plaintively informed also that "one is allowed to understand that interruptions are not appreciated." We wonder what they did to the poor man. Perhaps they ran a mine car into him? It is very evident that our friend was out of his element. Yet, notwithstanding his obvious unfamiliarity with underground conditions, he proceeds to make this oracular statement, to wit, "It is estimated that the development work now in progress and to be continued for the next few months will add

five million dollars to the known ore reserves in the mine." The gentleman can apparently see as far into the ground as the next man, and he finishes his letter by stating: "It is the general opinion up here that the Argonaut is fast developing into the richest gold mine in the country." What we like about these gentry is their lack of ambiguity.

It is quite possible that the Argonaut may be a rich mine, but this kind of thing is not playing the game squarely.

Those who really know mines are not deceived by the fake technical gibberish that disfigures so many of the financial pages of our most reputable newspapers, but those who do not know mines are greedy and credulous readers of it all. The Editor has on his desk a letter from such an investor, who says that through one of his real friends his attention was called to Canada. He says, truly enough, "I have been unfortunate in my investments so far. It was never any fault of mine, but invariably the dishonesty of the promoter."

The problem of protecting the "investor" against fraudulent mine flotations is, as Mr. Gray says, somewhat of an abstract science, but there is nothing abstract about the cash-down payments that our newspapers ask before they will print these dubious advertisements, nor is it making an unfair statement to declare that in allowing such advertisements to appear in their columns, our newspapers are inflicting upon their readers a deliberate dis-service, and are not playing cricket.

## FLIN FLON DEPOSIT WILL BE DEVELOPED THIS YEAR.

It is announced that arrangements have been completed between the owners of the Flin Flon property and men associated with W. B. Thompson of New York that will insure vigorous development of the property this year. It is understood that the plant at the Mandy mine has been purchased for the work at Flin Flon mine and will be immediately moved. It is reported from The Pas that a number of men have already been engaged for the work of transporting and installing the machinery and putting the camp in shape for action.

It is common knowledge that the Flin Flon deposit is a very big one. The work that has been done has given information which makes it appear probable

that a very big mining industry will be founded on this deposit. Diamond drill exploration has indicated the presence of several million tons of sulphide ore that may reasonably be expected to be mined at a profit, if suitable transportation facilities are provided.

The surface stripping and 25,664 feet of diamond drilling has permitted sampling and assaying, from the results of which an estimate of 20,000,000 tons of ore has been made. This ore contains, according to the information now available, 1.69% copper and 3.49 per cent zinc as well as small but appreciable amounts of silver and gold. During the present summer shafts will be sunk and underground exploration carried on. It is said that the option is for one year and it may be expected therefore that work will be pushed ahead rapidly this summer.

The development of the Flin Flon property will have an important effect on mining explorations in Northern Manitoba. The work done this year will itself give an impetus to other operations in the district. If the results are satisfactory to the holders of the option and the bigger undertaking of mining and smelting of the ore follows closely on this year's development Flin Flon will soon be the centre of a flourishing mining industry—R.E.H.

#### WORK FOR THE CANADIAN MINING INSTITUTE

In the address of Mr. J. A. Campbell, M.P.P., before the Canadian Mining Institute, attention was directed to the attitude of Governments towards the mining industry. He particularly referred to conditions which are delaying development of the mineral resources of Manitoba. He pointed out that there is in Manitoba a peculiar situation; the Province does not own its mineral resources, but has a mining law; the Dominion owns the mineral resources of Manitoba, but has no mining law. The Dominion administers the mineral lands through the Department of the Interior, Properties are taken up and operated under regulations instead of under statutory enactments. The Minister of the Interior is empowered to enact royalties and the amount is not fixed.

There is good reason to believe that the Province of Manitoba wants its mineral resources developed and that the present government will do what it can to encourage capital to undertake exploration of properties. There is also good reason to believe that the Dominion Government, and particularly the Minister of the Interior, will be pleased if Manitoba should become an important producer of metals as well as of agricultural products. The prospective investor can be well advised not to overlook Manitoba in spite of the unsatisfactory conditions. There remains, however, a duty which those interested in the mining in-

dustry should not overlook. Unsatisfactory conditions are unnecessary and could be removed by united effort. To advise governments in such matters is obviously the duty of the organization which represents the mining industry of Canada. The Canadian Mining Institute is not functioning fully while it neglects to use its weight in removing obstructions which the pioneers in new districts find in their path.

A few years ago an unusually important discovery of copper-zinc ore was made at Flin Flon lake. Preliminary exploration has proven the deposit to be of great size. It has recently been announced that development of it will be carried on vigorously this year.

It may be taken for granted that the men who have undertaken the work have received ample assurance that they will get a fair deal from the governments concerned, if they proceed with mining and smelting operations and the big expenditure of money which the project will involve. That these men are going ahead with the venture should of itself be encouraging to others, for it is an indication that they feel reasonably certain of fair treatment. There remains, however, the fact that regulations and governments are subject to frequent changes. Statutory laws governing mining in this new district are much to be desired.

That the development of the Flin Flon deposit should prove a success is a matter of interest to the country generally, as well as to the present and prospective owners. If the establishment of a mining industry at Flin Flon is recognized as highly desirable, the respective governments will be supported by the public if they encourage the projects. Does it not seem to be a duty of the Canadian Mining Institute to use its influence towards obtaining recognition of the national and local advantages which a big metal mining industry in the prairie provinces would bring?—R.E.H.

It was intimated by one speaker at the Wednesday morning session of the Institute, that more resignations from the Geological Survey are likely to come soon, if provision for more adequate salaries for geologists is not made. It would be very unfortunate if disorganization should continue so rapidly as during recent months and it is to be hoped that action will be taken to hold together what remains of the Survey staff. Mr. Campbell in his address held out the hope that the revision of the classification, now being considered, may result in better salaries for the staff.

The question as to whether the Dominion Government should retain control of mining lands in the Prairie Provinces was not debated at the meeting. There seemed general approval of the statement made that mining will proceed under either control, provided that a definite understanding and proper protection for capital is obtainable.

# Annual Meeting of the Canadian Mining Institute

Twenty-Second Annual General Meeting, Toronto, March 8th—10th, 1920

(Reported by the Editor.)

## A Joyous Meeting.

Three things helped to make the Toronto Meeting a happy one, namely; the efficient spade-work of the Local Committee in preparation for the meeting and the entertainments; the presence and active participation in the meeting of a large number of members returned from the war; and the special care taken to ensure the presence and comfort of the ladies. The combination of these circumstances, with others that might be named, gave to the meeting from the first a keenness and elation that redeemed it from stodginess, and sustained the interest throughout an unusually full programme of work.

The reception of the Institute by the City of Toronto was most courteous and hospitable. The Institute was invited to luncheon by the Mayor and Civic Corporation, a mark of honour that has rarely, if ever before, been shown to it, and one which the retiring President, in thanking the Mayor and the City, accepted on behalf of the mining industry of the country as a recognition of the influential and representative position now generally accorded to the Canadian Mining Institute. The compliment paid to the Institute was not less marked than the appreciation it evoked from the members in attendance.

The Government of Ontario also, by the presence of Lieutenant-Governor at the Annual Dinner, and by the attendance of the Minister of Mines both at the opening session, and at the dinner, conferred distinction upon the Toronto meeting.

In addition, the most generous assistance was given by the Mines Department of the Province both before and throughout the course of the Meeting.

The sessions were so full, and the various events of the Meeting followed in such quick succession that the visitors did not see much of the city itself, but in no place has the Institute been more signally honored at its Annual Meeting than in Toronto.

## OPENING SESSION, MONDAY 8th.

### Address of the Minister of Mines.

The Minister of Mines, the Hon. H. Mills, welcomed the members as coming from the West and the East and as representing every province of Canada, and said he appreciated the honor conferred upon him by the Toronto Branch in recently electing him as an honorary member of the Institute. During the few weeks he had held office, Mr. Mills said he had been filled up with advice, so varied and extensive that he had decided it was safer during the coming session of the House to follow certain narrow trails. He had hoped to make changes in the Mines Act. The Act was, he believed, a good one, but not so good that it could not be bettered, and in detailing briefly what he hoped to accomplish during the Session, Mr. Mills said:

The prospector is responsible for the pioneer work of mining development. He is to the mining industry what the settler is to the farming industry, and should be encouraged in every possible way. The prospector does not know all about the game yet. He has a lot to learn.

Valuable claims have been passed over by prospectors in the past because of the lack of proper information on the part of the prospector. The education of the prospector would be a step in the right direction, and the Government proposed to institute evening classes for prospectors in the various camps next winter. The provision of up-to-date geological maps and blue-prints of districts and mineral zones would be undertaken, and an office was to be opened at North Bay, for the preparation and issuance of such information to prospectors at cost.

The Government intended to assist in making trails and opening roads, and had included ten thousand dollars in the estimates for opening streams and trails and anticipated a large return on this investment.

Assistance would also be given to the prospector by reducing the license fee from \$10.00 to \$5.00. Requests had been made for even greater reductions, and a fee as low as \$1.50 had been suggested. It was possible that some people would accept a free license. Staking would be limited to three claims per man and three claims for two other parties, that is nine claims in all. Some persons may consider this limitation objectionable, but in the past too much land had been given away. One claim covered 6,400 acres, and another 9,300 acres. Would venture to say that not more than one per cent of the claims are developed. It is the development and not the granting of claims that is of interest to the Government.

The Government proposed to assist by granting free assays, for which two coupons would be issued to each person, covering gold, lead, silver and copper. The Department was considering enlargement of the Toronto Assay Office and extending operations to Cobalt. Two assays would be allowed for each recorded claim. In the matter of licenses, the Government hoped to encourage the small prospector, and make things more equitable without reducing its own revenue by charging a \$5.00 license fee to the actual prospector, and \$15.00 for the licenses taken out by proxy.

Requests had been received from the Great War Veterans Association, in its various centres, for everything. Fifteen

HON. H. MILLS.  
Minister of Mines, Ontario.

hundred returned men claimed to hold claims before enlistment, and the Government had been asked to forgive all assessment work arrears, but this might run into a sum as large as four million dollars, and caution was necessary. The Government purposed to allow the non-payment of the statutory fee of three dollars per acre for unsurveyed claims and \$2.50 for surveyed claims, which would cost the Government from \$300,000 to \$500,000.

#### Iron Ore Bounties.

The Government had not committed itself to a policy of granting iron-ore bounties, and did not feel disposed to do this. In British Columbia, three dollars per ton had been offered as a bounty for pig-iron made from local ores. This offer has not been taken up as it should be and I believe that in the case of our own ores, the time will come when they will be of the utmost importance, if it is really necessary they should be developed. The electro-thermic process of reduction of iron-ores is stated by competent authorities to be a feasible one, but our drawback is lack of electric power. We have not, however developed more than one-sixth of our own water-powers in Canada, and it is most important that we should do this if we are to develop our iron-ores.

In regard to our place in Ontario as a producer of minerals, in regard to gold output we lead any province or state in America, except California. In silver production we have fallen down, owing to the decreasing yield of the Cobalt mines, a fact that is not either surprising or alarming, as all mines commence to die at birth. We have promising prospects elsewhere, and from the confidential information at our disposal, I believe we have other and undiscovered Porcupines, Cobalts, Sudburys and Kirkland Lakes.

#### Address of Mayor Church.

The Mayor of Toronto stressed the necessity to develop our water-powers, and referred to the enormous importance of the Chippewa scheme. The deepening of the St. Lawrence waterway, and the utilisation of the powers that can be obtained from its long and falling course to the Atlantic was worthy of all help.

Mr. Church asked the mining executives to assist in every possible way the education of university students, and particularly mentioned employment in the long vacation.

#### PRESIDENTIAL ADDRESS.

The retiring President, Mr. D. H. Mc. Dougall read the address, which follows:

It is the custom for a retiring President either to review the year's events, as they affect the business of the Institute, or to speak with particular reference to some phase of Canadian mining.

I propose at the dinner to say a word on Institute affairs, but today would ask your consideration of some circumstances connected with the economic utilization of our national resources.

First of all, I would propound two statements, as the text of my remarks, which, made from this Chair, may strike you as unusual, and possibly heretical. The statements that I would make are that the natural resources of Canada are:

- a. Very specialized.
- b. Not inexhaustible.

I am aware that it has been the custom for many years to refer to our national resources by such terms as "illimitable," "immense" and "boundless," and, while these phrases may have been warranted when our people numbered a few millions, is it not perhaps time to take stock of our national assets in the light of future population, which may within the lifetime of those present here be doubled, or maybe trebled?

Canadian views have possibly been colored by reflection of those of our friends in the United States, whose prodigal natural resources have been a revealed phenomena of modern times. The World has not been before, and cannot see again, such a treasure house as the territory now known as the United States of America was when the white man first commenced to mine those resources, without much thought of the future.

In coal, iron, gold, silver, copper, zinc and lead; in the great forests of oak, pine, cypress and walnut that formerly existed, in agricultural possibilities and variety of climate, there never was so fortunate a land seen by white men, nor ever can be seen again in its unspoiled and intact pristine wealth.

But, in Canada, have we so great an accumulation of potential wealth? It is much to be doubted. Our wealth is truly vast, but relatively, we have certain distinct limitations, which, if we will admit them now, and proceed in that wise and prudent manner which has become a proverb, to "cut our coat according to our cloth," we may to a large extent offset.

Three basic requirements of our national life are, in their natural order of importance, coal, iron and wood, and, if we enquire carefully into the extent of our national resources of these three essential materials, their limitations, so far of course as our prospecting and the progress of scientific research today have led us, will be disclosed.

To deal in order, and very briefly, with these three basic materials:

#### Coal

Our coal deposits do not include anthracite, barring some anthracitic coals of small tonnage quantity in the West.

Our bituminous coals are concentrated in widely scattered localities—not, as yet, the most populous parts of Canada—and the gap between is wide and important.

With the exception of the great coalfield of Alberta and eastern British Columbia, which is of course essentially one deposit, we have remaining only the coal deposits of Vancouver Island, New Brunswick and Nova Scotia.

The great reserve of the two coalfields of Vancouver and Cape Breton Islands is under the sea, and, in regard to both these widely separated localities, the extent of the coal reserve depends on the progress that science will make in providing the means to transport light, air and motive-power over long tracts of underground passages.

The limits to the mining of coal imposed by great depth of cover, and by distance from shore, are not known, because they have not been tested, but it may be confidently presumed that these limits will be widened as human knowledge is increased by experience, and I merely wish to emphasize that the limitation exists.

In the same manner the removal of the present obstacles to the utilization of the low-grade lignites of the West rests with the advances of applied science, as does also the means of making Canada independent—as far as may be—of importations of anthracite from the United States.

#### Iron.

Canada's position in regard to iron ore is deducible from the definition of commercial iron ore which is contained in the Encyclopedia Britannica article on "Iron and Steel" by Dr. Henry Marion Howe, of Columbia University, who writes:

"Whether a ferruginous rock is or is not ore is purely "a question of current demand and supply. That is ore "from which there is a hope that metal can be extracted "with profit, if not today, then within a reasonable time."

Our iron-ores, so far as we know them consist of large occurrences of ore of relatively low iron content. Their utilization will depend on the progress made in concentrating these lean ores to compete economically with richer ores. This again is a matter for practical scientists, and some progress has already been made in this direction.

#### Wood.

The inroads that are being made upon our forests are a matter of notoriety, nor are these inroads accompanied by anything approaching adequate reforestation. Indeed, it is doubtful whether in some instances reforestation is practical.

Enquiry will prove that timber lands are daily increasing in scarcity, and therefore in cost, and our limitations in Canada in this regard are not only distinct, but actually alarming.

What I have said regarding these three basic materials is quite probably true of other essential things, but these do not so properly concern us as a Mining Institute.

One general conclusion we may draw, namely, that efficient and full use of our resources is dependent upon the progress of science, which, applied to their limitations, and supplementing their deficiencies, will have the effect of increasing their quantity and duration.

Dealing now with my second statement, and with those natural resources that I have called "specialized," I would direct your attention to the fact that Canada contains almost the world's reserve of nickel, asbestos and cobalt.

These minerals are chiefly important in being necessary to certain large industries, and, if this word is permissible, they are minerals possessing a "strategic" value, inasmuch as our almost exclusive possession of these minerals should enable us to drive a fair bargain with those nations that possess essential natural resources with which Canada is somewhat meagrely or unevenly supplied.

The members of the Iron and Steel Section of our Institute have not been slow to comprehend the growing importance of alloy steels, but this is an industry that Canada should strive to make a national speciality. We have large water-powers and the means of generating with comparative cheapness large quantities of electricity. Canada possesses, as

With reference to many of the ores of precious metals found in Canada it is well-known that their complexity of composition has been a deterrent to earlier profitable development of many deposits, but Canada today can boast of great strides in the processes of recovering the precious metals. So marked is this feature of Canadian mining, that during the past year, the members of the Canadian Mining Institute decided by a preponderating vote to change the name of the Institute as a recognition of the important status of the metallurgist.

What conclusion do these considerations lead us to? Inevitably, I think, and quite unmistakably, to a recognition of the importance of applied science to our young nation, and

MR. O. E. S. WHITESIDE.  
President of the Institute 1920.  
(Photo from the Bulletin by permission.)

MR. D. H. MCDUGALL.  
The Retiring President.

mentioned, a preponderance of the world's nickel and cobalt, and in addition she is supplied with smaller quantities of chrome, molybdenum, and magnesite—from which magnesium is obtainable. As a producer of synthetic steels, the variety of which is now immense, Canada only requires for success the development of trained metallurgists, for she has all the natural resources necessary.

The dominance of Canada in asbestos production, and her important contribution of amber mica, should enable us to take overshadowing position in the electrical industry, in which these two products find such varied and indispensable employment.

if this conclusion be admitted, then I think, it will be necessary for the Canadian people to entirely revise their valuation of the scientific worker.

The Canadian Mining Institute in common with our sister societies, has for years urged greater recognition of students of science, of the universities and institutions of scientific learning, and of those civil servants charged with the development of the resources of the mines, the forest, the farm and the sea.

The salaries paid to those engaged in demonstrating in our Universities, and to civil servants engaged in scientific work, are so inadequate as compared with the rewards avail-

able by accepting employment with any of the large industrial companies in the country that the average scientific worker in our universities and Government service is compelled to choose between carrying on at a great personal sacrifice the work in which he is engaged or relinquishing it and accepting employment outside his present duties which will at least be sufficiently remunerative to provide the necessities of life.

Among others, there is one branch of the Civil Service—later to the Geological Survey—which has never been appreciated at its true worth. No Canadian Government has yet voted a worthy appropriation for the purposes of the Survey. It has always been hampered in its work by an inadequate number of workers, inadequately paid; and this deplorable, but I think undeniable fact, arises from a fundamental misconception of its importance. The Canadian people does not know what advantages flow from applied geological research, and, largely for this reason, it does not care. I suggest that here is a direction in which the Canadian Mining Institute can do useful work. We should fully consider the work of the Geological Survey and should present to the Government a memorandum of how we conceive its usefulness can be maintained and enlarged, and then back our recommendations by the entire influence of the Institute. Certain steps have already been taken and these steps should be supplemented to the fullest possible extent. Unless we ask for what we want, and ask plainly and urgently, we shall go wanting.

Canada is not a country where wealth is easily gained, but it is a country not yet fully known, not half-prospected where in the past sincere work has almost always reaped a satisfying reward. What we, and our children, will get out of Canada will be in exact measure to what we put into Canada in the way of brains and work. We have great national wealth, but none to waste. We have problems and limitations, but, if these are properly tackled we can lead the world in many things. Only, we must give up talking thoughtlessly of our "boundless" natural resources, and prepare, by fostering science and encouraging scientific workers, to get the best out of our country, which may well prove to be something that will not only pleasantly surprise ourselves, but more favored nations also.

Further, our problems should be studied in the light of what has been accomplished in other countries, and this should not be left to that small proportions of our people that can afford out of their resources and time to go abroad

### MINERAL STATISTICS.

Mr. John McLeish, Chief of the Department of Mineral Statistics, Department of Mines, Ottawa, read an abstract from the Preliminary Report of the Mineral Production of 1919. An abstract, and commentary on 1919 production, was published in the "Canadian Mining Journal" of the last issue. (vide No. 10, vol. XLI, page 189.) Mr. McLeish pointed out the transitional nature of 1919, and managed, as he always does, to make statistics interesting.

Mr. Theo. Denis, Superintendent of Mines for the Province of Quebec, was able to report that the mineral production of Quebec, "in the first after-war year, was the highest in history." Mr. Denis was felicitous in his presentation of Quebec's encouraging record, and while a more extended review of the Province's production may be reserved until a later time, the following abstract from the printed Report, contains all the necessary information. Mr. Denis's repeated warnings against fraudulent mining flotations are as commendable as they are necessary. An abstract follows:

#### MINERAL STATISTICS OF THE PROVINCE OF QUEBEC FOR THE YEAR 1919.

The mineral production of the Province of Quebec in 1919 reached a total value of \$20,701,005. This is an increase of \$1,993,243, as compared with the previous year when the value was \$18,707,762. The proportional increase in 1919 over

1918 is then 10.7 per cent. Therefore the past year has been prosperous and it is gratifying to observe that as regards value of output, the Quebec mineral industry has not suffered during the dreaded period of transition and readjustment from war conditions to a more normal peace régime. The Province produces several of the so-called "war-minerals," such as molybdenite, chromite, magnesite, the mining of which received a strong impetus during the hostilities, and the armistice strongly reacted on the activities of these materials. But fortunately, the great majority of our mineral products have so far, been substances used in peace industries, such as asbestos, mica, and building materials. Therefore, while in 1919 we record decreases in some of the items, these were more than compensated by greater production in the others, with the result that figures of production for the first after-war year are the highest ever recorded.

The high proportional increases in value which each year has shown over the other since 1914, have in a measure, to be attributed to higher prices rather than to increases in tonnage, for the various items. The quantities have not grown at the same rate, and as an extreme example, of this state of things, we may quote our main product, asbestos, which in 1919 figures for an increase in value of 279 per cent as compared with 1914, while the tonnage has only increased 33 per cent in the same period.

It is to be particularly a matter of congratulation that during this difficult period of transition, so generally marked throughout the world by industrial and social unrest, the Province of Quebec has been comparatively free from serious troubles as regards undue exigencies of labour, and there have been no strikes on a large scale, such as paralyzed production in many other parts of the world. The cost of labour of course, has increased in keeping with the cost of living, but the demands have never been such that they could not be amicably and satisfactorily settled between employers and employes, without prejudice to the industries.

The progress of mining in the Province of Quebec in the last twenty years cannot be more graphically illustrated than by a table of the annual value of the products of the mineral industries.

MR. THEO. DENIS,  
Supt. of Mines, Quebec.

Table of Value of Annual Mineral Production of Quebec from 1900 to 1919.

Year	Value	Year	Value
1900	\$1,276,076	1910	\$ 7,323,281
1901	2,997,731	1911	8,679,786
1902	2,985,463	1912	11,187,110
1903	2,772,762	1913	13,119,811
1904	3,023,568	1914	11,732,783
1905	3,750,300	1915	11,465,873
1906	5,019,932	1916	13,287,024
1907	5,391,368	1917	16,189,179
1908	5,458,998	1918	18,572,595
1909	5,552,062	1919	20,701,005

The Quebec Bureau of Mines has repeatedly issued warnings to the investing public to put them on their guard against buying shares and stock certificates of mining ventures organized for the sole purpose of attracting and entrapping the hard-earned savings in rural and urban communities. The last few years have been prosperous, savings accounts have grown appreciably, and these conditions have caused the reappearance of the professional promoter, with his flock of peddlers of beautifully engraved stock certificates.

As we have repeatedly stated before putting money in ventures of which he knows little personally, the investor should make thorough enquiries from reliable sources, as to the value of such enterprises and investigate and weigh the chances of success. The Quebec Bureau of Mines is at the disposal of the public for technical information regarding the mines and the mineral resources of the Province. An enquiry on such subjects, addressed to the Department of Colonization, Mines and Fisheries, Quebec will, as a rule, bring to the writer information which will enable him to go in to it with a better knowledge of the facts.

**MINERAL PRODUCTION IN ONTARIO.**

Mr. T. W. Gibson, the Deputy Minister of Mines for Ontario dealt with the mineral production for 1919. He referred to the falling curve of silver production, but this he forecasted would be flatter and more prolonged than its phenomenal rise from 1905 to 1913.

Mr. Gibson mentioned that the increased price of silver had the effect of increasing the value of silver properties to an extent which, while not predictable, certainly would be equivalent to prolongation of the life of the mines in proportion to the amount of low-grade ore thereby made mineable.

Gold production was becoming more important, and Kirkland Lake was a field of established value.

With regard to natural gas, the tendency was to use it in the coarser industries, for which of course it was a most desirable fuel. Now that the supply was decreasing, the Government considered it proper to confine its use to domestic requirements. The task had been a difficult one to undertake, but public opinion had sustained the policy. The result of restricted use had of course been a smaller production, and this had increased the cost of unit production, which may necessitate an increased selling price, but the expectation of a longer life for the wells, and the necessity to conserve natural gas to help the general problem of domestic fuel and heating in Southern Ontario, would offset the disadvantages which an increase in price brings with it.

The extent of variety of Ontario's mineral production does not permit of a satisfying abstract at this time, but some of the outstanding features of the Report may be mentioned.

The total production of silver from the Ontario silver mines since the discovery at Cobalt in 1903 to the end of 1919, is 303,610,836 ozs. valued at \$152,239,

972. Mines shipping over half a million ozs. in 1919 are given in order as follows:

New developments during 1919 include the completion of the British-America Nickel Company's refinery at Deschenes, near Ottawa, and the new smelter of this Company at Nickelton. Radium-bearing minerals have been found in encouraging quantity near Maberly. The production of soda ash at Amherstburg by the Brunner Mond, Canada, Ltd., is a development of 1919, and its importance is properly emphasised in the Report.

**Status of the Engineer.**

Mr. James McEvoy of Toronto had consented to open a discussion on this question, and gave a summary what had been accomplished. In part, Mr. McEvoy said:

During the early years of the Institute efforts were made in some of the provinces to pass legislation regulating the practice of engineering of all kinds, but representations made on behalf of the Institute had caused such legislation either to be withdrawn or to have omitted from its scope the direction of mining operations.

The Quebec Act of 1898 specified the character of engineers' work, and provided that no person except a member of the Canadian Society of Civil Engineers could act as engineer within the definition of the Act, and the Act was amended this year to make the provisions apply to any person not a member of a corporation of engineers.

This Act creates practically a close corporation, but the mining engineer is not specifically designated, and the terms of the definition are loose. As far as can be learned the Act is not enforced.

A little over a year ago the Engineering Institute of Canada called a Committee together in Montreal representing each of the provinces to prepare a bill which might be used as basis of legislation in each province and thereby secure some degree of uniformity. The Committee reported and a model act was published in the E. I. C. Journal.

MR. T. W. GIBSON,  
Deputy Minister of Mines, Ontario.

In Ontario the bill has received earnest and full consideration by the E. I. C. members in Ontario. So far as the C. M. I. is concerned the bill has been discussed by individual members and some of the branches have objected to certain of its provisions. As yet, however, the C. M. I., as a whole, has not decided on any policy in the matter nor has it, so far as the ordinary member knows even considered it at all.

The Joint Committee of Technical Organizations in Ontario has also submitted a model bill, which is a distinctly popular bill, inasmuch, as it suggests the governance of the different branches of engineers under a board of engineers of each class, the whole being under a government department. In this respect the bill is different to the plan of the E. I. C. model, which is more properly of the close corporation type.

A Committee consisting of two representatives from each of the professional organizations in Ontario, namely, the E. I. C., C. M. I., and the organizations of the architects mechanical and chemical engineers, is to convene in Toronto next week to consider the question of engineering legislation.

A study of professional organizations has been made by Sydney & Beatrice Webb, and printed in the Engineering News Record, which shows variations in them ranging from a typical trades union organization to the type that considers only the ethical side of the professions.

This Report makes some definite recommendations, namely:

a. It is undesirable that the government of a profession should be exclusively and autocratically by a lay authority.

With all this we shall agree.

b. It is undesirable to give to professional organizations undivided control over the conditions of entry to the profession, powers of expulsion, etc. What is required is a composite authority.

This Report does not offer any complete solution of the problem, but says finally:

"The only inference we can draw is that the constitution of any professional council, whether statutory or voluntary must necessarily be complicated, ought always to be elastic, and will need to be perpetually revised."

Some general facts to bear in mind are:

Engineers include employing engineers and employed engineers, whose views are unlikely to coincide.

In all professional organizations there are groups of older men, ranking high in the profession, and younger men, who may be called the rank and file. Differences of opinion arise here.

There is a tendency in professional organizations to develop groups having special interests and at a certain stage to split up into separate organizations, possibly leading to disintegration of the parent body.

Is legislation for the engineer to be for self interest, or for service? Should our attitude be: "What is there in this for me?" or, "Will this be of public service?"

Having endeavoured to outline some phases of the question without having personal bias, Mr. McEvoy submitted his own views, as follows:

a. It is yet an open question whether or not we need any legislation for mining engineers. We must bear in mind that if we do not legislate for ourselves someone will legislate for us, unless we are perpetually armed against outside legislation.

b. That legislation which may be suitable for other branches of engineering may not, in fact is not, at all alike to satisfy the needs of the mining profession or the mining industry. Special provisions for the government of mining engineers is essential, whether this be afforded by special clauses in one all-embracing Act, or by means of a separate ancillary Act.

Third: There is grave danger to the mining industry if legislation of too exclusive a character is enacted. It ought to be freely admitted that the owner of a property can engage any one he likes to tell him what he thinks of it, and how it should be worked. If the foreign capitalist cannot freely send his own man in whose judgment he has confidence to advise him about investment, then without doubt the development of our resources will suffer.

Fourth: That not only for the good to the public, but also for the welfare of the members of the profession itself, it is not desirable to have the profession a close corporation. This may appear to be a debatable point, but while I am open to conviction it is the opinion I now hold after a good deal of thought on the subject.

Fifth: That the Administration or Government of the profession should be carried out with the assistance and advice of members of good standing.

Sixth: It is very doubtful whether in any legislative Act a satisfactory definition exists of what work is legally termed mining, engineering.

In conclusion, Mr. McEvoy said the Engineering Institute of Canada had a definite policy regarding legislation. The unwritten policy of the C.M.I., he gathered, was against legislation. He thought the opinion of the individual members should be expressed, and suggested the appointment of a committee of the Institute, representing all provinces, charged with the duty of following the question to a finality, so that the attitude of the Institute towards legislation could be defined.

The President stated that a Committee had been during the year appointed by the Council to scrutinise all legislation affecting the status of the engineer, and vested with authority to notify any persons moving to effect close corporation legislation that the Institute could not be a party to such legislation, and authority was also given to a member in each province to attend the Legislature to oppose any legislation in which the interests of the Canadian Mining Institute had not been considered.

Professor Haultain said that if he had understood Mr. McEvoy to state that the E. I. C. had appointed a Committee with authority to seek legislation defining the legal status of engineers, Mr. McEvoy was wrongly informed. Apparently Mr. McEvoy's point was that the E. I. C. had a definite policy towards legislation, but the C. M. I. had not yet defined its point of view.

Lunch time had been reached, and unfortunately no discussion of Mr. McEvoy's pro and con recapitulation of the subject followed. The matter was not again reached during the continuance of the meeting, but it is to be hoped that the publication of Mr. McEvoy's paper in the Bulletin will lead to steps being taken to define the feeling of the members either for or against legislative enactments defining the status of the engineer.

MR. JAMES MC.EVOY.  
Toronto.

AFTERNOON SESSION, MONDAY 8th.

Mr. C. E. C. Smith in the Chair.

Reports of Committees.

**Committee on Education.** Dr. W. L. Goodwin reported progress by the Committee on Education appointed two years ago by the Institute. He was present at the Winnipeg Conference on Education (see C. M. J. issue Aug. 6th 1919, page 581), and the fact that the recommendations which the Committee had previously formulated were identical with the recommendations decided upon by this great conference was a compliment to the idealism of Mr. Corless who first brought this matter to the attention of the Institute, and an indication that we were in the van of progress. Dr. Goodwin asked that his remarks be taken as a report of progress, and moved that the Committee be continued for another year, which was agreed to.

A number of papers of interest to the Iron and Steel Section had been arranged for, but unfortunately none of them were given at the meeting. Mr. G. C. Mackenzie's paper on "Ferro-Alloys in Canada," was looked forward to, but at the last moment Mr. Mackenzie was unable to get to Toronto. Two papers on the Plate Mill of the Dominion Iron and Steel Company at Sidney were in course of preparation, but were not finished in time for presentation. It is expected these papers will be read at the Annual Meeting of the Mining Society of Nova Scotia at Glace Bay in May next, and will appear duly in the Transactions of the Institute. Mr. F. E. Lucas's paper is also expected at the Glace Bay Meeting, and deals with "Economies in Steel Plants".

MR. CYRIL KNIGHT, Toronto.  
To whose work as Local Secretary much of the success of the Meeting was due.

Molybdenite in the Ottawa Valley.

Dr. M. E. Wilson described with the aid of lantern slides the occurrences of molybdenite in the Ottawa Valley. From an economic point the work so far done, and the extent of the deposits as revealed by actual mining, show that there would be steady work for a number of mills for many years should the market price of the mineral allow profitable operation of the known deposits.

The Iron Ranges of the Michipicoten District, Ont.

Mr. W. H. Collins, of the Geological Survey, spoke on the iron ranges, and gold occurrences of the Michipicoten District and the vicinity of Goudreau. An abstract of Mr. Collin's report on the work done by the Survey in this region was contained in the "Journal" of 25th February (see page 156).

The most interesting portion of Mr. Collin's remarks was his description of the attempt made to establish a definite stratigraphic succession within the Keewatin complex of the rocks immediately associated with the iron ranges. The general succession of basic volcanics, banded silica, pyrite, siderite and acid tuffs, in the order given was found to apply to the Michipicoten District. If the top and bottom of the known ranges could be determined, then this succession could be used to guide with some accuracy the course of future exploration.

The faults encountered had a tendency which in nine cases out of ten was to the left, and displacements of 6,000 feet of horizontal throw were frequent.

With regard to the Houldsworth pyrite deposit, about 900,000 tons of high grade pyrite were under development, and Mr. Collins suggested the possibility of further deposits of this kind being discovered.

Dr. Goodwin mentioned that in 1912 he was summering in the Magpie District, and had at that time noticed the difference of texture on the rocks on the upper and lower contact of the iron formation, and was able to confirm from his recollection some of the features brought out by Mr. Collins.

In answer to Mr. Bradley Stoughton, who asked whether the ore could be used without concentration Mr. Collins said that Mr. Cowie of the Algoma Steel Corporation was present, and could give exact information. The siderite runs about 35 per cent iron, and by roasting it can be raised to 51 per cent iron. The ore is almost self-fluxing.

Mr. Cowie said that after driving off the sulphur, the roasted ore contained from 50 to 52 per cent iron, and the manganese content was increased up to as high as 3 per cent. At the Helen Mine, there was an immense deposit and the next generation would still be mining siderite. There was 150 million tons, and all that was required was a bounty to enable it to be opened up.

Work of Mining Organizations in the United States.

Major Percy Barbour, Assistant Secretary of the A. I. M. & M. E. said that during 1919 the American Institute had done a great deal of work of a non-technical character, but no really outstanding mining undertaking had been in progress during that year. The feature of the year had been the activity of the Institute in important public matters, and the Charter of the Institute had been amended to permit of this being done.

The year began with strikes. The mining executive's work had been increased, but the results had been disappointing because of the lessened production and general inefficiency, and he had not been given credit for his greater responsibility and increased worries.

He described how at the Miami Copper Company the industrial troubles had been straightened out by bringing in the workmen and mine foremen into consultation.

The return of the soldiers had presented a great problem, and the four national technical societies had co-operated with great success in solving the problem. Twenty thousand engineers has been put into touch with positions in 1919.

The interest of the mining industry had been watched in connection with such matters as the Mineral Relief Act and mines taxation. In connection with taxation the Institute had assisted the U. S. Government by request.

With regard to the licensing of engineers, Mr. Barbour said the mining engineers did not care whether civil engineers license themselves up the front and down the back, but they ask to be let alone. There were 48 states in the Union, and if a consulting mining engineer had to take out a license in each state, and conform with as many different notions of what constituted the status of the engineer, they might as

well go out of the business. Examples of freak legislation were Oregon and Colorado, but the representations of the A. M. I. E. had been successful in opposition. The whole business originated in a difference of opinion between the structural engineers and the architects.

In connection with relief to gold miners, much had been said and written, but nothing accomplished. Most people who had tackled the problem forget that the law of supply and demand is about as immutable as the law of gravitation.

Mr. Corless's paper on "Industrial Democracy and Education" had attracted a great deal of attention, and there had been a widespread demand for copies of the paper. It was a classic. For the first time, the mining engineer has branched out and assumed an important place in literature. Mr. W. R. Ingall's paper in "Industrial Co-operation" has also been widely read.

In connection with the bituminous coal problem, the Institute had recently held an open forum, and good results were anticipated from the concentration of some of the best informed men in the country upon this important question.

In conclusion, Mr. Barbour said the selection of Herbert Hoover as President of the Institute had aroused great hopes for the future.

MR. C. V. CORLESS.

MR. J. L. AGNEW.  
Vice-President International Nickel Co.

## EVENING SESSION, Monday 8th

**The Creighton Mine of the International Nickel Company at Sudbury.**

In the evening, Mr. J. C. Nichols, General Superintendent of the Mining and Smelting Division of the International Nickel Company, described with the aid of the lantern the operations at the Creighton Mine, and at the Smelter at Copper Cliff. Unfortunately, owing to the use of the lantern it was not possible to make extended notes, but Mr. Nichols had an intensely interested audience. A notable feature was the description of the underground loading plant and crusher. The exposition of the mining system was very lucid, and an excellent idea was given by Mr. Nichols of the extent and shape of the ore body. All but about two percent of the ore was obtained in the different stages of extraction. The hoist and underground loading arrangement, which ensured a steady and equable load for the skips, handled 2800 tons in eight hours. The arrangements for the comfort of the men underground included water-bubblers for drinking purposes, and appeared to be as complete as those on the surface. The "Journal" of February 13th contained a full description of the International Nickel Company's operations by Mr. W. L. Wotherpoon (see page 118), in which issue there is also contained a diagrammatic section of the Creighton Mine, and some views of the Port Colborne Refinery. Additional views are contained in this issue.

Mr. Nichols mentioned that at the smelter, pulverised coal had been used for nine years, without any trouble, notwithstanding that coal containing 13 per cent ash had been used.

**The Alfred Peat Bog.**

Mr. A. A. Cole, whose abilities as a photographer are well known, showed lantern slides and moving pictures of the Alfred Peat Bog, and synthesised the work accomplished by the Peat Committee, which included Messrs. R. A. Ross of Montreal and B. F. Haanel of Ottawa, on behalf of the Federal Government, and Messrs. R. C. Harris of Toronto, and Mr. Cole, representing the Ontario Government, assisted by Mr. E. V. Moore of Montreal who acted as Engineer to the Committee. The process adopted consists of excavation, maceration and spreading. Maceration appears to contain the solution of the problem, and the

Waiting at the Collar of the Creighton Shaft.

final product, after drying and curing in the sun, contains 25 per cent moisture.

The Anrep Plant, which includes an excavator, mounted on caterpillars, a macerator and spreader, was first experimented with, and later a modification of this equipment, with which the name of Mr. Moore is coupled, was evolved. This plant is identical with the Anrep Plant, except in the spreading process. The mechanical processes have been further perfected in the Moore Plant which requires only seven men to operate it, against 13 to 15 in the original Anrep design.

The work done has been on the Alfred Bog between Ottawa and Montreal. The season has a length of from 100 to 120 days. Peat is being sold f.o.b. cars Alfred Station at \$3.50 per ton, which allows for the reasonable commercial profit, after deduction of 10 per cent

depreciation and an 10 per cent amortization allowance.

Mr. Cole states: "A ready market is obtainable in Ottawa and Montreal for the product of many such machines as those built for the Peat Committee. It is not supposed that peat fuel will entirely replace coal, even where most plentiful but for certain special uses it has advantages over coal and if used for these purposes will materially help the fuel situation.

Peat can be used to advantage for open grates and in cooking ranges but is not recommended for furnace use except in the fall and spring when light fires are needed or in conjunction with coal when a coal fire has to be hurried.

The programme laid out for the coming season is to work both plants to capacity marketing the product and showing thereby what can be done on a commercial basis. It is also proposed to test out a small three man machine which is now being built and which we hope will make available a great many small bogs of comparatively shallow depth throughout Ontario and Quebec that would be too small to endeavour to work with the larger machines.

It will be gathered that Mr. Cole's communication is of a most important character, indeed, one of the most important and far-reaching of recent meetings.

MR. A. A. COLE.  
A Past President.

Mr. R. C. Wallace, who was to have presented some aspects of the mining situation in the middle West, was unable to be present, a fact that was much regretted, as the members would have liked to hear something about the new discoveries in Northern Manitoba.

After Mr. Cole had spoken the members called it a day, and some did not.

Mention should not be omitted of the Ladies' Tea and Reception in the Hotel in the afternoon. There was then observable that social distinction and bearing, and that *joie de vivre* that sits so gracefully upon certain of our members. The attendance at this function greatly exceeded the attendance at any other event during the meeting.

TUESDAY MORNING, 9th MARCH.

Chairman, Mr. O. E. S. Whiteside.

Formation of Proposed Coal Section.

This question was laid over for further consideration by the incoming Council.

In the absence of Mr. J. T. Stirling, a paper on "Coal Mining Industry in the Province of Alberta" was summarised by Mr. McEvoy.

The main points in Mr. Stirling's paper were as follows:

The coal deposits of Alberta are conservatively estimated to contain 1,059,976 million tons. The existing mines have a producing capacity which is twice the present coal requirements of the district they serve.

The growth of the coal production of the West is shown by the following figures of production:

	Tons.
Total North West Territories, 1901.....	346,649
Alberta, only, 1918 .....	6,148,620
Alberta, only, 1919 .....	5,022,412

In 1919, there was imported from the United States into Canada, into territory which should undoubtedly be supplied with Canadian-mined coal, a tonnage of 2½ million tons.

The possible present market for coal in Alberta and Saskatchewan is from 7,500,000 to 8,000,000 tons per year.

In December 1919, Alberta alone produced 780,832 tons, so that an output of 9,000,000 tons of coal per year is possible in Alberta with the present supply of labour and the existing mine development.

The prejudice against the use of Canadian coal is disappearing, and in a few years the western mines will supply the territory as far east as Fort William.

To hold the Canadian market proper attention must be paid to preparation. Dirty coal must be avoided. Low grades coals have been sent for long distances incurring heavy freight charges, which is not advisable, and arrangements should be made to give the customer authentic information as to quality and moisture content so that the distances to which coal is forwarded may answer to some extent to its quality.

The following figures show the difference between costs of production under conditions of maximum output in months of good demand, and insufficient demand in Spring and Summer.

	Tons mined	Cost	Being
		per ton	
Year 1919 .....	2,395,290	\$6,126,120	\$2.55
December, 1919 .....	451,016	1,031,112	2.28
April 1919 .....	85,478	308,025	3.60

The intermittent operation of collieries increases costs, and the mines must operate more steadily, or, in other words, the market must be enlarged, or the production must be reduced to fit the market.

The average annual production per mine during 1918 in Alberta, compared with British Columbia and Nova Scotia is given below:

	Tons.
British Columbia .....	92,106
Nova Scotia .....	89,516
Alberta .....	19,936

In Alberta under existing conditions, five times as many plants, offices, and staffs of officials are required for the same production as in the other coal-mining provinces.

Since 1905 there have been opened in Alberta 600 mines, of which only 276 are in operation, meaning that 324 mines, or 64 per cent of the mines, have been abandoned.

During this same period 100,448,038 tons of coal in the ground were affected by mining operations, of which, 47,227,498 tons is estimated to have been extracted, leaving 53,356,540 tons developed, probably not more than half is recoverable. This indicates a loss of coal through improper mining of 26,629,000 tons in less than 15 years.

Since 1903 there has been expended in mining \$39,110,775 of which \$9,813,500 tons, or twenty-six per cent has been invested in mines completely abandoned.

Of 324 mines abandoned since 1905, only three were so abandoned because the available coal had been extracted.

We may look forward to the time when Canadian mines will supply all the fuel required in Alberta, Saskatchewan and Manitoba.

### Canada's Coal Supply.

Following Mr. Sterling's paper, Mr. F. W. Gray read a paper on "Canada's Coal Supply", which will be found elsewhere in this issue.

### Lignite in Saskatchewan.

Mr. A. Mc Lean, assisted by lantern slides, described the occurrence and mining of lignites in the district around Estevan, Bienfait and Roche Percee. (See the Geological Survey Report on the Wood Mountain, Wil-low Bunch areas). Mr. Mc. Lean showed some very nice slides descriptive of the difficulty of determining the horizons in this district. Only comparatively few of the seams have as yet been worked.

Mr. Mc. Lean specially described the mine of the Western Dominion Coleries at Taylorton. This is a shaft mine, with modern equipment, including self-dumping cages, trolley haulages underground, and electric coal-cutters, making a six foot cut. No gas is found in this mine, or generally in the district. Reference was made by a speaker to the unsuitability of box-car loaders of the loading-arm type for the friable lignite, and mentioned that loaders of the cradle type had been found more suitable. The lignite production in 1919 was about 250,000 tons, and in view of the large amount of lignite available for mining, compared with the coal requirements of Saskatchewan, which are approximately 1,500,000 tons annually, it will be seen that a large market is available for the lignites, particularly if a successful briquetting industry is established.

### Principles and Practice of Fuel Briquetting.

Mr. Edgar Stansfield, of the Mines Branch at Ottawa, opportunely followed Mr. Mc. Lean's paper by one of the most lucid and comprehensive accounts of the present attainments of the fuel briquetting industry ever given to the Institute.

Mr. Stansfield said that with other gentlemen appointed for the purpose he had visited numerous briquetting plants both in the United States and Europe, and had had many interesting experiences seeing that the work of visiting was commenced on November 11th 1918.

Generally speaking, Mr. Stansfield thought that the failures experienced in briquetting trials in this country had been due to attempting to transplant European methods without regard to the essential differences and the economic factors. There is no royal road to briquetting, and the perfect briquette has not yet been attained. Many difficulties still remain to be overcome, and Mr. Stansfield said the problem involved an infinite number of variables.

Some of the main facts brought out by Mr. Stansfield are as follows:

There are two general types of briquetting plants, namely, those using a hard binder, and those using a liquid or molten binder.

European briquets are of all sizes, up to briquets that are a comfortable load for one man. American briquets have a maximum weight of probably 13 to 14 ozs., and are generally much smaller. The industry now growing up on this side the water is an American industry.

Desirable characteristics of a briquet should include suitable size without friable corners, should be strong and clean to handle, weather-proof and not affected by rain or frost, not unduly soft in the heat of the sun, and should be good fuel.

As an instance of the small things that influenced briquet making, Mr. Stansfield mentioned a case which occurred in the trials at Ottawa, where one binder had been tried with many failures, but on one occasion a perfectly suitable binder had been made. The raw materials and proportions of this binder were known, but it had not been found possible to repeat the successful result.

With regard to the raw materials used in briquetting, anthracite was the best known example. A large quantity of fines was made in preparing anthracite for market.

It was not usually found necessary to briquet bituminous coal.

Lignite required carbonizing before briquetting, and samples of lignite briquets were displayed by the speaker.

There had been many attempts to briquet coke breeze, and it was usually mixed with bituminous coal. Coke breeze was an abrasive and wore down the briquetting machines rapidly. Charcoal had also been briquetted.

The nature of the material to be briquetted made a great difference to the process. For example, the briquetting of anthracite meant the consolidation of a number of particles of a hard and solid material, but coke was porous, not strong in structure, and drunk up the binder greedily.

### Binders.

The number of binders is legion, but the number actually employed is small. Asphalt from oil refineries, and coal tar as among the best materials. Sulphide pitch is a nice binder, but is not cheap, as it contains much water which must be removed, and is of course not a waterproof binder. It must be baked to make it waterproof.

The admixture of a dry binder with the crushed coal is good practice, but when coal comes hot from the carbonizer it is difficult to mix a dry binder that softens with heat.

The speaker said he had concluded from his observations that briquetting was an infant industry, and is not yet standardized as to practice.

The carbo-coal briquet is a good one, but the process of manufacture is quite complicated. Bituminous coal is mainly used, and the object is to get a large yield of tar oils. The coal is carbonized at a low temperature. The coke resulting is mixed with the pitch obtained at a later stage in the process. The briquets are then baked in an oven at a temperature corresponding to the nature of the use to which the briquets are to be put. This makes a very pretty dense briquet, which is a smokeless fuel. The people who make this briquet have a large experimental plant at Irvington, N. J., and one at Clinchfield. Referring to Mr. Gray's paper, a plant of this description at Montreal, treating Nova Scotia coal would give us a fine home-made substitute for anthracite.

### Types of Plants Now Working.

Plants at or near coal mines, owned by the coal operators. Plants between the mine and the shipping point. The coal comes from the mine and is screened. Screenings are briquetted. Plants at or near mines, operated by interests independent of the mines, and buying for briquetting purposes the coal from a number of mines. In one case of this kind, washery refuse is sent down by flumes to a briquetting plant. It is hoped that such a central plant of this kind will include the plant of the Lignite Briquetting Company at Edmonton. Another type of plant is found at points of transshipment, where coal is screened. A plant of this kind is a possibility in Canada, should the system of storing anthracite suggested in Mr. Gray's paper be adopted. The fines screened out of transhipped coal, which has already been screened at the mine contains a much smaller percentage of ash than the mine screenings. Screenings from screened lump coal will average about 20 per cent less ash than the mine screenings.

Mr. Payne, of the American Mining Congress, advised the thorough going utilisation of low grade fuels. He mentioned the discussion at the A. M. I. E. meeting in Chicago last September, when the suitability of coals containing more sulphur than it has been customary to specify for gas coals was pointed out. Their utilisation is only a question of additional purifying capacity at the gas-plants.

The morning session was ended, as the time had expired, and the further reading and discussion of the papers on fuel was left until the afternoon.

**Complimentary Luncheon by the City of Toronto.**

At the noon hour the Institute members were the guests of the Mayor and the City Corporation of Toronto. The Mayor asked the consideration of the mining industry in affording all possible employment for returned soldiers, and gave particulars of the fine record of enlistments held by Toronto. Speeches were made by Dean Adams of Mc.Gill University, by Mr. Bradley Stoughton, Secretary of the American Institute, and by the President. Mr. Stoughton amusingly contrasted the summerlike aspect of Toronto with the sub-Arctic condition of New York and Boston. He congratulated Toronto on its Mayor and feelingly deplored the lack of a similarly good man in other cities. He mentioned the over-shadowing calamity occasioned by the 18th Amendment to the U. S. Constitution, and said that in New York they used to have both optimists and pessimists, but now only optimists were left. "The pessimists are dead."

The President thanked the Mayor for the especial manner in which the Institute had been marked out for distinction in Toronto, which he said had been so unusual as almost to embarrass the individual members, who felt, however, that the compliment paid was to the responsible status reached by the Institute as the spokesman and representative of the mining and metallurgical industries of Canada.

DEAN F. A. ADAMS.  
McGill University.

**AFTERNOON SESSION, 9th MARCH, 1920.**

Mr. M. A. Mc. Innis, of the Lackawana & Mc.Crory Coal Company, Montreal, and formerly a Superintendent of the Dominion Coal Company in Cape Breton, gave a paper on:

**Coal Transportation.**

An abstract of this paper is as follows:

At our present rate of importation of anthracite and bituminous coal from the United States totalling 22,000,000 tons annually, or 60,000 tons daily, we shall have from time to time to deal with abnormal conditions, and for these, and for the ordinary increase in population and consequent increased coal consumption, we should be prepared.

In 1919 Canada consumed 35,000,000 tons of coal, or about 4½ tons per capita. When our population reaches 10,000,000, which may be expected by about 1925, consumption will have increased by 9,000,000 tons, to a total of 44,000,000 tons., which, unless our home production can be increased in the meantime, means that by 1925 we shall have to import 27,000,000 tons, or 74,000 tons daily. Of our total imports 42 per cent is water-borne, 46 per cent rail-borne, and 12 per cent comes by car-ferries.

For handling our water traffic we have at present available the following plants:

Plants	Discharging	
	Storage Capacity	Rate Per Hour
On St. Lawrence River.....	44	1,750,000 7,800
On Lake Ontario.....	9	29,000 240
Lake Erie .....	3	5,500 300
Huron and Georgian Bay.....	52	815,000 4,800
Superior .....	11	2,800,000 3,600
Sault Ste. Marie.....	4	715,000 1,400
		<hr/>
		6,114,500 18,140

The 12 per cent of the imports handled by ferries to two points on Lake Ontario and four on Lake Erie amounts to about 2,600,000 tons yearly.

British Columbia, Saskatchewan and Alberta do not need to import fuel, and the matter of transportation in these three provinces need not concern us.

In Manitoba, although about 1,500 miles distant from the mines, the water haul of 800 miles with a low freight rate keeps the price of coal in Winnipeg within \$1.50 per ton of the price in Quebec and Ontario.

Our greatest difficulty in importing coal by rail occurs at what is known as the Niagara Gateway. Canadian roads at this point are unable to accept freight at the speed and in the quantity offered by the American roads. Ontario points must take more coal by water, and adequate unloading and storage facilities must be developed to allow this to be done.

Importation of coal into Eastern Ontario and Quebec has but seasonable difficulties. Ample transportation facilities exist for the importation of both American and Nova Scotia coal into this territory.

The Maritime Provinces have no difficulty in providing themselves with coal.

The coal trade of Nova Scotia advanced in the early nineties in exact proportion as the transportation facilities of the St. Lawrence improved. With steamers of 30 ft. draft and 10,000 tons capacity coal could be landed in Montreal for 50 cents a ton freight. As the transportation and handling facilities were improved the coal importations from Nova Scotia to St. Lawrence ports improved. The market was there in every case, and the coal was in Nova Scotia. **Transportation was the weak link in the chain.**

Storage of coal in the Summer months has in the case of anthracite been assisted by the differential price between Summer purchases and Winter purchases, and the application of this principle to bituminous coal is urged.

Store coal early in different parts of the country, and it will diminish to a large extent the danger of coal famine, will avoid high prices caused by shortage, and, without laying an extra mile of track, it will increase the effectiveness of our existing transportation systems by giving them the bulk of coal to be carried when it can best be handled. The maximum service from coal cars will also be thus obtained, as they can be unloaded more quickly in Summer, and the tying up of railway yards and junctions by congestion of unloaded cars would be avoided.

No discussion followed the reading of Mr. McInnis's paper, which perhaps is explainable by the fact that most of the members interested in coal matters had been called to a meeting of the Sub-Committee on Mining and Metallurgy by the Hon. Advisory Council. There has rarely been presented to the Institute such a symposium of papers on the coal problem as those which were concluded by the reading of Mr. McInnis's paper. These papers covered adequately the production of coal in the eastern and western mines of Canada, the use of the Saskatchewan lignites, the briquetting of coal and lignites, the national aspect of the subject and the transportation questions. Those who arranged this symposium anticipated a real discussion, such as was held in New York recently, and actually there was not a peep out of anyone. This circumstance cannot be regarded as less than disappointing.

#### Oil Papers.

Following the coal papers a number of papers were presented dealing with oil in Canada.

Dr. M. Y. Williams spoke regarding the future prospects for oil and gas production in Ontario, and showed a number of lantern slides of Ontario oil wells. After describing the well-known fields in South-Western Ontario, Dr. Williams made reference to his preliminary investigations in the search for oil in the slope of the James Bay District, and showed photographs of the country. He stated that privately conducted

search for oil was being undertaken in this area. (A Report by Dr. Williams on the South-Western Oil Fields of Ontario will be found in the Summary Report of the Geological Survey for 1918, Part E.)

Mr. Estlin's paper on Natural Gas in Ontario was not presented.

#### Oil Possibilities in Western Canada.

Dr. Dowling spoke on the above subject, illustrating his remarks by a series of coloured and relief lantern slides of much excellence. The "Canadian Mining Journal" hopes to have an opportunity of publishing Dr. Dowling's paper, as it is one which not only contains excellent information, but presents it in a lucid and understandable form. Dr. Dowling stated that oil was a result of low forms of marine life. It is found in rocks of older age in which the remains of life are not so discernible or traceable, but it is found in greater quantity in those later rocks in which we find more evident and numerous traces of life, particularly in rocks of Tertiary Age, which, Dr. Dowling suggested would appear to indicate that life had been increasing in abundance upon the earth. By a process of elimination Dr. Dowling showed on coloured slides those portions of North America where oil might be found, distinguishing between the older and newer strata with which the presence of oil is associated.

Dr. Dowling mentioned how in the West many oil wells had been spoiled by salt water by being bored through a strata which contained a moderate supply of oil, in the unrealized hope that deeper boring might produce a greater flow of oil. He suggested that some one well should be chosen to treat the presence of the deeper seated oil horizon, and that it was a pity to spoil a lot of wells now assured of a moderate supply.

Mr. A. P. Rowe, in discussing Dr. Williams's paper, said that so far as the evidence shown by the drill went it had showed the presence of oil in synclines.

Mr. Louis Simpson of Ottawa thought the Institute should press for the exemption of oil-drilling machinery from customs duties.

Mr. Gibson, who was in the Chair, said it was a pity Mr. Eugene Coste was not present as he was interested in the possibility which had been suggested of oil coming from pre-Cambrian sources. The reference was to an occurrence of oil in Southern Alberta, near the Rockies, where pre-Cambrian rocks have apparently been pushed over newer formations. Oil has been obtained from cracks in the pre-Cambrian rocks under these conditions.

This ended the proceedings on Tuesday afternoon.

#### THE SMOKER.

The smoker is best described as a "peach". The battery-commander was Lieut.-Col. Penhale, and when he called "Fire" his guns roared. A gentleman with a pleasingly rotund voice had reached the culminating point of "The Bandelero" when there was a regular movie smash of dishes and plates, and two colliding waiters were apparently thirsting for each other's blood. The audience was quite thoroly fooled, and not until the ring shoes and gloves were noticed did the spectators realise that the "Penhale has been up to one of his tricks". The mill was a good one, and singular-

MR. D. B. DOWLING.  
A Past President of the Institute.

ly enough no one remembered the singer until next morning. Eddie Holland was the raconteur of the evening, and gave a performance that was at once *amusant et risqué*. One of the most pleasing numbers was the rendition of the "Marsellaise" by Mr. Denis, who covered himself with glory. In other phrase, "he done fine". The singing-sheet was good, and the enthusiasm of the singing-leader was so infectious that even Presbyterians were noticed yodelling.

Mention must not be omitted of the pianoforte solos by the Chairman's charming daughter.

#### WEDNESDAY MORNING, MARCH 10th, 1920.

The opening session of the last day of the meeting commenced with the reading of a short paper by Mr. G. R. Mickle, of the Provincial Mines Office, entitled "Expectations", which had been announced as the mystery paper of the meeting.

Mr. Mickle spoke of the two periods of mining development, namely, that of reaping and that of sowing, or the period of putting money into development, and the period of taking profit-yielding minerals out. He showed the curve of probability in each period, and instances in illustration the mines of Cobalt, now in the productive stage, and the mines of Porcupine, still in the development, or the "expectation" stage.

Following Mr. Mickle, Mr. J. A. Campbell, M.P. spoke at some length regarding the Government's attitude towards mining development.

Mr. Campbell's remarks chiefly had reference to conditions in Northern Manitoba. He gave an interesting account of the promising mines in Northern Manitoba, and explained the dire need of that district for railway communication. He referred to the extraordinary richness of the Mandy copper deposit, and its ability to stand the transportation and re-shipments charges to Trail B. C. for treatment. Mr. Campbell also spoke of the Flin-Flon mine, and indicated the probability of its sale to interests that would energetically develop the deposit, and would erect a smelter that would serve other mines in the district and generally help development.

The speaker dealt at length with the necessity to abolish the dual control of natural resources that now obtains in the Western Provinces. There should either be definitely vested in the provinces or in the federal government. The present uncertainty was hindering development.

Dr. J. B. Porter of Mc.Gill University reported progress made by the Committee on Engineering Standardization, with especial reference to standardization in the mining industry. He asked for assistance in the Committee's work, and asked that members would communicate with him if they had any suggestions to bring about more complete standardization.

Mr. W. S. Landis read a paper on Canadian Cyanide, its Manufacture and Utilization.

Mr. Landis said that in the Autumn of 1916 the cyanide situation became so acute that a large mining corporation with headquarters in the United States interested the American Cyanamid Company in undertaking serious development work at the Cyanamid Plant at Niagara Falls, Canada, with the object of developing a process of producing cyanide from cyanamid. No operating plants or processes were found to exist that could be given consideration, and they were forced to commence at the fundamentals of the process. Plans were completed for the experimental installation at Niagara Falls, Canada, and the first units were put into operation about 1st January 1917.

Extensive tests of the Aero Brand cyanide were made in Mexico, and recoveries were found to be equal to those obtained from 98 per cent sodium cyanide. The brand had been in extended use in the silver districts of Ontario, with very successful results.

Mr. Landis said that today Canada possesses a cyanide manufacturing industry which within three years has so grown and expanded that it is supplying the bulk of the cyanide consumed in the mining and fumigating industries of the United States, and will shortly lead in the Canadian and Mexican fields. The proximity of the Ontario fields to the point of manufacture gives a favorable delivery service, and the Company confidently look forward to their brand of cyanide replacing the previously used and more expensive high-grade material.

Present Method of Teaming Mine Supplies in Northern Manitoba.

MR. G. C. BATEMAN.  
Who announced the coming development of the Flin-Flon Mine.

WEDNESDAY AFTERNOON, MARCH, 9th.

### Quebec Asbestos Deposits.

Dr. Harvie, of the Geological Survey, described the geological characteristics of the Quebec asbestos occurrences. Mr. Theo. Denis and Capt. J. C. Ross discussed the probable depth of these deposits, and urged the speedy publication of Dr. Harvie's Report.

### Nickel Coinage.

Mr. MacDonald of the International Nickel Company led the discussion on nickel coinage by a very convincing presentation of the physical and financial advantages that go with nickel coinage. Mr. MacDonald said the the press articles advocating nickel coinage in Canada had done so largely from the standpoint of national pride in our national metal, but while he did not minimise the usefulness of sentiment, he desired to set forth the very substantial advantages that nickel was intrinsically possessed of. The use of nickel in coinage dates back to 235 B.C. in Persia.

Following are some of the main points made by Mr. MacDonald:

Seventy-four countries have adopted some form of nickel coinage, and eleven countries have adopted pure nickel, namely, in the following order of date:

Switzerland, 1881; Austria, 1892; Italy, 1901; France, 1903; Serbia, 1906; Mexico, 1910.

Properties possessed by pure nickel are responsible for its constantly increasing use in coinage, among which may be named:

- a. Stability of value of the metal.
- b. Desirable appearance.
- c. Resistance to wear, corrosion and oxidation.
- d. Malleable and susceptible to the die.
- e. Difficult to counterfeit.

Mr. MacDonald compared the qualities of nickel with cupro-nickel and other alloys, with bronze and aluminum, and with silver for coins of low intrinsic value. Aluminum is too light. Cobalt is too hard. Nickel-copper, after use, assumes a greenish cast which is displeasing. Appearance of bronze coins becomes unattractive in use, and if used as tokens for coins of higher value can be easily counterfeited because of ease with which metal can be worked. The wear is also considerable, amounting to about one per cent per annum.

The speaker quoted a table of figures showing resistance to abrasion established through experiments by the Swiss Government, giving nickel by far and away the lead in all suitable coinage metals.

Mr. MacDonald strongly urged the adoption of a five cent coin in place of the small and inconvenient coin of silver now used, and suggested the replacing also of the ten cent silver coin by one of pure nickel. The nickel 5c coin would be same size as the present silver 10c coin, and the 10c coin would be the size of the present U. S. nickel.

The seignorage of the Government would in this event be in excess of \$500,000 per annum. If the present silver 5c coin was returned and nickel coinage substituted, the Government could recover silver which cost 70c an oz. and sell it at the present market rate. Should half the existing silver coinage represented by 5c and 10c pieces be so treated, a gain of one and one-third million dollars would result.

Mr. Corless, in response to an invitation by the Chairman to speak, said the matter had been entirely covered by Mr. MacDonald.

Dr. Coleman said he had advocated nickel coinage for many years, and would strongly support any move that the Institute could make to have nickel substituted for silver in our two smaller coins.

Mr. Gibson said it was expedient and advisable for the Canadian Mining Institute to make some active move to assist the Government in its consideration of this question. Sentiment was not a negligible thing in national life, and he thought that the minting of nickel coin would strike a responsive note of pride through-

out the country. The 5c. coin is entirely too small, and utterly inconvenient to handle, as those who had seen a lady fumbling in her purse with gloved hands for a 5c. piece on a cold day could realise. The coin should be of pure nickel. Nickel alloy becomes greasy and malodorous. To test this question, Mr. Gibson said he had for many years carried a few pure nickel and nickel alloy coins in his pocket. The nickel coins were as bright and attractive as when newly minted. The nickel alloy coins were dull and unsightly. He urged the passing of a resolution asking for pure nickel 5c and 10c coins.

Dr. Miller (who was in the Chair) read from the Hansard some remarks of the Finance Minister who held office when the Canadian Mint was established in 1901, and at that time the adoption of a nickel coinage was urged. The Minister of Finance said: "To a certain extent this desire for nickel coinage has been the outcome of legitimate national pride. No doubt this feeling has influenced the establishment of the Mint". Dr. Miller said: "The case is proved. What shall we do about it?"

Mr. Gibson moved, and Mr. A. J. Young seconded the following motion:

"The Canadian Mining Institute desires to go on record, and would strongly recommend to the Dominion Government the advisability of introducing nickel coinage at the earliest possible date."

There was no dissent from the motion.

Mr. Macgregor said that a certain amount of educational work would be necessary, and that it was desirable that some member of the House would raise the question at this Session. He moved that "We request the Council to procure the assistance of some member of parliament to bring about a discussion on the question of nickel coinage at the present Session, and that the full powers be given to the Council to assist in any way possible. Dr. Porter seconded and the motion was carried. A further motion was made and adopted that a copy of Mr. MacDonald's paper would be forwarded to the Minister of Finance.

It may be mentioned that a very full exposition of the advisability of nickel coinage will be found in the description of the Mond Nickel Company's operations which was issued in 1918. This description contains reproductions of all the nickel coins in use throughout the world at that time.

### The Lost Placers of Ontario.

Dr. Coleman said he has advocated nickel coinage old papers he found a little vial, and remembered where it had come from, and that brought to his mind the question of placers.

Placer mining usually preceded quartz-mining, with the exception of the Klondyke. Two other exceptions were South Africa and Ontario, which had never had a placer stage. Why these two exceptions? The reason in the deep-seated and fine grained deposits of South Africa was obvious. Why had we not placers in Ontario, where the gold is found free?

A good many years ago a placer was discovered in Ontario. It was at Vermillion Lake. Dr. Coleman said he had got a hundred colours in the pan, and had found a nugget worth four cents. Where did the gold come from. He thought it came from the North because the glaciers came from there. Porcupine is now a very imposing region. We have had over \$100,000,000 of gold recovered or in sight. How much more was there originally? I think at least double that amount. We are half way down in the Archean at Porcupine. Thousands of feet of rock have been destroyed. How much above the present surface did these quartz veins extend? Maybe a

thousand feet. Were these upper veins as rich as those we know? Have we lost millions of gold by their destruction? Where did it go?

The highest point at which I got gold at Vermillion Lake was where the coarsest gold occurred, and it is 400 ft. above the present gold-bearing rocks of North Ontario. When did the weathering begin that set free the quartz deposits? Where did the rivers of that day flow? The placer deposits ought to be on the way to James Bay. About half of the Porcupine region is covered with drift, and as you go North the drift covers everything. There is a possibility of placers in the clay belt. There ought to be placers in the Paleozoic rocks of the Hudson Bay slopes. Is there any gold in the Cobalt conglomerates?

Mr. J. W. Evans said that in the old days when he prospected Vermillion they found that all the gold was in the first six inches of sand below the grass roots, and we wondered why. It was all in the red sand below the grass roots. No one went to bedrock.

Dr. Coleman did not think anyone ever went to bedrock.

Mr. Gibson asked why no suggestion was made of silver placers? Dr. Coleman said "Look for it under the clay."

DR. A. P. COLEMAN.

Dr. Miller said he once made an estimate of the erosion of Cobalt rocks, and said more had been eroded than since recovered.

In calling upon Major Mc. Millan to speak on this subject, Dr. Miller struck one of the key-notes of the meeting by referring to the number of members present who had been absent for the past four years. The presence of members returned safely from the war, and again busily occupied in mining work, gave to the Toronto meeting almost a sense of elation, and Dr. Miller's remark was audibly appreciated.

Major McMillan presented the changes in the mining camps as he was impressed by them after three and a half years absence on overseas service, and compared the conditions of 1914-15 with those of 1920.

Developments in Cobalt traceable to increase price of silver. Has been an endeavour to increase mill capacity as mill-heads have decreased in value. This has been secured by much coarser grinding by stamps and the addition of tube-mills for re-grinding. Another factor has been increased recovery due to flotation. A minor factor has been the enhanced value of cobalt residues, making it profitable to mine cobalt ores, and to introduce tables to recover the residues.

Previous to the war, mechanical concentration at Cobalt gave a 75 per cent recovery from 20 oz. silver ores. Tube-mill re-grinding and cyaniding recovered from 10 to 15 per cent additional. In 1915, cyaniding bid fair to replace straight concentration, but flotation process made great progress in the meantime, and today is in use at Cobalt in mills with a daily capacity of some 1,600 tons. Re-treatment plants have since become general.

Progress in concentration is exemplified by a comparison of practice at the Coniagas mill in 1914 with that in 1920, as outlined by Mr. Reid.

1914. Straight concentration. 60 stamp mill treated 180 tons a day of 20 oz. ore plus high grade. Stamps crushed to 14 mesh; sand and slime tailings went direct to waste from concentrating tables carrying 4 to 5 ozs. silver.

1920. Concentration and flotation. 60 stamps treat 300 tons a day of 10 oz. ore. No high grade. Crush in stamps to 3 mesh and as coarse as 2 mesh. Table this product and re-grind the coarser than 100 mesh material in tube mills preparatory to treatment by flotation. One oz. tailing to waste.

Increasing value of Cobalt ores in the past ten years is shown by the following table of the value in ozs. per ton of the McKinley-Darragh heads.

1910.....	47.0	1915.....	17.2
1911.....	39.7	1916.....	14.8
1912.....	32.7	1917.....	13.4
1913.....	31.0	1918.....	12.9
1914.....	17.2	1919.....	11.8

Change produced in Cobalt camp is remarkable. From a camp with stopes of narrowest possible dimensions on high-grade veins, it has become one with workings comparable in size with those of any precious metal mines. Several mines contain stopes 20 to 40 feet in width. In the Coniagas, where formerly the widest stope was 15 feet, there are now two with a width exceeding 60 feet.

Extensive exploration has taken place in all the mines and drilling practice is much improved by introduction of drills of the Leyner type.

A number of properties considered to be worked out have been acquired by companies owning the largest mills, and a singular feature of the sales instanced by Major McMillan was that "in every case where the properties have been sampled this has been done by the vendors in order to determine whether they should accept the price offered." Major McMillan's statement caused some amusement.

The increased cost of wages was referred to and instances given, and it was mentioned that as a result of this mechanical haulages had been introduced, and electric storage batteries of various makes are in use on tracks of ordinary mine gauge hauling 8 to 10 cars.

Major McMillan suggested that the progress of mining and metallurgical practice in this camp during the past ten years was worthy of compilation for permanent record.

Full particulars were given of changes in underground practice at the Hollinger Mine, and reference was made to the introduction of the Armstrong shovel underground. The best performance to date has been 100 tons with 4 men in attendance. Large pieces of rock in the muck cause trouble, and sometimes the machine lifts the light track and at other times refuses to lift the piece of rock. It is believed that this machine can however be modified to suit the conditions.

At the McIntyre Porcupine the main shaft has a depth of 1550 feet, and the ores have consistently improved in depth so far as development has been reached.

The production record of the Dome was referred to as being previously unattained in gold-mining in Canada, being 7 tons daily for each employee underground, and the milling of 3 tons daily per employee. The methods used to secure the Dome's results include, adequate shaft and haulage ways, box-hole chutes 6 ft. in width at the angle of running muck, say 33 degrees; the use of 4 ton cars, holding 85 c. ft. on all developed levels; haulage by electric storage-battery locomotives; ore passes to the eighth level where the primary crusher is situated, hoisting from ore-pockets by means of 4-ton skips working in balance, and haulage from surface.

bins to secondary crusher in 25-tons cars. Those who saw Mr. Nichol's description of the Creighton workings will recognize some similarity between the methods at that mine and at the Dome.

References were also made to the progress at Kirkland Lake, where in six mines some 300 men are employed, to Boston Creek, and to Gowganda silver mines. Major McMillan expressed some definite opinions as to mismanagement and waste of investors' funds which had come under his observation through the direction of affairs by unqualified persons.

At this point resolutions were passed thanking the Local Committee for its work; and also expressing the thanks of the Institute to the Ontario Government, to the Minister of Mines, and to the Mayor and City of Toronto. The ladies were also thanked for the arrangements made for the comfort and entertainment of the visiting ladies.

Prof. Haultain asked the loan of the lantern for a minute while he presented some "finished business", and displayed a cheque for \$25.00 signed by a well-known member of the Institute, which he observed did not bear the statutory affixation of a two-cent stamp.

The President announced the names of the officers for the ensuing year.

#### The Silver Islet Mine.

Mr. T. L. Tanton, in a brief but an absorbingly interesting address, described the history of the Silver

Islet Mine in Lake Superior, and showed photographs and a diagrammatic geological section of the locality. He pointed out that attention had been confined to the vein which yielded such phenomenal results on the Islet itself, and stated that another vein was recently discovered crossing, under water, the end of Burnt Island. He referred to the remarks of Sir, Wm. Logan many years ago, who had suggested search for mineral in the fractured zone. Mr. Tanton said that the prospecting which had been done on the land had not been directed by geological deduction, and suggested that attention should be directed to those points in the fractured zone on the mainland where the quartz veins intersected the dykes. He believed that mineralization was much more likely at these points than in the sediments which are included between the parallel dykes.

The concluding paper of the meeting was one by Mr. J. W. Evans who dealt at length with the minerals and producing mines of Eastern Ontario. Mr. Evans urged the payment of a bonus to enable the iron ores of the Marmora district, which are magnetites, to be developed by the electric furnace. He referred to the vanadium and other rare metal content of some of these ores.

The paper on "Mining Methods at Nipissing" by H. Park, Jr., was read by title.

This photograph was taken at a previous Institute Meeting in Montreal. Among those included in this group who took part in the Toronto Meeting will be noticed Messrs. McLeish, Gibson, Cole, McDougall, Adams, Goodwin, Tonge, Dresser etc. As Mr. Bradley Stoughton said at the Dinner, the Toronto gathering missed Mr. Dresser and Mr. Stevenson Brown, Mr. Hardman, and others of the "Old Guard."

#### THE ANNUAL DINNER.

The Annual Dinner was attended by the Lieutenant Governor of Ontario, by the Minister of Mines, and by representatives of sister societies and the Toronto Board of Trade. The most marked feature of the meeting was the amount of advice the Institute received. It was pointed, free and copious. The variety and vociferousness of the college yells kept the uninitiated hesitating as to whether the function was a poultry show or a boiler-shop. "Foghorn" MacDonald's rendition of "Drill ye carriers" had a delicious Hibernian savor, and was up to the standard of the Vancouver meeting, led by Major Brock. The Minister of Mines was in happy vein, and was duly received

into the bosom of the Institute. Mr. E. P. Mathewson discoursed on tittlebats and tittlemice, and grew eloquent on the distinction between tweedledum and tweedledee. His manner was of Pickwickian excellence, but it is to be doubted whether that genial gentleman could have excelled the gallinaceous arias that ever and anon escaped the throat of the gentleman who gave his name to "Matheson, Ont."

The retiring President announced the resignation of Mr. H. Mortimer Lamb, and took the opportunity to express his personal appreciation of the Secretary, and asked permission to voice what he believed to be a general opinion "that the present esteem in which the

"Institute is held, and the harmonious nature of its membership, is to a very large extent the result of Mr. Lamb's services."

Referring to Mr. Whiteside's incumbency, the retiring President bespoke the hearty support of the members. Mr. McDougall said that the new President represented that part of Canada which contains the largest coal reserve we have, which "is equivalent to saying that it will some day be the most important industrial and political factor in our national economy. The increased interest taken by the West in Institute affairs, is I believe, the best indication of our vitality and ability to read the signs of the times."

Mr. Bradley Stoughton, whose remarks are always anticipated by a pleased preliminary expression on the faces of the members, expressed his sorrow at Mr. Lamb's resignation and referred feelingly to their personal friendship.

Mr. Whiteside, the new President, spoke most appreciatively of Mr. Lamb, and asked the members to rise and drink his health, which was done with a will.

Mr. Marriott, representing the Toronto Board of Trade, said he knew there was money in mines, because he had put some in them, and referred to some nicely engraved stock certificates he was possessed of, some of which paid dividends, and some of which did not. The members responded with a ditty from the pen of a knight-errant, which intimated delicately, "the mines that make us happy, are the mines we sold to you."

## THE EXCURSION TO PORT COLBORNE.

Thursday, March 11th.

Notwithstanding that some members of the Institute felt like singing "We don't want to get up this morning," ninety of them were at the station at 8-10 a.m., to take advantage of the invitation extended by the International Nickel Co., to visit the Port Colborne Refinery.

The International Nickel Co. proved a generous host, providing the visitors with breakfast, lunch and dinner, for which purpose a regular Pullman diner was attached to the train.

The outward trip from Toronto occupied some three hours, and the return trip a little longer. The fun was unlimited, and there was leisure to observe that as yarners certain members of the C.M.I. have Boccaccio backed off the map, and are in fact the pink penultimate.

Arrived at the Refinery, the visitors were shown every part of the establishment, from the cupola house to the manufacture of nickel-shot. The arrangements for handling material are well-thought out. In the cupola-house the arrangement of the three large double-acting cranes is particularly interesting to observe, particularly in the changing of pots. The Cottrell House proved most interesting, notably the pyrotechnic effect of the rectifiers which are interposed between the d.c. motor-generator and the step-up terminals.

A full description of this refinery was written by Mr. Wotherspoon, of the International Nickel Company, and is reproduced in the 1919 Report of the Ontario Bureau of Mines, q.v.

On leaving the Refinery, Major Leonard expressed the thanks of the members to Mr. Miles and his assistants for their hospitality and the thorough manner in which the works had been shown and explained to the visitors. Mr. Miles in replying said the reason the Company had not previously given out its secrets was, as the visitors had been able to observe, because it did not have any.

Before leaving Port Colborne, the members also visited the works of the Canadian Furnace Company, and witnessed the tapping of a run of pig-iron. A description of this plant will be found in the February issue of "Iron and Steel of Canada". This blast furnace, which was blown in September 1913, has since steadily continued its annual output of 120,000 tons of foundry and malleable iron. The Port Colborne blast-furnace has one of the best and most consistent records of any in North America. The arrangements for unloading ore and coal, and for stocking are well laid out, and full advantage has been taken of the advantageous water-front location of the plant.

Mention was omitted in the account of Monday night's session of the moving pictures of the Cobalt silver-mining industry, taken at the instance of the Ontario Government. These pictures were excellent, but discerning observers may have noticed a timberman feverishly driving in a new cap over a timber of some antiquity, judging by the fungoid growth which covered it. One also admired the determination with which the movie man persisted in photographing the lighting of a series of fuses, until it occurred to one that possibly fuses they were, "and nothing more." It was noticed that Mr. H. Y. Russel showed no alarm.

MR. E. P. MATHEWSON.

# Canada's Coal Supply

By F. W. Gray.

The political division of North America, as it finally evolved from the conflict of races and the divergent search for an identical ideal by two branches of the English-speaking peoples, bore no considered relation to the balancing of the mineral resources of Canada and the United States; and, in so far as coal supply is concerned, the boundary line was fixed before the national importance of coal in peace and in war was realized, and in ignorance of the coal resources of what used to be known as the Far West, and is now known as the Canadian provinces of Alberta and British Columbia.

It no national issue has arisen, and North America has developed its resources as one nation, then in the East the coalfields of Nova Scotia would have supplied the Atlantic seaboard with bituminous coal; British Columbia and Alberta would have supplied the Pacific seaboard and the North Western States, and the central territories would be supplied entirely from the great central coalfield of Pennsylvania and the adjoining coal-yielding states.

This is the natural scheme of distribution. Under such circumstances, however, it is certain that the territory which is now included within our own borders would not have reached so advanced a development as is the case, as the independent impulse of our own nationality would have been absent in the North, and industry would have concentrated itself further south and nearer the great central coalfield. Also, it may be surmised, the coal production of Nova Scotia would have been upon a much larger scale than it is, while Sydney, Nova Scotia would have been of greater importance and Montreal of lesser importance than is the case today.

But the national issue did arise. Canada is a nation, so acclaimed and recognized in the councils of the world powers, and although the boundary line between ourselves and our good friends in the United States has certain disadvantages to ourselves, we must even make the best of accomplished facts.

## Canada's Coal Problem is Largely one of National Defence.

Our unevenly distributed and deficient coal resources, and to a large extent also their backward state of development, are a consequence of this country's determination to be a nation within the British Empire. We have desired national independence, and have achieved it, and as our coal problem is an outcome and a concomitant of this desire and achievement, it becomes a principal duty of Canadians to work for the solution of our most pressing internal problem—the country's coal supply.

It is necessary to state these dominating considerations in order to emphasize that our coal problem is not altogether economic or geographical, but is primarily associated with Canada's national independence

and defence. It is with this idea taking precedence of purely commercial considerations that this presentation of the question is submitted.

## Canada has no Anthracite.

North America is favoured above the nations of Europe in having a supply of anthracite, a most desirable fuel, more especially for congested centres of population, because of its smokeless character and greater heat value.

Unfortunately, Canada has no anthracite, so far as is known, with the exception of some anthracitic metamorphosed coals of relatively small tonnage in the West. Therefore, if we use anthracite it must be imported.

## Bituminous Coal is Already Sole Fuel Used in Large Tracts of Canada.

Large parts of Canada use bituminous coal and have never found it necessary to import anthracite. In many parts of Canada the burning of anthracite is not understood, and all grates and furnaces are adapted for the burning of bituminous coal. This being the case, and seeing that Europe gets along with bituminous coal, it can hardly be argued that anthracite is indispensable in those districts of Canada that can be supplied with bituminous coal from Canadian mines; and it follows that anthracite, under such circumstances, no matter how desirable, is a luxury.

## Anthracite a Rapidly Diminishing Commodity.

There is also the further consideration that men can always do without that which they cannot get, and anthracite will shortly be a luxury for the rich only, as it will steadily increase in cost as it decreases in quantity. Old anthracite mines are today being worked over for what was left by a more opulent generation, and anthracite seams of under two feet in thickness are being mined, facts which tell more eloquently than figures the impending scarcity of anthracite.

## Can Zones of Distribution of Canadian Bituminous Coal Cover Canada?

Assuming therefore that bituminous coal can entirely replace anthracite in Canada, we have only to consider over what extent the bituminous coals we have can be distributed, or, how we can extend the zones of distribution of Nova Scotia and Western coal so that they may approach, and if possible, meet.

So far as Canada west of Fort William is concerned it surely can be equally well supplied with bituminous coal from the western mines in Canada as with bituminous coal brought from Pennsylvania. Transportation distances do not enter into the question in the same grave manner as they effect Nova Scotia coal.

West of the longitude of Lake Superior, there is as much bituminous coal in the province of Alberta alone as in the remainder of the western half of North America.

Canada has not yet apprehended all the implications of the vast concentration of coal, and probably oil also, that exists in Alberta, and there is no compelling reason why the zone of distribution and use of Alberta bituminous coal should not be as extended as that of Penn-

\*A paper prepared for presentation at the Toronto Meeting of the Canadian Mining Institute, March 8-10th 1920.

sylvania and West Virginia. **West of Fort William, Canada is more than capable of providing itself with all possible requirements of fuel.**

#### **Problems of Coal Mining In Nova Scotia.**

There remains to consider the possible radius of distribution of the coal of Nova Scotia, but first something should be said as to the extent of the maritime coal deposits and the costs of mining them.

The coalfields of Nova Scotia, while they are not relatively large, forming as they do only one percent of Canada's coal resources, have never been worked to full advantage because of divided interest and scattered operation.

The consolidation of operation that followed the formation of the Dominion Coal Co. was the salvation of the Sydney field, but, unfortunately, consolidation did not go far enough to ensure the maximum cheapness of production that it only can make possible. Sporadic, uncoordinated, haphazard, and in some instances, unwise operation of the coal deposits of Nova Scotia, have conspired to prevent a healthy growth in the annual production of this province. One who, say in 1907, had looked forward to the annual coal production in Nova Scotia of ten million tons by 1920, could not have been regarded as unduly optimistic. Indeed, the objective of the Dominion Coal Company alone was at that time seven million tons annually, as those who refer to the late Mr. James Ross's remarks on the matter may confirm for themselves. The disappointingly small production of Nova Scotia during the past six years is chiefly a result of the war, and in that respect is a passing incident, but underlying, and altogether apart from the temporary effects of war, coal production in Nova Scotia has shown a recessive rather than an advancing tendency. **What is the reason for this lack of vigor in the maritime coal industry?**

Without attempting to excuse the faults of operation that have hindered coal production in Nova Scotia, it may be answered that the non-progressive character of the industry is due to a general lack of encouragement on the part of the railways and large purchasing interests in Canada; and the failure of governments in successive administrations to understand the paramount influence of coal supply on financial, military and naval security.

#### **Canadian Railways Have Demanded Unremunerative Selling Prices.**

For many years it was the policy of the Canadian railways to screw down the Nova Scotia coal operators to a minimum selling price. American competition being skilfully used to effect this. As an instance, it may be mentioned that Cape Breton coal was sold to the large railways in Canada delivered at Montreal at \$2.40 per ton, a figure that was—when the costs were correctly calculated—below the cost of production. The American coal against which the Cape Breton coal competed on a rigorous basis of monetary cost, was itself sold at prices below the cost of mining to the American operator, a fact that the statistics of the United States Fuel Administration have since abundantly demonstrated.

A combination of inaccurate (or perhaps one should say) partial cost-sheets, divided interests and low selling prices for coal prevented the coal companies in Nova Scotia from accumulating adequate financial reserves, with the result that they found it difficult to survive the ordinary hazards of coal-mining, and per-

iods of trade depression. But a principal pre-disposing cause of these unfortunate conditions has been the unreasoning hostility of certain sections of the public towards the coal operators and the short-sighted attitude of the railways, including the Canadian Government Railways, in enforcing prices that did not permit coal operators to expend the large amounts of capital that maintenance of output capacity and reasonable increase of production insistently demand in coal-mining.

This feature of Nova Scotian coal-mining is not new, but of long standing. The writer, in a Bulletin prepared for the Mines Department in 1916, stated the matter as follows:

"Within the past twenty years the price of coal has varied very little, it being one of the few commodities that have not materially increased in price. It is doubtful whether the market for Nova Scotian coal has ever yielded the operators a greater price than \$2.50 per ton at the pit-mouth, and the average price realized, after allowing for waste and slack coal, is very much less than this figure. A comparison with normal European pit-mouth selling prices will show how moderate this figure is, if due consideration is accorded to the higher cost of labour and materials in Canada. The margin of profit has been too small to permit of the accumulation of proper reserves to provide against the troubles from mining coal, or to allow of adequate depreciation reserves for the amortization of capital liabilities and the depletion of coal areas. Therefore, periods of financial depression, or mining accidents, have too often forced the abandonment of mining operations, and have involved investors in losses.

#### **Output of Coal in Nova Scotia capable of Great Expansion**

Coal must always cost relatively more to mine in Nova Scotia than it does in the uniquely favored deposits of the United States, but a considerable part of the abnormally high mining costs in Nova Scotia at the present time is a result of too small a production of coal in relation to the capital invested in mine properties and transportation equipment. Nothing can so effectively lower the unit costs of production in Nova Scotia as an increase in the output of coal. The coal companies there possess equipment sufficient to handle from two to three million tons annually of additional coal so far as transportation and marketing facilities are concerned. Given a sufficient expenditure and the necessary lapse of time to open new collieries and extend the existing collieries, there is no reason why Nova Scotia cannot produce twice its present output of coal. Such a programme is however only possible through the thorough-going consolidation of the operating coal companies, unification and concentration of direction, and very large capital expenditures on new mines and transportation equipment. Before investors can be induced to undertake the heavy commitments indicated there must be a change in the attitude of the public and the railways towards the coal-trade. Mr. C. A. Magrath, the Fuel Controller, in his Final Report, suggested that the railway companies should give contracts for their coal supply for a term of years, at cost, plus a fair percentage of profit, provided the coal companies made the necessary expenditure to equip and maintain properties with all appliances to enable production to be carried on at a minimum of cost. There is much to be said for this suggestion. It should be obvious that if in times of plenty our Canadian railways choose to starve our domestic coal mines by buying coal in the United States, or by demanding that the domestic producers meet United States competition even though that involve a profitless transaction or an actual loss to the

Canadian producer, our coal trade must live a precarious life, and will always be unready to meet the national emergency which may at any moment arise through political, social or diplomatic occurrences, or by reason of physical hindrances.

Canada cannot be run as a successful economic whole if we ignore the obligations of nationality and insist on buying goods in the cheapest market merely because they are cheap. That way lies loss of independence and national disintegration.

#### **Coal Resources of Nova Scotia Imperfectly Known.**

The apathy of public opinion if not actual hostility towards the struggling coal trade of Nova Scotia is not less effective because it is based on ignorance and is against the best interests of Canada, for not only has it discouraged the expansion of the known coalfields, but it has deterred the search for the hidden coalfields, the existence of which is much more than a presumption. It would be entirely incorrect if we were to assume that the known coal deposits of Nova Scotia comprise the whole of the coal resources of that province, and here again there is reason to complain of the lack of interest on the part of our governments, for no part of Canada has been so neglected during the past thirty years in the matter of geological exploration and mapping as Nova Scotia.

As a case in point, one would mention the Springhill Coalfield, which has an unknown but extremely probably southward extension. The port of Parrsboro which now serves the Springhill coalfield, as known, is distant by water only some 90 miles from St. John, N. B., which place by the direct line of the Canadian Pacific Railway is about 380 miles from Montreal. There is nothing insuperable in sending coal from this field to Montreal even by rail. Much longer hauls are made from the mines to great cities in the United States.

There is however no necessity to send coal by rail. It has in the past gone from Nova Scotia to Montreal by water at the rate of two million tons in the season of navigation, and could be sent in very much greater quantity by providing additional transportation equipment.

The feasibility of sending coal by water from Nova Scotia to Montreal has already been demonstrated. What can be done to cover the gap between Montreal and Fort William that is now entirely dependent upon United States coal? The cheapness of transportation from the United States central coalfield to the Great Lakes and the adjoining territories arises from a combination of water transport and a preferred inland freight rate from the mines to the Great Lakes ports. The carriage of coal to Canada gives an outward load for the cars carrying iron ore from the Lake Superior ranges to Pittsburgh, which otherwise would make the outward journey in an empty condition. From such points as Ashtabula and Cleveland, the transportation of coal to Canadian ports is cheaply affected by the water routes.

#### **Deepening of St. Lawrence Waterway Would Extend Zone of Distribution of Nova Scotia Coal.**

Apparently the only way by which the radius of distribution of Nova Scotia coal can be greatly extended east to say the eastern extremity of Lake Ontario is by deepening the St. Lawrence channel so as to give access to ocean-going vessels to the Great Lakes. In such event, Nova Scotia coal could compete

on fairly even terms so far as transportation is concerned with United States coal, as the all-water route from Nova Scotian ports to the point of unloading in a Great Lakes port would offset the preferred rail rate from the United States mines to the point of transshipment on the Great lakes. This project is under investigation. So far, all the protests that have been made against the project are such as, if conversely applied constitute arguments for its carrying out, so far as Canada is interested.

It may be submitted that if the project is pronounced feasible it offers to Canada the opportunity to become thoroly self-supplying and self-contained in bituminous coal supply. By affording to Nova Scotia a cheap water-route for coal shipments, the coal miners there would be able to so enlarge outputs as to effectively reduce costs of production, and soft coal from Nova Scotia could be shipped far enough west to span the country and meet Canadian soft coal shipped from the western mines.

The deepening of the St. Lawrence waterway is however not an immediate possibility, while the necessity to make Canada more independent in bituminous coal supply is indeed a most immediate urgency. What is feasible is the enlargement of distribution of Nova Scotian coal today? We can at least get back to the pre-war shipments to St. Lawrence ports of some two million tons annually. Further the same factors of increase in the cost of coal production have been at work in the United States also. There is also some encouragement in knowing that the Canadian people have to some extent awakened to the serious handicap we suffer from such entire dependence on the United States for coal, the danger of dislocation of our business, the threat of discomfort and physical danger that are always impending whenever interruptions to our coal supply occur.

These new conditions suggest that an extension of the pre-war radius of distribution for Nova Scotia coal may be possible at the present time if energetic effort is made by the operators to recover and extend the St. Lawrence markets.

The present moment offers an opportunity to the coal interests of Nova Scotia, and the transportation interests of Eastern Canada to work together to secure the future permanency of the coal trade of Nova Scotia, which, whether they appreciate it or not, is something on which the railways, the public and the Government of Canada are equally interested with the coal operators and the mining population.

The equipment of the Nova Scotia collieries is modern, and, apart from the duplication inseparable from divided interests, no grave criticism can be made of the technical or business management of the operating properties, but some changes will be necessary before the most efficient production is possible. In particular, the present system of single shifts will have to be replaced by multiple shifts. The present practice of working the collieries for only eight hours in each 24 hours, often for only five days a week, does not permit of full returns from the capital invested, or the extent of underground territory developed.

To sum up these opinions—which it may again be emphasized are all dependent upon the assumption that Canada can only be politically dependent in so far as she controls and supplies her own bituminous coal—it would appear that to effect the necessary increase in the coal output of Nova Scotia, two things

are chiefly required, namely, a unified control of the operations of mining, transportation and sales, and the recognition by purchasing interests, for their own future welfare and protection, of the necessity to buy Canadian-mined coal, and to pay a just price for it.

The writer will not attempt to discuss what relief we can obtain from utilisation of our peat-bogs and hydro-electric reserves, for these have been ably dealt with by specialists, and even their completest utilisation can only be in the nature of a palliation of the fuel problem, and can never constitute a remedy.

#### Coal Problem one of Deficient Transportation.

With regard to the bituminous coal supply we may conclude that the problem is not one of a source of supply in Canada as it is one of deficient and difficult transportation. Canada has sufficient bituminous coal for its own needs, but the country has never undertaken to become thoroly self-supporting from a conviction that this was not only desirable, but actually essential to national independence. It cannot therefore be said that our capacity to be self-supporting in bituminous coal supply has even been tested.

#### Storage of Anthracite Urged During Summer Months.

With regard to anthracite, the situation is different. It has been contended that the use of anthracite where Canadian bituminous coal was available is a luxury, and this contention is still maintained. There is however a portion of Canada, which, until our transportation systems are perfected, must have anthracite, although, as also already intimated, the anthracite supply must year by year decrease in quantity and increase in price by reason of exhaustion of the United States reserves. It is suggested that the whole matter of anthracite supply is in need of oversight by some department of the Government, similar to the recent organization of the Fuel Control Department. It is unnecessary to enter into details of why it is desirable that anthracite should be purchased, transported and stored in Canada in the Spring and Summer seasons. The ideal condition would be to have the cellars of the ultimate consumer filled before the close of Summer with sufficient coal to last until the next Spring, but this is an ideal difficult of attainment. The possibility of storing anthracite in Canada during the Summer to an extent sufficient to eliminate entirely any movement of anthracite from the United States to Canada, after say October first in each year, is a proper matter for Government enquiry, and if found feasible, for government management. Such an arrangement would save much money, much anxiety in Canada, and would be welcomed by the United States railways and mine operators. The necessity to import anthracite being one of our national handicaps, it is for that reason alone a matter in which the government should take the initiative. Anthracite, unlike bituminous coal, suffers no deterioration in storage, and it not subject to spontaneous combustion or heating when piled.

#### Canada's Future Rests Upon Coal and Iron.

In conclusion, one may be permitted to quote a remark of George Stephenson's, made long before coal had become so indispensable as it is to us today. "The strength of Great Britain lies now in her iron and coal beds: the Lord Chancellor now sits upon a bag of wool, but wool has long ceased to be emblematical of the staple commodity of England. He ought to sit upon a bag of COALS" In Canada, we have long

thought in terms of wheat and lumber, but these are in process of ceasing to be our staple commodities. Iron and coal are the two things upon which our future chiefly rests, and we cannot long have our frontiers march with the opulent and enterprising nation of the United States unless we develop our coal resources in a more thorough going fashion than has hitherto been attempted. Far from expanding our coal output we are not even holding our own, and every year's record of Canadian coal output is more disappointing than the one preceding. How is it that the worse examples of dishonored bond issues in Canada are connected with coal-mining enterprises, and that in at least two well-known instances, the capital invested by Canadian and British interests has been lost, and re-organization has been effected by United States capital? While a good many reasons could no doubt be advanced in explanation, the lack of any well-defined policy to foster coal production in Canada, because of its national importance, will explain the ill fate of many well-intentioned and promising coal mining flotations on this side the line.

It may be necessary to explain that this presentation of the Canadian side of the coal problem is not made in any spirit of hostility towards the United States. On the contrary, the generous and whole-hearted manner in which the U. S. Fuel Administration co-operated with the Fuel Controller of Canada in the desperate conditions of fuel shortage in 1917-1918 is gratefully remembered here. In this instance the United States shared its inadequate supplies of fuel with Canada in a manner worthy of all praise.

The people of the United States, however, are the last people in the world to excuse a lack of enterprise in another people, and if they should criticise the backwardness of our fuel policy, it would be criticism well-deserved.

MR. T. L. WALKER.  
University of Toronto.

### "INVESTOR" OR "SPECULATOR"?

Protection of the "Investor in mines or "prospects" is somewhat of an abstract science.

Mr. Tyrrell and Mr. Hore—both eminent in their profession—have stated their views as to the advisability of safeguarding the "Investor" while encouraging the "Prospector".

They are not so divergent in their conclusions as the esteemed Editor of The Canadian Mining Journal assumes—for the advocate standardization without circumstancing the sphere of influence of the pioneer to whom must be accredited most of the "Great Adventures" in Miningdom.

Perhaps Mr. Tyrrell, accustomed as he is to pass judgement upon immutable geological conditions, is too much of a strict constructionist.

Then, again, Mr. Hore, with the ardour of the scientist who revels in rocks, naturally is predisposed to favor the "pick and pan" fraternity.

How to bridge the "two stools" upon which these gentlemen are seated, is one of the problems they bestow upon the so-called "Farmers' Government".

Unfortunately, the Idealist on the platform is not prolific in practical performances—unless popular sentiment is aroused and support is forthcoming. I once heard John P. St. John, who "prospected" Prohibition, remark that, "prohibition legislation is feasible only insofar as the people make it effective". So it is with "Blue Sky" laws. Statutory provisions governing mining promotions and the sale of shares in mining ventures, cannot accomplish what either Mr. Tyrrell or Mr. Hore urges,—unless the people make it clear to the Governments that a stricter censorship of syndicates and companies seeking public monies is imperatively necessary.

Also, unfortunately, the rank and file of the public know little or nothing about mining industrialism—and will not learn—because the altogether too unanimous impression is that having-to-do with "a mine"—even if it is not "a hole in the ground"—is proof all-sufficient of obliquity.

Impliedly, the Ottawa Government acclaim the inconsequential character of their Geological and Mining Departments, by keeping the staffs on a "starvation wage"—doubtless to minimize their mischief-making—and "give the Investor a run for his money". Consequently, the Provinces maintain bureaus for their renewal possibilities; taxation, fees, licenses, designedly make it difficult for any "guilty man to escape".

Ontario geological and mining officials have pre-eminent status for their integrity and scientific services—but that status is personal to those officials—and the people most concerned played a feeble role in creating it. Instead of being the creatures of environment, the official spokesmen domiciled at Parliament Buildings, Toronto, have been constructive—while there have been times when anything aiming at corrective regulation of "mushroom" mining promotions was declared to be subversive of the rights of the "speculator", including those who had to make affidavit as to "bona-fide" discoveries—usually an elongation of the truth, to begin with.

A year ago Mr. Lucas was almost "hung, drawn and quartered" for thinking of "ideal" mining legislation.

The mediums of share distribution were lachrymose at the thought of the hardy "prospector" being prevented from marketing his wares. Trades or organizations resolved that "the purchasing power of the prospectors" was to be "cribbed and confined"—and the capitalist was execrated for an attempt to "crab the mining game".

Mr. Tyrrell is familiar with all of this. Mr. Hore has followed closely events in the Ontario North Country. There is a middle ground upon which the "prospector", the "promoter", and the "investor" can operate—and, after all, it is technical advisers primarily—and a more rigid accountability—that will remedy a great deal of what is urgently sought. The "Investor", per se, never discovered a new mining field. The "Speculative Investor" provided capital to prove mining fields. But, for example, it was Hamilton Smith who induced Rothschild to advance Rhodes enough to make De Beers Consolidated a going concern—and Smith was a trained mining man. Rhodes was not an "Investor". He was a "digger". So was J. B. Robinson, who "beat" Rhodes to an important portion of the western Witwatersrand. Beit, apart from Kimberley experience, was not expert in mining matters. Nor was Julius Wernher—nor Hermann Eckstein. Promoters and "Investors", counselled by scientists subscribed capital, or procured it, Mr. Tyrrell will recall that Cobalt lacked "Investors". It made millionaires overnight—and for years "bloom" and "calcite" with a bit of "smaltite" or "native" was justification for starting printing presses running off reams of script—without the judgment of recognized mining scientists. Hence the disastrous failure of the entire Montreal River area—with two or three exceptional claims, thus far.

On the other hand, Cobalt and Porcupine were visited with condemnation by scientists of international repute. Other scientists, more familiar with such occurrences, recognized the attractive geological and mineralogical conditions. Cobalt capitalizations were of the "wildcat" species; yet the less than a dozen real silver mines there have broken all records for values in a given tonnage. It was rash assumptions that every "silver showing" in the diabase would be "another Kerr Lake", that wrought havoc. The inexperienced "placed their bets" on the checker-boarded Montreal River country; the Township of Bucke, in South Lorraine, and elsewhere—not to speak in polite society of the Gillies Limits—and the Government helped themselves to the contents of the till. The Government "needed the money". What the Government did not take, the "prospector", "promoter", or the now-you-see-it-and-now-you-don't "mining" brokers took.

Canada simply learned the "mining game" from the United States, Australia, and South Africa. It is unlearning some of it—and there is healthier sentiment. What is needed more than anything else, is a campaign of education in which the new Ontario Mine Operators' Association, the Mining Institute, and the newspapers, can materially assist the Government. Mining engineers are not infallible. Those who are qualified to sit in judgment upon propositions are as high-minded as those who frown upon "Mining" as a profession. When the Get-Rich-Quick elements are restrained by having newspapers decline to let them have space and publicity; when "dope" literature is

censored—and incorporation papers cannot be obtained without explicit sworn statements as to values and work done—such statements to be subjected to inspection—then the “prospector” will have to take his chances with the “speculative investor”.

Meanwhile, it might be as well for bankers, business-men—and Governments to concede to reputable mining scientists the same rating as the other professions. For every “prospector” who has something worth having, there is an army of others without anything of much merit. It is the recognized engineers or geologists who should decide. After that “the dopester” should be made amenable to police regulations.

Alexander Gray, Montreal.

## Northern Ontario Letter

### THE SILVER MINES.

New favorable developments at such properties as the Nipissing, Kerr Lake, Beaver Consolidated, La Rose and Chambers-Ferland are adding to the aggregate of ore reserves in the mines of Cobalt. The supply of labor is adequate, and the men show general contentment. Wages, based on the high price of silver is accepted as an equitable scheme, while the recognition of workmen's committees, at each of the mines affords ample opportunity to keep working and other conditions satisfactorily adjusted. In this way harmony is manifest on every hand.

It is officially announced that as a result of the exploration and development program commenced a few months ago, the Chambers-Ferland has already placed at least \$150,000 in new ore in sight. The average grade is about 15 ounces of silver to the ton. At the present point of operation, average values of 28 ounces to the ton occur over a width of about five feet. Regular shipments are being made to the Dominion Reduction Co. for treatment.

On the Beaver mine large quantities of silver mine produced an average of \$10,603 every twenty-four hours, while development work in a general way was favorable. In his regular monthly report to the president and directors, Hugh Park, manager, states in part:—“During the month of February the company mined ore of an estimated value of \$307,485 and shipped bullion from Nipissing and custom ores of an estimated net value of \$409,253. Development and stoping operations at all shafts continued to be favorable during the month. Exploration work resulted in the discovery of medium grade mill rock have been developed, and the life of the mine has been lengthened considerably. Substantial quantities of high grade also occur, but it is to the mill rock that reliance on a large and sustained silver output is based. Mining and milling costs combined amount to between \$7 and \$8 to the ton of ore treated, which is exceedingly low for Cobalt ores.

During the month of February, the Nipis-

a new vein of promise. The most important development of the month was the cutting of vein 230, by a cross cut being driven to connect 63 shaft and 96 tunnel. Two veins were found, within six feet of each other, one being one inch in width and the other vein two inches. The intervening country rock contains appreciable amounts of argentite, native and ruby silver. The veins are not particularly high grade, but are strong physically and show fair amounts of leaf silver and cobalt. The development is important as the cross-cut is just above the Keewatin contact, which, at this point is 225 feet from surface. A crosscut 90 feet higher up and 110 feet distant also encountered milling values in a disturbed zone, which may ultimately prove to be part of vein 230. Good milling values occur over a width of six feet.”

Contrary to current reports, the Mining Corporation of Canada has not encountered new bodies of high grade ore on its recently purchased Buffalo mine. In view of the opposition to the recent deal, made by a minority interest of the Buffalo, the reports gained headway, but are now denied. The truth of the situation, it is learned, is that on veins which both the Buffalo and the Mining Corporation had mined up to the party wall, a small amount of ore was left in the intervening regulation seven feet of wall. Beyond this, no high grade has been encountered. As to general operations on the Buffalo, the indications appear to be that a substantial tonnage of medium grade mill rock will be

MR. B. NEILLY.  
Vice-President of the Institute. Secretary of the Ontario Mine Operators' Association.

mined. Of, course, the fact that the Mining Corporation paid close to half a million dollars for the property makes it only reasonable to suppose that a large tonnage of ore will be taken out on which to realize the profit commensurate to the gamble taken.

In the Mining Corporation, an electric pump with an automatic starter has been installed, and with which all the mines of the company are de-watered. A huge stope in the lower workings, some 800 or 900 feet in length, nine feet wide and about 60 feet in depth has been converted into a giant sump to which all the water from the various properties has a natural flow. The scheme has eliminated the necessity of duplicating pumping equipment, and has reduced the number of pumpmen.

The Coniagas Company is still negotiating for a working option on the Gamble-Thompson claims in the Gowganda district. Indications that the deal will go through are quite promising.

During the month of February the Hargraves Consolidated, a merger of the old Hargraves and the Reliance properties, shipped 210 tons of ore to the Dominion Reduction plant for treatment. The ore contains an average of about 15 ounces of silver to the ton. As yet a force of only ten men is engaged on the Hargraves Consolidated, and the work is confined to the Reliance part of the property.

Arrangements have been made to carry on sinking operations on the Oxford-Cobalt property, situated in Gillies Limit, about one mile south from the Kerr Lake mine. A contract for 200 feet of sinking has been let, the work to commence just as soon as the air transmission line is completed.

The possibilities of working some of the outlying properties in the Cobalt district for the cobalt (the metal, cobalt) which they may contain is occupying the attention of a number of mining men. With cobalt valued at \$2 a pound and coming in for increased use, it is thought that some of the old properties might be turned into revenue producers. This belief is greatly strengthened by the following facts:—

From the silver producing mines of Cobalt, in 1918, approximately \$3,793,652 worth of cobalt was produced as a by-product. This includes 438,229 pounds of metallic cobalt valued at \$1,074,556, and 1,147,535 pounds of cobalt oxide valued at \$1,813,947, together with other cobalt compounds amounting to 185,416 pounds, valued at \$905.14, or a total valuation of \$3,793,652. In view of the increasing use of stellite which is a new steel manufactured from an alloy in which cobalt plays an important part, and which is used in the manufacture of high-speed tool-steel as well as cutlery, etc., it is believed that quotations for cobalt metal will continue to rule high.

The suggestion has been made that now is an opportune time for a re-study of the geological conditions in the various precious metal mining districts of Northern Ontario and that it would be well for the Ontario Bureau of Mines to supervise the work. This would tend to assure access to all underground workings and make it possible to prepare a geological map, on a basis of correlation. It is thought that even in Cobalt a re-study of conditions would be valuable, while in such districts as South Lorrain it might reasonably lead to renewed activity with fair prospects of success.

**Ore Statement.**

During the week ended March 12th, four Cobalt com-

panies shipped an aggregate of five cars containing approximately 367,964 pounds of ore. The McKinley-Darragh with two cars was the heaviest shipper. A summary follows:—

Shipper.	Cars.	Pounds.
McKiuley-Darragh . . . . .	2	143,840
La Rose . . . . .	1	87,859
Temiskaming . . . . .	1	72,008
O'Brien . . . . .	1	64,257
Totals . . . . .	5	367,964

**THE GOLD MINES.**

The voluntary increase of 50 cents a day to the mine workers in the Kirkland Lake district is an outstanding feature in connection with the gold mining industry of Northern Ontario. The step is pointed to as one which indicates the sincerity of the mine operators of Kirkland Lake in their endeavor to share with their employees the advantages of the gradually improving economic condition. As to what may occur along these lines in the other gold mining camps of this country, time alone will determine, but, in other camps, as was the case at Kirkland Lake, it is felt that a spirit of co-operation will continue.

Official figures which show that after resuming milling operations last spring the Dome Mines, up to December 31st treated 187,580 tons of ore and recovered \$1,290,301.19 are received with a high degree of optimism by shareholders. While the mill operated in June, yet the achievement really only represents the last half of the year as some little time was lost in getting work well under way. This being true, it is interesting to note that an average of over thirty thousand tons of ore was treated monthly. It also shows that an average of \$6.87 a ton was recovered from the ore milled. Prior to the war the Dome handled its ore at a total cost of between \$2.50 and \$2.60 a ton. At last Summer's meeting the general manager stated that costs had advanced about 30 per cent. This being so, it is evident that a cost of about \$3.50 would cover that of the present, in which case the net profit during the last half of 1919 amounted to more than an average of \$100,000 a month, or at the rate of upwards of 30 per cent annually. It is believed that when the company's year ends, on March 31st, a surplus of around \$900,000 will be shown. This would compare with \$56,801.26 a year ago. The rapid recovery thus realized is one of the outstanding achievements in the Porcupine district.

Shareholders of the Dome Extension Company, at a special meeting held on March 10th, ratified a by-law authorizing a six month's extension on the working option held by the Dome Mines.

Operating its mill at full capacity, and with mill heads running higher than the average, the McIntyre-Porcupine is setting new high records in point of value produced. In January it is stated in usually well-informed circles that upwards of a quarter of a million dollars was produced. Also, the current rate of output would tend to indicate net profits of around 25 per cent annually on the company's 3,600,000 issued shares. Development work at depth continues very favorable.

The endeavor to place the Dome Lake property on a self-supporting basis is being carried on with fair prospects of success, although ore reserves are low and the cost of operation is running neck-and-neck with the gold content of the ore.

The increase in wages at Kirkland Lake, previously

referred to, amounts to an average of about 50 cents a day, and will give muckers \$4.25 and machine runners \$4.75 for each eight-hour day worked. This increased rate is expected to attract additional men to the camp, and may reasonably meet the added demand for workmen as a result of the resumption of work at the Wright-Hargreaves and at the Tough-Oakes.

The Chaput-Hughes property has inquired as to the possibilities of purchasing the small mill on the Burnside Company, in that the latter in merging with the Tough-Oakes will have no use for its mill. In regard to this, however, only a limited amount of work has been done on the Chaput-Hughes and the ore necessary to operate a mill has not yet been found. The property is well located.

About April 15th, it is officially announced, the Wright-Hargreaves will commence work in connection with installing its new large mill, the machinery for which is already on the ground.

Financial arrangements necessary to assure an extended program of exploration and development work on the Hunton-Kirkland property are being made, and the prospects of success are very bright, is the advice submitted to the correspondent of the Journal by a mining man who is heavily interested in shares in the company.

Arrangements are being made to deepen the shaft on the Elliot-Kirkland, which properties lies directly west of and adjoins the Kirkland Lake Gold Mines. Formerly, work was carried to a depth of 500 feet on the Elliot, and, although the main fractured zone was encountered, yet only a very limited amount of gold ore was found. Now, going on the theory that as the ore body extends to the West the horizon of mineralization dips downward, the Elliot-Kirkland Company will carry their shaft to a depth of perhaps 700 feet, at which point exploration work will be carried on.

A deal for the Stitt property in the township of Grenfell is pending, according to advice received from Kenogami station. The Stitt group of claims will perhaps be remembered on account of the interest which they attracted a few years ago following the discovery of rich gold ore in narrow veins. The geology is very similar and is believed to be the westward extension of that belt which passes through the Kirkland Lake district.

Official information from the Argonaut Gold Mines at Beaverhouse Lake, some twelve miles east from Kirkland Lake is very reassuring. It is stated that the shaft has been completed from the 70-ft. to the 200-ft. level at which point drifting has been carried on for a distance of over 100 feet and with ore averaging about \$9 to the ton over several feet in width. In the meantime the mill is being kept in operation, and by a process of straight amalgamation sufficient production is being maintained to almost offset the current cost of carrying on the desired development work. Tests are being made with cyanide so as to ascertain the process best suited to adopt in the proposed new mill. A force of about fifty men are engaged.

A contract has been let to continue the shaft on the Boston-Kennedy property to a depth of 150 feet where it is proposed to carry on lateral work. The shaft is now down 100 feet. \$10,000 has been subscribed with which to continue on the extra 50 feet and finance the desired amount of drifting.

"Jim" Nelson, owning claims in the township of Baden in the Fort Matachewan district, has organized a new company known as the Thesaurus Gold Mines,

for the purpose of financing the operation of his promising group of claims. Mr. Nelson is a practical mining man who has spent many years prospecting, and who has carried on a large amount of real prospect work on his claims.

In connection with the Fort Matchewan Gold Mines (the Otisse property), it is learned that the ore occurs in lenses more or less widely separated, but that they show a width of from 8 to 30 feet at their widest points. It is stated that in that part of the lenses measuring 8 feet or more in width the indicated average gold content is about \$11 to the ton and that the proposition would appear to be a commercial undertaking of at least moderate proportions.

### BRITISH COLUMBIA LETTER.

Stewart, B. C.

The fourth shipment of ore from the Premier Mine, Salmon River District, has been made to the Tacoma (Wn.) smelter. The shipments average 300 tons and the ore is reported to assay about \$275 to the ton. Development are proceeding on the Big Missouri. The tunnel on the Bush Mine is reported to be in high grade ore. The same is true of the Forty Mine. A crosscut tunnel is being driven on the Unicorn. Up the Bear River the crew at work on the Lakeview Mine is in ore. The Indian Mines, Limited, plan to resume development on their four claims situated on the west side of Cascade Creek, opposite the Bush property. Development consists of three opencuts on the crop-pings and two tunnels. The opencuts expose a well defined vein, when can be followed on the surface for about 2,000 feet. The vein is quartz and appears to follow a wide dioritic dyke which intrudes the greenstone schists. The minerals found include galena, sphalerite, and pyrites. With the report that the old Portland Canal Tunnel Company may be revived interest is being manifested in properties of Glacier Creek back of Stewart. The tunnel was an ambitious scheme started in 1912 to run a 2,000 foot tunnel to tap at depth all ore bodies of Glacier Creek, including those of the Portland Canal Mining Co., The Stewart Mining and Development Co., the Glacier Creek Mining Co., Portland Wonder Mining Co., "O.K." and the Pacific Exploration Co. An early opening of the Salmon River District is expected according to advices from the North, the weather having been mild recently, much of the snow in and immediately around Stewart having disappeared.

Alice Arm, B. C.

More high grade ore is reported to have been struck on the Esperanza, Alice Arm District. The Centre Star has been bonded to O. B. Bush, the original purchaser of the Premier, Salmon River. The property adjoins the Last Chance, now bonded to H. B. Price, of New York, and is close to the Moose, owned by Dave Cameron, who staked the Wolf. It is stated that the consideration was \$75,000, there being a small cash payment and an undertaking to commence work before the 1st of July.

New Hazelton, B. C.

On Hudson's Bay Mountain there are a number of promising properties under development. The Mamie, under bond to Seattle capitalists, is attracting attention. J. D. Galloway, District Engineer, reporting in 1917 said of this property that the ore-minerals disseminated through the gangue in bunches and stringers are zinc-blende and arsenopyrite, together with a little chalcopyrite. The main value in the ore is zinc, but the arsenopyrite carried low gold values.

Some silver occurs with the zinc but as a rule the silver content is low. The Victory and Empire Groups, staked by the Simpson Brothers, are under bond to the Skeena Milling and Mining Co., which has started the installation of a concentrator. There also is the Coronado Group, also leased by the last named Company, and which is showing up well, being considered one of the most promising properties on the mountain.

**Nelson, B. C.**

D. F. Strobeck, one of the pioneer operators of the Ainsworth Camp, and who sold the Florence Mine to its present owners, has returned to take up the development of other properties. He holds a group of mineral claims on Princess Creek and also is interested in the Eden-Crescent Group on Coffee Creek. The Mountain Chief Mine at Renata, B. C., on which the shaft has been extended about 40 feet, still is in ore.

In the upper shaft the ore was largely chalcopyrite and with the attaining of depth a considerable percentage of bernite has been shown. Air drills are being used, the Mountain Chief Compressor being one of the few of the district not incommoded by water shortage. Shipping is expected to be resumed shortly. The mill of the Rambler-Cariboo Mines Company has been closed down. The Compressor Plant ceased to be a factor in operation some weeks ago owing to lack of pressure but the mill was continued. However, a late freeze diminished still further the flow of water in the streams and the Company had to discontinue. About the only large mill in the district operated by its own power and still working is that of Clarence Cunningham at Alamo. Here, with the flow of the north fork of Carpenter Creek available, no difficulty is being experienced.

# A MARSH HOIST

## IS MADE THE RIGHT SIZE FOR YOUR MINE

and in either Steam Power or Electric Power

This shows one of our Electric Mine Hoists. We make many other types. Send for our catalogue of Mine Hoists, Cars, Cages, Buckets, etc., and see what we offer you. It will repay you.

From the little 10 Horse Power size for prospectors or small mines to the massive 50 Horse Power size, one of our 7 sizes should be just right for your mine.

We are specialists in the building of Hoisting Machinery of all sorts. For nearly a quarter of a century we have been designing and building Hoists, and have developed a Hoist that we are really proud of—proud because of the record of good work they have done, and are doing in mines, quarries, and other classes of work from one end of Canada to the other.

**THE INTERNATIONAL NICKEL COMPANY**

# INCo MONEL metal

**T**HE introduction of MONEL Metal in the valves, condensers and other equipment in the Cos Cob power plant of the New York, New Haven & Hartford Railroad has materially helped to maintain heavy train schedules in the electrified zone with maximum economy of operation and fewer interruptions to service.

Valves used on the high pressure superheated steam mains and the turbine stop valves have MONEL Metal discs, seat rings and stems. All these valves have been in continuous service since 1912 with no repairs except occasional packing.

Bronze shaft sleeves used originally in the condensers soon wore and deteriorated under salt water conditions. MONEL Metal sleeves were substituted 7 years ago and at the present time show no wear or corrosion—a remarkable service record.

MONEL Metal has replaced cast iron for impellers and runners on the Le Blanc condenser pumps (which handle salt water with other impurities) because MONEL wears longer and withstands erosive and corrosive action.

Brass bolts holding the sealing rings on the Westinghouse remover pump deteriorated—lasting about one year—and were replaced with bolts made of MONEL Metal. The MONEL bolts, after several years' service, show no sign of deterioration and are good for many more years.

MONEL Metal is a natural alloy of nickel and copper—strong as steel—tough and ductile. Withstands alkalis, high temperatures, most acids, corrosion and the erosive action of hot gases and *superheated steam*. Can be cast, forged, rolled, machined, drawn, soldered, brazed and welded by electric or oxy-acetylene method. Takes and retains a perfect nickel finish.

MONEL Metal is manufactured in the form of rods, castings, wire, strip stock, sheets, etc. Some of its common uses, other than valve trim and turbine blading, are pump rods, plungers and liners; spark plug electrodes; aeroplane parts; mine screens; pickle pins; marine fittings; oil, gas and refrigerating machinery; dyehouse and dairy equipment; storage battery casings and screw machine products. The MONEL booklets show the many uses for which MONEL has proved superior.

Our experience as sole producers of MONEL Metal since its discovery in 1905 is at your disposal through our Sales or Technical Departments

# The Minerals of Nova Scotia

## THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY,  
GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

**Coal** Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

**Iron** The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

**Gold** Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

**Gypsum** Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and other Literature may be had free on application to

HON. E. H. ARMSTRONG, - HALIFAX, N.S.

*Commissioner of Public Works and Mines*

# EDITORIAL

## Montreal and Nova Scotia Coal

The Montreal City Council recently adopted a resolution which, after stating that a large portion of the coal used in Canada is imported from the United States at prices which are continually increasing, with frequent shortages occurring which may become permanent, requests the federal government to encourage by all possible means the intensive operation of Canadian coal mines. Such a policy, it is urged would remove the danger of interrupted or inadequate coal supply, and would provide much additional employment. This resolution is encouraging as an indication of the tardy realization by the general public of Canada's mendicant and defenceless position in regard to coal supply. As the Montreal resolution rightly suggests, Canada's regrettable position in assuming

inability to be self-supporting in coal supply, is entirely needless, and is due to an ill-informed public opinion, which, it is most pleasing to observe, is in process of correction. The vicinity of Montreal alone is annually purchasing three million tons of bituminous coal from the United States that could and should undoubtedly be supplied from Nova Scotia. As the recipient of a large tonnage of coal from the United States, instead of being the distributing centre for a similar quantity of coal from Nova Scotia, Montreal is not only paying out money at high exchange rates unnecessarily, but is missing the revenue which it would earn from the distribution of Nova Scotian coal, and from the disbursements made by ocean-going vessels using the Port of Montreal.

## Causes and Results

The report of the Deputy Minister of Mines for the year 1919 shows that Ontario mines produced 505,963 oz. gold valued at \$10,451,688 and 11,383,905 oz. silver valued at \$12,913,316. The producing companies are for the most part operating at Cobalt, Porcupine and Kirkland Lake. Most of them made profits on the year's operations and are expected to make profits this year. Gold and silver mining has become in Ontario a flourishing industry. The chief producers can present reports that will please the shareholders. Most of the producing corporations are now in very satisfactory circumstances and able to finance exploratory work on other properties than their own and thus possibly continue mining operations after the properties which they were formed to operate fail as sources of ore.

It is well to note that these successful corporations and their substantial treasuries are the result, not the cause, of the development of mineral deposits. The producing mines were not discovered or developed by work done with money supplied by long established mining corporations. The early history of each of the mines that has been the source of wealth of the big corporations is the history of individual efforts of men who were ready to venture their money and time in an efforts to make mines out of prospects. The speculators made the mines. After preliminary development they formed corporations in which they kept

substantial interests and then sold part of the stock to the public. These corporations, at the time of their organization, had to depend for their life on very doubtful sources of income. They were speculative enterprises. It is true that some of them have reached a stage of development which permits the owners of shares to breathe easily; but the fact remains that the men who took up the Nipissing, Hollinger and other great properties and found the money to develop them were taking chances that would cause a great outcry from corporation shareholders if taken by directors on behalf of a corporation.

It is true that our mining corporations are in a splendid position to undertake the development of new discoveries, and it is to be expected that some will do this. Many of them have already spent considerable sums of money in the search for new properties and a few have had some success. The most notable success has been in cases where the corporations undertook development of properties adjoining or near their own. When it is borne in mind that the producing companies have organization and experience in their favor, it is reasonable to expect that activity in developing new properties will become more and more the work of big mining corporations. The fact remains, however, that up to date they are the effect and not the cause of development of new fields—  
R.E.H.

### INSTITUTE NEEDS PRESS BUREAU.

The annual meeting of the Canadian Mining Institute was a success in many ways, but it evidently did not attract much attention on the part of the public. Topics of interest to thousands of people were discussed and yet the local newspapers presented very poor reports of the meeting. It may be taken for granted that the press is ready to publish information about mines and mining that is likely to interest the general reader. Whose fault is it that full accounts of the more important discussions were not published each day of the meeting? It seems to me that the fault lies with the Institute rather than with the newspaper publishers. The reporters find it difficult to obtain desired information and so they spend little time at the meetings and the publishers are not even aware that important discussions by well informed persons are taking place.

The average reader of newspapers would find little to interest him in a purely technical mining or metallurgical paper, and the press is well advised in giving little space to the papers of this class. Many of the items on the program, however, were of such a nature that any enterprising newspaper publisher would be pleased to present full accounts of them to his readers.

It would seem desirable that the Institute should take steps to see that its meetings be more adequately reported in the newspapers. To accomplish this the Institute should advise the publishers of the fact that good copy is obtainable at the meetings, and should see to it that it is obtainable. Press notices calling public attention to items of general interest should be sent out freely by the Institute during the week preceding the meeting, and summary accounts of papers presented and discussions at each session should be prepared by the Institute to form a basis for the reporters' daily stories. It is hardly to be expected that the ordinary daily newspaper reported will be able to present a good account of an Institute meeting if he is not given more help than has been the custom in the past. We have been leaving publicity for Institute meetings too much to chance. Is it not worth while to have organized publicity?—R.E.H.

We congratulate the "Engineering and Mining Journal" on its feat in reporting the Toronto Meeting of the Canadian Mining Institute, ending on the 11th, in its issue of the 13th March. Not only was the Institute Meeting reported, by using the telegraph wires, but the issue of the 13th contained articles on the Dolly Varden Mine in British Columbia, and on the Mandy Mine in Northern Manitoba, of which Mr. Spurr, the Editor of the "Engineering and Mining Journal" was one of the discoverers. While the "Canadian Mining Journal" is not unaware of importance of the "Engineering and Mining Journal" as a competitor in the correct reporting of Canadian mining news, it would

we consider, be ungracious not to express pleasure at the quick publicity given to the Toronto Meeting, and the compliment to the growing importance of Canadian mining implied in the large amount of space devoted to description of Canadian mines and Canadian mining problems. Particularly pleasing is the editorial statement that: "Canada's record in the mining and metallurgical industry is one to which she can point with pride, for it is largely through the efforts of her own men that progress has been made. Her technical schools, such as McGill, Toronto, and Queen's, about which we hear little on this side of the line, have produced some brilliant men." Might we, however, suggest that the three universities named regard technical education as only one part of their activities.

### IRON ORE BOUNTIES.

At the Annual Meeting of the Canadian Mining Institute the Minister of Mines for Ontario said that the Provincial Government had not committed itself to granting a bounty on iron ore, and did not feel disposed to take this course. He expressed the belief that when it became really necessary that domestic iron ores should be mined, the value of the large deposits of ore in Ontario would become apparent.

The point made by Mr. Mills lies entirely in the question as to when it becomes "really necessary" to develop our own iron-ore deposits. There is a school of thought in Canada which conceives that we should draw to the fullest extent upon the resources of the United States for the purpose of conserving Canadian resources, and the people who hold this viewpoint usually have in mind coal and iron. The fallacy in their argument is a little elusive, but we do not think it represents the most robust type of Canadian thought. Iron ore deposits, particularly those of the type found in Ontario, are not like a reservoir ready and waiting to be tapped. Their development will in any case be a slow process, and much work must be done, both in the prospecting field, in the laboratory and in the full-scale experiments of the iron and steel works of Canada, before these deposits will be in a position to yield ore on a commercial scale.

As we understand it, those who are requesting a bounty desire it to be paid upon the quantity of pig-iron or steel made in Canadian furnaces from domestic ores, and, as been previously pointed out in "Iron and Steel," unless the proposal to develop Canadian iron ores is economically sound, it will not succeed, and the amount the Government would be required to disburse would in such event be negligible, whereas if the bounty were earned, the resultant impetus to industry would be such as to far outweigh and thoroughly justify the cost of the bounty.

The Minister of Mines suggested that the offer of the British Columbia Government to pay a bounty of

three dollars per ton on pig-iron produced in that province from British Columbia ores had not evoked the response it should, but the offer has had one beneficial result, namely to arouse interest in the subject, and, as a direct result of that offer, there is now proceeding in British Columbia precisely that process of preliminary investigation which yields exact information, and which must always precede any worth-while commercial undertaking.

It is also fair to point out to those who believe in reserving our resources by taking immediate advantage of more advantageous conditions existing in the United States, that the possession of undeveloped resources is in the actual effect equivalent to non-possession of such resources.

There already exists in Ontario a pioneer enterprise in the beneficiation of siderite, namely at the Helen Mine. The Algoma Steel Corporation has proved the presence of immense tonnages of siderite, and has also proved the commercial possibility of its utilization by beneficiation. For its work in this direction, the Algoma Corporation deserves the thanks of Ontario.

Coming as he does from Port Arthur, where the question of beneficiation of iron ores is a live question, the Minister of Mines is probably well acquainted with the reasons urged for a bounty on iron ore, or as we believe it should be put, a bounty on pig-iron, and we trust that Mr. Mills's very definite statement that the Ontario Government does not favour such a course is not the last word on the matter. The whole question of the development of the iron ores of Ontario is worthy of study. That Canada should provide from domestic mines only 4.6 per cent of the ore fed to Canadian blast-furnaces is not a condition that should be perpetuated longer than is unavoidable.— From "Iron and Steel of Canada".

#### THE LEGAL STATUS OF WORKMEN'S COMPENSATION BOARDS.

The Manitoba Court of Appeal has reversed the judgment of Mr. Justice Mathers holding the Workmen's Compensation Board to be a Court, and the appointment of its members by the Ontario Government to transgress the prerogative of the Federal Government in the appointment of judges. It is stated that a further appeal will be lodged with the Supreme Court of Canada.

The wide powers given to Workmen's Compensation Boards are disliked by lawyers, as witness the report of the Law Reform Committee of the Ontario Bar Association that the Workmen's Compensation Board of Ontario is "one of the most autocratic institutions in the Province, and absolutely independent of all government jurisdiction except by special legislative enactments."

It was doubtless the deliberate intention of those who framed the Ontario Act to make the Compensation Board an entirely independent body, charged with the

duty of making decisions not subject to judicial review. This is a logical sequence to the acceptance of the root principle of workmen's compensation as viewed in Ontario, to wit, that compensation for injuries arising in and out of the course of employment is an inherent right of the workmen, not to be questioned, and, in the intent of the Act, merely assessable as to amount of compensation payment. The scale of compensation being laid down by the Act, it is held that the function of the Board is merely to disburse the sum prescribed in the schedule. As trustees for the proper disbursement of prescribed compensation payments, the Compensation Board is also charged with the collection and custody of funds raised by statutory assessment on the payrolls of employers coming within the scope of the Act. These duties of Compensation Boards so completely dispense with the necessity for outside legal assistance that to those who have not accepted this root principle of workmen's compensation the self-contained status of Workmen's Compensation Boards presents an autocratic aspect.

It should be pointed out, however, that there are two aspects to the unreviewable nature of the Compensation Board's decisions. The Board may award compensation in cases where the employer may consider it unjustified, but may also refuse compensation to workmen claiming injury at work. If the workmen cannot prove his case he can make no appeal from the judgment of the Board, and it is understood that this is one aspect of the unappealable nature of the decisions that is objected to.

Criticism is also made of the fact that the Ontario Compensation Board—and this is true of other Boards—handles its own investments without government oversight.

There is a good deal to be said in favour of governmental audit and accounting of the accumulated funds of Compensation Boards, as these funds will in the course of years reach a very large maximum aggregate. Any such government oversight should, however, we believe, be in the direction of further safeguarding of these funds as intact accumulations of securities, and should not contemplate any merging of the funds into the general treasury of any province, nor, to anticipate a future probability, in the Treasury of the Dominion of Canada.

While, as an effective, equitable and economical method of administering workmen's compensation, the Compensation Boards can hardly be bettered, it cannot be gainsaid that there is something repugnant to the tested traditions of British judicial bodies, or of administrative bodies charged with quasi-judicial functions, that these should not be subject to review, writ of error, or superior accounting of trust monies. Discussion of these unusual powers of the Compensation Boards is likely to grow with the growth of their duties and the funds entrusted to their care, two certainties of the future.

### THE WABANA IRON ORE DEPOSITS.

The description in this issue, by Mr. R. E. Chambers, of the sinking of the submarine slopes of the Nova Scotia Steel and Coal Company, at Wabana, Newfoundland, is of timely interest. These slopes have achieved the maximum penetration of the unique submarine iron-ore deposit, and Mr. Chambers's detailed account of the successful completion of the haulage slopes will appeal to such readers of this periodical as are engaged in the mining end of the iron and steel industry, but will more particularly interest those concerned with the operation of steel works in Canada because these slopes have definitely proved the existence and accessibility of a seam of iron ore, at a distance exceeding two miles from land, averaging from 17 feet to 30 feet in thickness.

The Wabana deposit has no parallel. As a coal seam, the mineral which is above all others distinguished by its regularity and persistence of deposition over large areas, the Wabana deposit would be notable for these last-named characteristics; but as an iron-ore deposit we believe it to be unique. As to the probable extent of the deposit, nothing can be said except that the probability of its continuance beyond the known limit of mining is conceded by all who have studied the deposit. It may also be added that the limit of mining has not been tested, and is therefore unknown. Col. Thos. Cantley, before the Mining Society of Nova Scotia put this aspect of the Wabana deposit with precision is stating that "The volume of ore is so great as to present a new feature in mining, to this extent, that it will make practically no difference, not only to this generation, but to several generations to come, as to what rate of extraction is carried on at Wabana."

There is excellent reason to believe that the recent interest taken by large British ironfounders and shipbuilders in the steel incorporations in Nova Scotia was attracted more by a desire to acquire the Wabana iron-ore deposit than by any other reason, although additional reasons are not lacking either in number or cogency.

When large United States' steel interests commence in an impressive manner to undertake the concentration and beneficiation of the comparatively lean magnetites of the Eastern Mesaba range in Minnesota, the implication is fairly plain. The marketability of lean iron-ores is first-hand evidence of the scarcity of richer ores. The Wabana deposit is gradually coming to be recognised as one of the most impressive reserves of iron-ore of high iron-content remaining in the temperate zone.

The relative value of an iron-ore depends to a large extent on its accessibility and geographical position. As a point of distribution of iron-ore to be used within the British Empire, the position of Wabana could not

be bettered. The rapidity and moderate cost with which Wabana ore could be delivered in British ports by the use of modern freighters of large capacity and quick steaming capacity is obvious, if modern unloading plants were provided in Britain.

A good deal has been mooted about the Imperial character of the motives which are said to actuate those who desire to consolidate the control of the Wabana ores, and while these motives have no doubt played their part in bringing Wabana to the attention of British statesmen following the visit of the Dominions Royal Commission to Wabana in August 1914, we venture to believe that what is really actuating the British enquiries is a realisation of the intrinsically valuable business asset that possession of the Wabana ore deposit will be to any combination of ironfounders and shipbuilders that require iron ore in very large tonnages.

Some idea of the height of the ore-seam at the point where it is tapped by the haulage slopes may be obtained from a photograph accompanying Mr. Chambers's article which shows a mechanical loader, electrically driven, but of the familiar type of boom and bucket that is chiefly associated with a railway steam-shovel, working two miles from shore.

The whole production of the Scotia slopes is today loaded into the mine cars by mechanical shovels of several types, with a negligible exception of the tonnage handled by four pairs of men.

No man has had more to do with the discovery and development of the Wabana iron-ore deposit than Mr. R. E. Chambers, and we believe the readers of "Iron & Steel" will welcome his authoritative and first-hand account of a unique engineering achievement in an ore deposit that stands alone.—From "Iron and Steel of Canada."

---

### INSTITUTION OF MINING AND METALLURGY WAR MEMORIAL. GIFTS OF MALACHITE REQUESTED.

The Institution of Mining and Metallurgy has decided to raise a fund of about £4,000 for the purpose of commemorating the services of members of the Institution in the Great War, and perpetuating the "memory of those who made the Great Sacrifice."

As already announced in the "Journal," Lt. Col. Peter N. Nissen, D.S.O., has prepared a design for the figure, which has been accepted, and he will model the figure and the friezes. These will be executed in bronze, and the pedestal base in malachite, with four silver-alloy plates upon which an appropriate inscription and the Roll of Honor will be engraved.

The Council states that it has been fortunate in receiving gifts of specimens of malachite to be used as parts of the base-pedestal, but these are insufficient for the purpose, and it is suggested that members who may possess specimens should place them at the disposal of the Council.

# The Sinking of Wabana No. 3 Slopes, Newfoundland

By R. E. CHAMBERS.\*

(Published concurrently in "Iron & Steel of Canada")

During the year 1919, there was completed at Wabana, Newfoundland, a pair of slopes, the construction of which means much to the steel industry of Nova Scotia, as it assures to the Nova Scotia Steel and Coal Company a permanent supply of iron ore of enormous extent. This ore had been previously opened up by slopes, driven for a distance of 4,000 feet through the sub-marine ore of the Dominion Company into the areas of the Scotia Company, and for a further distance of 3,000 feet into the Scotia areas, these being termed the No. 2 slopes. But according to the agreement made between the two Companies the No. 2 slopes were to be surrendered at the close of the year 1918, and the ore from the Scotia submarine areas was to be mined through a new set of slopes to be completed by that time. Although a very formidable undertaking extending over several years, these slopes were completed at the time specified and are now producing 1200 tons of ore per day.

The construction of the No. 2 slopes was described in an article published in Vol. 12 of the Journal of the Canadian Mining Institute. It is to the second set now known as the No. 3 slopes of the Nova Scotia Steel and Coal Company, that the present reference is made.

\* Mining Engineer and Director of the Nova Scotia Steel and Coal Co., New Glasgow.

Briefly, the work consisted in driving two parallel slopes, each two miles long, and each with a cross section of 10 ft. by 17 feet at an average grade of about 13 per cent from the main level of the Scotia submarine mine to the surface near the outcrop of the lower bed of ore. The total time occupied was not phenomenally short being about 5 years. The work was, however, much delayed during the period of the war by shortage of labor and other drawbacks, being for certain periods entirely discontinued.

The speed of driving for certain monthly periods, while labor was plentiful, was more creditable. The average advance over monthly periods was over 12 feet per day in the West slope and over 11 feet per day in the East slope. While for level tunnels this is not a record, yet when the large dimensions of the slopes, the descending grade of 13 per cent, the handling of a considerable quantity of water, a somewhat faulted ground and other adverse conditions, are taken into consideration, the speed above referred to is rather exceptional. It is not, however, with the object of claiming any record, that this is written. But having been asked for a description of the work, there are two principal reasons which appear sufficient for endeavoring to comply.

First:—To emphasize the fact that the completion of these slopes assures to the Nova Scotia Steel and Coal

General Plan of Submarine Areas of Iron-ore at Wabana, Nfld., showing approximate position of slopes and workings.

Company an ample supply of ore for the future. The ore has been found to extend to the farthest working yet reached. These workings are two miles to the dip from the outcrop of the bed, and the slopes are among the longest known, yet the ore extends below their deepest point. During the past 24 years the blast furnaces of the Scotia and Dominion Companies on Sydney Harbour have been supplied and several millions of tons exported in addition, from an area of about two square miles of the ore field.

The submarine holdings of the Scotia Company cover an area of about 83 square miles, and of the Dominion Company 5½ square miles. The same geological conditions are believed to extend over the greater part of these areas. The Scotia slopes are now working at a capacity of 1200 tons per day; with improved labor conditions this can be much increased. While the ore beds vary in thickness over different parts of the field, the thickest section known is in the

submarine mine of the Scotia Company two miles from the outcrop. Attempts to reduce to exact figures the ore tonnage of this field are necessarily connected with uncertainty, but it is evident that in the enormous area of the Scotia Company, above referred to, there is an ample supply for all their future requirements. The geological conditions peculiar to the ore field are believed to extend to the dip a much greater additional distance than the slopes are now driven, and the evidences indicate that on the strike the ore will extend for many miles, placing the Scotia Company in a most favorable position for ore.

This result has not been obtained without much effort in many fields.

In many, we may say most cases, such investigation has been unproductive, but in the case of the Wabana deposit and some others which warrant future consideration, the result has fully justified the energy and the somewhat large sums of money expected in ex-

Position of Bell Island with reference to Mainland.— White Areas are Pre-Cambrian, Perpendicular Hatching denotes Ordovician, and Cross Hatching denotes Cambrian rocks.

ploration, development work and equipment. The Scotia Company is now in the happy position of being independent as to the future ore supply for themselves, and if required, for others, and in the opinion of all mining experts who have studied the question, of owning one of the largest iron ore mines on the North American Continent and its outliers.

Second: The successful construction of these slopes, apart from the element of luck, which continued most favorable, was largely due to the faithful and energetic efforts of the mining staff under me during the period in question, and I wish to give some public recognition of this service. During the several years in question the work was followed with undiminished energy and intelligence by the various heads of departments and the staff generally. It is not practicable to give a full list of those to whom credit is due. This would include the members of the office, mechanical and surveying staffs and many of the workmen, but I would like to mention the following names, and hope others taking a less prominent part, but who performed their duties faithfully, will pardon the omission and understand that with 200 men engaged in the work, it is not practicable to publish all.

#### Staff Connected with No. 3 Wabana Slopes.

1. A. R. Chambers, in general charge.\*
2. C. B. Archibald, in charge locally.
3. F. Burrows, late resident manager
4. L. McLean, underground manager.
5. T. Gray, Asst. Underground Manager.
6. C. Main, Mechanical Superintendent.
7. R. G. Watson, Mechanical Superintendent.

8. Wm. Lindsay, Mechanical Department.
9. Wm. McGrath, Mechanical Department.
10. Thos. Blackwood, Sinking Foreman.
11. M. J. Murphy, Sinking Foreman.
12. J. B. Gilliatt, Chief Surveyor.
13. John Harvey, Heading Boss.
14. John Gunn, Heading Boss.
15. Fred Droken, Heading Boss
16. Fred Noftall, Heading Boss
17. Reid Proudfoot, Accountant.

The number identifies the persons shown on the accompanying photographs.

The improved efficiency in driving these slopes in comparison with other similar work previously done is attributal to two principal causes, viz.:

A system of trammung was adopted, by which the muck at the face was more quickly disposed of after blasting. The crosscuts, which were located at about 1200 feet intervals, were driven at an angle of about 30 degrees with the centre line or slopes instead of at right angles, as in the previous slopes. This enabled a hoisting engine of large capacity stationed at the surface deckhead to tram from both the East and West Slopes with very little delay of trips. Smaller electric engines did the trammung at the immediate faces, and assembled the trips for the longer hoist to the deck. By fans of ample capacity connected to the surface deckhead, an ample volume of air was supplied to the working faces, enabling work to be resumed at a comparatively short time after blasting, and helped to maintain the energy and efficiency of the workmen.

*View of Dockhead, Ore Bins and Picking-Belt House at No. 3 Scotia Slopes.*

### Bonus System of Payment to Workmen.

Another factor, which contributed largely to increased efficiency was a well adjusted bonus system. All foremen and laborers underground received an advance in their wages varying up to 75 per cent, according to the advance made per week. This bonus system was largely responsible for the continued interest and effort on the part of all concerned, and contributed much to the successful completion of the work. There being a time limit, it was necessary to excavate from both ends, necessitating very careful surveying to ensure the proper connections. In the final break-through the error was found to be so small as to be inappreciable.

### Rate of Progress.

The cross section of the slopes is 10' x 15' inside timbers, which necessitated about 11' x 17' of excavation. The total length driven in the West Slope is 11,233 ft. and in the East Slope 10,755 ft. The best week's work in the West Slope was 83 feet for the week ending April 15th, 1918 and in the East Slope 81 feet for the week ending April 8th, 1917.

The best months advance for the West Heading was 344 feet in April, 1917, and for the East Heading 285 feet in, October, 1916.

The total excavation for both slopes was 127,613 cu. yds. with an overbreak of 11,315 yards or 8.8 per cent.

### Power Plant.

A most important factor in work of this description is a careful preliminary study of the plant required and it is false economy to endeavor to save on this

item. Fortunately in this case, the Mine having been in operation for many years with a large accumulation of various machines, the purchase of such new material was not necessary, but even in cases where new purchases are necessary, machines of ample capacity should be secured for drilling, hoisting, pumping and ventilation.

The following is a brief resume of the plant required and used for this work and for help in the preparation of which acknowledgment is made of the assistance of the officials at the Mine.

The regular mining plant supplied the requirements for Boilers, Electric Power, Compressors and some other items, and it being impossible to separate the two services the whole plant is referred to in the lists of those three services.

### Boilers.

Steam was obtained from boilers of the general mining plant consisting in part of 3 batteries (6 boilers) Sterling water-tube boilers, 231 h.p. each, 1 boiler 200 lbs. pressure 100 degrees superheat with chain-grate stokers.

At the central air-plant, 1 battery (2 boilers) same dimensions hand fired, and 1 battery (2 boilers) at the old submarine or No. 2 Slopes.

### Electric Plant.

Electric power also from the general mining plant consisted of 2 Brown-Boveri, 3 phase, 60 cycle, 500 K. W. generators, 6,800 volts, driven by Belliss & Morcom triple expansion condensing engines.

*Main Slope Ore-Car. Makes the trip of two miles in five minutes with 20 tons of ore.*

*View of Break-through of the Slopes. This took place in No. 3 West, at 7,500 ft. down from the surface, or two-thirds of distance.*

*Another View of Deckhead, etc., at No. 3 Slopes.*

### Air Compressors.

1 Walker duplex Cross Compound 3,500 cubic feet per minute capacity.

1 Nordberg duplex cross-compound of 2,700 cu. ft. per minute capacity.

1 Reavell electric Single-Stage, 4 cylinder of 500 cu. ft. per minute capacity.

1 Sullivan electric of 625 cu. ft. per minute capacity.

### Hoisting Engines.

In the early stages of sinking a Lidgerwood 10 x 12 steam hoist converted to an electric with 52 H.P. Westinghouse motor at the West Slope and one of similar capacity at the East Slope were sufficient. As the face advanced however, it was necessary to install a 112 H.P. single-drum Lidgerwood at the West Slope freeing the one previously in use, for handling the rock to the waste dump on the surface.

Subsequently a 50 H.P. electric hoist was set up near each face for handling and assembling the trips. Still greater depth necessitated an electric hoist with 2-112 H.P. motors at the surface and before the completion of the slopes it was necessary to still further supplement this by stage hoisting with an additional engine of the same type installed at No. 4 Crosscut.

### Ventilation Plant.

Very careful preliminary study was given to this as a result of which a 48" Sturtevant fan was installed at the air shaft to produce a circulation of 15,000 cu. ft. of air through the Slopes and lowest crosscut; the upper crosscut being of course, built off as the lower was connected.

In driving below the lowest crosscut by installing between each face and the lowest crosscut a 20 H.P. electric fan of 5,000 feet capacity each, connected by spiral rivetted pipe of 15 inch and 18 inch diameter, it was found possible to advance the faces 1,200 feet beyond each crosscut before driving the following

one. Pressure fans were used because the heavy current of air blowing from the end of the ventilation pipe was found to sweep the working face and clean the atmosphere much more quickly than the exhaust method.

This installation enabled the dynamite smoke to be cleared from the faces promptly after blasting, permitting work to be resumed with a minimum of delay.

### Drills.

At the start the U. D. Sullivan piston drill was sufficient. As the work advanced however and some quartzite bands of extreme hardness were encountered, it was necessary to change to the D. R. 6 water-tube bit, self-rotating hammer drills. These latter proved eminently satisfactory and while somewhat expensive in maintenance were a very important factor in the successful completion of the work.

### Pumps and Pipes.

Although it was expected that much water might be encountered in these slopes, this was fortunately not realized, the quantity being considerable but not excessive. In anticipation of contingencies however, a pretty complete installation of pumps was made and without going into particulars of their location, etc., they consisted of the following:

4 No. 6 Cameron Pumps.

1 18 x 18 x 29 Jeansville Pump.

2 10 H.P. 2 Stage Allis Chalmers Centrifugal Pumps. and as spares,

1 No. 6 Cameron.

1 12 x 15 x 13 Knowles Sinking Pump.

Two 8" pipe lines were carried along as the slopes progressed, these being supplemented by the necessary branches and extensions of smaller diameter.

In event of meeting a very large flow of water, which it was proper to provide for, a grouting machine

*Surface Stripping on the Dominion Ore-bed, showing regular dip of seam, and characteristic cubical fracture of ore.*

Localities referred to in memoir shown thus 206  
 Based on map by J. F. Chambers, Jan 1900  
 and survey by G. W. Higgins and A. D. Hayes 1914

Outcrops of Ore-Beds on Bell Island.

capable of injecting cement grout against a pressure of 600 lbs. per square inch was constructed, and kept ready for emergency near the work. This machine was similar to those used in the New York underground tunnels of New York city and was under the supervision of a specialist in this line from there, who spent some time at Wabana.

**Tramming.**

Perhaps of first importance in any work of this kind is an efficient system of tramming.

Cars of 30 cubic feet capacity running on 30 lb. rails with track of 3 ft. gauge in trips of 5 or 6 cars handled by the capacious engines above referred to, resulted in prompt removal of the muck after each blast and did the work under this heading in a satisfactory manner.

**Protection from Runaway Cars.**

Sampson Posts and other swinging gates were installed above the working faces for the protection of the miners at the face, and also a trailer used behind each trip. The gates and posts were promptly moved ahead as the face advanced, the result being a comparative freedom from accidents from this cause.

**Surveys.**

In a recent issue of the Canadian Mining Journal, James Purves, described a very creditable survey of slopes constructed at Princess Colliery, Sydney Mines, very similar to those under discussion.\* The length of both was about two miles, but the angle of inclination 5 per cent at Princess and 13 per cent at Wabana. The principal difficulty encountered at Princess was from unstable or shifting ground, the conditions being not quite as bad as near the Pitch Lake in Trinidad where a line of stakes run straight at night is a series of curves the next morning, but having the same difficulties in a lesser degree. This difficulty made the result achieved by Mr. Purves very creditable.

The ground was firm enough at Wabana but probably the distance of carrying the survey rather greater, being at the time of the connection of headings, on account of the slopes being driven from both ends about four miles. The surface or descending end of the slopes were started on the produced centre line of the old No. 2 Slopes, a base line was then established and its alignment produced over the surface and down No. 2 West Slope to the main level in the submarine workings. A traverse by way of the levels and submarine workings and a slant excavated for the purpose to a point on the desired centre line, about 9,000 ft. from the surface, from which point angles were turned to the proper course, and the uphill driving commenced resulted successfully.

Grades and alignment were carried by plugs driven into holes in the solid roof. After about five years of excavation, the downhill and uphill headings finally met with the following result.

- Error in alignment, . . . . . 0.10 feet
- Error in elevation, . . . . . 0.217 feet
- Error in chainage, . . . . . 0.062 feet

\* See Canadian Mining Journal, p. 804, 1919.

Plan and Section of the No. 3 Slopes.—Nova Scotia Steel & Coal Co., Wabana, Newfoundland.

Members of Staff connected with Sinking of No. 3 Slopes.  
See page 243 for index to names.

The greater error of elevation over alignment was to be expected from the necessarily short sights in a slope of 13 per cent inclination.

#### Method of Working.

The length of shifts was 10 hours commencing at 7 a. m. and 7 p. m.

Blasting was done in the intervening hours between shifts.

The method of drilling and blasting was similar to that employed in driving No. 2 Slopes, which was described in Volume 12, of the Journal of the Canadian Mining Institute.

The shifts were commenced by the preparatory work of cleaning back the muck from the face and connecting up air and water lines. This accomplished the routine work of drilling, mucking and timbering as far forward as practicable without interfering with the work at the face, was rushed till the accumulated pile from the previous blast was sent to the surface.

The blasters now took charge as soon as the shift men were hoisted to the surface. After blasting and a reasonable time allowed for the smoke to clear away, the face was examined for missholes, loose rock taken down by the face cleaners, and after the place being reported safe, the same routine followed by the succeeding shift.

The regular timbering was kept advanced as near to the working face as possible, which in practice was found to be 60 or 70 feet. Where required temporary timbers were put in in this intervening distance, but usually the roof was firm enough to stand up till the regular timbering force working behind the excavation made it secure.

The very effective type of haulage successfully used for the first time in these slopes is of special importance to the steel industry of Cape Breton inasmuch as it points to a solution of the haulage problems arising from the moving of submarine deposits of coal at increasing distances as the working faces recede from the shore.

**MR. RICHARD BROWN, M. E.—1805-1882.****MR. RICHARD HENRY BROWN, M.E. — 1838-1920.**

An Appreciation by THOS. J. BROWN, Sydney Mines, Nova Scotia.

On the 9th day of February in this year, at his home in Halifax, after a few hours illness, died Mr. Richard Henry Brown, at the age of 82 years. The names of Mr. Brown and his father, Mr. Richard Brown, have been so long and so creditably associated with coal mining and its kindred interests in this province, it is appropriate that your paper should record these few appreciatory remarks. It is a very remarkable fact that these two gentlemen, father and son, should have had control of the affairs of the principal, and at one time, the only company engaged in the mining of coal in this province, for the extraordinary span of 74 years, and it is also a remarkable coincidence that each gentleman served exactly the same length of time, 37 years.

The father, Mr. Richard Brown, F.G.S. F.R.G.S., was born at Lowther, Cumberlandshire, England, on May 2, 1805, and came to Cape Breton as the agent of the General Mining Association of London in the year 1827. In June of the year 1864 he resigned the position of agent and manager in favor of his son Richard Henry, and returned to London, England, where he died on the 30th of October 1882. He married Sibella daughter of Captain Barrington, of the 60th Rifles. Their children were two daughters, Margaret and Sibella, and four sons, Richard, Charles, David and Henry.

Mr. Brown, aside from being a practical mining engineer and expert, was a great student of geology and history and was closely identified with such noted authorities as Sir Charles Lyell and Sir William Dawson, the two famous geologists of those days. He added many valuable papers to the engineering and geological literature of his time and some rare geological specimens and fossil remains were through his efforts supplied, and added to the English and Canadian collections. As the result of his geological research work in Cape Breton, he wrote a "History of the Coal Trade of the Island of Cape Breton," a book filled with the most accurate information which is still used as a reference book on the subject, and those who have occasion to refer to the book are amazed at the amount and the accuracy of the information it contains, particularly when it is remembered that the information about the outcrops, thickness and quality of the various coal seams was collected when the country was a wilderness and the means of travel very limited. The attention he gave to a study of the Island's history, the attachment he had for the place of his adoption, the interest he manifested in the youth of Cape Breton, caused him to write a "History of the Island of Cape Breton." This he did after his retirement to England, and the work which he dedicated to the youth of Cape Breton is an interesting and invaluable one.

He was the first man in Cape Breton to see and appreciate the value of the Island's under-sea coal measures. His faith was manifested in a decision to sink a shaft at the water's edge for the purpose of winning the coal underlying the sea. This was pioneer work, and the engineer who undertook to advise the company to sink this mine through strata filled with sea water for the purpose of mining coal under the sea, must have been an engineer of remarkable foresight

and courage, and such undoubtedly was Mr. Brown. The undertaking was proceeded with, and after eight years of many difficulties and dangers, the work was completed. The Winning is what is now known as the Princess shaft of the Nova Scotia Steel and Coal Company, and has produced coal uninterruptedly from the year of its opening to the present time. To his son was left the task of completing the work. It became necessary owing to the sea breaking into it, to line the shaft with metal to keep the water back and the successful completion of this work was considered an engineering feat of considerable consequence in those days. The son was also called upon to face the problems of the extraction of coal under sea. They were many and serious, but the plans and intentions of the one were ably executed by the other, and mining engineers engaged in this field of work today willingly pay tribute to the courage and foresight of the Browns, both father and son.

Richard Henry Brown, M.E., was born in London in the year 1838. His early education was received at the Collegiate School, Windsor, N. S., and subsequently he attended the engineering department in the St. Lawrence Scientific School at Harvard University. He spent some years as a student of mining in the Seaton collieries in the north of England and served under the celebrated mining engineer, Mr. Thomas E. Forster, of Newcastle-on-Tyne. On the first of July, 1864, he succeeded his father as the agent manager of the General Mining Association in Cape Breton. In addition to the management of Sydney Mines, Mr. Brown has also the management of the Lingan and Victoria collieries, which were then operated by the Association. He continued in the management of Sydney Mines for the Association until they sold out to the Nova Scotia Steel & Coal Company, in the year 1900, and continued as manager for the new company until they got nicely underway, when he decided to retire to Halifax to spend his declining years.

Mr. Brown was the first mayor of the town of Sydney Mines, and unopposed held the position until his duties began to interfere with his duties as manager, when he retired in favor of others.

He married Barbara Davidson of Pictou, and their family are one son, Richard now engaged in business at Sydney Mines, and four daughters, Annie the late wife of Dr. Lewis W. Johnstone of Sydney Mines, Margaret, Elizabeth and Lillian, living at their home, Kent street, Halifax.

The names of the Browns, both father and son, will always be associated with the coal industry of Nova Scotia. They were both remarkable men of untiring industry and unflinching integrity. Their word was their bond and they built up for the English interests they so long and ably represented in this country, a wide reputation for honesty and fair dealing.

Consistently throughout his whole lifetime, Mr. R. H. Brown was an exceptionally good living man. He had very high ideals and was scrupulously honest and upright in all his dealings. He never failed to be solicitous for, interested in and thoughtful of the sick and needy. He was notably open and honest in all his dealings and absolutely incapable of deception.

At Sydney Mines a few days ago when the many old friends of the late Mr. Brown gathered around his remains to pay him their last tribute of respect all felt they were parting with an old friend, who in his particular sphere of life had industriously striven

to do his duty, and had gone to his reward leaving after him the proud record of having been a good Christian citizen, a loving, thoughtful husband and parent and an honest straight-living, God-fearing man.

Note:—The Editor is very glad to publish the foregoing account of the life of the Browns of Sydney Mines, prepared by Mr. T. J. Brown, General Superintendent of the Nova Scotia Steel and Coal Company at Sydney Mines. Mr. T. J. Brown, it may be mentioned, is not a relative of the two gentlemen whose life he has detailed, although by a curious coincidence his name has continued the long tradition in the management of the Sydney Mines collieries.

### THE GOWGANDA RAILWAY PROJECT

Editor,  
Canadian Mining Journal.

Sir:—

Mr. F. B. Macaulay, in your issue for February 25th, forgot to tell us, that Uncle Samuel is a member of, what I believe, is termed the Pan American Union, composed of the South and Central American countries. These countries are known to possess partly developed and undeveloped mining, agriculture and range land as well as timber. May not Uncle Samuel insist in getting paid in gold, from John Bull & Sons, and devote his trade, money and gambling spirit, towards developing the South American countries?

Canada today needs every man and every dollar she can secure for the purpose of developing her natural resources and it is safe to say, that had it not been for the American gambler, Canada would have had no nickel from Sudbury, no coal from the Crow's Nest, no gold and copper from Rossland and Boundary, in fact mighty little of anything, but an unexplored wilderness in possession of the Hudson Bay trapper.

The history of Canadian development shows that John Bull & Sons is more apt to invest in a hole in the ground, from which Uncle Samuel has shipped ore, than to risk irrational development. There is to be admitted, that now and then, there is an exceptional case in which John Bull & Sons shows pluck. One of these instances referred to is the history of development of the Miller-Lake O'Brien at Gowganda. To offset that, however, we have the faint heartedness of the Province of Ontario, which during the last ten years has failed to muster sufficient courage to build twenty-seven miles of railway into what undoubtedly will prove a second Cobalt, namely Gowganda.

During the last five years, newspapers, periodicals and patriots, have carried on a useless and today, it is beginning to be realized, an unprofitable agitation and demonstration against the Aliens in Canada.

Prohibition of trade, wholly or in part, with the country to the South of us, is likely to prove equally unprofitable.

Without the men, who are willing to risk their capital, and the men to carry on the work, the minerals contained in the Canadian rocks are of no service.

L. O. HEDLUND,

Gowganda, March 5th 1920.

We think that Mr. Hedlund has misunderstood Mr. Macaulay, who did not desire to discourage the United States capitalist from bringing his money into Canada. What he wished to discourage was sending Canadian

gold out of Canada. When Uncle Sam's sons invest money in Canada, as so many of them have done and are still doing, they become members of the firm of John Bull & Sons, and the trading is all done within the family. As to the "exceptional cases in which John Bull and Sons shows pluck" we leave that to our readers. During the past six years the firm has incurred heavy liabilities, yet when we read in one issue of the daily paper that the old man has occupied Constantinople and has sent warships to the United States with \$40,000,000 in gold, we surmise there's life in the old dog yet.—Ed.

### PORT ARTHUR NOTES.

Robert Wachman, President of the Wachman Mining and Milling Co., Ltd, Dryden, Ontario, is in Port Arthur superintending the shipment of six cars of machinery, from Kawene, on the Canadian National Railway, to the Company's property, situated seven miles south of Dryden. On arrival at the mine, this machinery will be installed in their new 20 Stamp Mill, now nearing completion. It was originally intended to have the Stamp Mill in operation on May 1st. It is found that this will be impossible, and it is now the intention to begin dropping the stamps on June 1st.

Fifty men have been employed during the winter. Camps are all completed, and a wharf is now under construction.

No. 1 shaft is down 53 feet. The vein has widened to 8 feet of solid quartz, carrying average values of \$20.60 per ton. No. 2 shaft is down 27 feet, bottomed in rich spectacular ore, a quantity of which is now on exhibition at Dryden.

J. I. Carmichael, M.E. of Winnipeg, has recently reported on the property for the shareholders. Prof. Kay, of the University of Iowa, has just completed an examination, and has made a highly satisfactory report, remarking that it has a great future.

The main vein has been uncovered for seventy feet, south from shaft No. 1 visible gold shows for practically the whole distance.

The Contact Bay Mining Co. (formerly Rognon) are opening up three properties adjoining the Wachman. They are down 110 feet. At the 100 foot level a drift is being pushed north in the direction of the Wachman, in which they have encountered an ore chimney, averaging \$70. per ton. This is a continuation of the Wachman vein, and crosses both properties.

The Iowa-Canadian Mining Co. are opening up three properties about four miles from Contact Bay. At present they are employing 12 miners, this force will be largely increased in the near future. There are four parallel veins on their lands, with a dip that indicates they will come together at a reasonable depth. Carefully taken channel samples taken from the surface show an average of \$55.60 per ton, over the four. Test pits put down at the top of a hill show the vein to be 4 feet in width. Pits sunk at the bottom of the hill show the vein to be 8 feet in width.

Visible gold is found in all of these veins.

All the necessary sinking and hoisting plant has been purchased at Gold Rock, and will be immediately installed.

**NORTHERN MANITOBA MINES.**

By R. E. HORE.

**Activity at Flin Flon This Year.**

It was announced last week that the copper deposit at Flin Flon Lake, Manitoba, would be developed this summer by Col. W. B. Thompson and associates. Additional information is given in the Mar. 12 number of "Engineering and Mining Journal", to the effect that W. J. Judson, C. F. Ayers and a certain mining company are associated with Col. Thompson in the deal. The price is said to be \$1,500,000, payable in cash at the end of one year. It is understood that the prospective purchasers have agreed to spend \$200,000 on the property. The plant at the Mandy mine has been purchased and \$60,000 worth of equipment and supplies is being taken to the property.

The Flin Flon is situated in the Pas district Northern Manitoba. The Manitoba-Saskatchewan boundary line crosses the ore deposit; the greater part of the known ore is in Manitoba, but Saskatchewan will become a copper producer when the Flin Flon is in operation. It is not unlikely that the work done this year will result in big undertakings later. A railway 80 miles long will give the necessary transportation facilities. Water-power can be developed at Birch Rapids on the Sturgeon river or at Island falls on the Churchill river. The size of the ore deposit is such that large scale operations will be possible, and a smelter that will treat 2,000 tons daily is spoken of.

That a project of this nature will mean much for Manitoba is obvious. By encouraging such projects our governments will help to bring about a better balance of industrial activities in the Prairie Provinces. The announcement that the Flin Flon project is finally well under way, should prove encouraging to other enterprising persons, for Northern Manitoba is a very promising field and there is now firmer ground for believing that the governments concerned will not be unappreciative of the desirability of establishing mining industries in the province which do not own the minerals within their borders.

**Discovery of the Mandy Mine.**

The Mandy mine in the Pas district Northern Manitoba has been an important factor in drawing attention to the mineral possibilities of the Prairie Provinces. From this property there has been mined about 25,000 tons of high grade, 19 per cent. copper, ore during the past few years. Operations have been discontinued but are likely to be resumed when the transportation facilities are available. It is estimated that there is 200,000 tons of mixed copper-zinc-iron ore blocked out in the mine. If the Flin Flon property is developed and a smelter built, the Mandy mine will be heard from again.

As this is Manitoba's first producing copper mine, the story of its discovery and development is of special interest. This story is told by Mr. J. E. Spurr in the March 13th number of "Engineering and Mining Journal". Mr. Spurr has been identified with the enterprise from its birth and he gives an intimate account of the events leading up to the discovery.

**Appreciation of Government Assistance.**

The need of continually calling on governments to take action that will help to bring about more rapidly the development of our mineral resources is well recognized. It may not be out of place, however, to state that public commendation of what our governments do for the industry is also desirable. It is therefore

with pleasure that I read Mr. J. E. Spurr's statement that in the development of the Mandy mine, the Manitoba Government "was very liberal and helpful". This statement is both courteous and well deserved and would be less noteworthy if it were less exceptional.

Criticism of our governments policies effecting mining is intended to be constructive, and it is commonly taken for granted that the good features of mining laws in Canada need no publicity. A little commendation is nevertheless desirable.

**INTERNATIONAL MINING CONVENTION****Seattle, Washington, U.S.A., April 7th to 10th 1920.**

When the very successful International Mining Convention was held in Vancouver in March 1919, the Seattle delegates anticipated a return visit to the Convention of 1920 in that City reciprocating by British Columbia mining men the large attendance of visitors from across the line at Vancouver, and indications are that this hope will be fulfilled.

The Official Call is now issued, and the object of the Convention is stated to be to bring together from around the "Rim of the Pacific" those interested in mining and its allied interests. Among subjects to be ventilated are the following:

**GOLD.**—The American Mining Congress is sponsor for a bill which is to be placed before the U. S. Congress immediately asking for a bonus of ten dollars per oz. on all gold mined. An address will be given by Mr. John Clawson, formerly with the Chemical National Bank in New York, and now with the Union National Bank at Seattle. Another banker, Mr. Crawford of Portland, Or., will address the Convention. Mr. Crawford originated the resolution asking for a bonus on gold that was passed by the American Bankers' Association at Chicago in 1919. It is hoped that a talk on gold from the miner's standpoint will be given by Governor Emmet D. Boyle, of Nevada, who fathered the Pittman Act regulating the price of American silver. There is no subject more discussed in mining conventions today, and less understood, than the status of gold and gold-mining, and a lively discussion may be anticipated.

**IRON AND STEEL.**—Many facts regarding the manufacture of iron and steel on the Pacific Coast will be presented, and discussion is also likely to be animated on this question, which greatly interests the North-West at this time.

Addresses are expected from C. P. Bowie, of the U. S. Bureau of Mines, on Petroleum, by Dorsey A. Lynn, also of the Bureau of Mines, on the needs of the mining industry; on electro-metallurgy, by O. C. Ralston, and by Mr. T. A. Rickards with regard to mining investments. The Minister of Mines for British Columbia is expected to speak with regard to British Columbia iron resources. Prof. Joseph Daniels will speak regarding the Coal Resources of the North-West, as to which he is very well informed. Mr. J. G. Ralston, hydraulic engineer, of Spokane, will speak on the water powers of the North-West, and will explain the effect upon the public of the recent legislation of the Congress of the United States on water-powers.

It is announced by several Seattle hotels that Canadian money will be received at par.

An exhibition of minerals will be feature of the Convention, and arrangements are being made for suitable entertainment of the visitors. The address of the Convention Headquarters is 1316, L. C. Smith Building, Seattle.

# Our Northern Ontario Letter

## THE SILVER MINES

In the midst of world amazement at the lightning-like social and political upheaval throughout the German Empire, interest in silver during the past week or so showed a slight decline, and resulted in a considerable recessions in quotations for the metal. The slump in the opinion of Canadian silver mine operators, is but temporary, and when the concrete results of the present new wave of added destruction in old Europe emerge, the demand for silver is believed likely to be renewed afresh and to be intensified.

Mindful, also, of among other things of the official statement made by Chang Kung-chuen, Vice-Governor of the Bank of China, that the appetite for silver in the Far East is indeed proving to be insatiable, and that hoarding is now more general than ever, the silver producers of the Cobalt district do not regard with any undue alarm the fluctuating quotations. To the contrary, there appears to be a more deeply rooted belief that with the world literally flooded with paper currency, the demand for the precious metals may not yet have reached the peak, and that another sustained upward swing in quotations is not at all improbable.

During the past week or so practically no bullion has been shipped from the big silver producers of Northern Ontario. In the meantime, production is proceeding at full blast, and the vaults which but yesterday, so to speak, were looted clean of their precious contents on account of the high quotations for silver bullion, are being rapidly refilled during the present period of but only a slight decline in prices.

Added evidence of the general prosperity in the Cobalt field is this week's official statement by the McKinley-Darragh Mines, as well as by the La Rose Consolidated, covering operation during the year 1919.

For the twelve months ended December 31st, last, the La Rose produced 289,317 ounces of silver, the value of which was \$356,124, or an average of \$1.17 an ounce, as compared with an average of 99.83 cents an ounce in 1918. The surplus at the end of the year amounted to \$514,424, compared with \$456,046 in the previous year. Of its entire surplus, the La Rose holds \$372,834 in cash, call loans and Victory Bonds. Also, since the report was issued, development work on the Company's University property has been quite favorable, and the general outlook for 1920 is good.

The Mc-Kinley-Darragh in 1919, in spite of last summer's labor strike, added upwards of 200,00 ounces of silver to ore reserves. Production for the year amounted to 767,798 ounces, against which 970,021 ounces in new ore was developed. Ore reserves at the beginning of 1920 are estimated at 1,077,411 ounces, as compared with 852,754 ounces at the beginning of 1919. Current assets are \$579,100.30, while the net surplus, after providing for a dividend of \$67,430.76 at the beginning of this year, amounts to \$365,601.92. The average cost amounted to a little under 72 cents an ounce, while the average price received amounted to close to \$1.11 an ounce.

Following is a summary of production and costs since the company first commenced operations:—

## Ounces Recovered to Date

Year.	Ozs.
1906-7.....	749,216
1908.....	718,068
1909.....	1,297,326
1910.....	2,356,006

1918.....	904,543
1919.....	767,798

Tot. to Jan. 1, 1920 18,995,443

## Costs and Profits Compared

Years	Ave. Price Received	Total Costs.	Net Profits Per Ounce
1906-7 .. . . .	0.59	\$0.2614	\$0.3286
1908 .. . . .	0.52	0.2341	0.2859
1909 .. . . .	0.5131	0.2263	0.2868
1910 .. . . .	0.5405	0.1705	0.3700
1911 .. . . .	0.5416	0.19479	0.34681
1912 .. . . .	0.6166	0.1859	0.4307
1913 .. . . .	0.5919	0.2233	0.3686
1914 .. . . .	0.54385	0.31325	0.2306
1915 .. . . .	0.50785	0.28710	0.22075
1916 .. . . .	0.67364	0.40730	0.26634
1917 .. . . .	0.8320	0.5709	0.2611
1918 .. . . .	0.99724	0.6842	0.31304
1919 .. . . .	1.1065	0.7113	0.3872

During 1919 the Right-of-Way Mine was not operated profitably. The directors have advanced personally to date \$21,000. The profit and loss account shows a balance at debit of \$12,661 at the end of 1919, as compared with the balance at credit of \$514 at the beginning of the year. Current assets total \$9,049, while the current liabilities amount to \$16,443.

Negotiations in connection with the proposed merging of the Adanac and the Victory Silver Mines have taken a more favorable turn and now offer fair promise of being concluded successfully within a reasonably short time. It is stated that operations on the Hylands property of the Victory Company is now practically assured, either as a result of completing the merger or with the support of Buffalo capital. The basis of the proposed new merger is to organize a new company with an authorized capital of \$3,000,000, made up of 3,000,000 shares of the par value of \$1. each. Of this, 1,000,000 shares would go to the present Adanac shareholders, 1,000,000 to the owners of the Victory Silver Mines, and leave 1,000,000 shares in the treasury, to be sold at some subsequent date for the purpose of financing operations.

The Oxford-Cobalt Company, with property in Gillies Limit about one mile south from the Kerr Lake Mine is arranging to commence sinking at an early date. A small circular letter has just been sent out, dealing with the promising outlook at the property and offering shares for sale. It is stated that a five-inch vein on the property has been found to contain 25 ounces of silver to the ton.

In the Gowganda district, attention is centering with renewed interest on the Castle property of the Trethewey-Cobalt Company, from which it is intimated that a carload of ore may be sent out within the next few weeks. While various reports in circulation greatly exaggerate the true physical condition of the mine, it is learned that the result of work has been extremely satisfactory, and that a considerable tonnage of high grade ore is already assembled ready for shipment, and that it is quite reasonable to expect such a shipment to be made before the spring break-up. The proceeds from such a car could then be used in connection with work of developing additional ore and assembling further high-grade for shipment at such time as transportation facilities appear to warrant it.

During the week ended March 19th, the Coniagas was the only company to ship ore from Cobalt. Three cars were sent out by the company, consigned to the Coniagas Reduction works at Thorold.

The total ore contained in the three cars amounted to 194,458 tons.

### THE GOLD MINES

Now that the mining companies of Porcupine have made a similar announcement to that of the Kirkland Lake Companies in connection with increased wages, the general belief is that mine workers will be attracted to the gold mining districts in increasing numbers. The new wage scale adopted, place the mine worker on a similar basis as at Cobalt when the price of silver averages between \$1.20 and \$1.30 an ounce. At Cobalt the muckers, etc., are paid \$3.25 a day plus a bonus of 25 cents a day for each ten points to which silver advances above 80 cents an ounce, so that with silver at \$1.20 an ounce the bonus amounts to \$1 extra, making a total of \$4.25 for each eight-hour day worked. The scale to machine runners is \$3.75 a day plus a similar bonus as to the muckers, making a total of \$4.75 a day. Compared with this, the announcement is made, both at Porcupine and Kirkland Lake that muckers, etc., will be paid \$4.25 a day and machine runners \$4.75.

The changed policy of the Porcupine companies in regard to their wage schedules is commented on favorably by mining men in general. The departure from the former flat rate of \$4 a day to all underground workers is regarded favorably. The system of classification of labor is generally believed to be preferable, and the present return to such a policy is welcomed. Early difficulties have arisen, however, but they promise to be adjusted satisfactorily. For instance, without former classification, it was inevitable that in making the change the more skilled labor would receive a greater increase than the unskilled and that some dissatisfaction would be expressed by the latter.

The mill at the Porcupine Crown Mine has been set in operation and with half a year's broken ore available no difficulty is expected in getting up to full capacity.

Last week's statement in the "Journal" showing official figures in connection with the tonnage treated and the gold produced by the Dome Mines has aroused considerable favorable comment in mining circles. While it is recognized that in recovering \$6.87 a ton, a higher grade ore than the mine's average was being treated, yet it is thought that when mill capacity is increased another 1,000 tons a month, the lower average mill-

heads may still leave a total net profit almost equal to that being realized while operating on high heads but on about two-thirds of mill equipment. It would perhaps be only fair to suggest that shareholders would do well to take into account the fact that the average gold content in the Dome's ore as estimated in latest reports is \$5.10 per ton, and that it may be possible that costs will rule high for some time. Should this be true, it might not be well to figure on more than \$1.50 profit on each ton treated, should this prove to be the case, the mill running at full capacity of from 40,000 to 45,000 tons a month would result in producing from \$200,000 to \$225,000 gross monthly, or a monthly net profit of between \$60,000 and \$70,000. In order to pay dividends at the rate of 20 per cent annually, it is only necessary to realize net profits of \$66,666 monthly. Thus in dealing with the Dome on this ultra-conservative basis, the shareholders of the company would appear to have reasons for being exceedingly confident.

At Kirkland Lake, April 15th is the probable date on which the Wright-Hargreaves Company will commence the construction of its big cyanide mill. James Grant has been in the service of the Company for the past several months, having designed the mill the chief parts of which have already been transported to the mine. The reduction plant is to have a capacity for treating at least 200 tons daily, and will be similar to that of the Lake Shore. Continuous counter-current decantation will be the process. The mine itself is highly developed, there being upwards of a dozen faces from which ore may be drawn.

The Ontario-Kirkland will continue its main shaft from the present depth of 300 feet to about 500 feet at which point it is proposed to establish another development level. The ore body developed at the 300-foot level will be developed to as great a depth as possible, during the course of which it is planned to erect a new mill. The aggressive and business-like way in which the Ontario-Kirkland (formerly the Hurd claims) has been developed has been one of the outstanding favorable features in connection with the Kirkland Lake Camp.

It is estimated that the combined current output from the Lake Shore, Teck-Hughes and the Kirkland Lake is at the rate of between \$90,000 and \$100,000 a month. Following the completion of the Wright-work with the Tough-Oaks mill, it is believed that this Hargreaves mill together with the resumption of production may be doubled.

The Miller Independence Mines will probably turn on electric energy this week, following a number of unfavorable delays, and from now on the work of developing the mine will be speeded up considerably. A contract for some 300 feet of lateral work at the 500-foot level has been let, and rapid progress is expected, both at the depth and on development work that is also to be carried through an incline shaft from surface (and following the ore body in which gold tellurides occur).

The Peerless Company is making good headway in continuing its shaft to the 250-foot level. The recent report that a five-foot vein had been encountered at a depth of about 160 feet has been officially confirmed, but it is learned that the mineralization was not as heavy as that at first reported.

The Better 'Ole Mining Syndicate has been formed with object in view of developing a group of claims in the Sesekinika Lake district, in the township of Maisonneville, adjoining the Murray-Mogridge property. The syndicate is capitalized at \$100,000, made up of 2,000 share of the par value of \$50 each. It owns 320 acres of territory, and includes the two Ashly claims which were staked six or seven years ago. Nothing was done on the property during recent years owing to the owner being overseas, but it is to be proposed to carry out sinking operations. A feature in connection with the new syndicate is that Captain Bruce Bairnsfather, the clever cartoonist who turned the grim tragedies of war to fun, and whose work became famous in many countries, is a member of the Better 'Ole Mining Syndicate.

### MINING PERSONALS

Ernest C. Johnson, president of the Marathon Mill and Machinery Works, Chicago, as well as the Johnson Engineering Works is spending a few days in the mining districts of Cobalt, Boston Creek, Kirkland Lake and Poreupine. Mr. Johnson is the inventor of the Marathon Grinding Mill.

Mr. Hubbell, representing the American Cyanamid Company, Niagara Falls, Ont., was a business visitor in Cobalt this week, and returned south last night.

Wm. Gowans, of the staff of the Eastern Mining and Milling Company, at Eastman, Que., some 25 miles from Sherbrooke, is visiting at his home in Haileybury. Mr. Gowans declares that excellent progress is being made on the copper property of the Eastern Mining and Milling Company and that the mill is treating about 140 tons of ore daily.

T. J. Flynn, of the Port Matchewan Gold Mine is in Haileybury on business.

### OFFICERS AND OBJECTS OF THE ONTARIO MINING ASSOCIATION.

An organization to be known as "The Ontario Mining Association" was effected in Toronto on March 9th, 1920.

The object of the association will be to foster the development of the industry and to co-operate with the Mines Department of the Ontario and Dominion Governments.

By collecting and consolidating data and statistics relating to the industry the Association will be in a position to supply authoritative information hitherto unavailable in the hope that the people of Ontario may gain a more reasonable and keener appreciation of the importance and problems of the industry.

The following is a list of the Officers and Directors:

President: A. D. Miles, Toronto; 1st Vice-President: A. F. Brigham, Poreupine; 2nd Vice-President: Col. R. W. Leonard, St. Catharines; Directors: C. W. Corless, Sudbury; C. D. Kaeding, Poreupine; H. H. Kea, Cobalt; H. Park, Cobalt; F. L. Culver, Kirkland Lake; Mr. Cowie, Sault Ste. Marie; W. A. Carlyle, Ottawa; G. H. Gillespie, Madoe; A. J. Young, Toronto; G. C. Bateman, Toronto; J. P. Bickell, Toronto, Alex. Fasken, Toronto; Secretary-Treasurer: B. Neilly, Toronto.

These Directors represent the following branches of the Mining Industry:

- (1) Poreupine, Kirkland Lake and Boston Creek gold districts.
- (2) Cobalt and Gowganda silver district.
- (3) Nickel, Copper Mining, Smelting and Refining Industry.

(4) Iron and Sulphur Ore Mining.

(5) Silver smelting industry.

(6) Non-metallic production from Eastern Ontario.

Practically all producing mines, as well as a large proportion of the more important properties under development in the Province, are already members of the Association, making it apparent that the Ontario Mining Association will represent the Mining Industry as a whole.

A permanent office is being established in Toronto.

### THE MINING SOCIETY OF NOVA SCOTIA.

Glace Bay Meeting, May 4th and 5th 1920.

The Council has made such arrangements that, with the co-operation of the Members in the matter of papers and attendance, will insure a very successful Meeting.

A smoker will be held on Tuesday evening, for which a very attractive program has been arranged.

The Dominion Coal Company has invited the Members to be their guests at a luncheon, at the Glace Bay Hotel on Wednesday.

The Committee desire, that all who intend to submit papers should send a copy to the Secretary before April 15th., so that they may be printed.

Full program will be forwarded prior to date of Meeting.

We feel assured that all Members will be amply repaid for any effort which may be made to be present.

### PROVINCIAL GOVERNMENT OF MANITOBA TO EXAMINE DAUPHIN OIL DISTRICT.

Investigation of the Dauphin oil fields by the provincial government may be undertaken in the immediate future, according to an announcement made today by Hon. George A. Grierson, minister of public works.

Representatives have been received by the government from the Dauphin board of trade asking for an investigation of the oil shale in the district, in order to find out if it is present in commercial quantities. Mr. Grierson said that he had communicated with Commissioner R. C. Wallace, of Northern Manitoba, and Hugh McNair, of the Public Utilities Commission, asking them to report on the possibilities of oil in this district.

Should the report from these experts be favorable the government, he said, will dispatch a drill to the district to test for oil. The drill will be capable of boring to a depth of 1,000 feet. The report will be based on a geological survey of the Dauphin district.

### JAPAN IS POSSIBLE MARKET FOR BRITISH COLUMBIA COAL.

The Japanese Consul at Vancouver, Mr. H. Ukita, states that British Columbia coal, even under high freight charges now current, could be sold in Japan and realize a substantial profit. During 1919, says Mr. Ukita, Japan consumed 27,000,000 tons of coal, at a price equivalent to \$22.00 a ton.

### THE HEDLEY GOLD MINE RESUMES OPERATIONS.

The Hedley Gold Mining Co. has resumed operations after several months inactivity. G. P. Jones, General Superintendent, states that the intention is to work the property to the capacity of the plant henceforth. The mine is situated on the Nickel Plate Mountain at an elevation of 5,800 feet and has been in operation for over 20 years.

**BRITISH COLUMBIA LETTER.****The Metal Mine.**

H. J. Bush, at one time owner of what now is the Premier Mine, and a prominent mine operator of British Columbia, recently returned from England and is authority for the statement that the Selukwe Gold Mining and Finance Company has taken a third interest in three properties controlled by Messrs O. B. and H. J. Bush and associates. These properties now are administered by the Bush Mines, Ltd., the B. C. Silver Mines, Ltd., and the Salmon-Bear River Mining Co., Ltd. It is understood that a single company to be known as the British Canadian Silver Corporation will be formed to take over the three first mentioned and that the Selukwe Gold Mining & Finance Company, which will subscribe the working capital, will take shares in the new Company. These three holdings are said to embrace about fifty claims from which some high grade ore has been taken but which have yet to be developed.

Roy Price, formerly in the employ of the Granby Consolidated Mining and Smelting Co., is behind a project which is to be given a trial in the development of the Salmon River District of Portland Canal, B. C. and which, although unique in Canadian mining operations, is pronounced by those most competent to judge, to be eminently practicable. It is the use of one or more hydroplanes from Hyder, Alaska, or Stewart, B. C. for the transport of light supplies to the properties now under development in that locality. There is nothing, it is pointed out by those who have been over the ground, impossible, or even formidable, in the undertaking. From either Hyder or Stewart there is straight flight up the broad Salmon River Valley to Long Lake, the distance by air line being probably little more than eighteen miles. There are no mountains of extremely high altitude to cross along this route so that the press reports of the character of the task are not warranted. From Long Lake there is a trail to the Mineral Hill and other properties which at present, is rather rough for about a mile but from that point is in fairly good condition, so that the distribution of freight from Long Lake to the different operating properties would be a comparatively simple proposition. On return trips it would be possible to the hydroplanes are a success in this field, to bring to tidewater such high grade ore as might be available for shipment. Lieut. Ernest O. Hall, of Vancouver, B. C., a Canadian aviator with overseas experience, is one of those interested and with him is associated Test Pilot E. Hubbard, of Seattle, Wn. The former states that a Seattle firm has contracted to deliver by April 15th one specially designed flying boat and two more of the same model by May 15th next, and if these are satisfactory three more will be built for delivery on or about June 15th. Each plane will have a carrying capacity of approximately forty cubic feet. Owing to the shortness of the summer season in the north the aviators are not figuring on more than 100 days suitable for their work but by making frequent trips they, and the mine operators, are said to be confident of their ability to transport by air, not only all light freight needed in the camp, but a large proportion of the year's output from the mines. Lieut. Hall and Pilot Hubbard have announced that they will take off from the Sound City in the first hydroplane completed about April 15th and that the 600-mile trip up the Coast will be made with only one stop, the place selected being Ketchikan. The planes will have a cruising radius of 450 miles.

The strike which has been interfering with operations at the Premier Mine is reported to be settled, an advance of 50 cents a day being granted the workmen, together with other concessions among them the undertaking to employ a competent cook.

In the Marmot River section of the Portland Canal Mining Division there has been little mining during the past several years outside of assessment work but, with the intense activity along Salmon River and with high silver prices and a market promising to maintain its stability, an improvement is looked for this season. The Montana Group of Claims, situated in this locality, having been acquired by the Stirling Mining Co., which concern also has taken over the Grand View Group of four claims. The ores of both carry silver lead values. The Kay-Bee-Bird Group, also of Marmot River, is reported to be bonded to a Vancouver syndicate.

**Alice Arm, B. C.**

A. J. T. Taylor, president of the Taylor Mining Company, accompanied by C. M. Rolston, the Company's vice-president, and G. Nutter, representing the Mineral Separation Company of London, England, is visiting the Alice Arm District. The party propose making a survey of the scene of this year's operations in connection with the Dolly Varden Mine. Plans no doubt will be considered with reference to the additions to mine plant, railroad equipment, etc., which the company intends to install at an early date.

Travel to northwest British Columbia and southwest Alaska, which includes the camps of Salmon Arm and Alice Arm, has reached the proportion of a rush in the last few weeks. The Grand Trunk Pacific northbound vessels from Victoria, Vancouver, and Seattle have been crowded. Sleeping accommodation is at a premium for some weeks ahead. Residents of Vancouver who witnessed the departure of the last G. T. P. boats were reminded of the Klondyke rush, miners and prospectors, with little more than blankets, and asking only for deck space, are hurrying to the new fields in order to be ready to get into the hills as soon as the winter breaks.

**Barkerville, B. C.**

The Lightning Creek Gold Gravels and Drainage Co., operating near Wingdam on Lightning Creek, Cariboo District, has been unsuccessful in its last attempt to reach bed rock according to reports from that section. The timbers of a fine new shaft have been carried away, which would appear to mean that the Company's elaborate preparations, heavy expenditures in special equipment, etc., have gone for naught. In 1918 J. D. Galloway, mining engineer, told of the undoubted possibilities should the efforts being made to reach and operate at bed rock be successful. He explained that portions of the channel had been broken into by means of bed-rock drifts from the shafts which were sunk in the rim-rock," but in each case the great pressure of water and gravel encountered when the drift broke into gravel has been more than could be handled."

A Vancouver Syndicate is reported to have succeeded in development operations on the leases of the Antler Creek Gold Mines, Ltd., bed-rock having been reached and good pay found.

**Trail, B. C.**

Ore receipts at the Trail Smelter of the Consolidated Mining and Smelting Co. for the week extending from the 22nd to the 29th of February incl. were 6,004 tons.

For the first week in March they were 3,538 tons, bringing the total for the year up to 57,384 tons. Shipments from the Rossland Mines of the Consolidated Company ceased with the opening of March, which was to be expected in view of the announcement that for a time these properties were to be subjected to development.

A dividend of \$261,936 has been declared by the Consolidated Mining and Smelting Co., payments to be made on April 1st to shareholders of record on March 10th. The pending payment will increase the total dividend disbursements to \$6,567,211.

Simultaneously with the dividend announcement comes the statement that the Company has broken ground at Trail, B. C., for a large new concentrating mill, and has considered the construction of another at Kimberley, B. C. for the treatment of the ores of the Sullivan mines. The Trail Mill will dress the ores of the Rossland Mines. If the report regarding the latter is authentic it means that the management has decided definitely in favor of Trail as against Rossland as a site for the new installation.

#### Kimberley, B. C.

The action of the Consolidated Mining and Smelting Co. is advancing the wages of employees 50 cents a day has brought the strike at Kimberley to a close, the miners' union having, as a result, declared hostilities at an end.

#### Nelson, B. C.

Representations were made some weeks ago by the Associated Boards of Trade of Eastern British Columbia to the British authorities regarding the granting of an imperial preference to Canadian metals. A reply has been received through J. Henry, secretary to the Canadian Mission in London. He states that there undoubtedly is a large market in the United Kingdom for zinc and lead, there having been imported in 1918 a total of 217,610 tons of lead of a total value of over £7,000,000. Zinc imports aggregated 94,226 tons of a total value of £4,000,000. "The only question" Mr. Henry observes "is whether British Columbia can send lead and zinc to this and European markets at competitive prices." It is added that J. J. Warren, president of the Canadian Consolidated Mining and Smelting Company, spent some weeks in England last summer studying this question. Mr. Henry close as follows: "I should perhaps add that in the case of zinc the British government has entered into an agreement with the Australian government by which the available surplus of zinc in Australia for the next ten years has to be placed at the disposal of this country. I pointed out the fact to Mr. Warren and he was endeavouring to find out how far this would affect the supply of zinc from other parts of the Empire."

L. A. Biggar, a Montreal metallurgist, is visiting the Kootenay District. He is acquiring information as to mining conditions, having in mind the establishment of an ore testing and sampling plant.

#### Kamloops, B. C.

A company has been formed, known as the B. C. Silica and Talc Company, Ltd., for the development of a group of claim situated seven miles northeast of North Bend. The silica of this property, judging from a sample presented for assay, is exceptionally high grade. The assay return was 99.4. The Company was incorporated last December with a capital of \$250,000, divided into 25,000 shares.

#### Slocan, B. C.

Operations on the Evening Star Mine, Dayton Creek, have been suspended pending the arrival of weather conditions that will permit the pumping of water. The underground workings have been flooded.

#### Cowichan, B. C.

The "Hill 60" Manganese Mine of the Cowichan District, Vancouver Island, B. C., is being placed on a basis that will permit uninterrupted production. An aerial tramway, designed by Major A. W. Davis, Vancouver, B. C., is being installed. It is a two-bucket balance tram, having a capacity of thirty tons in eight hours, and is costing about \$10,000. About six towers carry the cable to the mountain face, whence the wire runs for a span of 3,600 feet to the Esquimalt and Nanaimo Ry., the total length of the cable being 4,750 feet. Bunkers are being constructed both at the workings and at the railway. Since last Spring about 500 tons of manganese ore have been shipped to the Willrowe Alloys Co. of Tacoma, Wn. As to development the open cut now discloses a twenty-five foot face of fifty per cent manganese ore. While the ore body has not been extensively explored what already has been shown, together with the exceptional indications, are considered very satisfactory by those interested.

#### Vancouver, B. C.

The International Mining Convention to be held at Seattle, Wn. from April 7th to 10th is attracting much attention among Canadian mining men and there is no doubt that there will be a large attendance from British Columbia. It is assured that Eastern British Columbia will send both delegates and an exhibit of the ores of the Kootenays.

#### Victoria, B. C.

Paul Billingsley, of Seattle, Wn., representing the Anaconda Copper Mining Co., and H. H. Townsend, an American mining engineer, passed through Victoria recently, paying their respects to Hon. Wm. Sloan, Minister of Mines, en route to examine some of the provincial mining prospects.

#### The Collieries.

If reports received from Alberta are correct it is likely that the coal operators of British Columbia will have competition on the local market shortly. Alberta interests are said to have arranged for the shipment of coal from that Province to the Pacific Coast, it being proposed to undersell the product of British Columbia by a considerable margin.

Judgment has been handed down in British Columbia in favor of thirty-four coal miners and general employees who sued the Merritt Collieries, Ltd., Diamond Vale Collieries Co., Ltd., et al for wages said to be owing them. The plaintiffs, whose claims amount to approximately \$3,000, sought to enforce mechanics' lien against the defendants under the Mechanics' Lien Act and the Mechanics' Lien Amendment Act of 1917. The judge explained that, as a result of the amendment, the men were able to obtain their lien to the extent of 25 days wages and that this charge would be laid against the property precedent to any mortgage on record. Plaintiffs also were awarded the costs of trial. The Diamond Vale Collieries, Ltd., which is chiefly concerned, has not been in operation for some time.

That a seam of high grade coal, twelve feet in thickness, has been discovered on the property of the Harvard Coal Co., East Princeton, B. C., is the effect of a report from that district. Preparations for de-

velopment to the point that shipping will be possible already are in progress. Coal bunkers with a capacity of 200 tons are being constructed and it is expected that production will be commenced early next month, between 30 and 40 men being employed. H. G. Duerfeldt, the president of the Company, and Dr. Wymond Miller, one of the heavy stock holders, both are residents of Spokane, Wn.

The Telkwa Collieries, situated on the Grand Trunk Pacific Ry. near Prince Rupert, B. C., have been shipping all winter but it is not expected that much coal will be hauled after the snow leaves the ground. Probably work during the summer months will be confined to development.

The Vancouver Island coal trade has fallen off to some extent recently. Such, of course, is to be expected during the "between season" period when the winter domestic demand is on the decline and before the bunker trade has become brisk. In the Pacific Northwest the warmth of Spring is beginning to be felt and people are not so particular about keeping full the home bins, there being no danger of further cold snaps. What the forthcoming season is going to bring to the coal dealers in bunker business remains to be seen but it is feared that the exchange situation is likely to have so serious an effort on mercantile trade of the Pacific that the collieries of this Province will experience its influence in an unpleasantly lethargic market. However, conditions are not yet bad although the mines are not as active as was the case throughout the winter months. Last month (Feb.) the Canadian Collieries (D) kept their men at work at the three Comox Mines for 17 days, at Extension for 22½ days, and at South Wellington for 23 days. The Canadian Western Fuel Co. operated its properties at Nanaimo, Harewood, Reserve and Wakesiah for 24 days. This also applies to the collieries of the Granby Consolidated Mining and Smelting Co., at Cassidy's, the Pacific Coast Coal Mines, the Nanoose-Wellington Collieries, as well as to the Coalmont Collieries in the Nicola-Princeton Field.

The production of the Companies named during the month of February was as follows:

	Tons.
Canadian Collieries (D) Ltd. (Comox).....	28,515
Canadian Collieries (Extension).....	18,377
Canadian Collieries (S. Wellington).....	6,450

Vancouver Nanaimo Coal Co.....	1,441
Coalmont Collieries.....	280
Telkwa Collieries .....	325

**THE LATE HENNEN JENNINGS.**

By Alexander Gray, Montreal.

The death of Mr. Hennen Jennings on March 5th., at Washington, D. C., where he had resided since his return to America from South Africa, is more than a loss to mineral industries and mining scientists; it is a misfortune of world-wide effect, in that he no longer can speak for whatever will dignify and exalt mining.

Other noted mining engineers may have been more in the limelight. None, however, wielded more widespread influence and commanded more confidence and capital. Economically perfect; uninfluenced by other than the soundest bases of valuation; gifted with a rare judgment reinforced with experience acquired on two continents; implicitly trusted by financiers of Great Britain, Europe, America and South Africa; he was the corner stone of the "Corner House", as Wernher, Beit, Eckstein, were known. Throughout the years, until his voluntary retirement, he was Consulting Engineer to the group of mining capitalists which even now controls a greater part of the world's gold production. No other group, company or firm, contributes as much gold as the Central Mining and Investment Company—which succeeded to certain Wernher, Beit, Eckstein interests—and that distinction is largely the result of Hennen Jennings's thoroughness in the mastery of facts and management. Wernher, Beit, Hermann Eckstein and now Hennen Jennings—have responded to the last roll call. The quartette represented the greatest degree of integrity in mining finance. More gold was produced under the aegis of Hennen Jennings than that of any of his contemporaries. Scattered along the Witwatersrand — exhausted outcrops, partly exhausted first row "deeps" second row "deeps"—and deeper "deeps" all the properties taken over and operated by the "Corner House" passed under the actuarial scrutiny of Mr. Jennings—a scrutiny that was implacable—unless the sampling, and structural conditions dictated affirmative decisions. There was no appeal to his principals from a Jennings adverse opinion. It was said of him that "he sampled his firm into everything worth having—and sampled them out of everything they ought not to be in"—and no finer eulogy need be bestowed upon him.

Nor did Mr. Jennings confine his distinguished abilities to mining affairs. Where mining was the paramount industry—as it was in the Transvaal—inevitably he was foremost in advocating whatever would conduce to the prosperity of the industry and the people it employed. At the time of the historic Raid when "Dr. Jim", made his Falstaffian attempt to capture the Kruger domain, Mr. Jennings was involved, along with Rhodes, John Hays Hammond, and others. He never shrank from a duty.

During the World War he rendered notable service at Washington, insisted that gold production must be increased; urged special inducements to that end. "One blast upon his trumpet" had more influence than what gets into the Congressional Record. At the moment when metal mining has to contend with grievous hindrances that legislators and leaders do not comprehend, the mineral industries can ill afford to lose him. Harvard, two years ago, honored itself by conferring upon him the degree of Master of Arts. Canada knew him better by reputation than by contact.

When the Secretary of State for the Colonies, the

Right Honorable Joseph Chamberlain, visited South Africa in 1902, Mr. Hennen Jennings was chairman of the committee of Consulting Engineers appointed by the Transvaal Chamber of Mines to prepare a descriptive and statistical statement of the gold mining industry of the Witwatersrand. Among his colleagues were Dr. Hatch, Fred. Hellmann, George Hoffmann, W. L. Honnold, Sidney J. Jennings, Sam. C. Thomson, H. H. Webb, George E. Webber, and Pope Yeatman. The document formulated was a masterpiece in graphic detail and textual lucidity. It was characteristically Jenningsesque, the social and economic aspects of the gold industry being reviewed as Mr. Jennings knew how to review them. Glancing over that document, I am prompted to cull the following in order to impress upon those who think capital invested in Canadian mines can await the pleasure of labor and politicians:—

“The vital importance to mining of the factor of time is easily demonstrated. In any ore deposit there is a certain unalterable amount of ore, and any profit obtained from exploiting it is more valuable the quicker it is made available for further investment.

“If we could assume the output, its value, and cost of production to be constants, and that the deposit would yield, say, 10 millions tons of ore which would give a profit of 15 shillings a ton, if it were exhausted in equal yearly amounts, in

“100 years an owner would receive 100 annuities of £75,000 each.

“Or if in 50 years an owner would receive 50 annuities of \$150,000 each.

“With so speculative an investment as mining, 5 per cent. compound interest would certainly be demanded. The ‘present value’ of the investment on

“The 100 years basis would be £75,000 x 19,8479095 = £1,488,590.

“The 50 years basis would be £150,000 x 18,2559246 = £2,728,380.

“If, by lowering working costs, and bringing under exploitation, say, double the foregoing assumed tonnage (or 20 million tons) of ore, which would yield a profit of, say, only 10 shillings a ton, the calculation would work out at

“For 100 years 100 annuities of £100,000 each, or

“For 50 years 50 annuities of £200,000 each.

“The present value of which, taking the previously assumed factors, would be in the former instance, £1,904,790, and in the latter instance, £3,651,185. **The necessity for activity to attract more capital is thus very clear.**

Mr. Jennings had the true perspective—and always adhered to the truest practice.

#### ECHOES OF THE TORONTO MEETING.

The new Minister of Mines of Ontario made a good impression when he addressed the Institute at the opening session and at the banquet. He has capable men on the staff of the Mines Department and he seems disposed to consult them. It was news to many that he had as a young man worked for some time in a coal mine. He has as a resident of Port Arthur a proper appreciation of the desirability of encouraging capital to develop mineral resources of Northern Ontario. If he uses his opportunities to good advantage, he may prove an important factor in improving relations between labor and capital.

Mr. H. E. T. Haultain has found someone whom he can agree with fully in matters relative to the Canadian Mining Institute's future. He says that Mr. Mathewson presented his ideas admirably in his speech at the banquet.

Mr. J. W. Evans made a big step up in the estimation of members at the smoker on Tuesday evening. He is in danger, however, of being referred to hereafter simply as the father of his talented daughter.

The moving pictures of scenes at the Nipissing mine were remarkably good and should help to give those who see in them some intelligent idea of the mining, handling and treating of ore at Canada's greatest silver mine. The underground views, in view of the difficulties of mine photography, do great credit to those who made them.

Col. Penhale was his old self as chairman of the smoker. His running mate G. G. S. Lindsay would have contributed largely to the fun if he had been able to be present.

Mr. E. P. Mathewson carried off the individual championship in the college yell contest. The superiority of McGill, Toronto or Queens remains undecided and there is some doubt as to whether the individual champion did not outpoint the class entries.

The excursion to the International Nickel Company's refinery proved a very popular one and Mr. Miles and his aides received many congratulations. Members of the Institute have always been courteously received at Copper Cliff and Creighton and have been shown everything of interest there. The extension of this courtesy to include the new refinery was quite in keeping with the old policy of Copper Cliff, but owing to the secrecy which has shrouded the Orford works the refinery proved unusually magnetic.

Mayor Church made a hit with the visitors from Montreal and New York and received invitations to run those cities if he ever gets tired of his present job.

Mr. Bradley Stoughton is more than ever popular with the members. His talks always do a great deal towards improving the happy relations between American and Canadian mining engineers.

The Institute owes his thanks to the acting secretary, Cyril W. Knight, who took over the duties on short notice and under unusually difficult conditions. He was ably assisted by his fellow workers,—the technical staff of the Ontario Bureau of Mines,—and succeeded so well that comparatively few of the members were aware of the fact that he had had so little time to familiarize himself with the work ordinarily done by the Institute officers and staff.

The “status of the engineer” discussion, although well introduced by Mr. McEvoy, did not bring out expression of opinions. Apparently most of the members are content to leave things as they are. If a serious attempt is made by others to bring about a close corporation control of engineers, there will doubtless be no uncertain negative vote by mining engineers. The meeting expressed its approval of the steps taken by Council to prevent status legislation that does not meet with the Institute's approval.—R.E.H.

# A MARSH HOIST IS MADE THE RIGHT SIZE FOR YOUR MINE

and in either Steam Power or Electric Power

This shows one of our Electric Mine Hoists. We make many other types. Send for our catalogue of Mine Hoists, Cars, Cages, Buckets, etc., and see what we offer you. It will repay you.

From the little 10 Horse Power size for prospectors or small mines to the massive 50 Horse Power size, one of our 7 sizes should be just right for your mine.

We are specialists in the building of Hoisting Machinery of all sorts. For nearly a quarter of a century we have been designing and building Hoists, and have developed a Hoist that we are really proud of—proud because of the record of good work they have done, and are doing in mines, quarries, and other classes of work from one end of Canada to the other.

### ENGINEERS OF THE NORTHWEST TO HOLD CONFERENCE IN SEATTLE, APRIL 6-7, 1920.

Of great interest to all technical men is the conference of engineers of the Pacific Northwest, which will be held in Seattle on April 6th and 7th of this year. The purposes of this conference are to bring the engineers of the Northwest together to discuss all problems pertaining to engineering interests and to

organize a permanent annual conference, the conferences to rotate as to place of holding same. It is suggested that Portland be the next one, the Spokane etc. At this coming conference it is also planned to arrange for a propaganda in support of the Jones Reavis bill, which is coming from congress to create a National Board of Works Department in the United States government. This department to take over all the engineering and construction departments of the different departments of the government as they now exist, and place them under the one head. This conference coming just before the Mining Convention will no doubt bring many engineers to Seattle who will attend both of the events.

## Legislation Prescribing the Status and Practice of Engineers

In this issue will be found a précis of a draft act, now before the British Columbia Legislature, the short title of which is cited as the "Engineering Profession Act." The draft act is the result of consultation between technical societies in British Columbia, and is understood to have been amended in accordance with representations made by members of the Canadian Mining Institute resident in British Columbia.

The specification of the practice of a professional engineer by the Act is very comprehensive, including as it does the civil, railway, hydraulic, steamship, electric, sanitary, mining, metallurgical and chemical engineer; the mine surveyor, the geologist, the petrologist; the "development of rocks, minerals (including coal, petroleum, natural gas, and other fluid substances of value)," and "all other engineering works." Definition of "engineering work" savors of an attempt to set bounds to the infinite. If "engineering" as it is sketched in the interpretation clause of the draft act does not comprehend the entire sum of human knowledge, it goes more than halfway. Take for example the phrase: "Investigations relating to the examination, surveying, exploration and development of rocks, minerals, rock structures, geological processes and the application of geology to practical problems of the industries, arts and engineering." In this all-comprehending phrase there must be included the prospector, the ordinary mining engineer, the chemist, the metallurgist, the mineralogist, the petrologist, the paleobotanist, the paleontologist, and speculative and practising geologist in all his infinite variety.

Frankly, we do not believe that legislation of this comprehensive, and therefore necessarily unspecific character, can be enforced in practice. The powers which would reside in the Council of a Professional Association such as the Act proposes would be immense, but very indefinite. Because of the wide sweep of distinct professions which the Act attempts to take in under the generic term "engineering," the powers given to the proposed Association would be much wider, and not comparable with those given to professional associations such as control the medical, dental and similar professions. In these cases, the limits of professional qualification are nicely and exactly drawn.

but what chiefly recommends the conference of special powers upon the professions of which the medical profession is the best example is that they deal in matters of health, extending almost to powers of life and death. In the case of engineers—using the wide-open definition of the draft Act, it cannot be urged that matters of public health, or the preservation of human life, are so intimately concerned. Where the public safety is touched in engineering performance and design, the existing laws contain all that is necessary, inasmuch as the safety of bridges, dams, factories, ships, electric transmission and grain elevators are all most carefully provided for in public regulations of long standing. In the case of mining, statutory regulations exist in every province, providing for the safety of appliances, and requiring certification of the competency of mine officials. In questions of public safety, therefore, the functions of a Professional Association such as is suggested by this draft Act, would duplicate public statutes of great variety and very long establishment.

As concerns the expenditure of public and private monies, the situation is different. It is well known that much money has been foolishly expended through incompetent direction, but is this a question that permits of statutory regulation? To attempt it trenches upon sumptuary legislation, and, no matter what Statutes are enacted, he that pays the piper will always call the tune.

The objects of the Association proposed—that is to say, the attainable objects—therefore resolve themselves into the raising of the status of the "engineer," or in other words, a desire to secure his more definite recognition by the public, and to raise his emoluments. This is an understandable, and, within proper limits, a laudable aim.

It is, however, open to the gravest question whether compulsory regulation by statute is the best manner in which to effect the aim mentioned, with which aim we desire to emphasise, no fault can be found. The question is, nevertheless an open one.

We would suggest, however, that there is no question as to the unwisdom of attempting to regulate the engineering profession under an interpretation so wide, and at the same time, so impracticably indefinite as that prescribed in the British Columbia Act.

When the Act was introduced into the British Columbia Legislature, after having had a stormy passage through the Private Bills Committee, it met the severest criticism from Premier Oliver, and Mr. J. H. Schofield, the Member for Trail, B. C. Mr. Schofield said the Act was bitterly opposed by prospectors, miners and smelters. The Premier expressed his most determined opposition to the Act, as drafted, basing his viewpoint on a belief that practically trained men had often succeeded where scientifically trained men had not. Mr. Anderson, who introduced the Act, said the text did not warrant the construction put upon it by the Premier.

This reception is probably typical of the criticism that will be levelled against any legislation seeking to enforce a close corporation for "engineers," and it is significant that the criticism levelled against the draft act was based upon its wide interpretation of what constituted engineering practice.

We believe the formation of an association of professional engineers, such as is proposed by the draft act under discussion is unworkable because of the fundamentally erroneous conception of the possibility of comprising within the scope of one incorporated body all the ramifications of the activities of the engineer. We also believe that this conception, if persisted in, will limit the usefulness of the engineer by attempting to set bounds to the boundless.

It is suggested that the manner in which the engineer can gain that public recognition which is his undoubted right is through the strengthening of existing professional societies, each functioning within the limits of its own specialized activities. When our professional societies have so arranged their own internal affairs as to be able to place upon their members the stamp of professional competence and rectitude, and to discipline unworthy members; and have educated the public to accept the society stamp as a guarantee of those things that are desirable in an engineer, then, and not till then, have our societies any right to ask governments to attempt that which, so far, our professional societies have not yet found it within their ability to compass.

There are one or two details in the British Columbia draft act that should not have been included, namely the provision that the Secretary of the Associations should be bonded for one thousand dollars, and the power which it is proposed to grant to the Council to suspend a member who should have been convicted of a criminal offence. The definition of "crime" is capable of even less exact determination than the scope of the qualifications and the practice of the engineer. The indelicacy of the provision as to bonding the Secretary should be sufficiently obvious.

Mr. Theo. Denis, the Superintendent of Mines for the Province of Quebec, writes to the March "Bulletin" of the C. M. Institute on the effect of engineer-

ing legislation in Quebec, and as his point of view deserves consideration by mining men in other provinces, the letter is re-published in this issue.

Mr. McEvoy's designedly neutral and philosophical examination of the trend of engineering status legislation did not evoke at Toronto the discussion it was desired to bring about, a matter, we believe, for regret. The Council of the Institute, as the President clearly explained, is fully awake to the circumscription of the liberties of the mining profession that is threatened by ill-considered legislation, should such legislation when enacted, be found operable. In the impossibility of defining the indefinite will probably reside the strongest safeguard of all.

### AN EQUAL CHANCE.

R. E. HORE.

In view of the present activity of some engineers in pressing for the legislation designed to bring about corporation control of the engineering profession, I would draw attention to a part of President Herbert C. Hoover's inaugural address at the recent meeting of the American Institute of Mining and Metallurgy, Mr. Hoover declared:

"For generations the American people have been developing a social philosophy as part of their democracy. This philosophy has stood this period of test in the fire of common sense; it is in substance, that there should be an equality of opportunity—an equal chance—to every citizen. This view that every individual should, within his lifetime, not be handicapped in securing that particular niche in the community to which his abilities and character entitle him is itself the negation of class. Human beings are not equal in those qualities. But a society that is based upon a constant flux of individuals in the community, upon the basis of ability and character, is a moving virile mass; it is not a stratification of classes. Its inspiration is individual initiative. Its stimulus is competition. Its safeguard is education. Its greatest mentor is free speech and voluntary organization for public good. Its expression in legislation is the common sense and common will of the majority. It is the essence of the democracy that progress of the mass must arise from progress of the individual. It does not permit the presence in the community of those who would not give full meed of service."

An other paragraph from Mr. Hoover's speech that is particularly interesting in view of the strong present tendency towards organization along class lines is the following:

"If we cling to our national ideals, it will mean the final isolation and the political abandonment of the minor groups who hope for domination of the government, either by "interests" or by radical social theories through the control of our political machinery. I sometimes feel that lawful radicalism in politics is less dangerous than reaction, for radicalism is blatant and displays itself in the open; unlawful radicalism can be handled by the police. Reaction too often fools the people

through subtle channels of obstruction and progressive platitudes. There is little danger of radicalism ever controlling a country with so large a farmer population, except in one contingency. That contingency is from a reflex of continued attempt to control this country by "interests" and other forms of our domestic reactionaries."

Mr. Hoover's remarks about his own country are applicable also to Canada. Class organizations are properly regarded with distrust by the community, for in them self interest dominates. They become most dangerous when they conceal their activities under a cloak of professed public service.

When one class organizes to make itself more strongly felt as an influence in public affairs, the elementary and expected result is that other classes will in self protection take similar steps. Such organizations may be regarded as necessary so long as the others exist and their formation is easily justified, as a natural defensive move. If such organizations make their weight felt for the good of the community and are willing and satisfied to make progress with the community and not at its expense they are desirable institutions and will live. In proportion as they do not, their life is likely to be short and uninfluential.— R.E.H.

## Good Advice by the Grain Growers' Guide

Seeing that the metropolitan newspapers which are held in much repute and have large circulation in the farming districts do not endeavor to protect the rural capitalist against accepting at face value the advertisements of mining stocks and oil flotations that appear in these newspapers, but, on the contrary deliberately throw temptation in his way for the sake of the advertising revenue, the "Grain Growers' Guide" of Winnipeg, which boasts a circulation of 76,000 copies weekly, has commenced a counter propaganda, the forceful nature of which may be judged from the cartoon herewith reproduced.

There is now going on in the technical press, and elsewhere, a not disinterested controversy which im-

plies that many mines which are today in the dividend-paying class were floated by the sale of stock of small par value, attractively advertised through the newspapers. This may well be the case, but does not make it any less the part of unwisdom in the farmer to invest his money in mining or oil stocks on the strength of a newspaper advertisement. The cobbler should stick to his last, and it would anyway be difficult to find a more paying investment than farming in these days. The "Grain Growers' Guide" will have the approval of all who have the best interests of mining at heart in advising the farmer not to sink his money in ventures about which he knows just enough to make his knowledge worse than ignorance.

How to Entertain the Agent Who Peddles Worthless Mining Stock

—From "The Grain Growers' Guide".

# The Anthracite Supply Available to Canada

Combination of Decreasing Reserves, Increasing Populations in United States and in Canada, Increasing Per Capita Consumption in Both Countries; and Relatively Greater Rapidity of Anthracite Exhaustion in Fields nearest to Canada calls for Immediate and Continuous Attention of Canadian Government—Within Thirty Years Wyoming Anthracite Supply available for Canada is threatened by Exhaustion of Mines—As Canada has least claim on Anthracite Supply, and is situated furthest from Source of Supply she must initiate precautionary measures—Canada's Coal Supply is Paramount Factor in National Independence and Commercial Survival

The writer of the article which follows desires publication to be made anonymously, but we may state that the article was written at our special request, made because of the special qualifications for dealing authoritatively with the anthracite supply of Canada possessed by the author, who has a thorough knowledge of the problem of Canadian coal supply, obtained in Canada, combined with an equally complete knowledge of the anthracite mines of the United States.

Our coal-mining readers will appreciate correctly the condition of the anthracite reserve of the United States when the mining of such thin seams of anthracite as are described in the article has become an accepted commonplace; and will not fail to deduce from the facts presented the conclusion that Canada must in the future draw its anthracite supply from a reserve which is rapidly becoming smaller and more difficult to mine, and therefore increasingly expensive to produce and transport to distant markets. It should not be forgotten that as coal becomes increasingly costly to mine, the cost of its transportation increases in a proportionately greater ratio.

Anthracite shipments reached the record figures of 77,062,787 tons in 1917, and 75,894,217 in 1918.\* Of this amount, approximately 6,640,923 tons (8.6 per cent) were produced from "Banks" and "Washeries," leaving a fresh mined shipment in 1918 of 69,253,294 tons. To obtain the actual mined tonnage, the fuel consumed at the mines and preparation losses have to be added, approximately an average of 25 per cent, so that the anthracite coal fields may be considered as being depleted in round numbers at a rate of 90,000,000 tons annually.\*\*

The country has just passed through several years of unprecedented industrial activity, which has helped to keep the demand at an unusually high mark, and although there may and quite possibly will be a reaction, during which production will fall, such an ebb and flow in consumption is just what has taken place in the past, the ultimate result having been a consistent and persistent growth in the market at the rate of approximately 20 per cent in each of the last three decades.

\* From the Coal Trade, 1919—Error or misprint of 500,000 in grand total.

\*\* 1913, 91,525,000; 1914, 90,821,000; 1915, 88,995,000; 1916, 87,587,000; 1917, 99,612,000; 1918, 98,826,000; 1919, 86,200,000 (estimated by U.S. Geo. Survey).

The demand for domestic sizes will certainly be maintained as long as the growth of the population increases; consumption of steam sizes follows the rise and fall of activity in industrials, and the clash of consumption as to time and period of demand is the cause, not only of occasional scarcity of certain classes of fuel, but a source of loss to the operators. Domestic coal cannot be produced without a sale or storage of steam sizes, nor can steam fuel within economic limits be disposed of without a production of domestic sizes. The population increase in the three states of Pennsylvania, New York and New Jersey, where almost 60 per cent of the anthracites produced is consumed, was from 19,315,892 in 1910 to 23,324,287 in 1917.

Fresh mined production fell off in 1918 over 1917 2,000,000 tons, but it increased to the extent of 8,000,000 tons in 1917 over 1916.

Year.	Total Shipment.	Bank Coal.	Fresh Mined Shipments.
1909.....	61,969,885	3,694,470	58,275,415
1910.....	64,905,786	3,296,318	61,609,468
1911.....	69,833,801	3,171,678	66,662,123
1912.....	64,667,248	3,155,150	61,512,098
1913.....	70,758,312	2,090,170	68,668,142
1914.....	69,947,357	1,719,547	68,227,810
1915.....	68,179,474	2,492,639	65,686,835
1916.....	67,060,356	3,133,609	63,926,747
1917.....	77,062,787	5,413,139	71,649,648
1918.....	76,307,687	6,640,923	69,666,764

This increase took place in face of the loss of men to munition industries, and then the army, and the difficulty of obtaining necessary material for the extension of plant and development work. From 1910 to 1918, approximately 10 per cent of new collieries were opened, and the present production has been brought about partly by this new development and partly by the expansion of existing operations. The limit to existing capacity has perhaps not yet been reached, but it is possibly not more than ten million tons away.

## Wyoming Field of Greatest Interest to Canadian Consumer.

Hard coal is sold under the trade names of Wyoming or Lackawanna, Lehigh and Schuylkill, corresponding roughly to the three great natural divisions of the coal fields. From the point of view of the Canadian consumer, the Wyoming field is of peculiar interest and importance. It is the most northerly of the three and nearest to the Canadian market; the transportation systems which serve it connect naturally and directly to export points to Canada, and undoubtedly by far the largest tonnage that reaches the

Dominion originates in this field, this being particularly true of eastern middle Canada, where exists the Dominion's greatest consumption.

To originate all the tonnage for this market from either the Lehigh or the Schuylkill districts would not only lengthen the transportation considerably, and necessitate much cross hauling, but of much more importance, however, than a resulting increased cost and probable irregularity of delivery to the consumer, will be the new distribution factors entering into the questions of production and demand, when the time comes that through decreasing activity in the Wyoming field, the Canadian demand, and other trade previously supplied from that area, begins to fall on the other districts.

In the natural sequence of trade, supply and demand, those markets most convenient to the new pro-

ducing centres, linked to them by strategic transportation routes and presently being supplied from them, will be attended to first. In this connection it is interesting to note that the estimates of unmined anthracite based on figures prepared by William Griffith and published over twenty years ago, show the percentage of control of future supply to be arranged as follows. This arrangement has not materially altered to date:

Delaware, Lackawanna & Western .....	6.55
Delaware & Hudson Co. ....	2.29
Erie & Wyoming Valley R.R. ....	1.82
Erie R. R. Co. ....	.77
New York, Ontario & Western .....	.28
New York, Susquehanna & Western R.R. Co. ...	.54
Delaware, Susquehanna & Schuylkill R.R. Co. ...	1.38
*Pennsylvania R.R. ....	6.24

SHIPMENTS OF ANTHRACITE OVER PAST FORTY YEARS FROM THE THREE PRODUCING DISTRICTS.

Central Railroad of New Jersey .....	17.30
Lehigh Valley R.R. Co. ....	16.87
Philadelphia & Reading Ry. ....	42.25
Uncontrolled tonnage . . . . .	x3.71

\* Hanna interests.

x Published in The Coal Trade, 1919.

Condensed, this table shows that the reserve adjacent to transportation roads serving the Wyoming, as compared with the other districts, to be as below:

	1896.	1920.
	P.c.	P.c.
Wyoming . . . . .	12.25	10.40
Lehigh . . . . .	84.03	85.88
Schuylkill . . . . .		

While there is plenty of reserve to take care of any demand, the same or greater than today which may exist when the Wyoming field falls off, the conditions under which that reserve exists are decidedly interesting. Over 50 per cent is in the Schuylkill field where the majority of the coal above water level has been extracted. This basin is, roughly, 4,000 feet in depth at its centre, the veins pitch steeply both ways, are contorted and broken, water is extremely heavy, the pressure of the strata is great and gas exists in considerable quantities. In a word, the problems of mining, timbering, ventilation, pumping and transportation are here intensified and extreme. Only collieries with very large territorial capacity, with huge daily production and demanding colossal expenditures are going to produce a return on the capital invested. Naturally, exploitation under such conditions will be slow and it is quite within reason that as long as the present fields can cater to approximately the present demand, this development will not take place until such a condition arises that instead of increasing production, the one field will rise as the other falls. Some of the greatest future mining engineering problems in America will have to be solved in the operation of this field, and while the engineering talent will be equal to the task, it still remains to be seen whether finance will be able to play its part with equal courage.

The original tonnage distributed between the three districts, has been calculated as follows:

Wyoming . . . . .	5,700,000,000
Lehigh . . . . .	1,600,000,000
Schuylkill . . . . .	12,200,000,000

19,500,000,000 tons†

The veins in the Wyoming Valley proving more readily accessible, the depth of the basin not being relatively so great, the beds more regular and less disturbed and heavy dumping not presenting itself, mining in that district early attained a lead over the other areas, to the extent of providing since 1875 an approximate average of 57 per cent of the total coal produced.

† 21,000,000,000 tons; Marcus R. Campbell, U.S. Geo. Survey, 1917.

Report of the Commission appointed to investigate the waste of coal mining with the view to the utilizing of the waste.—Commonwealth of Pennsylvania, 1893.

In common with all other coal fields, much coal was irretrievably lost in the early days of hard coal mining, and the consequent recovery was extremely poor. As the greater proportion of the production was from the Wyoming region, it follows that the loss of coal was there at its greatest. In the remaining tonnage, and in the Schuylkill District, where the largest untouched reserves exist, the future recovery will be high. Poor mining practice resulting mainly in taking too large a proportion of coal in the first mining, brought about "squeezes" destroying over large areas not only the remaining available coal in that vein, but also affecting similar areas in veins above and rendering beds below tender and difficult to mine. On the other hand, some territories considered unminable and abandoned, have since been re-mined, not only once but three times; and while this has a tendency to balance the other losses, there is still a large percentage

of coal that will never be recovered, being required for protection of bridges, rivers, towns and cities, destroyed by fires, crushed beyond all possible chance of recovery and left as barriers against water troubles from adjoining territory.

The Commissioners on Waste in Coal Mining, sitting in 1890-1893, reached the conclusion that since the commencement of production possibly not more than 30 per cent of the coal originally in the mined out areas has been shipped and they consider that this possibly may be raised, on account of re-working culm banks and recovering areas considered lost, to 40 per cent.<sup>1</sup>

In an estimate of the Wyoming field by William

<sup>1</sup> Commonwealth of Pennsylvania sitting in 1893.

Griffith, figures relative to the life of this field are stated as follows:<sup>2</sup>

Original reserve . . . . .	5,057,808,560
Total shipments to 1892 . . . . .	383,244,241
Loss in preparation . . . . .	76,648,478
Total production . . . . .	459,892,709
Balance untouched . . . . .	4,597,913,186
Future recovery . . . . .	50 per cent
Balance minable . . . . .	2,298,906,593

which at the then rate of production of 24,000,000 tons annually showed that the basin would be exhausted in 95 years. Since 1892, 1,320,744,581 more tons have been taken out, which on the same calculation would leave a present minable reserve of 1,638,534,302 tons, and that in turn at the now existing rate of extraction, which quite possibly may be exceeded for a few years, will give a life of 32 years. In other words, during the 27 years (1892-1919) the life of this field has been reduced 63 years.

The report of the Commission of Waste on Coal Mining, of which Mr. Griffith was latterly a member, started out with an original estimated reserve of 5,700,000,000 tons for the Wyoming District. The

<sup>2</sup> Colliery Engineer, 1892.

U.S. Geological Survey reports a shipment to date of 1,243,863,982 tons. At the time the Commission was sitting, the average recovery of coal was given as 45.6 per cent, and that coal sold at Collieries and used as fuel was 10 per cent. As the prediction as to the sale of "Bank" coal has been verified, an increase in recovery is justifiable which makes the total ratio of shipped tonnage to mined over tonnage that it represents, say approximately 40 per cent, giving an extraction of 3,100,000,000 tons, and leaving a balance of unmined coal of 2,600,000,000 tons.

Modern practice makes the difference between shipments and production approximately 25 per cent, to which has to be added the percentage of recovery in mining, in this case estimated at 80 per cent. Much coal considered unworkable is now being recovered in re-mining, and the return in the newer sections of the territory will practically be over 90 per cent. This gives a marketable tonnage of 65 per cent of the present reserve, equal to 1,560,000,000 tons, which would allow the field a life of 31 years.

A CULM PILE.

Lest these calculations and statements be misunderstood, it might be well to elaborate them in another direction. Consider Canada in twenty years, now with a population of 5,147,000 (estimated 1918), in the anthracite consuming centre. Unless all past history is to be falsified, she will continue to grow and on a reasonable estimate based on past expansion, should reach to in 1940 a population of 6,800,000, requiring an anthracite consumption of 5,100,000 tons for Ontario and Quebec, which she must have by reason of the severe winters.

**Growth of Consumption Exceeds Rate of Growth of Population.**

Consider also that that part of America which consumes the greatest tonnage of anthracite is also going to grow, and that it, too, must have fuel. Figure that out and we get a total demand about 1940 of 110,000,000 tons (shipments). If this is averaged at 115,000,000 tons production, then the period of production from the Wyoming field, should it continue to supply over 50 per cent of the demand, would not be 32 years, but 14 years. There is also the further factor that the growth of consumption exceeds the growth of population, or in other language, the

CONVEYING ANTHRACITE DOWN A CHAMBER.

LOADING AT THE FOOT OF THE CHAMBER. NOTE THINNESS OF SEAM.

consumption per capita has increased steadily. In 1871 it was only .72 in the anthracite consuming states, now it is 1.95 at its highest. In Canada it is still only a little less than one-half that of this side:

Again, if we assume that a 100 million is about the production capacity of existing operations, this leaves 19,000,000 a year to get from fresh ventures and is equivalent to an investment of \$76,000,000 distributed over 20 years. In the present attitude of labor, the condition of the country in general, the situation of the coals in the Schuylkill region, the railway position, and other matters of national importance, that capital is not going to be spent just now—it will wait a more favorable period.

**Thirty Years Will See Great Decline in Production of Wyoming Field.**

While these latter calculations as to tonnage to be produced will never be attained, they probably help to show that it is not unreasonable to consider thirty years as making a very considerable change in the productive capacity of the Wyoming field, and the end of that period will witness a tightening of the flow of fuel to Canada. This does not imply in the least that the life of the Wyoming field is going to stop abruptly in thirty years—no district ceases mining so suddenly; but it does indicate before the thirty years have swept past, that production in this field is going to steadily and rapidly decline, and in so doing accentuate the difficulties of placing dependence on this fuel as the only source of heat in a country with the climate of Canada.

WOODEN CRIBS USED IN LONGWALL MINING IN THIN SEAM OF ANTHRACITE.

There are, of course, at least two factors that will operate before the rise in production, which the growth of population predicts is even approximately attained. Production cannot continue to increase indefinitely, and the economic substitution of another fuel for anthracite must eventually take place and is, to some small extent, already being tried. The question of future production has already been touched on in regard to present capacity, and costs of new developments, while there is also a limit to the territory or land area on which new mining can take place.

Of the possible substitutes, only two appear to have any chance of univesral application as opposed to mere local solutions, coke and oil. The consumption of coke as a domestic fuel is growing, and will increase. Oil fuel has played an important part in power production, and has now invaded the domestic field as in-

dicated by the introduction of oil fuel into the heating plants of some of the large New York buildings. Inasmuch, however, as the production of oil is only about one leap ahead of the consumption, and as it has its own field of activity to provide for, a steadily growing one, oil fuel does not yet appear over the horizon as a rival to hard coal in the average domestic anthracite market.

It is to be noted that neither of these sources of relief can so far be considered as possible for Canada. Oil, because the Ontario production is too small to be an important factor and of admittedly uncertain future while other sources imply importation like anthracite or a long haul from presently unknown western fields. Coke, because this possibility has not been given proper study as part of a sufficiently broad and national investigation of the fuel problem.

The normal distribution of domestic sizes of anthracite produced is calculated below:

	% of normal distribution	1918-1919 allotment	% of distribution 1918-1919
Penna., N.Y., N.J.	58.9	29,375,784	54.0
Maine, R.I., Conn.			
Mass., Vt., N.H.	15.5	10,331,000	19.0
Ala., Ark., Dela., Dist. of Col., Md., Fla., Ga., Ky., La., Miss. N.C.			
S.C., Okla., Tenn., Va., and West Va.	2.4	1,938,970	3.4
Ill., Ind., Iowa, Kan., Mich., Minn., Mo., Neb., N.D., S.D., Ohio, Wis., Colo., Cal., Ida, Mont., Ore., Wash. and Wyo.	11.8	5,761,945	10.6
Railroad Fuel	7.0	2,481,754	4.5
Exported to Canada	4.4	3,602,000	6.6
Miscellaneous Exports		51,930	0.8
Army & Navy Camps & Cant.		600,000	1.1
<b>Total</b>	<b>100.0</b>	<b>54,345,783</b>	<b>100.0*</b>

\*Coal Trade 1919.

This proportion has been steadily maintained for a number of years prior to 1916. Total Canadian exports are given below:—

Year	Tons	% of Total Shipments
1913	4,154,386	5.8
1914	3,830,244	5.4
1915	3,540,406	5.2
1916	4,165,652	6.2
1917	5,350,817	6.9
1918	4,435,593	5.7

Anthracite exported to Canada is distributed from this side as follows:—

	1917	1918
Buffalo District	2,911,208	2,483,761
Dakota District	14,344	3,165
Duluth Superior District	4,862	1,092
Michigan District	826	11,451
Ohio	96,736	34,976
Rochester	643,161	648,171
St. Lawrence	1,551,859	1,356,842
Vermont	127,821	21,497
<b>Total</b>	<b>5,350,817</b>	<b>4,560,955</b>

and it is received in Canada through these districts:

	1917
Nova Scotia	71,263
New Brunswick	100,555
P. E. I.	5,147
Quebec	1,664,095
Ontario Central	2,963,940
Western Ontario & Manitoba	443,016
Saskatchewan	71,514
<b>Total</b>	<b>5,319,530</b>

from which it appears that there is approximately the following relationship between exports and imports:—

Vermont supplies New Brunswick (P.E.I., and Nova Scotia; largely water shipments from New England ports.

St. Lawrence supplies Quebec and the western part of New Brunswick.

Buffalo supplies Central Ontario and part of the head of the lake shipments.

	Total	Buffalo	Dakota	Duluth Superior	Mich.	Ohio.	Roch.	St. Lawrence	Vermont
Novia Scotia	71,263								71,263
New Brunswick	100,555							60,144	55,411
P. E. I.	5,147								5,147
Quebec	1,664,095						172,389	1,491,715	
Cent. Ont.	2,963,940	2,493,061					470,881		
West. Ont. & Man.	443,016	508,147							
Sask.	71,514		14,344	4,862	826	21,484			
<b>Total</b>	<b>5,319,530</b>	<b>3,001,208</b>	<b>14,344</b>	<b>4,862</b>	<b>826</b>	<b>21,484</b>	<b>643,161</b>	<b>1,551,859</b>	<b>131,821</b>

The consumption per capita of domestic sizes in America is given below, to which the figures covering the same period for Canada is added:

	1916—1917		Consumption Per Capita
	Population	Consumption	
Connecticut	1,719,623	1,952,900	1.14
Delaware	234,710	223,503	0.95
Dist. of Columbia	345,856	517,760	1.49
Maine	646,588	556,683	0.86

Manitoba	619,000	443,339*	.72
Average.....			.83

\* Includes head of the Lakes.

Canada's consumption in that area where the population is greatest, and when other sources of fuel for this purpose are not presently available is, therefore, not yet equal to that of the heaviest anthracite consuming community of America.

### Canada is the Last Applicant at the Final Source of Fuel.

These deductions point to these considerations: that Canada being the most distant market, the most indirect to reach, the last applicant at the final source of this fuel, will in all probability witness in future years many a recurrence of the situation of 1917-1918, when coal was scarce and hard to get. When the united demand is moderate and the production going well, Canada will be supplied, but when the demand is heavy and production low, Canada will again be a participant at the interesting function of allotment of fuel supplies; a fact which must inevitably be a detriment to her economic and social development. That drawback takes place and is present in a period in her history when expansion is not long past mere commencement. And on top of these statements, it has to be remembered that Canada can only ask for consideration; she has no voice in any proposals developing or conserving production for her future necessities, no control over efforts to expand this industry; no means to compel any change in policy, and

no authority to force her needs. While nothing brought forward in these papers need be accepted as a definitely established fact,—rather the figures are to be conceived as illustrating the future by the light of the past, still the importance of this fuel question to Canada cannot be comfortably explained away by the fact that there is enough coal in the whole of the anthracite fields to last two hundred years. Rather the position should be that by virtue of this situation and the geographical position of Central Canada to her own fuel supplies, it is essential that Canada earlier than any other market should promptly initiate the means, conduct the experiments and plan the campaign to reach complete or some measure of independence in this direction. The little problem should be handled as a national question and not by way of a variety of efforts at local relief. What ever is being done in the latter direction should be welded in as part of a larger programme.

### Modern Methods of Extraction Prevail in the Wyoming Field.

These facts, figures and fancies on the present and future importance of the Wyoming field to the Canadian market, and the trend of the Canadian consumption arouses considerable interest in what is being done to offset the future decreasing life, and so prolong the capability of the field to maintain a maximum of production. Progress along these lines largely centres on modern efforts to attain maximum recovery, the mining and operation of the thin veins, and the utilization of coal at present going to the culm dump.

In the estimates quoted above, no veins under 30 inches were included. But since that date, beds down to 24 inches are being mined. Ultimately, it is possible that this present limit will be carried down to 18 inches. Unfortunately beds between the limits of 24 and 18 inches cannot be left untouched as a small future reserve, because not only of their physical situation in the general stratification of all the properties, but also because of the economic question of cost.

In all these fields, thin veins alternate with thick veins, consequently in mining out these thick veins, there comes a time when the robbing of thick coals becomes retarded by the presence of an overlying coal. A decision has, therefore, to be reached as to whether this thin coal shall be mined or abandoned. As the coal becomes thinner, it becomes easier to make this decision because the ultimate possibility of mining such a bed is then more remote.

The extraction of a 24 inch coal is, comparative to the operation of neighboring thicker veins, not presently an economic success. The cost of mining a thin coal increases rapidly with the decrease in thickness, and the greatest proportionate increase is below the 30 inch limit. Mr. H. M. Chance compiled a curve of anthracite costs illustrating this point, which is reproduced below.\* A similar chart for soft coal mining in Canada appeared in 1913. Both show clearly that the proportionate rise in cost is due to decrease in vein size. To Mr. Chance's curve, an addition has been made representing the variation of costs due to thickness under conditions that are more recent than those depicted in 1909. At that date machine mining in the anthracite region was only in its infancy, while today it is, and must become more so, a very important factor in thin coal production. The additional dotted line indicates roughly that despite the increases in wages and materials, the application of machine mining has kept the balance of the cost of thin coal mining quite comparable with the previous calculated figures.

#### Thin Seams Should be Mined To-day.

Out of the recognition of the approaching exhaustion of the fields, the principle has been evolved that a proportionate tonnage of thin coal to the relative tonnage of thin coal still in the ground should be mined. This is a sound economic policy in any coal mining field, and had it been recognized years ago, the extra cost of mining these coals, so as to avoid a loss of minable coal and obtain release of underlying veins, would not have been felt. The sooner any company whose operations are so great as to be inevitably bound up with the progress of the field and

whose life will approximate that of the field itself, recognizes this, a guarantee is obtained that the costs of production will be maintained at the lowest average figures. This may be mining for posterity, but coal being a natural resource which should be conserved as much as possible, this is the proper plan to follow.

Modern methods of extraction present a vast change for the better. Twenty or thirty years ago, or somewhat earlier, a larger percentage was extracted in the first mining and thereafter the bed abandoned as exhausted. This resulted in small pillars which later crushed, gave rise to squeezed territory affecting large areas of often unworked coal. In cases where it was at all possible, these old areas have been re-entered and worked over again. Under more enlightened management, the tonnage extracted in first mining has been considerably reduced, large pillars left behind, more regularity and design exhibited in the work, and where the robbing of these pillars was some time away in the future, or they were to be mined under improved surface property, the chambers were filled with mine rock, or flushed with culm or ashes. Under such conditions, very little coal is lost and recovery will be at a maximum.

The preparation of anthracite for market is a science fully comparable to the metallurgical problems encountered in the concentration of many base metal ores. As the coal is mined it comes to the breaker with a varying percentage of waste material, according to the character of the vein being mined and the carefulness or otherwise of the miner. The coal beds range in quality from those of pure coal to those containing large percentages of intermixed material. Such veins can be cleaned either by the miner in the mine, or in the breaker. Where the foreign material is in the form of a layer of rock that separates readily from the coal, the miner in most cases separates the rock

\* Engineering and Mining Journal, July 20, 1909. (see page 269 of this issue.)

A MODERN ANTHRACITE BREAKER.

by gobbing it in his chamber, but as the veins become more intermixed with slate and "bone," it becomes more economical to clean it in the breaker. Very careful attention is paid to the amount of foreign material sent out by the miner in the care of coal. Standard discipline is well maintained.

In the preparation of this fuel, the following dimensions show the standards, round and square, utilized in screening the coal:—

	Through		Over	
	Square	Round	Square	Round
Grate	4"	4 1/2"	2 3/4"	3-1/8"
Egg	2 3/4	3-1/8	2	2 1/4
Stove	2	2 1/4	1-3/8	1-9/16
Nut	1-3/8	1-9/16	3/4	7/8
Pea	3/4	7/8	1/2	9/16
Buckwheat	1/2	9/16	1/4	5/16
Rice	1/4	5/16	1/8	3/16
Barley	1/8	3/16		3/32

The allowable percentages of foreign matter are approximately as follows:—

Broken	3%	Chestnut	15%
Egg	4%	Pea	18%
Stove	7%	Buckwheat	20%

Competition and demand in normal times control the percentages of waste, and also the percentage of over and under size in the different classes of fuel as marketed. In former days it was difficult to find a market for pea coal, and much of it went out to the dump. Then it became saleable as a steam fuel, and latterly is well established as a house fuel. This process of extending the usefulness of the various sizes of fuel is still going on, and buckwheat, once entirely unsaleable, has now passed into the steam class of fuel, and is encroaching on the domestic market, home furnaces being now available to burn this size.

**Culm Piles Becoming Valuable.**

Far-sighted operators long ago foresaw the coming utilization of the smaller sizes, and in many cases carefully dumped that material separate from the breaker and mine refuse. This has at different times given rise to absurd statements of millions of tons lying available on the surface not being utilized and

inferentially, if not directly stated, being held for higher prices. The truth is that the domestic consumer who most commonly believed such statements, would not have purchased and even if purchased, would not have known how to burn the small sized material these banks contain. These coal piles are now rapidly disappearing, and as each successive scarcity of steam sizes appears, there is a fresh activity in their disposal. The improvement in preparation and utilization of the finer sizes is still going on until now the question of culm is receiving attention. Ultimately as already stated, instead of a loss of about 25 per cent of coal in preparation, this will be reduced to an unavoidable loss of 10 per cent, and the whole of the coal mined with either be used at the colliery or marketed.

Utilization of culm has taken place through direct consumption in dust burning boilers, or conversion into briquettes or coking. Direct consumption as dust will doubtless come in the future; it is already successfully established in certain phases of the copper industry. As practiced as a direct steam raiser, certain difficulties are experienced still to be removed in practice and, mostly brought about by the scouring action of the anthracite dust.

Briquette production has been going on for a number of years on a modified and successful scale, and will increase in the future; while still another method employs a coke oven process in the production of anthracite coke. In both coke oven work and briquetting, the troublesome question has been the reduction of the ash, and it is in accomplishing this that the preparation process has adapted still other features of the metal mining industry. Normally the percentage of ash in culm will range from 20 to 60 per cent, consequently any fuel made from this material would be unsaleable unless the ash contents would be reduced. To accomplish that, coal mining has borrowed from metal mining and introduced the Dorr thickener and classifier as a means to that end. It also appears as if the concentrating table would ultimately be used for a further reclamation of culm. The Dorr opera-

CANADIAN COAL MEN

Mr. O. E. S. WHITESIDE

President of the Mining Institute, 1920-21

The Canadian Mining Institute has elected Mr. O. E. S. Whiteside to the office of President, a proceeding that is notable in that following Mr. D. H. McDougall, the Institute will have two presidents, in immediate succession who are coal miners in active charge of coal mining. Mr. Whiteside is likely to be a good president, first because of his own qualifications for the position, and second, because of the importance of the section of the Institute's activities that he represents.

The "Bulletin" for March has the following succinct account of Mr. Whiteside's career, from which it will be seen that Mr. Whiteside's purview of the operating and financial of colliery management is very wide and practical. The new President's record of labor accomplished on behalf of the Institute also recommends strongly the wisdom of the unanimous choice of Mr. Whiteside for this office. The "Bulletin" states:

"Mr. O. E. S. Whiteside was born at Metcalf, Ontario. His early education was obtained at the Ottawa Collegiate Institute from which he entered McGill University in 1890, securing the Jeffrey Burland scholarship. He graduated with first class honors in natural science

in 1894, with the degree of B.A. Sc. Later, in 1900, he took his master's degree. After graduation he was employed for a few months in the McGill observatory before going to Alberta where he has been continuously employed ever since although he has found time on numerous occasions to visit the coal mining areas, not only of Canada and the United States, but of England and the continent as well. Mr. Whiteside spent his first nine years in Alberta with the H. W. McNeil Co, Limited, at their Anthracite and Canmore collieries, first as mining engineer and later as general superintendent. In 1904 he accepted an appointment as general manager of the West Canadian Collieries, Limited, at Frank, where he remained until 1908, when he resigned to accept his present position as general manager of the International Coal and Coke Company's mines and works at Coleman.

Mr. Whiteside is a charter member of the Institute and has always taken the keenest interest in its affairs. He has been a member of Council for the terms 1910-12 and 1914-16, and has been closely connected with the activities of the Rocky Mountain Branch, of which he was one of the original organizers. He was also one of the organizers of the Western Coal Operators' Association, which was formed about fourteen years ago, and was elected President of the Association this year.

**PRECIS OF PRELIMINARY DRAFT OF PROPOSED  
BILL RESPECTING THE ENGINEERING PRO-  
FESSION BEFORE THE BRITISH  
COLUMBIA LEGISLATURE.**

**Interpretation: The practice of a Professional Engineer  
Within the Meaning of this Act.**

"(b) The practice of a Professional Engineer within the meaning of this Act embraces advising on, reporting on, valuation, laying out and the design, carrying out, direction of the construction, installation, improvements of public utilities, factories, industrial works, railways, bridges, tunnels, highways, roads, canals, harbours, harbour works, river improvements, light-houses, wet docks, dry docks, dredges, cranes, floating docks, ship design and construction and other similar works, steam engines, turbines, pumps, internal combustion engines, and other similar mechanical structures, air ships and aeroplanes, electrical machinery and apparatus, chemical operations, processes, apparatus, and machinery, and works for the development, transmission or application of power, light and heat, launch ways, marine ways, grain elevators, municipal works, irrigation works, water works, water purification plants, sewerage works, sewage disposal works, drainage works, incinerators, hydraulic works, mining properties, mining operations, mining and concentrating machinery and apparatus, mine and concentrator buildings and structures, oil and gas wells, mineral deposits, metallurgical works, metallurgical processes machinery and equipment, metallurgical buildings and structures, investigations relating to the examination, surveying, exploration and development of rocks, minerals (including coal, petroleum, natural gas, and other fluid substances of value), rock structures, geological processes and the application of geology to practical problems of the industries, arts and engineering, and all other engineering works, and all buildings necessary to the proper housing, installation and operation of the Engineering works embraced in this section.

"The execution as a Contractor of work designed by a Professional Engineer, the supervision or the construction of work as a foreman or superintendent or as an inspector, or as a roadmaster, trackmaster, bridge or building master, or superintendent of maintenance shall not be deemed to be the practice of a Professional Engineer within the meaning of this Act."

**Provision for a Close Corporation.**

All persons registered as Professional Engineers under this Act, shall constitute the Association of Professional Engineers of the Province of British Columbia, and shall be a body politic and corporate, with perpetual succession and common.

Association is given power to hold real estate, within specified limits, to pass by-laws not conflicting with the Act for governance, discipline, admission, etc.

**Who May Practice.**

Only such persons as hold membership in the Association, or license from the Association to practice. Persons having five years previous practice as a professional engineer under the definition of the Act, and residing in British Columbia at the date of the passing of the Act. Provision is made to permit persons to practice who come from other provinces of Canada, who fulfill specifications of membership and

pay the prescribed fees. The Act does not apply to government employees. Engineers who have been overseas are given full rights of members of the Association.

A provision which it is understood has been asked by representatives of the Canadian Mining Institute, reads as follows:

"Notwithstanding anything to the contrary in the Act, any person who is not a resident of British Columbia may practise without license in the Province for the purpose only of examining of, consulting on, advising on and reporting on properties and works in the said Province, in the interests of persons who are not residing in British Columbia. Such persons may also superintend operations, directly resulting under this Clause, for one continuous period of not exceeding three months, without license, provided that this privilege of superintendence shall not be permitted more than once in connection with such operations."

**Powers of the Association.**

The Act provides the form of corporate organization and specifies the officers to be appointed. Powers are given to expel members for unprofessional conduct, negligence, or misconduct, or for commission of a criminal offence if convicted by a competent Court. Rules of evidence and procedure are specified. Penalties are prescribed for persons practising as a professional engineer without license.

Provision is made for admission by examination, all of which is given to the discretion of the Council of the association. Provision is also made for joint action in these matters with other Councils of professional associations in other provinces of Canada. The names of licensed engineers will be recorded on a Register, and duly gazetted in the "British Columbia Gazette."

No person may be registered until he is 23 years of age, and has been engaged for eight years in some branch of engineering, except in the case of a graduate of a recognized engineering college, in which case the period is reduced to six years, which may include the term of instruction.

Provision is made for appeal to a Judge of the Supreme Court against refusal by the Council to issue a license to practice.

Within three months of the passage of the Act the Lieutenant-Governor-in-Council shall appoint a provisional Council of the Association consisting of eleven members, who shall elect their own officers.

**ENGINEERING LEGISLATION IN QUEBEC**

Mr. Theo. Denis writes in the "Bulletin":

The Engineering Institute presented a bill at this present session of the Quebec Legislature, transferring the powers of administration of the "Act Concerning the Practice of Civil Engineering" (1898) from the Council of the Canadian Society of Civil Engineers to a Provincial Board consisting of the members of Council of the Engineering Institute residents of the province, and this has revived attention to the Act in question, the bearing and arbitrary powers of which I had no conception until a few days ago. In the original Act the definition of a Civil Engineer is vague, and there has always existed a doubt as to whether or not it includes mining engineers and metallurgists.—One thing certain is that it includes all persons "advising on, making measurements for laying out, designing or supervising

the construction of railways, metallic bridges, wooden bridges, public highways, roads, canals, harbours, river improvements, lighthouses, and hydraulic, municipal, electrical, mechanical or other engineering works." No person is entitled to act as a civil engineer unless he is a "Corporate member of the Canadian Society of Civil Engineers," now the Engineering Institute of Canada.

So that, if I interpret the Act correctly, a mining engineer in charge of a mine a hundred miles from nowhere, a science graduate from a university, a man of eminence as an engineer, who wishes to build a road from his mine to his mill, or who wishes to build a flume for working his placer, is not allowed to design or supervise this work, but must secure the services of a "Corporate member of the Society" to do it. If he should undertake it himself, he is liable to a fine of \$200.00 for the first offence, and \$500.00 for each of the subsequent offences.

If I am wrong, I would like to be set right. If I am right, then the powers conferred by the old Act of 1898 are arbitrary in the extreme, much more so than any of the other acts respecting liberal professions. For, the medical Act does not fine me if I take quinine or aspirin for a cold without calling in a physician; if I have the nerve to do it I may pull out my own aching teeth without a dentist's permission; I am allowed to make plans for my chicken coop, or for my house without being fined \$500.00 by the corporation of architects, but a mining engineer may not design and build a two-foot gauge tramway from his headframe to his dump without incurring a liability to a \$200.00 fine for a first offence and \$500.00 for a second.

I consider such a statutory measure detrimental to the development of our mineral resources, inasmuch that foreign capital, being timid by nature, is liable, for slim causes, to be diverted into other fields, such as Government bonds, at a time when the cry is that "production, more production and greater production," is the only way out of the complicated anomalous economic situation which the world faces at present. I am of the opinion that steps should be taken to modify the arbitrary terms of the Act of 1898.

Quebec, Feb. 12, 1920

T. C. DENIS.

### MANITOBA SAFEGUARDS INVESTOR IN MINING FLOTATIONS.

Amendments to the "Sales of Shares" Act have been adopted by the Local Legislature.

The chief points are that before placing Development Stock on the market a prospectus of the Company must be submitted to the Public Utilities Commissioner for approval. This must set forth the price paid for the property and the amount of Vendor's Stock, and all advertising must conform to statements set forth in the prospectus.

Further, that no Vendor's Stock may be offered on the market until the amount of money has been subscribed by Sale of Development Shares to warrant development of the Mine to a point where there is a reasonable prospect of the mine making a fair return to investors and the permission of the Public Utilities Commissioner must first be obtained thereafter authorizing sale of Vendor's Stock.

## Northern Ontario Letter

### THE SILVER MINES.

The One Big Union, in Cobalt, has commenced a campaign of so-called "sniping" tactics. The membership is comparatively small, and is composed chiefly of the radical element. Also, it is opposed by the majority of the workers. While probably not able to cause any general labor disturbance, the organization by bending the will of its few fanatical followers may be able to create local disturbances, decidedly limited in their scope.

Wages, hours of labor and general conditions in Cobalt have long since been approved of by the great body of workers. Direct representation is made between the men and the companies by the appointment of workmen's committees at each mine. This being so, it is regarded as being exceptionally remarkable that, having no just excuse for promoting discord, that the O. B. U. executive should have the audacity to attempt such an experiment.

J. Cluney is secretary of the O. B. U. in Cobalt, last summer at a meeting of the workers here he was charged with having been a paid representative of the O. B. U. in Winnipeg at the time of the labor trouble there. He is a man with practically nothing at stake in this country, and one possessing extreme radical views which he constantly attempts to foist upon those who come in contact with him. So radical are his views as to cause not a few labor men to express the opinion that the government owes it to this country to take immediate steps to investigate the matter, and if able to secure proof of offences against constituted order, should take him into custody.

Production from the mines of Cobalt continues quite uniform, although shipments of bullion have been withheld for some weeks on account of the slight decline in quotations for silver. With silver averaging from 10 to 20 cents an ounce above the average obtaining during 1919, it is believed that the margin of profit will be increased to a point where it will not only offset the higher bonus to the men, but will also offset the gradual decline in output and still leave a greater net profit.

The indications are that the La Rose will have a moderately favorable year, owing to continued favorable developments on the Violet property, and new favorable results on the old University mine. The physical condition of the company's several properties would lead to the belief that the current year's earnings would be large, but for the fact that the cost sheet for 1919 showed that it cost the company \$1.05 for each ounce of silver mined.

A labor dispute, arising over the discharge of a few One Big Union members who attempted to slow down production at the McKinley-Darragh, retarded development work at that property for a few days during the past week, but production at normal capacity has been continued. The affair only served to temporarily reduce the number of men employed underground, for a few days. At the time of writing, full forces are engaged and those who were discharged have not been reinstated.

The Oxford-Cobalt has purchased a hoist from the Adanac, which it proposes to instal at shaft No. 2. The plan of operation is to sink a shaft to a depth of 200 feet, at which point lateral work will be carried on. The promoters of the enterprise appear to

be confident of being able to provide the necessary money for development work.

In discussing the project light narrow gauge railways from Elk Lake to Gowganda, one of the gentlemen involved in the proposition intimated to the "Journal" that provided the Ontario government grants the charter, the rails to the camp will actually be laid within only a few weeks. It is also learned that the leading operators still evince their desire to have a standard gauge railway, and that some hope is still entertained that the Elk Lake branch of the T. & N. O. Ry. may yet be extended. As to this, however, the belief is growing locally that the Ontario Government may gladly accept the present opportunity to let private interests take up the matter of transportation to Gowganda when by so doing the Government will be unburdened of at least a part of its responsibilities.

At the Kells property, in the township of Corkhill, in the Elk Lake district, the result of underground work to date has been exceedingly favorable. Samples just brought out which are said to come from a depth of about 80 feet, contain several thousand ounces of silver to the ton. The veins are similar in composition to the Cobalt district. Four of these narrow veins occur in close proximity to each other.

Mining Commissioner, T. E. Godson, K.C., will hear at least five mining disputes at his monthly sittings to be held in Haileybury on April 14th. The list is made up as follows:—

George R. Smalles vs. Philip Godson, K.C., will hear dispute in respect of mining claim L.S. 386, situated in Gauthier township, in the Larder Lake Mining Division.

A. P. Orr vs. Capt. Albert Johnston, which is a dispute in respect of mining claim L. 6204 and L. 6205, situated in lot 2 concession 6 in the township of Skead, in the Larder Lake Mining Division.

R. P. McGregor vs. S. W. Barber, being a dispute in respect of mining claim 18834 situated in the Gillies Limit, in the Temiskaming and Coleman Mining Division.

R. H. Douglas vs. M. P. MacDonald, a dispute involving mining claims M.R. 6087, 6088, 6089, and 6090 situated in the township of Cairo, in the Montreal River Mining Division.

Gibson and Kennedy vs. Smith, being an application for relief from forfeiture in respect of mining claim L. 4575, situated in the Larder Lake Mining Division.

On the White Reserve property, in the Maple Mountain part of the Elk Lake district, it is planned to commence work this spring provided sufficient men can be induced to go in to work. During the past winter it was found impossible to get men who would accept employment at the property owing to it being situated so far from a railway.

A at meeting of the shareholders of the Nipissing Extension Mines, Ltd., held on March 19th the following directors were elected.

Hon. Albert Loenig; A. J. Young; William E. Stevenson; D. Inglis Grant; and Joseph Montgomery.

At a meeting of the directors, held on March 24th, the following officers were appointed:—

A. J. Young, President; William E. Stevenson, Vice-president; Hon. Albert Loenig, Treasurer; Joseph

Montgomery, secretary; and Wm. R. Sweeny, Assistant secretary.

Major E. H. Birkett was re-appointed resident manager in charge of operations, and with F. J. Bourne as consulting engineer.

Following is a statement of ore shipments over the T. & N. O. Railway for the month ending February 28th, 1920, in tons of 2,000 lbs. as submitted by Arthur A. Cole.

Silver Ore.		Tons.
<b>Cobalt Proper.</b>		
1. Coniagas . . . . .		65.03
2. Hudson Bay . . . . .		30.32
3. La Rose . . . . .		118.10
4. McKinley-Darragh . . . . .		180.36
5. O'Brien . . . . .		32.02
6. Temiskaming . . . . .		31.86
		457.69

The above shipments were made to the following Companies;

Canada.		Tons.
Deloro Smelting and Refining Co., Marmora		219.71
Coniagas Smelter, Thorold		32.00
<b>United States.</b>		
American Smelting and Refining Co., Pueblo . .		33.03
American Smelting & Refining Co., Perth Amboy . . . . .		77.80
Pennsylvania Smelting Co., Carnegie . . . . .		95.15
		457.69

Price of Silver.		Price.
Feb. 2nd. Highest . . . . .		134,500
Feb. 24th. Lowest . . . . .		129,000
		Average . . . . . 131,295

During the week ended March 26th, three Cobalt companies shipped one car of ore each, the total amounting to 231,176 pounds.

Following is a summary:—

Shipper	Cars	Pounds.
McKinley-Darragh . . . . .	1	82,260
Coniagas . . . . .	1	88,000
Hudson Bay . . . . .	1	60,916
Total . . . . .	3	231,176

During the corresponding period the Nipissing was the only bullion shipper, sending out 80 bars containing 106,624.45 fine ounces.

### THE GOLD MINES.

The bill introduced in the House at Washington, having the support of the American Bankers' Association, and having for its aim the placing of a tax on all gold used in the arts, has aroused considerable interest in the gold producing districts of Northern Ontario.

While all measures tending toward a search for some method whereby the gold producing mines could be assisted meets with ready support in this country, yet the latest proposal is accepted with all due reserve. It seems to be the opinion of careful observers that the placing of a tax on gold used in the arts might well lead to complications, and might prove to be attended with expenses totally out of proportion to the advantages which it would bring. Not only that, but goldsmiths would be given added opportunity and temptation to melt down gold coins and possibly add

to the present unfavorable monetary status of the nations. It seems as though humanity will always clamor for gold trinkets. As long as this demand continues, it would not be sound business to have \$20 gold pieces minted while for an equal amount of gold the goldsmith would be obliged to pay \$30. It seems to suggest the necessity for dealing with all new gold produced.

The proposed new bill would tax the arts \$10 an ounce extra for all gold used, and would pay the proceeds to the gold producing companies. It is a plan that conveys the threat that it might only serve to create work for an additional army of office holders and tax collectors whose energies might be wasted in an unproductive occupation, while the real relief for the present economic problem lies in a greater number of hands being employed in producing something. The re-juggling of the world's gold, entailing the use of many men, and with the possibility of the expense of such an organization consuming the large part of the taxes collected does not appear to constitute a solution of the problem which is confronting some of the nations, if not the world.

In Northern Ontario the gold mining industry is on a comparative prosperous footing. Mines that have been closed down from two to three years are one by one resuming work. Those that have continued to operate during the past few years are increasing the scope of their activity, and on the whole the gold mining industry of this country is in a better position than ever before in Ontario's history. Barring unforeseen contingencies the year 1920 will not only bring some of the former producers back to their former standing, but will also add new producers to the list. It is a condition about which it is only reasonable that great optimism is being expressed, and also something which would tend to offer encouragement for the application of additional capital in the industry for the development of mines pending the return to normal conditions when the reward for the present improvement in mining methods will be realized. The truth is that economy is being practiced to a greater degree than ever before. It is due in part to greater experience and natural improvement, but is also due in a large measure to the fact that the hardships caused by the war made it absolutely necessary to establish the highest possible degree of efficiency, or go out of business.

The Dome Mines will end a comparatively successful fiscal year at March 31st. Having started up its mill last spring, and having treated a medium grade ore from which \$6.87 a ton was recovered during several months of operation, the net profit has been considerable, and has enabled the company to disburse two dividends each amounting to  $2\frac{1}{2}$  p. c. or a total of \$200.00. It is now believed that although able to earn fairly large profit, the company will not pay more than  $2\frac{1}{2}$  p. c. quarterly until such time as a surplus has been accumulated with which to meet any future emergency. The previous experience in this respect may cause a changed policy.

During 1919 the Davidson mine had only a moderately successful year. While it had been previously officially stated that the mill had been completed and had a capacity for treating 60 tons of ore daily, and that a large tonnage of fairly high grade ore had been blocked out, the figures for 1919 show that the mill treated an average of less than ten tons of ore daily and that the total recovery was but \$7.07 per ton, or a total output of \$2 under \$24,000.

The Teck-Hughes Gold Mines had a fairly successful year in 1919, the output amounting to \$169,590.41, as a result of having treated 18,387 tons of ore. This shows a recovery of \$9.22 a ton. The achievement is considered favorable due to such having been accomplished in spite of the prolonged labor strike at last summer in the Kirkland Lake camp. It is believed that under present conditions the company will this year be able to pay off a fair amount of the bonds held against it.

At the Kirkland Lake Gold Mines during 1919 the result of work was not so satisfactory it being shown that a total of but \$4.97 a ton was recovered from each ton of ore treated. Whether or not this is an indication that former estimates were not accurate, or whether it points to difficulty in obtaining the desired percentage of extraction is a matter of speculation. Opinion seems to lean to the latter being the cause, owing possibly to the presence of tellurides in the ore. A total tonnage of 11,324 tons were treated from which a total of \$56,262.59 was produced. The achievement was obviously not a profitable one for the reason that costs in the Kirkland Lake camp have in no case been reduced to below \$8 a ton.

On the Bidgood property, situated in the Eastern part of the Kirkland Lake district a contract has been let to sink a shaft to a depth of 300 feet, at which point some 2000 feet of lateral work will be done.

A charter has been granted to the Moffat-Hall Gold Mines, with property in Lebel township. The company is capitalized at \$3,000,000, made up of 3,000,000 shares of the per value of \$1 each.

A test shipment of ore recently made from the Clifton-Porcupine mine, showed an average gold content of \$66.45 a ton. While this is above the average of the ore so far developed, yet it is said to be the average of one of the ore shoots on the property. In the meantime development work is proceeding at the 200-ft. level and a good deal of success is being met with. The management states that provided the present favorable results continue, it is expected that plans for a mill will be taken into consideration.

#### PERSONALS.

Mr. A. G. Burrows and Mr. P. E. Hopkins, geologists of the Ontario Bureau of Mines are making underground studies at Kirkland Lake. They spent the greater part of the last field season in the Kirkland gold area, and are preparing a detailed report and map.

Mr. Balmer Neilly, formerly manager of the Penn Canadian mine at Cobalt and recently appointed secretary of the Ontario Mines Owners Association will move to Toronto shortly and open an office there for the Association.

#### NEW MONTREAL SALES OFFICE

The Engineering and Machine Works of Canada, Limited, St. Catherine, Ont., owing to the rapidly increasing demands for their products consisting of boilers of all types, horizontal, vertical, locomotive and marine, tanks, plate work of all descriptions, etc., and particularly in connection with their recent and very successful venture, the manufacture in Canada of the Keystone Light Traction Excavator, Model 4, have found it necessary to open another Eastern Sales Office in the Birks' Building, Montreal, where inquiries can be more quickly and satisfactorily handled. This is in addition to their Sales Office in the Sun Life Bldg., Sherbrooke, Que.

**BRITISH COLUMBIA LETTER.****Victoria, B. C.**

The forecasted Bill amending the Placer Mining Act of British Columbia has been presented to the Legislative Assembly by Hon. Wm. Sloan, Minister of Mines, and, as has been prophesied, provision is made for the elimination, by easy stages and in an equitable manner, of accumulated arrears of rentals on Placer Mining Leases, these now being estimated as approximating \$350,000.

Because of the standardized value of gold and the increased cost of plant, labour, supplies and every necessity in relation to its production interest in the development of the gold-bearing sands and gravels of British Columbia has fallen off in late years. The annual output of the precious metal from this source has declined. Consequently large sections of the placer mining districts are held under leases upon which the owners, unable to pay the yearly charges, owe considerable sums to the government and for some time have done little or no work.

This is a condition detrimental to the best interests of the mining industry but it is one requiring careful remedial treatment, it being necessary to guard the rights of the license holder who has invested heavily in development, contemplates further development but has been temporarily embarrassed financially and yet to assure that ground tied up by leases likely to continue inoperative shall be thrown open to others anxious to make them productive.

That this problem has been kept in mind by Mr. Sloan in the drafting of the Bill now before the House is quite clear. He has not the difficulty of the situation by providing a simple means of collecting the arrears. They are to be consolidated and the payment spread over a period of years. Besides there is introduced a uniform procedure for the obtaining and the protecting of Placer Lease Titles in the future.

The provisions of the proposed legislation may be summarized as follows:

In respect of leases now in arrear for more than one year's rental the lessee may apply before the 1st of January, 1921, for the consolidation of the annual rentals in arrear and arrange for their payment by annual instalments extended over a period not exceeding ten years. Where the arrears are consolidated, the failure to pay the annual instalment or the current annual rental when due will automatically result in a forfeiture of the lease. Where the lessee so in arrear fails to apply for consolidation and fails to pay the arrears before the first of January 1921, his lease is forfeited.

Provision is made for the issuance of leases, beginning 1st of July, 1920, at a reduced annual rental and reduced annual expenditure for development work. Leases in this new form will contain a provision for automatic forfeiture, if the lessee fails to pay the annual rental or to do and record the annual development work. Reinstatement is permitted within thirty days where the fault consisted only of failure to record the work. Excess development work done in any one year may be recorded so as to count on future development work requirements for the following three years only. Cash may be paid to the Crown in lieu of expenditure on development.

In the case of leases in good standing it is provided that the lessees have the option of applying at any time while the regular charges are paid up to have the annual rental and annual expenditure reduced to the rates under which new leases are to be issued after the 1st of July. If they apply and obtain this reduc-

tion the conditions of automatic forfeiture for default, and the privileges of recording excess work and paying cash in lieu of work, which are applicable to new leases, will also attach to these old leases. If they decide not to apply for a reduction of rental and annual expenditure their leases will continue subject to the same provisions to which they now are subject.

Leases which become in good standing through consolidation of arrears, may also be brought under the reduced rates of rental and other provisions applicable to new leases issued after the 1st of July.

Although the foregoing are the chief alterations there is yet another innovation of importance. Heretofore Placer Mining Leases have been issued by the Gold Commissioners, who have their headquarters at different central points throughout the Province, with the sanction of the Lieut.-Governor-in-Council, the authority to issue the same being invariably based on the Gold Commissioner's report accompanying the application. It is now proposed that Gold Commissioners, having full knowledge of all local conditions, shall be empowered to issue such leases without reference to the Lieut.-Governor-in-Council, while, as has been indicated, automatic forfeiture is provided for in cases where the lessee fails to observe the covenants and conditions of his lease.

These changes in the provincial law, it is pointed out, are proposed by Mr. Sloan, and supported by other members of the government, not through any lack of confidence in the Placer Mining Fields but because it is recognized that, at least in-so-far as the long exploited placer sections are concerned, the methods of the individual miner has given place, for the most part, to those of the hydraulic or dredge operator. And as the latter has contributed materially to the arrears of rental indicated, it is felt that a reduction in both rental and expenditure rates will have the effect of stimulating and stabilizing the placer mining industry of British Columbia.

The alterations in connection with the taking up and the maintaining of placer leases in the Province are as follows:

Hydraulic lease, \$25 in place of \$50 per annum and development \$250 instead of \$1,000 per annum.

Creek lease, \$37.50 in place of \$75 per annum and development \$250. instead of \$1,000 per annum.

Dredging lease, \$25 in place of \$50 per mile and development \$250 instead of \$1,000 per mile per annum, the value of any new plant or machinery employed to count as money expended on development; and 20 cents royalty to be charged against every ounce of gold recovered.

**Stewart, B. C.**

Definite information is available regarding development plans on the Big Missouri Group of Mineral Claims, Salmon River Section of Portland Canal Mining Division. There will be started a diamond drilling contract of 12,500 feet. This, together with work to be carried on simultaneously, will cost about \$40,000. Two camps will be maintained throughout the season. The erection of a concentrator and of all other necessary equipment is proposed providing the exploration and development for which plans have been laid gives satisfactory results.

Dale L. Pitt, who is known in Pacific Coast mining circles as the ore buyer for the Tacoma Smelter and later a manager for a copper producer at Index, B. C., has been appointed General Manager of the Premier Mine, Salmon River. R. K. Neill, of Spokane, Wn. and Vancouver, B. C. whose place he is taking, retains his

interest in the mine. Mr. Pitt has stated that development will be carried on vigorously, that a concentrator will be installed, water power developed, and a saw mill erected.

#### Alice Arm, B. C.

The Molybdenum Mining and Reduction Co., of Seattle, Wn., which is interested in one of the best showings of molybdenum in British Columbia, situated in the Alice Arm section, states that a bona fide effort is being made by all concerned to dispose of this property. It has been tied up by litigation for several years, the complications as to title making it impossible to place the property on a producing basis even during the war when prices were high and the Allies were crying out for the metal. The court has fixed the price at \$150,000.

#### Atlin, B. C.

A 50-ton shipment of the hydro-magnesite of the Atlin District, British Columbia has been shipped from Vancouver, B. C. to England. This was part of a 200-ton lot brought from the north in 1914 and which has been held at Vancouver at the command of Old Country parties throughout the period of hostilities. Nichol Thompson, who is handling the business, anticipates that this is but the beginning of regular shipments of magnesite from this province. There is another deposit situated in the Cariboo District and within a short distance from the line of the Pacific Great Eastern Ry., now under construction.

#### Princeton, B. C.

Construction operations at Allenby and Copper Mountain will be resumed by the Canada Paper Corporation about the 1st of April. It will be possible then to start tracklaying on the new railway from Allenby to the Mine, as the grading will be complete. The bridge timbers are being framed at Princeton and will be forwarded to Allenby for distribution. Both H. R. Van Wagenen, the General Manager of the Company, and Van H. Smith, of Butte, Mont., the Mill expert, have been wintering in the United States. They are expected to return shortly.

#### Trail, B. C.

Shippers to the Trail Smelter of the Consolidated Mining and Smelting Co. of Canada are being paid, commencing with 1920, everything over 5 per cent on exchange values.

#### Greenwood, B. C.

The Providence Mine, Greenwood District, continues to ship. Two cars have been dispatched this month, aggregating 75 tons, most of which was taken from the 400 feet level. The value of this is placed at \$14,000. Development now is in progress on the 500 foot level where there is considerable high grade ore in sight.

#### Grand Forks, B. C.

The Rock Candy Mine and Fluorite Plant of the Consolidated Mining and Smelting Co. has resumed operations with sufficient orders ahead to assure continuous activity for a year or more. The Mill has been closed down for the past few months, although development has continued. The shipments from the decrepitating plant probably will reach about 18 cars a week.

#### British Columbia Government Proposes Reservation of Iron-Ore Deposits.

The Bill now before the Legislative Assembly giving the Lieutenant Governor in Council power to place a reserve on iron ores deposits, the said power to extend over a period of three years, will be applied to a lim-

ited extent, and the authority so granted will be exercised, not to the detriment, nor in such a way as to inflict any hardship of interference with the prospector of any class of people interested in the mining industry. Rather it will be used for the advancement of the interests of those directly or indirectly concerned in the development of the mineral resources of the Province, as well as for the benefit of the public at large.

To the criticism that the bill will hamper the prospector it may be replied that he had not heretofore and cannot at present benefit materially by reason of the discovery and location of purely iron deposits. Without an Iron and Steel Industry in Western Canada there is not a sufficient market, if any, to make the product of such holdings saleable. That the force of this is recognized by the prospectors is confirmed by a statement voluntarily given to Hon. Wm. Sloan, Minister of Mines, who is responsible for the proposed legislation, by J. W. Mulholland, President of the Prospectors' Protective Association, who says in part:

"The iron deposits of British Columbia have in the past been of no value to the prospector. This class of ore is absolutely useless. By reserving districts which are idle and not covered by mineral claims there should be no reason or ground for opposition, for, if we have a Steel Plant in the Province, it would furnish a market for ores which are now being held by the prospectors of this Province and which would remain idle until such time as this market is created. Considering the benefits which this Province would derive from an industry of this kind I feel it my duty to give you (the Minister of Mines) my approval."

To the charge that present holders and operators will be adversely affected it is only necessary to direct attention to the fact that the authority asked for does not apply to iron ore locations already held until the Mineral or any other Act.

The object sought, briefly, is to prevent the further alienation of the iron ore resources to such an extent that their development is impeded. At present many such deposits are privately held and on none has much work been done. The only conclusion possible is that they were acquired, and are being held, for speculative purposes, a situation which, it must be clear, handicaps the efforts being made to interest capital in the development of an Iron and Steel Industry, an enterprise most important if British Columbia is to take the place her mineral riches warrant in the industrial world. An illustration in point is found on Texada Island where there are large iron ore deposits, of high grade, which have been out of the hands of the Crown for fifty years or more and on which there has been little expenditure in development.

While it is not intended to touch the unquestioned rights of these who have complied with all the laws heretofore, and have kept their properties in good standing, it is proposed that for a time such properties of this character, as may be deemed as of sufficient importance, shall be reserved by the Crown.

On the report of the discovery of iron ore, the resident engineer of the district in which such find has been made will be asked to inspect and report on the same. If it is considered on investigation that the ore is so situated, is in such quantity and of such quality as to warrant the belief that it might assist in the object in view, namely, the launching of an Iron and Steel Industry, the government power to apply the reserve probably would be exercised.

**MANITOBA LETTER.**

From Chas. A. Millican.  
(Our Winnipeg Correspondent.)  
Rice Lake District.

The Gold King Mines Ltd., with properties situated near the North East End of Hole River Lake in the Rice Lake District is the latest Company to place Development Shares on the market, offering 25,000 shares at 25c.

The prospectus and advertising matter are very conservatively worded; keeping clear of rash and extravagant statements.

On the Gold Pan Extension the Manager is rushing to completion the camp buildings and installation of Machinery. It is expected that mining operations will begin by 1st April and sinking carried on from the present 50 feet shaft down to the 300 feet level before much drifting is undertaken.

Mr. G. H. Porter, Managing Director of the Commonwealth Mine left on the 20th with supplies and a small crew of men to erect camp buildings preparatory to starting mining operations.

Major Pelletier has returned from the Gabrielle Mines, having completed the erection of new Camp building and putting the old buildings into serviceable condition for present use.

This Company will not instal any heavy machinery this season. It is the intention to do considerable stripping together with some sinking on present shafts. A large block of this Company's Treasury Stock has been purchased by an English Syndicate.

It is not expected that any work will be carried on at the Brooklyn Mine during the summer season.

On the 22nd inst., one of the Winnipeg evening papers made the announcement of a strike of \$200,000 ore at the Gold Pan Mine, which caused considerable excitement in the City.

Later news relates the finding of a small pocket in the 200 ft. drift 83 ft. south of the shaft, but in extent it was exceedingly small, and the value not anything like as high as reported. A single shot blew out all there was of high grade ore. Work on the drift is still proceeding.

**Golden Vein Mine.**

The shaft on this property is now down 30 feet. Cross samples taken every five feet run as high as \$34.00 per ton, with a general average assay value of close on \$9.00. A sample was taken from the bottom of the shaft shows an assay of \$62.50 per ton. The vein is 15 feet wide at the bottom of the shaft and values appear to increase with depth.

Work on the Marigold Claim is being pushed. The shaft is now down 25 feet. The vein has widened to 5½ feet, and is carrying visible Gold.

**WANTED.**

Experienced man or Company, to install and operate concentrating plant on high grade chrome iron property. Over 1000 tons of ore mined, averaging better than 38 p. c. chromic oxide ready for concentrating. We have market for concentrated ore, and will allow substantial interest in proposition to party installing and operating concentrating plant. Address: c/o Canadian Mining Journal, 528 Winch Bldg., Vancouver, Canada.

**CHANGES IN THE CANADIAN MINING INSTITUTE**

To the Editor "Canadian Mining Journal."

The plea of Mr. E. P. Mathewson in his address at the annual dinner of the Canadian Mining Institute for the adoption of the modern methods of business in the affairs of the Institute is warmly supported by many members. That there are obligations to the proposed plan, while not to be overlooked, should not be allowed to prevent a big step forward being taken now.

The purpose of the Canadian Mining Institute, according to its charter, is to encourage the development of the mineral resources of Canada. Its membership is predominantly made up of men of the engineering professions; but it includes many interested in other phases of mining. At times there as appeared a desire to degenerate to the status of a technical society; but the purpose of the Institute's existence has continued always to be the furthering of the mining and allied industries. The presentation and discussion of technical papers has always been a prominent feature of the meetings of the Institute; but never allowed to become the only feature. In this the Canadian Mining Institute has been a step in advance of the sister organization in the United States. It is interesting to note that the American Institute has recently made changes in its constitution which make it more nearly like the Canadian organization.

The Canadian Mining Institute occupies the position of representative of the Canadian Mining Industry.

It seems to me that Mr. Mathewson and his supporters are on firm ground when they urge that steps be taken to insure that Institute should capably fill the position which it occupies. There is room for discussion however, as to whether the increased activity proposed should be made dependent on the securing of the financial support of the larger operating companies. The large companies have big interests to protect and it is quite proper and very necessary that they should unite to protect themselves. It is a proper function of the Canadian Mining Institute to support the big companies in many of their claims, for in the main the interests of the operating companies and of the whole industry are the same.

There can be little doubt that if the mine owners would give the affairs of the Canadian Mining Institute the attention that they give their own affairs they could soon make the voice of the Institute heard more insistently in places where it is highly desirable that it should be heard. With a business organization on modern lines the Institute would take on a new lease of life and become of vastly more importance to the industry and more fully function as the representative of the industry. There will nevertheless be members who will not look kindly on any proposal which will tend to make something of the nature of a mine owners' association out of the Canadian Mining Institute.

In recognizing the Institute's business office staff so as to make possible greater activity in matters that affect the industry, it may be found possible to get the desired results without seriously changing the present nature of the Institute. My own inclination would be to adopt Mr. Mathewson's plan and insure greater activity on the part of the Institute even if there is danger that the objections to the scheme may prove well founded. Possibly means can be found to avoid the danger without greatly altering the main feature of the plan, which is essentially to place the Institute in a position where it can be of greater service to the industry.

Toronto, 19th March, 1920

R. E. Hore.

# A MARSH HOIST

## IS MADE THE RIGHT SIZE FOR YOUR MINE

and in either Steam Power or Electric Power

This shows one of our Electric Mine Hoists. We make many other types. Send for our catalogue of Mine Hoists, Cars, Cages, Buckets, etc., and see what we offer you. It will repay you.

From the little 10 Horse Power size for prospectors or small mines to the massive 50 Horse Power size, one of our 7 sizes should be just right for your mine.

We are specialists in the building of Hoisting Machinery of all sorts. For nearly a quarter of a century we have been designing and building Hoists, and have developed a Hoist that we are really proud of—proud because of the record of good work they have done, and are doing in mines, quarries, and other classes of work from one end of Canada to the other.

## Why Waste Coal When It Costs So Much?

THE COCHRANE METERING HEATER TELLS HOW  
MUCH YOU ARE GETTING FOR YOUR MONEY.

How many pounds of coal do you use to produce a thousand pounds of steam? 200, 150, 100 or less. A Cochrane Metering Heater will tell how many pounds of water are evaporated per pound of coal, and it will instantly show any improvement in evaporation due to better fuel, better methods of firing, better condition of heating surfaces (removal of soot and scale), better condition of boiler setting (stopping up air leaks), etc.

# EDITORIAL

## Mining Investments in the Middle West

In the editorial pages of this Journal in recent issues there has been under discussion the very pertinent question of the relationship of investors to operating mining companies and to the owners of prospects. We had intended to discuss some phases of this subject at the recent annual meeting of the Institute. It is an unfortunate fact that financial and business men in Manitoba and Saskatchewan look askance at investments in mining fields. In many cases, indeed, when investments are made, secrecy is enjoined in order that the standing of our financial men be not impaired by the knowledge of the fact that they are interested in mining ventures. This is a situation so serious that we cannot avoid facing it and discussing the methods that may be adopted to change the present state of affairs.

In Manitoba, and probably in Saskatchewan, the mining industry in the precious metals will only be placed on a secure footing as far as the confidence of mining men is concerned, when a real industry is established. The fact that the Flin Flon property is now being operated and the probability that a deal will be made which will ensure an industry of large proportions, is of paramount importance. The gold industry, necessarily of a speculative nature, will secure confidence in financial circles when it is seen that a real industry has been established in mining through the copper properties. For that reason the future of the Flin Flon property has been the crux of the situation in connection with the recognition of mining among the industries of the Middle West.

It has been felt by mining men that irresponsible publicity in connection with gold prospects, more particularly in relation to advertising matter, has done a great deal to undermine the confidence of the men whose confidence it is important to secure. Advertisements of gold prospects appearing in the daily press are ostensibly written, as a rule, not for business men or for mining corporations, but for the small investor. The point of view is a mistaken one, and, like a boomerang, recoils on the districts connected therewith. It will be gradually conceded that legislative restrictions will not finally cure this situation; such restrictions, however, may do much to check mistatements and keep the situation under control. Certain enactments which have been passed by the Manitoba Legislature during the recent session provide that prospectuses

be filed with the Public Utility Commissioner, whose duty it is to administer the Sale of Shares Act, and that such prospectuses give full details with reference to properties and the methods of organization of the companies applying for permission to sell stock. It is also provided that all advertising matter conform to the facts set forth in the prospectus. It is not to be expected that such provisions will inaugurate a new era; they indicate, however, the temper of the representatives of the people in this regard and such indication may mean much for the future.

There is a duty, however, which the mining men of Canada, more particularly through the Institute which represents them, should perform in order to assist the Middle West at the present time. Local branches may do much to assist the mining industry. The Institute as a whole, however, can do much more. There is no doubt that the western meeting was fruitful of good results, particularly in British Columbia. The suggestion should be carried out that the next western meeting should hold at least one session in the City of Winnipeg in order that the prominent mining men of Canada may discuss with the business men of Winnipeg the whole mining situation, more particularly in its western aspects and thereby establish confidence in the circles where confidence will mean much in an industry which, while it will not vie with agriculture, will yet be of great importance to the provinces of the Middle West.—R.C.W.

### IS THE INSTITUTE READY TO ASSUME ANOTHER RESPONSIBILITY?

That the mine operators will find, in the services which the Secretary can render the industry, adequate compensation for the financial assistance which it is proposed to ask of them in putting the Institute on a better business basis may be assumed. At present the Institute is recognized by the Government as an organization that contributes to the welfare of the country and the Government helps to defray the Institute's expenses. The government grant, like the government officials on the Council, is recognized as a source of weakness when deputations from the Institute wait on governments. The Institute will be stronger if it can carry on without the assistance of a government grant. It is proposed that the operating companies should properly be requested to make this

possible by subscribing in proportion to their investment in the industry towards the cost of the Institute's work. It is proposed further to ask for subscriptions to pay for increased work by Institute officers.

There can be little doubt that the willingness of past governments to give financial support to the Institute resulted not from the organization's work on behalf of established industries, but from its useful work in connection with the establishment of new industries. The Institute has, owing to the early stage of development of our country, given much attention to development of mineral areas and has been a big factor in supplying useful information about mineral deposits and methods of mining and treating ores. If this part of the Institute's work is to continue and expand, there must be recognition of the fact that government officials and others not in responsible charge of mining operations have been the chief contributors. Men who represent money are asked to take the responsibility of putting the Institute on a better business basis. They should accept with this responsibility the duty of seeing to it that the educational part of the Institute's work is not allowed to sink too far into the background. There are many members of the Institute who have contributed something more valuable than money to the industry. Their contributions become more valuable when discussed by experienced operators; but care should be taken to insure that the contributions continue and that the demand for better business methods does not result in too little appreciation of the necessity of the encouraging of the pioneers and of the help given pioneers in the industry by men who do not represent money invested in the industry.—R.E.H.

#### MINING COMPANIES SEARCHING FOR PROPERTIES.

During the past few years several of the mining companies operating in Ontario have given much attention to the search for new properties. Some of the operators of silver mines at Cobalt have been particularly active. Company scouts have visited and examined hundreds of prospects, not only in Ontario, but also in far distant mineral districts. Some of the companies have undertaken exploratory work on many properties. Occasionally a company has committed itself to a large expenditure on property held with the option to purchase. In a few instances terms and results of exploration have proven satisfactory and the mining company has become the owner and operator of a new property. In other cases a controlling interest has been purchased and the responsibility of operation taken on. Up to date there are not many mines in Ontario that have been developed by com-

panies in this way; but it is reasonable to expect that the existing organizations will be taken fuller advantage of in the future and that our mining companies will give more and more attention to the search for new properties that can be made productive.

An obvious advantage in favor of the mining company in this search is its staff of experienced men and its facilities for making assays and tests and for obtaining necessary men and supplies to carry on development work. An obvious disadvantage is the variation in opinions among shareholders when expenditures on a very speculative enterprise are to be undertaken. The original shareholders whose success came from a highly speculative enterprise may themselves be satisfied to hold what they have instead of venturing again. If they are willing, they have then to consider the many newer shareholders who did not invest when there was danger of failure and who may not be willing to venture now. If the shareholders are willing to speculate on development of new properties, they can well do so through their company's officers and staff, for they will thus have the benefit of a strong organization. The risk to be run, however, despite the best of guidance, is in most cases such that directors hesitate to act for their companies as they would for themselves, and mining companies are not making the progress in new development that some might expect.—R. E. H.

#### BRITISH COLUMBIA AND THE GEOLOGICAL SURVEY.

In this issue is published the text of a speech made by the Minister of Mines of British Columbia with reference to the resignations of members of the Geological Survey. The "Journal" welcomes Mr. Sloan's whole hearted and convincing endorsement of a point of view that has been urged with perhaps tiresome iteration in these columns. In setting forth his point of view Mr. Sloan has written a history of the Geological Survey of Canada that eloquently sets forth the proud and worthy traditions of what we venture to name the "Look Out" of Canada, which we believe our readers will find not only interesting, but inspiring. Mr. Sloan goes very far when he says that the Geological Survey "is the one branch of the Dominion Civil Service that has any direct bearing on our future". Yet, when that statement is pondered over, little exception can be taken to its accuracy. If other executive officers of provincial mine departments were as clear and as outspoken on the importance of the Geological Survey and its unimpaired maintenance there would be some chance of dissipating the ambiguity that characterises official attitude towards the Survey.

# The Possibilities of the Oil Resources of Canada

By D. B. DOWLING\*

The mobility of the liquid fuel introduces into the question of a survey of oil resources many problems quite foreign to the study of the coal measures. Certain formations indicate the probable presence of either of these resources, and generally the formations carrying oil precede in time of formation those carrying coal. The influence of earth movements and the introduction of compressive strains generally harden and consolidate the coal, but have the effect on the semi-fluid matter of increasing its fluidity and so hastening its segregation into pools, or even of facilitating the long period through which they have since been the porous beds to natural outlets. The survey of these resources must, in addition to the superficial mapping of the areas, also include studies of the physical condition of the beds presumed to be oil-bearing. As already suggested excessive fracturing and disturbance indicate a possible waste, whereas gently flexed beds may provide many structures favorable for the retention and collection of the oil.

The study of our probable fields must consequently include the outlining of the deposits, in which the oil has been found in other parts of the continent, a careful study of the general structure with the view of eventually eliminating those portions from which the reserves may be deemed to have been drained, and selecting for prospecting of those parts which give some promise of success. The term prospecting is not applied here in the same sense in which it is used when referring to the search for other minerals, but generally involves the actual drilling of wells to test the measures, which should be undertaken only after the preliminary examination outlined above.

The granites of the Canadian shield represent parts of the older continent; upon this rests the stratified beds, in which are entombed the remains of the passing life of the earth. Much of this represents the life in the sea, and the great mass consists of the simplest forms. These appear to furnish the material which is altered to oil, while the plant life in the marshes and lagoons and near the shores appears to have been preserved as coal. Large areas of these rocks have been stripped from the granite base, leaving bare the "Canadian shield," which must be excluded from our possible oil fields, and other areas are broken, folded and faulted, so that careful examination will eliminate parts where it would be useless to bore. In these areas it may prove, however, that the faulting has exposed to ready mining shales that have absorbed or have retained the oils or materials that can be distilled into oils.

## The Oil Formations

In the United States, oil is found in formations of Palaeozoic, Mesozoic, and Tertiary ages. In the Palaeozoic, oil formations are found beneath the Coal Measures in rocks whose ages range as far back as the Cambro-Silurian. The greater accumulations appear to be in the porous beds of the Devonian. In the Mesozoic formations, porous beds of the upper Cretaceous

are productive in Wyoming. Similar strata have been prospected in the Canadian fields, but with little success. Oil has been found in Canada in the Lower Cretaceous, the horizon being approximately between the coal bearing Kootenay, and the western representative of the Dakota rocks. The Tertiary formations of the Pacific coast that represent marine deposits have proven rich in oil in the Californian fields. Very small patches of rocks of this age are found along the the Canadian coast, but these so far have not proven commercially valuable.

## Palaeozoic Formations

As these formations were deposited about the old continental nucleus, during the period of its greatest depression, they now form, or underlie, a large part of the present surface. They have, however, in large areas been stripped from the old continent during the long period through which they have since been subject to erosion. In the subsequent changes of elevation, the differential movements are impressed on the beds in the form of undulations thereby facilitating the collecting of any contained oil in pools, but where the stresses were very great the deformation reached the proportions of destruction.

Of the original measures surrounding and partially covering the ancient continent, not only has a large part been removed by denudation, but great zones are fractured, folded and crushed. From these zones much of the broken material has been removed. Blocks that have been elevated have become drained of any possible oil, and the folded and crushed areas in consequence rendered of very slight value as oil fields. Where, however, the oil has not migrated to the coarse porous beds or sands, but is retained in the shales, the fracturing may be an aid to their exploration.

The fracture zones of the continent are for the Palaeozoic sediments the limiting boundaries of the oil fields, although within these zones small areas may be found with indications of oil.

## The Fracture Zones

Two main lines of intensive crushing and deformation are indicated. The greatest follows the line of the Cordilleras through the length of the two American Continents. In Canada this belt line of weakness or deformation, which affected the Palaeozoic sediments, is a broad one, and is represented by the Eastern Belt of the Canadian Cordilleras. In this, the zone in which accumulation of oil might have been looked for, is entirely destroyed, and the blocks that are elevated and exposed in the eastern edges of the Rocky Mountains appear to be already drained.

Near the Atlantic coast, lines of elevation and fracture show the effect of great lateral pressure exerted at various times. The lines of weakness are not continuous nor essentially parallel, so that the band of deformation contains within it areas not badly crushed, and in some of these small showings of oil have been found. The disturbed measures show large quantities of oil shales, and the potential value of the Maritime Provinces for the production of oil would seem to lie in these shales.

Fracture zones are found in the northern or Arctic regions. These represent what appears to be normal

\*Composite abstract of papers read before the Royal Canadian Institute, March 28, 1920, and before the Annual Meeting of the Canadian Mining Institute, Toronto, March 8-10, 1920.

Diagram showing the area occupied by the Canadian shield (Archaean) and to the west and southwest, the disturbed and broken sedimentaries.

faulting and have made their impress on the topography mainly by the subsidence of great blocks as in Baffins Bay and Davis Straits.

**Denuded Areas**

A large portion of Canada forms what is referred to as the Canadian shield. This is an area largely denuded of any covering of Palaeozoic beds that may have been deposited on the pre-palaeozoic continent. It now forms an undulating or mammillated surface of crystalline or highly metamorphosed rocks.

**Possible Oil Producing Areas.. Eastern Maritime Fields**

Between the fracture zones of the Atlantic border there are a few areas which suffered but moderate deformation. The largest is in New Brunswick and a slight production of oil has been obtained. In the eastern part of Quebec in the Gaspè peninsula the presence of oil seeps has induced the spending of large amounts in prospecting. The attempt has not been successful in a commercial sense, owing no doubt, to

### Western Basin

The older deposits of the central part of the basin probably present the same succession of beds as in the southern and eastern fields but the deposits of the eastern and northeastern margin show for this central part of the continent a geological history very different from that of the areas more nearly connected with the outer seas. This has no doubt had an influence in the non-retention of oil in the beds of the outer margin of the basin. Bore holes in Manitoba and on Athabaska and Peace rivers in this outer margin give negative results in the search for oil. There is evidence in the absence of early Palaeozoic sediments and the absence also along the northeastern outcrop of Middle Devonian formations that the sea margin of this long period was a fluctuating one and that possibly the interval from Devonian to post-Carboniferous time saw a steady withdrawal of the sea or a slow elevation of the land.

During this long lapse of time it is quite possible that large areas suffered denudation, as the mantle did not consist of massive beds and would be easily fractured by differential elevation.

The retaining of fluid hydrocarbon in the elevated and probably thinner parts would therefore be extremely problematical. The central part of this continent was then depressed beneath the muddy Cretaceous sea and possibly the cover of shale then deposited on the remaining Palaeozoic beds has helped to retain in them some of the original oil. The general rise of the continent in Tertiary times brought the edge of the basin—the part now exposed—far above sea level and it would be natural to suppose that the drainage of the oil since that time would tend toward the basin.

In the Manitoba portion, where the Devonian section contains beds that are elsewhere oil-bearing, it should be noted that these beds are there about 800 feet above sea level. Their westward continuation at Moosejaw would be at least 1000 feet below sea level so that, provided the wastage before Cretaceous times did not exhaust the beds, the cover of Cretaceous shales and the limestones of the upper Devonian might retain the oil drained westward. In the absence of folding in the structure the oil might be found on this slope as low as the line of water saturation which is not known for this basin, but we might assume it to be as low as sea level.

The prospecting of this horizon would mean drilling through the Cretaceous shales and would be confined to a strip of country not more than about sixty miles in width measured from the edge of the Cretaceous escarpment.

Along the northern border the problem is somewhat different in that it is not known with any degree of accuracy to where the supposed oil bearing beds which are exposed in Manitoba extend. The outcrops of the Palaeozoic at the contact with the Archean show overlapping of the beds, that is, at different points Devonian, Silurian and Ordovician sediments respectively are found in contact with the pre-Cambrian. Fluctuations of the margin are also shown in the individual beds of the formations; for instance, the Middle Devonian is absent in the exposures on Peace River below the cascades, and under the Upper Devonian is resting on the gypsum beds of the Silurian.

To the southwest the section is probably complete, and the location of the oil bearing Middle Devonian beneath the cover of shales and Upper Devonian limestones is the first problem to be solved, since on

its position depends largely the occurrence of oil in the Devonian. Where it can be found near the margin and at a convenient elevation, there would be some hope of a future production from this horizon.

As it is not certain that the oil beds are present at any point in the northern area and drillings in the Peace and Athabasca valleys are in the nature of explorations; but without such adventure little will be learned.

The northward continuation of this interior basin follows the western edge of the Canadian shield. In Dakota and eastern Montana and northward through the prairie provinces of Canada it assumes a definite basin form, in which is found above the Palaeozoic oil beds, those Cretaceous deposits which provide both coal and oil for the western states and very abundant coal reserves for Canada. Owing to the great depression in the central part of the continent to which the Palaeozoic beds conform the areas available for oil prospecting consist mainly of parts of a somewhat narrow rim along the eastern side of the basin that is in a way limited to the part which projects above sea level.

This assumption of a boundary to the productive area is a tentative one based on the fact that farther into the basin the depth of Cretaceous sediments to be pierced become so great that drilling operations become very expensive and very difficult.

The re-appearance of the Palaeozoic rocks to the west of the basin is generally in the form of fault blocks overthrust on the newer sediments, and the actual western rim is deeply buried. There may be places where these rocks could be reached outside of the fractured zone of the mountains, but a great thickness of Carboniferous and early Mesozoic deposits here overlie the Devonian, and experience in the American field points to the greater value of the Cretaceous beds which overlie them, as oil containers. Beside the surrounding rim it may be of interest to note that although there are little evidences of abrupt changes of slope or of structures favourable to the occurrence of probable oil reservoirs, one terrace or broad anticline can be traced on the eastern slope of the basin from the northern point southeasterly about parallel to the mountains. It is probably more sharply defined in the measures near the surface than in these beds, and is discussed as effecting the Mesozoic deposits. It is joined at almost right angles by an uprise, which extends northeasterly from the Bow Island anticline, which rises to the south to join the Sweetgrass arch, a structure running into Canada from the uplifted and intruded area of northern central Montana.

This ridge structure which crosses the basin may be too deeply buried for present prospecting, but its presence will be of interest should the Palaeozoic rocks of this basin prove at any place to have oil pools.

### Northern Basins.

No exact dividing line is drawn between the western basin and those basins to the north. The syncline of the Western basin flattens to the north and the amount of depression in the front of the mountains lessens. A large area is underlain by Devonian beds that exhibit a very slight degree of folding. This area extends from the Rocky Mountains eastward to the granite areas of the Canadian shield. The relief is generally low and includes the Mackenzie valley. The disturbance which is marked by the upthrust of the Rocky Mountains extended into the area but with lessening force. A major fold or break crosses the

valley from south to north, dividing it into two distinct basins differing in structure. The area east of this fold and extending to Great Slave lake and Great Bear lake is a plain bounded on the south by the edge of the plateau built up of Cretaceous sediments, on the west by the Nahanni mountains and on the north-east by the mamillated surface of the Archaean rocks. The outcrop of the Middle Devonian sediments on Slave lake shows several oil springs. These rocks dip slightly to the southwest and seem to offer a large field for prospecting.

To the west of the dividing fold, noted above as the Nahanni Mountains, and along the lower part of the Mackenzie valley the sediments show a series of strong folds and oil seeps are quite common. In both these fields there seem to be great masses of oil saturated shales and porous dolomites from which oil is expected to be obtained by drilling. Should the drilling of the favourable structures not prove the presence of a fluid oil in commercial quantities, the reserve of oil in the shales should in itself be of great importance.

#### Arctic Islands.

The northward continuation of the strata exposed in the Mackenzie Valley is exhibited on several of the outer islands of the group. The structure of the islands exhibits very little of the compressive strains of the continent. Normal faulting is probably indicated as being the basis of the geographic features. The blocks which form the islands show the beds dipping at slight angles to the northwest and north. In rocks of Carboniferous age shales or cannel coals which appear to have a value as oil shales has been found on Melville island. The measures in which these occur are thought to thin out toward the east, as on Elsmere island they appear to be wanting. The rocks there exposed are mapped as Triassic overlying Devonian.

#### James Bay Basin.

An area of Devonian rocks to the south of the bay forms a small prospective area in which oil or oil shales may be discovered.

#### The Oil Possibilities of Western Canada.

The wonderful increase in the various uses to which the products of petroleum have been applied within the last few years, has called for an intensive search for new fields that is world-wide in its extent.

Canada has not hitherto been considered a particularly promising field but the large production that has been realized from the Cretaceous deposits of the western American plains, has stimulated prospecting in the northward continuation of these beds and also in the underlying Palaeozoic deposits which are found in the Dominion of Canada.

The structure of the oil-bearing area which lies in front of the mountains of Wyoming and Colorado has no exact counterpart in Canada inasmuch as the flexures in the beds are there largely due to uplift as well as to the effects of tangential pressure, while to the north the deformation is largely due to tangential stresses. There is thus a more complicated structure in the American fields than in Canada and to this is probably due a greater alternation of the petroleum-forming substances and probably a greater migration through the measures to retaining beds. It is noted also that horizons found to be oil-bearing in Wyoming have in Canada yielded but slight indications of oil. In the lower horizons we have evidence of the presence of a heavy oil at several places, but as the re-

ords are not numerous a general statement is all that can be offered.

A study of the structure to which is added the few drilling records has however been compiled in the following observations.

Oil-saturated sands have been found at the following localities:—

(1) At the southern edge of the Province of Alberta near the Sweetgrass hills—vaseline-like saturated sands.

(2) On Milk river in the Beaver well, a small flow of oil in artesian water.

(3) In Etzikon coulee at the United Company's well sands saturated with heavy oil.

(4) Gas wells Nos. 2 and 4 at Viking, a small showing of oil in gas sands.

(5) Oil shales at bottom of Morinville well.

(6) The MacMurray sands exposed on the Athabaska river, called generally the "Tar sands"

(7) At Peace river, thick oil in sands bored through between 900 and 1100 feet below surface.

These occurrences all appear to be in sands of approximately the same age and may be considered as indicating a rather extensive sheet impregnated by a heavy oil—in many places too thick for commercial extraction except where they occur at the outcrop. The areas in which commercial exploitation might be suggested are those which surround the deep basin of the Alberta syncline and include the outer foothills which are on the western edge; the upraise at the south in the Bow Island anticline and the north-eastern margin of the basin as far south as the depression leading to the eastern basin which centres about Estevan. In this eastern part it is not known that the oil horizon of Alberta is present.

The occurrences in the foothills do not seem to prove the continuance of the oil deposits, in their crude state, as far as the mountains. The oil that is there found in association with wet gas has the appearance of having been condensed by some natural distillation process, that is, it is not crude oil. Its transformation might be hypothetically assumed to be due to the great pressure and moderate temperature to which the heavy oil of the sheet just mentioned would be subject especially in the part deeply depressed in the Alberta Syncline. Its volatile constituents of the oil would follow the short limb of the syncline up toward zones of lower pressures and temperatures where they would be condensed. The condensed portions reaching the overturned edge would there be trapped as appears to be the case in the Turner valley anticline, and the gas would have vapours of the lighter oils still in it.

Renewed interest is being taken in the structure features of the outer foothills as being the edge of the Alberta syncline. Where this edge is marked by anticlines not too deeply buried, prospect drillings are to be prosecuted by the larger interests, in the hope of striking either light oil or finding gasoline vapour in the natural gas.

The production of the foothill areas last year was about 13000 barrels of light Kerosene oil containing probably 60 per cent of gasoline. Small stills are installed at three of the wells and the oil broken up for domestic use. At the Calgary Petroleum Products Cos. wells, absorption plants are installed and from the natural gas it is expected that up to 30 barrels per day of light gasoline will be obtained.

In connection with the foothill area an area forming

part of the mountains near Waterton lake merits consideration. Here the rocks are very much older than any known oil bearing rocks but in their bedding planes have distinct evidences of oil. As the oil does not seem to be indigenous to the rocks, it has been assumed that it comes from the Cretaceous beds that have been over-ridden in the overthrust of this mountain mass over the plains. It has been assumed that the plane of the thrust fault is at a low angle and that the shortening of the crust reached large proportions so that an extensive area may be underlain by rocks from which the oil might be derived. This assumption which has elements of probability might predicate an overlap between twenty and thirty miles in width, but in the mountains to the north of this no single thrust reaches this proportion, so that it seems necessary to modify the original theory.

The presence of the oils in rocks far above heights to which it could be borne by general water saturation and its light specific gravity suggests that the transference was gaseous probably along with vapour distilled from carbonaceous material in the overridden Cretaceous. The overlying beds are not badly folded and form a rather large covering mass that would retard the escape of the vapours.

The form of the cover is a synclinal trough, the lowest point being near the watershed which is here only a few miles from the eastern edge of the mountains. The trough is edged by anticlines and near these oil seeps are found both east and west of the summit. If the ascending vapours penetrated the base of the syncline where there would probably be open fractures and followed the beds in both directions it might be expected that the lighter oils would be found at a greater distance from the centre of the syncline than the heavier oils as they would have a greater penetration and longer life in the gaseous form. The facts seem to accord with this hypothesis as the seeps at the west about eleven miles from the centre of the syncline, yield oil of very light gravity (40°-42° Baume') while those to the east four miles from the same point yield oil much heavier (30° Baume').

The distillation process that might be presumed to have been active at one time, seem to have declined at the present time as there is little evidence of the escape of gas or of gas pressure in the wells now bored. These wells appear to be merely draining the beds above their level and if this is true it follows that prospecting may have to proceed on the assumption that the saturation is not being supplemented by present emanations of moment, that is oil derived from the draining of the beds by gravity from each side of the anticline should be the object of drillings.

The supposition outlined above of a gaseous origin for the oil introduces another interesting possibility namely that the sand beds of the Blairmore formation, which no doubt underlie the Cretaceous of the plain in front, may have also acted as passage beds and that some of the oil may have been transferred through them to retaining structures under the plains in the folds which parallel the outer edge of the overthrust mountains.

On the plains most of the prospecting has of late years been centred in the Peace river valley, where several wells averaging eleven hundred feet in depth pass through sands impregnated with heavy oil. The

flow is necessarily slow and although the presence of oil seems to be proven, no production has been attempted possibly on account of the trouble with water which can generally be attributed to insufficient or defective casing, and to lack of restraint on the part of the operators in drilling through the oil sand into the water bearing bed which lies below it.

The direction of the extension of the oil horizon depends on the attitude of the beds and as there are few exposures of the outcropping rocks and few bore holes by which to trace it, the general features only can be indicated. The gas fields at Viking and the Peace River oil fields are situated on a structural terrace which consists of a flattened strip on the eastern slope of the Alberta syncline. The flattening may in places even reverse the dip and form low anticlines. The western edge of the terrace is marked by an abrupt change of dip and at the point where this line swings to the southwest from near the border of Saskatchewan, surface crumpling is quite evident. The position of the oil-sands in this part of the terrace is here probably lower than desirable, but the flattened area or structural terrace widens considerably and there is always the possibility of local flexures and rolls in the bed providing local catchment areas for oil and gas. With this possibility in view a bore is being put down near Czar, Alta, on Ribstone creek. Boring near Lesser Slave Lake is being undertaken with the hope of extending the Peace River field. The information at present available is not sufficient to determine the exact direction of this extension; its position can be determined only by future boring toward the south east.

The belief that is so general among the drillers, that the really profitable oil horizon is in the limestone of the Devonian which lies beneath the oil impregnated sands of the lower Cretaceous has led indirectly to the spoiling of several possible productive wells in the Peace River field, as with the object of reaching the limestones, borings have been continued below the heavy oil of the Cretaceous into the water-bearing beds which overlie the Devonian limestone.

#### Tertiary Formations.

During the later history of the continent and after much of the deformation and erosion of the older oil formations, beds of Tertiary age were deposited along the western edge of the continent. Those found in the interior are generally of continental origin and what carbonaceous material they contain appears to have been altered to coal or in places to a very heavy asphalt. The more fluid hydrocarbons are at present supposed to be associated with the beds formed near sea level including those of the west coast and possibly some of the Tertiary of the extreme north on the Arctic islands.

On the Coast the rocks of the valley and coast of California have been found to contain very large stores of oil. Small exposures along the coast northward and in the depression occupied in part by the Straits of Georgia have been partially examined, so far with little success. In the delta of the Fraser river boring is now proceeding, but the deposits are very thick and the sandy nature of the measures suggest that the oil may be widely dispersed rather than gathered into pools.

# The Part Played by the Canadian Geological Survey in the Development of British Columbia

Speech by Hon. WILLIAM SLOAN, Minister of Mines, British Columbia.

I desire to bring to your attention the serious state of affairs which threaten to have a most unfortunate effect on the development of the mineral resources of this Province. I refer to the recent resignations of a large proportion of the staff of the Geological Survey of Canada, by reason of which, British Columbia is immediately deprived of the services of four geologists who worked here last summer, and will probably later lose others now available.

Everyone in this province knows more or less in a general way, of the work of the Geological Survey, but not many outside the mining fraternity, among whom I class that indispensable pioneer, the prospector, realize the great value of this institution to Canada.

It is my intention to set before you certain facts in connection with the survey with special reference to its work in this province, so that we all may realize the imminence of the danger to development of the natural resources of British Columbia and to suggest means by which it can be averted.

## The Fathers of the Survey

The Geological Survey of Canada is largely the outcome of the personal enthusiasm of William Logan, with whom became associated Dr. T. Sterry Hunt, men whose names are yet honored among scientists the world over for the work they did.

I do not know in just what year Sir William Logan's first work was done, but it was prior to 1843, for by that time the Geological Survey was in existence, and the first "Report of Progress" was for the year 1843, although not published until 1845. Naturally at that time, the first work of the "Survey" was in the "Upper and Lower Canada" of those days and in the Maritime Provinces.

Later came in the service, Sir William Dawson, who subsequently became principal of McGill University, and who was to be followed in later years in the Survey by his equally illustrious son, Dr. George M. Dawson, whose name is one to conjure with all over Canada, particularly in British Columbia.

The geologists and mining engineers of later days following in his footsteps, marvel at the accuracy and scope of his explorations, and geological chartings.

The first office of the Geological Survey was in Montreal and was later moved to Ottawa. The first Director of the Survey was Sir William Logan, who was succeeded by Dr. A. R. C. Selwyn, Dr. George M. Dawson, Dr. A. Bell, Dr. A. P. Low, Dr. R. W. Brock, and others, down to the present day Director and Deputy Minister, R. C. McConnell, now in his 42nd year of service in the survey.

Volume 1 of the Survey Report was for the years 1870 and 1871, practically the date of entry of B.C. into the Confederation of Canada.

With the opening of the West came the need of surveys, of exploration of its resources of all kinds, and the Survey stepped into the breach, and how well it did the work is a matter of history.

## Maintenance of Geological Survey a Condition of British Columbia's Adherence to Confederation.

So well and favorable was its work and the need of such work appreciated, even in the then far-off B.C. at the time of Confederation, that we find in the Terms of Union of B. C. with the Dominion of Canada in 1870, in Section 5 subsection H. a separate and distinct proviso that the Dominion Government shall maintain and continue a geological survey in B. C., a proviso, I believe, inserted and insisted upon by the Hon. J. S. Helmcken, one of the few still with us of those farsighted pioneers who shaped our history and so well laid our national foundations. Possibly its acceptance was one of the things which reconciled him to the entry of this Province into the Confederation. So B.C. has a unique claim to the survey. We adopted it as one of the conditions of entry into the Dominion.

Of the early explorations of the Survey's staff, particularly to the West of the Rocky Mountains, the work of Richardson on the Coal Fields of Vancouver Island, etc., these are familiar to all of us interested in mining.

Then came Dawson and his work along the surveys of the C.P.R.'s various routes and his exploration into and through the Yukon, the latter taking place in the year 1887. I well recall the Fall of '96, when camped at the mouth of the "Throan Duik," which usage soon converted into "Klondyke," that the question came up of naming what it was known, in view of the importance of the discoveries, would become a busy centre. The name of Dawson was finally adopted and met with general satisfaction, it being considered an honor properly due the distinguished Canadian who years before had made tracks in a trackless land. Dr. Dawson's survey of Queen Charlotte Islands, his map of which, made from a sailing schooner, still practically constitutes the official chart of its eastern shore, and his trip up the Stikine with McConnell as assistant, the latter continuing down the Dease and Liard rivers, wintering at Fort Providence on the Mackenzie River, are other achievements with which his name always will be associated.

## The Geological Survey has been the "Lookout" of Canada

Tyrell, of the Survey, told us of the Barren lands of the far northern interior, a district which possesses much mineral wealth. Low, afterwards director of the Survey, spent two years continuously in the Hudson's Bay, gathering data of all sorts and now Hudson's Bay promises to be the outlet for the grain of the great Northwest, Malloch died while wintering among Arctic ice. Drysdale was drowned, fording the Kootenay river. Capt. Leroy was killed in action in France.

These are the stories of patriotism, service and adventure that should stir our young Canadians to prepare themselves by intensive scientific study to be fitted to carry on; to bring a lasting name to themselves and permanent benefit to their Country.

They were willing to abandon the dream of future wealth, ever present with youth, for science, with very small monetary reward for many years. Must they

see their hopes of advancement to a higher rank barred by the stone wall of an unappreciative or indifferent country?

Perhaps the most striking result of the early work of the Geological Survey was the elucidation of the complex structure and relations of the great Pre-Cambrian formation in the vicinity of the Great Lakes. This was done by Sir William Logan, that great pioneer of Canadian geology, and his able assistants, working under handicaps of transportation, difficulty of obtaining supplies, etc., that the present day workers can scarcely realize. The great "Pre-Cambrian Shield" of Canada, contains the largest single area of rocks of that era exposed in the world, and besides being of unexceptional scientific interest these rocks contain numerous extremely rich mineral deposits. The names "Cobalt," "Porcupine," "Sudbury" and the iron and copper ores of the Lake Superior district are sufficient to remind one of the economic importance of this region. In that country, then a wilderness, Logan and his assistants, little dreaming of the vast wealth later to be discovered, carried on their labors. Their classification of the Pro-Cambrian formation stood in its entirety until recent years, and even yet forms the basis of Pre-Cambrian geology in America. Their work was done largely from the point of view of the pure scientist animated by no love of gain, and it has proved of inestimable value in the study of the highly mineralized areas which since have been discovered.

Logan, and later Sir William Dawson, were the first to study carefully the magnificent section of Carboniferous rocks exposed at the head of the Bay of Fundy, in Nova Scotia. Their detailed sections stand unrivalled to the present day, and are a lasting monument to the painstaking efforts of those early investigators. Their work in Nova Scotia was carried on by Hugh Fletcher and our present knowledge of the geology of that Province is largely due to the efforts of that extraordinary field worker whose name is a household word in that Province. With men like those to father the Survey and establish its custom, a pace has been set and tradition grown up that are not excelled by any other Governmental Geological Survey.

#### Work Done in British Columbia.

One of the most important pieces of geological field work ever done in America and certainly the largest single investigation undertaken in recent years was done in B. C. in connection with the re-survey of the International Boundary on the 49th parallel. This was done between the years 1901 and 1905 by Dr. R. A. Daly, a Canadian, now head of the Department of Geology at Harvard University. His report embraces several large volumes and an unequalled series of maps, illustrating the geology of a belt of country for 5 miles north of the boundary and stretching from Sumas Mountain on the Pacific to the frowning rampart of the Rocky Mountains overlooking the great plains in Alberta. Dr. Daly's work has thus given us a complete geological section across British Columbia, and it forms the basis for surveys and investigations carried on by later workers in the important mineral bearing districts in the southern part of the Province. The facts elicited during this intensive study of the Canadian Cordillera have contributed largely to the advancement of geologic science, and in Dr. Daly's hands have tended to solve problems of world interests.

Mr. Camsell, now the senior member of the staff working in this Province, has obtained valuable re-

sults at Hedley in his study of the Nickel Plate Mine, and later by his important discovery of the increased possibilities for prospectors in the Coast range, particularly along the line of the P.C.E. He is now in charge of the Vancouver office of the Geological Survey, an institution which is greatly appreciated by the mining fraternity of this Province.

An account, however brief, of the work of the survey in B. C. would be incomplete without reference to the topographic and geologic maps of the southern portion of Vancouver Island. These maps are masterpieces of accuracy and detail, and were intended as a standard type for Canada. An expert topographical engineer, R. H. Chapman, was obtained from the United States Geological Survey to superintend the mapping of these sheets and carried on his work from 1909 to 1913. The geological mapping was done by Dr. C. H. Clapp, now at the School of Mines, Butte, Montana.

In particular, the Geological Survey of Canada has developed and perfected the photographic method of surveying, and this research of great practical value was carried on in this Province.

Mention must also be made of the work of Dr. Schofield in the East Kootenay and other parts of the Province; of Dr. Allan in the Ice River district, and of Malloch in the Groundhog coal fields.

#### Work Done in Recent Years in B. C.

Having considered briefly some of the more important studies carried on by the Survey in the past in B. C. it is of interest to examine in more detail the work done in recent years from other points of view.

The following tabular statement compiled from the summary reports of the Geological Survey for the years specified, is very significant.

#### Field Parties.

Years	Geological
1908	8
1909	13
1910	12
1911	12
1913	14
1914	3
1915	9
1916	1
1917	3
1918	7
1919	8
1920	Possibly 3

And here let me say a word in connection with the efforts of the late Hon. Wm. Templeman, during the period he held at Ottawa the portfolios of Inland Revenue and Mines, on behalf of British Columbia's claim to the attention of the Geological Survey Branch. The table strikingly shows the results of his intercession in the interests of the Province. There were more parties in the field here during this period of office, 1909-10-11 than there have been in the last eight years.

The foregoing table shows the number of field parties the Survey maintained in B. C. for the years specified. It will be noted that in 1916 the effect of the war was most apparent. This year, owing to the resignations from the staff, it is possible that no more than 3 parties will be in the field, and perhaps not even that number.

In view of the almost certain large increase in prospecting, developing and general activity in the mining affairs, this condition is nothing short of deplorable.

Since 1914 the Geological Survey has lost a number of its most able field workers in B. C. by death. Besides, others have left for various reasons. Dr. C. H. Clapp, whose work on Vancouver Island has provided us with the key to the geology of the Coast District, is now at the School of Mines, Butte Montana; Dr. John Allan, of Ice River fame is head of the Department of Geology at the University of Alberta; Dr. A. M. Bateman is professor of economic geology, Yale University; and Dr. J. D. Mackenzie, who worked in the Queen Charlotte Islands and in the Telkwa District is still suffering from the effects of wounds received in France.

A review of the present situation shows, in brief, that out of 21 men fit for field work on the Geological Survey, eight have already resigned and more are likely to follow, leaving possibly only eight men available to carry on the Geological work of the Survey next summer, throughout the Dominion. This is less than the average number of geological parties in B. C. alone for the four years preceeding 1916. In addition to the loss of these trained experts the men who are immediately available to replace them are going as well; opportunities in commercial work are so much more advantageous than any offered by the Governmental service. This lays the Survey open to the danger of being recruited by insufficiently trained men; and in the calling of a geological expert, insufficient experience and lack of careful training is an insuperable bar to success. Even provided the Dominion Government offers sufficient inducement to students now in College to train for the survey work, they will not be ready to take up the duties of such men as Mackay, Wright, and others who are leaving, for ten years at least. It will take this time to gain the experience and knowledge necessary to make his opinion as valuable as that of the men who have just gone.

The present high standard of scientific attainment and the personal integrity of the survey men has long been recognized by all interested in mining in this country. The "Man from the Geological Survey" has always been welcome in mining districts, and the prospector has invariably welcomed him as an expert adviser. Survey men can obtain information and facilities for work from owners and operators that otherwise would not be available.

If the Survey slackens its efforts or if poorly trained men carry on its prestige will invariably suffer, the high tradition will be lost, and the whole country will lose accordingly. I wish now to bring to your attention how the losses will immediately affect this province.

On this point it is well to remember that British Columbia is somewhat differently placed to most of the other provinces of Canada because of the immensity of her undeveloped mineral resources, the wide expanses of unknown country geologically speaking and the fact that under the terms of the Confederation the Dominion Government undertakes to have carried out a geological survey of the Province.

The name "Cariboo" is one to conjure with B.C., and in fact the rush to the Cariboo placers in the 50's gave the first considerable impetus to the settlement of this Province. The gold in the present day channels

was soon largely taken out but if the ancient buried channels can be discovered, the possibilities are unlimited, as witness the richness of the Tertiary river beds of California and Victoria, Australia. Recently the Geological Survey has had Dr. B. R. Mackay working on this problem, Dr. Mackay possesses unique qualifications for the admittedly difficult problem of tracing out the old river beds, as he had special training in physiography and long experience as well. To this energetic, keen and highly trained scientist, his country offered the salary of \$2,580 per year, with an annual increase of \$180. He has resigned leaving his work incomplete and is now receiving \$5,000 a year and all expenses.

The Portland Canal District is one that has produced very lately some of the richest ore mines in this Province, and is a new field where the services of a trained geologist would be particularly valuable. Dr. J. J. O'Neil who worked in that area last summer, and who like Mackay received \$2,580, has resigned also, leaving his work incomplete to accept a salary of \$5,000 a year and all expenses. Other instances are those of L. Reinecke, who spent last year on geological work in the Princeton and Pacific Great Eastern Districts and J. Stewart who worked for years in the Peace River District of B. C. Mr. Reinecke was receiving \$2,580 and Mr. Stewart \$1,900 per annum. Both have left the service and are now receiving \$5,000 a year and expenses.

The many promising prospects and mines of Vancouver Island and the Southern Coast Districts are well known and their future development would be greatly facilitated by a comprehensive study of their peculiarities. Dr. V. Dolmage, who possesses special qualifications, is now engaged in this work at a salary of \$2,100 a year and no doubt unless his position is materially bettered, he too will be lost to B. C.

Few, if any, of the Geological Surveys in the world, demand such a high standard of educational preparation as does our Canadian Survey for entrance into the geologists' ranks, and few have the scope for the field work to turn out such good men.

That this is appreciated abroad, if not in some portions of our homeland, is evidenced by the fact that Pearsons of London, who have need for geologists in all parts of the world, sent their chief geologist to Canada to corral as many of our Geological Survey as possible. We know they took six in one day at Ottawa, chiefly British Columbia of Western men and we know that they sent to Vancouver to try and get further recruits from the B. C. branch, but without success, so far, perhaps owing to the disinclination of the individuals to leave the Province.

Are we to see these men obliged, for financial reasons to leave us?

#### Present Value of the Geological Survey of Canada to British Columbia.

The present value of the survey to this Province

As to the present value of the survey to this Province. I will briefly list some of the less obvious, but none the less valuable, general benefits to be derived by B. C. from having the services of an active corps of geologists at the disposal of the mineral industry of the Province.

(a) It secures the services of the most highly trained scientists to work on local problems.

(b) These unbiased investigators can approach their problem in an entirely impartial manner.

(c) The staff are trained and expected to solve the larger geologic problems for which no individual mining Company can afford to maintain experts.

(d) These men are associated at Ottawa with others who work all over Canada and who are thoroughly conversant with the latest geological information. Thus, by criticism and suggestion, B. C. problems receive the benefit of this world-wide experience.

(e) The results of the work of the surveys are free to all, to the prospector as well as the mine manager or capitalist. Verbal information is given to any owner or investor at once. Written information in advance of Reports can be obtained at short notice on application at Ottawa.

(f) Geological maps form an accurate and reliable guide to prospecting. They act positively in directing the attention to most promising districts and in scarcely less valuable negative manner by outlining areas likely to be barren.

(g) The present day problem of mining are often largely geological in their nature. Such questions as haulage, transportation, ventilation, etc., can be easily solved by modern methods and there are plenty of engineers competent to do this.

It is not possible to get back the men who are gone for some years at least, if at all, but the 5 or 6 members of the staff who are now unsettled, can be retained, and students can be encouraged to train for the vitally important work of the Geological Survey as a career, if the situation is met promptly.

The cause of the dissatisfaction which has led to the wholesale resignations is not so much the scale of the salaries set out by the classification of the Civil Service, although this is by no means liberal, as it is due to the grading by the Civil Service Commission.

British Columbia is essentially a mining country. Our future is dependent upon that industry.

Proportionately as compared with other Provinces, we are more vitally interested in it than in any other part of Canada. If we do not have the mines, the rest is of no avail. We have vast areas totally unexplored, and vast areas merely run over, but sufficiently known to indicate wonderful mineral possibilities, and we need the geological survey. It is the one branch of the Dominion Civil Service that has any direct bearing on our future.

#### **The Survey Crippled at the Threshold of its Work.**

And what do we find? The survey crippled, its usefulness threatened with paralysis for the next eight or ten years just at the critical period of our development, when reconstruction after the war is so essential.

It is now nearly fifty years since we entered Confederation, and, as I have stated one of the stipulations we made, and one of the undertakings given by the Dominion, was that a Geological Survey of the Province would be completed. This, as I have stated, was one of the terms of union. If the work is carried on no faster than it has been, it will be centuries before it is finished. I am speaking now from no close computation, but am sure that an estimate is well within the mark. And I am of the opinion that those who were assenting parties to the Terms of Union, in so far as this Province at least is concerned, never contemplated that this survey would extend into the period indicated. Let it not be supposed that I am unappre-

ciative of what has been done. That, however, is not the point. Again let me say that British Columbia is differently situated as compared with her sister Provinces at this time, when reconstruction is beginning, when the mining industry is commencing to take the important place in our industrial life which the extent and richness of our mineral resources warrant, and when bright and a prosperous future, provided mining men are given proper help and encouragement, is assured—I say that it is particularly unfortunate that, at this moment, the efficiency of the Geological Survey, in so far as B. C. is concerned, should be so seriously crippled.

In conclusion I have endeavored to present this matter fairly and without criticism and I trust that the House will unanimously support the resolution which I am about to move. This endorsement is sought in the hope and expectation that the Ottawa authorities will give immediate consideration to substantial financial increases to members of the Geological Survey and also that they may more fully grasp the importance of this scientific work and take such steps as are necessary to assure a more generous compliance with the Terms of Union in this respect than up to the present has been the experience of British Columbia.

---

#### **BOOK REVIEW.**

**L. OR, PROSPECTION, GISEMENT, EXTRACTION,** by Georges P. Proust. Gauthier-Villars & Cie., Paris. 1920. Oct. Paper Backs, 320 pages. 10 francs.

This volume, in French text, is a comprehensive account of the occurrence of gold and its extraction in all parts of the world. It deals with the geology and chemistry of gold ores, prospecting for gold, the mining and recovery of the metal by concentration and cyanidation, and extraction costs. A rather unusual chapter is one of advice on outfit and clothing for colonial prospecting, which includes information on the raising and preparation of edible vegetables. A lexicon of minerals and their characteristics is appended. The work forms one of a series of science and industrial primers.

---

**MINERALOGY,** by F. H. Hatch, Fifth Edition Revised, with 124 illustrations, 7 ins. by 5 ins. Boards, 258 pages with index and tables. Six shillings net. Sir Isaac Pitman and Sons, London.

This work by Dr. Hatch, past-President of the Institution of Mining and Metallurgy, and well-known as an authority on petrology and the geology of ores, was first issued in 1892, and has been reprinted three times, without revision. The present edition is rewritten and enlarged, but Dr. Hatch in the preface states he has been careful to retain the essential features of its original arrangement. New features in the edition are tables of specific gravity and the refractive indices of the more important minerals, which will be found useful for those engaged in mineral separation and microscopic work. In the reference to iron ores there is, probably through inadvertence, no mention of the hematite deposits of Wabana, Newfoundland, nor to any of the Canadian occurrences, except as these may be included in the references to the Lake Superior District.

## Northern Ontario Letter

### The Silver Mines.

The upward turn in quotations for silver has been signalled by the resumption of bullion shipments, from the producing mines of Cobalt. During the period when a slight decline in quotations occurred, practically no bullion was shipped, the operators believing the recession to be only temporary. In this they appear to have reckoned accurately.

Reports that a shipment of \$250,000 in bullion had been made from London to New York, and that the consignment was a part of a fairly extensive amount soon to be shipped from Germany via London served to influence the market more or less adversely. The influence caused was not so much due to the amount of silver involved, but was chiefly on account of its possible significance. It now develops that no adverse influence has resulted, and the quotations have accordingly strengthened considerably. Also, the former belief that a new upward movement is pending is taking renewed form among the silver producers.

An announcement of interest to Northern Ontario is that this district will be visited in September by a company of approximately six hundred journalists from the British Isles. It is stated that this will comprise perhaps the most distinguished group of journalists that ever paid a visit to the Dominion. The party will arrive in Cochrane at an early hour on September 6th, being accommodated in two trains of about ten coaches each. They will visit the Porcupine gold district in the morning and will arrive in Cobalt late in the afternoon of the same day, and will leave Cobalt for North Bay in the late evening.

Favorable developments on the University property of the La Rose Consolidated offers fair prospects of making it possible to maintain the record established by that company during the past calendar year. It is evident, of course that the University may not offer equal chance of large ore bodies as does the Violet property of the La Rose Company, but the amount of territory as yet undeveloped presents very important possibilities. The encouragement already met is considerable, and the company has commenced to ship medium grade ore, estimated to contain approximately fifteen ounces to the ton. Under present conditions, costs of operation are expected to continue to average about the same as last year, at which time it cost \$1.05 to produce each ounce of silver. Even at this, with silver quoted at between \$1.25 and \$1.30 an ounce the margin of net profit is fairly substantial.

Reports of a possible margin of the Kerr Lake, Crown Reserve and Dominion Reduction companies have not been officially confirmed. If such a deal is really under consideration, knowledge of it appears to be confined to the head offices of the companies mentioned.

Considerable doubt exists as to whether or not the Adanac will be included in a merger with the Victory Silver Mines. At the time of writing the odds are decidedly in favor of the Victory interests accepting an offer of financial assistance made by Buffalo men whereby funds would be provided for the commencement of operations this spring on the Victory property. That there is little or no hope of the present interests in the Adanac attempting any further work on the Adanac property is indicated in the fact that the pro-

perty is being dismantled, a part of the equipment, including the hoist, having been sold to the Oxford-Cobalt Company.

Underground work at the Cross Lake property has been suspended owing to the shaft having been flooded through the water in Cross Lake having risen several feet the outlet having become partially blocked by sand tailing from one of the custom concentrators.

The Tretheway Company, now confining its efforts to the operation of the Castle property in the Gowganda district, has met with the difficulty of an early breaking up of the road from Elk Lake to Gowganda. Whether or not this will delay the shipment of the carload of ore which the company has been assembling for shipment, has not been announced.

On the strength of a peculiar instrument operated by Andrew Cullen of Haileybury, with which Mr. Cullen claims to be able to discover mineral deposits, Mr. R. I. Henderson, of Toronto, has taken a working option on a group of claims located in the Gowganda district. The ultimate purchase price is said to be \$300,000. It is proposed to carry on sinking operations just as soon as possible. Mining men are entirely skeptical of the claim made for the instrument, and the general impression appears to be that it is but another delusion of the class of old-time divining rod. The Cullen instrument is claimed by its owners to be constructed and operated on the principle that two things of a like nature attract each other and that by use of a small particle of silver he can discover the presence of silver, by the use of a little gold he can discover gold deposits, and by the use of coal-oil he can discover oil wells, etc. The instrument, however, does not appear to be taken seriously in the North.

At the 180-ft. level of the Triangle property in the township of Auld in the Elk Lake Mining Division a shoot of ore has been encountered. The vein is stated to be from one to two inches in width and contains several thousand ounces of silver to the ton. The wall rock also carries considerable leaf silver for several inches back from the vein. The force of men is being enlarged from 18 as at present to about 25.

On the strength of a reported silver find in the township of Pense about twenty-five miles North from New Liskeard, about 85 mining claims have been staked and recorded by Toronto men. While nothing of a definite nature can be learned regarding the reported find, it is known that the rock formation is favorable, being made up of conglomerate as well as diabase. The stakings have occurred in the central and northern part of the township, as well as a few claims being staked in the central and southern part of the adjoining township of Mulligan.

Rumors have been current during the past week or so that the Canadian National Railways might consider a scheme to tap the West Shining Tree and the Gowganda mineral areas, by extending a branch from the Canadian Northern to Gowganda, by way of West Shiningtree. The report is totally unofficial and is therefore received with all due reserve.

### The Gold Mines.

The fairly general discussion of the tariff question by the political contestants in the Temiskaming by-election set for April 7th, has caused more than ordinary attention to be directed toward this phase of the economic situation as effecting this country. For this reason, an editorial appearing in March 5th issue

of the Canadian Mining Journal has been widely read in the mining districts. Here, while opinions are varied and numerous, the contention is heard that gold being the standard of value, the gold mines would stand to benefit greatly by a reduced tariff. It is pointed out that free trade would all but shatter Canada economically, that buying in the United States would increase and would cause a further violent decline in the value of the Canadian dollar, whereas the gold produced by the gold mines on the strength of cheapened Canadian money would command full value in the United States and thus operate to the benefit of the gold mines.

As to the attitude of not a few gold mine operators, it is interesting to learn that there is a strong desire to avoid too much meddling with the tariff. Free trade, it is believed, would greatly benefit the gold producing companies, but, in doing so, would all but destroy Canada industrially and economically. That the gold mines could offer a stronger argument in favor of free trade than that presented by the farmers seems to be quite evident. The one difference is that the mining interests are apparently willing to not sacrifice Canada's financial status by bringing about free trade that would operate to the profit of but a few favorably placed industries.

At the Hollinger Consolidated an average of about 2,200 tons of ore daily continues to be treated, and from the record set during the first quarter of the current year, it appears reasonable to believe that operations for 1920 will compare favorably with that of the preceding year.

With wages having been increased in the Porcupine district to a point where they about equal that being paid in the silver camps, there is no longer much competition for labor, the supply having a tendency to become more evenly distributed over the entire field. While there is still a shortage in the Porcupine district, the situation has not grown any worse while it has shown moderate improvement. With winter having about drawn to a close, with the consequent curtailment of lumbering operations, it is believed that a large number of workmen from the lumber camps will now find their way to the mines. Accordingly, during the next month or so there is fair promise of working forces increasing materially.

The McIntyre-Porcupine continues its high rate of output, and with the ending of the company's fiscal year on June 30th next, the record shown will exceed by a large margin that of the previous banner year. Heavy production and continued favorable developments at depth tend to strengthen the outlook for the McIntyre. The mine has a full supply of workmen.

It is reported that work will be carried out this year on the Gold Reef property, and that a shaft will be put down to the 300-ft. level for the purpose of exploring for the downward continuation of the narrow, but rich vein which was worked near surface.

After more or less prolonged negotiations, the Porcupine Crown and the Thompson-Krist properties will be merged. The directors of both companies have agreed upon the basis of the merger, and the scheme now awaits ratification at a special meeting of the shareholders. It is proposed to incorporate a new company with a capitalization of \$3,000,000, made up of 3,000,000 shares of the par value of \$1 each. Of this, 2,000,000 shares will go to the Porcupine Crown and

1,000,000 to the Thompson-Krist. The Porcupine Crown Company will remain in existence and will retain control. It also withholds its cash from the merger. The Porcupine Crown will be represented by six and the Thompson-Krist by three directors. The announcement has been received with fairly general favorable comment, as in offers to the Porcupine Crown an opportunity to perhaps develop new ore bodies on the large acreage of the Thompson-Krist, while to the latter it offers the advantage of being taken into a thoroughly going concern, fully equipped with a modern mining and milling plant.

In the Kirkland Lake district, the arrival of spring has been marked by a further increase in activity among the owners of property in the development stage. It is evident that many new mining operations will be carried on this year.

During the month of February, according to an official statement just issued, the Lake Shore Mine produced \$40,126.43. The tonnage treated amounted to a little under fifty tons daily or a total of 1,435 tons, while the average recovery from each ton treated amounted to \$27.96. This is the highest grade so far treated by the Lake Shore.

Work at the 200-ft. level of the Kirkland-Combined property has met with a fair amount of encouragement and the work is being continued aggressively.

At the Ontario-Kirkland, preliminary plans in connection with the matter of providing a mill have been up for consideration for some time, and an official statement is expected as to the probable date on which the work of erecting a mill will commence.

The Peerless Gold Mines, at Boston Creek, of which Shirley Ogilvie of Montreal is president, is making good headway in the development of its Mondeau property. The shaft has reached a depth of 250 feet, where a station is being out preparatory of commencing lateral operations. Once drifting is well under way at this point, it is proposed to continue the shaft to a depth of about 400 feet. The vein on which the shaft is at the present depth of 250 feet.

The Miller Independence is proceeding with cross-cutting operations at the 500-ft. level. Delays have occurred in connection with turning on electricity, but the difficulties have now been overcome, and within a few days power will be switched on and will thus make it possible to speed up operations.

A small mining plant has been shipped to the Kennedy-Boston property where it will be installed for the purpose of continuing the shaft from its present depth of 100 feet to the 150-ft. level where it is planned to carry on drifting operations.

Announcements that the Ontario Government is favorably disposed to continue the Temiskaming and Northern Ontario Railway from Cochrane to James Bay have been made. The date of commencement, however, is very vague, so much so that many things may in the meantime happen to alter the Government's opinion. For instance, it is stated that while in sympathy with the projected line, it would be unreasonable to proceed with the plan until such time as economic conditions become reasonably adjusted. This latter plan is believed in the North to be the proper course. However, it offers an opportunity for politicians to express "Costless" sympathies.

# The Northern Manitoba Field

By R. C. WALLACE, Commissioner of Northern Manitoba.

At the date of writing, more than a month before break-up, prospects look very bright for the summer and for the future in the territory north of The Pas. The fact that the Flin Flon property has been optioned to very responsible copper mining interests has meant that the eyes of the mining world on this continent are being turned to this territory. Mr. Hammell, who has negotiated the twelve months option under which \$200,000 will be spent on the property is in the district, as also Mr. Koerner who will direct operations for the Thompson interests. The contract has been taken by the Longyear Exploration Company and Mr. Eubanks, with forty miners, has already gone through to Flin Flon. It is understood that Mr. Stovel, who is well known to Ontario mining men, is in general charge for the Longyear Company and that he will himself visit the district at break-up. The plant belonging to the Mandy Mining Company has been bought by the optionees and it is understood that the Prince Albert Mining Co's plant at Beaver Lake is also being taken over. The intention is to sink two shafts on the ore body to the 400 ft. level, to drift at that level the whole length of the property and to cross-cut to both walls at short intervals. There is a good set of buildings on the property which will be sufficient for the preliminary development work, and all the heavier machinery and supplies will be taken in over the ice before the break-up.

Arrangements are also being made that the Provincial Government put into shape for summer transportation the seventeen-mile wagon road between Sturgeon Landing and Lake Athapapuskow. This will enable summer transportation to be carried through almost entirely by water with the exception of this stretch of wagon road. With those who know the property well and who understand what the development work now to be carried on means, there is confidence felt that the option will later mean a sale of the property, and that the initiation of a copper smelting industry there and the building of the railway to the property which will necessarily follow, will establish a solid mining industry of large proportions in Northern Manitoba. On this will also be built a gold mining industry at Beaver Lake, Copper Lake and Herb Lake; the former area lying on the western end of the belt in Saskatchewan. Whether another Flin Flon will yet be discovered in this area is on knees of the gods, but even the most conservative would admit that the chances of the discovery of other copper properties of value in this territory, which has only been imperfectly prospected, are very good. Even at present a custom smelter erected at the Flin Flon would result in the development of some properties on which it is possible to concentrate the copper ore and ship the concentrates to the smelter.

There will be solid development work on the gold properties throughout the belt during the coming summer. In the Beaver Lake area in Saskatchewan, Ontario mining interests have secured a sampling option on the Graham property. The Wolverine properties in the same area are included in the Flin Flon deal and will doubtless be operated either for a flux or independently. It is also known that the Ontario interests have an option on a sulphide body at Ross

Lake, one of the numerous sulphide bodies of large dimensions which are to be found throughout the belt. On Gordon's big dyke at Copper Lake, diamond drilling operations are now in progress, the contract having been obtained by Smith and Travers. It is understood that fifty thousand dollars will be spent on this property. In the Herb Lake district it is a matter of gratification that sufficient money has been obtained through Winnipeg financial men to recommence operations immediately on the Rex Mine, the successful development of which is now confidently expected by all who know the property well. Work will also be recommenced immediately on the Northern Manitoba property, on which very rich ore was obtained to the 100-ft. level to which the property has already been developed. Preparations are also being made for the operation of the Bingo property which shows very high surface values. On the Apex group at the north end of the Lake, which represents a large body of mixed quartz and granite, mineralized to widths in places of sixty feet with arsenopyrite and with good surface values in gold; it is expected that work will be begun in the Spring and that development will be carried out immediately by diamond drilling to ascertain the value of the ore body as a whole. Some four car-loads of canoes have already been sold at The Pas and the indications from enquiries made from many quarters on the continent are that a large number of mining men and prospectors and many mining companies will be actively interested in this district during the coming summer.

The Associated Engineers at Crosby, Minnesota, represented by Messrs Pearl and Knickerbocker, have made arrangements to instal an assay office at The Pas and to place in charge a qualified assayer of some seven years' experience. This office will be of great assistance to prospectors and mining companies, owing to the fact that considerable time will be saved in getting returns for material taken in from the field.

## THE BELCHER ISLANDS IRON DEPOSITS.

Popular interest in the Belcher Islands has been aroused by rumors that an attempt would be made to take examining engineers to the property this winter by airplane. It is quite unlikely that the hazardous journey will be made, but it is understood that it was seriously contemplated by certain engineers. There is good reason to believe that the deposits will be examined this year as soon as weather permits transportation by water.

Excellent iron ore has been brought to Toronto from the Belcher Island by the discoverers and by engineers who visited the property for the owners. Evidence is accumulating that large bodies of good ore have been found. It is not at all unlikely that an iron mining industry will be founded on these discoveries. It is possible also that waterpowers on the adjoining mainland will be utilized to smelt electrically the iron ore from the islands. The present difficulty of access has made naturally for delays in recognition of the mineral possibilities of Hudson Bay. It seems likely now that this year will see a long step forward on what has been a very slow journey.

**NOVA SCOTIA NOTES.**

The Dominion Coal Company's Glace Bay collieries in March showed an encouraging increase in output. The production for the first quarter of the year compares with 1919 as follows:

	1920	1919
January . . . . .	275,129	276,036
February . . . . .	248,338	262,876
March . . . . .	292,668	273,051
	816,135	811,963

It therefore approaches 1918 figures by approximately five thousand tons. April is a short month, containing several holidays, but it should be possible to exceed the production of 1919, which was only 258,196 tons, unless drift-ice interferes with the shipping.

The suggestion has been made in the Nova Scotian newspapers that the Dominion Coal Company will not, during the coming Summer, make any determined attempt to send coal to the Montreal market, but will content itself with supplying the local demand, and selling cargo and bunker coal, for which of course there would be a brisk demand during the coming season. While it is probable that local demand will absorb so large a portion of the coal production as to leave for export a much smaller quantity than was the case before the war, it will be a surprising reversal of the policy of the Dominion Coal Company, if no decided attempt is made to regain the Montreal market, where, as recently pointed out in these columns, a potential market of at least three million tons per year exists for Nova Scotia coal.

The improvement which had commenced in the European coal situation, and which led to hopes that industry there was resuming its interrupted progress, has been nullified by the events in the coal district of the Ruhr, Germany, the result of which will be quite far-reaching. Britain and the United States will be called upon to make good the deficiency of coal in France, Italy, Holland and Denmark, and along the whole course of the Rhine which will arise from the troubles in the Ruhr District. A continuance of European demand for coal from North America may therefore be expected, from which Nova Scotia will benefit, but it is not to be expected that the Nova Scotia operators will lose sight of the necessity to regain their own proper and ancient market, which extends, or should extend, just so far as ocean-going vessels can navigate the St. Lawrence channel.

There is ground for much cynical comment in the announced intention of the United Mine Workers in Nova Scotia to base a new demand for increased wages on the increase recently granted to the bituminous miners in the United States. Two years ago the coal operators of Nova Scotia and the United Mine Workers executed an agreement, the crux of which was that miners' wages in the States were not to be used as a basis for adjustment of miners' wages in Nova Scotia. The spokesmen for the United Mine Workers at the conference in Montreal where this arrangement was formulated and signed by the parties thereto made much capital out of the solicitude of that organization for the sacredness of contracts, and urged recognition and acceptance of the control of the mine workers by the United Mine Workers because this union always kept its agreements, a fact that would ensure satisfactory and permanently harmonious relations in the future. The truth of this statement now awaits confirmation.

**MANITOBA LETTER.**

By CHAS. E. MILLICAN, Winnipeg.  
2,200 lbs. of ore has been shipped to Ottawa from the "Wolf" property, east of Little Rice Lake for the purpose of having a comprehensive test made. A local assay of this shipment gives \$86.00 per ton.

The Ripstein Syndicate, a close Corporation holding several claims in the Rice and Long Lake Areas, have a party of men doing a considerable amount of stripping.

The Northern Copper and Nickel Mining Co. near Ingolf, east of Winnipeg, have men on the ground proceeding with stripping. This Company has ordered a diamond drill and as soon as it is on the claim boring will be started. It is the intention of this Company to operate three drills this season.

On the Pan Extension all machinery has now been installed and sinking operations begun.

A very comprehensive map has been compiled by the Overseas Development Corp'n. Ltd. of Winnipeg showing the respective prospected mineral areas in South Eastern Manitoba to date. This map has been compiled from various authentic surveys and a great deal of additional information has been embodied, such as the existing winter routes, proposed summer road to Rice Lake. The map proper is on a scale of 3 miles to the inch and shows the relative positions of all these mineral areas to Winnipeg and to the different water and rail routes as well as the different power sites. It is understood that copyrights will be allowed for this map.

It is expected that, with the opening of the water routes, a considerable amount of exploration work will be undertaken this summer in those parts of the Rice Lake Area which have not yet been thoroughly prospected. It is also probable that more attention will be paid to the copper discoveries in the vicinity of Lac du Bonnet and the country north of the Winnipeg River.

It is proposed to induce parties of students of the University of Manitoba to engage in prospecting trips during the summer vacation, and in some cases we believe that several of the students interested in geology will be taken on the different mining gangs where exploration and development work will actively be carried out this summer, especially in the Rice Lake country. In all probability some of the work being undertaken on the Gabrielle camp this summer will be done by students under the direction of an experienced foreman.

The Public Works Dept. of the Provincial Government has issued the necessary authority for the construction of a Summer Road into the Rice Lake District via the Hole River and Hole River Lake water route to the lower Bellevue Mine Landing, thence in a South Easterly direction to Caribou Lake.

A Portage Road about two miles long on the South side of the River from the head of Lake Navigation to the upper side of the rapids is to be put into good shape.

The Dominion Government is to be asked to repair the rock dam located just above these rapids, which was damaged by ice some years ago. The result of

this work will be to raise the water in the river and lake to a sufficient height to afford draft for boats and barges drawing four or five feet right up to the Bellevue Landing—a distance of about 20 miles inland. Under present conditions a boat drawing 3 feet can make this point.

From this Landing the new road—about 15 miles long—will be constructed to Caribou Lake, following ridges where possible, and will serve a number of Mines in this District, which will be reached by short lateral roads, and will prove of great assistance in getting summer supplies.

From the Caribou Lake end of the road a good canoe route can be followed to Long Lake, with only three short portages to negotiate.

On the Bingo Mine a camp is being constructed, having a present capacity for a crew of 12 to 15 men. The buildings are of log construction—the timber being in close proximity to the Camp site.

The Company are installing a gasoline engine of sufficient power to carry sinking operations to the 500' level. A hoist is also being installed. A contract has been let for sinking to the 100 ft. depth.

C. H. Miles, M.E., exploring engineer, Fort Frances, Ont., is in Winnipeg en route to the Copper Lake district, northern Manitoba, where he and his associates have secured a large number of mineral claims. They will carry on development operations this summer. There are six experienced miners and prospectors in the party.

### THE LOW-GRADE ORES OF ONTARIO.

#### Successful Beneficiation of Masabi Range Ores of Similar Character, Suggests Similar Possibilities in Ontario.

By J. J. O'CONNOR, Port Arthur, Ont.

The successful development on a commercial scale, of Canada's enormous reserves of low grade iron ore, situated mainly in Northern and North Western Ontario, would do more to place this country on a sound, independent economic basis, than any project looking to production, that could be undertaken.

Few Canadians realize the enormous wealth in iron ore lying dormant and undeveloped within our borders. Most of them believe that we are without sources of supply, of this most necessary basic metal. They are not blameable for this opinion, so generally held, but feel that they are justified in holding it, in face of the fact that we now import 96 per cent of the iron ore used in Canadian blast furnaces, and in addition, import upwards of 100,000 tons of pig iron, and about \$175,000,000 worth of iron and steel products annually.

During the past five years railway maintenance has been at the lowest ebb, railway construction practically nil, and all other forms of constructive development, almost at a standstill. We now find ourselves in the midst of a period of readjustment, and reconstruction, when these arrears of construction work must be caught up. With an immense mileage of railway improvements to make, and railway extensions to be constructed. Steel ships to be built as a necessary complement to our government owned railways, in pursuance of the adopted policy of a government owned merchant marine, for the expansion of Canada's foreign trade. With all other industrial lines to be developed and expanded, to enable Canada to pay its enormous war debt. There has never been a time in

the history of this country, when the maximum of possibilities were as great as they are today, never has been a time when we are so much in need of our latent mineral wealth, as we are at present.

With 14,000 miles of railway on our hands, and more to follow, with traffic to find for this enormous mileage, for its maintenance and necessary extensions, together with other industrial needs, it would seem to be a fitting time for the government to come to the aid of the iron ore industry, in a practical way, and make Canada independent, instead of practically dependent, on foreign ores, as she is today.

At this time, when the Canadian dollar has lost a considerable portion of its face value, through over purchasing abroad, the logical course is to turn to our own resources, and make of them, assets in fact. No natural wealth can be considered an asset until it is developed.

Instead of importing over two million tons of iron ore annually, develop our own ore, help stabilize exchange, and bring the Canadian dollar back where it should be.

One of the greatest factors in retarding the development of Canadian ores, is the easy accessibility of United States, Lake Superior ores. Furnace men are able to import these high grade ores free of duty, at low freight rates, and consequently have paid no attention to our own ores.

Canadian blast furnaces have been subsidized to the extent of \$17,000,000, they have been placed on a sound basis at the expense of the neglect of our own ores. It is not reasonable to expect them to turn to the use of ores that must be benefited in some form, while other ores are so freely open to them.

That we have immense deposits of low grade beneficiable ores, has been amply proven. Particulars of the location, quality, extent, and amount of development that has been done on them, has already appeared in these columns.

The twenty-eighth annual report of the Ontario Bureau of Mines, 1919, just issued, says, on pages 31-32, "The fact that most of the iron ore mined in Ontario requires beneficiation before smelting has undoubtedly retarded the development of iron mining in the Province. There are very large reserves of ore in the northern and northwestern regions, but so far as the character of the deposits has been revealed, they are in the main low in metallic contents, and in some cases carry an objectionable proportion of sulphur." "Many of these deposits are contained in ranges of banded ore, composed principally of magnetite, but frequently carrying hematite as well. In these layers iron ore alternates with layers of silica or jasper, such layers varying in thickness from that of leaves in a book, to a foot or several feet. The intermixture of iron and silica being intimate, fine grinding is necessary before any method of magnetic concentration can be employed, and complete separation between the particles of ore and those of silica is difficult."

Much time, and a very large expenditure of money has been made on the Masabi range in Minnesota, in perfecting processes for the beneficiating of ores similar to our own. These processes have been brought to such a state of perfection, in their experimental plant in Duluth, by the Masabi Iron Company, that they are amply satisfied that they now have commercial success within their grasp.

Their plans are all complete, the money has been paid in, and construction is about to begin on their

new plant at Argo, Minn. The original unit will entail an expenditure of \$3,000,000. The new plant is to be constructed of steel concrete and wood. The first unit will have a capacity of treating 3,000 to 4,000 tons per day. Other units will be added as circumstances dictate.

The equipment will consist of crushers, ball mills, magnetic separators, sintering plant, etc.

Their product will be in the nature of a clinker, which is produced after the separation of the ore from the rock, by the sintering process. They are now experimenting with peat to be used in sintering. The product may be described as a clinker of high grade ore, free from moisture and all deleterious elements, very porous. The desirability of the product has been established by the preliminary tests, following the operation of the experimental plant in Duluth. They put three-quarters of a million dollars into the experimental stage of their enterprise, standing to lose it all, or make good.

If shrewd iron operators, on the richest iron range under development, in the world today, can make such huge expenditures for the beneficiating of low grade ores, it means that they have sufficient vision to prepare for a future that is certain to come, when high grade ores will be diminishing. They cannot last for ever at the present rate of fifty or sixty million tons per year.

Between 10 per cent and 15 per cent of the iron ore used in the United States today, is beneficiated. All of the New York and Pennsylvania ores undergo some treatment before smelting.

The enterprise and foresight shown by operators on the Masabi range in improving the grade of their ores, is increasing yearly, every season shows an increase in tonnage of beneficiated ores, over the preceding one.

With this example before Canada, why should not something be done along the same lines for the development of our own iron?

Our ores in the main, lend themselves to beneficiation and much more readily than the ores to be treated by the plant mentioned above.

The Bureau of Mines report above referred to, says "Undoubtedly the iron ore deposits of Ontario will be called upon, and it may be at no distant date." With this authoritative statement, some measures of aid should be undertaken by the Government of the Province, aided by the Federal authorities to bring about the early exploitation of this natural resource.

The Province should undertake the diamond drilling of the various ranges, to be recouped for its expenditure, where merchantable, or beneficiable ores are located, contingent on expending the money so repaid, in further drilling on another range, and so on, until the whole of the ranges were gone over. If they would undertake to do this an experimental plant would be erected in this district, that would demonstrate the feasibility of creating, not only an iron ore industry, but a steel plant, rail mill, by-product plant, and all the subsidiaries that go with an iron and steel enterprise.

The railway mileage to be maintained, and the mileage to be built in the future, will be greater west of the Great Lakes, than in the east. This means at least \$1.50 per ton on steel rails, in favour of this point, as against any point east of here.

This form of government aid should not occasion fear on the part of the public that that any one man,

group of men, or any one community would be the sole beneficiaries of the aid given, its benefits would be felt from coast to coast, no one section of the people would be so directly benefitted as the agriculturists. It implies the continuous flow of freight traffic. Prosperous communities would be built up, enlarging and bettering the farmer's market. More, and cheaper agricultural implements would be manufactured in Canada, leading to a solution of the tariff problems of the present.

The Federal government could give substantial aid to a beneficiating plant, without the expenditure of one dollar by admitting the heavy and expensive machinery necessary in such a plant, free of duty.

This is a concrete and feasible proposition, easy of accomplishment, that would demonstrate Canada's ability to stand on its own feet, in the matter of iron ore requirements.

### SKINNER'S MINING MANUAL AND MINING YEAR BOOK

We have received a copy of the 1920 edition of this standard work of reference on mines and mine incorporations which has now reached the 34th year of publication. The price is 20s net, or 21s 6d post free out of Great Britain. The volume contains one thousand pages, and can be obtained from Walter R. Skinner, 11, Clements Lane, London, E.C.

The information given is unusually complete, and and of a nature that will make it useful to consulting engineers and all persons interested in mining investments.

### METAL QUOTATIONS.

Fair prices for Ingot Metals at Montreal, 6th April, 1920.

	Cents per lb.
Copper, Electro . . . . .	24½
Copper, Castings . . . . .	24
Tin . . . . .	71
Lead . . . . .	11
Zinc . . . . .	11½
Aluminum . . . . .	45

### MINING SOCIETY OF NOVA SCOTIA.

#### Proposal to Change Name of Society and Date of Annual Meeting.

At the Annual Meeting of the Mining Society of Nova Scotia, which will be held in Glace Bay, Cape Breton, on the 4th and 5th of May, a motion will be made to change the name of the Society to "The Nova Scotia Mining and Metallurgical Society." A further motion will be made to allow the Annual Meeting to be held between January 1st and July 1st in each year, instead of between January 1st and April 1st, as prescribed in the by-laws.

### POSSIBILITY OF OIL OCCURRENCES IN SPITZBERGEN.

The Northern Exploration Company, of London, in a letter to the shareholders states that following the observance of the gas flows in Spitzbergen by the Company's geologist, arrangements have been made for exploration of the neighbourhood for oil. The "Financier and Bullionist" refers to liquid oil springs and specimens of bitumen, noticed in Spitzbergen in 1905 by the Rev. E. T. Gardner.

# A MARSH HOIST

## IS MADE THE RIGHT SIZE FOR YOUR MINE

and in either Steam Power or Electric Power

This shows one of our Electric Mine Hoists. We make many other types. Send for our catalogue of Mine Hoists, Cars, Cages, Buckets, etc., and see what we offer you. It will repay you.

From the little 10 Horse Power size for prospectors or small mines to the massive 50 Horse Power size, one of our 7 sizes should be just right for your mine.

We are specialists in the building of Hoisting Machinery of all sorts. For nearly a quarter of a century we have been designing and building Hoists, and have developed a Hoist that we are really proud of—proud because of the record of good work they have done, and are doing in mines, quarries, and other classes of work from one end of Canada to the other.

ESTABLISHED 1846

BELLEVILLE, ONTARIO, CANADA

Sales Agents:—MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

# BOLINDER'S

## Heavy Crude Oil Engine

FOR MINING AND INDUSTRIAL PURPOSES

Built by a Firm who Stands Supreme in the Whole World as Oil Engine Experts.

The Bolinder operates on a cost of only  $\frac{1}{2}$  cent per Brake Horse power per hour—an enormous Saving as compared with a Steam plant. A 200 B.H.P. Bolinder (which is equal to a 250 I.H.P. Steam engine) costs only \$1:—per hour at full load.

The Bolinder eliminates firemen and fire hazard.

The Bolinder is the result of 30 years' experience.

**Simple**  
**Reliable**  
**Durable**

A 320 B.H.P. Bolinder Engine directly connected with a Generator.

Representatives:—

Swedish Steel and Importing Co., Limited, Shaughnessy Building, MONTREAL

### A SIGNIFICANT STORY

The story of the discovery and early development of the Mandy ore deposits, as recounted by Mr. J. E. Spurr in the March 13 number of the "Engineering and Mining Journal," give some indication of the opportunities that Northern Canada presents to those who would develop mineral deposits. Mr. Spurr and his party were making a visit to the Flin Flon discovery when observations were made that soon led to the discovery of the Mandy deposit, which has now yielded several thousand tons of rich copper ore and which may yield a larger tonnage of lower grade copper-zinc ore in the near future. Manitoba's first copper producing mine became a producer very soon after its discovery. Mr. Spurr says of the events leading to staking of the claims:

"From Athapapuskow we travelled along the narrow Schist Lake; here we noted that the iron-stained rock gave the first suggestion of mineralization; and, indeed, we knew that we were not far from the Flin Flon discovery. We kept on the west shore, but got little protection from the wind sweeping straight down the lake. Arriving at what seemed to be a small island (where now is the Mandy mine), we kept inside the island for better protection against the choppy waves. It turned out to be a peninsula, and we returned with speed and disgust, for we had counted on making the long swamp portage between Schist and Flin Flon Lakes before dark, and it was getting late. Coming back along the shore we noted at one point very heavily iron-stained float at the edge of the woods. We stopped to land and investigate, but we were warned that if we took the time to do so our present day's schedule, and so our whole schedule, would be disarranged. It was agreed, however, that Jackson and Reynolds (two of the party), after visiting Flin Flon, should return by the way we had come and should investigate this locality carefully."

After visiting the Flin Flon and returning to the Pas, Mr. Spurr's party waited there for Jackson and Reynolds. Jackson arrived the following day and reported that he had found sulphide ore—

"immediately under the moss at the spot we had noticed and discussed, had scraped off a space three or four feet wide and found no walls; and had located claims, those covering the ore in his own name and probable extensions in the name of friends. He showed me the ore, clean bronze-like massive pyrite, concerning whose value he was in doubt; but I advised him judging from the peculiar yellow shade, it should contain between 20 and 30 per cent copper. He accordingly recorded the claims, and a written agreement was made transferring his locations to the Tonopah Mining Co., of Nevada, of which I was vice-president and engineer, leaving him an interest in the property as compensation.

"Immediately I sent for an engineer—McDaniel—to come from Colorado to the Pas, and arranged to have him return to the spot with dog teams as soon as the river froze hard, make camp and trace the discovery."

"MacDaniels' first cut across the outcrop of the Mandy mine, as Jackson had named it, showed about forty-feet of nearly solid sulphides, copper and zinc, averaging about 18 per cent copper and high in zinc. Subsequent cuts, however, proved that the first had been the widest and later trenching revealed the surface outcrop as lenticular and a little over 200 feet long. Diamond drills were sent in to determine the depth and revealed the lens pitching to narrow dimensions in about 200 feet.

"The high grade copper lay in masses and layers separate from the zinc ores and mixed ores, permitting separate mining and the then high price of copper determined the plan of mining and shipping this copper ore. Mining equipment was hauled in over the ice, and when installed the ore was systematically mined."

The story of the discovery and development of the Mandy mine is a very creditable one. It shows how one little patch of the Northern wilderness has been made productive, and should prove an incentive to other enterprising men who are willing to spend time and money in exploring new fields.—R. E. H.

### U. S. SUPREME COURT DECISION ON THE STEEL CORPORATION.

In "Some Considerations on Monopolies" discussed in this column in our November issue, we suggested there was "no good reason for objecting to large consolidations of capital, as such." The Boston News Bureau recently summarised the main feature of the U. S. Supreme Court decision in the suit of the U. S. Government against the Steel Corporation by the phrase: "Size no Sin." The U. S. Steel Corporation was upheld as a lawful consolidation because its monopoly had not been used to menace the State, which should serve to strengthen the hands of those who hold that the more complete the control of any industry, and the nearer that control approaches monopoly, the more economical and efficient will be the operation of the industry, and that in this respect unified control of any industry is for its general good, so long as no attempt is made to subvert legislative processes. As a means of obtaining the unified control that is necessary to ensure the fullest measure of efficiency, it will be generally admitted, after the lessons of the war period, that private control includes less evils, and is not so objectionable from the point of view of the public weal, as government control under a system of popular representation based upon the ballot.

In regard to the extension of the Steel Corporation's activities into Canada, it is fair to assume that some hesitation may have been present in the minds of those who direct the Corporation's policies, so long as the legal status of the consolidation was questioned by the government of the United States, but this uncertainty having been removed, there would seem to be no further reason for hesitation, and, seeing that the conditions which favour the extension of United States business organizations into Canada were never so powerful as they are at this time, a logical result of the Supreme Court decision may be the hastening of construction work at Ojibway. In such event, the Canadian steel companies will have to compete with the efficient forces of a great consolidation, under unified control, a condition that will force Canadian steel interests to fall into line with the general tendency of the times towards self-protection by a combination of forces.—From Iron and Steel of Canada.

**Mining Engineer** desires change of position. Competent mine-surveyor, analyst and geologist. Three years milling experience. Technical graduate. Single. Age 28. Will go anywhere. Canada or United States preferred. Apply, Box 11, Canadian Mining Journal, Ste. Anne de Bellevue, P. Q.

**Position Wanted** as Storekeeper, at present employed, married, age 30. Ten years experience in Mining Supplies and Storeroom Routine. Canada or United States preferred. Apply, Box 12, Canadian Mining Journal, Ste Anne de Bellevue, P. Q.

# EDITORIAL

## The Mines Act 1907

We are publishing, for the information of our readers, and abstract of the Mines Act, 1907, under which the Department of Mines at Ottawa was established. Some information on the old classification and salary schedules is included; this information has all been gleaned from public documents which can be obtained from the King's Printer in Ottawa free of charge.

Members of the mining profession and others interested in mining matters in Canada appear to be lamentably ignorant of the Federal Department of Mines and the organization provided under the existing law. Our issue of February 25th last contained a resolution (on page 159) unanimously adopted at the last meeting of the Mining Society of Nova Scotia re Salaries of the Geological Survey. This resolution has been forwarded to the Government at Ottawa and, among other things, "Urges on the Minister of Mines the complete reorganization of the Department, including the uniting of the Geological and Mining Branches under one executive head."

Strange to relate these two Branches not only are perfectly logical divisions of the work of the Department but were definitely recommended to the Government by the Canadian Mining Institute in 1900, and this suggestion was adopted in the legislation introduced by the Hon. Clifford Sifton in 1907. The law has provided for a **single executive head** of the Department of Mines since its inception. The present executive head is Mr. Richard G. McConnell, B.A., who

has been Deputy Minister of the Department of Mines since the first of December, 1914. A reference to the text of our article on the Mines Act will show that the Geological Survey is a very large organization with a wide field, which embraces nearly all branches of Natural Science. In addition to Geology many other branches of scientific investigation are covered by the staff and the importance and value of this other work must not be overlooked.

We make these comments because we think that it is advisable that critics of the Department of Mines and would-be advisors of the Government should first carefully inform themselves as to the facts before making representations at Ottawa.

The salary question, the unrest in the Government service, and the question of resignations of the scientific staffs in Ottawa, will be dealt with more fully in a subsequent article. We wish to point out that the Department of Mines is only one of several Departments employing a scientific staff and that resignations from absolutely essential technical services have been very frequent of late throughout the whole public service. In the Department of Mines, it might be noted in passing, there have been more resignations from the Mines Branch than from the Survey, although the latter has about twice the staff. The work of certain divisions has been greatly reduced, and in some cases it may cease altogether.

## Little Discussion of Papers or Topics at the Annual Meeting of the Institute

As a social gathering, and as a source of papers for inclusion in the Transactions, the recent meeting of the Institute in Toronto was an unqualified success. The papers were of high merit, and in accord with the best traditions of the Institute. There also prevailed the meeting a sense of nearness to active business affairs, and a feeling that the Institute was a real force in the direction of policies that was unusually vivid. There was also an actual participation in the meeting by men of large affairs and responsibilities that was much appreciated, particularly those features of the meeting which were made possible by the courtesy of the International Nickel Company.

Nevertheless, the meeting would have been a greater success if more discussion had taken place on the papers read, and on the topics that were listed on the programme for discussion.

For example, the symposium of papers on fuel supply represented much preparatory work by the Secretary and Committee, and can be correctly described as covering most of the phases of our fuel supply, comprising as it did papers that dealt with lignites, briquetting, oil, bituminous coal, anthracite, and questions of economics and transportation affecting fuel supply. Mr. Stirling's paper bristled with points on which discussion is needed concerning a coal field of

vital value to Canada. It is, we believe, a matter for genuine regret that this exceptionally complete symposium of fuel papers did not, as far as the coal and lignite papers are concerned, elicit any discussion at all; and, in regard to oil, an inadequate and rather irrelevant discussion.

There is no question of more pressing urgency before Canadian mining men than that of fuel supply, for upon it all the mining activities of the country are dependent. It is to be hoped that the complete absence of discussion on this matter in Toronto does not indicate a disinclination on the part of the members of the Institute to examine the fuel problem, or to tackle a question that is not made of lesser importance by fear of its many difficult phases. The Canadian Mining Institute can hardly expect definite action from those who direct the policies of Canada, if its own attitude remains obscure.

Mr. Mc. Evoy's paper on the Status of the Engineer was designed to provoke discussion. The fact that a discussion was desired was noted on the Programme, but in spite of all this no one said a word. The President explained very clearly the attitude of the outgoing Council, and the quite definite action it had taken, but if the incoming Council was looking for an expression of opinion on the part of the members to guide them in the coming year, they did not receive it. It may be that the members of the Institute so unanimously approved the action of the Council that they considered discussion unnecessary, but, as no one said anything, such a conclusion cannot be more than a surmise.

We ventured some months ago to suggest in this column that the programmes of technical society meetings are too crowded, and that papers selected for reading at the larger gatherings should be reduced to a few previously published papers, selected for discussion because of their topical, provocative or unusually important character, rather than for initial presentation.\* We were also sufficiently ingenious to ask for expressions of opinion on this suggestion, but failed in this endeavor to "start something", much as the papers read in Toronto failed to elicit comment. It would, of course, be temerarious to infer that the members of the Institute are inarticulate as a body, because there is both traditional and contemporary evidence to prove that as individuals they can on occasion become loquacious, if not actually vociferous.

We believe the lack of discussion at Toronto was occasioned by the fullness of the programme, and the desire of those present to give an opportunity to every person who had prepared a paper to deliver it.

A full programme is a desirable thing, but adequate discussion is not less desirable. Is it not possible to compass both?

#### IN MEMORY OF CAPT. O. E. LeROY.

The "Journal" is in receipt of a communication from the University of British Columbia, published in this issue, which announces the successful commencement of the raising of a fund of ten thousand dollars for the endowment of a memorial scholarship at this University.

Simultaneously, we learn that the LeRoy Memorial Fellowship in Geology at McGill University is being founded, and that a sum of ten thousand dollars is being sought, from the proceeds of which a student will be able annually to take a post-graduate course in geology.

The "Journal" believes that those of its readers who knew the late Captain LeRoy will echo the comment of one of the McGill men who is trying—and with gratifying success—to forward the Montreal project, who, upon first learning of the Vancouver project, remarked, "Two memorials are none too many for O. E. LeRoy." The Canadian mining community is large enough and wealthy enough to justify the hopes of those who are seeking subscriptions both in the East and in the West.

J. Austen Bancroft, of the Department of Geology, McGill University, Montreal, is receiving subscriptions for the McGill Fellowship; and R. W. Brock, Dean of the University of British Columbia, Vancouver, for the Scholarship.

No memorial is so lasting, and so much in accord with our national traditions, as an educational endowment of future generations in memory of a scholar-soldier who died in battle. We recommend both these memorials to the generosity of the mining profession in Canada.

#### RESULTS OF THE INDUSTRIAL CONFERENCE.

It is announced that a conference with the Government is to take place at Ottawa between representatives of employers of labour, workmen, and provincial governments, with a view to unifying the existing provincial and federal laws that have to do with industrial occupations. This conference, although the fact is not announced in the newspapers, is presumably a result of the Industrial Conference held at the instance of the Minister of Labour in Ottawa last September, and is being convened by the Department of Labour. As the attention of the Federal Government is to be directed to the existing provincial statutes affecting minimum wages, mothers' pensions, workmen's compensation, factories acts, labour bureaus, hours of labour, child labour, and all legislation connected with arbitration and conciliation in labour disputes, it will be advisable for employers to keep in close touch with this very important matter.

One of the recommendations to be made that is likely to receive consideration by the Federal Government, is that urging uniform codification of workmen's compensation laws. In some of the pro

\*Issue November 26, 1919, page 879.

vinces, workmen's compensation laws of much merit and fairness are being well administered, while in other provinces compensation laws exist that in one instance cause unnecessary and costly litigation and are very unsatisfactory from the workmen's point of view; and in another instance penalise the employer to an inordinate extent. It is very advisable that large employer should carefully watch the development of unification of compensation laws—which, in one form or another is a foregone conclusion—lest unfair provisions should be given wider application.

#### GOLD PRODUCTION IN NOVA SCOTIA.

The gold mining industry in Nova Scotia has had a hard task to exist for many years past, and production has declined year by year, but it will be readily understood that under the present conditions of labour and costs of wages and materials, the Nova Scotia industry has suffered more than that of any other part of Canada. The Mines Report states: "The continued demand for labour in other industries, together with higher rates, with no decrease in the cost of material, has had the effect of still further decreasing the output of gold in the Province." A special report on the gold mining industry has been prepared by Mr. G. F. Murphy of the Halifax Technical College, and is elsewhere published in this issue. It will be noticed that some relief from high fuel costs is hoped for from water-power electricity. Time was when Nova Scotia produced most of the gold mined in Canada, and it is to be hoped that some means will be found to prevent the entire cessation of gold mining in the Province, which appears to be not an unlikely contingency.

By the courtesy of the Editor of "Coal Age," who attended the Toronto Meeting of the Canadian Mining Institute, we reproduce in this issue a cartoon from "Coal Age" which is an example of the telling manner in which a clever cartoonist can sum up in one drawing the gist of many reams of writing. One thing we believe our readers will appreciate and admire in this cartoon is its good-natured limning, for while Miss Canada is shown wielding the hammer in business-like fashion, she is represented as a comely and youthful damsel, as we all believe her to be; and the correctness of Uncle Sam's attitude is just what one would expect from a well-bred old gentleman towards the young lady next door. Mr. Dawson Hall and the cartoonist are happy in their collaboration.

Many a fellow's prospects are bright only by contrast with his own dullness.

#### CAPTAIN LeROY MEMORIAL.

##### University of British Columbia.

In 1915 C. E. LeRoy, late of the Geological Survey, enlisted in the 72nd Seaforth Highlanders of Canada. After training with them in Vancouver, he was transferred, to help recruit and to command the company that the University of British Columbia, in its first session, was contributing to the 196th Western Universities Battalion.

While leading his company at Passchendaele in the autumn of 1917 he fell mortally wounded.

The returned boys whom he recruited, trained and led, have resolved that the memory of his life of service, his sterling qualities, his lovable nature, his generous disposition, his thoughtfulness for others, his devotion to duty, and his supreme sacrifice, shall be perpetuated as a priceless tradition to inspire present and future students of the University he so honored by his service.

It has always been a favorite, if secret, practice of Capt. LeRoy to assist needy students to attend college. Had he returned, he would now be helping some of his boys to fit themselves for leadership in civil life. The boys decided that such assistance shall continue to be forthcoming in his name. At a dinner on February 25th, the Universities Service Club undertook to raise at least \$10,000 to found the Captain LeRoy Memorial Scholarship to assist necessitous students, preference to be given first to returned soldiers and then to dependents of enlisted men. Over \$1,000 was immediately subscribed, in addition to \$250 cash paid in to permit announcing the Scholarship immediately for next session.

As the members are almost exclusively returned men who have their own financial difficulties in completing their college courses, they cannot attain this objective without outside help, but they realize that Capt. LeRoy's many friends (and all who knew him were his friends) will welcome this opportunity to assist in commemorating his memory in so appropriate a manner.

A new university stands in particular need of such scholarships; it stands in particular need of tradition to inspire its students with ideals of perfect citizenship. Returned soldiers now need such scholarships and many soldiers' orphans will need them if they are to receive the education their fathers would have provided for them. There will always be good students who can never receive a university training except by this means.

There is every incentive to make this memorial a worthy one. Anyone who wishes to be associated with this undertaking may communicate with R. W. Brock, University of British Columbia, Vancouver.

#### OBITUARY.

##### Elias Rogers.

With the death of Elias Rogers there passes a pioneer of the coal trade in North America. Mr. Rogers purchased the first coal mines opened in Jefferson County, Pennsylvania, and in 1876 came to Toronto and established with his brother Samuel the coal business which later became the Elias Rogers' coal Company. In 1909, Mr. Rogers became President of the Crow's Nest Pass Coal Company. He died at the age of 70 years. Mr. Rogers was born at Whitechurch, York Co., Ont., and was a prominent member of the Society of Friends.

## Correspondence

### PETROLEUM HYSTERIA OF E. & M. JOURNAL.

To the Editor of the  
"Canadian Mining Journal."

Sir:

German propaganda and Sinn Feiners machinations are being carried on more actively than ever in the Great Republic to the south of us. Judging from the editorial in the "Engineering and Mining Journal," March 27th, pp. 733-4, even the Editor of your contemporary has been infected with the virus. In his hysterical "The Menace of Britain's Petroleum Policy" and the "Higher Patriotism" he says in part: "In the conduct of which campaign she (Britain) has discriminated against American commercial competitive progress, by laws, regulations, and decisions barring aliens from fields under her control." This statement is remarkable, or shall we say, amusing, when we consider what has long been the law of the United States regarding the staking of mineral deposits. No alien can get title to a mineral deposit in that country, as the following quotation from the American Mining Code shows: "All valuable mineral deposits in lands belonging to the United States, both surveyed and unsurveyed, are hereby declared to be free and open to exploration and purchase, by *citizens of the United States and those who have declared their intention to become such* . . ." but by no other persons.

Moreover an alien cannot even own a house in his own name in many, if not in all, the States.

Contrast these conditions as regards the treatment of aliens with those that prevail within the British Empire! But probably we have been too lenient and good natured in the past and it is well that we should now take a leaf out of Uncle Sam's book and prevent aliens from getting title to our natural resources, especially those like petroleum that are of both great military and industrial importance. Our friends in the Great Republic need not fear that we have ulterior motives if we are seeking to control the petroleum resources of the Empire. As it was in the last war, so it will be in the future, our Navy will stand for the protection especially of all the English-speaking peoples.

Has old Standard Oil come to life again after its almost complete dismemberment by the United States Government a few years ago? And are some of its hired men joining in the howl with Germans and Sinn Feiners against perfidious Albion?

At the beginning of the Great War one of the most important petroleum companies, although nominally under neutral control, was really enemy controlled and made conditions awkward for the allies. Why should the British Empire in the future not follow the United States example and not permit aliens of whatever nationality to get control of her natural resources?

From the following extract from a recent Press despatch it is evident that more control of the industry by government would do no harm in Britain, and elsewhere—"The present retail price of 3s 8½d a gallon of gasoline—about 90 cents if exchange were at par—compared with the wholesale price of 1s 6.4d f.o.b. at New York, reveals a good deal of profiteering in distribution. . . The world supply of motor

spirit . . . is virtually controlled by the Standard Oil Company and the Royal Dutch Shell Company. . . There is some hope for British consumers in the fact that the Government controls the Anglo-Persian Company, and it is urged that the products be sold at a reasonable figure within the Empire. A recent British government report suggests that the whole question of the production and price of motor spirit should engage the attention of the League of Nations." But, according to the Editor of the "Engineering and Mining Journal," Britain is committing a crime in attempting to control profiteers! He would let the Standard, the Shell, and other concerns run the industry to suit themselves. He would even blacklist American oil geologists who enter the employ of the British! But after all is said we should make allowance for the E. and M. Editor's hysteria. The long drawn out discussion on the Peace treaty at Washington must tend to get on a fellow's nerves. We should remember that our friends are technically still at war.

PHILAMERICA.

April 6th, 1920.

### CANADA'S ALLEGED AUTONOMY.

To the Editor of the  
"Engineering and Mining Journal,"  
New York.

Sir:

The Canadian Mining Journal, in its issue of Jan. 16 commenting upon an editorial which recently appeared in the "Engineering and Mining Journal" on the League of Nations, objecting to the plural vote for the British Empire, remarks that the article "betrays a curious inability to understand the status of Canada." Referring to British colonies for which votes are claimed, our contemporary goes on to say that "each of the peoples so named constitutes a self-supporting, autonomous, sovereign nation, and if this fact is not understood throughout the world, it is only possible to express surprise." The "Canadian Mining Journal" betrays a curious inability to understand the English language when it describes Canada as an autonomous, sovereign nation. Canada went to war automatically as soon as England desired hostilities. Her government pledged aid to the Allies, and preparations for an expedition were under way on an extensive scale long before the assent of the Canadian Parliament was asked as a mere matter of form. During the controversy which ensued the principle that "when Britain is at war Canada is at war" was accepted by all parties with the exception of the Quebec Nationalists. How can a country claim sovereignty and nationhood when it is bound to render military aid to a suzerain power whenever the latter demands it?

Lord Robert Cecil, a prominent advocate of the League of Nations, in a recent speech, displays the same "curious inability to understand the status of Canada" at which the "Canadian Mining Journal" can only express surprise. He is reported as saying that "We could not continue indefinitely the system by which the direction of our foreign policy was exclusively in the hands of the mother country, though any blunder in it might affect the prosperity and possibly the national existence of all parts of the em-

pire." In the face of such an admission the claim that Canada and the other Dominions are entitled to representation in the League as autonomons and sovereign states is preposterous.

PHILLIPS THOMPSON.

Oakville, Ont., Feb. 16, 1920.

*Note.*—The preceding letter to the editor of the "Engineering & Mining Journal" had been overlooked, but it requires a reply. While we entirely disagree with Mr. Thompson's statement that Canada has in recent years considered herself "bound to render aid to a suzerain power," it should be pointed out that our remarks in the 16th January issue had reference entirely to Canada's new status as a signatory to the Peace Treaty, in which is incorporated the provision for the League of Nations. If there existed any dubiety in 1914 as to Canada's status as "a self-supporting, autonomous, sovereign nation" none exists today, and it was this fact we desired to emphasise. We also understand Lord Robert Cecil's statement to be confirmation of our point of view, namely, that the exclusive direction of foreign policy in the Mother Country has passed away. This is not an "admission." It is weighty enunciation of a new condition. As to the assent of the Canadian Parliament being asked to a declaration of hostilities in 1914, we have yet to learn that the consent of the British House of Parliament was asked. The British Cabinet acted, and so did the Canadian Cabinet. If the Cabinet had not acted "automatically," or, (as is presumably meant) quickly, the Canadian people would speedily have empowered a new Cabinet. If ever there was a spontaneous expression of the popular will it was seen in the manner in which Canada went to war in 1914—Editor.

### BOOK REVIEW.

"FURTHER INCIDENTS IN THE LIFE OF A MINING ENGINEER." By E. T. McCarthy.

Mr. McCarthy, the author of this book, is one of the most highly respected and best beloved of that now small number of English mining engineers who studied under Professors Huxley and Tyndall, and who form a genial coterie into which it is a particular pleasure for the engineer, visiting London, to be admitted.

His books, of which this is the second, give an account of his life in most of the mining districts of the world, including Canada, the United States, Mexico, Uruguay, South Africa, Australia, New Zealand, China, Manchuria, Siberia, the Malay States, Siam, Borneo and Japan.

He begins his stories, for the book is a series of more or less disconnected stories, with a trip to Chiapas in southern Mexico and his life for three years as the manager of an isolated copper mine. His staff was small and his men were mostly renegades and murderers who had fled from the more settled parts of Mexico and the Southern United States.

Later he describes another trip to a gold and silver mine in the States of Chihuahua where he stayed for a few weeks as examining engineer.

In 1897 he took charge of Pigg's Peak Mine in Swaziland where he remained with his wife and young son till 1899, when in spite of contrary instructions from his directors in England, and of objections and discouragement on every side, he closed the mine and fled with the men, women and children who would

go with him, to Lorenzo Marques on Delagoa Bay, whence he took ship to England. Three days after he left the mine, the Boers in South Africa opened active hostilities against the British, took possession of this property and took away the few men, who had insisted on remaining at it, and forced them to march hundreds of miles across country to Pretoria.

Most of the rest of the book is taken up with the author's life in the far east, including China, Japan, Malay States, Siam, Perak, Borneo and Korea. Afterwards he made several visits to the Spassky and Atbasar Copper Mines, as well as to many other places in Siberia, while the final short chapter is devoted to brief notices of two visits to Porcupine in Northern Ontario, one after the great fire in 1911 and the other in 1914, just on the outbreak of the War. On the latter occasion he was accompanied by Mr. Edward Hooper, and shared the hospitality of our fellow Canadian Dr. J. Mackintosh Bell.

The book is dedicated to the memory of his wife, whom he found very ill when he returned from Canada and who shortly afterwards died. His tribute to the memory of his wife, who was his heroic companion throughout his travels, is very touching and pathetic. She had helped him to make a home wherever he went, both for his own family, and for the mine staff working under him.

The book is not only the account of the life of a mining engineer, it is the story of the doings of a forceful Englishman who has roamed over the world, and has helped to develop its resources, partly for his own benefit, but mostly for the benefit of humanity at large, for whoever induces the earth to increase its yield, whether of grain for food, or of metal for implements, etc., is advancing the cause of civilization and progress. He pushed civilization a little further forward by his ability and capacity for work and by his willingness to undergo hardship and privation for the sake of successful accomplishment. As long as the British race is dominated by the spirit that prevades this book, no matter how gloomy the immediate outlook, there need be no fear of its ultimate success.

The book should be read by all mining engineers and should be used as a text book in the mining courses of schools and colleges, for it indicates to all who contemplate entering the profession the trouble, labour, vicissitudes and pleasures that pave the way to a successful career.

As in the case of the former volume any profits that may be derived from the sale of the book have been generously devoted by the author to St. Dunstan's Hostel for the Blind.

Toronto, April 7th, 1920.

—J.B.T.

### NEW MINING COMPANIES.

Recent mining company incorporations announced in the Ontario Gazette are: King Kirkland Gold Mines, Limited, with a capital stock of \$2,500,000; the Gowganda Engineering and Construction Company Limited, head office Toronto, authorized capital \$40,000. Silbar Cobalt Mines, Limited, head office Toronto, authorized capital \$1,500,000. Federal Fields par, Limited, chief place of business, Ottawa, capital stock, \$40,000. Kitchener Kirkland Mines, Limited, head office, Kitchener, Ont., authorized capital \$3,000,000, provisional directors, H. O. Feick, C. A. Imerson, R. O. Kleinschmidt, C. W. Feick and G. E. Chapman.

# The Department of Mines of Canada, its Organization and its Work.

The Department of Mines of Canada, as at present constituted was created by an Act of the Parliament of Canada assented to on the twenty-seventh of April, 1907. Although the Department has been in existence over twelve years, the plan of organization and the functions of the two branches and other subdivisions are matters not clearly understood, even by many in Canada who are closely associated with the mining industries and with the work of the departmental staff. The present article is intended to place before the readers of this journal a concise and accurate statement of the present organization and functions of the department as defined by the statute under which it was created. A brief historical sketch of the more important events which led to the organization of the department is included.

The Geological Survey of Canada, the forerunner of the present Department of Mines, first constituted in 1842, was organized only after some ten years' active propaganda on the part of interested persons. During its early years, the work of the survey was confined largely to general scientific geologic work, much of which had, however, an economic bearing. The investigations embraced only parts of the provinces of Ontario and Quebec, which then constituted Upper and Lower Canada. After confederation (1867) its work was extended to include the Maritime Provinces and, later, the whole of western Canada, and this with only a very slight increase of staff at that time.

During the next interval of a little more than two decades, general areal explorations were carried on in various parts of Canada; a few men inadequately equipped were required to explore the vast domain of half the continent.

In the early eighties of the last century, persons who were immediately concerned in the development of the mineral resources of Canada began to implore the government of the day to give more attention than had been given in the past to the collection of statistical and other information relating to these resources and to the mining industries of the country. The matter also seems to have been a subject of discussion among the interested members of the British Association for the Advancement of Science, which met in Montreal in 1884, for we find that members of this association, at this time, strongly urged that prompt steps be taken to supply this want. Two years later, in 1886, a strong and influential deputation of mining men and others interested in mining, representing all parts of Canada, waited on the Minister of the Interior, with a request that a "Bureau of Mining and Mineralogy" be established. Their memorial reads as follows:

Whereas, it is believed that the information and statistics regarding mining and mineral developments in Canada furnished by the Dominion Government are not in keeping with the desire of those interested in such developments, and are neither sufficient nor accessible enough to supply the public with full, authentic and prompt information on these subjects; we do, therefore, wish to respectfully bring to the attention of the government the following desires of a section of our community:

1. To have full and reliable information of the mining and mineral developments, and statistics connected therewith, for the whole Dominion, published each year, as soon after the end of the year as possible.

2. To have a medium through which information relating to our miners in all parts of Canada can be given to the public—such medium to be a monthly publication.

This would have a tendency to bring our mining industries constantly before the public and to educate them to take an interest in sound and legitimate mining enterprises, besides giving to the world at large constant information about mineral development in Canada compiled from records and reports of a mining bureau under government control which would be authentic and reliable.

This memorial contained five numbered suggestions, the first and most important of which reads as follows:

That a mining and mineralogical branch of the Geological Survey be established which will publish its reports separately and annually, such a branch to be presided over by an independent officer.

These recommendations seem to have been accepted and acted upon, for in the following year, 1887, was published a report entitled "Statistical Report on the Production, Value, Exports, and Imports of Minerals in Canada, during the year 1886 and previous years," the first report of its kind. Subsequently, a special Mines Section of the Geological Survey in charge of Mr. Elfric Dient Ingall, who is still a member of the Geological Survey, was organized to collect and publish information of this character.

Statistics and the various methods of compilation seem always to be a bone of contention and Canadian mining statistics have been no exception. Again, the rapid expansion of the country create new demands. In a new country, such as Canada, with her vast extent of territory, largely unexplored, where new industries are constantly being organized to exploit her natural resources, the demands upon the government for information and assistance in the establishment of these industries are both insistent and persistent. There are many enterprises where technical knowledge and skill are required, more especially in the initial stages, and there are many occasions where a paternal government can, in various ways, assist its constituents with technical information. Even after the organization of the Mines Section of the Geological Survey, these matters of statistical information and of more direct aid to mining industries of the country became matters of frequent discussion among mining and others associated with the industry.

These discussions seem to have culminated in the passing of the following resolution at the Montreal meeting of the newly organized Canadian Mining Institute in 1900.

Resolved that the Canadian Mining Institute in annual session assembled desires to direct the attention of the federal government to the magnitude and importance of our mining industry which during recent years has developed so rapidly and respectfully urges an increase of government aid wherever possible and the establishment of a strong and practical Department of Mines or of a department which shall be devoted to the interests of the mining and metallurgical industries and which shall include the Geological Survey and all other necessary branches.

This resolution when presented to the government, was also accompanied by a statement and recommendations with reference to the establishment of the proposed Bureau or Department of Mines, as follows:

It requires an independent head, which, while responsible to a minister, should be practically free from political control, and administration entirely on a non-partisan basis.

Should be divided in three main divisions, viz.,

- (1) A Geological Survey,
- (2) A Mining and Technical Branch,
- (3) A Statistical Branch.

1. The present survey to be reorganized and the different branches separated so as to avoid confusion; e. g., a Topographical branch, which would greatly expedite the work of another branch, viz., the Geological branch proper. There also should be divisions to include petrography, chemistry, palaeontology, etc.

2. The mining and technical branch should deal with inspections and reports concerning the economic possibilities of districts already discovered, and of regions yet to be explored. Monographs on various localities, industries, processes and methods should be issued frequently. This branch also should deal with questions of production, transportation and cost. If possible, the head of this division should be an experienced and practical (if not practising) mining engineer.

The difficulty of obtaining such a man leads to the suggestion that the head officer of this bureau should have a list of competent engineers who are authorities in the different fields or branches of the profession, who should be called upon, when required, to report upon special subjects or special operations, at the discretion of the head officer, or when demanded by the public interests.

3. Statistical work is rendered necessary by the different ways and units employed at present by the different provinces of the dominion, and by the fact that existing statistics from any department of the Government are not inclusive of all the information that is available on any one material or subject.

It happened that some years previously, as a result largely of informal discussions and interviews, this question of the establishment of a Department of Mines had already been favorably considered by a responsible minister of the Crown. We find that a few months after the resolution above quoted was presented to the cabinet an Order in Council was passed making a new appointment to the position of Superintendent of Mines, an office in the Department of the Interior which had been created nearly thirty years previously. The first duty assigned to this officer was the establishment of the Dominion Government Assay Office at Vancouver. In the following six years a number of technical reports on mining subjects were prepared and published under the direction of this officer. The most important work undertaken during this period was probably the investigation of the processes of Electric Smelting of Iron Ores in Europe, followed by the experimental work under government auspices in electric smelting of iron ores at Saulte Ste. Marie. Another important innovation was the introduction of the Swedish methods of magnetic surveying for exploring Canadian magnetite deposits, and the publication of a monograph on "Magnetometric Methods of Surveying."

During this period, we find an anomalous state of affairs in the organization of the governmental service for investigating mines and mining. The original Department of the Geological Survey, one branch of which was engaged in special investigation of mining matters, were presided over by the Minister of Interior. Under this same minister, in the Department of the Interior, was a Technical Branch, controlled by a Superintendent of Mines and a third branch called the Mines Branch,\* also existed, in which was vested the control of mineral lands belonging to the Crown.

It was not until the end of the year 1906 that the

\* At the present, the branch of the Department of the Interior is called "The Mining Lands and Yukon Branch," the chief administrating officer is Mr. H. H. Rowatt.

government decided to further accede to the wishes of those interested in the mining industry, as made known to it both by the resolution of the Canadian Mining Institute, and independently, by individuals and corporations. On the twenty-seventh of April, 1907, the statute now in force, entitled "An Act to Create a Department of Mines" (6-7 Edward VII., Chap. 29), became law. In general principles this Act embodies all the recommendations contained in the resolution of the Canadian Mining Institute, presented to the government six years before.

The principal clauses of this statute are as follows, the numbers being those of the original Act:<sup>1</sup>

1-2. Include merely the short title of the Act and certain definitions.

3. Establishes "The Department of Mines under the control and management of a Minister of Mines."

4. "The department shall administer all laws enacted by the Parliament of Canada relating to mines and mining,<sup>2</sup> and shall also have the management and direction of all subjects assigned to it by the Governor in Council."

5. "The department shall consist of two branches, one of which shall be called the Mines Branch, and the other of which shall be called the Geological Survey."

6. "The functions of the Mines Branch shall be: (a) to collect and publish full statistics of the mineral production and of the mining and metallurgical industries of Canada, and such data regarding the economic minerals of Canada as relate to the process and activities connected with their utilization, and to collect and to preserve all available records of mines and mining works in Canada; (b) to make detailed investigations mining camps and areas containing economic minerals or deposits of other economic substances, for the purpose of determining the mode of occurrence, and the extent and character of the ore-bodies and deposits of the economic minerals or other economic substances; (c) to prepare and publish such maps, plans, sections, diagrams, drawings and illustrations as are necessary to elucidate the reports issued by the Mines Branch; (d) to make such chemical, mechanical and metallurgical investigations as are found expedient to aid the mining and metallurgical industry of Canada; (e) to collect and prepare for exhibition in the Museum specimens of the different ores and associated rocks and minerals of Canada and such other materials as are necessary to afford an accurate exhibit of the mining and metallurgical resources and industries of Canada."

7. "The functions of the Geological Survey shall be: (a) to make full and scientific examination and survey of the geological structure and mineralogy of Canada; to collect, classify, and arrange for exhibition in the Victoria Memorial Museum such specimens as are necessary to afford a complete and exact knowledge of the geology, mineralogy, palaeontology, ethnology, and fauna and flora of Canada; and to make such chemical and other researches as will best

<sup>1</sup> It has not been thought necessary to publish the statute in detail; only those clauses which explicitly define the functions of the various branches of the service and the scope of their investigations are here reproduced.

<sup>2</sup> This clause has never been put into force.

tend to ensure the carrying into effect the objects and purposes of this act: (b) to study and report upon the facts relating to water supply for irrigation<sup>1</sup> and for domestic purposes, and to collect and preserve all available records of artesian and other wells; (c) to map the forest areas of Canada, and to make and report upon investigations useful to the preservation of the forest resources of Canada,<sup>2</sup> (d) to prepare and publish such maps, plans, sections, diagrams and drawings as are necessary to illustrate and elucidate the reports of surveys and investigations; (e) to carry on ethnological and palaeontological investigations."

8. "The department shall maintain a Museum of Geology and Natural History for the purpose of affording a complete and exact knowledge of the geology, mineralogy and mining resources of Canada."

9. "The Governor in Council may appoint a Deputy Minister, a Director of the Mines Branch, a Director of the Geological Survey, and such other officers and clerks as are required for the proper conduct of the business of the department, who shall be appointed and classified under schedule A of 'The Civil Service Act,' and in accordance with and under the terms of section 6 of the said Act."<sup>3</sup>

10-19. Deal with internal affairs of the department, appointments, restrictions, equipment, and annual summary reports.

20. "The minister may cause distribution to be made of duplicate specimens to scientific, literary and educational institutions in Canada and other countries, and also authorize the distribution or sale of the publications, maps, and other documents issued by the department."

21. "The minister may, for the purpose of obtaining a basis for the representation of the mineral, mining and forestry resources and of the geological features of any part of Canada, cause such measurements, observations, investigations and physiographic, exploratory, reconnaissance surveys to be made as are necessary for or in connection with the preparation of mining, geological and forestry maps, sketches, plans, sections or diagrams."

22. "Chapter 65 of the Revised Statutes, 1906, is repealed."

During previous years, several statutes and amendments thereto had been passed, establishing the Department of the Geological Survey and defining its functions. These various statutes were subsequently consolidated and revised, appearing as Chapter 65 of the Revised Statutes of Canada. Section 22 of The Geology and Mines Act, 1907, specially repeals the statutes, and section 5 constitutes the Geological Survey Branch of the Department of Mines. The purpose of this change appears to have been to avoid having two deputy ministers administering small depart-

ments whose work was closely related, and to avoid a continual overlapping of work, which would lead not only to confusion but to waste of time and effort and loss of efficiency.

A comparison of sections 6 and 7 of the act, quoted, will show that in general the Mines Branch of the Department of Mines is concerned with technical problems and with the detailed investigation of mining properties, while the more purely scientific and geologic investigations and the exploratory work are assigned to the Geological Survey Branch.

The department is administered by a deputy minister, acting under the Minister of Mines. Directly under the deputy is a staff of 17 which includes the editor's branch and the accountant's branch neither of which is constituted as a special branch of the Department of Mines by the statute. The technical work of the department is carried on, under the administrative head, by the two principle branches of the department, the Mines Branch and the Geological Survey Branch. The work of each of these branches is controlled by principal technical officers, who are termed respectively the Director of the Mines Branch, and the Director of the Geological Survey Branch.

#### MINES BRANCH

The Mines Branch, as at present constituted, is divided into the outside and the inside service, both services being administered by the Director of the Mines Branch. The Dominion Government Assay office at Vancouver is attached to the outside service of this Branch: the inside service, with headquarters at Ottawa, is organized for administrative purposes into the following divisions, each with a chief technical officer and such additional staff as has been provided:<sup>1</sup>

Administration and Library Staff.

Metal Mines Division.

Non Metal Mines Division

Fuel and Fuel-Testing Division.

Ore Dressing and Metallurgical Division.

Ceramic Division.

Roads Material Division.

Chemical Division.

Mineral Resources and Statistics Division.

The civil estimates for the fiscal year 1919-20 provide for a staff of 63 exclusive of the Assay Office at Vancouver.

**Outside Service.** The Dominion Service Assay Office at Vancouver was established at that point to purchase and market gold from Yukon, British Columbia, and adjacent territories. The officials employed in this office number ten, in addition to the Director.

The various Testing laboratories at Ottawa require the services of a number of employees, which include technicians, skilled mechanics, and labor. These employees are also classed in the outside service. Their numbers vary from time to time. The Summary Report of the Mines Branch for the year 1916 gives 23 names on this staff.

**Inside Service.** The inside service of the Mines Branch has its headquarters in Ottawa and is compris-

<sup>1</sup> These duties are performed in part by the Dominion Water Power Branch Department of the Interior, of which Mr. J. B. Challies is the present Superintendent.

<sup>2</sup> These duties are not performed by the Geological Survey, but by the Forestry Branch Department of the Interior, of which branch Mr. R. H. Campbell is Director.

<sup>3</sup> The present Deputy Minister is R. G. McConnell, B. A. The present Director of Mines Branch is Dr. Eugene Haanel.

<sup>1</sup> Compare Summary Report of the Mines Branch, 1916, p.1.

ed of those employees who are on the permanent staff. The estimates for the last fiscal year, as already noted, provide for a staff of 63 persons. Field officers of the Mines Branch also very frequently engage additional temporary assistance, but no statement of the number of persons employed on this service from year to year has been published in the annual reports.

#### Geological Survey Branch

The Geological Survey Branch of the Department of Mines, as constituted in 1913, was organized as follows under the Director of the Branch.<sup>1</sup> No essential changes are noted in this organization in the Summary Reports of recent years.

Administrative Division.  
Geological Division.  
Topographical Division.  
Biological Division.  
Anthropological Division.  
Draughting and Illustrating Division.  
Photographic Division.  
Library.

This branch also undertakes the work of collecting and caring for material for the Victoria Memorial Museum. The Civil Estimates for the last fiscal year, 1919-20, provide for a permanent staff of 141 persons. During the field season it is customary to engage the services of a number of independent scientists, usually members of the several University Staffs. The field parties of the Geological Survey are also provided with such labor as may be required. The number of persons employed in their several capacities on outside temporary service of this character varies from year to year. The annual summary reports do not contain any statement showing the size of the extra staff employed upon field service by the Branch.

#### Explosive Division

Provision was made in 1914, by Act of Parliament, for the regulation of the Manufacture, Testing, Storage, and Importation of Explosives. (Chapter 31, 4-5 George V). The Explosives Act was put into effect by proclamation on Mar. 1st, 1920 as provided in clause 27 of the Act. Originally it was planned to have this Act administered under an Explosives Division of the Mines Branch. This plan has not been carried out. An Explosives Division has been organized in association with the administrative staff of the office of the Deputy Minister. The staff of this Division, as at present constituted, comprises four technical officials and two clerks. It is stated, non-officially, that it is proposed to constitute this Division as a separate Branch of the Department of Mines, but no provision for the creation of such a branch appears in the Mines Act or in the Explosives Act.

#### General Considerations

The Civil Estimates for the last fiscal year (1919-1920) provide for a permanent staff of 222 persons in the Department of Mines at Ottawa exclusive of the newly organized Explosives Division. The total salary vote for this service was \$422,747. This amount does not include the salaries of persons employed on temporary service or those in the so-called outside service. The remuneration for these services is provided in other votes.

The average salary provided is at the rate of \$1,904 per annum. The Mines Branch vote was \$123,362, providing an average salary of \$1,955 for the 63 Employees of that Branch. The Geological Survey vote was \$265,722, providing an average salary of \$1,884 for the 141 employees of this branch, the lower average being due to the larger proportion of clerical service provided.

The technical employees of this Department are grouped chiefly in the two upper divisions of the classification in effect at the time these estimates were provided. The Mines Branch estimates provide for 51 employees in the two upper divisions, with an average salary schedule of \$2,158 and a total vote of \$110,037. The Geological Survey vote provided for 109 employees in the two upper divisions, with an average salary schedule to be \$2,156 and a total vote of \$235,060. It is therefore to be inferred from these averages that the technical staffs in both branches of the service are paid on practically equivalent scales.

The maximum salary paid in the Department, exclusive of that paid the three chief administrative officers is \$3,700. There are four officials in the Geological Survey on this rating. The maximum in the Mines Branch is \$3,500. The salary of the Deputy Minister of the Department is \$6,000 per annum and is not included in the above averages. The salary of the Directors of the two Branches (Mines \$4,000, Geological Survey, \$3,800) are included in the averages.

Finally it is to be noted that in the case of all appointments made since 1896, which includes nearly all the staff with the exception of a few of the higher paid officials in the Geological Survey, five percent of the nominal salaries as given here is not paid to the employees, this amount being retained for a fund not under the control or available to the employees, and known as the Retirement Fund. The actual salaries paid, and available to the employees to meet the costs of living are only 95 per cent of the amount given in the greater number of cases.

### GEOLOGISTS LEAVE THE CIVIL SERVICE

#### Whitehall Petroleum Co. and Universities Take Three Men

Dr. E. L. Bruce, geologist in charge of work in northern Manitoba, has tendered his resignation to the director of the Geological Survey in order to take a position for the summer with Whitehall Petroleum Co., before accepting the professorship in mineralogy at Queen's University, Kingston. The tremendous development taking place in the recently discovered mineral district north of The Pas has been greatly assisted by Dr. Bruce's timely reports and maps.

Dr. F. J. Alcock, who for a number of years has likewise been working in northern Manitoba and Saskatchewan, is also considering an offer of employment with Whitehall Petroleum Co.

It is announced that Dr. S. J. Schofield, who has had 13 years experience in British Columbia, is leaving in the fall to accept a professorship in geology at the University of British Columbia.

# Report on the Metalliferous Mines of Nova Scotia

(Prepared by G. F. Murphy, and abstracted from the  
Mines Report for 1919.)

## Serious Condition of the Gold Mining Industry.

The tremendous rise in the cost-level of labour and materials in the last few years has effected the gold-mining industry by causing a rising in the cost of production which, due to our monetary system, can not be balanced by a proportionate rise in the price of the product.

In Nova Scotia, where gold mining has been struggling for a number of years, this added burden has made profitable mining almost impossible. There were only three companies that carried on any regular mining operations throughout the past year, and in the case of at least two of these, I have reasons to believe that operating expenses were at least five times the value of the gold recovered. Therefore, their hope lies in the value of the product being increased by some means at present not apparent, or something done to reduce the cost of production. This seems more apparent when we remember that practically all the larger undertakings in past years, when operating costs were only half what they are today, failed badly. Many of these undertakings were no doubt, mismanaged and exploited without any sincere effort to make the venture pay, but all mismanagement has been discontinued in recent years by the increase in the cost of operation.

I have examined a statement of expenses of one company operating last year. These figures show that it has cost them—\$13.00 per ton for rock, broken or \$207.00 per ton of ore milled—50 per cent. of total expenditure went in wages and 16 per cent. for fuel. The value of the ore was \$40.00 per ton. These figures may not be altogether reliable as their tonnage is usually estimated, nor do I think this is a fair average of the cost of mining in Nova Scotia, but the figures can be used to compare with the cost of mining in Northern Ontario, where the total cost per ton of ore milled is as low as \$5.00

The great increase in cost in Nova Scotia per ton milled over per ton of rock broken, as noted in the above figures, is due to our narrow veins. In the mine referred to above, it is estimated that it is necessary to break 16 tons of rock to secure one ton of ore. This ratio would be a fair average for the entire province and is a difficulty with our gold veins that is seldom realized.

The question that naturally arises is what can be done to revive this industry, once an important source of revenue to the province.

The diamond drill has been used to great advantage in the development of the gold mines of Northern Ontario and other mining camps, and might be used to stimulate mining operation in some of our gold mining districts. Our irregular ore bodies with their many rolls and enrichment zones, are not as well suited to drilling operations as the large, regular ore bodies of Ontario; but there are many cases where drilling could be used to advantage in proving the existence of veins, especially those where the value is known and the lead has been lost by faulting, or in districts like Killag, where prospecting, on account of the heavy drift, is very expensive and uncertain.

Many reasons have been given for the present condition of our gold mining industry and a consider-

ation of them, no doubt, will help to guide future efforts, but I think that the important thing at present is to find a means of reviving the industry. I believe that we must realize that our gold mines must be worked on a small scale. That is, that only the enriched portions will pay to mine, more especially is this true with the increased cost of mining. It naturally follows therefore, that the building of elaborate plants must be discouraged, as our mines can not pay a large overhead-charge.

A difficulty at present is a scarcity of labour. Mines that are prepared to pay the prevailing wage cannot obtain miners, as only those remain in the districts who, due to family ties, could not move out. This, of course, will right itself eventually.

The fuel question is serious. Wood, the fuel that was chiefly used, has become very scarce in close proximity to the mines, and with the high cost of labour it is no longer a cheap fuel. The result is, not one of the mines operating at present is using it, but for the most part, have substituted oil engines. Coal, on account of transportation difficulties, is usually out of the question.

The only solution for this problem is to supply the mines with hydro-electric power. If, through the efforts of the Government, cheap power could be supplied, one of the chief difficulties in the way of successful gold mining would be removed.

I would therefore strongly recommend that the Government give the gold mining districts special consideration in their water-power project. Also give every aid to prospecting. Human nature will provide the incentive, and the search for gold will go on. Let the industry stand or fall on its own merits, its history in the past has been too tragic to be repeated.

The following is a list of the companies or individuals who have been mining during the last year:

Sherbrooke Mines & Power Co., Goldenville, Guys-boro Co.

Montagu Goldfields, Ltd., Montagu, Halifax, Co.

H. F. Ross, Caribou, Halifax Co.

Caribou Gold Mining Co., Caribou, Halifax Co.

Alex. Greenough, Oldham, Halifax Co.

John Greenough, Oldham, Halifax Co.

Harry Ferguson, Oldham, Halifax Co.

John Hyland, Fairview, Halifax Co.

W. P. C. Inglis et al, Mt. Uniacke, Hants Co.

M. J. O'Brien, Renfrew, Hants Co.

Great Canadian Gold, Consolidated, Malega, Queens Co.

D. M. Thompson, Mill Village, Queens Co.

Scheelite Mines, Ltd., Scheelite, Halifax Co.

Malagash Co., Malagash, Cumberland Co.

Consolidated Manganese Co., New Ross, Queens Co.

## The Malagash Salt Deposit, Nova Scotia.

The Annual Report of the Mines Department of Nova Scotia has the following reference to the Malagash salt deposit, to which previous references have been made in the "Journal".

As development proceeds in the Malagash salt deposit, more definite information is obtained. Last year's report mentioned that bore holes had tended to prove the existence of 600 square feet of salt-bearing

strata; at the close of 1919, drill holes had revealed the presence of brine underlying an area of about 5,000 square feet.

Messrs. Chambers and McKay continued the development during the whole of 1919, have sunk the shaft referred to in last year's report 33 feet farther or to a total depth of 118 feet, and had at close of year driven a tunnel north from the bottom of the shaft 20 feet into the salt strata. The salt extracted from the workings has been of a satisfactory character.

Evidence obtained from the bore holes and shaft, seem to indicate that the overlying 85 feet which is horizontally stratified, is made up of material derived from rock associated with salt that went into solution, and that below that plane the strata assumes the dip and strike found in the surrounding rocks that have been examined.

The structure of the main body of rock in the area is that of an overturned anticline, and the deposit lies in the northern limb with a south dip. Assuming that salt underlies wherever brine was encountered in the bore holes, there is space for a thickness of about 350 feet of salt strata with a dip of 35 degrees.

As the salt was doubtless formed in a basin-shaped body of water, it is reasonable to expect that a thickness of 350 feet must have had considerable lateral extent and that therefore, unless a great deal has been eroded, the salt must extend to considerable depth. The direction of the bedded strata is that of the belt of lower carboniferous rock that extends across the country from Malagash Point away towards Cumberland Basin. It is also reasonable to expect a continuation of the salt bearing strata in that direction. The surface features around the salt deposit are also suggestive of lowering, owing to underground material going into solution.

It seems, therefore, that the conclusion that there are millions of tons of salt present in the deposit, is quite a justifiable one. The presence of potash salts in the deposit is also a matter of great importance.

## NOVA SCOTIA NOTES

### Labor Matters at the Coal Mines

The Board of Conciliation which considered the wage questions at issue between the Nova Scotia Steel Company and its mine employees has recommended a higher scale of wages. In recommending the increase the Board explains that its suggestions of increase are not as large as it would have preferred to make them, but in view of the difficulties under which the Scotia mines are operated, in comparison with competing companies, the Board believes that the granting of rates as high as are paid in competing mines would necessitate the entire or partial closing down of the Sydney Mines collieries.

The Conciliation Board makes a suggestion of similar bearing to that made by the Fuel Controller in his final report, namely, that the Government Railway should contract to take a certain quantity of coal over a period of four or five years ahead. This has particular reference to the Jubilee mine, the coal from which is unsuited for some purposes, but has been largely used as locomotive steam coal on the Government Railway for some years past. If the company were able to count upon a definite outlet for Jubilee coal, the systematic arrangements for working the mine and assuring continuous employment could be made.

The Conciliation Board which sat at Inverness Colliery has also made its report, and recommends certain wage increases.

The United Mine Workers have been in convention at Truro, N.S., during the week beginning April 5th.

The Wage Committee recommends that a demand be made for a 27 per cent increase in wages to date from the first of May, 1920, which shall be cumulative upon and in addition to the general increase in wages granted at the first of the year. This increase was made the subject of a yearly agreement, which provided for revision at the end of each four months should the cost of living and other economic conditions have altered the relative status of wages and living costs.

The new increase is asked for as a result of the recent 27 per cent increase obtained by the United Mine Workers in the bituminous coalfields in the United States. As has been previously pointed out, it was agreed between the coal operators and the United Mine Workers at the beginning of 1918 that wage conditions in the United States should specifically not be taken as a basis of wage demands in Nova Scotia. In view of this agreement, and the general increase obtained January 1st, the recommendation of the Wage Committee that a further 27 per cent be asked was unexpected and will doubtless be vigorously combatted by the operators.

The Department of Labor announces that future Boards of Conciliation will be so arranged as to permit of simultaneous dealing with similar wage questions in one district. This is presumably to avoid such long-drawn out negotiations as have taken place in Nova Scotia since the first of the year, where it has not been possible to adjust the wage conditions in one district until another district had been dealt with.

The Convention was marked by reaction from the Winnipeg strike and the O. B. U. movement in the western collieries in District 18. While the Convention as a whole was distinctly opposed to the O. B. U. idea, there was evidently a minority in favor of it. Much discussion was caused by the reading of a confidential letter from the Minister of Labor pointing out the dangers and the unwisdom of the methods of the O. B. U. J. C. Watters said that to go over to the O. B. U. would bring chaos and disaster to Nova Scotia, and he advised adherence to the United Mine Workers, a sentiment that met with almost unanimous approval. The criticism of those who favored the O. B. U. side of the western controversy was directed against the limitation of individual action which had been enforced upon O. B. U. members by the "closed-shop" and "check-off" system compulsory in the mines of District 18.

### The Late Edward Hall Carter.

The death took place in Toronto on April 18th at his residence in Toronto of Edward Hall Carter who for some years had been prominent in mining circles both in Ontario and British Columbia, where he was manager for several years of a gold mine in Yellowstone, and afterwards Inspector of Mines for Ontario from 1900 to 1906. The late Mr. Carter was also one of the geological party which drew the dividing line running from Lake Superior to the Hudson Bay between the Provinces of Ontario and Quebec. He won the gold medal at Bishop Ridley College and graduated from the University of Toronto as a Bachelor of Applied Science. He was a member of the National and Royal Canadian Clubs, and is survived by his wife, and four sons.

## Northern Ontario Letter

### THE SILVER MINES

Emphasis is placed on the importance of local silver refineries by the absence during the last week of March of any ore shipments from Cobalt. It demonstrates a conclusive way the fact that an increasing percentage of the product of the mines of Cobalt is being refined at home. The great volume of white metal now goes out in silver bars in express cars, rather than the old expensive method of shipping the ore in its crude state with its thousands of tons of accompanying rock.

Silver quotations appear to have again become quite steady at a point not far below a parity with gold at 16 to 1. At such a price the mines are pushing operations to the maximum of capacity, and in the case of the leading producers the treasuries are literally building up cash. The companies for the greater part welcome this opportunity to strengthen their treasures, in that some of the mines are growing old, and in order to perpetuate the prosperity accruing to the shareholders, new productive mines must be developed or purchased. To do this successfully, a substantial treasury is invariably necessary.

According to the belated annual statement of the Beaver Consolidated Gold Mines, the Company treated a total of 26,974 tons of ore during 1919 and recovered 301,781 fine ounces of silver. The total cost of mining, milling, administration, taxes, depreciation development, exploration and repairs amounted to only \$7.41 for each ton of ore treated. Despite the loss of time caused by the 7-week labor strike, as well as the influenza epidemic, the net profit on the year's operations amounted to \$158,215, as compared with \$168,642 in the previous year. Broken ore reserves total 25,696 tons in which the silver content is estimated at ten ounces per ton. In addition to this is \$73,892 in ore ready for shipment, plus a large tonnage of low grade material not included in the estimates. On the whole, the physical condition of the Beaver appears to have been strengthened during the year. As regards the financial statement, a surprise of \$1,049,080 is shown. In a sense, however, this is yet largely on paper. For instance, \$362,261 is shown as shares in the Kirkland Lake Gold Mines, while \$404,726 appears in bills receivable, this being money advanced to develop the Kirkland Lake Mine. The latter property is referred to again in this summary under the "Gold Mines" heading.

The Kerr Lake Mines have issued an interim report which promises to meet with general satisfaction, not only for the reason that it shows candour to the shareholders, but has several favorable features, not the least of which is the fact that a majority interest has been acquired in a Utah silver mine, and also a gold dredging property in New Zealand. The official statement follows:—

"Recent important acquisitions have been made for your company, and in order that you may be fully informed, the following interim statement is submitted covering the six month period ended February 29, 1919.

"As you have been previously advised, no definite life can be estimated for your property at Cobalt, and in view of this, it has been deemed advisable to prosecute a vigorous search for new mining ventures in which to employ the company's large cash resources.

"After due consideration and careful examination by competent mining engineers, a majority ownership has recently been acquired in a silver mine in Utah, and also in a gold dredging property in New Zealand. Further than this, your properties in Cobalt have been operated with little interruption and a satisfactory output has resulted therefrom.

"The Utah property referred to has recently been equipped and entered upon the productive stage in December, 1919 the mill having a capacity of 150 tons a day. The ore reserves of this mine stand at the present time at 87,000 tons, averaging 18 ounces of silver and 80 cents in gold. The productive limestone extends over a mile across the property, and approximately half this length on the surface shows an outcrop similar to that above the ore thus far developed. Only a small percentage of the total mineralized area has thus far been prospected, and the best geological opinion indicates the possibility that very many times the above tonnage will be developed.

"Taking silver at \$1.10 per ounce, which is a price substantially lower than now ruling, it is estimated that a net profit of approximately \$9.50 per ton will result from this ore. Thus the share of the Kerr Lake Mines in the annual earnings of the Utah property alone, after the repayment out of earnings of certain advances made on the purchase price of the property, is estimated at \$265,000, equivalent to about 45c. a share on its issued capital. Very favorable reports were made by the engineers who investigated the New Zealand property. The ground has been exhaustively tested and it is estimated that the area thus far drilled will net a profit of \$3,436,000 after deducting cost of property and equipment. It is estimated that the annual income accruing to Kerr Lake through the two-thirds interests in this property, will amount to approximately \$287,000 or approximately 50 cents a share. The equipment of this property with a dredge is now in process and should be completed by spring of next year."

In regard to the Kerr Lake Mine, itself, the report says:—

"The developed ore reserves as of August 31st, 1919, were reported at 500,000 ounces. Further underground work during the period produced additional ores with the result that the actual production for the six months ended February 29th, was 610,231 ounces. No accurate estimate of present reserves can be made, but it is expected that your Cobalt mine will continue to be productive for a considerable time. The production for the first two months of 1920 amounted to 213,234 ounces.

"Besides the money already invested in the new properties above referred to, your company had on hand as of February 29th, 1920, in cash and Government securities alone, \$2,415,027, or slightly in excess of \$4 per share on the outstanding capitalization."

During the month of February the Kerr Lake Mine produced between 99,00 and 100,000 ounces of silver valued at \$135,000, made up of silver at \$1.25 an ounce plus the premium on New York exchange.

During 1919 the Trethewey mine produced \$169,294, as compared with \$254,038 in the previous year. The net for the period amounted to \$31,814. In January, 1920, the company sold its Cobalt mine for \$100,000, as reported at that time in the "Journal." The annual statement declares that the \$100,000 thus received will finance the development of the company's recently purchased Castle property in Gowganda, if needed, but that at present the property has already been brought to almost a self-supporting basis. The report deals optimistically with the outlook at Gowganda.

The McKinley-Darragh financial statement for the first quarter of 1919 is very favorable, showing a total of \$474,864.39, made up as follows:—

Cash in Bank . . . . .	\$203,594
Canadian Victory Loan Bonds . . . .	100,000
Ore in Transit and at Smelter . . . .	127,700
Ore at Mine Ready for Shipment . . .	43,570
	<hr/>
	\$474,864

The McKinley plans to also start up its big oil flotation plant about May 1st.

An injunction has been issued restraining the La Rose from purchasing the minority interest of the University property. It holds good for three weeks.

It is reported that the Peterson Lake has made arrangements to have the Dominion Reduction Company treat its tailings pile, the arrangement having the appearance of being likely to result in a moderate profit to the Peterson Lake.

Water trouble caused at the Cross Lake property by rising water in Cross Lake are being overcome, and work will soon attain normal proportions.

At Gowganda, the Reeves-Dobie company is making arrangements to install additional grinding equipment in its mill, with which it is hoped to place the property on a profitable producing basis.

During the month of March, the Nipissing Mining Company produced \$384,723, or an average of \$12,410 every twenty-four hours. This compares with \$329,401 in February and \$423,139 in January. The output for the first quarter of 1920 amounted to a total of \$1,137,263 and is at the rate of \$4,549,052 a year, thus once more setting the highest record in the history of the Nipissing Mine, which company since 1904 has produced over fifty-seven million ounces of silver bullion valued at not far under forty million dollars.

In his regular monthly report to the President and directors, Hugh Park, manager, says:—

"During the month of March the Company mined ore of an estimated value of \$384,723 and shipped bullion from Nipissing and customs ore of an estimated net value of 136,771.

"General underground development at all shafts continued to be favorable during the month. Two small veins were found at the first level of 63 shaft. They are each one inch wide and contain good values. It is probable they are extensions or branches of the previously known veins. Development of these veins at the second level will be delayed until connection between 63 shaft and 96 tunnel has been completed, in about five weeks. This future development will probably produce satisfactory results.

"The low grade mill treated 6,814 tons. The high grade plant treated 173 tons. The refinery shipped 106,624 fine ounces of bullion.

"Following is an estimate of production for the month of March:—

Low Grade Mill.. . . . .	213,789
Washing Plant .. . . . .	170,934
Total .. . . . .	\$384,723

**Silver Ore and Bullion Shipments**

Ore shipments from Cobalt during the week ended April 9th totalled well over half a million pounds. Five companies contribute to the output, sending out a total of eight cars containing approximately 575,736 pounds.

Following is a summary:—

Shippers	Cars	Pds.
Temiskaming .. . . . .	2	156,663
Comogas .. . . . .	2	148,000
Northern Customs .. . . . .	2	130,400
La Rose .. . . . .	1	65,673
Dominion Reduction .. . . . .	1	65,000
Totals .. . . . .	8	575,736

During the corresponding period, no bullion shipments were reported.

**GOLD MINES**

A slight, though gradual improvement in the economic conditions is steadily adding to the scope of mining operations in the gold-bearing districts of Northern Ontario. Questions pertaining to labor, that is to say: the temper of the workers and the question of wages, is one that may or may not enter into the calculations which are to correctly deal with this year's work. However, harmony is as much in evidence now as formerly, and the Porcupine district has not had a labor disturbance since 1912.

The Hollinger Consolidated continues to treat approximately 2,200 tons of ore daily, while the number of men engaged number 1,100. From this it will be noted that about two tons of ore is being treated for each man on the new pay-roll. This will compare with about 1½ tons per man at one time during the war.

At the Porcupine Crown, the mill is operating at nearly full capacity and mill heads are reported to be running high, the average grade of the broken ore being around \$11 to the ton.

The McIntyre-Porcupine has cut the downward continuation of its main, or No. 5 ore body, at a depth of approximately one quarter of a mile. The vein shows a width of about fourteen feet, and is comparatively high grade at the point where cut. This is confirmation of diamond-drill results formerly secured while drilling from the 1,000-ft. level. It is now proposed to carry out an aggressive development program at the present depth, as well as to direct attention toward still deeper workings.

Nothing of more than ordinary interest is reported this week on the Dome, with the exception that good progress is being made at the 1,100-ft. level in the work of exploring the Dome Extension property.

Reports that an exploration program has been outlined for the Gold Reef have served to attract interest toward that property. It is reported that a large block of stock has been underwritten at a price that promises to finance a fairly comprehensive scheme of exploration.

In the Kirkland Lake field, the report on the Kirkland Lake Gold Mines is one of the features of the week. The report shows that sufficient ore is blocked out between the 300-ft. level and the 700-ft. level to keep the mill operating at full capacity of 150 tons a day for more than two years. While the report thus refers to "ore," yet it is disappointing to note that no reference whatever is made as to either the grade of the ore tested during the past year, or to the gold content of that said to be blocked out.

Premature reports have been sent abroad that the Tough-Oakes Gold Mines had resumed early this month. The truth is that this is under consideration, and may possibly take place some time next month. Even such an early start has not been definitely decided upon.

On the Canadian-Kirkland it has been decided to discontinue the present plan of exploration underground, and, instead to carry on a diamond drilling campaign.

### ADVISORY CONFERENCE COMMITTEE ON ENGINEERING LEGISLATION IN ONTARIO.

Views of all Engineers are sought.

In common with their fellows of other provinces, the engineers of Ontario are keenly interested in obtaining suitable legislation to establish their status and to regulate their practice. To accomplish any real results, it was realized that all branches of engineering should be consulted, and that all kinds of divergent opinions must be brought together on common ground.

The Advisory Conference Committee has been formed with this end in view. The Committee consists of two representatives of each of the following organizations:—

- Canadian Mining Institute;
- Engineering Institute of Canada—Ontario Division;
- American Society of Mechanical Engineers—Ontario Section;
- American Institute of Electrical Engineers—Toronto Section;
- Canadian Institute of Chemistry;
- Association of Ontario Land Surveyors.
- Ontario Association of Architects.

The above organizations have been chosen as most representative of their respective branches of engineering in Ontario.

Two lengthy sessions have already been held, and much progress has been made towards the establishment of broad general principles upon which legislation should be based. Now that the work is well organized, it is the intention of the Committee to pursue the matter vigorously until a conclusion has been reached. The task is not an easy one, and if some considerable span of time should be found necessary to its fulfillment, it will be because the Committee wish to be thorough, and to bring in a report, which can be freely endorsed by both parties. The matter is being considered by the committee with a view to meeting the requirements of the different branches of the profession as well as eliminating grounds for objection on the part of any branch, while retaining one general organization of the whole profession. It is perhaps not going too far to say that the result of the conferences already give reason to expect a satisfactory conclusion.

The views of all engineers of Ontario are sought, and any of them may feel free to communicate with the Committee to this end. Mr. Clifford E. Smith is chairman; Mr. Willis Chipman, Vice-Chairman, and Mr. F. R. Ewart, Secretary. Communications may be addressed to the latter at 207 Excelsior Life Building, Toronto.

### TORONTO NOTES.

(By Our Toronto Correspondent.)

A meeting of the shareholders of the University Mine was held in Toronto on April 5th, when it developed that legal proceedings on behalf of certain minority shareholders of the company had delayed the sale of the assets of the mine to the La Rose Mine. The officers are now faced with an interim injunction to restrain the sale and an adjournment for three weeks was taken.

The La Rose Mine already owns about 98 per cent of the stock of the University, but news of the proposed transfer brought the 2 per cent minority, or some of them, into action, with the result that an interim injunction was granted by Judge Wallace in Woodstock, Ont. It is understood that the minority

shareholders of University Mines number about forty, and their share of the liability of \$61,000 of University to La Rose, which it was proposed to wipe out in payment for the entire property, is about \$1,200. The claim is made that to wipe out their rights, for this small debt, would be unfair and illegal, and that the proposed price is altogether inadequate.

It seems quite likely that extension of the T. & N. O. Railway from Cochrane to Moose Factory on James Bay will be proceeded with in the not far distant future. The Ontario Legislature has gone on record as favoring the extension of the line and Premier Drury has declared his entire approval of the project. The Premier said that the Government was placing \$25,000 in the estimates for surveys and exploration of the route to the Bay. He depreciates, however, embarking on any large capital expenditure at the present time.

The attempt of J. A. Jacobs of Montreal to secure by agreement certain rights with regard to the external affairs of Black Lake Asbestos and Chrome Company, has received a set-back by the decision of Mr. Justice Kelly in Toronto, granting an injunction to McDougall and Cowans on behalf of themselves and their shareholders against the directors of Black Lake restraining them from carrying out an agreement made with Mr. Jacobs. The action arose out of an agreement whereby Mr. Jacobs was to be given certain rights with regard to the internal affairs of the company, including the right to choose his own board of directors. Conditional thereto he undertook to purchase a proportion of the company's stock. It is anticipated that the court decision will defeat Mr. Jacob's attempt to gain control of the company.

At a meeting of the shareholders of the Black Lake Asbestos & Chrome Company held in Toronto on Wednesday of this week the proposal to move the head office of the company to Montreal was dropped. A committee was appointed to represent the shareholders and bondholders and co-operate with the directors in connections with any future negotiations for possible sale of control of the company.

Hugh Sutherland, of the firm of F. C. Sutherland and Company, and party of English capitalists who recently spent a week in Porcupine, Kirkland Lake and Cobalt, returned to the city last week and expressed themselves as being impressed with the mineral possibilities of Northern Ontario.

They were particularly surprised by the magnitude of operations at Porcupine. The party included two well-known mining engineers. As a result of their visit it would not be surprising to learn of a considerable volume of new capital coming into the camp in the immediate future. The party, accompanied by Mr. Sutherland, is returning to London via C.P.R. liner S.S. Corsican, sailing from St. John, N.B. Mr. Sutherland expects to be in England about two months.

Mr. J. A. M. Alley, a director and secretary-treasurer of Wasapika Consolidated Mines Ltd., died in Toronto on April 2. Mr. Alley was 65 years of age and was born in Quebec.

He early became identified with the Traders Bank, of which he was Secretary when the amalgamation with the Royal Bank took place. He was then appointed Manager of the Toronto office of the Royal Bank, a position which he held until he retired from the bank's service.

**NEED OF "SEASONAL" COAL RATES.**

A word much used, and like other commonly employed terms sometimes abused, is the adjective "seasonal" as applied to industry. Occasionally there appears to be an undue and unreasoning subservience to the restrictive influences of the seasons.

The bans imposed by nature upon agriculture are the least escapable. Even some of these have been made more elastic by more scientific farming. It is in mining and manufacture that a good deal of needless and wasteful tyranny, consecrated by custom, persists. Some of these customs are almost as arbitrary as the fashions.

A notable instance is the marketing of coal. The individual, seeking a convenience and cheapness that are often illusory, helps impose a collective handicap of cost or danger, and helps disorganize the great industry of coal mining—with such incidental effects as complaints and strikes of the miners. The need is to encourage an ordering of coal pretty much the year round, instead of a convergence of demand on a small part of the year.

The remedial suggestion expressed recently in the Boston News Bureau by Vice-President Cousens of the Metropolitan Coal Co., in favor of "seasonal" rates on bituminous coal to encourage the movement at the proper time of year, meets with favorable consideration from railroad men and coal people in New England.

As a matter of fact it is understood that during federal operation a suggestion to this effect was made but for some reason without result. The subject, however, is one that is likely to receive increasing attention. It is not revolutionary and seems to be one means of relieving New England of the recurring winter periods of distress from acute coal shortage.

President E. J. Pearson, of the New Haven Railroad, says it is possible that the New England railroads may undertake to develop interest on the part of the consumers of coal in New England in the direction of laying in such quantities during the open season that along about the first of next December there will be an average of perhaps three months' supply at the various points of use or local distribution throughout New England.

Eugene McAuliffe, who has been largely identified with the use and production of fuel, and who did much valuable work during federal operation in the direction of fuel economy, declares that the fundamental and crying need of the bituminous business in stabilization. "The production curve, work day curve and workers' wage curve, as well as the profit and loss curve, all show too many peaks and valleys."

The effect of the fluctuating load that is now being placed on the over-taxed transportation facilities of the country represents a great source of economic waste. For instance during summer months the railroads, which own 974,547 coal-carrying cars, are ordinarily taxed for storage room in which to place their idle cars. Certain roads whose freight traffic is 50 per cent or 60 per cent coal are compelled to send their cars elsewhere in order to find room for them.

To bring about equalization it will probably be necessary for all consumers, including railroads, industries and domestic dealers and distributors, to purchase during the months of March to August, inclusive, about 50,000,000 tons of bituminous coal that is now ordinarily purchased during the remaining six months of the year.

The publication of "seasonal" coal freight rates with a reduction from the established basis from March to August, inclusive, would, assist very materially in remedying conditions.—Boston News Bureau.

"SURELY BY THIS THE CANADIANS SHOW THEMSELVES TO BE OUR BLOOD KIN."

"For they Exhibit the Same Readiness to Sell and the Chariness to Buy that is ours in Generous Measure."

—From "Coal Age" of March 25th, 1920.

**MANITOBA LETTER.**

By CHAS. A. MILICAN, Winnipeg, Man.

V. H. Campbell, of the Public Works Department, Provincial Government has left for the Rice Lake District to complete the survey and carry on construction of the new Summer Road from Hole River to Caribou Lake. All the camp equipment, hay and oats for feed, road scrapers, explosives and drilling tools have been delivered on the ground at Goid Creek, some three miles along the new road location, which starts from the Lower Bellevue Landing on Hole River. This work will be pushed ahead as rapidly as possible, so that the road may be in commission by July or August.

It is authoritatively stated that prominent and substantial Americans, including well known Minnesota bankers have secured a group of claims on Hole River. This group consists of six claims directly east of the Gold King's holdings. The claims are the "Omi Fraction," "Knox," "Dunn," "Mareoni," "Jack Pine Fraction," and "Wilson." This property has been only partially prospected, but is said to have some very attractive leads. A wide vein runs diagonally across one of the claims, and it is the intention of the new owners to put a diamond drill on this lead and prove it up.

The Pan Extension Gold Mines Co., Ltd., held its annual meeting April 5th.

The directors reported that the affairs of the company were in a very satisfactory condition, and that preparations had been made for systematic and energetic work on the property. To this end one of the most complete plants in the province has been installed, and a large supply of wood for fuel purposes brought to the mine, sufficient to secure the operations on the property through the entire season.

The financial statement was read and showed that the company had ample funds to prosecute the work on the property, and was in sound condition in every way.

The following directors were elected for the ensuing year: H. B. Montgomery, John Beekman, E. J. Harden, Wm. D. Shaw, all of Winnipeg, and William F. Yers of Minneapolis.

The managing director, Mr. Beekman, explained that it was the intention to sink the shaft to deeper levels and block out the ores so that the company would be in a position by the time that the next winter season arrived to instal a mill if conditions warranted.

The Gold King Mining Co. has sold the block of development stock which was placed on the market three weeks ago and is now in a position to carry out the work mapped out for this season. Work will commence as soon as navigation on the lakes will permit.

A charter has been secured by the Deep Rock Mining Co. This company has four claims east of Gold Lake.

**PORT ARTHUR NOTES.**

By J. J. O'CONNOR.

Messrs. Wilson Bradley, and R. C. Jamison, of the Silver Islet Syndicate, are in Port Arthur, engaged in assembling the necessary plant and machinery for the opening of Silver Islet Mine. Much of this has al-

ready arrived, part of the plant is being secured locally, and all will be in readiness to begin this important undertaking on the opening of navigation, in about ten days.

For the present, they purpose unwatering the mine, down to the 100 foot level, and will then have a look over the roof and workings, to that depth.

A large percentage of values taken out under former operations, were found in that zone.

Further plans will be determined on the results of this preliminary work.

The water will be blown out of the mine by an air lift, with a capacity of one thousand gallons per minute. No difficulty is anticipated in keeping the zone of operations free of water, and it is expected that the work will be carried out under the very best of mining conditions.

No plans for the mainland operations have been definitely decided upon, but are being given consideration.

The revival of this famous old silver mine, will be watched with interest, by the whole mining fraternity, and their best wishes go out to these enterprising men, in their spectacular undertaking.

Conditions today, are in striking contrast to those that obtained in 1869, when the first mining work was done on this little speck of bare rock, less than one hundred, by one hundred feet, in size, and but nine feet above the surface of Lake Superior. At that time the mainland was an unbroken wilderness, now it is the most popular summer resort on the north shore of Lake Superior, peopled in season, by many happy souls, housed in the most inviting cottages, with ample wharf, and landing accommodations. There is no finer bit of scenery on the north shore of Lake Superior, than in the vicinity of Silver Islet, it is rugged, picturesque, and beautiful in the extreme, and will go a long way to make the new mining operations an easy task, as compared with the old beginnings, when tomorrow might see the work of today wholly obliterated by the elements.

**DESTRUCTION OF ROUMANIAN OIL WELLS.**

The Roumanian Consolidated Oilfields Company brought suit against the British Government for damages sustained by the destruction of their oil-wells and equipment by Colonel Sir John Norton Griffiths, M.P., who was commissioned for this purpose just before the Germans occupied Roumania. Mr. Justice Darling gave judgment in favor of the company, finding that Colonel Griffiths, as the envoy of the British Government, had promised compensation, and that on this promise the company had consented to destruction of its property. Mr. Justice Darling, in his judgment, remarked that Colonel Griffiths had gone about like the great god Thor, with a hammer, knocking off any essential part of machinery, and throwing it down the wells. He thought that the Germans, had they obtained possession of the oilfields undamaged would have worked them to their own advantage, nor could he imagine that these "foresighted summoners of war and waste" would have gone away and left enemy property in any better position than they left the library at Louvain.

# A MARSH HOIST

## IS MADE THE RIGHT SIZE FOR YOUR MINE

and in either Steam Power or Electric Power

This shows one of our Electric Mine Hoists. We make many other types. Send for our catalogue of Mine Hoists, Cars, Cages, Buckets, etc., and see what we offer you. It will repay you.

From the little 10 Horse Power size for prospectors or small mines to the massive 50 Horse Power size, one of our 7 sizes should be just right for your mine.

We are specialists in the building of Hoisting Machinery of all sorts. For nearly a quarter of a century we have been designing and building Hoists, and have developed a Hoist that we are really proud of—proud because of the record of good work they have done, and are doing in mines, quarries, and other classes of work from one end of Canada to the other.

## MARSH ENGINEERING WORKS, Limited

ESTABLISHED 1846

BELLEVILLE, ONTARIO, CANADA

Sales Agents:—MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

# Why Waste Coal When It Costs So Much?

THE COCHRANE METERING HEATER TELLS HOW  
MUCH YOU ARE GETTING FOR YOUR MONEY.

How many pounds of coal do you use to produce a thousand pounds of steam? 200, 150, 100 or less. A Cochrane Metering Heater will tell how many pounds of water are evaporated per pound of coal,

and it will instantly show any improvement in evaporation due to better fuel, better methods of firing, better condition of heating surfaces (removal of soot and scale), better condition of boiler setting (stopping up air leaks), etc.

Send for Catalogue No. 820

OFFICES---Toronto, Montreal, Quebec, Halifax, Sydney, Ottawa, Cobalt, S. Porcupine, Hamilton, London, Winnipeg, Calgary, Edmonton, Nelson, Vancouver.

## Chain Drives for Mines Mean Fewer Shut-downs

**M**INE drives must operate under varying conditions—dampness, dirt, heat, coldness. Each of these conditions has a direct effect on leather belts.

Sometimes they stretch. Sometimes they shrink. Sometimes they slip. Sometimes they break. Never do they render anywhere near 100% efficiency.

Link-Belt Silent Chain Drives are unaffected by heat, coldness or dampness. They deliver 98.2% of the power to the driven machine all the time. They never slip—never waste power—and breakage is almost unheard of.

Link-Belt Silent Chain Drives are "Flexible as a Belt, Positive as a Gear, More Efficient than Either." They maximize production and minimize delays, shut-downs and power wastage.

Our Book No. 125 gives details. Send for it.

# EDITORIAL

## The Glace Bay Meeting of the Mining Society of Nova Scotia

The Annual Meeting of the Mining Society of Nova Scotia promises to be unusually interesting this year. It is to be held at Glace Bay, the local capital of a district that has been producing coal for a century and has seen the mining and shipping of more coal than any other producing point in Canada. Among other claims for distinction possessed by Glace Bay is that it was the site of the first wireless call across the Atlantic, it being from Glace Bay that Marconi first talked with Poldhu Station.

A later, and more notable honor that attaches to Glace Bay and its immediate environs, is the large voluntary enlistment that took place during the war. While comparisons of enlistments and casualties are open to misconstruction unless very carefully worded, we believe that Glace Bay's record in this regard is an exceptionally proud one, and its results in the reduction of coal production have been and will continue to be very far-reaching.

Glace Bay is a name that will in years to come be very prominent in the transactions of mining societies, as in its immediate vicinity the future will see the most important developments of undersea mining in the world, so far as present knowledge of undersea coal deposits indicates. The long-distance underground transmission of electric current, the conveyance of

ventilating currents for distances and against resistances not now contemplated, the speeding up of the underground transportation of coal and materials; the carriage of workmen to and from the producing coal faces, and new problems in mine illumination and signalling, will all see great advances at Glace Bay. The distances from shore at which coal can be mined will, in the first instance be limited by economic factors, the chief of which will be the commercial value of coal. That this is a steadily rising value can be taken for granted. Nevertheless, it is probable that the cost of coal extraction from under the sea will set bounds to production before physical difficulties set the absolute limit. Sufficient is known today, however, to indicate that the old assumed limit of three miles from shore can be exceeded, and very possibly this limit can be doubled so far as physical considerations are concerned. In this connection, much interest will attach to the paper which is to be read by Mr. Walter Herd, the Mining Engineer of the Dominion Coal Company, on the application of hydraulic stowing to undersea coal workings, with especial reference to the Sydney coalfield. Probably no development of mining practice of recent years has such a bearing on the possible extent of undersea coal-mining as the feasibility, or otherwise, of hydraulic stowing.

## Resignations from the Mines Branch and Geological Survey

In this column last week, the frequency and number of recent resignations from the Mines Branch at Ottawa was commented upon, and it was mentioned that the work of certain divisions had been greatly reduced and in some cases may be expected to cease entirely because of the depletion of the staffs.

Mr. P. G. McConnell, the Deputy Minister, has recently stated before the Committee that is examining into expenditures on scientific work under government direction that in a few months half of the staff of the Mines Branch will have left that Department's service for private employment, because they feel "that scientific men are placed at a disadvantage in the government service, and are taking the only course open, namely, getting out to private work."

Mr. McConnell's summing up of the situation is exact. The question that interests the public is whether

Canada can afford to be deprived of the services of these trained scientists, who, in most instances, are leaving the service of the Government not because they are attracted by higher salaries, but because they cannot live, as professional men should live, on the salaries allotted to them.

A recent debate in the Senate on the scale of salaries that should be paid to scientific workers in government service was illuminating, inasmuch as it disclosed on the part of men who should know better, fundamental misconceptions on several matters that have from time to time been emphasized in this "Journal," namely, the importance of the work carried on by the technical departments of the Civil Service, the scale of remuneration that trained scientists are entitled to, and the possibility of filling the vacant places caused by resignations. The average salary paid to

servants of the Mines Branch and the Geological Survey is respectively \$1,904 and \$1,884 per annum. In the upper divisions of the two branches, which includes the technical employees, the annual salary averages in the case of the Mines Branch \$2,158, and in the case of the Geological Survey, \$2,156. The maximum salary in the Geological Survey is \$3,700, and in the Mines Branch, \$3,500.

When it is possible for men who have achieved sufficient distinction in public life to be made senators to maintain that such salaries as these are adequate, that the country cannot afford to pay more, and that the places of men who refuse to give their services any longer for such indecently inadequate payment can without difficulty be filled, it must seem that further resignations cannot be avoided. It also follows that

if the country places such a low estimate on the work of the technical department of the Civil Service it will reap correspondingly poor results. Parsimony at the source of national wealth and progress is wrongly applied. The encouragement of mediocrity, timidity, lack of faith in one's country, ingratitude and miserliness proceeding from ignorance, have not hitherto been characteristics of the Canadian people. We believe they are alien to the Canadian spirit, and constitute the negation of progress. In the public interest, Mr. McConnell's frank statement is to be welcomed. If the Canadian public understood how vitally the future of the country was imperilled by the justifiable dissatisfaction of technical civil servants at this time there would be a speedy readjustment of official attitude at Ottawa.

## The Public's Duty Towards Coal Producers

"Coal Age" of New York, in a recent issue, summarises the majority report of the Commission that has recently considered the problem of coal production, distribution and sales in the United States, and points out some conclusions of this Commission which parallel strikingly the reasons given by the Editor of the "Journal" for the comparative failure of the coal trade in Canada, in a paper recently read at the Canadian Mining Institute meeting in Toronto.

Our contemporary writes: "The consumer of coal is told bluntly that most of his coal troubles are his own fault, springing from the fact that he has been heedless of his duty to the men who dig and ship his coal." The Commission points out the evils of high demand in Winter and no demand in the Summer, and says unhesitatingly "that the railroads, the iron and steel producers, the public utilities and other big consumers of coal must shoulder the responsibility for these conditions. It condemns frankly "the traditional coal purchasing methods of the railroads," and "Coal Age" remarks that "this way of telling the public of its own shortcomings and advising it to remedy its own faults instead of choosing fantastic theories of economic betterment seems strangely new and refreshing."

The high prices of coal today is a consequence, in large part, of the hostile attitude of the people and large purchasing interests towards coal operators in the past. The United States Commission finds that all the bituminous coal producers in the United States in 1918 made only 9.72 per cent on their investment, while "the companies reporting very high rates of return upon investment are all small concerns with investments of only a few thousand dollars, whose net income represents to a large extent the earnings of the owners for their own labour and management." The same might be said of Canadian coal producers,

except that it would be difficult to find in Canada, even in 1918, a coal company that made ten per cent on its investment.

For example, the price of coal to the consumer in the Sydney, Nova Scotia, district is today seven dollars per ton. During at least fifteen years, from 1900 to 1915, the price of coal in this locality remained stationary at three dollars per ton. At that figure the operators did not realize a return on their investment which would permit of the accumulation of proper financial reserves, nor is it probable that in this fifteen year period the business of mining coal in Nova Scotia yielded an average of five per cent to the operator. The attitude of the public was so hostile, and that of the railways so short-sighted, that the operators did not dare to face the full truth of their own cost-sheets, and they for years sold coal at a price which recouped them for the immediate expenditure of wages and purchases of material, but did not include the provisions for amortization, depreciation, depletion of areas and rising costs of production that were just as properly a part of the costs of mining coal as were labour and material charges. Today, the consumer must pay for undercharges of the past, and he must also, unless worse things are to follow, pay a proper actuarial proportion of the costs of the future. It is all very well to load posterity with debt, but the public today happens to be the posterity of an indifferent, non-understanding and hostile past.

To those who have had the direction of coal mining operations know what labour and thought are needed to take a half-cent per ton off the producing cost. They have had the pleasure of learning in recent years, through the investigations of fuel administrations, that the profit of the coal producer is as nothing compared with the "spread" of the coal merchant and the distributing agencies. They have seen the local coal-

hauler add more to his charges in a day than the coal operator added in years, and the conviction is spreading among coal operators, that, as was pointed out in the "Journal" some years ago, the coal operator must, in self-defence and for the protection of the public, himself control the sale and distribution of coal from the pit-mouth until it is landed in the cellar of the ultimate consumer. As an example of waste of effort and generally misdirected energy, take the case of most Canadian towns, where coal is hauled in half-ton carts to consumers' cellars through snow and mud, when, if ordinary common-sense were applied to the question, it could be transported at a moiety of the cost, in large motor-truck consignments, under Sum-

mer conditions. Ten cents a ton off the cost of production would send a mine manager crazy with joy, but a good many times ten cents is thrown away by antiquated methods of delivery little in advance of the bullock cart. Why should all the efforts of the mining engineer, mine accountants, machinery experts, and the provision of devices for utilising refuse coal and saving all the possible by-products of the industry be nullified as soon as the colliery confines are passed by a system of coal distribution whose chief characteristics are waste, duplication of effort, misdirected energy and general confusion, interspersed by excellent opportunities for discerning persons to make a few dollars in the confusion.

## Increased Wages to Mine Workers Cause Double Increase to the Ultimate Consumer

One of the least understandable contentions put before the public in connection with the selling price of coal is that it is possible for substantial wage increases to be given to the mineworkers without necessitating any increase in the price to the consumer. It has been suggested that an increase in wages at the source of coal supply can be minimised by larger production and economics until a vanishing point is reached with the arrival of the coal in the bins or cellar of the ultimate consumer. Nothing could be more misleading. The effect of a wage increase upon the selling price of coal must always be "crescendo" and never "diminuendo." One of the most unjust statements we have recently seen is a warning put out by a government official in the United States against profiteering in coal which intimates that the increased cost of coal to the consumer will be limited to the increased amount of wages given to the mine workers.

The mine-workers in the United States have been given an increase of 27 per cent in wages. To illustrate how this will work out, take as a concrete example a colliery raising 2,000 tons of coal per day, with a labour cost before the increase of one dollar per ton.

2,000 tons at one dollar . . . . .	\$2,000
Increase in wages of 27 per cent . . . . .	540

As a result of the increased wages paid to the mine-workers there will be an immediate rise in the cost of materials secured locally, such as horse-feed, pit-timber, and in all incidental costs of hauling, machine-shop work. This increase can be conservatively placed at five cents a ton. There will be a much greater ultimate increase, as eventually all the increased cost of wages will come back upon the purchase price of metal supplies, wire ropes, mine cars, oils, etc., but this rise will be gradual, and cannot be figured accurately as to immediate effect.

Added to the previously mentioned costs, we now obtain . . . . .	\$2,640.00
Divided by 2,000 tons, or, per ton . . . . .	1.32

A colliery of this size will use for its own consumption, at boilers, for heating and yard transportation, say 200 tons daily. The extra cost of coal to fires will be therefore \$64.00, being 2,000 tons at 32c per ton.

The price of coal to employees will remain constant, so that the increased cost must be recouped from an addition to the cost of production. Assuming the number of householders to be 125, which would be about right for a colliery of this extent, and consumption of coal at two tons monthly per household, there will be about ten tons daily, or say three dollars to be added to mine cost. The sum of these additions is \$2,707.00, equal to a cost per ton of \$1.35.

It is assumed that the production under increased wages will remain unimpaired, but it is well known that contract workers usually have before them a certain daily earning, which consciously, or unconsciously, they do not exceed. The history of wage increases has been that a decrease in the output of the contract worker follows. Should this be the case, the cost per ton will be increased by much more than the amount instanced.

The coal operators must charge the railways more for coal under these circumstances, which we will estimate will increase the cost of coal transportation to market by five cents per ton. As the wholesaler does business on a percentage basis, his spread on the handling of coal to the retailer will be necessarily increased by at least two cents per ton. The retailer, who must take a larger percentage, will probably have to add another five cents, and the teamster who deposits the coal in the cellar will be moderate if he does not add more than three cents per ton. Addition of these cumulative increases, all small, but we believe all unavoidable, will bring the original 27 cents per

ton up to 50 cents, without any additional revenue to the coal operator.

Nothing is said of the case of the railways, who will shortly after the increase to the miners becomes effective, have to face a demand for increased wages from the railway employees, on the plea of dearer coal, and will also, as mentioned, have to pay more for locomotive coal.

The foregoing considerations have been confined to labour costs, but there are many other costs on the colliery sheet which will be affected by the wage increase, such as rates and taxes, insurance costs, compensation costs, and other fixed charges, and eventually every item of material, everything that depends on freight rates, administrative and executive charges, will be increased, too probably accompanied by a decreased production.

The foregoing is not intended as an example of the vicious circle, about which we have heard ad nauseam, but as concrete example of how a 27 per cent increase to the miner will, before it reaches the consumer, become a 50 per cent increase, despite all the pious hopes of the profiteer hunters, without benefiting anyone permanently, the miner himself not excluded.

There is no help for this condition of affairs apparently, but the officials of the United States Government should not add insult to injury by suggesting through the press that it is possible for coal operators to absorb the cost of wage increases out of their profits, or to confine the increase to the consumer to the actual amount of increase obtained by the miner. It cannot be done.—From "Iron and Steel of Canada".

#### "CLOSED SHOP" BY GOVERNMENT EDICT.

The "Edmonton Bulletin" has the following:—

"Our so-called Minister of Labor has started to enforce his edict that no one may work in a mine in Alberta unless he belongs to the United Mine Workers. The first fruit of his enterprise in that direction is that four mining camps in the province are shut down, with more results of the same kind likely to follow the further extension of his mischievous interference. Autocratic measures can be carried a good way in Canada. But when it is attempted to compel men to join a labor union the point is reached where such measures ought to fail, and are likely to fail. Any man who can dig coal, and who is willing to do so, and to behave himself, ought to be allowed to work in a mine—so far as the law is concerned—without asking the consent of the United Mine Workers and Senator Robertson. And the people of Alberta are entitled to have coal to burn whether or not the men who dig it have the approval of this alien labor organization and the irresponsible head of the labor department. If the Minister of Labor cannot do anything to get men to labor he at least might stop preventing men from

laboring at a time when increased production is so desperately needed."

In our January issue we expressed the belief that the enforcement of the "closed shop" by Government edict was new, and also very dangerous, because based on a fundamentally erroneous principle. The problem of the O.B.U. in the West was, and is, no doubt a very anxious one, but not even the most pressing problems can condone expediency, nor can it ever come about that the violation of a first principle of citizenship can ever bring in its train anything but harmful results. The Minister of Labour, or any other person in office, has no right to enforce membership in an organization upon any man. He might just as properly dictate the cut of his clothes.—From "Iron and Steel of Canada".

#### AIRPLANES FOR PROSPECTING.

In a recent number of the "Engineering and Mining Journal" attention is called to the great undeveloped northern areas of Canada which may reasonably be expected to prove productive of minerals, and it is suggested that airplanes might be advantageously used in exploration. Many who have slowly traversed the northern wilderness have longed for the power to fly like the birds, and the great impetus given by the war to aviation has made it seem likely that the explorer's dream may soon come true. We are particularly favored in Northern Canada owing to the presence of numberless small quiet lakes that would make splendid stopping places for airplanes of the "boat" type.

Those who have made enquiries concerning the cost of operating airplanes, are not inclined to believe that there will be much flying over our northern woods for some years yet. There are, however, special occasions when the advantages gained might compensate for the cost and we may expect to hear soon of exploring parties starting off in the early Summer by airplane for districts that are otherwise very difficult of access. It is to be expected, however, that the spirit of adventure and the pleasure of exploring new fields will for some time be more effective in luring the aviators than will comparisons of transportation costs and the saving of time on the journey.—R.E.H.

Mr. Balmer Neilly, Secretary of the Ontario Mining Associations, has left Cobalt, where he has been a resident for many years, for Toronto, and he will immediately open the permanent office of the newly formed Association.

Mr. Neilly was manager of the Penn-Canadian Mines and is a past-President of the Timiskaming Mine Managers' Association. He is also a vice-President of the Canadian Mining Institute.

Mr. J. B. Tyrrell, of Toronto, Canada, has been engaged by the National Mining Corporation of London, England, as one of its Consulting Engineers.

## Correspondence

### THE GOVERNMENT OF CANADA

The Editor of the  
"Engineering and Mining Journal"  
New York.

In the March 6 issue of *Engineering and Mining Journal*, page 595, under the title "Canada's Alleged Autonomy," I note with interest the statements made regarding Canada's status as a nation, and as many of the statements are incorrect, I take the liberty of writing you on the subject.

There is still considerable misconception in republican countries on the Canadian system of government, and, among uninformed sections of the people, a fairly general opinion still exists that the Dominion, forming part of the British Empire, with a monarch at its head, is necessarily subject to autocratic rule, or at least, very much at the dictates of the Colonial Office in London. Nothing is farther from the truth, as residents of the Dominion who have come from all quarters of the globe could testify, and though maintaining her place as an integral part of the Empire, Canada is absolutely self-governing, and its government second to none in its democratic traits. Canada is a nation, and her status, as such, was plainly asserted and recognized at the Peace Conference, and she is accorded a voice among the nations of the earth. Though spontaneously her loyalty to the Empire took her into the war immediately upon England's declaration, she entered as an independent nation, and was under no compulsion to enlist her forces or resources.

Canada is a self-governing British Dominion, with a responsible government, which means that the will of the people is absolute in the matters of government, and that the Governor General, the King's representative in the country, must form his executive council or cabinet from the members of Parliament who can command the support of the majority of members of the House of Commons, the house, which in practice, has sole control of the powers of taxation and appropriation. It means that the political executive of the day resigns its executive functions whenever it ceases to possess the confidence of the people.

The Dominion of Canada is under responsible government in the fullest meaning of the term, and in the internal affairs of the country there can be no uninvited interference by Great Britain, whether by Parliament at Westminster, the Colonial Office, or the Governor General. Recognition of this fact is the fundamental principles of the relations between Great Britain and the overseas Dominions. The Imperial Parliament has far less to do with the internal affairs of Canada than, for instance, Congress has to do with the internal concerns of the several states of the Union. Relations between Great Britain and Canada are not those of domination on the one hand, of subserviency on the other, but as between nations equally free to do as they will.

Before the confederation of the Dominion in 1867, there was a Governor-General, established at the capital of the United Provinces, and a Governor in each of the then other provinces of British Columbia, Nova Scotia, and Prince Edward Island. They were all appointed by the crown at the recommendation of the

Colonial Office. By the British North America Act, however, though the office of Governor-General was continued, governors of the separate provinces ceased to exist, and for them were substituted lieutenant governors—invariably Canadians—appointed by the Governor-General in council.

The Governor-General and the lieutenant-Governors of the provinces are the sole representatives of the King in Canada, and the appointment of the former, which is always done with the approval of the Dominion Government, is the only civil designation made by the crown. These men have absolutely no influence on the Government and its policies, and, directly or indirectly, do not affect the every-day life of the Dominion, its policies, standard, or ideals, as much as, for instance, any Canadian newspaper editor. The Governor-General is the material link with the Imperial Government, and is only interested in the smooth and continuous running of the Government. The only voice of the country is that of public opinion as expressed at the polls at the periodical elections.

The people of Canada elect their own governments, make their own laws, and control all their own political affairs. All matters of taxation are entirely in their own hands, and Great Britain has no more control over them in this regard than it has in the imposition of a tax on the people in the United States. Canada, though a loyal dominion of the British Empire, as the recent war most clearly evidenced, maintains her place among the nations as responsible and self-governing; and pursues the way of democracy untrammelled by autocratic bonds or extraneous hindrances to her people government.

In this question it is interesting to read the Prince of Wales' remarks at a recent banquet tendered him in Ottawa. Speaking on his relations to Canada, he says: "Canada, like the other British dominions, played such a big part in the war that she has in consequence entered the partnership of nations and has affixed her signature to the peace treaties. This means that the old idea of an empire, consisting of a mother country, surrounded by daughter states, is entirely obsolete and has long been left behind by the British Empire. Our empire has now taken a new and far grander form. It is now a single state, composed of sister nations of different origins and different languages. The British nation is the largest of these nations, but the younger nations have grown up to its equals, and Great Britain, like the dominions, is only one part of the whole.

In view of the facts, as set out in the foregoing, I trust, in fairness to this country, you will be disposed to publish this letter, as you have published statements of Mr. Thompson, in the article referred to.

NORMAN S. RANKIN,

Montreal, Canada, March 27, 1920.

The "Journal" welcomes Mr. Rankin's satisfying reply to Mr. Phillip Thompson's letter in the "Engineering and Mining Journal" of New York, which found fault with our statement that Canada was a self-supporting, sovereign, autonomous nation. If there are persons who doubt that this is Canada's status, it is, as previously remarked, only possible to express surprise. An established fact does not permit of argument.—Ed.

# The Importance of Cool Dry Compressed Air in Mining

A Discussion of Some of the Troubles Caused by Moisture in Compressed Air and how They may be Overcome.

By F. A. McLEAN.

## The Evils of "Wet" Air.

Moisture in compressed air should always be avoided, especially where it is to be used to operate reciprocating or rotating mechanisms, on which it has a pernicious effect when carried into the working parts, tending to wash away the lubricant; thereby increasing the wear and shortening the life of the moving parts through leaving highly finished and closely fitted surfaces bare, and in sliding or rolling contact with each other. While this is true of practically all air compressed machines, it is particularly so in the case of those operating at high speeds, such as hammer drills, pneumatic tools, motor-driven air-hoists, sand rammers and the like, in which the surfaces exposed to wear are of necessity limited in size as well as machined to very close limits, and wear is particularly objectionable on the ground of lowered economy through increased air consumption and loss of power.

While moisture in wet air is bad enough in interior piping, its effects are likely to be far worse out of doors in open-cut mining, quarrying, contracting, switch and signal work, etc., where it is likely to collect at low points in the system, causing water hammer, with consequent racking effect on the joints, and loss of power through reduction of the air passages, as well as increasing the danger of freezing and bursting of the pipes during cold weather. The low temperature caused by the rapid expansion of the air from the exhaust of rock drills, pneumatic hammers and other air-operated devices will often freeze the moisture, clogging the exhaust openings, and preventing their efficient operation.

Time is generally an important factor in mining operations and losses in this respect are usually of more importance than in other directions. It is, therefore, essential that the proper precautions be taken to ensure freedom from interruptions which are too often caused by freezing of the pipe lines or drills. In a case of this kind which came to the writer's attention late last fall, operations at a large eastern mine were held up and the miners forced to sit around and "swap" stories for two hours while waiting for the pipes to be thawed out and this did not happen on a cold day either, although it was damp and muggy.

## The Importance of Cool Compressed Air.

Air discharged from the cylinder of a compressor is hot in comparison with the atmosphere and on entering the supply pipe-lines heats them to some extent. This heating effect, travelling further along the pipe lines with the continued operation of the compressor, causes them to expand gradually, with the result that when the compressor is shut down for the night, in the cooler atmosphere they are subjected to an equivalent but more violent contraction. Although this effect may not be readily noticeable, it is likely to result in strained and loosened joints, with consequent loss of efficiency through leakage.

## Aftercoolers—The Remedy.

It is a well known fact that atmospheric or free air always carries moisture (the amount varying with meteorological conditions in different localities) and

also has the capacity to absorb more up to the time that its saturation point is reached.

The moisture carrying capacity of air increases rapidly with rises in its temperature, and decrease, but not quite so rapidly, with increases in pressure. As the pressure will always be at the highest point just as the air is leaving the compressor, if we can reduce its temperature to the lowest point, the air will be in a position to give up so much of its moisture that there will be little or none left to cause trouble when lower pressure and mayhap higher temperatures are reached further along the line. It is thus evident that the remedy for these conditions lies in reducing the temperature of the air after it leaves the compressor and often before it enters the pipes, to as low a point as possible, which will not only prevent all of these troubles, but will ensure better all-round distribution efficiency as a whole. Some cooling takes place in the intercooler of a compound or stage compressor, and with the larger and better designed inter-coolers used on modern compressors, more of the moisture is removed by this means than was possible with the older types. The air receiver also cools the air to some extent, and serves as a receptacle for the collection of moisture from the air which passes through it, and for this reason is fitted with cocks by which the moisture can be drawn off at intervals.

In the simplest form of compressed air power plant, the receiver is the only means of removing moisture from the air that is employed. Too much reliance should not be placed on the receiver for this purpose, however, as when located close to the compressor, as it should be; and the consumption of air is heavy, the temperature of the receiver shell will usually be such that little or no condensation can occur. In some cases, the temperature of the receiver becomes so high that oil carried from the compressor cylinder becomes ignited, causing serious fires or explosions. It is, therefore, better to depend on some means of cooling and drying the air after it has left the compressor, and before it enters the receiver and supply lines, and this is where the after-cooler "fits in".

## What The Aftercooler Will Do.

Aftercoolers cool and dry the air more thoroughly than is possible with the best type of receiver, and so reduce to a minimum the troubles which follow the use of wet air, and in addition remove some of the oil which might be carried into the receiver and perhaps to the pipe lines, to the detriment of the air-supply hose. While clean air is of considerable importance in open-cut mining, quarrying and contracting, it is especially so in tunnels and shafts where oil in the exhaust of rock drills or coal cutters tends to vitiate the air.

One of the principal functions of an air receiver is to compensate for the pulsating effect of each stroke of the compressor piston and prevent rapid fluctuations in the air pressure. For this reason the receiver should have sufficient capacity to prevent any material rise in the receiver pressure by the volume of air forced into it at each stroke of the compressor piston.

If the air is allowed to pass directly into the supply pipes there will not be sufficient space for its immediate accommodation and the pressure will momentarily run up far in excess of the average pressure in use accompanied by a periodic acceleration of flow. This results in an increase in the frictional resistance of the pipes and at the end of each stroke the compressor piston is required to force the air out of the cylinder against a pressure temporarily greatly in excess of normal, increasing the power consumption and putting an unnecessary strain on the compressor. In a single cylinder compressor the discharge pulsations are more violent than in stage compressors, as the total discharge must take place from a cylinder of larger diameter in a smaller portion of the stroke than is the case with the high-pressure cylinder of a multi-stage compressor where the discharge valves open earlier in the stroke and the diameter of the air pipe is about one-half of that of the cylinder. In this respect the installation of the aftercooler, since it increases the available receiver capacity, will be of considerable benefit, especially in intermittent work, such as running rock-drills, pneumatic tools, hoists, etc., and will assist the governor or regulator of the compressor in maintaining a steadier pressure.

**Construction of the Aftercooler.**

Aftercoolers usually consist of a cylindrical steel shell with cast-iron heads supported on cast foot-pieces and surrounding a nest of iron or brass tubes, the ends of which are either expanded or fitted with copper ferrules and caulked into steel tube plates at each end of the casing, provision is made for expansion and contraction. Water enters the lower set of tubes, traverses each row and leaves at the top of the shell, while the air enters and leaves at the top surrounding the tubes in transit, and travelling in a direction opposite to the water. Baffle plates are arranged so as to cause the air to cross and recross the tubes several times. An open funnel is generally placed in the water discharge to show the amount of water flowing and facilitate its adjustment. The moisture collected from the air is prevented from escaping with it by a plate in front of the air-discharge opening.

Fig. 1.

There is some difference of opinion as to the respective merits of iron and brass tubes for this class of service. Brass is a better conductor of heat than iron, but on the other hand, galvanized iron tubes are usually rougher and present more surface to the air so that there is probably little or no difference between them in cooling effect. Vertical aftercoolers are sometimes preferred on account of the smaller floor space which they occupy, but aside from this, there is no reason for using one style in preference to the other. While aftercoolers of different makes vary in minor details the essential principles of all are the same and

their construction will be more readily understood by referring to Fig. 1.

**Sizes and Capacities.**

Aftercoolers are usually equipped with pressure gauge, safety valve, flanged pipe connections, water fittings and drain cocks. When properly designed and supplied with the requisite amount of water they will readily reduce the temperature of the air passing through them to within 15 or 20 degrees of the entering cooling-water. The temperature and quantity of the latter required depends on the cooling effect desired. The following figures, which are based on good cooling results with air at 80 to 100 pounds gauge pressure when compressed by a two stage machine, will be found accurate for use with aftercoolers of the type described:

Temperature of Cooling water	Gallons per hour per 100 cu. ft. of Actual free air per min.
50 degrees Fahr.	120
60 " "	150
70 " "	180
80 " "	210
90 " "	240

Aftercoolers are made in a number of different sizes, the capacity of which varies with the temperature of the cooling water and whether the air to be cooled is obtained by single or multistage compression. This point will be seen more clearly by examining the table in Fig. 2, giving the sizes and capacities of Ingersoll-Rand Aftercoolers.

An aftercooler may be suspended from the ceiling or mounted on, or under, the floor, as may be most convenient from the standpoint of economy of floor space or ease in making the necessary connections. It should be placed between the receiver and the compressor and as close to the latter as possible. Pipe of amply large size should be used in making the necessary connections and care should be taken to provide piping by which the moisture may be drained off at intervals. It is good practice to make connections from the compressor to the aftercooler and from the aftercooler to the receiver one or two sizes larger than that leaving the receiver, using reducers to make the actual connections if necessary. Elbows should be avoided, any bends that are necessary being made by giving the pipes a wide sweep.

In some localities water is scarce and where this condition exists, it is often possible to use the cooling water from the aftercooler for hot boiler-feeding, increasing the efficiency of the plant and adding to its economical operation to some extent through the recovery of waste heat.

While an aftercooler will not eliminate all of the moisture from compressed air, —(the best results in this respect, especially in the case of large installations, being obtained by the use of an aftercooler in conjunction with a number of small secondary receivers or moisture traps placed at intervals along the supply lines)—it will be found that in the majority of cases the aftercooler alone will dry the air to such an extent that the troubles due to wet air and the consequent inconvenience and low efficiency which follows are entirely done away with.

In addition to this, the installation of the aftercooler often results in increased economy in power consumption with no outlay other than the cost of the aftercooler, the necessary connections and a moderate sup-

ply of cool running water. It is thus evident that the inclusion of an aftercooler when securing estimates on a new compressed-air plant, or the addition of one

to a plant already in existence, is a subject well worth the attention of anyone desirous of obtaining the highest efficiency from their compressed-air equipment.

## Annual Meeting of the Mining Society of Nova Scotia

May 4th & 5th Glace Bay, Nova Scotia.

The 28th Annual Meeting of the Mining Society of Nova Scotia will open in the Club Rooms of the Dominion Coal Company in the morning of May 4th. Business will include consideration of motions to alter the date of the Annual Meeting of the Society and to change its name.

In the afternoon, the President, Mr. A. J. Tonge, General Superintendent of the Dominion Coal Company, will deliver the presidential address. The following papers are expected to be read:

"The Application of Hydraulic Stowing to Under-sea Coal Workings with special reference to the Sydney Coalfield" by Walter Herd, Mining Engineer of the Dominion Coal Company.

"Generating Steam by use of Open-Hearth Furnace Waste Gases" by E. G. Mackay, Superintendent of Blast Furnace Department, Nova Scotia Steel and Coal Company. "Conservation in Drawing Mine Timbers" by P. G. Prendergast, Manager of Dominion No. 3 Colliery. "The Plate Mill of the Dominion Iron and Steel Company" by W. H. Graham, Superintendent of Construction, Dominion Steel Company.

A Smoker will be held on Tuesday evening in the Club Rooms.

On Wednesday morning, Mr. H. Y. Russel of the Canadian Explosives Company is expected to give a talk on the manufacture of explosives. Mr. Angus W. Macdonald, Employment Agent and Superintendent of Welfare Work of the Dominion Steel Corporation, will give a paper on "Labor Turnover in Industrial Plants, and what can be done to minimize it. A paper on "Longwall Mining and Conservation" will be presented by Mr. J. H. Cunningham, Papers are expected to be given by Mr. John Preston of the Nova Scotia

Steel and Coal Company, and by Mr. F. E. Notebaert, Mining Engineer of the Acadia Coal Company. The papers read at the Toronto Meeting of the Canadian Mining Institute on "Transportation of Coal" by Mr. M. A. McInnes, President of the Lackawanna & McCrory Coal Company, and formerly a District Superintendent of the Dominion Coal Company, and by Mr. F. W. Gray, on "Canada's Coal Supply," will be open for discussion.

At noon on Wednesday, the Members and visitors will be guests of the Dominion Coal Company at luncheon.

On Wednesday afternoon a meeting will be held in the Savoy Theatre, to which the public will be invited when a paper on "Coke and By-Products" will be given by Mr. F. E. Lucas, Economy Engineer of the Dominion Steel Corporation, and a paper on Colliery Power Plants, by Mr. W. S. Wilson, both of which will be illustrated by lantern slides and moving pictures. Prof. Sexton, of the Halifax Technical College will speak at this meeting on the Vocational re-training of Workers in Industry.

No specific arrangements have been made for visits to plants or mines, but arrangements will be made by the Secretary for any persons who wish to visit any of the neighboring collieries or steel plants.

### ANGLO-PERSIAN COMPANY'S OPERATIONS IN NEW BRUNSWICK.

It is reported from Moncton, N. B. that that the Anglo-Persian Oil Company has struck a moderate flow of gas in a bore near Coal Branch, Kent County. Boring for oil has for some time been proceeding in this locality by the Anglo-Persian Co.

## NOVA SCOTIA ACCIDENT PREVENTION ASSOCIATION

The Workmen's Compensation Act of Nova Scotia provides that an association of employers for the prevention of accidents may be formed under the auspices of the Compensation Board, and that such rules as may be decided upon by the Association for the purpose of preventing accidents, shall, if approved by the Board, become compulsory upon employers in the Province.

An organizing meeting was held last year, and recently the first annual meeting of the Association was held in Halifax.

The newly elected officers of the Association are as follows:—

President: George D. Macdougall, General Superintendent, Nova Scotia Steel & Coal Co., New Glasgow.

GEORGE D. MACDOUGALL.

President of the N. S. Accident Prevention Association, and Vice-President, Mining Society of Nova Scotia.

1st Vice-President: F. E. Lucas, Economy Engineer, Dominion Steel Corporation, Sydney.

2nd Vice-President: J. E. Lucas, the Halifax Shipyards, Ltd., Halifax.

Secretary-Treasurer: H. B. Thompson.

An Executive Committee is composed of the Chairmen of the respective trade sections, these being as follows:—

Mining, A. J. Tonge, General Supt., Dominion Coal Co.; Lumbering and Woodworking, R. E. Dickie;

Metal Trades, R. B. Stewart, Maritime Bridge Co., New Glasgow; Building Construction, A. S. Curry, Rhodes Curry, Ltd., Amherst; Public Utilities, J. H. Winfield, President, Maritime Telephone Co.; Transportation and Navigation, G. W. C. Hensley, Pickford and Black, Halifax; Miscellaneous, C. V. Managhan, Moirs Ltd., Halifax.

The meeting was addressed by the past-President, Mr. C. D. Dennis, Rhodes Curry Ltd., who described the organizing meeting held last April and outlined some of the difficulties which it had been necessary to overcome in commencing the work of the Association. Mr. A. F. Lucas then addressed the meeting, and was followed by Mr. F. W. Armstrong, Vice-Chairman of the Compensation Board, and Mr. John Mackeigan, auditor, who explained the financial position of the Board, and outlined the manner in which it was hoped the Association would be able to assist the Board in controlling and reducing accidents and the assessments.

F. E. LUCAS.

Vice-President N. S. Accident Prevention Association.

As all the officers of the Association are men who hold responsible positions of superintendence in the main divisions of industry comprised within the scope of the Compensation Act in Nova Scotia, it may be anticipated that such regulations as may commend themselves to the Association will be enforced. The Association will also form a nucleus and a directing force for first-aid work, "safety-first" meetings, and similar activities that have had such excellent results in the reduction of the accident rate in other industrial communities. Nova Scotia is to be congratulated on the formation of this Accident Prevention Association, and on the personnel of the officers.

# Canadian Oil Exploitation and Prospects

The world's supplies of petroleum are to-day everywhere attracting the attention and serious consideration of Governments and industry. The continued source of supply and control of that supply, the vastly increasing demand for liquid fuel as the motive power for transportation of all kinds by land or water, from the humble car now owned by the average citizen to the latest type of battleship of the British Navy bunkering over 1,300,000 gallons, for power and lubrication in the world's factories, for lighting purposes and for surfacing the enormous road mileage which must be maintained to meet conditions of modern mechanical transport, are questions of vital interest throughout the world, and here in Canada point the way to a field of opportunity and effort whose importance to the country as a whole can hardly be exaggerated.

With two of the large oil producing fields, Mexico

maximum this year and to decline steadily thereafter," and in another issue of that journal the same authority states, "Canada is the only country in which the petroleum industry may be said to be controlled by foreign (United States) interests."

Beyond calling attention to this latter statement this article is not concerned with the question of political control, but is an attempt very generally to summarize those conditions which tend to a conservative optimism as to the vast oil possibilities to-day hidden in the unexploited sedimentary strata of Canada.

## Area of Possible Oil Fields.

If we take the map of Canada and very roughly draw a line from east of Great Slave Lake passing through Lake Athabasca down to the north end of Lake Winnipeg, along the east shore of that Lake to its southerly end, thence to and along the North

KNOWN AND POSSIBLE OIL RESOURCES OF THE WORLD

From the U. S. Geological Survey

A diagrammatic index showing distribution and relative size of oil supplies for the future, as estimated according to present information

and Russia (sources of 20 per cent of the world's supply), temporarily handicapped by unsettled conditions, with the probable early decline of the United States fields (the source of 60 per cent of the world's supply), reports which come to hand of prospecting and drilling activities of the approaching season in the vast potential oil fields of Western Canada are of greater national importance than almost any other proposed line of development.

## Canada's Annual Production.

According to Government statistics, Canada's annual oil production up to date stops short of 310,000 barrels (90 per cent from the Ontario fields) in comparison with over 330,000,000 barrels produced by the United States. A leading United States Geologist (J. D. Northrop) writing in a recent issue of the Engineering and Mining Journal, states, "petroleum production in the United States is expected to reach its

shore of Lake Superior to the Soo, and thence along the northerly shore of the Georgian Bay to Parry Sound, thence due east to the St. Lawrence River, and along the northerly bank of that river to its mouth, we shall have divided the Dominion into two vast areas, that lying to the northward of our line being regarded as generally hopeless for oil prospecting, that lying westward and southward being from its geological formation rich in promise for the finding of productive oil fields within the economical range of practical drilling.

If we further examine the Geological map of this latter area, we find that the great oil-bearing strata of the North American Continent, which in the United States have been productive of the richest and most prolific oil reservoirs of the world, contributing in fact over 60 per cent of the world's total oil supply, constitute the principal geological formations and outcrops of this vast Canadian territory.

All of these Geological formations contribute in the various oil fields in the United States to the vast total production of that country.

It requires, therefore, no more than an average share of optimism to predict that Canada's future as a world oil producer is certain, and only awaits the assured result of time and capital expended on the scientific location of favorable structures of these formations and their subsequent exploration by the drill.

#### The Western Provinces.

In the Western Provinces attention in the past has chiefly been divided between the possibility of commercial development of the bituminous sands exposed on the Athabasca River, commonly called the "Tar Sands," and the search for petroleum in the vast regions of the Mackenzie River Basin, north and south of Edmonton, in Northern, Central and Southern Alberta, in the Peace River and Great Slave Lake Districts, whilst recently reports are to hand of organization for prospecting and drilling in the districts of Kootenay and Vancouver, B. C.

tain reservoirs holding large pools of pay-oil, since the entire absence of folding in the strata is unfavorable to the large accumulation of such reservoirs and moreover, denudation by ancient glacial action has exposed the oil sands to the atmosphere, so that in the course of ages, evaporation of the lighter oils has taken place, leaving only the heavy tarry residue, now in evidence, dispersed throughout these vast deposits.

#### Commercial Value of Tar Sands.

Hence it is likely that for years to come, the commercial value of these tar sands will be limited to their development as bituminous road making material for which purpose their suitability has already been demonstrated in the city streets of Edmonton, and the economics of the question are being fully investigated by the Department of Mines of the Dominion Government. Improved methods of distillation may make the recovery of the oil content of these deposits a commercial proposition as also may the future exhaustion of producing oil wells, but this latter is too far ahead to be of interest to the present generation.

#### The Athabasca Tar Sands.

The outcrop area of the "Tar Sands" of the Athabasca River has been estimated to extend from 750 to 1,000 square miles, and the deposits probably extend considerably further to the southward under heavy cover. Various estimates have been made of the probable oil content of these sands which have been reported to range in thickness from 140 to 225 feet, and to contain 25 per cent. of oil, but in fact the numerous shallow wells drilled have only obtained small amounts of black viscous oil showing on analysis a high percentage of light oils. The more volatile and valuable constituents of this petroleum have long since disappeared and, as the flow has ceased, the rocks from which it issued are probably exhausted, in short these tar deposits are all that remain of a vast oil reservoir now spoilt and wasted. Further, the horizontal stratification of these deposits is entirely against the probability that they will in themselves be found to con-

In the Athabasca District, at Pelican Rapids, the Canadian Geological Survey sank a shallow well in 1798 and tapped a heavy flow of gas, and later, at the same place, the Pelican Oil and Gas Company met a heavy gas flow in a shallow drill hole. In 1917-18, the Imperial Oil Company sank two wells along the Alberta and Great Waterworks Railways and the Tapley Syndicate put down a third in the same territory. These tests were made by practical men but success was not attained, a small show of tarry oil being obtained at depths of about 1,000 feet. These results however do not in any way disprove the presence of pay oil in the vast fields to the south of this area which are so far from the outcrops that even the most expert explorer has little data to guide him, and drilling "in the dark" is the only test that can be resorted to.

#### Scientific Study of Structures.

The first essential therefore for the successful dis-

covery of liquid oil accumulations is the location of suitable structures of the oil bearing sands, and their exploration by drills, those beds distant from the area of outcrop of the Athabasca sands offering better prospects than those in the immediate vicinity, as also do the regions Northwest of Edmonton and Athabasca Landing where favorable structures which are independent of these tar sand leakages are known to exist. Whilst numerous widely separated wells have been sunk there has in the past been a tendency to locate them without particular regard to testing the main structural features or the promising horizons, but recently considerable work has been done in the direction of scientific geological study of these structures. The Geological Survey of the Department of Mines, as well as such large commercial organizations as the Imperial Oil Company, The Standard, The Shell, and the Anglo-Canadian Oil Companies, are accomplishing good pioneer work in locating the regions which show the folded geological structures of the petroliferous sands most favorable to success in oil drilling, and particular attention has been paid to the Peace River district of Northern B. C. and to the Great Slave Lake district.

#### The Peace River District.

The upper cretaceous formations of the Peace River District are reported as consisting of a gentle homocline not favorable to formation of oil reservoirs, but further West the survey parties report more promising conditions of sharp folding and domes.

The above does not in any way disprove the existence of Peace River oil reservoirs in the underlying Devonian sands, these being non-conformable to the upper cretaceous deposits which alone have been explored by the drill to date. Indeed, the very fact that these Devonian beds are deformational to the upper beds may be an encouragement to further prospecting of this district, since, if the formation bed has a gradient it may go far to neutralize possibly unfavorable conditions created by the homoclinic structure of the overlying beds. Moreover, this homoclinic structure is not necessarily unpromising for oil reservoirs provided that the gradient is sufficient to allow of gravitational segregation of the water, oil and gas; elsewhere conditions of sand porosity and cementation have resulted in the isolation and accumulation of large oil reservoirs in such homoclinic structures, and indeed some portion of every anticline, the formation usually reported on as most favorable for oil, is in itself a homocline.

The Peace River Oil Company, the Tar Island Oil and Gas Company, the Consolidated Oil Fields Ltd., the Victory Oil Co., and the Northern Pacific Oil Company have all had drills in this region penetrating to depths of from about 1,000 feet to 1,300 feet. Their general experience has been the finding of small quantities of heavy tarry oil, and, in an effort to reach the lower Devonian formations, encountering heavy flow of gas or water which must be shut off before further exploration can proceed. This difficulty is however purely physical, and the Three Creeks Oil Company are reported to be now installing large pumping units to deal with this obstacle.

#### Southern Alberta.

In the district around Calgary considerable drilling has been done, and in some cases small flows of from 15 to 30 barrels a day, ranging from very light to

heavy oil, have been obtained. Geological opinion is that in this territory the rapid descent of the oil-bearing strata from the faulted and folded areas created by the mountain uplift has placed these strata at so great a depth in this district as to make drilling a doubtful commercial undertaking. Some experts also hold the opinion that the very light finds of oil in the Calgary field are indications that the original source of the oil, the parent reservoir, was at a great distance, and that the oil in its lateral movement has been subjected to so great filtration as to have rendered it an unpromising prospect. New methods of distillation of these light oils may however give them an added value and revolutionize opinion in this respect, converting the class of oil into a valuable source of supply of motor fuel spirit.

The principal companies which have undertaken Alberta Oil Company. The Prudential Oil Company, and the Calgary Petroleum Products Company, most of the wells being in the Sheep River area.

#### South and Southeast of Edmonton.

Examination of the vast districts southeast of Edmonton lying between the North Saskatchewan and the Belly Rivers have determined that the reported anticlinal folds of the upper cretaceous structure do not exist in Central Alberta. The homoclinic structure of this area may be responsible for the difficulty hitherto experienced in locating any large accumulation of petroleum oil, but the area is vast and the absence of anticlines does not disprove the existence of such reservoirs.

It is said that the Imperial Oil Company, The Shell Oil Company, and some other interests will spend large sums in drilling in this field during 1920, and the activities of such experienced oil men show how great is their confidence in the promise of this region.

#### Kootenay and Vancouver Districts.

The Amalgamated Oil Co., Ltd., and the Crow's Nest Oil Company are reported to have acquired extensive rights in the Kootenay District, and to be either actively engaged in drilling or preparing to do so in 1920, and on the International Boundary near Vancouver, a Company known as the Boundary Bay Oil Company is reported to have drilled to a depth of over 700 feet, and to have produced a small flow of oil, whilst in the same district the Pitt Meadow Oil Wells Company and the Empire Oil and Natural Gas Company have sunk wells, and the Spartan Oil Company has drilled a test hole near Burnaby Lake to a depth of about 2,000 feet, at a point where one of the most important oil seepages occurs.

It is difficult to analyze the geological promise of the Kootenay District in regard to large oil reservoirs, owing to the faulted and fracture-displayed nature of its structures. The reports of the Dominion Government Geological Society show large outcrops of Carbonaceous limestones (elsewhere a prolific source of oil) and of post-Cambrian rocks, and petroleum has actually been found in these regions, and verified by Dr. Selwyn as far back as 1891. Geologists have reported that in this region, the ancient limestones have been thrust forward over cretaceous beds in which the petroleum may have originated, and which may yet be the source of unknown quantities of oil. In this connection the following quotation from the Dominion Government Geological Survey Annual Report of 1898 is illuminating having regard to present day activities above noted.

"The indications certainly seem to be sufficiently promising to warrant some outlay in the work of sinking test wells, notwithstanding the generally disturbed and broken character of the formations of the region," and it may here be noted that the most productive of the United States oil fields, that of California, is of diversified geological structure complicated by faults, outcrops, and igneous intrusions.

In the Vancouver district, oil and gas seepages have been known for some years past though their origin has not been demonstrated, but it has been thought that they may indicate oil pools in the sedimentary rocks underlying the Fraser River. Few natural outcrops of these rocks exists, but it is thought that they are folded in a series of anticlinal and synclinal folds favorable to accumulation of oil pools, and it is reasonable to suppose that they are an extension of the structures of the same deposit known to exist further south of the International Boundary, and a striking general resemblance may be noted between the geological structures of this district and those of the great producing oil fields of California, which have been estimated to contain seventeen billion barrels of fuel and asphaltic oils.

#### The Fields of Eastern Canada.

This review would be incomplete without reference to the oil fields of Eastern Canada, in fact the Devonian formations of Ontario are at present producing the greater part of the output of the Dominion and have been producing since 1857. In this province the Mosa oil field in Middlesex County is the largest producer and contributed 108,988 barrels in 1918 to the provincial total of 288,760. This production is reported by Government Geologists to be from the crest of a dome of the Delaware limestone (corniferous) at depths of about 300 feet. This productive field developed from an abandoned prospect as a result of careful study of structural formations followed by practical drilling, it is quoted as proof that the possibilities of the Ontario oil fields are far from exhausted.

There are eleven other oil fields in the province, all producing from shallow wells in the Devonian formations. In the opinion of some experts, deeper lying formations in Ontario, which have not yet been explored by the drill, may prove to be extensions of the Lower Devonian and Silurian formations which constitute the great oil fields of Pennsylvania and Central Ohio.

#### The Maritime Provinces.

In New Brunswick and Nova Scotia oil possibilities have attracted attention since 1859, but competition with the enormous output of the adjacent United States oil fields has done much to discourage production. The New Brunswick Petroleum Co., in about 1900, drilled over 70 wells in the South Eastern district of the Province and obtained a small flow of pay-oil from the Carboniferous and Devonian formations. More important are the oil shale deposits in Albert County, which comprise the residuum of a petroleum field exhausted through seepage.

These petroliferous shales may yet have high commercial value when modern methods of distillation shall render the recovery of their by-products commercially possible such a development may be indicated in the near future in the recovery of motor fuel spirit through new process. In 1908 these oil shales were tested for yield

of crude oil and Sulphate of Ammonia in the retorts of the Pumphreston Oil Co., Scotland—the average yield being 40.09 gallons of crude oil and 76.94 lbs. of Sulphite of Ammonia per ton of shale—the result comparing favorably with Scotch shales, which have been successfully worked for many years. In Nova Scotia efforts to find oil were made as early as 1864, but without commercial results. Various seepages occur and favorable geological Devonian and Corniferous formations are noted in certain districts, but the structures are not considered promising, having been badly broken up and contorted. Oil shales have been known in this province for over 60 years; their analysis yields somewhat similar results to those of New Brunswick, but lower in Ammonium Sulphate, they are at least as good as the successfully operated Scotch deposits. The remarks as to their probable development which have been made above in connection with the Albert County deposits of New Brunswick, apply equally here.

#### WILL DEVELOP ATHABASCA OIL FIELDS IN ALBERTA.

Anglo-Dominion Petroleum Company will spend much money in exploring the 340 square miles of oil lands under lease.

(From Our Toronto Correspondent.)

Exploration and development of the Athabasca River oil region in Northern Alberta on a big scale is foreshadowed by A. F. A. Coyne of the Anglo-Dominion Petroleum Company of London, England, who has arrived in Toronto from England. Mr. Coyne has come over from the company in charge of seven geologists, one of whom is W. P. D. Stebbing, F.G.S., and the part is enroute to the West, where they will immediately start geological investigation of the 340 square miles which the Anglo-Dominion Company have under lease. Equipment is about ready for the operation of thirty oil rigs.

Mr. Coyne states his company has appropriated two and a half million dollars for the first twelve months of exploration and operation and further large sums will be spent as occasion demands. The British Government is vastly interested in the exploitation of Canadian oil fields and is lending every support to any enterprise that promises to free the British Dominions from dependence on the United States for oil. The London market realizes that Canada is a country of great mineral wealth and both the Government and financial groups, representing various mining industries, are ready and willing to back any legitimate scheme that promises a fair return on the money invested. The Anglo-Dominion Petroleum Company has already acquired the Athabasca gas franchise and is applying for the Edmonton franchise.

Connected with the Anglo-Dominion Petroleum Company are Alexander Duckhan, chairman of the Board of Directors of the Trinidad Central Oil Fields; Ballie Underdown, director of Trinidad Central, director of the U.S. Cable Co. and President of the British Motor Manufacturers' Association; Henry Antrobus, Wallis Wood and other well-known British financiers. W. R. Martin, of Medicine Hat, holds the position of field superintendent and Martin & Phillips of Medicine Hat holds the position of field superintendent and Martin & Phillips of Medicine Hat have entered into a five year contract with the company for the drilling of the wells.

### COAL AN IMPRESSIVE QUESTION IN CANADA.

Reference was recently made in these columns to plans being discussed in Canada for shipping Nova Scotia coal up the St. Lawrence River and Lake Ontario for distribution to points in the Province of Ontario now dependent on the United States for coal.

Whether this plan is feasible or not, it would seem that the high price of anthracite will tend to restrict its use in some parts of the Dominion. In fact, some of the Canadian papers are expressing fears that the growth of the country may be interfered with by the price of fuel in the more remote sections, where a high freight rate enhances the cost to the consumer. It is even suggested that part of the population may be forced to emigrate.

Under the stimulation of railroad building and industrial activities, the settlements in Canada have been pushed far back into the interior. Only a minor portion of the requirements can be met by water-borne deliveries, and in exact ratio as the settlements extend up towards the north the need for fuel increase. So we may readily believe that the fuel bill is becoming a very important matter, the more so as Canada has generally been on a lower price and wage basis than the United States in all particulars, especially in the smaller communities.

Psychologically a coal bill at the rate of \$18.00 a ton at some small town in northern Ontario creates about the same impression as a bill at the rate of \$25.00 a ton in New York.—“Saward's Journal,” New York.

### STEEL COMPANY OF CANADA INCREASES ITS COAL HOLDINGS.

A significant item in the Annual Report of the Steel Company of Canada is the President's statement that the Company has consolidated its holdings with two companies in the United States, and now owns a third interest in a single block of coal lands comprising 4,438 acres. Mining is to be carried on through a centrally located shaft, which will effect a saving over present methods.

### NEW MINING COMPANIES

The International Prospecting and Developing Company has been granted a provincial charter for the purpose of engaging in a general mining business with head office at Ottawa. The company is capitalized at \$1,000,000 and the provisional directors are R. F. Kelly, M. J. O'Connor, A. G. Midford, U. Chatelain, and C. G. Cummings.

Another company to be granted an Ontario charter is Algomont Mines, Limited, with head office at Toronto. The capital is fixed at \$4,000,000. Toronto people are named as the provisional directors.

### DOMINION STEEL COMPANY DRILLING FOR IRON ORE

The Dominion Steel Company is drilling for iron-ore near Loch Lomond Cape Breton, about 30 miles from Sydney. Outcroppings of high-grade hematite are present, and diamond drilling is being undertaken to prove the extent of the deposit

### THE LATE PROFESSOR LAPWORTH.

#### A Distinguished English Geologist.

Prof. Charles Lapworth, LL.D., F.G.S., F.R.S., died on Sat. at his residence, 38 Calthorpe-road, Edgbaston, in his 78th year. Prof. Lapworth was for more than 30 years one of the most accomplished members of the professional staff of Mason College and the University of Birmingham, and had a wide reputation as a geologist. Born at Faringdon, Berkshire, in 1842, Prof. Lapworth was educated at the Training College of Culham, near Oxford. Then he became a school-master at Galashiels. It was while he was at Galashiels that he began to study geology, and in 1870 he read his first scientific paper before the Geological Society of Edinburgh. This led to his acceptance of an appointment at St. Andrew's University, and he stayed there from 1875 until 1881, when he went to Birmingham as Professor of Geology in Mason College. It was not until 1913 that he decided to retire from the active work of his profession, and the council of the university, in accepting his resignation, passed a resolution in which they thanked him for his long and assiduous services, and recorded the fact that the geological surveys of the Empire owed some of their methods to the genius of Prof. Lapworth, whose name was of more than European reputation. Then followed the conferment upon him of the honor of Emeritus Professor. In 1883 he was accorded the distinction of LL.D. of Aberdeen University, and in 1912 of Glasgow also, while some time prior to that he became M.Sc. of the University of Birmingham. In 1887 he was awarded the Bigsley gold medal of the Geological Society, and in the following year was elected a Fellow of the Royal Society, while the Council further recognised his work in 1891 by conferring upon him their Royal gold medal. In 1889 he received the Wollaston medal of the Geological Society, while in 1905 he was the Wilde medallist of the Manchester Philosophical Society. As far back as 1892 he was the president of the Geological Section at the annual meeting of the British Association; from 1902 to 1904 he was the president of the Geological Society; in 1895-96 he was a member of the council of the Royal Society; and when the Royal Commission was formed in 1902 to enquire into the coal resources of this country he was appointed a member of that body, while in addition for a very long period he was the consulting geologist on matters of mining and civil engineering—particularly with reference to the water Bills of Birmingham, Gloucester, Harrogate, Leicester, etc. Prof. Lapworth's contributions to scientific literature were voluminous. He published altogether 40 or 50 original papers in the annals of various societies, giving accounts of his discoveries and conclusions. The important group of fossils known as the graptolites, which lie at the foundation of the study of the older fossiliferous rocks of geology, were first reduced to order by him and his classifications. In the West of England he similarly worked out the true arrangement of the rocks and fossils and the type districts of Shropshire and elsewhere, and in the Midlands geologists are familiar with his discovery of Cambrian rocks and fossils in the Nuneaton and Lickey district. Prof. Lapworth leaves a widow, two sons, and a daughter.

—“Colliery Guardian.”

### THE SILVER MINES

Under pressure of what is reported to be an attempt on the part of some of the European countries to bring about a decline in the price of silver, the quotations for the metal have again become unsteady. Mindful, however, of the outstanding fact that consumption is greater than production and that the visible supply is daily becoming less, the silver producers still cling confidently to the belief that the law of supply and demand must inevitably run its course and that in such a case the quotations could scarcely be expected to decline to any very great extent, while there is great promise of another upward swing following the expected failure of Europe to break the market.

Now that the annual statements of all the leading mines in Cobalt have been issued for the year 1919, it is impossible to review with a full measure of accuracy the extent of the prosperity enjoyed during that interesting period when silver prices averaged away above any previous record in the history of Cobalt. It is interesting to note that in the majority of cases the value of the output compared favorably with that of the preceding year, despite the fact that the mines lost an average of at least seven weeks due to last Summer's labor strike.

Having maintained its output in 1919 almost on a par with 1918, and having actually increased its ore reserves during the period, the McKinley-Darragh is now on a fair way to round off another prosperous year in 1920. About the end of April or the first week in May, the big oil flotation plant will be set in operation, and should result in further materially increasing the revenue.

The annual statement of the Nipissing Mining Company for 1919 is one of the factors that holds out considerable assurance of improved economic conditions. The report shows that in spite of the added expense due to curtailing operations on account of the strike, the company succeeded in reducing the cost of production by upwards of  $3\frac{1}{2}$  cents on each ounce of silver produced. Total production for the year amounted to 2,905,475 ounces, so that the saving due to the decline in costs amounted to \$101,691. The value of the year's output was \$3,553,958, and the net operating profit amounted to \$2,717,312 which was the highest in the history of the Nipissing Mining Company. Following is the official summary of the company's operations at Cobalt during the year:—

"The year 1919 was a remarkable one in the silver industry. The official price of  $\$1.01\frac{1}{2}$  per ounce, set by the United States Government, remained in force for the first four months of the war. Early in May, however, both the United States and British Governments removed all restrictions on the price and on the exportation of silver. Due mainly to the strong demand from China, the price thereafter gradually rose to the maximum of  $\$1.37\frac{1}{2}$  quoted in New York on Nov. 25th

"The New York official average for the year was  $\$1.1112$  per ounce. Nipissing received  $\$1.1371$  United States currency, f.o.b. Cobalt for 1919 shipments.

"The miners of Cobalt went out on strike July 23rd, and returned to work September 8th, but the mill could not be started until September 24th. This two month's shut down was mainly responsible for the drop in the year's production to 2,905,475 ounces, which is the lowest production (in point of ounces) since 1908.

"The net operating profit, however, was the largest in the history of the company amounting to \$2,717,312. The cost

of production was 35.6 cents per ounce, compared with 39.02 cents in 1918. The company received for the silver produced during the year, including the inventory sold since January 1, 1920, an average of  $\$1.2077$  per ounce.

"The low grade ore assayed 27.09 ounces per ton; the average in 1918 was 23.81 ounces. The profit was 72.42 per cent of the gross values of the production.

"Exploration met with better results than usual, so that the ore reserves are up 350,000 ounces from a year ago.

"Wages have been increased  $82\frac{1}{2}$  per cent since 1915, but Cobalt did not escape the epidemic of strikes which passed over the country. Since then, mine committees elected by the employees treat with their respective managements regarding local questions, and in addition a central council composed of mine managers and one employee from each mine, discuss questions affecting the camp as a whole. It is hoped that the new arrangement will work out more satisfactorily for all concerned."

Surplus of the Nipissing Mining Company was \$4,372,952 at December 31st, 1919.

The Beaver Consolidated Mines has declared a dividend of 3 p.c., payable May 31st, after a lapse of two or three years as a non-dividend payer. The statement has been made that the Kirkland Lake Mine is now on a profitable producing basis, and this is believed to be the reason for the resumption of dividends on the Beaver. The latter company, purchasing the Kirkland Lake Mine, and financing its development found its resources taxed to the limit during that period, and, now with the Kirkland Lake Mine on a paying basis, the Beaver is free to give returns to its shareholders. From this date forward, the Beaver will only receive the benefits of the profits made from the operation of the Beaver mine, but will also stand to receive the return of the \$404,000 which the Beaver advanced to the Kirkland Lake, plus seven-eighths of the total profits from the operation of the Kirkland Lake Mine. As yet, of course, net profits on the Kirkland Lake enterprise are not large, but promise to increase considerably, seeing that the President of the Company states that the broken ore underground will average around \$12 to the ton. It is stated that the mill on the Kirkland Lake operated 21 days during March and recovered \$16,145.

While it is stated that the Kirkland Lake Mine is on a paying basis, yet the margin is obviously narrow, for these reasons: In February the mill treated 2,439 tons of ore, or an average of about 84 ton a day, according to official figures. It is understood that production amounted to about \$19,000, which would indicate an average recovery of around \$7.80 a ton. Mr. Culver estimates costs at \$7.50 per ton.

The Keeley Mine, in South Lorrain is making good headway. The milling equipment purchased a few weeks ago from the Coniagas Company was transported to the Keeley before the winter roads broke up, and has left the Keeley free to carry out the work of installing the mill with the least possible delay.

Late advice from the Triangle property in Auld township in the Elk Lake district tends to show that continued encouragement is being met with at depth where heavy leaf silver is being encountered in a one-inch vein, and with good values extending well back into the wall rock.

It is believed that the recent shipment of twenty tons of ore from the Castle property of the Trethewey Company, in Gowganda, will yield between \$40,000 and \$50,000. The enterprise appears to be already on a self-supporting basis.

The Coniagas Mines will disburse a 2½ p.c. dividend plus a bonus of equal amount on May 1st. The disbursement will amount to \$200,000 and makes a total of \$9,840,000 paid to date by this company. The Coniagas has produced to date about 27,500,000 ounces of silver, and has ore reserves good for three years in advance of current production.

It is estimated that arrangements will be made to commerce operations at an early date on the Bailey-Cobalt mine, the litigation in connection with which was recently concluded.

Negotiations which may be of far-reaching importance are being carried on between the Temiskaming Mine Managers' Association and a workmans' committee with the object in view of inaugurating a system of sick benefit insurance.

**ORE AND BULLION SHIPMENTS**

During the week ended April 16th, three Cobalt companies shipped an aggregate of approximately 385,455 pounds of ore. The Mining Corporation with four cars was the heaviest shipper, this company having decided to ship an average of about one car daily for some little time. Following is a summary:—

Shipper	Cars	Pounds
Mining Corporation . . . . .	4	260,860
O'Brien . . . . .	1	64,595
La Rose . . . . .	1	60,000
<hr/>		
Totals . . . . .	6	385,455

During the corresponding period, the leading producing companies continued to withhold their bullion from the market, no shipments of refined silver being made apparently on the strength of the belief that the present recession in quotations for the metal is but temporary.

Following is a statement of ore shipments over the T. and N. Railway for the month ending March 31st. (In tons of 2,000 lbs.) :—

Cobalt Proper	Tons
Coniagas . . . . .	141.23
Dominion Reduction . . . . .	31.00
Hudson Bay . . . . .	30.46
La Rose . . . . .	43.93
McKinley-Darragh . . . . .	103.05
Northern Customs . . . . .	43.14
O'Brien . . . . .	32.13
Temiskaming . . . . .	36.00
<hr/>	
	460.94

The above shipments were made to the following Companies:—

**CANADA**

Deloro Smelting & Refining Co., Marmoros . . . . .	248.12
Coniagas Reduction Co., Thorold . . . . .	141.23

**UNITED STATES**

American Smelting & Refining Co., Perth	
Amboy . . . . .	30.46
Pennsylvania Smelting Co., Carnegie . . . . .	41.13
<hr/>	
	460.94

**PRICE OF SILVER**

March 2nd. Highest . . . . .	132.000
March 12th. Lowest . . . . .	117.000
Average . . . . .	125.551

**THE GOLD MINES**

On account of the enforced curtailment of lumbering operation caused by the spring break-up, a large number of men are seeking employment in other industries. The situation promises to benefit the gold mines in that the high wages being paid by the producing gold mines offers big attractions as compared with other work in the most northerly districts. It is thought possible that the aggregate tonnage treated by the leading mines will increase during the next month or two.

In June of 1919 the Hollinger reached the peak in point of number of men available. The same causes are again at work, and the same effect is anticipated. At that time the management was able to accumulate a big reserve tonnage of broken ore from which to draw for milling requirements toward the end of the year when a decline in the number of available men declined.

It is intimated unofficially that the Dome management has undergone a change, and that Mr. Depensier is now general manager, with Mr. Dowsitt as assistant manager. Mr. J. Jordan is mill superintendent, with F. Horne as assistant. It is also stated that the Dome will employ mucking machines underground and that hopes are entertained of being able to bring the mill up to close to 1,400 tons daily.

At the McIntyre, the tonnage being treated and the high average mill heads points to the probability of the output for the fiscal year to end June 30th to exceed two million dollars for the first time in the company's history. It has been officially stated that net profit for the period may be expected to exceed one million dollars. In addition to this, the development of the downward continuation of the main ore body at a depth of over one-quarter of a mile is serving to maintain high ore reserves in spite of the large production. A continuation of the present results is expected to result in the interim dividend disbursements to be made at increasingly frequent intervals.

With the mill on the Porcupine Crown operating at full capacity, and with half a year's mill requirements in broken ore lying on the stulls, the company is on a fair way to pile up a substantial surplus in a remarkably short time. This view is strengthened by the fact that average mill heads are in the vicinity of \$11 to the ton.

At the Wright-Hargeraves mine at Kirkland Lake a number of men have been taken on preparatory to the commencement of the big construction program. The work at hand will consist of de-watering the mine and preparing the various working faces for production pending the completion of the mill

The question of re-opening the Tough-Oakes mine is still more or less unsettled, with the indications pointing toward a beginning early in May, although this has not yet been definitely decided.

A new head-frame is being erected on the Kennedy-Boston property. A small steam driven mining plant is also being installed. This work is preparatory to continuing the shaft from its present depth of 100 feet, to a depth of 150 feet at which point considerable drifting will be done. About 5,000 logs have been cut and will be turned into lumber right away in the Company's small sawmill. This lumber will be used in connection with the construction of necessary camp-buildings.

In the Fort Matachewan district, the Matachewan Gold Mines, Limited, is being explored by use of three diamond drilling machines, one of which is owned by the company, and two of which are working under contract. It is planned to do about 6,000 feet of drilling and to complete this program by about August. The results achieved will have a vital bearing on the future course of the company.

### WELLAND SMELTER CHANGES HANDS.

The Cobalt Smelter at Welland that has been operated since 1912 by Metals Chemical Company has been purchased by The Ontario Smelters and Refiners, Limited. The plant is being altered to suit the requirements of the new owner's process and they expect to begin smelting operations early in May.

The Ontario Smelters and Refiners, Limited, will continue treating all grades of Cobalt silver ores that carry cobalt in commercial quantities. Their process of extraction has the advantage over some other processes in that it gives almost a complete recovery, not only of this silver and cobalt contents, but also the nickel, arsenic, antimony and copper.

The daily capacity of the Welland Smelter is fifteen tons. It is well equipped with cupola, mechanical furnace, crushers rolls, ball mills and chemical department.

### CLAIM RECORDING FEES REDUCED IN ONTARIO

By the new mining act introduced by Hon Harry Mills, Minister of Mines in the Ontario Legislature, there is a reduction of from \$10 to \$5 in the fee charged for recording a claim by a miner for himself. The fee for recording a claim staked out by someone else has been increased from \$10 to \$15. Another amendment is that no licensee can stake out more than three mining claims for himself or more than six for any one else in any one mining division a year. Every licensee who stakes out a claim by sending a sample to the provincial assayer at Toronto with one departmental coupon in the case of gold, silver, copper, lead or metallic iron and by sending two coupons he can get one assay made without cost for the tin or tungsten.

### SECOND INTERNATIONAL MINING CONVENTION SEATTLE, WASH.

The Second International Mining Convention on the Pacific Coast was held at Seattle, April 7th to 10th. The outstanding feature of this Convention was the attention paid to the problem of gold mining occasioned by rising prices of labour and commodities and the fixed price of the metal. Governor Emmet D. Boyle of Nevada spoke on the question from the miner's standpoint and Mr. Frank A. Vanderlip of New York presented the banker's viewpoint.

The attendance and mineral exhibit from British Columbia were fully representative. The West Kootenay Prospectors' Association was represented by its President, Mr. John Mullholland, and the East Kootenay Association by the Secretary, Mr. J. H. Huchcroft. The concentration of the exhibits and meetings under one roof made for the greater success of the meeting.

The next and third convention is to be held in 1921 in Portland.

### ASSOCIATED GOLDFIELDS MINING CO., LTD.

The Annual Meeting of this Company was held in Toronto on April 16th., several hundred shareholders being in attendance.

Dr. G. A. Mackay, President of the Company, in his address to the shareholders said that a dividend might be expected next year. Liquid assets at the end of 1919 were reported as being \$1,048,862, with total liabilities of \$11,164. During the year \$169,258 was expended in mining. A large part of this expenditure is being credited to assets as capital expenditure on development. The President said the ground for the first milling unit of 1,000 tons daily capacity had been broken at Block "D" and actual construction begins at once. The building of an additional unit will be deferred until more is known about the labor situation and transportation facilities. The President announced the Company's intention to proceed with the development of further sources of hydro-electric power, and mention was made of the sinking of a new 500-ft. shaft on Block "C."

The shareholders expressed confidence in the management of the properties, re-electing all the old Board of Directors. It was decided to extend the present stock pool until January first next, or until thirty days after the commencement of operations at the new mill.

The most important statement made was that in addition to the low-grade ore bodies on which the Company's milling equipment plans were based, two lenses of ore averaging \$11.15 a ton had been discovered. These lenses were ascertained to be 2,000 feet long, from 50 to 150 ft. wide, and had been proved to a depth of 500 ft. without indications of cutting out.

It was announced that Dr. H. C. Cooke, formerly of the Geological Survey, had been retained as the Company's geologist.

Housing for 200 men has been erected during the past year, and sufficient accommodation for a force of 500 men was contemplated before the end of the Summer. A private hospital, under the direction of the Company's physician, and a number of cottages for married employees were proposed.

### BOOK REVIEW.

MICROSCOPIC EXAMINATION OF THE ORE MINERALS. W. Myron Davy and C. Marson Farnham. First Edition. Mc. Graw-Hill Book Co., New York. 154 pages with Indices. 6 ins. by 9¼ ins. Cloth Boards.

This work deals with the technique of polishing and examining the specimen, and with the photomicrography of polished sections. The main feature of the volume is a series of determinative tables, to which a thumb index is given. The index is arranged as to order of reagents used in identification. A number of supplementary tests are detailed. The examination of polished specimens of ores is in the work referred to as "mineragraphy" following the analogy of the better known term of metallography. The work is intended for advanced students and for professional reference in the laboratory. The printing, indexing, and general arrangement of the work leaves nothing to be desired.

**BRITISH COLUMBIA LETTER.****Stewart, B. C.**

It is announced that certificates of incorporation have been issued to two companies for the operation of an express service by hydroplane between Stewart, B. C. and Long Lake, the latter being situated close to the Premier Mine and other prospects of the Salmon River section, Portland Canal District. Roy C. Price is mentioned as the organizer and the manager of the enterprise and it is said that finances are being advanced by business men of northern British Columbia and that terminal facilities have been arranged for.

Dale L. Pitt, manager of the Premier Mine, has returned to the property accompanied by two engineers, Messrs Hansen and Trojanowski, of the American Smelting and Refining Co. Mr. Pitt states that it is the intention to continue diamond drill development. The two engineers named are to supervise plans for the construction of a new mill. The company proposes to continue the shipment of high grade ore and to mill the low grade, transportation in the summer being by wagon road.

The Pacific Coast Development Co. is carrying on development of the Big Missouri and is taking in supplies over the snow so that the possibility of transportation difficulties in the summer will be obviated. The Algoncian Development Co. also is shipping in equipment both for mining and for the maintenance of camps while on the Forty Mine recent showings have been developed of a very promising character.

P. W. Racey has been appointed engineer in charge of the properties of the Silver Creek Mines, Ltd., Salmon River.

**White Horse, Y. T.**

A body of high grade copper ore has been disclosed at the Copper King Mine near White Horse and a considerable quantity has been sacked ready for shipment with the improvement of weather conditions.

**Alice Arm, B. C.**

A. J. T. Taylor, managing director of the Taylor Mining Co., having returned from Alice Arm states that it is expected that the railway will be cleared of snow and the shipment of ore by rail rendered possible sometime early in the month of May.

**Hazelton, B. C.**

The opening up of a new vein of two feet of good milling ore is reported by the operators of the Silver Standard Mine. Development is continuing. Necessary alterations and repairs have been made to the Mill and a short time ago operations were commenced, some silver-lead and silver-zinc concentrates already being ready for shipment. Because of this early start the milling season will be six weeks longer in duration this year.

**Princeton, B. C.**

The Canada Copper Corporation plans to commence milling at its new plant, Allenby, B. C., by next August. It is estimated that over 600 men will be employed this summer at the Copper Mountain Mine and at the Mill.

**Kamloops, B. C.**

A car of high grade ore from the Joshua Mine of the Donohue Mines Corporation awaits shipment to the Trail Smelter. Additional concentrating machinery is to be installed to bring the capacity of the plant up to 25 tons a day.

**Sheep Creek, B. C.**

The Motherlode Mill, of the Nuggett Gold Mines, Limited, which combines the ball, stamp and tube principles, is being overhauled and will be ready for work in May. The ore body under development continues to show up well and the Company is looking forward to a successful season.

**Ymir, B. C.**

The Mining Corporation of Canada has taken up its bond on the Yankee Girl Gold Mining Property, Ymir, B. C., and development, it is stated, is to be proceeded with on a considerable scale. Last December this company took a conditional bond on the Yankee Girl and subsequently A. W. Newberry, a New York Mining Engineer, made an examination. It is understood that there will be a new incorporation known as the Texas Yankee Girl Mining Company, under which the mine and adjoining mineral property will be developed and operated.

**Grand Forks, B. C.**

The Provincial Government has decided to undertake some diamond drilling on properties of the Franklin Camp, situated close to Grand Forks. The Mitchell Diamond Drill Contracting Company is preparing to start work under the direction of P. B. Freeland, District Mining Engineer, as soon as weather conditions permit.

**Trail, B. C.**

Employees of the Consolidated Mining and Smelting Company of Canada at Trail, B. C. have been experiencing difficulty in securing housing accommodation. So marked has the problem become that not a few have had to make homes for themselves at Rossland and Nelson, communities some distance away from the scene of their daily labors. Recently the Company recognized their employees troubles by announcing a decision to help those who wished to build homes in Trail by making loans for the specific purpose of meeting the cost of construction. The chief points of the Company's plan are that advances will be made to married employees up to \$2,500, the total allowed in no case to be over 80 per cent of the estimated value of the lot and the building, that the sum granted shall be repayable both as to principal and interest in monthly instalments extending over four, six, or eight years; and that the loan shall be secured by a first mortgage on the property. While the Company expresses the wish that those building adopt of the one standards plans which are being provided this is not being made a necessary part of the agreement.

Ore receipts in gross tons at the Consolidated Mining and Smelting Company's Trail Smelter for the week extending from the 22nd to the 31st of March last were 7,271 tons, making the total for the year 73,246 tons.

**Victoria, B. C.**

An amendment has been passed to the Iron Ore Bounties Act of British Columbia extending the period of its operation to 1925. This legislation empowers the Provincial Government to pay a bounty of \$3 a ton on pig iron manufactured in British Columbia from local ore and \$1.50 a ton on pig iron produced from ore produced outside the Province.

The British Columbia Government proposes a radical innovation this year for the stimulation of interest in the mining industry and for the assistance of returned soldiers. Last year \$2,000,000 was voted to provide funds for the bonusing of local industry. Not all of

this was loaned and the Provincial Legislature is being asked to supplement the appropriation by some \$500,000, of which \$50,000 is to be set aside for the financing of returned soldiers desirous of going into the hills in search of minerals. The details have not yet been worked out but Hon. Wm. Sloan, Minister of Mines, is understood to contemplate the sending out of about thirty parties this summer, each party to be composed of two of whom one shall be an experienced prospector and the other a man who, by reason of his overseas service, is entitled to special consideration. In the case of each party the government will take the place of the provider of the time-honoured grub-stake. Discoveries will be recorded as provided under the Mineral or Placer Acts and the government, no doubt, will expect to be reimbursed where the prospectors meet with success. More particulars will be available later but meanwhile it may be stated that the authorities feel that, although this is an advanced policy, attractive theoretically but somewhat doubtful as to the results to be expected on practical application, it may serve the twofold purpose of inspiring the prospectors with renewed energy and enthusiasm and giving a hand to those veterans who feel that they wish to change from former sedentary occupations to a life in the open.

The "Allied Forces Exemption Act" of British Columbia has been amended at the present session of the Provincial Legislature in order that its provisions may continue in force until 1921. It also is made to apply to placer claims whether held by record or lease under the Placer Mining Act. This simply means that returned soldiers who held mineral or placer properties in this Province at the time of their enlistment are given a further period to get on their feet before the obligations set out in the Mineral and the Placer Acts are applied to them.

The construction of a concentrator at the Sunlock Group of Mineral Claims, Jordan River, Vancouver Island, will not be proceeded with immediately, such a decision having been reached at the recent annual meeting of the shareholders of the Coast Copper Co., Limited. The recommendation of the board of directors to make a bond issue of \$500,000 was endorsed. This fund is to be used on further development and when the ore reserves assure a daily output of 500 tons, and construction conditions are satisfactory, a concentrator will be installed. The President's report stated that the work of the year had practically doubled the ore reserves and that new locations now give the property a total of twenty-three claims and several fractions with a total area of about 968 acres. Test shipment sent to the Trail Smelter during the year proved the Sunlock ores to be readily amenable to the flotation process of concentration. Development, it was decided, will be continued; ore blocked out; and, such as may have to be mined, stored, so that when the time comes to provide a concentrator there will be available and in sight a sufficient supply to maintain operations indefinitely. T. W. Bingay, is the president and A. N. Skill the secretary while the old board of directors was re-elected as follows: W. R. Winter, W. O. Miller, P. W. Racey, Stuart Campbell, and W. M. Archibald.

#### Texada Island.

The Calumet and Arizona Mining Company is reported to have purchased the Cornell, a copper property belonging to the Van Anda Group, which was lo-

cated some 20 years ago and worked for a period. The property was bonded to the present purchasers two or three years ago. It is the intention to instal the plant necessary to clear the main shaft of water and then to prospect by drilling about 2,000 feet of diamond-drill borings. This work will be undertaken this summer.

#### MANITOBA LETTER.

By C. A. MILLICAN, Winnipeg.

The Gold King Mines, Ltd. has acquired a half interest in two claims lying south of, and between the company's holdings and Hole River Lake. These will give the company frontage rights in the Lake about half a mile long, and have been secured chiefly with that object in view.

Mr. Victor Mattson, who owns these claims, and who is in charge of operations in the Gold King properties has so much faith in the district that he declined an offer for the full rights. Up to date there has not been much prospecting done on them, but Mr. Mattson evidently expects to find some rich veins, hence his reason for obtaining a half-interest.

It is the intention of Marigold Mine to discontinue sinking in the near future and devote available funds for surface stripping. An assay of ore from the bottom of the 30 feet shaft shows value of slightly over \$10 per ton on a 6 ft. vein.

Mr. Beckman, Managing Director of the Gold Pan Extension Mine, has returned from a trip to the property. Mr. Beckman states that the buildings are all completed, and active mining operations are being carried on.

The four drill compressor is not yet working, but sinking is being carried on by hand drilling for the present. Very shortly the compressor will be in commission when sinking will proceed at the rate of 100 feet per month.

The vein in the shaft is 5 feet wide, composed of quartz and schist, between well defined walls. A crew of fifteen men are at present working, sinking being carried on by double shifts.

Work is progressing steadily at the Gold Pan Mine. The drift to the south at the 200-foot level is now about 115 feet from the shaft.

A movement is on foot to organize a Trading and Transportation Co. to handle the business of the Rice Lake District. Undoubtedly there will be a heavy movement, both in people and supplies, in that section of the country this season.

#### OTTAWA WILL NOT DISALLOW BRITISH COLUMBIA LEGISLATION REGARDING DOLLY VARDEN MINE.

The Minister of Justice has refused the application for disallowance of the legislation of the Province of British Columbia regarding the Dolly Varden Mine. Solicitors for the Dolly Varden Mines Co., Ltd., the original owners, will now seek to establish through the Courts that the Act passed by the B. C. Legislature was ultra vires, and that the persons presently in charge of the mine are liable for damages for trespass and to account for all monies realised from the working of the mine.

# Associated Goldfields Mining Company, Limited

HEAD OFFICE: TORONTO - MINES: LARDER LAKE, ONT.

CAPITAL - \$5,000,000

ANNUAL MEETING, APRIL 16, 1920

## PRESIDENT'S ADDRESS TO THE SHAREHOLDERS:

To the Shareholders:

Your Directors have much pleasure in submitting their report of the operation of the Associated Goldfields Mining Company, Limited, for the year ending December 31, 1919. Accompanying the report are statements as to the physical condition of our mining properties at the time of this annual meeting, and reference to the company's development and construction policies.

It is with considerable pride that your Directors call attention to the enviable financial position of the company. At December 31, 1919, the company's liquid assets were:

Cash on hand and in the banks	504,778.44
Victory Bonds	93,883.96
Notes receivable	450,000.00

Total . . . . . \$1,048,662.40

Total liabilities were:

Trade accounts payable	\$6,897.32
Wages accrued	4,266.75

Total . . . . . \$11,164.07

Of the authorized capital of 5,000,000 shares of a par value of \$1, there remained in the treasury at the end of 1919, 1,073,588 shares.

To bring these figures closer to the date of this meeting, we have certificates from the banks, showing cash on hand at March 31, 1920, \$737,580.55; Victory bonds, \$87,821.84, and notes receivable, \$275,000. Therefore, after large expenditures for labor, supplies, materials and equipment during the past three months, we had at March 31 approximately \$1,100,000 in liquid assets.

### Mining Expenditures.

During the year 1919 more money was spent on developing the properties than in all previous years combined. The sum of \$169,258.62 was expended, the chief expenses being wages, supplies, diamond drilling and freight. A large portion of this sum has been considered a capital expenditure and has been transferred to assets as capital development.

### Mining Results Obtained.

Splendid results were obtained during the year, and the physical condition of our three main mining properties was greatly improved.

At Block "B" mining work has been carried on vigorously, and highly satisfactory results are being secured on the three hundred, four hundred and five hundred foot levels. It is felt that development and exploratory operations should be carried on further before engineers draw conclusions as to the character and extent of the ore bodies and the type of mining and milling operations most suitable for their treatment.

### High-Grade Ore Bodies.

On Block "C" and "D" our endeavors to develop a large body of ore, approximating \$5 a ton in value, have been very successful, and these endeavors have been unexpectedly satisfactory in that we have located and partially bounded two wide lenses of considerably higher grade ore.

Underground workings and diamond drilling have shown these high-grade lenses to have a known length of 2,000 feet each, and each averages from 50 feet to 150 feet in width. Diamond drilling shows these bodies to exist at least 500 feet below surface. The average value of these high-grade lenses, over the areas covered by these dimensions, is \$11.15 a ton.

As development and exploration of these two high-grade lenses is still proceeding, and the boundaries have yet to be exactly fixed, it is not deemed advisable to present at this date

an estimate of the total tonnage of high-grade ore here existing, but there is unquestionably sufficient high-grade ore to supply for years a mill of 2,000 tons daily capacity.

### Low-grade Ore Bodies.

These high-grade lenses are enclosed in an exceptionally extensive body of low-grade ore, with a width of from 400 to 500 feet. The removal by selective mining of the high-grade material will not interfere with the later mining and milling of the low-grade material on the large scale originally planned.

The company now finds itself in the enviable possession of high-grade ore sufficiently proven and developed as to fully warrant the immediate commencement of a mill of at least 1,000 tons daily capacity. We possess enough ore of high value to assure profits from milling operations of this size, comparing well with the probable profits from the treatment of a much larger tonnage of lower grade material. Therefore returns will result earlier than anticipated.

### First 1,000 Tons Milling Unit.

The ground for the first milling unit of 1,000 tons daily capacity has been broken at Block "D," and actual construction begins at once.

A decision as to the building of an additional and adjoining unit of 1,000 tons depends on a study now being made as to probable labor conditions of the near future, and as to how far delivery of mine and mill equipment will be affected by the transportation facilities existing. Your directors desire to emphasize that the construction of first units is in the nature of steps toward the ultimate aim of gold mining plants of an aggregate daily capacity of 10,000 tons.

### Railway Facilities.

The company's consulting engineer, in advising the construction immediately of the first milling plant, also advises that the most complete development of the properties and the largest production of gold, of which our mines are capable, depends on the building of a branch line from the T. & N. O. Railway to Larder Lake, a distance of twelve to sixteen miles, according to which route is chosen. This question of railway facilities is under the consideration of your Directors.

### To Develop Additional Power.

To provide sufficient energy for enlarged mining and milling requirements, as well as other demands, the Directors have decided to proceed immediately with the development of further hydro-electric power.

### New 500-foot Shaft.

Work at Block "C" on the sinking of a three-compartment shaft has been commenced. The first objective is 500 feet. Stations, stoping-levels, electric tramping levels, ore pockets, etc., will be established at intervals. From this shaft will be developed and drawn a large part of the high-grade ore referred to above. As these bodies to a considerable extent have been opened and prepared for stoping in our existing underground workings, there seems every reason to expect that with the workings from the new shaft producing ore, a large tonnage will be accumulated when milling operations commence, and that a constant supply of ore will be maintained.

When weather permits, the diamond drills will be brought from underground, and further exploration of ore bodies will be resumed from surface, the immediate object being to learn the total length of the high-grade lenses.

### Accommodation for 500 Men.

During the past year the company constructed accommodation for 200 men, and these living quarters and dining-halls will compare favorably

with the best in the mining districts of northern Ontario. As the scope of our operations is increasing rapidly, the company is proceeding with the construction of further quarters, so that, by summer, 500 men may be accommodated. Among the new buildings will be a private hospital, under the company's resident physician, and a number of cottages for the married men of the staff.

### Appreciation of Staff.

The Directors desire to express their appreciation of the loyal and able services of all members of Associated Goldfields forces. The company is very fortunate in its possession of the services of Mr. A. J. Moore, the consulting engineer. He brought to his work with us the benefits of a long and thorough technical education and the experience gained in thirty years of managing some of the largest mining and metallurgical operations on this continent.

### Dr. H. C. Cooke Engaged.

To its staff of mining engineers the company, your Directors are pleased to announce, has been able to add Dr. H. C. Cooke, who for many years was with the Geological Survey Dominion of Canada. Dr. Cook is now engaged in his duties as the company's geologist. Two other graduate mining engineers are also on our technical staff.

In conclusion, your Directors wish to assert that since our last meeting they have accomplished all that they set out to do, and much more than they anticipated doing. At the properties the discovery and development of gold-bearing bodies has exceeded their most optimistic expectations. In the important matter of financing the company to the stage where its mines are adding to the country's production of gold the Directors desire to say that their work is already completed. No further stock need be offered for subscription. On November 11th, 1918, the day of the armistice, the company had \$5,000 on hand above the liabilities. At the time of our last annual meeting, on April 10th, 1919, the company had on hand \$160,000. Since this last date approximately \$260,000 has been expended at the properties, and to-day the company possesses cash, bonds and similar resources of \$1,100,000.

With gold-bearing bodies of large dimensions, and profitable values proven, there remains the task of bringing the company's mines to the broadest stages of production and fullest return on investment. Now that ample financial resources have been secured, we have complete confidence that our mine management and forces will successfully accomplish this task.

For the Directors:

G. A. MacKAY,  
President.

The Board of Directors was re-elected.

Geo. A. MacKay, President; A. A. McFall, Vice-President; A. Singer, J. Dinwoody, D. H. McCartney.

The following were elected members of the Advisory Board: James Langskill, Geo. H. Smith, A. N. Burns, Senator V. Ratz, G. M. Hendry, Capt. J. J. Walters, Jas. Dohson, Samuel Harrop, F. W. Fisher, Robert Smith, W. T. Taylor, Chas. D. McGregor, Walter Page, Orrin Kolb, Simon Sinclair, W. T. McClain, Alfred Singer, John H. Taylor, Dr. R. K. Anderson, M.P., Scott L. Cowley, B. Stone, W. H. Smith, W. H. Despard, J. Robinson, A. B. Rose, Henry Goldwater, J. A. Wilson, M.D., W. A. Johnson, William Schnelder, C. W. Schiedel, F. Powell, A. J. Gough, Jos. Bamford, S. B. Gundy, F. Jacobi, A. Butler, S. W. Jenckes, H. H. Stevenson.

# A MARSH HOIST

## IS MADE THE RIGHT SIZE FOR YOUR MINE

and in either Steam Power or Electric Power

This shows one of our Electric Mine Hoists. We make many other types. Send for our catalogue of Mine Hoists, Cars, Cages, Buckets, etc., and see what we offer you. It will repay you.

From the little 10 Horse Power size for prospectors or small mines to the massive 50 Horse Power size, one of our 7 sizes should be just right for your mine.

We are specialists in the building of Hoisting Machinery of all sorts. For nearly a quarter of a century we have been designing and building Hoists, and have developed a Hoist that we are really proud of—proud because of the record of good work they have done, and are doing in mines, quarries, and other classes of work from one end of Canada to the other.

## MARSH ENGINEERING WORKS, Limited

ESTABLISHED 1846

BELLEVILLE, ONTARIO, CANADA

Sales Agents:—MUSSENS, LIMITED, Montreal, Toronto, Winnipeg and Vancouver

### THE CANADIAN INSTITUTE OF CHEMISTRY

The Canadian Institute of Chemistry came into being in May, 1919, by vote of chemists of Canada assembled in convention, and shortly after, the first meeting of the original members was called when the following officers and Council were elected:—

President: J. Watson Bain, University of Toronto.  
Vice-Presidents: George Baril, M.D., Laval University; Dr. A. McGill, Chief Chemist Dept. Trade and Commerce, Ottawa; R. D. Mc. Laurin, University of Saskatchewan.

Councillors: G. R. Ardagh, University of Toronto; Dr. J. S. Bates, Price Bros., Ltd., Kenogami; Dr. Harold E. Biglow, Mt. Allison University; S. J. Cook, Dept Trade and Commerce, Ottawa; J. A. Mc. D. Dawson, Dept. Trade and commerce, Vancouver.; Dr. L. F. Goodwin, Queen's University; I. Grageroff, Canadian Explosives, Ltd.; A. Lehmann, University of Alberta; Matthew A. Parker, University of Manitoba.

At the present time the Institute numbers 113 Fellows, and three Associates, together with H. R. H. the Prince of Wales, who graciously consented to become an Honorary Fellow.

Mr. Harold J. Roast (393 Guy St., Montreal) is the Secretary-Treasurer.

The Institute represents Canada on the Board of the inter-allied Chemical Union.

The following extracts from the Constitution set forth the objects of the Institute and the qualifications required for membership:

Objects of the Institute:—

"A" To raise the profession of Chemistry to its proper position amongst the other learned profession, so that it may

attract a larger proportion of the best intellects and thereby secure a supply of trained Chemists adequate to the growing industrial needs of the country.

"B" To form an organization immediately available for consultation by the Government.

"C" To protect the public by gathering together a body of men who may be consulted with confidence.

"D" To look after the professional well being of the Chemists by:—

1. Having a registration bureau for Chemists.
2. Having social centres for Chemists and Chemists only.
3. Maintaining an employment bureau for Chemists.
4. Having centres for the interchange of Scientific experience, by both papers and lectures.
5. Maintaining a clearing house of available chemical knowledge, including a library and suitable register that would enable the central bureau to put one Chemist in touch with that other chemist, who might be able to assist him in his particular problems (leaving it to the parties interested to arrange details as to recompense or otherwise).

"E" To secure such Government recognition as may from time to time be deemed advisable.

"F" To maintain a professional association for professional men.

"That the membership consists of two classes: Fellows and Associates, of either sex, the former having the right to use the letters F.C.I.C., and the latter having the right to use the letters A.C.I.C.

"That the following be the requirements for Fellows:—

- (a) One who shall be of the age of twenty-five or over, being a graduate of a recognized University, having a four years course in Chemistry or Science, and who can satisfy the Council that Chemistry, Pure or Applied, has been his major subject, and who has been actively engaged in the pursuit of Chemistry in a responsible capacity for two additional years.
- (b) One who shall be of the age of twenty-five or over, being a graduate of a recognized University, giving only a three year course in Chemistry or Science, who can satisfy the Council that Chemistry, Pure or Ap-

plied has been his major subject, and who has taken another year's training in Chemistry, at a University, and has had in addition two years experience in Chemistry in a responsible capacity in a laboratory approved by the Council, or under the direction of a Fellow of the Institute. If the additional year at a University is not taken, then three years training in a responsible capacity in a laboratory by the Council.

- (c) Those who do not qualify under (a) or (b) being of the age of twenty-five or over, shall have held a position of responsibility in Pure or Applied Chemistry for not less than five years and shall be examined by a Board appointed by the Council. The Candidates shall be examined on the theory and practice of Chemistry with special reference to the branch of Chemistry in which they have been engaged. This examination may be waived at the discretion of the Council if the Candidate was engaged in Chemistry at the date of the inauguration of the Association and has held a position of professional responsibility for not less than eight years.

"That the following be the requirements for Associates:—

Persons being under twenty-five years of age who would otherwise be eligible for membership as Fellows under provisions a, b, and c, the requirements under a and b regarding the practice of Chemistry in a responsible capacity for two years being waived.

"An Associate upon reaching the age of twenty-five years may become a Fellow providing he is recommended by three Fellows and has been engaged for at least two years in the practice of Chemistry pure or applied, and is otherwise eligible as a Fellow.

"An Associate upon election to a Fellowship shall pay the difference between the initiation fee for Fellows and Associates.

"The Council reserve the right to refuse admission to any applicant, or to remove any member for sufficient cause.

Fees:—The entrance fee for Fellows be Ten Dollars and Annual Fee Ten Dollars.

The Entrance for Associates be Five Dollars and the Annual Fee Five Dollars.

**METAL QUOTATIONS.**

Fair value for ingot metals at Montreal, April 30th 1920:

	Cents per lb.
Electro Copper . . . . .	24
Castings Copper . . . . .	23½
Lead . . . . .	11
Zinc . . . . .	10
Tin . . . . .	71
Antimony . . . . .	13
Aluminum . . . . .	40

**UNDERGROUND TEMPERATURES IN THE KENT COALFIELD.**

In the course of an article on the Kent Coal Field in the "Financial News" (February 13), Dr. William Galloway gives some particulars in regard to some of the deeper seams encountered in the course of development. Thick seams have been found at Barfreston (3,318 feet depth, 9ft. 6in. thick); Stonehall (3,332ft., 8ft. 7in.) and Maydensole (3,760ft., 5ft. 8in.). These depths verge upon the maximum of 4,000ft. below which the Royal Commissions of 1871 and 1904 thought that coal could not be worked in this country on account of the increase in temperature of the strata. The Commissioners estimated the rate of increase (geothermic gradient) to be 1 deg. Fahr. for every 60ft. of additional depth below a plane parallel with, and 50ft. below, the surface, at which the temperature of the strata does not fluctuate, and is the same as the mean annual temperature at the surface, namely, about 50 degs. Fahr. in Kent. Some seams will probably be found at a greater depth than 4,000ft. in Kent, more especially south of Stonehall and under the Channel, and for that reason the following observations of the rock temperature in Snowdown and Tilmanstone collieries are of interest. Those made in the Beresford seam at Snowdown and Tilmanstone, and in the Hard seam at Snowdown, were taken with the thermometer, and in the manner specified by the Committee on Underground Temperature of the British Association; that in the seam at 3,011 ft., at Snowdown, with an ordinary thermometer placed in a bore-hole in the coal:—

	Temp. Fahr. Deg.	Av'ge depth. Ft.	Geothermic gradient. Ft.
Beresford at Tilmanstone and Snowdown . . . . .	74	1,500	60
Hard (Snowdown) . . . . .	80	2,240	60
Seam at 3,011ft. . . . .	90	3,011	75

The geothermic gradient from a depth of 50ft. below the surface to the Beresford seam is 1 deg. Fahr. for every additional 60ft.; that from the Beresford to the seam at 3,011ft. is 1 deg. for every additional 94ft. This decrease in the gradient with increasing depth is not unusual. If it holds good in other parts of the field, and at greater depths, the temperature of 113 degs. Fahr. will not be reached in Kent until the depth is rather over 5,000 ft., or 1,000ft. below the limit imposed by the Commission.

# EDITORIAL

## The Choice of Underground Illumination

A recent advertisement of a well-known type of oil safety-lamp under the caption "Fortunate Escape from Fearful Disaster" relates that on February 27th a blower of gas filled the workings of the Ponthenry Mine in Gwendraeth Valley, South Wales, and extinguished all the lamps. It is assumed that the fortunate escape of all the workmen, save one, was due to the use of the oil safety-lamp, and the advertisement proceeds: "One shudders to think what would have happened if the pit had been fitted with electric lamps wherewith the men could have gone on working until they had all been fatally overcome with gas." The supposition is a very large one, and is open to a good many qualifications.

The writer recollects an occurrence of this nature in South Yorkshire, where a blower of gas issuing from the floor fouled the intake air up to the fan-drift itself. The workmen in the district affected remained at work until their lamp gauzes were red-hot. The boys at work became frightened quickly and made for the slope-mouth, but the men had to be fetched out by the officials. There was little doubt of the nearness of a disaster in this instance, and one defective lamp would have caused an explosion.

In the absence of particulars as to the nature of the gas in the blower at Ponthenry Mine, it would be useless to comment on the rapidity with which the safety-lamps are stated to have been extinguished, and, if the gas were methane, then it must have been in tremendous volume, containing a non-explosive atmosphere (and of course non-respirable) near the blower, and an atmosphere of limitless explosive possibilities on the fringe of the gas-filled district where admixture with air in explosive proportions presumably existed. Under such circumstances the extinction of the oil-flame lamps was not an unmixed evil, as it lessened the danger of explosion in escaping from the mine should a defective lamp have been present. At the same time, the men lost their lights, and presumably had difficulty in escaping in the dark.

What would have been the conditions had the mine been worked by electric lamps? There would without doubt have been provided the necessary number of oil-lamps, in the hands of officials, for the very pur-

pose of detecting a condition of the mine atmosphere dangerous to life. Such a condition might arise from the presence of inflammable gas, but might also be caused by the presence of carbon di-oxide, which the oil-lamp would show; or the presence of carbon monoxide, which the oil-lamp would not indicate. Warning would have been given and the men could have escaped, but without running the danger of causing an explosion at the point where an explosive atmosphere existed.

We believe the incident quoted in the advertisement referred to is just as good an example of the dangers of the oil-lamp as it is of the electric lamp. The electric lamp has only one drawback to its general use in collieries, and that is its inability to detect atmospheric changes. This drawback can be easily overcome by appointing officials, who would carry both oil and electric lights, to observe atmospheric conditions and take the necessary measures.

The chief defect in the oil safety-lamp is the insufficient and partial nature of the illumination it gives, and there is no question at this date but that the oil safety-lamp is the cause of miners' nystagmus. The evidence accumulated on this point by Sir Josiah Court, and recently published, is overwhelmingly convincing, and it is an instance of the paralysing effect of an accepted idea that the oil safety-lamp should have remained for so many years in general use, despite the unsatisfactory nature of the illumination it afforded. The portable cap-light type of electric storage-battery lamp affords an ideal illumination for the miner, and as the idea gradually gains force that any form of flame is objectionable in a colliery, whether it is protected by gauzes or not, the electric miners' lamp will come more and more into favor. Only those who have had experience of colliery lamp-house reports know just how many things can happen to an oil-flame safety-lamp to make it anything but what it purports to be. The additional expense connected with electric lamps, as compared with flame lamps, is not of sufficient importance to cause hesitation in adopting the electric lamp once it is acknowledged that the incandescent light is safer than the flame.

## Propagandists of Hate

Propaganda may be cunningly disguised, but it is usually possible for the discerning reader to distinguish the well-timed and recurrent contributions of the propagandist from the ordinary news of the dailies and periodical press.

It is not difficult, therefore, to detect in the unusual amount of space that the newspapers of the United States and those of the British Empire are devoting to oil occurrences and their exploitation the influence of the powerful rival groups of interests that seek the domination of the oil occurrences of the World.

There is nothing that is inherently wrong, or even novel, in this quite apparent condition, if the protagonists of the competing interests will confine themselves to proper limits of discussion. In astuteness and vision, the financiers of the United States and those of the British Empire are a fair match. They have many times in the past pitted their wits against each other, or have combined them against a common rival, as may have seemed to them at the time desirable, without rancor, and according to the ethics of the business game. All they have hitherto asked has been a fair field and no favor. Each has placed a premium on brains, and has been willing to pay good money well for services rendered.

Latterly, however, another and a less worthy spirit seems to have obtained prevalence, although it has not yet obtained predominance. This spirit is traceable to injudicious, provocative and short-sighted propaganda, emanating from private interests, but purporting to express national and racial ambitions. Strangely enough, this overdone and false expression of national aims is a product of the war. It might have been thought that the example of the Prussian, who discussed world trade in terms of military strategy, and made such an awful mess of his grandiose plans, would have cured the other nations of a similar wicked obsession, but on the contrary, the virus has spread, and those who before the war were business friends and won the war together, now see their comradeship endangered by newspaper writings that dilate upon ordinary competitive business affairs much as an Economic Committee of the Prussian General Staff might have reported to their War Lord.

There are some phases of a nation's internal economy that call for publicity, and the inculcation of a national concern; such as for example, the fuel problem of Canada. This is a question of national defence, because it is essentially a question of national existence. Public discussion of such matters is desirable, and should be frankly undertaken in the open. Our friends in the United States—that is all those whose friendship is worth having—will take no umbrage if Canada undertakes to become thoroly self-sup-

porting wherever it shall prove possible. They will admire us for so doing, and conversely they will secretly despise us if Canada unnecessarily places herself in a mediant attitude. On all such questions open discussion is possible, because the matter is one of public interest.

But apart from pressing matters of our own internal economy, of which coal is the most typical instance, nothing is to be gained, and much may be lost by irresponsible discussion in the newspapers of the supposedly high strategic aims of the political leaders of the United States and the British Empire, aims that do not exist, but which, correctly interpreted, will be found to bear on the real aims of rival oil interests. Apparently these people do not care whether they embroil the United States and Mexico in war, or whether they split the alliance between Britain and the United States that won the war, but looks like losing the peace; causing some people to wonder whether civilization can even yet be saved, and whether it is really worth saving, if all the people of North America have gained from their fighting comradeship has been the absorption of the Prussian viewpoint.

The journalist, or paid propagandist, who endeavours to cause friction between the United States and the British Empire is a most dangerous criminal, and he is especially dangerous in Canada. We suggest that cables from London Sunday newspapers, which appeal to an audience which is not representative of the sentiment of the British Empire, and is certainly not representative of Canadian sentiment, should be read with large allowances; and that, similarly, items appealing to similar audiences in the United States, relating to the malign purposes of the British in securing oil concessions in the Himalayas or round the Great Slave Lake in Canada, for example, should be generously discounted. Also, it would be much better for the oil interests, and for the peace of the world, if these gentlemen would be frank about their commercial aims, and would discontinue their pretence to pose as the champions of national aims, and as the exponents of grandiose schemes that are not one whit better morally, and just as likely of success, as the proposals of Von Bernhardt in "Der Naechste Krieg".

Bolshevism is originally a reflex of the disillusionment of deceived men who have seen their genuine love of country prostituted to base uses by rulers who dreamed and planned wickedness. This is the grain of truth behind the puzzling belief of labor that capital caused the war, and those who play fast and loose with patriotism for purely commercial ends are toying with the same forces which were unloosed in a recent war that is still running its course despite official peace treaties.

*ECONOMIC DEPENDENCE OCCASIONS  
POLITICAL SUBSERVIENCY.*

It is not necessary, in a Canadian paper, to discuss the taste of Senator Underwood in speaking of the Crown Lands of Canada as though they were an adjunct of his own country. Canada believes she has the right to decide what she will do with her own, and any talk of retaliation by the United States is a challenge to Canada's sovereignty and a threat against the comity of nations.

The threat to place an embargo on coal and sulphur will be of interest to our readers only as a further instance of the necessity for Canada to become self-supporting in the matter of coal supply. The Canadian coal market is not really a question of much importance to the United States' producer. A country that can mine 700,000,000 tons of bituminous coal, and 90,000,000 tons of anthracite annually, and could probably with ease reach an output of a billion tons annually if it so desired, is not likely to worry much about the small tonnage it imports into Canada, although that tonnage from the Canadian point of view is a question of the supremest importance. It is nothing to the United States, but it is life to Canada.

This paper has endeavoured to present the national aspect of coal production in Canada, and we have urged that dependence upon a neighbour for a raw material that is a prime necessity of national existence must inevitably lead to political subservience. This is exactly the threat implied by Senator Underwood, who, because Canada is so largely dependent upon the United States for coal, argues that this fact gives the United States a lien and a prescription upon our pulpwood resources.

These may be harsh words, but they are not harsher than the facts warrant. If Canada, through desire for ease, and a disinclination to tackle the difficulties of our fuel problem, puts herself in the position of a poor relation, then we must put up with insults and reminders of our dependency.

Senator Underwood does not mention, when he puts United States' cotton against Canadian pulpwood, that cotton is an annual crop, and that our pulpwood is a heritage that carries an entail, and is not replaceable.

Canada can buy cotton elsewhere within the British Empire. She can produce all the sulphur that is necessary from her own mines. And she can produce—if not all the coal our country requires—very much more than Canada has ever yet produced.

It is not so long not ago that Mr. McAdoo suggested the purchase of the British West Indies by the United States. Mr. McAdoo had apparently overlooked Mr. Wilson's pronouncement on the handing over of populations to foreign jurisdictions, which of course was

only a pronouncement, and is not yet a part of international law. But what is most disturbing about Mr. McAdoo's suggestion is that anyone in his position could conceive that there was any power resident within the British Empire that could "sell" British soil and British citizens and voters. Citizens of the United States, no matter how exalted their position in their own country, have no right to discuss the internal politics of Canada, the West Indies, or any other part of the British Empire. If they do, then they presume, and lay themselves open to the dangers of minding other peoples' business.

It is not likely that the United States, through its official representatives, will be associated either with Mr. McAdoo's suggestion, or Senator Underwood's remarks, because the limitations of national sovereignty are well understood, and such suggestions would receive the answer they deserve. It is not surprising to know that Senator Underwood, when asked as to the attitude of the State Department, said "he believed it was one of hostility". In other words, it is a correct attitude.

The lesson is that no country should voluntarily, and unnecessarily, place itself in a position of economic dependence. In the matter of coal supply, Canada has done this.

---

**CONSOLIDATED MINING AND SMELTING COMPANY ADOPT GROUP INSURANCE FOR EMPLOYEES.**

Today about eighteen hundred employees of the Consolidated Mining and Smelting Company of Canada, Limited, are protected under the Group Insurance system of the Sun Life of Canada.

Announcement to this effect has just been made, the Consolidated Mining and Smelting Company taking out a group insurance policy covering the men of the British Columbia plants including the big smelting plant at Trail, B.C.

The Consolidated Company treated every employee alike, this in spite of the fact that a number of miners are employed by them, the officials decided to pay the large extra premium in order to bring all under the group system of insurance.

Group Insurance is rapidly making headway in Canada and the policy just issued calls for the payment of \$500 to the widow or relatives of every employee, who has been working for the company for six months, the amount of insurance increasing \$100 for every additional six months' service, with a maximum of \$1,500.

The company have a number of returned soldiers and sailors in their employ. The length of service of these men for the company before the outbreak of war will be taken into consideration. This is an exceptionally good feature, which the returned men appreciate.

## Correspondence

### Peace River Oil Formations.

The Editor

"The Canadian Mining Journal."

Dear Sir:—

The following paragraphs appeared in the Journal of April 9th, page 292, which are part of Mr. D. B. Dowling's address before the Annual Meeting of the Canadian Mining Institute.

"On the plains most of the prospecting has of late years been centred in the Peace river valley, where several wells averaging eleven hundred feet in depth pass through sands impregnated with heavy oil. The flow is necessarily slow and although the presence of oil seems to be proven, no production has been attempted possibly on account of the trouble with water which can generally be attributed to insufficient or defective casing, and to lack of restraint on the part of the operators in drilling through the oil sand into the water bearing bed which lies below it."

"The belief that is so general among the drillers, that the really profitable oil horizon is in the limestone of the Devonian which lies beneath the oil impregnated sands of the lower Cretaceous has led indirectly to the spoiling of several possible productive wells in the Peace River field, as with the object of reaching the limestones, borings have been continued below the heavy oil of the Cretaceous into the water-bearing beds which overlie the Devonian limestone."

The writer has had for a considerable period conditions, as exist in the Peace River District, under investigation, and does not admit of the correctness of Mr. Dowling's statement.

In reading Mr. Dowling's address other references are made to the possibilities of finding oil in the middle Devonians, and I quite agree with Mr. Dowling as to such a possibility; but in my mind should oil be found in this formation, it will occur merely in segregated pools, and therefore will not lead to an oil field of great production. The characteristics of the field would be more or less similar to the Western Ontario field, which field is not to be depreciated in any way, but if a similar field were found in the Sub-Arctic regions (comparatively speaking), it would have little commercial value, owing to conditions of transportation, population, etc. Such a field, however, would be a great boom to the immediate vicinity.

Without doubt the management and operation of drilling in this Northern region have been carried on very inefficiently, and I believe this condition to be wholly responsible for the failure in reaching a point where the wells could be claimed even a successful prospect.

Personally I know of no operators who have ever had the intention of drilling to find oil below the limestone. (This of course with the exception of those wells which were started at the limestones). Such a decision might have been formulated after close ex-

amination of logs, once the limestone was reached. Further, I know of no information which would lead one to believe that the sandstone in which the large flow of water and natural gas was encountered was a sandstone directly above the limestone, but indeed to the contrary. I have been informed that one well, after sinking through about thirty feet (30 ft.) of this water and gas bearing sandstone, reached a quite impervious shale, but which they were unable to drill into more than five feet (5 ft.) before the high pressure above caused their casing to fail. The claim was made that previous to failure no water was entering their well, while in this shale. (I cannot vouch for the correctness of this information.)

The occurrence of heavy oil at various depths, and last the heavy pressure of gas and water, when considered in connection with conditions existing in other oil fields, brings out that the only decision possible of any operator would be to continue drilling to prove conditions as far as the limestone. It is not at all unlikely that the water and gas-bearing sandstone would be found considerably above the limestone and separated from it by considerable thicknesses of more or less impervious shale. If under this pressure these conditions existed, and if the formation immediately above the limestone were of a porous nature, it is not out of the way to state that conditions are well suited for the accumulation of oil in large quantities. (It must be understood that other characteristics of the field are to be taken into consideration in making this statement.)

The lot of the engineer is not the easiest, as it is quite impossible to foretell the existence or otherwise of oil, but it is quite possible for him to select locations after very detailed investigations where conditions are structurally best suited for successful operations.

From the result of detailed surveys I believe the limestones will not be reached at the location immediately below Peace River Crossing (Tar Island anticline), till about sixteen hundred (1600 ft.) and possibly more. The water and gas pressure was encountered at about eleven hundred (1100 ft.), which allows considerable leeway for conditions as outlined above.

If Mr. Dowling's position and reputation were other than they are, namely: the very best, I would not criticize in any way the statement, but when given publicity Mr. Dowling's statements are serious, and I believe in this case would bear considerable influence in affecting adversely the continuation of legitimate operations in the field mentioned.

The heavy oil encountered may at some later date prove to be of commercial value, but I distinctly doubt its value at the present date. It is regrettable that the operators did not take better care of their casing, so that the high water pressure could be controlled, and even now strenuous efforts should be taken so that this water pressure can be excluded from the upper oil bearing strata.

Mr. Dowling's statement concerning other possible fields in the West is very timely, and he is to be congratulated on the clearness of his argument.

Yours truly,

G. M. PONTON.

Ottawa, April 17, 1920.

# Calculations on Inclined Haulages

JOHN S. WATTS, New Glasgow, N.S.

The purpose of this article is to give a full and clear account, of how to calculate the horse power to handle a given amount of coal, or other material on an inclined slope or haulage plane.

The formulae and directions given in the technical books, on this subject, neglect to take into account the power or pull required to accelerate the loaded trip, and the time required to accelerate and deelerate the load, both of which have a considerable influence on the total time taken to make a trip, and therefore upon the daily output of the slope.

The simplest, and most usual case, is that of a straight incline at the same grade the whole length, and the factors that are known are, the grade and length of the incline, and the daily output required.

Generally also the weight and carrying capacity of the cars are known, or are fixed by conditions in the mine.

The first point to be decided is the maximum speed of hoisting, which depends upon the condition of the track, the better the quality of the track, and of the ear wheels and journals, the higher the speed at which the cars can be safely run.

If the mine is a small one, it will be cheaper to purchase one of the standard hoisting engines, in which case the speed must be that of the hoist of the required power.

However, in the absence of any reasons to the contrary, it may be taken that 500 feet per minute, will be a "safe and sane" speed at which to run the trip, and is average practice.

Having the maximum speed at which the hoist will run, and the daily output required, we can now estimate approximatively the time it will take to make one trip, and from that the number of cars we must haul per trip to get the desired output.

In making this estimate, allowance must be made, for the time taken to accelerate the trip to full speed, and for bringing it to rest. Also for the time necessary to change the trips at top and bottom.

It is necessary at the first attempt to make the above estimates, but after working out the calculations on that basis, we can cut and try again for the final result.

In referring to the grade of the incline, there are three systems of stating its amount. for example we may say, 1st, that the inclination is 1 in. 20, meaning that the vertical rise is one foot for each twenty feet of horizontal length; 2nd, that the inclination is 5 per cent, that is the vertical rise is 5 per cent of the horizontal length; 3rd, that the inclination is at an angle of 2°-52' to the horizontal.

All three of the above examples, represent actually the same inclination, and the third method is the one required for the basis of our calculation.

The first way of stating the grade of the incline can be converted into the third, that is degrees, by noting that the second quantity, that is 20, is the cotangent of the angle. By looking up a table of cotangents, we find that 20 is the cotangent of the angle of 2°-52'.

Similarly, the second way, can be converted into degrees by noting that the percentage of the grade ÷ 100 = the tangent of the angle, from a table of tangents we find .05 is the tangent of the angle 2°-52'.

To calculate the total pull on the rope, we have the following:—

- (1) Pull due to weight of loaded trip = Weight of loaded trip × sine of angle.
- (2) Pull due to friction of loaded trip = Weight of loaded trip × coefficient of friction.
- (3) Pull due to weight of rope = Weight of rope × sine of angle.
- (4) Pull due to friction of rope = Weight of rope × coefficient of friction.
- (5) Pull due to acceleration of trip =

$$\frac{\text{Weight of loaded trip} \times V}{G \times T}$$

- (6) Pull due to acceleration of rope =

$$\frac{\text{Weight of rope} \times V}{G \times T}$$

Where, V = maximum velocity in feet per second.

G = acceleration due to gravity = 32.16.

T = time of acceleration, or time taken to reach the maximum velocity in seconds.

Taking each of the above formulae in rotation:—

- (1) Presents no difficulty.
- (2) We have to know the coefficient of friction which is the absence of information from actual test on the cars in question, may be taken as being between .004 and .02, the lower figure being sufficient when the cars and tracks are in good average condition. The higher coefficient will only be correct under the worst conditions, such as frozen bearings, worn journals and uneven track. Under the usual conditions, the coefficient of friction to be used, is that of the cars in motion, not the coefficient required to start the cars from rest. This is because the pull allowed for acceleration plus the pull allowed for the moving friction, will be together greater than the pull required to start the cars from rest. This latter pull is only momentary, and the acceleration does not commence until after the cars are started moving.
- (3) We require to know the total weights of the rope, and to get this we must estimate the size of rope that will be required and correct this later if necessary.
- (4) Includes the coefficient of friction of the rope on its guide rollers, and in the absence of more precise information may be taken as .002, which is about correct for rope carried on rollers spaced about 25 feet apart. It should be noted at this point, that in No. 2 and No. 4 formulae, the friction will be reduced as the angle of the slope increases. This reduction is very slight for angles under 15°, and need not be considered unless the slope is steeper than that. For steeper slopes, the correction is made by multiplying the answer as calculated by formulae No. 2 and No. 4, by the cosine of the angle.

(5) To work out this formulae, we have to know the time, T, which we will allow for acceleration. And, as in the majority of cases, an empty trip is going down, while the full trip is coming up, this time of acceleration cannot be less than that taken by the descending cars to reach the maximum velocity under the action of gravity. This time can be calculated from the formulae:

$$T = \frac{V}{(\text{sine of angle} - \text{coefficient of friction}) \times G}$$

(6) Needs no comment, except that, of course, T is the same time as in No. 5.

Now adding together, the results of our calculations in formulae Nos. 1, 2, 3, 4, 5 and 6, we get the total maximum pull on the rope, which multiplied by the maximum speed of the rope in feet per minute, and divided by 33,000, will give us the brake horse power required in the hoisting engine.

However, as most of the makers of hoisting engines, specify the actual pull on the rope, that their engines will deliver, we do not usually need to specify horse power at all.

If the horse power must be given, one third should be added to the Brake Horse Power, as calculated above, to find the Indicated Horse Power required. This one third being necessary to overcome the friction of the gearing and engine.

Now to calculate the actual total time taken for one trip, we have

$$\begin{aligned} \text{The time of acceleration} &= T \\ \text{'' '' '' maximum velocity} &= T_1 \\ \text{'' '' '' deceleration} &= T_2 \end{aligned}$$

The time of acceleration, we have already, being T in formula 5.

The time of deceleration, cannot be less than that in which the cars will come to rest by the action of gravity, which is

$$T_2 = \frac{V}{(\text{sine of angle} + \text{coefficient of friction}) \times G}$$

To find T<sub>1</sub>, we must first calculate the space travelled over during the times of acceleration and deceleration which is

$$\text{Space during acceleration period} = \frac{V \times T}{2}$$

$$\text{Space during deceleration period} = \frac{V \times T_2}{2}$$

Adding these two lengths together, and deducting the sum from the total length of the slope, we have remaining the length to be travelled at full speed, and the time required will be that length divided by the maximum velocity, which added to the times of deceleration and acceleration, will give the total time of the haul. To this amount must be added the time required to change trips, and from the sum, we can calculate the number of trips per day.

From the above calculations it will appear that the period of maximum load is during the acceleration

period, and that during this time the engine receives no assistance from the empties going down, as they are simply gathering speed under the action of gravity, that is on an incline of regular grade.

The incline that would give a nearly uniform load on the engine, would be one that started off at the bottom on a low grade, changing to the regular grade at the point where the maximum velocity is reached, and, at the top, increasing the grade so that the empties would assist the engine in accelerating the full trip.

If the reasoning in the calculations set out above is understood there will be no difficulty experienced in making the calculation for an incline with varying grades.

Sometimes it is required to know what output can be expected from an engine which will deliver a certain pull on the rope, at a given speed, and this problem can be solved as follows:

Calculate the pull due to the weight of the rope, its friction, and acceleration by formulae 3, 4 and 6, and deduct the sum of these amounts from the total available pull on the rope, the balance will be the pull we have left to take the weight of the trip, its friction and acceleration, which pull is divided up as follows:

From formula 1. Pull due to weight of trip = weight of trip × sine of angle.

From formula 2. Pull due to friction of trip = weight of trip × coefficient of friction.

From formula 5. Pull due to acceleration of trip = weight of trip

$$\times \frac{V}{G \times T}$$

As the sum of these three pulls, must equal the available balance left, we have

$$\text{Balance of pull, available for trip} = \text{weight of loaded trip} \times (\text{sine of angle} + \text{coefficient of friction} + \frac{V}{G \times T})$$

For the first attempt, we must estimate the time of acceleration, T, and correct if necessary.

The above formula transposed becomes

$$\text{Weight of loaded trip} = \frac{\text{Balance of pull available for trip}}{\text{sine of angle} + \text{coefficient of friction} + \frac{V}{G \times T}}$$

Having the weight of the loaded trip, we can calculate the time taken for the haul, on the same lines as given above, and thus arrive at the daily output.

### A ZOOLOGICAL CURIOSITY.

“The complaint was made that men came to the district and asked inflated prices for shares, far above the market value, and it was argued that the new exchange would tend to obviate this system of sharks feathering their nests.”—“Punch” from a Lancashire paper.

# First Annual Report of the Explosives Division of the Department of Mines, 1919

The first annual report of the Explosives Division of the Department of Mines is issued. The formation of this Division has been under consideration since 1909, so that it took exactly ten years to get this much required undertaking commenced, although its necessity has been undenied since the Explosives Bill was drafted in 1910, and although both in the United States and in Gt. Britain such supervision over the manufacture and use of explosives in mines has long been in force.

The Explosives Act was assented to in June 1914, but was not proclaimed as effective until 1st of March this year.

The staff of the new Division is composed of the Chief Inspector, Lt.-Col. G. Ogilvie, R.A., Mr. J. G. S. Hudson, Dr. A. E. MacIntyre, and Mr. G. B. Frost. With regard to the qualifications of these officers, Col. Ogilvie states:

### Staff of the Division

"Concurrently with my appointment as Chief Inspector on April 15, 1919, the services of Mr. J. G. S. Hudson, Explosives Engineer of the Mines Branch, were made available and placed at the disposal of the division. Mr. Hudson, while on the staff of the Mines Branch, and in addition to his duties, been engaged in the work connected with the enquiries which gave rise to the first drafting of the Explosives Act, including a tour of inspection with Captain Desborough, and had subsequently conducted such inquiries as were then possible into the circumstances attending accidents with explosives. His acquaintance with the circumstances and conditions which have led to the introduction of the Act, and his previous experience in the coal mining industry, with the application of explosives thereto, give an added value to his services with the division and to his assistance in the task now before us.

We were fortunate in obtaining the transfer from the Department of Militia and Defence of Dr. A. E. MacIntyre, to take up the appointment of Chief Explosives Chemist. To a thorough chemical training at the West of Scotland Technical College, Glasgow, and at the University of Jena, Dr. MacIntyre has added many years of study and research in the chemistry of explosives, combined with practical experience in the working of the Dominion Arsenals at Quebec and Lindsay—of which latter he was acting superintendent when transferred. I consider the division is particularly fortunate in having secured for this responsible post one in whom is combined to a rare degree the highest technical qualifications with an appreciation of what is practicable in the application of the teachings of the science of explosives.

To the chemical staff was added on June 23, Mr. G. B. Frost, B.A., formerly inspector and chemist in the Explosives Section of the Imperial Ministry of Munitions Inspection Department, in which capacity he showed his eminent fitness for the efficient conduct of duties as will involve on him in his present positions."

Preliminary to the formation of the Division it was necessary to visit the several provinces and to harmonize the work and regulations of the Division with the already existing statutory and mining regulations of the provinces.

The report deals with Orders-in-Council which have been issued at the instance of the Division governing the classification of explosives, the equipment and nature of explosive factories, explosive magazines, the storage of explosives in small quantities, the packing and conveyance of explosives, licensing of explosives manufacture, importation of explosives, facilities for testing, and tabulation and investigation of accidents originating in the use of explosives.

So far as the mining industry is concerned, the interesting part of the Report is the reference to facilities for testing explosives, this being the original necessity which led to the formation of the division and caused various mining bodies to advocate it.

In this connection the Report states:

"The analysis and tests which require to be carried out on an explosive to determine its suitability for classification as an 'authorised explosive,' are such as may be carried out in a well equipped laboratory, and as a temporary measure, the premises at the corner of Kent and Vittoria street have been secured, and will shortly be equipped in a manner that will suffice to meet our immediate requirements.

The examination of the large number of explosives which are now being made and which will come forward for test will impose an abnormal volume of work on the chemical staff at the commencement, and in order that the time necessarily taken in completing this will not interfere with the normal manufacture of, and trade in explosives made in Canada, it is proposed, except where there may be special reason to the contrary, and pending the completion of the tests, to provisionally authorize the explosives of Canadian manufacture in use.

The provision of equipment for a testing station in which the suitability of an explosive for use in coal mines may be determined is a larger question, and one which has been receiving careful consideration. Involved in it is that of the best design of the equipment to be obtained, and it is hoped that in a short time we may, in coming to a decision on this matter, have the benefit of a knowledge of the result of researches now in progress elsewhere. In any event, tests of the first importance will be those which will be carried out in a 'gallery' to determine the maximum charge of an explosive that can be detonated without igniting certain mixtures of gas and air, or causing a coal dust explosion, therein. Amongst others also will be tests designed to give a measure of the relative power of the explosives under examination.

As a result of tests of these natures those authorized explosives, which satisfactorily meet them would be put on the "permitted list" of explosives which may be used in coal mines. The composition of these explosives and the results of the essential tests will be published—although the composition and results of tests of authorized explosives not on a permitted list will be kept strictly confidential.

The establishment and equipment of a testing station for the tests of "permitted" explosives must of necessity take some time, and is an undertaking of vital importance. If one may anticipate a little, I may forecast that, apart from the conduct of routine tests, such a station should enable considerable ex-

perimental and research work to be carried on, which would be of value to manufacturers in their efforts to provide suitable explosives for use in mines, and, in furnishing both the manufacturing and the mining industries with helpful information, further fulfil its primary function of promoting the safety of the mine worker”.

It will evidently be some time before Canada can issue its own list of “permitted” explosives, but it is gratifying to know that at last an organization has been formed and is actively working towards the preparation of a schedule of mine explosives that will accurately list their composition, the proper weight of charges, their behaviour in explosive mixtures, their ballistic properties, and other information which it is desirable should be at the disposal of mine managers.

Practically every notable coal mine explosion in Canada, and most of those in the United States, has had its proximate cause the flame and shock of some form of blasting powder or explosive, so that the necessity for accurate knowledge of the characteristics of explosives is beyond any question.

The Explosives Division of the Mines Branch has before it a lot of necessary and probably very hard work, and, while its formation is better late than never, it is impossible not to regret that the Division was not formed in 1910 when the Explosives Bill was introduced at Ottawa.

#### ATTEMPT TO UNIFY LABOR LEGISLATION

##### Ottawa Conference Will Point Out Desirable Elements in Existing Laws

The various provincial and federal laws affecting labor will be considered by a delegation representing capital and labor, and the Government of each Province of the Dominion which will wait upon the Government at Ottawa in the near future, with a view to making the laws uniform for the whole country as far as possible, making due allowance for varying conditions. The attention of the federal authorities will be called to the variation in the provincial labor laws, affecting the Minimum Wage, Mothers’ Pensions, Workmen’s Compensation, Factories’ Acts, Labor Bureaus, hours of labor, child labor, all legislation regarding arbitration and conciliation in labor disputes, and other matters affecting the workers of this country. It is hoped that as a result of this conference some agreement on necessary and desirable changes in the existing laws will be arrived at in order that the proposals may be submitted to the various Provincial Governments and the Federal Government for approval.

The Workmen’s Compensation Act varies in important details for the different provinces. The Saskatchewan Act allows a workman compensation to the extent of 100 per cent of his wages during enforced idleness arising from injury. In Ontario only 55 per cent of the wages are allowed, and the amount differs in the other provinces. The Ontario Act contains clauses offering special benefits to the workmen which are absent from the other acts. It is the purpose of the meeting at Ottawa to select the best ideas from the different acts, and apply a uniform act as far as possible to the whole Dominion. All forms of labor legislation will be considered with a view to the selection of the best element of the different laws that would apply to the various provinces.

#### BRITISH CONTROL OF OIL RESOURCES

Sir E. Mackay Edgar, in explaining Great Britain’s control of the oil resources of the world, says that within a few years the United States will be paying British oil interests \$1,000,000 annually for oil for the United States Navy and for home consumption.

“With the exception of Mexico and to a lesser extent, of Central America, the outer world is securely barricaded against United States invasion in force,” he said. “There may be small, isolated sallies, but there can never be a massed attack. The British position is impregnable.”

Sir Mackay declares that all known oil fields and all likely or probable oil fields outside the United States are in British hands or under British management or control, or financed by British Capital.

#### Great Harvest Certain

“We shall have to wait a few years before the full advantages of the situation begin to be reaped,” he said, “but that that harvest eventually will be a great one there can be no manner of doubt. To the tune of many million pounds a year the United States before very long will have to purchase from British companies and to pay for in dollar currency, in progressively increasing proportion, the oil she cannot do without and is no longer able to furnish from her own stores.

“Apart from Mexico,” Sir Mackay Edgar continues, “it is almost a case of the British first and the rest of the world nowhere. I should say two-thirds of the improved fields of Central and South America are in British hands. In Guatemala, Honduras, Nicaragua, Costa Rica, Panama, Colombia, Venezuela and Ecuador a decisive and overwhelming majority of petroleum concessions is held by British subjects, and will be developed by British capital. The Alves group, whose holdings encircle practically two-thirds of the Caribbean Sea, is wholly British, working under arrangements which insure that perpetual control of its undertakings shall remain in British hands.

#### Properties Widely Distributed

“No United States citizen and no United States group has acquired, or ever could acquire, any such position in Central America as that which enterprise and personality have secured for Mr. Alves, or take again that greatest of all oil organizations, the Shell group.

“It owns exclusive or controlled interests in every important oil field in the world—in the United States, Russia, Mexico, the Dutch East Indies, Roumania, Egypt, Venezuela, Trinidad, India, Ceylon, the Malay Straits, North and South China, Siam, the Starits Settlements and the Philippines.

Note:—

The foregoing news despatch may be quite true, but the judiciousness of this kind of propaganda is much to be doubted. It is quite unnecessarily provocative, and takes altogether too many things for granted. The “Sunday World” of London, in which Sir E. Mackay Edgar writes, is not a newspaper that commands a judicial audience, but it must puzzle even its readers to understand just what is feared from the United States, or what is to be understood by the phrase: “United States’ Invasion in force.” Are London journalists trying to emulate Mr. W. R. Hearst, or to find trouble for Sir Auckland Geddes? And have they forgotten the Argonne?—Ed.

## Book Reviews

"MINERS' DISEASES." Record of the Researches of Dr. J. Court, of Staveley, England, into Miners' Nystagmus and Ankylostomiasis.

This little book was printed for private circulation, and is the record of the life's work of a medical man whose residence in a colliery district occasioned an interest in miners' diseases that has had results of definite value, particularly in diagnosis of the predisposing causes of miners' nystagmus, in recognition of which Dr. Court was recently knighted.
